Like Wittgenstein, Heidegger, Popper and Derrida also Habermas wants to overcome traditional metaphysics. Habermas calls traditional philosophy as philosophy of consciousness. According to Habermas, paradigm of philosophy of consciousness is exhausted and the symptoms of exhaustion should be dissolved with the transition to the paradigm of mutual understanding (Habermas 1990a, pp. 296–298). Put shortly, Habermas wants to resolve transcendental philosophy with his reconstructive project which includes post-Wittgensteinian philosophy of language, Piaget’s

structuralism, Kohlberg’s Kantianism, reconstruction of Weber’s and Horkheimer’s theory of rationality, reconstruction of Parson’s functionalism, reconstruction of Schütz’s phenomenological sociology of knowledge, etc. This project is called as the communicative theory of action. Habermas also widens his theory of communicative action to the areas of ethics (discourse theory of ethics) and justice (discourse theory of justice) creating the encyclopedic system of knowledge in the spirit of Enlightenment.

When Habermas started his academic career, he was ultra-left-wing Marxist in the spirit of Herbert Marcuse. Nowadays, his political commitments lies somewhere, between social democracy and political liberalism. He strongly promotes so-called The United States of Europe, which has its own foreign minister, a directly elected president and its own financial basis (Habermas 2006, 2007; Habermas and Derrida 2006). This might imply also Europe’s own educational policy and the ministry of education.

Jacques Derrida

Jacques Derrida (1930–2004) is probably the best known French philosopher ever. He is linked to the postmodern movement, although he never explicitly uses the term postmodern. He refers to his project as deconstruction. His aim is to deconstruct (re-write, re-signify, re-value, etc.) the entire history of metaphysics and phonologistic, phallo- and logocentric Western thought, which prefer speech over writing, male over female, and reason over everything. For Derrida, as for Heidegger, the main issue in Western thinking is the so-called metaphysics of presence (ontotheology), which presuppose some deeper “presence” in the world (Derrida 2003):

The history of metaphysics, like the history of the West, is the history of these metaphors and metonymies. Its matrix (...) is the determination of Being as presence in all senses of this word. It could be shown that all the names related to fundamentals, to principles, or to the centre have always designated an invariable presence – eidos, archē, telos, energeia, ousia (essence, existence, substance, subject) alētheia, transcendentality, consciousness, God, man, and so forth.

One can consider Derrida as either a post-structuralist or a neostructuralist, as he relied heavily on Ferdinand de Saussure's theory of language (see Frank 1984, pp. 88–115; Heiskala 1997, pp. 218–221; Peters and Burbules 2004, pp. 17–21). According to Saussure, the sign is a relation between the signifier (the acoustic image of a human voice – image vocale) and the signified (the concept or mental idea). The difference between them is one of the basic principles of Saussure's theory, because a sign only signifies insofar as it differs from others signs. The example signs of “dog,” “hund” (German), and “koira” (Finnish) have the same signified but a signifier differed. For Saussure, the meaning of the sign is intralinguistic and language is a system of difference. Nevertheless, Derrida accuses Saussure of leaving the door open for the possibility that meaning could be located outside of language, outside the system of difference. Saussure leaves the door open for the so-called transcendental signified (Derrida 1981, p. 19). Derrida remains to his conviction that a sign is a linguistic trace – neither wholly present nor wholly absent – which refers to other traces and that there is no ultimate transcendental signified located outside of language or text. For Derrida, language is text and thus: “There is nothing outside of the text” (Derrida 1997, p. 158). When the transcendental signified is questioned, the distinction between signified and signifier becomes problematic (Derrida 1981, p. 20):

... from the moment that one questions the possibility of such a transcendental signified, and that one recognizes that every signified is also in the position of a signifier, the distinction between signified and signifier becomes problematic at its root. Of course this is an operation that must be undertaken with prudence for: it must pass through the difficult deconstruction of entire history of metaphysics which imposes, and never will cease to impose upon semiological science in its entirety this fundamental quest for a ‘transcendental signified’ and a concept independent of language.

Combining Heidegger's ontological difference and Saussure's concept of difference – and also keeping in mind Nietzsche's and Freud's *Aufschieben* and *Aufschub* – Derrida created a new concept, which he named *différance*. Signs

are traces which have no other foundation than the movement of *différance*. *Différance* and the structure of the trace are simply the conditions of meaning (Standish 2007, p. 4). Derrida's neologism *différance* refers both to a differing (i.e., that a sign differs from other signs and *Sein* differs from *seiende*) and a deffering (the endless chain of signs). (The Office Word 2003 word processor automatically tries to correct the word *différance* to “difference”. Office Word accepts the new word invented by Derrida if the language is set to French. *Différance*, however, is not a French word. It is Derrida's neologism from the French word *différence*. Both *différance* and *différence* are pronounced in a same way. With this neologism, Derrida makes the absent phoneme “A” visible. See Derrida 1996, p. 444.) *Différance* is an unstructural structure, which is neither present nor absent. *Différance* “is.” It is the unlikely origin and postponement of all difference (Derrida 1996, p. 444). It is both movement and structure, diachronic and synchronic. With this basic concept Derrida attempts to overcome the Western metaphysics of presence and shake all the powers of discourse.

In this context, Derrida introduces an entirely new brand of science called *grammatology*, which studies written signs (graphemes) and the play of *différance*. Writing is a system of *différance*. There is no deep meaning in any text – just the play of *différance*. *Différance* is a concatenation of traces in which a sing can only refer to other sings *ad infinitum* (Derrida 1981, p. 26):

Whether in the order of spoken or written discourse, no element can function as a sign without referring to another element which itself is not simply present. This interweaving results in each ‘element’ – phoneme or grapheme – being constituted on the basis of the trace within it of the other elements of the chain or system. This interweaving, this textile, is the text produced only in the transformation of another text. Nothing, neither among the elements nor within the system, is anywhere ever simply present or absent. There are only, everywhere, differences and traces of traces. The gram, then, is the most general concept of semiology – which thus becomes *grammatology*...

Politically, Derrida remained ultra-left-wing until his death. In 1993, he dedicated his book

Specters of Marx to the South-African communist leader Chris Hani (see http://en.wikipedia.org/wiki/Chris_Hani). In it, Derrida makes no secret of his own political views and affiliations (Derrida 1993, p. 52):

This dominating discourse ... proclaims: Marx is dead, communism is dead, very dead, and along with it its hopes, its discourse, its theories, and its practices. It says: long live capitalism, long live the market, here's to the survival of economic and political liberalism! If this hegemony is attempting to install its dogmatic orchestration in suspect and paradoxical conditions, it is first of all because this triumphant conjuration is striving in truth to disavow, and therefore to hide from, the fact that never in history, has the horizon of the thing whose survival is being celebrated (namely, all the old models of the capitalist and liberal world) been as dark, threatening, and threatened.

There is, of course, no direct link between Derrida's political commitments and his program of deconstruction. Deconstruction does not require any kind of political commitment. Rather, deconstruction calls for the deconstruction of any project which is standardized by the principle of reason, including both Marxism and psychoanalysis (Derrida 1983, p. 16). Derrida has said that he was never able to successfully link deconstruction to any existing political programs and added that indeed all political codes are metaphysical, whether they originate from the right or left (Derrida 1984, pp. 119–120). It is precisely this kind of political metaphysics that Derrida and Habermas practice in their jointly written articles (Habermas and Derrida 2003, 2006).

The Confrontation Between Derrida and Habermas

The confrontation which ultimately occurred between Derrida and Habermas was inevitable. By the 1980s, Habermas had become a leading German intellectual, and Derrida, for his own part, had been a major figure in the poststructuralist movement since the 1960s. When Jean-François Lyotard introduced the term postmodern in the context of philosophy in 1979 (Lyotard 1985), Derrida was quickly characterized within. (Christopher Norris emphatically claims that

Derrida and his deconstruction do not belong to the postmodernist movement, see Norris 1990.) According to John Caputo many considered Derrida “as the devil himself, a street-corner anarchist, a relativist, or subjectivist, or nihilist, out to destroy traditions and institutions, our beliefs and values, to mock philosophy and truth itself, to undo everything the Enlightenment has done – and to replace all this with wild nonsense and irresponsible play” (Caputo 1997, p. 36). Habermas shared this common and unfair impression. Habermas made his first critical comments about Derrida in the newspaper *Die Zeit* on 19 September 1980 (*Die Moderne – unvollendetes Projekt*), when he named Derrida as belonging to the group of young conservative antimodernists. Habermas claimed that intellectuals like Georg Bataille, Michel Foucault, and Jacques Derrida embodied the Nietzschean spirit of antimodernism (Habermas 1981). This paints a rather unscholarly portrait of Derrida, which can perhaps be explained by the fact that Habermas did not have a very comprehensive grasp of Derrida's philosophy at the time. (Before Manfred Frank's book *Was ist Neostukturalismus* (Frank 1984) was published, German philosophers did not know very much about French poststructuralism.)

