Engineering the Future – since 1758.

MAN Diesel & Turbo

MAN B&W Two-Stroke Propulsion Engines

MAN Diesel & Turbo Tier II and Tier III Engine Programme

The two-stroke engines in this programme are either:

- Tier II engines complying with IMO Tier II
- Tier III engines complying with Tier II when operated in Tier II mode and with Tier III when operated in Tier III mode

Engine Type Designation

To ensure that the engine designation describes the engine with regard to the fuel injection concept and Tier III technologies applied, the engine type designation has been expanded to include these concepts as described below (full designation, see page 15):

10S90ME-C9-GI-EGRBP

Information on Tier III technologies and fuel injection concepts are explained in detail on page 10 (GI and LGI Dual Fuel Engines) and page 11 (Tier III Technologies).

ME-C engines

The electronic control of ME engines includes flexible control of the cylinder process, i.e. fuel injection timing and actuation of exhaust valves, starting valves and cylinder lubrication.

ME-B engines

On ME-B engines, the injection timing is electronically controlled whereas the actuation of the exhaust valves is camshaft operated, but with electronically controlled variable closing timing.

MAN B&W Two-Stroke Propulsion Engines

CEAS and Turbocharger Selection (TCS)

CEAS and TCS applications include all available Tier II, Tier III technologies and dual fuel options. These applications include all engines and variants available, and specifications can be further investigated with respect to finding the basic data essential for the design and dimensioning of a ship's engine room (CEAS) and applicable turbochargers (TCS).

CEAS and TCS are available at: www.marine.man.eu → Two-Stroke under *CEAS Engine Calculations* and *Turbocharger Selection*.

In CEAS and TCS, all engines in this programme are designated '.5' and can be selected from the category 'Official catalogue'.

Earlier versions of this engine programme have additional engines mentioned. Some of those engine types are still available under the category 'Replaced engines'. New development will only be implemented in these designs to the extent considered necessary based on service experience. New efficiency enhancing features will not be available on older engine types.

Engine Power

The engine brake power is stated in **kW**.

The power values stated in the tables are available up to tropical conditions at sea level, i.e.:

- turbocharger inlet air temperature 45 °C
- turbocharger inlet air pressure 1,000 mbar
- cooling water (sea/fresh) temperature 32/36 °C

Specific Fuel Oil Consumption (SFOC)

The figures given in this folder represent the values obtained when the engine and turbocharger are matched to the lowest possible SFOC values while fulfilling the IMO NO_x Tier II or Tier III emission limits.

The SFOC figures are given in g/kWh and are based on the use of a fuel oil with a lower calorific value (LCV) equal to 42,700 kJ/kg at ISO conditions:

- turbocharger inlet air temperature 25 °C
- turbocharger inlet air pressure 1,000 mbar
- cooling water temperature 25 °C

Most commercially available HFOs with a viscosity below 700 cSt at 50 °C can be used.

MAN B&W Two-Stroke Propulsion Engines

Tolerances

The energy efficiency design index (EEDI) has increased the focus on part-load SFOC. We therefore offer the option of selecting the SFOC guarantee at a load point in the range between 50% and 100%. For part-load or low-load tuning methods the SFOC guarantee point is limited to the range 50% to 85%.

All engine design criteria, e.g. heat load, bearing load and mechanical stresses on the construction, are defined at 100% load independent of the guarantee point selected. This means that turbocharger matching, engine adjustment and engine load calibration must also be performed at 100% load independent of the guarantee point.

When choosing an SFOC guarantee at or below 100%, the tolerances, adjustment and calibration at 100% will affect engine running at the lower SFOC guarantee load point. This includes tolerances on measurement equipment, engine process control and turbocharger performance.

Consequently, SFOC guarantee tolerances are as follows:

- 100–85% SMCR: 5% tolerance
- 84–65% SMCR: 6% tolerance
- 64–50% SMCR: 7% tolerance

Please note that the SFOC guarantee can only be given in one load point for Tier II engines. For Tier III engines see page 11.

Turbocharging System

Two-stroke engines can be delivered with MAN, ABB or MHI turbochargers as standard.

