Department of Earth and Atmospheric Sciences,  
University of Alberta

UArctic Thematic Networks: Graduate Seminar  
on Climate Change Impacts and Responses in the  
Arctic

# OUTLINE

---

Introduction

---

Context: Communities in the Circumpolar North

---

Taking Action: Overview of Adaptation Approaches

---

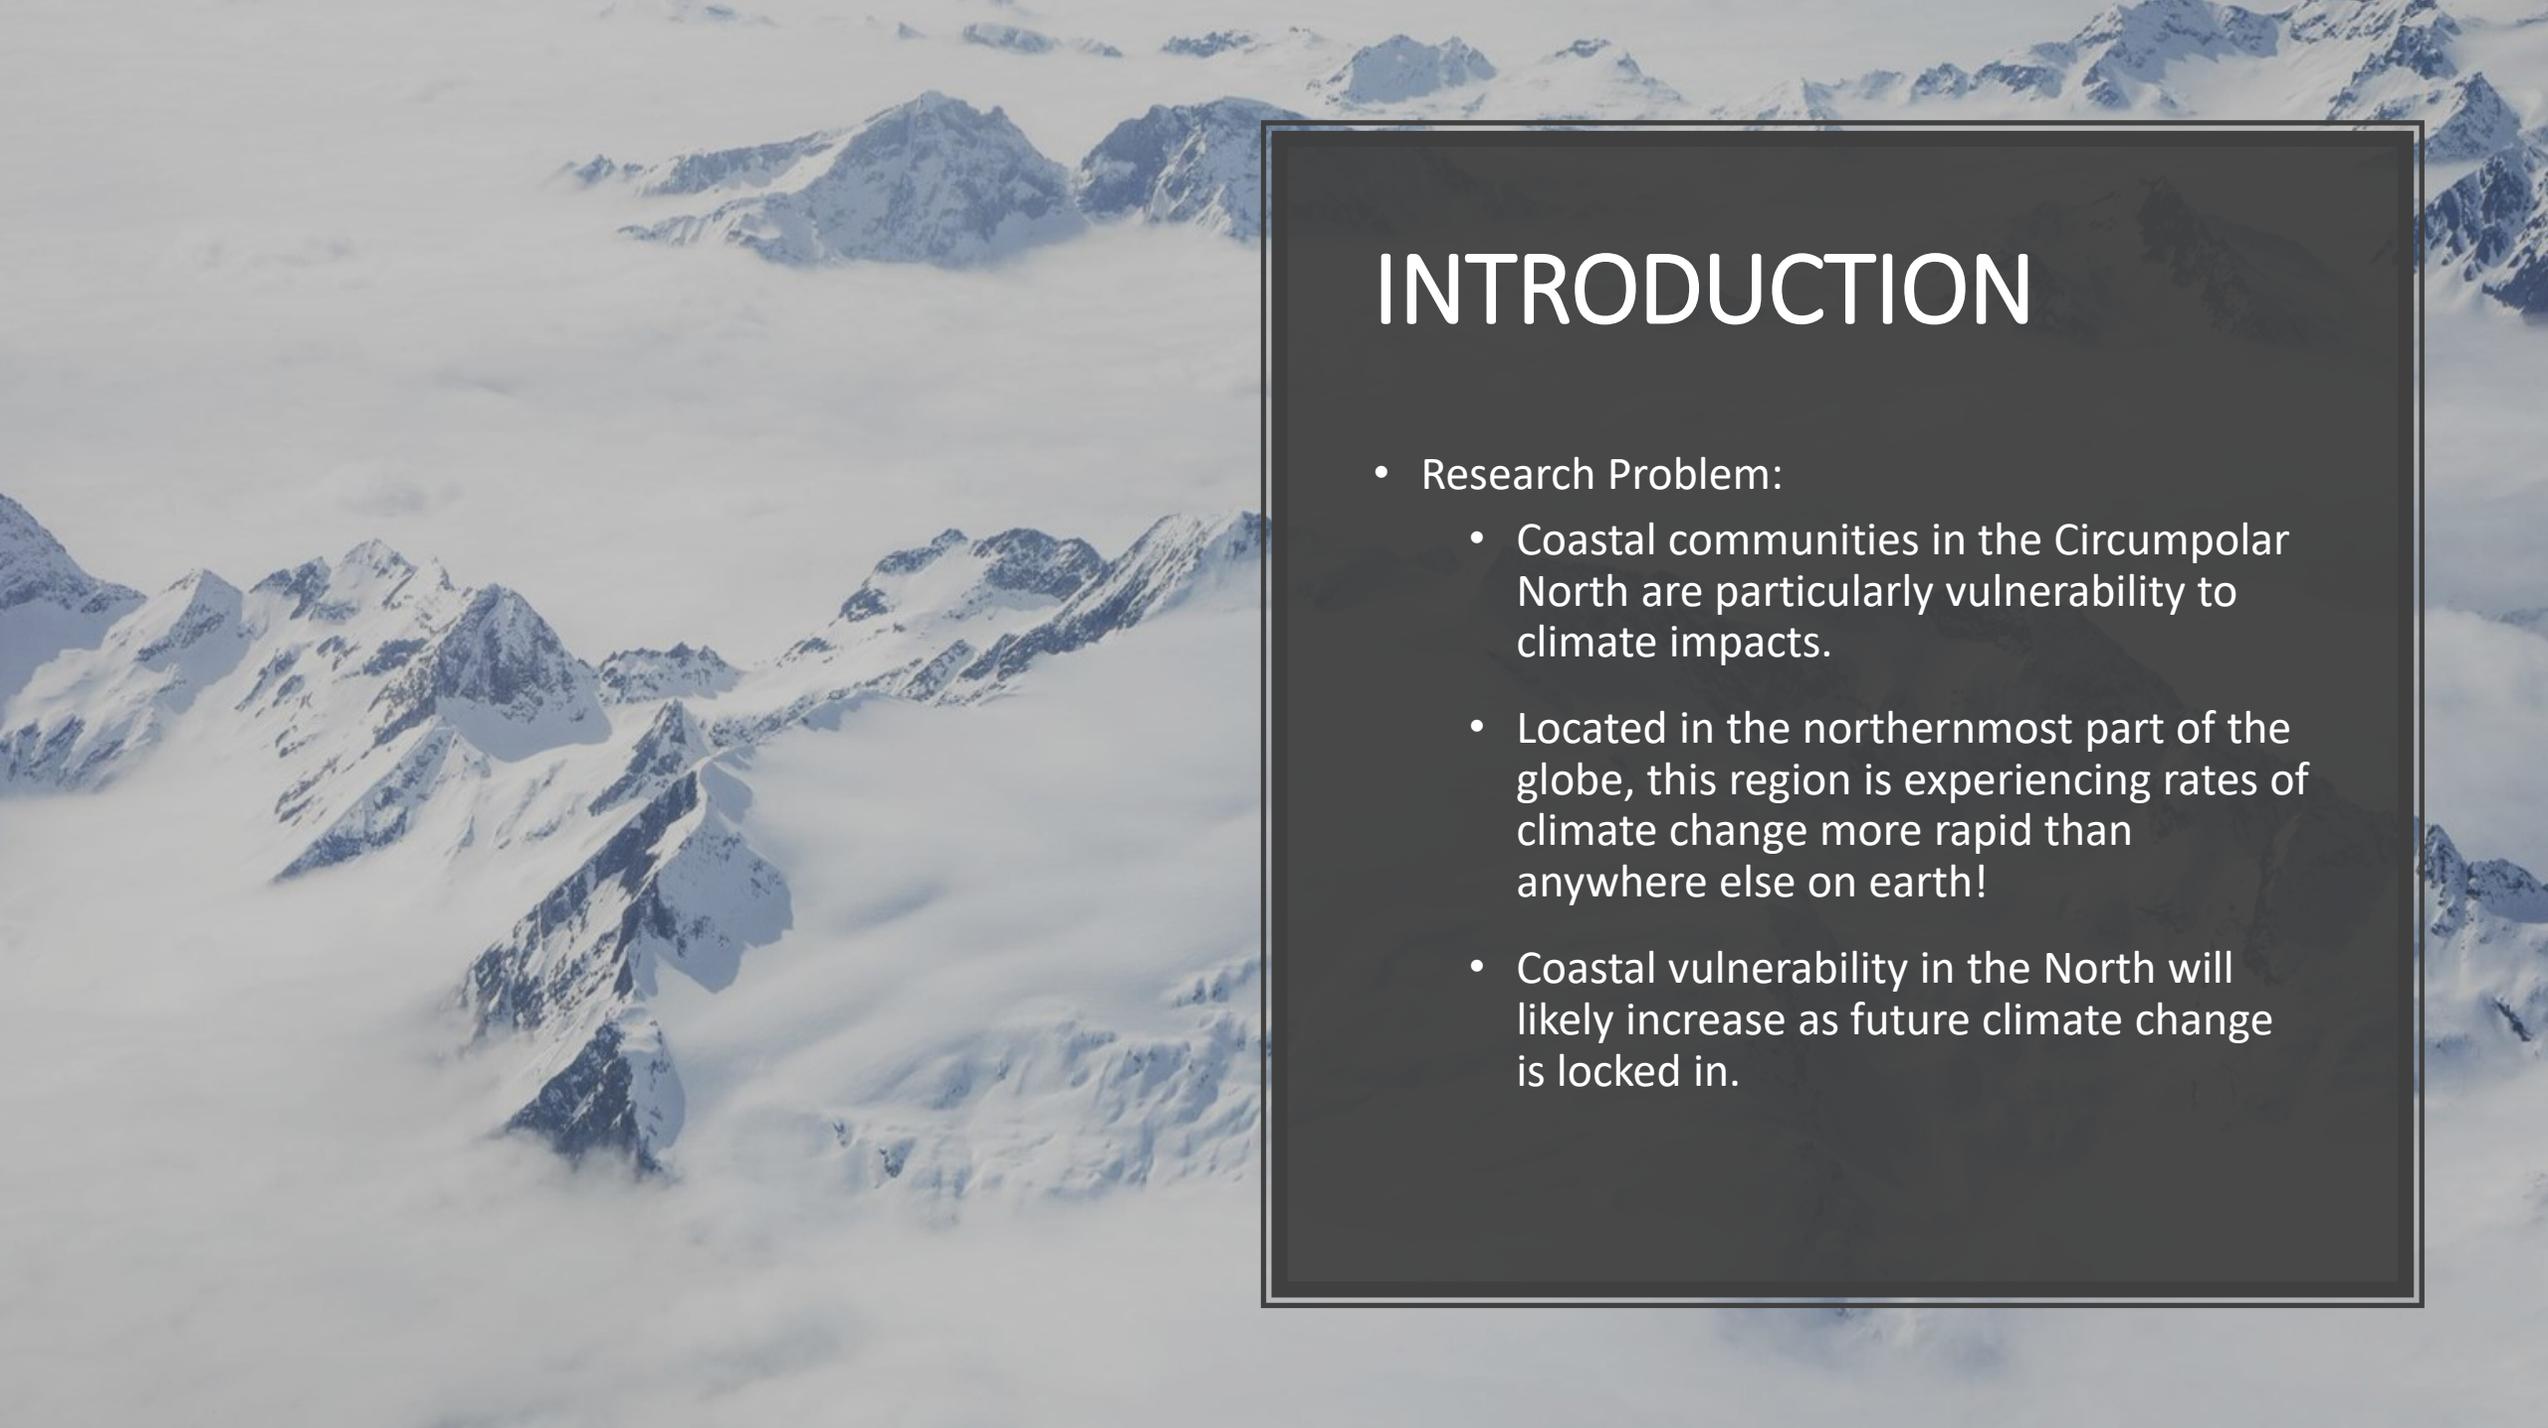

Adaptation Approaches in the Circumpolar North

---

Opportunities for Interventions

---

Conclusion

An aerial photograph of a vast mountain range, likely the Himalayas, with numerous peaks covered in snow and partially obscured by low-hanging clouds. The sky is a pale, hazy blue. A dark, semi-transparent rectangular box is overlaid on the right side of the image, containing white text.

# INTRODUCTION

- Research Problem:
  - Coastal communities in the Circumpolar North are particularly vulnerable to climate impacts.
  - Located in the northernmost part of the globe, this region is experiencing rates of climate change more rapid than anywhere else on earth!
  - Coastal vulnerability in the North will likely increase as future climate change is locked in.