In an interview in the *New Left Review*, Perry Anderson and Peter Dews ask Habermas to explain his rather rude verdict of Derrida's poststructuralism. In doing so, Habermas (1985) proves that he has indeed read Derrida. In the interview, Habermas modifies his earlier opinion and says that “verdict” is not the right word to describe his relationship to poststructuralism. Habermas even goes so far as to identify certain similarities between Derrida's deconstruction and Theodor Adorno's negative dialectics and deconstruction. He also identifies similarities between the critical theory's critique of instrumental reason and Derrida's critique of discursive powers. Adorno's and Derrida's work shared many aspects of Nietzschean thought. Habermas, however, claims that, despite certain similarities, there are still a number of striking differences between Adorno and Derrida. Adorno still adheres to the Hegelian notion of determinate negation and

applies it to the Enlightenment, claiming that the Enlightenment can be healed by radicalizing itself Enlightenment. Habermas's statement implies that Derrida is completely against Enlightenment. Habermas also accuses poststructuralism of causing a pessimistic and apocalyptic ambiance in German universities at the time (1985, pp. 222–223; see also Habermas 1990a, pp. 185–186).

That same year (1985), Habermas published two long chapters on Derrida in his book, *The Philosophical Discourse of Modernity – Twelve Lectures* (Habermas 1990a, pp. 161–210; see Norris 1990, pp. 49–76). In them, Habermas accuses Derrida of taking the literary character of Nietzsche's writing too seriously and attempting to transform philosophical discourse into a form of literary criticism in which rhetorical success supersedes logical consistency (Habermas 1985, p. 188):

Such a critique (which is more adequate to its object) is not immediately directed towards the network of discursive relationships of which arguments are built, but towards the figures that shape style and are decisive for the literary rhetorical power of a text. A literary criticism that in a certain sense merely *continues* the literary process of its objects cannot end up in science. Similarly, the deconstruction of great philosophical texts, carried out as literary criticism in this broader sense, is not subject to the criteria of problem-solving, purely cognitive undertaking.

Furthermore, Habermas states that Derrida's literary style presupposes the following three propositions (Habermas 1990a, p. 190):

1. Literary criticism is not primarily a scientific practice but observes the same rhetorical criteria as its literary objects.
2. There is no genre like the distinction between philosophy and literature. Philosophical text can be examined by applying the methods of literary criticism.
3. Because of the primacy of rhetoric over logic, all genre distinctions are ultimately dissolved. Philosophy and science are not able to assert their autonomy.

Derrida's critique of Austin's and Searle's speech act theories also touches on Habermas's communicative theory of action. Derrida criticizes

Searle's division of normal (the serious, literal, and binding use of sentences) and deviant uses of language (the fictive, simulated, or indirect use of sentences). The normal use of language is the kind of linguistic interaction which aims at reaching an understanding. (Richard Rorty highlights a similar division between normal and abnormal discourse in conversation, although he prefers abnormal discourse, because it challenges the metanarratives of normal discourse. The outcome of abnormal discourse can range anywhere from nonsense to intellectual revolution. See Rorty 1979, pp. 320, 377.) Derrida does not subscribe to this view. According to Habermas, for Derrida, every understanding is a misunderstanding and every reading is a misreading. Habermas states that language works only if language users use it in the "normal way" and presuppose agreement and understanding as the main goal of communication (Habermas 1990a, pp. 198–199).

In his brief reply Derrida, referring to Habermas's (1987) book, *The Philosophical Discourse of Modernity*, says that those who accuse him of reducing philosophy to literature and logic to rhetoric have clearly not read his work. Derrida claims that his own texts are neither purely literary nor purely philosophical, and that the same holds true for such major philosophers as Plato, Aristotle, Descartes, Hegel, Marx, Bergson, Nietzsche, Heidegger, and Merleau-Ponty. This does not, however, mean that these philosophers do not adhere to the rules of demonstration. The range of linguistic styles and types of logic and rhetoric used by various philosophers is so inherently diverse that it is impossible to speak of the existence of one main philosophical discourse (Derrida 2006, p. 37):

To analyze 'philosophical discourse' in its form, its modes of composition, its rhetoric, its metaphors, its language, its fiction, everything that resists translation, and so forth, is not to reduce it to literature. It is even a largely philosophical task (even if it does not remain philosophical throughout) to study these 'forms' that are no longer just forms, as well as the modalities according to which, by interpreting poetry and literature, assigning the latter a social and political status, and seeking to exclude them from its own body, the academic institution of philosophy has claimed its own autonomy, and practiced a disavowal with relation to its own language,

what you call 'literality' and writing in general. . . Those who protest against all these questions mean to protect a certain institutional authority of philosophy, in the form at a given moment.

Derrida does not believe in the existence of "a specifically philosophical writing which could be characterized as a pure from all sorts of contaminations (Derrida 2006, pp. 36–37). There is no solid ensemble of philosophy which remains the same in every epoch. Philosophy is written and spoken in a natural language whose modes are multiple and conflictual (Derrida 2006, p. 38).

This brief response from Derrida was followed by a decade long silence, which finally ended when Habermas and Derrida found a common enemy; an enemy they shared with German critical theory and French deconstruction. That enemy was US foreign policy. Habermas and Derrida embarked on a political crusade to reinforce the political status of the European Union as a counterforce against the US and its military campaigns. This common project has also had numerous educational ramifications, although I will limit my focus in this presentation to the first encounter between Derrida and Habermas.

Some of the Educational Ramifications of the Habermas-Derrida Abyss

There are a number of ongoing projects in the field of educational science which rely on Habermasian communicative reason. They include, just to name a few examples, Jack Mezirow's (1991) theory of emancipator learning, Robert Young's (1989, 1992) theory of ideal pedagogical speech situation (IPSS), Detmar Hans Tschöfen's (1990) critical sociology of education, Thomas Englund's (2006a, b, 2007) deliberative communication in schools, Raymond Allen Morrow's & Carlos Alberto Torres's (2002) critical pedagogy and Rauno Huttunen's (2003a, b) communicative theory of indoctrination. And there are at least as many research programs which are philosophically based on Derrida's deconstruction. Some examples include Gregory Ulmer (1985a, b), Robin Usher and Richard Edwards (1994), Peter Trifonas (2000, 2001), Michael Peters (2001) and

Nicholas Burbules (2004), and Paul Standish (2001). One common feature of these two approaches is that they are both somewhat critical of the existing educational institutions and wish to promote dialogue and multiculturalism. What is different about them is precisely what came between Derrida and Habermas in their first encounter – namely, the difference between the deconstructive critique of reason and the communicative critique of instrumental reason. To further clarify the differences and similarities between the deconstructive and communicative approaches in the philosophy of education, I would like to compare the two following educational research projects: (A) Ulmer's post(e)-pedagogy (applied grammatology) and (B) Huttunen's communicative theory of indoctrination.