The SFOC figures given in this folder for two-stroke engines are based on turbocharging with the best possible turbocharging efficiency generally available, i.e. 67% for all engines with 45 cm bore and above, and 64% for engine bores smaller than 45 cm. Both efficiency figures refer to 100% SMCR.

All engines with high-efficiency (67%) turbochargers can be ordered with a lower (conventional) turbocharging efficiency. Utilising this possibility will result in higher exhaust gas temperatures, lower exhaust gas amounts, and a slight change in SFOC. It is not possible to apply tuning methods (part- or low-load) when making such a conversion.

MAN B&W Two-Stroke Propulsion Engines

Fuel Consumption and Optimisation Possibilities for Tier II Engines

Various optimisation possibilities for improved part-load and low-load SFOC are available for the MAN B&W type engines. High-load optimisation is for best possible SFOC at 100% engine load.

Optimisation of SFOC in the part-load range (50-85%) or low-load range (25-70%) requires selection of a tuning method:

- EGB: exhaust gas bypass

Also high-pressure tuning (HPT) is available on request for ME engines.

The above tuning methods are available for all SMCR points, but cannot be combined. The SFOC reduction potential of each tuning method at L₁ rating can be seen on each individual engine page.

In cases where part-load or low-load EGB tuning is applied, and a higher exhaust gas temperature is needed, a solution exists for additional automatic control of the EGB, so-called economiser energy control (EEC). Forcing an open EGB at loads where the EGB is normally closed results in a higher mixed exhaust gas temperature, but with a penalty on SFOC. Calculations with this feature are made on request.

GI and LGI Dual Fuel Engines

This engine programme includes a number of engines designed for gas fuels (GI engines) and liquid gas fuels (LGI engines) operation.

Fuel	Fuel designation	LCV [kJ/kg]
Methane	GI	50,000
Ethane	GIE	47,500
Methanol	LGIM	19,900
LPG*	LGIP	46,000

*LPG is a mixture of liquid propane and butane.

In this engine programme, GI figures are included for all engines. Figures for GIE and LGIM are included for selected engines (see pages 94-103).

SFOC figures are shown for dual fuel mode operation (i.e. operation on gas or liquid gas fuels). Fuel oil mode SFOC is identical to the SFOC for a similar fuel oil engine. Data for both modes can be found in the CEAS report.

Dual fuel engines are available with standard tuning methods for part-load and low-load optimisation in both fuel oil mode and in dual fuel mode. In dual fuel mode, the fuel consumption consists of 3% mass-based pilot

MAN B&W Two-Stroke Propulsion Engines

liquid fuel of L₁ rating (SPOC = specific pilot oil consumption) and gas fuel (SGC = specific gas consumption).

All types of GI engines can operate with fuel sharing, also referred to as specified dual fuel (SDF) operation, where the ratio between pilot fuel oil and gas fuel can be selected according to preset values.

Guarantee figures for dual fuel engines are given for heat rate, which have the same tolerances as SFOC guarantees, i.e. see page 9.

Heat rate is defined as follows [kJ/kWh] (example for methane as dual fuel):

$$\text{Heat rate (kJ/kWh)} = \text{SGC (g/kWh)} \times 50 \text{ kJ/g} + \text{SPOC (g/kWh)} \times 42.7 \text{ kJ/g}$$

The pilot oil amount typically contribute about 5% of the heat rate and the distribution between SGC and SPOC together with heat rate over the load range are available in the CEAS report.

Please note that dual fuel engines must have cylinder lubrication systems capable of supplying both low-BN lubricating oils and high-BN lubricating oils.

Tier III Technologies

To comply with IMO Tier III regulations, two major NO_x reduction technologies can be selected – EGR or SCR. Which technology is preferred depends on market demands, engine size, other requirements and operational pattern.

Descriptions of these technologies in more detail can be investigated in the Emission Project Guide: www.marine.man.eu → Two-Stroke → Project Guides → Other Guides → Emission Project Guide

All Tier III engines have two operating modes:

- Tier III mode fulfilling the IMO Tier III regulations
- Tier II mode fulfilling the IMO Tier II regulations

The Tier III technologies are designed for the use of low-sulphur fuels (0-0.1% sulphur) in Tier III mode. This limitation for sulphur content apply to Tier III operation only. In Tier II operation, the engine is in all cases capable of using fuels with a high sulphur content.

