Corrigendum

Specific recognition and inhibition of Ewing tumour growth by antigen-specific allo-restricted cytotoxic T cells

U Thiel, S Pirson, C Müller-Spahn, H Conrad, DH Busch, H Bernhard, S Burdach and GHS Richter

British Journal of Cancer (2011) **105,** 596. doi:10.1038/bjc.2011.305 www.bjcancer.com

Correction to: *British Journal of Cancer* (2011) **104**, 948 – 956; doi:10.1038/bjc.2011.54

When published originally, earlier this year in Volume 104, the authors noticed a couple of errors in the Results section.

The first is in the subheading entitled 'Selection of peptide- and ET-specific T cells'. In the second paragraph of this subsection, on page 951, the second sentence should read 'For example, of the T cells initially specifically selected with the $CHM1^{319}$/HLA-A*0201-multimer, 96 cell lines were grown and tested for specific IFN-γ release against $CHM1^{319}$ peptide.'

The legend of Figure 4 should read 'Low granzyme B responses against HLA class I blocked A673 and HLA-A*0201^{+} PBMC compared with unblocked A673.'

The publishers and authors are now happy to correct these errors.

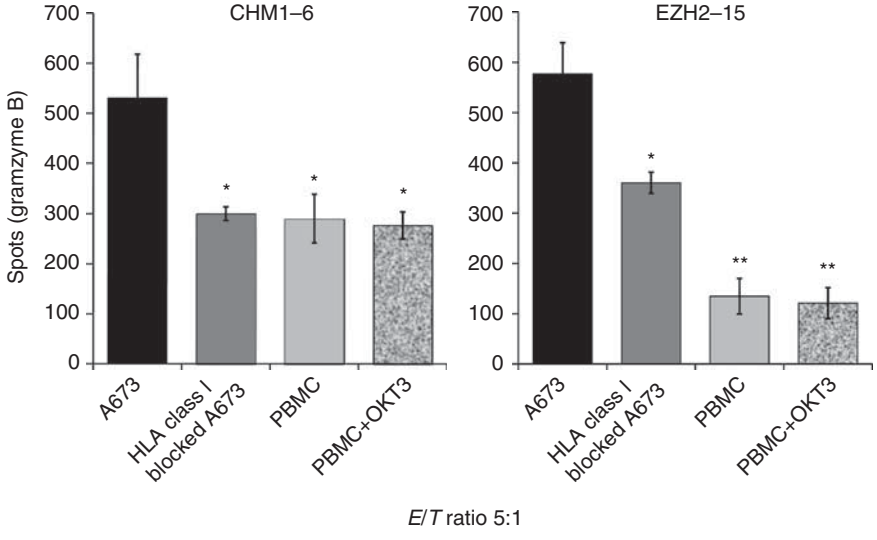

Figure 4 Low granzyme B responses against HLA class I blocked A673 and HLA-A*0201^{+} PBMC compared with unblocked A673. HLA class I blocking before granzyme B ELISpots caused reversion of specific recognition by $CHM1^{319}$ or $EZH2^{666}$ peptide specific $CD8^{+}$ T cells at an effector to target (E/T) ratio of 5:1. Granzyme B release upon contact with irradiated OKT3-stimulated/unstimulated HLA-A*0201^{+} PBMC remained low compared with unblocked A673 at the same E/T ratio. Asterisks indicate significance levels of A673 lysis compared with respective controls (two-tailed *t*-test, $*P<0.05$; $**P<0.01$).
