Our main objective isn't to propose theorems and proofs about DS and Algorithms. Wetook the direct route andsolved problemsofvarying complexities. That is, each problem corresponds to multiple solutions withdifferent complexities. In other words, we enumerated possible solutions. With this approach, evenwhen anew question arises,weoffer a choice ofdifferent solution strategies based onyour priorities.Topics Covered:IntroductionRecursion and BacktrackingLinked ListsStacksQueuesTreesPriority Queue and HeapsDisjoint Sets ADTGraph AlgorithmsSorting Searching Selection Algorithms [Medians] Symbol Tables Hashing String Algorithms Algorithms Design Techniques Greedy Algorithms Divide and Conquer Algorithms Dynamic Programming Complexity Classes Miscellaneous Concepts Target Audience? These books prepare readers for interviews, exams, and campus work. Language? All code was written in C/C++. If you are using Java, please search for "Data Structures and Algorithms Made Easy in Java" (ISBN: 978-1468101270). Also, check out sample chapters and theblog at: CareerMonk.com It appears to be a rehash of a lot of materials (books, blogs, websites etc). The book did not add much value.The book lacks an index. I was not able to search for a specific topic or problem and this was a deal breaker for me.The dimensions of the physical book was a bit awkward too. It was almost similar to the dimensions of A4. I would prefer something wider and less longer.You are better off with other books and other material available on the Internet. I especially liked "The algorithm Design Manual" by Skiena, and "Elements of programming interviews" by Aziz/Lee/Prakash. I acknowledge that these books do not really elaborate on DS and are primarily Algo related. CLRS and DPV are classics and very good for algorithms.