Tier III designs for use of high-sulphur fuels in Tier III mode are available on request.

Fuel consumption guarantees can be given for engines for both Tier II and Tier III mode.

MAN B&W Two-Stroke Propulsion Engines

EGR

Two EGR matching concepts are available depending on engine type:

EGR Concept	Description
EGRTC	TC cut-out matching for engines with bores ≥ 80 cm and more than one turbocharger applied
EGRBP	Bypass matching for engines with bores ≤ 70 cm and one high-efficiency turbocharger and for engines with bores ≤ 40 cm and one conventional efficiency turbocharger

EGR operation applies to ME and ME-B engines, including engine types for dual fuel except GIE.

SCR

Two SCR concepts are available:

SCR Concept	Description
HPSCR	High-pressure SCR with static mixer and SCR reactor installed upstream the turbocharger(s)
LPSCR	Low-pressure SCR with static mixer and SCR reactor installed downstream the turbocharger(s)

SCR operation applies to ME and ME-B engines, including engine types with dual fuel.

The SCR system must be supplied by an approved supplier.

HPSCR

For some large bore engines (bores ≥ 90 cm) with a high cylinder number, HPSCR is only available on special request.

Illustrations of the Tier III Technologies

Waste Heat Recovery Systems

Waste heat can be economically recovered on engines with high-efficiency turbochargers by installing equipment for waste heat recovery (WHR) and matching the engine for WHR. WHR systems are available for both Tier II and Tier III engines on request.

The following types of WHR systems have been approved for application:

- Power turbines with a power output equal to 3-5% of the engine shaft power at SMCR.
- Power turbines and steam turbines with a power output corresponding to 8-10% of the engine shaft power at SMCR.
- Steam turbine system – with a power output corresponding to 4-6% of the engine shaft power at SMCR.
- Turbochargers with a motor/generator attached to the turbocharger shaft, and with a power output equal to 3-5% of the engine shaft power at SMCR.

Lubricating Oil Consumption

The system oil consumption varies for the different engine sizes and operational patterns. Typical consumptions are in the range from negligible to 0.1 g/kWh.

Specific Cylinder Oil Consumption

Alpha ACC (Adaptive Cylinder-oil Control) is the lubrication mode for MAN B&W two-stroke engines that involves lube oil dosing proportional to the engine load and to the sulphur content in the fuel oil being burned. The specific minimum dosage for low-sulphur fuels is set at 0.6 g/kWh. The typical ACC dosage for a BN100 cylinder oil is $0.3 \text{ g/kWh} \times S\%$.

Our Service Letter SL2014-587 offers further information:

www.marine.man.eu → Two-Stroke → Service Letters → SL2014-587

Extent of Delivery

The final and binding extent of delivery of MAN B&W two-stroke engines is to be supplied by our licensee, the engine maker, who should be contacted in order to determine the execution for the actual project.

In order to facilitate negotiations between the yard, the engine maker and the customer, a set of guiding 'Extent of Delivery' (EoD) forms is available in which MAN Diesel & Turbo's recommended basic and optional executions are specified.

The licensees may select a different extent of delivery as their standard.

MAN B&W Two-Stroke Propulsion Engines

Engine Dimensions

The minimum length $L_{\min}$ is stated from the aft end of the crankshaft to the fore end of the engine.

$L_{\min}$ Minimum length of engine

A Cylinder distance

B Bedplate width

B1 Bedplate width at foot flange

B2 Bedplate width at top flange

C Crankshaft to underside of foot flange

H_1 Normal lifting procedure

H_2 Reduced height lifting procedure

H_3 Reduced height lifting procedure with MAN B&W double-jib crane

H_4 Normal lifting procedure with MAN B&W double-jib crane.

Dry Masses

Dry masses are stated in metric tonnes for engines with MAN turbocharger(s) and a standard tuning wheel. Figures will vary depending on the design and options chosen, e.g. moment compensators, tuning wheel, etc.

Dry masses for Tier III engines cover components directly integrated on the engine.

Indicated values are for guidance only and are not binding.