(A) Gregory Ulmer based his academic post(e)-pedagogy on Derrida's writings, Bourdieu's & Passeron's (1977) sociology of education and Joseph Beuys's avant-garde art (Ulmer 1985a, b; see Gallagher 1992, pp. 300–301). Some might say that Derrida does not have a pedagogical theory, but Ulmer states that Derrida has nothing but a pedagogy. (Ulmer found the following quotation, which paints a clear picture of Derrida's pedagogy (Derrida according to Ulmer 1985a, p. 163): "Teaching delivers signs, the teaching body produces (shows and puts forth) proofs, more precisely signifiers supposing knowledge of a previous signified. Referred to this knowledge, the signifier is structurally second. Every university puts language in this position of delay or derivation in relation to meaning or truth. . . the professor is the faithful transmitter of tradition and not the worker of a philosophy in the process of formation.") The political nature of Derrida's thought leads to the belief that teachers in State-run institutions have a special responsibility to understand the educational system in which they work, whose ideas are mechanically passed on from teacher to student and back again. Ulmer claims that both Derrida's deconstructive technique and his own counterconcepts can be more easily applied

to the field of education than, for example, Foucault's archeology of knowledge (Ulmer 1985a, pp. 157–158). In order to break the reproductive nature of university, Ulmer wants to understand the academic lecture – which he calls *lecriture* – as a text in the Derridaian sense. The *lecriture* is a playful discourse whose content always remains open (Ulmer 1985b, p. 43):

... the lecture as text is a certain kind of placing or spacing, the point being to refocus our attention, as composers or auditors, to the taking place of this place. At issue in these lectures is the extent to which the performance aspect of the lectures (the scene of lecturing, rather than the referential scene, the 'diegesis' of the lecture) is foregrounded, violating the students' expectation of information as message or content. There always is content, of course (*lecriture* is not nonobjective in that sense), but the matter of that content is left open

Ulmer's deconstructive lecture a.k.a. *lecriture* aims to minimize reproduction and maximize students' productivity. A *lecriture* should not just transmit its content from lecturer to student. The *lecriture* is a text that can be productively interpreted. It is an invention as opposed to a copy of an original (Ulmer 1985a, pp. 163–164). The aim is to achieve a love of learning in which the student is a participant rather than a consumer. The lecturer tries to create a "writerly" classroom. The classroom should be conceived as a place of invention rather than reproduction (Ulmer 1985a, pp. 162–163). Referring to Gerald Holton, Ulmer writes the following (Ulmer 1985b, p. 47): "Chief among the stimulating devices that are meant to provoke the student into writerly attitude is the use of experiments that the students manipulate themselves and models supplement discourse and aid memory."

Relying on Derrida (see 2003), Ulmer claims that both *paidia* (play) and *paideia* (culture, education) have been the victims of logocentric repression. Both words refer to the activity of the child (*pais*). Aristotle was the first to disassociate *paidia* from *paideia*. The Aristotelean notion of *paideia* (culture) was a scientific leisure activity opposed to pure play.

With the deconstruction of the academic lecture, Ulmer attempts to break this division between play and education (Ulmer 1985b, p. 55). For Ulmer, post(e)-pedagogy is a vacation from oppressive rationalism. It aims at meeting the needs of students working within the postmodern condition of information overload. Ulmer's preferred method of teaching is the textshop (synonymous to workshop), because it allows students to write with the mass of data that already exists. The textshop is kind of bricolage. Ulmer's post(e)-pedagogy has no strict discipline base but instead uses art and autography to decipher the relationship between student and knowledge (Ulmer 1985a, p. 61).

- (B) Huttunen defines communicative teaching as including value orientations in which the teacher commits herself to the "universal" presuppositions of argumentation and acts in accordance with these maxims as to the best of her ability ("normative minimum"; Mollenhauer 1972, p. 42). (2.1. Every speaker may assert only what he really believes. 2.2. A person who disputes a proposition or norm under discussion must provide a reason for wanting to do so. 3.1. Every subject with the competence to speak and act is allowed to take part in a discourse. 3.2 a) Everyone is allowed to question any assertion whatsoever. b) Everyone is allowed to introduce any assertion whatsoever into the discourse. c) Everyone is allowed to express his own attitudes, desires and needs. 3.3. No speaker may be prevented, by internal or external coercion, from exercising his rights as laid down in (3.1.) and (3.2.) See Habermas 1990b, pp. 88–89.) In this respect, pedagogical communication is a kind of simulated communicative action and is more simulated in the early stage of education. When communicative teaching is conceived in this way, as an exceptional form of communicative action, the concept of communicative teaching is looser than the concept of communicative action itself. Huttunen claims that communicative teaching – as the exceptional application of communicative

action – still remains within the realm of communicative action, although teachers sometimes make use of perlocutive speech acts (use language strategically). When the aim of education is to produce mature and communicatively competent individuals and the content of teaching provides the tools necessary for independent and critical thinking, the teacher may use methods that, when taken out of context, may resemble strategic action and the perlocutive use of language (or may de facto be some form of strategic action, depending on how one defines strategic and communicative action).

In his theory of indoctrination, Huttunen presents the communicative method and intention criterion for indoctrinative teaching. He defines strategic teaching as the kind of teaching in which the teacher treats her students solely as objects, as objects of a series of didactical maneuvers. This strategic teaching is a form of indoctrination (strategic teaching is not the same as indoctrination), in which a teacher attempts to transfer the content of her lessons to her students' minds, treating them merely as passive objects, not as active co-subjects of the learning process. Huttunen defines communicative teaching as contradictory to strategic teaching. The aim of communicative teaching is a communicatively competent student who does not need to rely on the teacher, or any other authority figure for that matter. In communicative teaching, students are not treated as passive objects but as active learners. The teacher and her students cooperatively participate in the formation of meanings and new perspectives. The teacher does not impose her ideas on her students, rather they make a joint effort to gain some kind of meaningful insight into the issues at hand. What Huttunen refers to as communicative teaching very closely corresponds with Gert Biesta's idea of practical intersubjectivity in teaching (Biesta 1994, p. 312). Communicative teaching comes as close as one can possibly come to the ideal of communicative action in an actual teaching situation. Communicative teaching is the simulation of communicative action (Masschelein 1991, p. 145) and free

and equal discourse. (2.1. Every speaker may assert only what he really believes. 2.2. A person who disputes a proposition or norm under discussion must provide a reason for wanting to do so. 3.1. Every subject with the competence to speak and act is allowed to take part in a discourse. 3.2 a) Everyone is allowed to question any assertion whatsoever. b) Everyone is allowed to introduce any assertion whatsoever into the discourse. c) Everyone is allowed to express his own attitudes, desires, and needs. 3.3. No speaker may be prevented, by internal or external coercion, from exercising his rights as laid down in (3.1.) and (3.2.) See Habermas 1990b, pp. 88–89.) On rare occasions, it breaks the limits of simulation and achieves the level of proper discourse.

Ulmer's deconstructive lecture and Huttunen's communicative teaching have the same ultimate goal: to avoid indoctrination and awaken students' own productivity. The goal is an educated individual who is able to speak and write independently. Both approaches correspond with Biesta's idea of the practical intersubjectivity in teaching. In fact, the practical application in actual teaching situations might be the same in both approaches. I have tried in my own teaching to follow the maxims of communicative teaching and have used methods which are reminiscent of Ulmer's deconstructive textshops. In practice, Ulmer's lecriture and Huttunen's communicative teaching are actually quite similar. The most significant difference lies in the foundation upon which each is based. Huttunen's communicative teaching relies on the Kantian notion of an autonomous subject – which in Habermas's terminology is referred to as a communicatively competent subject – and Leibniz's Enlightened idea of the principle of reason. (Even Huttunen's communicative version of the method and intention criterion does not recognize unintentionally or structurally caused indoctrination. It is for this reason that he also outlines the content and consequence criterion of empowerment. This criterion also utilizes some poststructuralist approaches in education. See Huttunen 2003b.) The principle of reason requires that every statement must be grounded on something and every theory must have a foundation. Derrida's

deconstruction attacks both of these assumptions. Educational science as a field relies on these two assumptions and deconstruction attempts to refute them. How is this possible? How could there be any education and educational science after Enlightenment? In Pink Floyd's song, *Another Brick in the Wall*, the chorus sings:

We don't need no education.
We don't need no thought control.
No dark sarcasm in the classroom.

One might say that *Another Brick in the Wall* marked the beginning of an era in which education – in the sense of Enlightenment – is no longer possible.

Nevertheless, the deconstructive and communicative approaches in educational practice and educational research share many common features, which should allow them to be critically friendly with one another (critical friendship) and help each other to keep in shape.

Introduction

This entry explores the relationship between key points in John Dewey's philosophy of education and that of Critical Pedagogy. Throughout the entry, pertinent similarities and differences are highlighted. More specifically, a foundational theme within this exploration is underscoring education as a social function and process through which it becomes a political enterprise and cultural project. Education is contextualized within the latter frameworks as a cultural project without end. However, as Dewey and critical pedagogues, alike, point out, this project is fraught with complexity, struggle, resistance, rigid parameters, and injustice. The rich prospect of such a successful cultural project also ignites a deep sense of hope, meaning, change, and promise for future generations. Through this analysis, both philosophies will be seen as complimentary and connected sets of ideas that strengthen one's understanding of education as a agent of social transformation.

