Parts per Thousand (ppt) Guide

Parts per thousand (ppt), also known as the "relative standard deviation", is useful when comparing the uncertainty between different measurements of varying magnitude (i.e. it is a measure of the *precision* within an experiment.) Parts per thousand can be applied to any set of data where more than one experimental value has been applied – i.e. volumes, percentages, concentrations, etc. We will use parts per thousand often this year, so knowledge of how it works is critical for the successful student.

For the values x_1 , x_2 and x_3 :

• Take the **average** of the values

average =
$$\frac{\text{sum}}{\text{# of values}} = \frac{x_1 + x_2 + x_3}{3}$$

• Find the **deviation** of each value relative to the average

deviation₁ = absolute value (average
$$-x_1$$
) = | average $-x_1$ |
deviation₂ = | average $-x_2$ |
deviation₃ = | average $-x_3$ |

• Find the average deviation of the deviations

average deviation =
$$\frac{\text{sum of deviations}}{\text{# of values}} = \frac{\text{deviation}_1 + \text{deviation}_2 + \text{deviation}_3}{3}$$

• Calculate the **parts per thousand (ppt)** for the values

$$ppt = \frac{average \ deviation}{average} * 1000$$

Example: Calculate the parts per thousand for the values 35.72%, 35.92% and 36.02%

• Average =
$$\frac{35.72 + 35.92 + 36.02}{3}$$
 = **35.89** %

- Deviation₁ = |35.89 35.72| = 0.17
- Deviation₂ = |35.89 35.92| = 0.03
- Deviation₃ = |35.89 36.02| = 0.13
- average deviation = $\frac{0.17 + 0.03 + 0.13}{3}$ = **0.11** %
- parts per thousand = $\frac{0.11}{35.89} * 1000 =$ **3.1***unitless*