MAN B&W

Two-Stroke

Propulsion Systems

MAN Alpha**Fixed Pitch Propeller Programme**

5-bladed Kappel propeller

The MAN Alpha FPP portfolio covers:

- power range of 4-40 MW per shaft
- blade configurations for 3, 4, 5 and 6-bladed propellers
- propellers with integrated shaft line and stern tube solutions
- wide range of stern tube lube and sealing systems
 - oil, water, biodegradable oils

The MAN Alpha FPPs are characterised by the following benefits:

- high-efficient hydrodynamically optimised blade profiles
 - Kappel designs available
- high reliability: Robust approach with ample mechanical design margins
- high-efficient aft ship integration with rudder, rudder bulb, ducts, etc.
- layouts for complete two-stroke propulsion systems, e.g. with PTO solutions
- plant calculations with upfront consideration to TVC, alignment and control systems

MAN B&W Two-stroke Propulsion Systems

MAN Alpha Controllable Pitch Propeller

- standard Mk 5 versions are 4-bladed – 3- and 5-bladed propellers are available upon request
- the figures stated after VBS indicate the propeller hub diameter
- standard blade/hub materials are Ni-Al-bronze, stainless steel is optional
- propellers are available up to the highest ice classes, however the below standard programmes, are based on 'no ice'.

VBS Mk 5 CP Propeller Programme

We are the world's leading designer of large-bore diesel engines. Our engines have unit power outputs ranging up to 103,000 horsepower.

The MAN B&W 11G95ME-C9.5 is the largest and most powerful engine from the MAN Diesel & Turbo portfolio ever designed and built.

MAN Four-Stroke Propulsion Engines

The diesel engine has always been the most efficient system for converting fuel into mechanical energy.

MAN Diesel & Turbo will ensure it stays that way: Advanced inhouse technologies for efficiency and ecology enable MAN diesel engines to comply with the most stringent emission limits.

MAN Four-Stroke Propulsion Engines

MAN Four-Stroke Propulsion Engines – All Emission Requirements

Besides the focus on power density and fuel economy, MAN Diesel & Turbo is committed to a steady reduction of the environmental impact of our engines.

IMO Tier II

Applying well-proven methods to achieve a cleaner and more efficient combustion process, MAN Diesel & Turbo has significantly decreased NO_x emissions. Our four-stroke propulsion engines are IMO Tier II compliant with internal engine measures alone.

IMO Tier III

For operation in emission control areas (ECA), MAN Diesel & Turbo has developed a comprehensive range of selective catalytic reduction (SCR) systems that tremendously reduces NO_x levels surpassing IMO Tier III requirements.

MAN Diesel & Turbo is the first manufacturer to successfully produce and offer IMO Tier III compliant four-stroke marine engines, based on a fully modular SCR kit covering our entire four-stroke engine portfolio. In 2014 MAN Diesel & Turbo was awarded the first IMO Tier III EIAPP certificate together with the classification society DNV-GL.

MAN Four-Stroke Propulsion Engines

MAN Diesel & Turbo's standard SCR system is available in fourteen different sizes covering our entire portfolio of four-stroke medium speed engines. Customised SCR systems are offered on demand.

MAN has developed a complete range of SCR systems that work perfectly with our engines for maximum system efficiency. The intelligent exhaust gas temperature control allows for significant savings in fuel consumptions as compared to third-party supplier systems. MAN SCR systems work with MGO, MDO and HFO with up to 3.5% sulphur.

MAN propulsion plant with complete SCR system

MAN Four-Stroke Propulsion Engines

Our modular system comes in 14 different sizes to match all power demands. Some notable benefits of standardisation are significant cost reduction and simplification of installation.

The modular SCR component kit

Typical urea consumption values for IMO Tier III compliance

Engine type	Engine speed	Specific urea consumption*
	[r/min]	[g/kWh]
48/60CR	514	13.5
32/44CR	750	13.0
28/33D STC	1,000	11.5

**Tolerance 5%*

MAN Four-Stroke Propulsion Engines

Conventional Injection Engines

Our well-established engine types are used in a vast array of applications all over the world. Based on long-term experience of historical proportions, our engines are in continuous development to increase power, reduce emissions, increase reliability, reduce fuel oil consumption, and increase longevity. Our engines are the prime movers of choice in the maritime sector.

