Preface

This book is about supply chain network (SCN) and its ecosystem, which comprises of elements that affect, control and create competitive advantage for the network. During the last two decades, the subject of supply chains has grown enormously both in terms of theory and applications. Several textbooks were written, research papers and case studies have been published, and new applications and innovations have resulted in blockbuster product and service industries. Outsourcing to low-cost countries has resulted in globalization, which resulted in creating emerging markets and a burgeoning middle-class. Several companies such as component suppliers, contract manufacturers, third party and fourth party logistics providers have emerged, and new state-of-the-art sea ports, airports, container freight stations, and special economic zones have been built. Companies such as SAP, Oracle, and IBM have built software packages for optimizing supply chain strategies and operations. Streamlining the business processes for automation using packaged software and the Internet is very common. The players in the supply chain are highly connected *logistically, informationally* and *financially*. In fact, it is often heard that it is not the manufacturing that matters; rather, it is the supply chain that provides the competitive advantage.

However, recent events have demonstrated that the efficiency contributors of SCNs can turn into risk creators. This is evident from the aftermath of the 2008 financial crisis and decline in trade threatening de-globalization, and also the March 11, 2011 earthquake, tsunami, nuclear crisis and the resultant plant shut-downs in Japan that slowed down the supplies of semiconductors to car parts to the globe. There were also lots of government interventions in the production matters in the form of protectionist regulations and preferences to local firms in government procurements. Thus, we see that the supply chains are indeed affected by exogenous factors such as the political and economic climate in the locations of the partners, delivery infrastructure in those locations, availability of the resources, and a host of other factors. It is not B2B and B2C that we need to study anymore; rather, we should concentrate on the ecosystem, which includes the entire supply chain, institutions covered by the supply chain partners, resources, and delivery mechanisms. Indeed, it is the ecosystem that creates competitive advantage for

the companies, products, and partners. This creates a tremendous need for supply chain redesign. This book is probably the first step in that direction. After reading the book, we hope that one would find several directions for further research and possible approaches for solving real-world problems.

In this book, we develop the supply chain ecosystem framework for the management of global supply chain networks. In our view, the supply chain ecosystem is a composition of networks of companies, countries and their governments, other industrial, social and political organizations, infrastructure, logistics and information technology services that connect the companies and the countries to the external economic and social environment and resources including natural, financial and human resources with talent, connections, knowledge of the industrial environment, interacting together with the landscape (space or domain) and climate. We develop a comprehensive analysis and design of the global supply chain networks, focusing on the location, planning, performance, risk, governance and innovation involving all the ecosystem players. We also discuss the application to green supply chain design.

How to Use This Book

This book can be used for teaching courses on Global Operations or Supply Chain Networks in MBA classes by supplementing with the Harvard cases mentioned in the book. Such a course provides the students with tools and frameworks to manage globally dispersed manufacturing and service network operations and also effectively deal with multiple strategic and operational issues such as outsourcing, green regulations, tensions with the network partners, increased transportation costs and regionalization. The book can also be used in engineering schools supplementing with topics such as Social Networks and Supply Chains, Orchestrator model for governance of SMEs, Location Selection based on Investment Climate, Tax-Integrated Global Supply Chains, Game Theory and Supply Chain Coordination.