Context

The struggle between the traditional and progressive thoughts on education is always present and continues to this day. It is important to contextualize this struggle in relation to many of the educational themes in this article and the challenges that face education today. The crux of the struggle revolves around a challenging issue for most, change – specifically social change by way of education. These two extreme opposites (traditionalists and progressives) espouse different educational methods for pedagogy and learning. Dewey, of course, faced these struggles and was criticized for being progressive. Dewey found, as modern educationists and critical pedagogues have, that traditional teaching and learning styles are less successful given contemporary diverse learning styles. The various ways in which people learn have changed, and because of that the pedagogy must also adapt and improve to meet those new challenges. The notions that the teacher is the authoritative figure in the classroom and that all students learn by rote memorization have gone out the window. Those traditional notions have been replaced by experiential learning, the teacher being seen also as a student, teaching not just subjects but people and Critical Pedagogy. The very idea of the “classroom” or learning environment has been extended to the schoolyard, the family, the street, the workplace, and within everyday social interactions. Individuals in the society are all teachers and students. Education is a crucial part of experience, and experience is a crucial part of education.

The word “progress” in progressive education is important here. Progress implies change or development, or movement. Tradition implies something that is set, static, accepted custom or habit or something that is not changed or something that is clung to. In modern society, people are becoming more critical of knowledge, ideas, policies, identity, and authority. They are very interested in “progress” and knowing what things are made of. The cultural context of education in everyday life shapes and informs individual’s notions of social change, freedom, power, and knowledge. Briefly examining Critical

Pedagogy’s relationship to Dewey presents an opportunity to continue redefining and critiquing the social role of education and the social institutions that threaten progress toward a critical cultural pedagogy and social transformation.

Critical Pedagogy

The development of Critical Pedagogy as a movement, field of scholarship, and practice is informed by a long history of progressive thought on education. Although it is somewhat disputed, Henry Giroux is credited with being the first scholar to recognize and use the terminology, Critical Pedagogy, in his book *Theory and Resistance in Education* (Giroux, 1993). Critical Pedagogy means various things to various people. There is widespread agreement that it is an ongoing, evolutionary movement that is concerned with schooling’s (education’s) relationship to social structure, power, knowledge, authority, political interest, social control, and oppression. There is no single, fixed, authoritative definition of Critical Pedagogy for it would undermine its open and flexible nature. Specifically, Critical Pedagogy is concerned with how, why, and what kind of knowledge should be taught and learned and who has the power and control to make those decisions. For critical pedagogues, critically examining knowledge’s social utility is paramount. critical pedagogues concern themselves with questions like “Who controls the means of control for the production of knowledge?” “How is knowledge made and by whom?” “Why do students learn what they do in school?” “Who creates the curriculum?” “Does schooling serve to liberate, or oppress students, and teachers?” and “What is the purpose of school?”

At root, Critical Pedagogy is the study of oppression in education. The leading figure and founding father for Critical Pedagogy was Paulo Freire. In some way, it is the study of how gender, race, class, colonialism, power, and sexuality mold the nature of education, its purpose, and its transmission. Also central to its mission, Critical Pedagogy promotes both teacher and student scrutinizing and questioning why certain knowledge is

being learned or taught. With this, the accent on liberation and freedom of inquiry is extremely important. Critical Pedagogy strongly resists assumptions that education is objective and value free.

Through the Critical Pedagogy lense, education is seen as factory through which people become enslaved because of what they have or have not learned through being manufactured on the educational assembly line. Within Critical Pedagogy, both teacher and student are key agents in social change. It requires that people realize that learning is fundamental to the notion of agency and agency is essential to the notion of politics.

Critical Pedagogy's philosophical lineage is rich and interdisciplinary. While it could be argued that the idea that learning is tied to agency dates back to Plato's cave, Critical Pedagogy has developed most directly from critical social theory of the twentieth century. Of course, key to the development of Critical Theory was the Frankfurt School. The Frankfurt School theorists were concerned with the critique of social structure and institutions. Largely, these theorists built upon the work of Karl Marx dealing with sub- and superstructures of society. Key figures in the early years of Critical Theory and the Frankfurt School were Theodor Adorno, Max Horkheimer, Erich Fromm, and more recently, Jürgen Habermas.

Critical Theory has a keystone concern for social change through democratic means and social inquiry. However, the qualitative outcome depends upon the knowledge and education of a given people. This is where Critical Pedagogy is very important to Critical Theory's goals for social transformation. Freire outlined how cultural domination drives education and serves to oppress and alienate. Other very important figures in Critical Pedagogy such as Peter McLaren, Henry Giroux, and bell hooks have taken Freire's work even further.

Critical Pedagogy's major values are liberation, social justice, consciousness, discourse, praxis, critique, reflection, Democracy, and social change. In order to do Critical Pedagogy, one must accept a couple of notions. The first is that oppression does exist. The other is that the

transformation of the oppressed is possible, i.e., those oppressed are able to free themselves from their oppression. Critical Pedagogy points to how the standard way in which people learn is undemocratic. They learn undemocratically because the means through which they have been taught are undemocratic. It is unengaging, and students do not have a voice. Freire refers to this as the banking concept of education whereby a teacher is at the front of room, keeper of all the knowledge, and the students have no say or voice in raising questions. Social change must occur through what critical pedagogues call "praxis." Praxis is a cyclical, pedagogical marriage of critical reflection and action. Through praxis, then, agents can transform reality and liberate themselves from oppression. This dialectical process is without end and paramounts to Critical Pedagogy's success and ongoing development.

John Dewey

John Dewey was a prolific writer and thinker. He is widely known among many other things as the father of progressive education. His philosophical investigations ranged from art and aesthetics to science and logic to social and political critiques to education and learning how we learn. He has been called the father of progressive education. Dewey, however, was also extremely interested in the social life of the human. Social philosophers consider him to be a key figure as well. Dewey was excellent at connecting concepts in order to understand them more fully, i.e., seeing how one idea spawned from another. He was as much a naturalist as he was a pragmatist. Academic disciplines did not concern Dewey. He was writing in a time when there were no such disciplines as Sociology, Psychology, etc. Everything was fair game.

On the whole, Dewey is applauded for his efforts and thoughts on education, yet his philosophy of education needed a social philosophy. What he had to do was to tie education to far-reaching social and political concerns of the day. Some have said that the only comparable philosophy of education to Dewey's is located

with Plato. Plato, like Dewey, tied education to political leadership and social process. Plato, unlike Dewey, was not a fan of Democracy, and neither was Aristotle. The main reason for this is because both Plato and Aristotle felt that in a Democracy freedom is given to a people who do not have the education or understanding of how to use their freedom wisely. The result of the uneducated masses will be abuse of their freedom and shall be followed by tyranny. Dewey, in a way, was responding to the ancient's concern for Democracy. He believed that Democracy was the most promising of all forms of government because of the freedom it afforded the masses. However, he understood that the ideal form of education needed Democracy and Democracy needed education. One cannot exist without the other. He fully understood that education was linked, by its very nature, to the political and social life of any community.

One of Dewey's most revered works is *Democracy and Education* (Hickman, 1996). Dewey once alluded to the fact that no other single work of his captured the entirety of his position quite like *Democracy and Education* (Hickman, 1996). In that work, Dewey makes a very important statement that is radical. He states that "with each generation Democracy must be born anew, and education is its midwife" (Hickman, 1996). Taking this notion further, then, Democracy is characterized by constant change with each new generation. However, this presupposes the fact that the old generations have imparted or transmitted the appropriate set of intellectual habits to the new generations so that not only Democracy can be born anew, but also, preceding that, education has been born anew. The reconstruction of education must take place prior to the Democracy's new birth.

Dewey applied pragmatism in a special way by using a scientific approach to solve problems in education. Education is an instrument for Dewey, and an important feature of this instrument must be the use of intelligence. The main tool used for the clarification of new ideas, for problem solving, is human intelligence. One of the central goals of education, for Dewey, is the development and maturation of human intelligence, creative

Democracy, and living "Democracy as a way of life" (Hickman, 1996). Intelligence, then, calls for special ways in which one organizes responses to certain impulses; at the elemental level, intelligence is discernment in recognition. Thus, intelligence must be critical. Intelligence arises when one is in the face of conflict. It is the mediating faculty because there is no mediating faculty in the push of an impulse. Reaching a resolution through intelligence is not enough; one needs to proceed to act upon the resolution. So, for Dewey, intelligence, by its nature, *must be* critical. An important point to understand here is that intelligence for Dewey was not individual. It was social. So, any form of intelligence is social in nature for Dewey. The nature of knowledge for Dewey, as it is with Critical Pedagogy, is social.