Common Rail (CR) Engines

The flexibility of our CR technology enables a substantial improvement of the combustion process that improves the fuel economy and reduces emission levels. It is particularly advantageous in the low-load and mid-load ranges where our unique ECOMAP system applies different engine maps to reduce fuel consumption while observing emission limits. Another feature is our patented Boost Injection. Our engine control system senses a load increase at a very early stage and tremendously improves load response with the activation of Boost Injection in our common rail control. In addition, exhaust gas opacity is markedly reduced, far below the visibility limit. Our CR engines run efficiently on liquid fuels complying with ISO 8217-2010 DMA, DMZ, and DMB, and on residual fuels up to 700 cSt (in compliance with ISO-F-RMK 700).

MAN Four-Stroke Propulsion Engines

Diesel Oil (D) Engines

The V28/33D STC features very favourable ratios of power-to-weight and power-to-installation space. Its combination of low fuel consumption, low emissions and reduced life cycle costs makes this engine the ideal solution for propulsion in high speed ferries, naval and offshore patrol vessels. The V28/33D STC engine operates on distillates according to ISO 8217 DMA or equivalent fuel types.

Sequential Turbocharging (STC)

The MAN Diesel & Turbo sequential turbocharging system operates with two high-efficiency turbochargers. Depending on the amount of charge air required, the second turbocharger is switched on or off. In this way, the engine is operated at its optimum operating point over the whole applicable load range.

The result is an extended operating envelope at low engine speeds, which gives a power reserve for ship acceleration, ship turning, sprints or towing. Furthermore, the STC system is characterised by a low thermal signature, decreased smoke emission, low vibrations and continuous low-load operation with reduced fuel consumption, which makes it the ideal solution for propulsion in naval applications and offshore patrol vessels.

Dual Fuel (DF) Engines

Dual fuel engines from MAN Diesel & Turbo run efficiently on liquid fuels or natural gas with very low emissions that are compliant with IMO limits. The possibility to switch over seamlessly from gas to diesel operation and vice versa provides full flexibility in multiple applications.

All dual fuel engines can run on natural gas with a methane number higher than 80 without adjustments. For lower methane numbers, MAN Diesel & Turbo can deliver well-adapted solutions. The optimised combustion chamber ensures a very low fuel consumption in both operational modes.

MAN Four-Stroke Propulsion Engines

Engine Power

Engine brake power is stated in kW.

Ratings are given according to ISO 3046-1:2002.

According to ISO 15550:2002, the power figures in the tables remain valid within a range of $\pm 3\%$ up to tropical conditions at sea level, i.e.:

- compressor inlet temperature 45 °C
- compressor inlet pressure 1,000 mbar
- sea water temperature 32 °C

For all medium speed propulsion engines, the power is defined according to the ICFN¹ definition (ISO 3046-1:2002:ISO standard power) with one exception.

For the load profile type Navy, of the engine types V28/33D STC, the rated power of the engine is stated according to the ICFN¹ power definition (ISO 3046:2002:ISO standard fuel stop power).

Load profile type: Navy (ICFN)

Typical use: fast yachts, corvettes, frigates and OPV

¹ I = ISO power

C = continuous power output

[F = fuel stop power]

N = net

MAN Four-Stroke Propulsion Engines

Specific Fuel Oil Consumption (SFOC) and Heat Rate

The stated consumption figures refer to the following reference conditions according to ISO 3046-1:

- ambient air pressure 1,000 mbar
- ambient air temperature 25 °C (77 °F)
- charge air temperature according to engine type, corresponding to 25 °C cooling water temperature before CAC

The figures are given with a tolerance of +5% and without engine driven pumps. Attached pumps and engines running in suction dredger operation will require additional fuel.

In accordance with the NO_x Technical Code 2008 of the International Maritime Organization, DM-grade fuel oil is used as reference fuel oil for engine tests and, thus, also forms the basis for the SFOC figures stated for engines in liquid fuel operation.