S. Kameshwaran

Acknowledgments

This book has come out of a course on *Global Operations Management* that the first author taught at Indian School of Business (ISB) during 2006–2011. Executive education programs were also given from this book. We would like to thank Kutti Krishnan (ISB) for his help and comments in running the course. Several researchers from the Center of Global Logistics and Manufacturing Strategies (GLAMS) — Usha Mohan, Abhijit Kumar, Ramakrishna Devarakonda, Shilpa Dixit, Prachi, Vinit Kumar, Sai Sailaja, Vikas Garg, Srivastava, Somya Sexena, and Sowmya Vedula — have worked on related logistics and supply chain problems. Some of these contributions appeared in the book released by the Prime Minister of India in 2006. The GLAMS Center of Excellence was financed in part by Hero Honda and TAFE. IBM has instituted a *Collaboratory on Service Science* (COSS) at ISB and several researchers from IBM — Gyana Parija, Vinayaka Pandit, Sameep Mehta, Munish Goyal, Krishna Kumamuru, and Nitya Rajamani — participated on joint research efforts. We have benefited immensely from these high-network worth individuals and organizations and would like to thank them for collaborating with us. We greatly appreciate the support extended to us at ISB from Ajit Rangnekar (Dean, ISB), The Munjal Family (Hero Corp), and Mallika Srinivasan (TAFE Motors and Tractors Ltd.). In particular, we would like to thank the students of ISB who took the course and carried out the term projects applying the popularly called PERC framework. The first author (NV) would also like to thank the Indian National Academy of Engineering for the financial support as a distinguished professor from August 2011 to date.

We would like to thank our alma mater Indian Institute of Science for what we are today. The first author (NV) thanks IISc for providing him with students, grandstudents (the second author is one of them) and great-grandstudents for collaborating on research projects, writing books and thought leadership papers. We would like to thank Professor Narahari for his help at the Department of Computer Science and Automation, Professor M. R. Rao for his help at ISB and Roshan Gaonkar for his comments and help in the initial stages of this book.

Along with the academic family of the first author NV, his family also has grown. He has five grandchildren: Sairaj from daughter Sundari and Kaladhar;

Arya, Ananya and Sachin from his son Murthy and Sunita; and Dhruti from his son Kiran and Rupal. They introduce me to new gadgets and teach me new video games and keep me and my wife Subhadra busy with Facetime. I would like to thank my grandkids and children and their spouses for giving me an excellent ecosystem for creative work.

Kamesh would like to thank his wife Navolina (who sacrificed her considerable amount of quality time for this book), grandparents Subramani and Saroja (first teachers), parents Sampath and Mangai (first friends), brother Mak and sister Raji (all-time pals) for their everlasting love and appreciation. Special thanks to colleagues at IBM Research (India) — Ramesh Gopinath (Director), Raghuram Krishnapuram (Associate Director), Ravi Kothari (Associate Director), Gyana Parija, Karthik Visweswariah, and Vinayaka Pandit — for their support and encouragement.

Contents

<i>Preface</i>	v
<i>Acknowledgments</i>	vii
PART 1: Ecosystem Framework	1
1. Introduction	3
1.1 Supply Chain Networks	3
1.1.1 Types of supply chains	4
1.1.2 The three flows in a supply chain	5
1.1.3 The three sub-networks in a supply chain	5
1.1.4 The three business processes in a supply chain	6
1.1.5 Supply chain governance	6
1.1.6 Focus over the last two decades	7
1.2 Global Supply Chain Proliferation	7
1.2.1 Institutional innovations and threats	8
1.2.2 Resources and distributed risk sources	9
1.2.3 Delivery services and failure to deliver	9
1.2.4 Need for a unified framework for studying supply chains	9
1.3 Supply Chain Ecosystem	10
1.4 GRIP: Drivers and Levers of Supply Chain Ecosystem	11
1.4.1 Governance	12
1.4.2 Risks	12
1.4.3 Innovation	12
1.4.4 Performance	12