Intersections and Conclusions

As can be seen, there are many points of agreement and overlap between Dewey's thoughts on the social function of education and Critical Pedagogy's. The shared values between these two schools of thought include but certainly are not limited to: Democracy, freedom, schooling, experience, communication, community, construction, deconstruction, reconstruction of knowledge, ideology, hegemony (Dewey might say "social control" instead), critique of social institutions, critique of social custom and habits of thinking, and change. Both perspectives understand that society is a function of education and education is a function of a society. Furthermore, it is understood in each case that pedagogy is central to politics.

Both viewpoints work from the position that education and teaching is always political and teachers and students are political operatives. Thus, freedom and liberation are extremely central to both agendas. It is understood in both philosophical contexts that freedom is something that must always be sought, cultivated, but also something that does not come without ongoing struggle and resistance.

While Dewey is often regarded as instrumentalist, he knew that knowledge was more than just

an instrument. One cannot arrive at any knowledge (whatever that is or means) without understanding. Understanding is a prerequisite of knowledge for Dewey, as well as Critical Pedagogy. The schools are responsible for guiding the understanding of cultural forces at work and the commensurate direction these forces are aimed at. But sometimes schools translate what knowledge is into merely information. Understanding, especially in this case, is not the same thing as knowledge. Understanding, in this context, should be taken to be a continual development, whereas knowledge could be taken to mean “information.” Guiding that understanding is crucial to both perspectives. The method for guiding understanding in both cases should be critical of the source of where the “information/knowledge” is coming from, why it is important, and if it is accurate based on realities of social life. Information is one thing; doing something with the information is another. This critically intelligent conduct or action is at the heart of both perspectives. Specifically, the connection between Dewey’s Pragmatism and Freire’s “praxis” is evident here.

In the vein of understanding, the concern in both cases goes beyond mere critical thinking and goes to what critical pedagogues call “critical consciousness” (Freire, 1998). Dewey won’t use that language but does use terms like consciousness, awareness, and attentiveness. Through this notion of critical consciousness, which Dewey promotes but uses different terms, is a way to get individuals to learn about themselves, their world, their relationship to others, and how to change the world through changing themselves. This goes to the point that both camps *understand* that knowledge is socially constructed and transmitted. In that way, then, knowledge should be deconstructed and reconstructed and by so doing creates the opportunity for social reconstruction, i.e., new ways of understanding what was understood and identifying what has yet to be understood.

Dewey and Critical Pedagogy take that stance that one must be critical of everything, including one’s own ideas, beliefs, and knowledge. More broadly, both perspectives felt an educational

system that promoted an ongoing critique of social institutions and self to be necessary. Key to the success of this ongoing critique is the important notion of inquiry. Dewey, like Charles Sanders Peirce, felt that the road to inquiry must never be blocked; it must always be wide open. Critical Pedagogy also supports this. Paramount to promoting, cultivating, and growing this sense of critical, open inquiry is an education and pedagogy that fosters this in students and to-be teachers.

In Dewey’s way of thinking, an ongoing, critical social transformation is needed with each new generation. What Dewey calls for is very radical for his time. He calls for a constant re-evaluation of one’s habits, customs, values, social institutions, and knowledge. critical pedagogues agree with this and recognize that it requires free inquiry, unlearning, a plasticity of habit, and a cultural yearning for transformation and change. Without this, one of Dewey’s greatest fears could be realized, “social arterial sclerosis” (Hickman, 1996). Thus, with the sclerotic condition of social institutions comes the inevitable and ongoing oppression that will only serve to render progress impossible.

Although the similarities between both viewpoints, on the whole, outweigh the differences, there are points of departure and weakness within each. One obvious difference is language and vocabulary. Another difference is scope as well. While Dewey was a true holistic philosopher, he was but one human being whereas Critical Pedagogy is a broad school of thought on a very broad topic – education. Critical Pedagogy also has its critiques ranging from feminist critiques, to post-structuralist concerns, to the problem of language. It should be expected that Critical Pedagogy be critiqued by critical pedagogues, other disciplinary scholars, and society, in general.

Dewey has also been deemed to be not radical enough for some critical pedagogues. He has been criticized for not focusing more on gender, race, class, educational access, oppression, economic status, and power relations in education and social structure. The latter point has especially been acknowledged by pointing to how far Michel Foucault takes the notion of power. Some scholars

within Critical Theory feel that Dewey's position overly paternalistic, which could perpetuate issues of social justice.

While Dewey is in no way bulletproof, he did treat many topics such as prejudice, justice, pluralism, political control, and even poverty in many of his writings. However, he did not treat the topics to the level of refinement that modern critical theorists do. Key to understanding Dewey's position on creative Democracy and Democracy as a way of life is noting that the both notions are built upon and flourish from unique individual differences within a society. Individuals, for Dewey, are only able to realize their potential through others. Learning comes through difference and is directly linked to social change.

Dewey has much richness still to offer Critical Pedagogy. One, of many examples of this, is Dewey's understanding philosophy of human nature. The paramount importance of progressive educational ideas focused on social reconstruction, transformation, or change depends upon changing one's human nature. Among many other benefits, Dewey offers Critical Pedagogy a deeper understanding of human nature, experience, social reconstruction, and the "social continuity of life" (Hickman, 1996). Concurrently, Critical Pedagogy has much to offer Dewey scholars in terms of refining and rethinking education's relationship to human suffering, power, oppression, privilege, gender, race, and class. Integrating the intellectual fruit of each viewpoint will serve to further expand, liberate, and progress one's conception of the scope and bottomlessness of education as a cultural project.

Introduction

The democratic faith in human equality is belief that every human being, independent of the quantity or range of his personal endowment, has the right to equal opportunity with every other person for development of whatever gifts he has. (Dewey 1939/1981, pp. 227–228)

In recent years, humanities scholars, social scientists, and educators have turned to what is often called the social model of disability, an orientation that begins with an intense appreciation for the lived experiences of disabled persons and culminates with a barrage of critical questions about the construction of ethical communities. Scholars have toiled to craft new theories that replace oppressive traditions of stigma and exclusion with fresh intellectual and practical pathways

seeking dignity and participation. Although John Dewey never wrote about disability, it is not surprising that scholars are now looking to his philosophy for resources to inform efforts to develop inclusive schools that accept and value students of all bodies and minds. His naturalistic understanding of human growth, pragmatic and pluralistic orientation to knowledge, and devotion to egalitarian democracy offer rich resources to educational philosophers examining issues of disability in contemporary education.

Education and Growth

Individual growth, a gradual expansion of capacities and competencies, is both social and biological, cultural and physiological. Dewey strongly opposed the hereditarian strand in psychology that reduced human learning and growth to physiology and genetics. The development of the concept of individual intelligence, in Dewey's view, was an illogical attempt to consolidate and calcify the widest variety of human activity across time and context into a single entity stripped of the actual content and processes of human living. The common notion that some essential aspect of human nature stands prior to development and continues as a static force over the course of individual growth denies the actual experience of learning and change over many lived situations and contexts. Dewey held that there is no such thing as an original essence of an individual's thought or actions that can be distinguished from all that a person acquires and learns during the course of living.

Rather than viewing biology as fixed factuality that precasts the limitations and potentials of human activity, Dewey observed biology as motion and change itself, as continuous unfolding such that "it is fruitless to try to distinguish between the native and the acquired, the original and the derived" (Dewey 1932a/1981, p. 32). At any point in the development of an individual, one can speak of what was original by explaining some feature of the current moment as an artifact of a prior essence. Yet this proposal is always an artifice that denies both the constancy of change in

living organisms and the modifying influence of the continuous interactions of the individual with his or her surroundings. What is natural, by Dewey's analysis, is not a fixed nature but the constant process of change that we customarily call growth, learning, and development.

The current preoccupation in the American education system with objectified types of disabilities demonstrates the failure of psychology and education to appreciate the forms of idiosyncratic and context-focused growth occurring in specific individuals. Educators have become distracted by assumptions about what young people should be and should become in reference to comparative timetables of normality. What is undeniable, in Dewey's philosophy, is not the existence of a nosology of defective types but a wide variability in how and when individuals grow. The human capacity to grow, taking on a multitude of situational, novel, and surprising forms, progresses in each unique life course. It is misleading to accumulate instances of failed learning or into an overall portrait of incompetence that denies the reality of human growth (Dewey 1916).