Unless otherwise specifically stated, SFOC figures are based on a lower calorific value of the fuel oil of 42,700 kJ/kg and, in addition for engines with common rail injection (CR-engines), on DMA-grade fuel oil (ISO 8217-2010). For engines with conventional fuel injection, SFOC figures are based on DMB-grade fuel oil (ISO 8217-2010). For further details please refer to our engine specific project guides available from MAN Diesel & Turbo.

Specific Lube Oil Consumption (SLOC)

The specific lube oil consumption is specified at MCR (maximum continuous rating) with a tolerance of 20%.

Blocking of Output

Blocking of output is made for engines driving a propeller at 100% of the rated output. For engines powering an alternator, blocking of output is made at 110%. However, operation above 100% load is only recommended for a short period of time for recovery and prevention of a frequency drop.

MAN Four-Stroke Propulsion Engines

Weights and Dimensions

For marine main engines, the weights stated refer to engines without a flywheel.

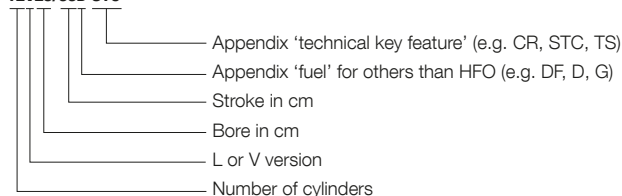

For auxiliary engines (GenSets), genset weights refer to the unit (including alternator). The weight of the GenSet may vary depending on the alternator make. All weights given are without lube oil and cooling water.

The length of the genset unit depends on the alternator make. For a twin engine installation, the centreline distance is stated for each engine type.

The centreline distance for twin engine installation is given as a minimum value. Specific requirements to the passageway (e.g. of classification societies or flag state authority), seating type or a gallery can lead to higher values.

Increasing the competitiveness of its products, MAN Diesel & Turbo has developed into a leading think tank and owner of the relevant key technologies driving the economic and ecological performance of its products.

MAN Four-Stroke Marine GenSets

MAN Four-Stroke Marine GenSets

MAN Four-Stroke Marine GenSets – All Emission Requirements

Besides the focus on power density and fuel economy, MAN Diesel & Turbo is committed to a steady reduction of the environmental impact of our engines.

IMO Tier II

MAN Diesel & Turbo has decreased NO_x emissions significantly by applying well-proven methods that ensure a cleaner and more efficient combustion process. Our four-stroke propulsion engines are IMO Tier II compliant by internal engine measures alone.

IMO Tier III

For operation in emission control areas (ECA), MAN Diesel & Turbo has developed a comprehensive range of selective catalytic reduction (SCR) systems that provides a tremendous reduction in NO_x levels surpassing IMO Tier III requirements.

MAN Diesel & Turbo is the first manufacturer to successfully produce and offer IMO Tier III compliant four-stroke marine engines, based on a fully modular SCR kit covering our entire four-stroke engine portfolio.

In 2014 MAN Diesel & Turbo was awarded the first IMO Tier III EIAPP certificate together with the classification society DNV-GL.

MAN Four-Stroke Marine GenSets

MAN Diesel & Turbo's standard SCR system is available in fourteen different sizes covering our entire portfolio of four-stroke medium speed engines. Customised SCR systems are offered on demand.

MAN has developed a complete range of SCR systems that work perfectly with our engines for maximum system efficiency. The intelligent exhaust gas temperature control enables significant savings in fuel consumption as compared to third party supplier systems. MAN SCR systems work with MGO, MDO and HFO with up to 3.5% sulphur.

MAN GenSet plant with complete SCR system

MAN Four-Stroke Marine GenSets

100% MCR PTO-solutions for L21/31 and L27/38 GenSets

Optimised for both new and existing ship designs

PTO on alternator – external pump

Pump on alternator – common base frame

PTO on front end – external pump (new feature)

Pump on front end – common base frame (new feature)

MAN Four-Stroke Marine GenSets

Fuel oil saving for small bore GenSet (part load optimised)

GenSets can be delivered with improved fuel oil consumption at low load and part load. The penalty will be a higher SFOC at high load. The part load optimised engine complies with the IMO Tier II limit.