1.5	How Can We Use the Ecosystem Framework?	13
1.5.1	Business stakeholders	13
1.5.2	Institutional stakeholders	13
1.6	Organization of the Book	14
2.	The Supply Chain Ecosystem Framework	17
2.1	Introduction	17
2.2	Supply Chain Ecosystem	18
2.3	The Ecosystem Elements as Enablers of Globalization	19
2.4	Supply Chain De-Verticalization, Modularization, and Outsourcing	20
2.4.1	Organizational modularity	21
2.4.2	Supply chain trends: Modularity and outsourcing	21
2.4.3	De-verticalization of electronics firms	22
2.4.4	De-verticalization of apparel firms	23
2.5	Role of Institutions	24
2.5.1	Economic, regulatory and trade-related innovations	25
2.5.2	Institutions and supply chains	25
2.6	Resources and Management	26
2.6.1	Clusters	27
2.7	Delivery Infrastructure: Logistics, Communication, IT, and ITeS	29
2.7.1	Logistics	29
2.8	How Can We Use the Ecosystem Framework?	33
2.8.1	Mapping the ecosystem of a supply chain: Auto vertical	33
2.8.2	Mapping the ecosystem of a service chain: Inbound logistics	34
2.8.3	Benchmarking the food supply chain in India	35
2.8.4	GRIP analysis	37
2.8.5	Smartening the players in the industry vertical	38
2.8.6	Improving the investment climate for industry growth in India	39
2.8.7	Design of smart cities	40
2.8.8	Ecosystem-based analysis of CEMEX	40
2.9	Conclusions	44
3.	Performance Analysis	45
3.1	Introduction	45
3.1.1	Business metrics	46
3.1.2	Societal and environmental concerns	46
3.1.3	Political issues	46

3.2	Performance Measures	47
3.2.1	Lead time	47
3.2.2	Cost	47
3.2.3	Flexibility	48
3.2.4	Quality	48
3.3	Performance Analysis	48
3.4	Lead Time	48
3.5	Total Landed Cost	50
3.6	Performance Measures and Ecosystem Components	51
3.6.1	Global logistics performance	53
3.6.2	Hard infrastructure	54
3.6.3	Quality of logistics services	55
3.6.4	Trade facilitation	55
3.7	Conclusions	56
4.	Supply Chain Risk	57
4.1	Introduction	57
4.1.1	Risks due to high connectedness	58
4.1.2	Risk transmission and amplification	59
4.1.3	Inventory effects	61
4.2	Supply Chain Risk Management	61
4.2.1	Supply chain risk in the ecosystem framework	62
4.2.2	Risk sources in the ecosystem	62
4.3	Risk Propagation	67
4.3.1	Systems of systems, systemic risks, and risk governance	67
4.3.2	Global risk response strategies	68
4.4	Case Study: Institutional Risks that Moved Tata from Singur	68
4.4.1	Wicked problems	70
4.4.2	Tata Singur as a wicked problem	70
4.4.3	Aftermath of Tata Singur episode	71
4.4.4	Decision-making strategies for wicked problems	72
4.5	Our Solution: The Supply Chain Redesign	73
4.6	Conclusions	73
5.	Innovation	75
5.1	Introduction	75
5.1.1	What are emerging markets?	75
5.1.2	Innovation in emerging markets	76
5.2	Supply Chain Innovations	77
5.2.1	Innovations in regulations	79
5.2.2	Co-evolution of innovations	80

5.2.3	Our approach	81
5.2.4	Public sector innovation	82
5.3	Some Examples	83
5.3.1	The Indian mobile telecom industry: The success story	84
5.3.2	A success story	86
5.3.3	The changing face of Indian auto industry	88
5.3.4	Orchestrator: Innovation in governance models	89
5.4	Innovations in the Delivery Infrastructure	90
5.4.1	Indian logistics: Innovation through orchestration	91
5.5	Conclusions	92
6.	Governance	95
6.1	Introduction	95
6.2	Types of Governance Structures	96
6.2.1	Vertically integrated organizations	98
6.2.2	Functional structure	98
6.2.3	Product structure	98
6.2.4	Customer-based structure	98
6.2.5	Matrix structure	99
6.2.6	Examples	99
6.3	Networked Organizations	100
6.3.1	Partner selection	101
6.3.2	Coordination	103
6.3.3	Control	103
6.4	Orchestrator Governance Model	105
6.4.1	Roles of network orchestrator	106
6.4.2	Talents needed for orchestrators	106
6.4.3	Orchestration is the riskiest model	107
6.5	Orchestration in Logistics	107
6.6	Olam International: Orchestrator of Global Agri-food Networks	109
6.7	Orchestration of SMEs	109
6.8	Li & Fung	111
6.8.1	Li & Fung business model	112
6.9	Conclusions	115
7.	Global Supply Chain Redesign	117
7.1	Introduction	117
7.2	The Four Phases in Supply Chain Design	118
7.3	Global Supply Chain Formation	119
7.3.1	Map the supply chain ecosystem	120