Dewey (1916) considered *growth* the end aim of an education which is ideally a "constant reorganizing or reconstructing of experience" (p. 76). Growth occurs along an "experiential continuum" that proceeds with – and is guided by – education (Dewey 1938). Dewey defined growth as an essentially natural human process which is simultaneously biological and social (Danforth 2008). This contrasted significantly from views of biology as scientific fact, framing human potential as fixed and devoid of context. Dewey (1916) specifically identified two conditions which foster growth: the need for social interaction and "plasticity," or the ability to learn from experience and thus develop habits of mind and behavior. Specifically, Dewey appreciated growth in habits and capacities that promote social integration, which further enhances learning. The goal of education is the growth of the whole child, including "adaptation to group relations" (Mayhew and Edwards 1965, p. 20), a fundamental skill for democratic community life. To support this goal, Dewey felt that curriculum

should be interactive, dynamic, and responsive to the changing needs and interests of students (Mayhew and Edwards 1965). His conception of growth is intrinsically based and not via comparisons as measured between individuals or groups. Growth is viewed strictly on an individual basis, based upon one's unique attributes and capacities.

Critics of Dewey's approach might argue that growth is something that happens *to* us and is not self-directed. However, Dewey is clear in stating that growth occurs individually when we participate in meaningful experiences. Growth is also manifested as self-realization achieved by successfully exercising capacities and realizing one's potential. Therefore, growth is not quantifiable through, for example, standardized testing. Instead, Dewey advocates that growth is first based upon personal experience from the student's perspective. Growth can also be appraised through individual contributions in communities where each unique social context determines what counts as growth. Echoing Dewey, Lekan (2009) sees growth as an element of well-being and an entirely individual concept, impossible to measure through comparisons. In this view, though individually defined, growth is best attained by developing capacities and potential through participation in communities. Growth, like many concepts in a Deweyan philosophy of disability, is viewed in regard to two aspects – the individual and society – seemingly distinct, for which Dewey takes great care to illustrate the relationships and connections. Growth as individuals facilitates growth of communities, while individual growth itself is supported by the “modifying influence of the continuous interactions of the individual with his or her surroundings” (Danforth 2008, p. 53). This idea of growth as concurrently biological and social frames disability as but one natural aspect of individuality. Education should be responsive enough to support and guide all students in the growth of social skills, communication, and competence in decision-making. Beyond these skills, even more critical is providing a social context in schools which nurtures growth through participation in shared learning activities.

Supporting Democracy Through Education

For Dewey, the formulation of a philosophy of education lies in his broad conceptualization of democracy and the challenges and opportunities inherent in building democratic communities. Although Dewey never wrote specifically about disability, his philosophy is sympathetic to special education programs and supplies theoretical and practical support for inclusive, democratic schooling that actively values all students of all backgrounds and abilities. Rather than envisioning individuality and community as opposing forces, Dewey framed individual growth as seeking fulfillment within positive contributions to a diverse, changing society. Throughout his writings, specific themes consistently emerge as foundations for a democratic way of life, including participation, communication, associations, individuality, growth, and equality. According to Dewey, participation is a form of collective action in which all who take part have a stake (Biesta 2013). All contribute from whatever interests and talents they have, seeking satisfaction and fulfillment in those preferred activities and all are supported as equal collaborators within the ongoing, practical decisions and deliberations that solve community problems and enrich community life. Education provides opportunities to experience community through mutual participation in shared activities that have personal meaning for participants and facilitate intellectual and practical growth for all students. Education involves collaborative participation in a common activity. These shared activities simultaneously allow each individual to contribute to the practical well-being of the group while also supporting the development of each student forward in her own talents, skills, and knowledge.

Instruction, in this light, is not done *to* or *for* students but *with* them, as a mode of interaction and experience that engages students intellectually and emotionally, tapping into and extending individual desires and interests (Westbrook 1991). Common understanding is not a prerequisite for cooperative activity. Rather, Dewey suggests the opposite; cooperation in action leads to common

understanding. This runs counter to traditional thoughts on teaching and learning. It is not merely participation in an activity; it is the quality of the participation that takes priority. Traditional education has concentrated on individuals revising schemas as evidence of learning, not the construction of new and shared perspectives.

Communication, as reciprocal and interactive, is the basis of human community and knowledge. Dewey understood communication not as transmission of information from person to person but rather as transactional meaning-generation, “a process of sharing experience until it becomes a common possession” (Dewey 1916, p. 14). For Dewey, communication through action results in meaning-making that is commonly understood by all, a critical aspect which supports growth and, on a larger scale, democracy. Communication then is action-oriented; it is something people *do*. More importantly, it is something people *do together* (Biesta 2013). The concept of communicative and relational participation is central to Dewey’s view of education and a philosophy of disability. Education does not simply occur through mere presence in a social environment. Rather, students must participate in the “embryonic community” (Dewey 1899, p. 19), the social relationships of growth and friendship which are the developing micro-society. Here education occurs through participation in shared activities which transform ideas, habits of conduct, and moral reflection.

For students with disabilities, inclusion defined narrowly by place alone cannot offer the opportunity for participation from a Deweyan perspective. What is required is an unabridged opportunity to be immersed within experiential fullness and richness of the social life of the school as a developmental microcosm of the larger society.

When the school introduces and trains each child of society into membership within such a little community, saturating him with the spirit of service, and providing him with the instruments of effective self-direction, we shall have the deepest and best guarantee of a larger society which is worthy, lovely, and harmonious. (Dewey 1899, p. 20)

The goal of the school is to develop each child’s intelligent and purposeful command over

their own actions within a context of cooperation and social support. Individuality and community, in this light, are built through the shared activities of investigation, learning, and action.

Communicative and relational participation takes place within common, shared activity and is a natural consequence of human association (Westbrook 1991). Human potential is not strictly an individual endeavor; rather, it is only reached through associations, or common interactions, with others. In this perspective, the chief goal of the school is to support all students in reaching their fullest potential, to “secure a free and informal community life in which each child will feel that he has a share and his own work to do” (Mayhew and Edwards 1965, p. 32). The educative *process* itself – comprised of participation and its subsequent transformation of thought and practices – is the end goal of education and requires various modes of human association.

For Dewey (1916), separation of students during the educative process denies the valuable “interchange of varying modes of life experience” (p. 84), diminishing the opportunities for relationships, interactions, and learning. For example, segregating students with disabilities into isolated classrooms or schools creates a situation characterized by a “lack of the free and equitable intercourse which springs from a variety of shared interests” (Dewey 1916, p. 84). Heterogeneous interactions enrich intellectual development for every student; “Diversity of stimulation means novelty, and novelty means challenge to thought” (Dewey 1916, p. 85). Dewey therefore viewed schools as places where modes of associated living among diverse learners developed the practical capacities necessary for building and furthering democratic communities (Westbrook 1991).

In a democratic model, teachers support (and schools are structured to facilitate) students so that everyone makes unique contributions that benefit the community. A shared education prompts development of “social sympathy” and results in “collateral learning,” which is more important in many respects than the content matter itself. In order to accomplish this, educators must “presume competence,” where they bracket out

preconceived stereotypes and stigma of disabled students in order to open up to the contributions those students can make (Biklen and Burke 2006). Dewey believed that a democratic design and perspective in education could *transform* society. Historically, however, the case has been that schools are not designed for that purpose but rather to *reproduce* society according to homogenized and standardized norms, or “mediocrities” (Dewey 1922a). The task for education, therefore, would appear to be to work within the existing structure of the educational system writ large but strive to create collaborative, democratic communities on a local scale.

Equality in Education and Society

Dewey (1922b) viewed equality as a precondition for freedom and used the concept of “moral equality” to frame student differences in more democratic ways that dispense with hierarchies. Moral equality therefore requires we accept humans as incomparable and that standardized measures (such as intelligence testing) which strive for comparison are decontextualized, ineffective, and even detrimental to the educative process. For Dewey, equality does not equate with sameness but with an equity of social valuing, an assumption that all persons are necessary to the community. To each student must be provided the resources and opportunities for each to fully develop his or her own capacities to contribute to a democratic society, in other words, *equality of opportunity* (Westbrook 1991). Equality is constructed in the everyday doing of living and not as an a priori philosophical or political ideal. Humans and their life’s activities are not comparable; instead equality is expressed by viewing a person’s unique qualities and capacities. In this sense, equality is not composed of hierarchies or any metric of comparison; it is about individual learning and growth within each unique life context where one is considered “morally equal to others when he has the same opportunity for developing his capacities and playing his part that others have, although his capacities are quite

unlike theirs” (Dewey 1932b, p. 346). In this way, equality can be expressed as a collective equation, a reciprocal interaction wherein what each person provides the group in terms of unique contribution is returned to every individual through richness and quality of experience.