The new tuning method, referred to as part load optimisation, optimises the engine performance at approx. 60-65% MCR, as this is often the load range in which the GenSet is operating, but it can also be customised to other specific operating conditions.

With part load optimisation, fuel oil savings of up to 12 g/kWh can be obtained, depending on the engine type/model and load point.

Traditionally, GenSets are optimised at 85% MCR because the power management system will engage additional GenSets when more power is needed.

With part load optimisation there is a fuel oil penalty when the load exceeds approx. 80% MCR, but this has no practical consequence as the GenSet rarely exceeds 85% MCR.

This is illustrated in the figure below. For further information please contact MAN Diesel & Turbo

Based on Project Guide figures for IMO Tier II engines – 60Hz:

ISO reference condition, HFO/MDO, without pumps, tolerance +5% (not included)

MAN Four-Stroke Marine GenSets

Diesel-Electric and Hybrid Propulsion Power Trains (HyProp ECO)

MAN Diesel & Turbo offers a full range of diesel-electric and hybrid propulsion power trains. Our solutions are designed and optimised to meet the highest efficiencies of a complete propulsion plant system covering the complete operational profile of the vessel. Our propulsion systems provide a well-balanced and tailor-made solution with emphasis on flexibility and performance.

Our comprehensive propulsion packages include the complete array of required components from GenSets to propulsors, including switchboards, variable speed drives and propulsion motors. Full diesel-electric propulsion power trains as well as hybrid systems ensure the optimal technical and economical solution while maximising power demand flexibility.

With HyProp ECO, a new hybrid propulsion system has been developed combining the best propulsion performance with low investment costs.

High-efficient and customised power trains for diesel-electric and hybrid propulsion applications

HyProp ECO: Hybrid propulsion system

MAN Four-Stroke Marine GenSets

Energy Saving Electric Propulsion (EPROX)

Recent developments in diesel-electric propulsion have resulted in electric systems where engines can operate at variable speed. The "classic" constant speed operation of GenSets is no longer a constraint. Utilising an enlarged engine operation map with a speed range of 60% to 100% paves the way to a high potential in fuel oil savings. Each speed set point of the engines can be adjusted independently, in order to achieve a minimum fuel oil consumption according to the system load. The electric system using DC distribution enables a decoupled operation of the engines, propulsion drives, and other consumers of energy.

Another major advantage is the possible integration of energy storage sources, like batteries. They can reduce the transient loads on the engines and improve the dynamic response of the propulsion system. Fast load application is removed from the engines and load peaks are shaved. Also, emission free propulsion can be realized when running on the batteries. In addition, the energy storage sources will have a positive effect on engine maintenance.

MAN Diesel & Turbo offers this advanced package solution in close cooperation with leading E-suppliers.

EPROX propulsion solution on anchor handling tug supply vessel

MAN Four-Stroke Marine GenSets

MAN L23/30H Monocoque GenSet – Continued development

The monocoque GenSet includes several updates of the tried and tested L23/30H engine, which are focused on weight reduction, vibration optimisation and simplified installation.

The most significant update is that the alternator is now a load-bearing component, with a 'top brace' connection to the engine. This enables up to 63% weight reduction of the base frame, which again results in up to 13% weight reduction of the GenSet and a lower vibration level.

The three and four point 'deck-level' supports significantly simplify the GenSet installation process. This design is installed on a flat deck which is a major reduction of the vessels foundation structure. Furthermore, applying only three conicals makes the GenSets self-leveling.

The monocoque GenSet application is available for all variants of the L23/30H engine.

MAN Four-Stroke Marine GenSets

GenSets

GenSets can be applied as auxiliary GenSets, GenSets for diesel-electric propulsion or for offshore applications.

Project specific demands can be clarified at an early project stage.

Tier III GenSets

Four-stroke GenSets are Tier III compatible when a downstream SCR is added to clean the exhaust gas on a Tier II engine. The additional SCR will only have an impact on SFOC if the backpressure is increased.

MAN Diesel & Turbo has been building auxiliary engines since 1929.

More than 20,000 GenSets, both from own production and from licensees, have been delivered over the years. Ever since, these engines have set the benchmark for the whole industry as an example of reliability and user friendliness.