7.3.2	Formulate the supply chain strategy	120
7.3.3	Select possible locations for facilities	121
7.3.4	Identify the supply chain risks	121
7.3.5	List the feasible supply chain configurations	122
7.4	Project Planning and Supply Chain Planning	122
7.5	Supply Chain Execution	123
7.6	Talent	124
7.7	Food Security in India: A Case for Supply Chain Coordination	124
7.7.1	Introduction to food security	125
7.7.2	Current efforts by the government	125
7.7.3	The street food hawkers	126
7.7.4	Efforts by NGOs	126
7.7.5	Food security indices	127
7.7.6	Literature survey	127
7.7.7	Our analysis and approach for food security	128
7.7.8	Supply chain planning	133
7.7.9	The possible supply chain risks	133
7.7.10	Governance and execution	134
7.7.11	Talent	135
7.7.12	Institutional interventions	135
7.7.13	Discussion on the example	135
7.8	Conclusion	136

PART 2: Applications 139

8.	Location Analysis	141
8.1	Introduction	141
8.2	Location Choice in Emerging Markets: Example — India	141
8.2.1	Location choice: National versus sub-national	142
8.2.2	Dynamics of the sub-national location decision	143
8.3	Related Literature	145
8.3.1	Location-production models	145
8.3.2	Agglomeration economies	145
8.3.3	OLI framework	146
8.3.4	Clusters	146
8.3.5	Investment climate and market attractiveness	147
8.3.6	Prescriptive decision models	147
8.4	Industry Best Practices	147
8.4.1	Buck Consultants International	148
8.4.2	IBM Plant Location International	148

8.5	Multiple Criteria Evaluation of Locations	149
8.6	Ecosystem-Based Location Analysis	151
8.6.1	Business value chain	156
8.6.2	Institutions	156
8.6.3	Resources and management	157
8.6.4	Delivery infrastructure	157
8.7	Other Applications	158
8.7.1	Measuring investment climate	158
8.7.2	Market attractiveness of tier II cities	158
8.7.3	Location analysis special economic zones	159
9.	Green Supply Chains	161
9.1	Introduction	161
9.2	Conventional versus Green Supply Chains	162
9.3	The Green Supply Chain Ecosystem	163
9.3.1	Forward-backward supply chain	163
9.3.2	Delivery mechanisms	164
9.3.3	Institutions	165
9.3.4	Resources	166
9.4	GRIP Methodology	168
9.4.1	Performance	168
9.4.2	Innovations	169
9.4.3	Risks	171
9.4.4	Governance, coordination, and control	172
9.5	Conclusions	173
10.	Smart Villages and Cities	175
10.1	Introduction	175
10.2	Literature Review and Motivation for Smart Villages and Cities	177
10.3	Smart Village Ecosystem	178
10.4	GRIP Analysis	180
10.4.1	Innovation	180
10.5	Methodologies for the Design of a Smart Village	181
10.5.1	Risks	182
10.5.2	Governance models	182
10.5.3	Performance measurement	183
10.6	Pochampally Village Case Study	185
10.7	A Case of Agriculture-Based Villages	187
10.7.1	Innovations in food supply chain in the four components	189
10.8	Smart Cities	190
10.9	Conclusion	191

11. Epilogue	193
11.1 Tax-Integrated Global Supply Chains	194
11.2 Multi-tier Risk Management	194
11.3 Orchestrator Model for Governance of SMEs	195
11.4 Social Networks and Supply Chains	195
11.5 Green Supply Chain Design	195
11.6 Game Theory and Supply Chain Coordination	196