Dewey’s stance on equality was based on values and differs from the typical definitions of societal comparison based upon a variety of attributes (socioeconomic status, opportunity, intelligence, social capital). Dewey, however, was very aware of social groups and problems of hierarchies in society. His response was to focus on supporting idiosyncratic growth of each student while creating social processes whereby students work together, accept and value one another, and collaborate to solve concrete human problems. Public education, historically and currently, operates systems that classify and segregate students with disabilities into one-dimensional learning communities. In Dewey’s view, such isolating, marginalizing, and classifying run counter to the democratic values of associated living and moral equality. At its core, Dewey’s notion of equality depended upon an education that afforded *all* students the opportunity to “make the best of themselves as active participants in the life of their community” (Westbrook 1991, p. 94).

Individuality as Educational and Social Attribute

In Dewey’s view, democracy itself depends upon the realization of individualized capacities. “Democracy will not be democracy until education makes it its chief concern to release distinctive aptitudes in art, thought, and companionship” (Dewey 1922b, p. 300). Dewey (1922a) denounced the “classificatory submergence of individuals in averaged aggregates” (p. 292) as represented by intelligence testing and other standardized assessments of ability or achievement. Education of students with disabilities has been characterized by standardized diagnostic testing and curricula based upon an array of needs that

represent actions a particular disability category might exhibit, both of which negate the value of individual capacities. The mindset of focusing on measured deficits instead of valuing the wholeness of complex individualities has implications far beyond the educational setting in terms of the vision for a truly democratic society. Therefore, education's great task is to discover and encourage the "unique service" (Dewey 1922b, p. 300) of individuals by asking questions involving real human problems that confront society, uniting young minds to be creative, collaborative, scientific, and practical.

Dewey cautioned that individuality should not to be confused with individualism, the valuing of detached independence or self-reliance. In contrast, individuality recognizes and celebrates the unique capabilities and contributions offered by individuals as part of a reciprocal interaction within a social situation. Indeed, Dewey (1916) stresses that:

every individual has grown up...in a social medium. His responses grow intelligent, or gain meaning, simply because he lives and acts in a medium of accepted meanings and values...the self *achieves* mind in the degree in which knowledge of things is incarnate in the life about him; the self is not a separate mind building up knowledge anew on its own account. (p. 295)

Not only do individual minds grow within a social milieu; consequently so does society insofar as it "counts individual variations as precious" (Dewey 1916, p. 305). Certainly, the value of individual differences in education and society is a common thread throughout Dewey's writings, one that also frequently connects to his conception of moral equality as incommensurability. As played out in the school setting, individual students, regardless of ability, grow through assuming their own unique roles within the collaborative experiences of the class (Danforth 2008). For schools to succeed in their task of developing social and democratic values, they must be organized as cooperative communities where each student feels as if he or she contributes and can achieve their full and unique potential.

Conclusion

Dewey clearly supported the potential of education to allow every individual to contribute to the democratic ideal in unique ways. Dewey's concepts of growth, democracy, equality, and individuality are interconnected elements of an overarching, egalitarian perspective. The educational implications of these concepts are best represented through an examination of strategies to create and sustain schools, classrooms, and other learning environments which recognize, affirm, and involve individual voices of students with disabilities as equal contributors in shared communities. Democratic modes of education which promote communication, participation, and human association include removing barriers to shared participation, providing opportunities for students to be socially integrated and contribute to the shared work of the classroom and creating social environments that are mutually enriching. A focus on growth as individuals in a Deweyan perspective requires working on incorporating individual ways of communicating, thinking, and learning actively into educational communities and assessment based upon growth within each individual, not according to an extrinsic or predetermined grading scale. Equality can be fostered through cultivating interpersonal relationships within classrooms which focus on respect, the value of individual contributions, and an inclusive community of caring (Danforth and Naraian 2015). As viewed through a democratic lens, Dewey's educational philosophy of disability contrasts markedly from a charity-based approach and stresses doing well *with*, rather than *for*, diverse others.

Introduction

The self, for Dewey, is an entity that emerges out of a biological and social milieu, growing and changing over time in transaction with the world. Thus, the self is “not something given once and for all at the beginning which then proceeds to unroll as a ball of yarn may be unwound” (Dewey 1940/1991, 103). Each individual self has a unique past, “a background of experiences long ago funded into capacities and likes” (Dewey 1934/2008c, 93) a present, which at its best becomes an art that manifests “what actual existence actually becomes when its possibilities are fully expressed” (Dewey 1934/2008c, 285), and an ever-unfolding future to be shaped through choices made in conjunction with environing conditions.

This discussion is organized into three main concepts that are essential for understanding Dewey's account of the self. The first is “impulse,” which helps to clarify how the realms of the individual and social interrelate in constituting the self. The second is “habit,” which is arguably the concept most central to Dewey's account of self. Finally, the concept of “art” is essential for understating the full richness Dewey's account of self, as for Dewey the creation of art is integrally linked to the creation of self.

This work was supported by the Academy of Finland.

Impulse

Impulse is essentially a release of energy that arises within an individual when his or her habits are not in tune with surrounding conditions. Impulse is chaotic, tumultuous, and “of itself [does not] engage in reflection or contemplation. It just lets go” (Dewey 1922/2008a, p. 124). Examples of impulse could be as basic as a biological need for food or something much more complex such as a gripping sensation experienced in the chest when a loved one lets us down. Crucially, neither the initial pangs of hunger nor the feeling of despair experienced with a broken heart are meaningful until they meet the social realm. Indeed, as impulses, they are merely blind discharges of energy that are yet to have a name. As such, “Gestures and cries [of this sort] are not primarily expressive and communicative. They are modes of organic behavior” (Dewey 1925/2008b, pp. 138–139).

Perhaps the most transparent example of impulse can be found in considering an infant’s initial gestures and cries. Dewey offers that rather than being communicative, such release in energy is essentially “over-flow” and “by-product.” However, in meeting the social environment impulse becomes transformed into something meaningful, as “the story of language is the story of *use* made of these occurrences” (Dewey 1925/2008b, p. 139). In other words, the initial pangs from an empty stomach become something more than merely raw sensation when they are interpreted and responded to as *hunger*. Thus, in this initial “establishment of cooperation in an activity in which there are partners” – what Dewey names as the *sufficient* condition for language – impulse becomes meaningful (Dewey 1925/2008b, p. 143). “In short, the meaning of native activities is not native; it is acquired. It depends on interaction with a matured social medium” (Dewey 1922/2008a, p. 65). And it is for this reason that babies “owe to adults the opportunity to express their native activities in ways which have meaning” (Dewey 1922/2008a, p. 65).

So, while impulse is native and arises within the individual, in meeting the social environment

impulse becomes transformed. In this, impulse gains a meaningful, social end. Accordingly, impulse provides the initial spark that can eventually lead to the creation (and continual recreation) of a self in the meeting of the social realm. “[I]mpulsive action becomes an adventure in discovery of a self which is possible but as yet unrealized, an experiment in creating a self which shall be more inclusive than the one which exists” (Dewey 1922/2008a, p. 97). Thus, “Personality, selfhood, subjectivity are eventual functions that emerge with complexly organized interactions, organic and social” (Dewey 1925/2008b, p. 162). Understanding the role of impulse in this complex organization is key for reconciling the interrelationship between the individual and social aspects of Dewey’s account of the self.

Habit

While Dewey’s account of habit is most fully elaborated in *Human Nature and Conduct* (1922), habit plays a significant role throughout Dewey’s philosophy and is particularly significant in his educational philosophy. Dewey’s discussion of habit describes both the stable aspects of self as well as the possibility for reorganizing the self through forming new habits that in some degree allow for the creation of a new self. Dewey’s conception of habit is much more encompassing than we typically afford the notion, as we often only become aware of habits when they are perceived negatively – as in the case of a bad habit we wish to break. But “When we are honest with ourselves we acknowledge that a habit has this [negative] power because it is so intimately a part of ourselves. It has a hold upon us because we are the habit” (Dewey 1925/2008b, p. 21). In this way, so-called bad habits allow us to recognize how central habits are to the self.