MAN Four-Stroke Propulsion Systems

MAN Alpha**Fixed Pitch Propeller Programme**

A 5-bladed Kappel propeller

The MAN Alpha FPP portfolio covers:

- power range of 4-40 MW per shaft
- blade configurations for 3, 4, 5 and 6-bladed propellers
- propellers with integrated shaft line and stern tube solutions
- a wide range of stern tube lube and sealing systems
 - oil, water, biodegradable oils

The MAN Alpha FPP's are characterised by the following benefits:

- high-efficient hydrodynamically optimised blade profiles
 - Kappel designs available
- high reliability: Robust approach with ample mechanical design margins
- high-efficient aft ship integration with rudder, rudder bulb, ducts, etc.
- layouts for complete propulsion systems
- plant calculations with upfront consideration to TVC, alignment and control systems

MAN Four-Stroke Propulsion Systems

MAN Alpha Controllable Pitch Propeller

- as standard Mk 5 versions are 4-bladed – optionally 3- and 5-bladed propellers are available upon request
- the figures stated after VBS indicate the propeller hub diameter
- standard blade/hub materials are Ni-Al-bronze, stainless steel is optional
- the propellers are available up to the highest ice classes. The below standard programmes, however, are based on 'no ice'.

VBS Mk 5 CP Propeller Programme

Propeller diameter (mm)

MAN Exhaust Gas Turbochargers

MAN Exhaust Gas Turbochargers

The TCR and NR types are designed with radial flow turbine, and the TCA and NA types have an axial flow turbine. All MAN turbochargers have the following design characteristics:

- straightforward design, uncooled gas casings, inboard bearing arrangement and plain bearings
- lube oil supply from the engine
- high availability, reliability and durability
- high efficiency
- easy maintenance and servicing
- long lifetimes of components
- long intervals between overhauls

Applications for Marine and Stationary

- propulsion units
- generating sets
- traction engines
- suitable for HFO, MDO and gas engines

Special

- tailor-made solutions
- variable turbine area (VTA)

MAN Exhaust Gas Turbochargers

TCA application range

■ four-stroke version ■ two-stroke version

TCR application range

■ high pressure four-stroke version ■ standard four-stroke version ■ two-stroke version

MAN TCA Series

NR29/S	3,820	31,300	780
NR34/S	5,400	26,300	1,450

Specific air consumption $l_e = 7 \text{ kg/kWh}$

MAN TCX Series

Exponential turbocharging

The scavenge air pressure can be increased substantially by two-stage turbocharging. A higher scavenge air pressure enables the engine to achieve a higher power density and, as a result, various downsizing possibilities arise. By increasing the scavenge air pressure, fuel consumption and NO_x emissions can be considerably lowered.

The MAN Diesel & Turbo two-stage concept consists of two turbochargers and is capable of offering scavenge air pressures of up to 10.5 bar. A specifically matched TCA or TCR is the low-pressure stage while for the high-pressure stage MAN has developed the new TCX series. The compressor map allows flexible air management (e.g. EGR).

By employing inter-stage cooling between the two turbocharging stages, the energy required to compress the intake air to a high pressure is considerably reduced compared to a system without intercooler.

Benefits

- higher power density
- higher charging efficiencies due to intercooling
- pressure ratios up to 10.5 bar (two stages)
- considerably lower fuel consumption
- reduced exhaust emissions
- compact two-stage unit with integrated intermediate and charge air coolers feasible

Technical data

Turbine type	Mixed flow turbine
Max. permissible temp.	650 °C
Pressure ratio (two stages)	up to 10.5
Suitable for HFO, MDO, gas	

TCX Turbocharger programme

Type	Max. engine output*	Max. permissible speed	Mass kg
	kW	rpm	
TCX09	1,700	91,200	42
TCX11	3,000	68,400	101
TCX13	4,200	58,170	164
TCX15	6,000	48,660	280
TCX17	8,500	40,980	470
TCX19	11,900	34,550	785
TCX21	16,900	29,000	1,325
TCX23	23,900	24,390	2,230

* $l_e = 6 \text{ kg/kWh}$; $p_{HPCin} = 3 \text{ bar}$; $THPCin = 45 \text{ °C}$