# INTRODUCTION

- Research Problem:
  - Adaptation strategies are intended to moderate or avoid harm associated with climate impacts.
  - Although the urgency of adaptation is gaining salience among government decision-makers, adaptation planning is still in its infancy.
  - Adaptation approaches are often reactionary and fragmented in practice, and in northern coastal communities, lack diversity.

# CONTEXT

Where is the Arctic and how do we define the Circumpolar North?

- The Circumpolar North: the polar region located approximately 66.5° North of the equator.
- Definitions of the North can vary substantially and include descriptions based on:
  - temperatures
  - the Arctic tree line
  - permafrost zones
  - political and cultural surroundings

# CONTEXT

## **Communities in the Circumpolar North in a changing climate**

- Experiencing unprecedented increases in temperature.
- Sensitivity to environmental change is acute.
- Climate stressors pose a significant threat to assets, infrastructure, and human health and safety.

## EROSION IN SHISHMAREF, ALASKA

<https://seagrant.uaf.edu/topics/environmental-hazards-alaskas-coasts/flooding-erosion/>

# CONTEXT

---

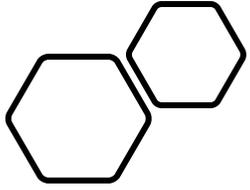

## Communities in the Circumpolar North in a changing climate

- These communities are often:
  - remotely located
  - sparsely populated
  - subject to a limited tax base
  - heavily dependent on marine resources

# TAKING ACTION

Definition and classification	Examples	Benefits	Drawbacks
<b>Structural</b> <ul style="list-style-type: none"> <li>• Hard adaptation typology</li> <li>• An infrastructural change or improvement that is intended to increase a community's resilience to climate impacts (Wenger, 2015)</li> </ul>	<ul style="list-style-type: none"> <li>▪ shoreline armoring</li> <li>▪ levees</li> <li>▪ sea walls</li> <li>▪ drainage channels</li> <li>▪ dams</li> <li>▪ dykes</li> <li>▪ elevated infrastructure (stilts)</li> <li>▪ heat insulators</li> </ul>	<ul style="list-style-type: none"> <li>• Commonly used and well understood</li> <li>• Quick to install</li> <li>• Associated with a visible sense of security</li> </ul>	<ul style="list-style-type: none"> <li>• Associated with rigidity</li> <li>• Capital intensive</li> <li>• Costly to maintain</li> <li>• Contribute to environmental degradation</li> </ul>

An aerial photograph of a coastal village, likely Shishmaref, Alaska. The foreground shows a large, grey stone seawall separating the land from the ocean. Behind the wall, a cluster of small, colorful houses and buildings is visible, along with a white church with a steeple. The background consists of a vast, green, flat landscape extending to a body of water where numerous small boats are anchored. A large, semi-transparent white circle is overlaid on the left side of the image, containing text.

## ADAPTATION APPROACHES IN THE CIRCUMPOLAR NORTH

---

- Small Northern coastal communities tend to rely on hard-armouring protection measures.
- Structural adaptations are:
  - quick to install and associated with a visible and perceived security
  - deteriorating.
- The effectiveness of structural approaches has been heavily debated

# ADAPTATION APPROACHES IN THE CIRCUMPOLAR NORTH

---

- The conception and use of non-structural adaptations is lagging in small Northern communities as a result of several constraints:
  - Institutional
  - Political
  - Capacity
- Many small northern communities have relocated buildings and infrastructure highly susceptible to climate hazards.

<https://www.nytimes.com/2016/08/20/us/shishmaref-alaska-elocate-vote-climate-change.html>

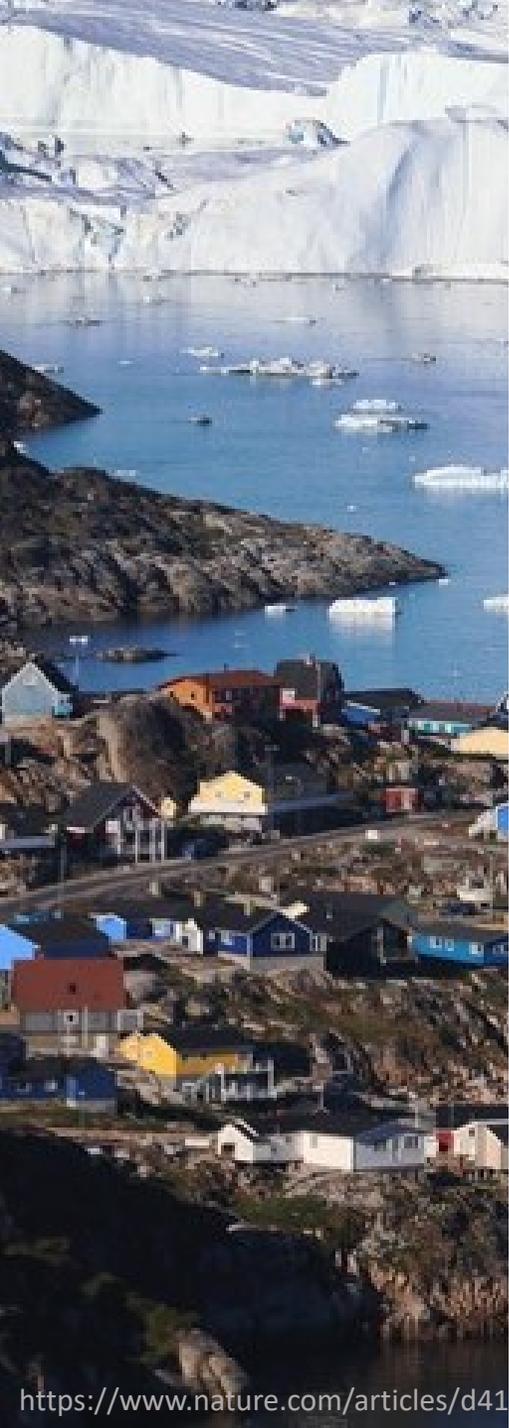

---

## ADAPTATION APPROACHES IN THE CIRCUMPOLAR NORTH

---

- Ecosystem-based adaptations are not a common approach to addressing vulnerability in Northern communities.
- Unforgiving climate and sensitivity of ecosystems in the Arctic decreases the ability to utilize a range of ecosystem services to reduce vulnerabilities

---

## OPPORTUNITIES FOR INTERVENTION

---

- It is recommended that existing structures be used in combination with soft adaptations to reduce costs and create a more robust response to climate stressors.

## OPPORTUNITIES FOR INTERVENTION

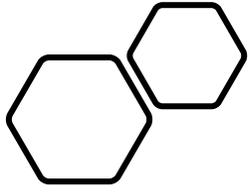

- It is recommended that managed retreat not be overlooked.
- The relocation of residents and assets out of hazard-prone areas presents significant opportunities for risk reduction.

# OPPORTUNITIES FOR INTERVENTION

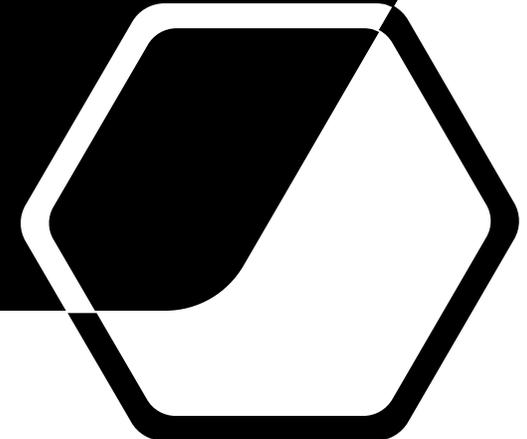

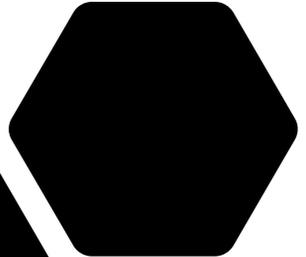

- It is recommended that various forms of education programming be utilized to foster awareness and facilitate buy-in for adaptation (Ford et al., 2018).
  - local decision-makers attending workshops/conferences on climate vulnerabilities and adaptation
  - collaborating with climate experts
  - participating in research networks such as those organized through UArctic

# CONCLUSION

- To enhance resilience, small northern coastal communities should adopt a diversified portfolio of adaptations that incorporate more sustainable non-structural and ecosystem-based (or soft) adaptation approaches.

THANK YOU