But habits are not always (or even mostly) bad. A habit is a form of intellectual efficiency that we retain from past interactions. Habits are helpful to thought in that they restrict its reach, fixing certain boundaries, preventing thought from straying too far off course (Dewey 1922/2008a, p. 121). By successfully narrowing thought’s focus and

keeping it on a productive, or at the very least, a proven, trajectory, habits are vital to our everyday functioning. Although it can be difficult to fully appreciate the extent to which we rely on habits, in reflection we can recognize that even seemingly straightforward acts of perception, such as seeing or hearing, are laden with habits of observation, recollection, foresight, and judgment. In this way, habits are constantly mediating all of our interactions with the world. “Outside the scope of habits, thought works gropingly, fumbling in confused uncertainty” (Dewey 1922/2008a, p. 121).

Habits are primarily objective in the sense that they are formed in conjunction with the world. In this, habits “incorporate an environment within themselves” and become “an ability, an art, formed through past experience” (Dewey 1922/2008a, pp. 38, 48). Once a habit is established, it has a projective, dynamic quality – always functioning on some level, even if only in a subdued and subordinate form, waiting for the right conditions to arise in order to emerge and guide thought and conduct.

For Dewey, what distinguishes a good habit from a bad habit is not whether it is somehow annoying or distressing, but rather how it functions in helping us to respond to a present environment. “[W]hat makes a habit bad is enslavement to old ruts” (Dewey 1922/2008a, p. 48). Thus, whether a habit “is limited to repetition of past acts adopted to past conditions or is available for new emergencies” is key for ultimately determining if a habit is good or bad, as the “goodness of conduct” “lies in effective mastery of the conditions which *now* enter into action” (Dewey 1922/2008a, p. 48).

The importance of recognizing habit’s connection to present conditions is pivotal for Dewey’s discussion of habit because it is upon this axis that habit’s function turns. Thus, as much as habit accounts for the stable aspects of self, Dewey’s discussion of habit at the same time posits the self as an ever-changing, regenerative entity. What distinguishes habit as stable or changing is its relation to a present environment. When habit is not in harmony with present conditions, impulse emerges, creating an opportunity for habit to become reorganized. In this, Dewey’s discussion

of the formation and reorganization of habit names a fundamental process that allows for life to grow and thus to qualify as a life at all (Dewey 1916/1980, p. 56).

Dewey’s commitment to fostering a life of growth is the reason he advocates that we cultivate impulse, the stirring of which is the initial first step in the reorganization of habit. Dewey asserts, “More ‘passions,’ not fewer,” as “the man who would intelligently cultivate intelligence will widen, not narrow, his life of strong impulses while aiming at their happy coincidence in operation” (Dewey 1922/2008a, pp. 136–137). But while impulse is vital and necessary for reorganizing habit, it is not nearly sufficient. “Impulse does not know what it is after. . . . It rushes blindly into any opening it chances to find” (Dewey 1922/2008a, p. 175). While “impulse is needed to arouse thought [and] incite reflection,” “only thought notes obstructions, invents tools, conceives aims, directs technique, and thus converts impulse into an art which lives in objects” (Dewey 1922/2008a, p. 118). And in converting impulse into an art, we form a new habit – we grow – and we become in some sense a new self.

The work of intelligence is critical in allowing for impulse to be converted in this way, forming a new habit. Intelligence clarifies and liberates restless impulse through a process of deliberation, “a dramatic rehearsal (in imagination) of various competing possible lines of action” (Dewey 1922/2008a, p. 132). In this rehearsal, potential action is tried out based on what is known from the past via habits in conjunction with impulse and the present environment. The rehearsal continues until a course of action is hit upon. Notably, this is not a progression of moving from indifference to preference, but rather a move from multiple competing preferences to the emergence of a unified preference that satisfies the situation. “We want things that are incompatible with one another; therefore we have to make a choice of what we *really* want, of the course of action, that is, which most fully releases activities” (Dewey 1922/2008a, p. 134). In making a choice, the existing self is revealed and simultaneously the future self is being formed. “Every choice is at the

forking of the roads, and the path chosen shuts off certain opportunities and opens others. In committing oneself to a particular course, a person gives a lasting set to his own being.” Dewey continues, describing this as “a process of discovering what sort of being a person most wants to become” (Dewey 1922/2008a, p. 287).

The choices we make can be reasonable or unreasonable. The distinction between the two, however, rests not on a guaranteed outcome of perfect success, but rather whether “justice” has been done to “every shade of imagined circumstances” (Dewey 1922/2008a, p. 135). In the case of an unreasonable choice, a particular object of thought becomes irresistible and overrides the others, but in so doing does not satisfy all facets of the present situation. By contrast, a reasonable decision requires the working (and wrestling) with competing impulses and habits in relation to a present situation in order to hit upon a projected resolution that will satisfy all aspects of a present circumstance. In this, deliberation is as much an operation of intellect as it is the working of art.

Art

The title alone of Dewey’s major aesthetic text, *Art as Experience*, says a great deal about Dewey’s approach to art. Contrary to conceptions of art as objects, Dewey maintains, “there is a difference between the art product (statue, painting or whatever), and the *work* of art. The first is physical and potential; the latter is active and experienced. It is what the product does, its working” (Dewey 1934/2008c, p. 167). Thus, Dewey conceives of art as an experience of “active alert commerce with the world; at its height [art] signifies complete interpenetration of self and the world of objects and events” (Dewey 1934/2008c, p. 64). Such commerce with the world is critical for this discussion of self because within the experiences Dewey puts forth as art, the self grows through “an adjustment of our whole being with the conditions of existence” (Dewey 1934/2008c, p. 23). In this, the process of reorganizing habit becomes synonymous with Dewey’s conception of art.

Although Dewey’s discussion of habit is presented most fully in *Human Nature and Conduct* (1922), it is in 1934 with the publication of *Art as Experience* that the notion of habit comes to fruition. Both of these texts consider the “turmoil” marking “the place where inner impulse [makes] contact with [the] environment” and in *Art as Experience* deliberation is further developed, revealing it to be a fundamentally aesthetic process (Dewey 1934/2008c, p. 72).

Although by 1934 Dewey preferred the term “impulsion” to “impulse” in order to designate “a movement outward and forward of the whole organism to which special impulses are auxiliary” (Dewey 1934/2008c, p. 64), Dewey’s 1922 description is clearly at work in a recast version in Dewey’s 1934 discussion of the act of expression. In this, Dewey suggests that every complete experience begins with impulsion – an instance of need, a lack of harmony between organism and environment. Initially, the experience does not know where it is going, as it must contend with resistance from the environment in what Dewey now refers to as reflection. This process of reflection is the same as deliberation in that it relates the impulsion stirred by a present “hindering of conditions to what the self possesses as working capital in virtue of prior experiences” – that is, to habit. Thus, Dewey continues, expression involves a “transformation of energy into thoughtful action, through assimilation of meanings from the background of past experiences.” The act of expression is thus “a re-creation in which the present impulsion gets form and solidity while the old, the ‘stored,’ material is literally revived, given new life and soul through having to meet a new situation” (Dewey 1934/2008c, p. 66).

A reorganization of habit is thus inherent in Dewey’s conception of art. With this, art becomes key for understanding the full richness of Dewey’s account of self. Indeed, the creation of art involves self-creation as well. “From the first manifestation by a child of an impulse to draw up to the creations of a Rembrandt, *the self is created in the creation of objects*” (Dewey 1934/2008c, 286, emphasis added). And whether this self be a Rembrandt or someone else, the process of self becoming is in itself inherently a working of art. Thus, in

overcoming resistances encountered through interaction with the environment, we transform objects external to us just as we transform internal objects as well – our habits and, by extension, our selves.

Dewey Lab School at the University of Chicago

A. G. Rud and Adam Attwood

Washington State University, Pullman, WA, USA

John Dewey established an experimental school in 1896 at the University of Chicago. He and his wife Alice were involved with the school until 1904 when they left Chicago. Dewey wanted to put into practice his ideas about education, test these ideas, and encourage what we now call action research, as well as provide schooling for his own children. Dewey's writings at the time about the school include brief descriptive articles (e.g., 1896) as well as his well-known book *School and Society* (1899).

Two principal accounts of the school other than Dewey's own reflect different views and help

provide here a holistic account of the Laboratory School: *The Dewey School* (1936/1966) and *Dewey's Laboratory School: Lessons for Today* (1997). The first account is by Katherine Camp Mayhew and Anna Camp Edwards, two teachers at the school, with an introduction by Dewey himself. They note that Dewey's purpose was "to discover in administration, selection of subject matter, methods of learning, teaching, [a way of] developing in individuals their own capacities and identifying their own needs" (pp. xv–xvi). The second account comes much later, from the curriculum theorist Laurel N. Tanner (1997), as she assesses Dewey's school in light of the dissemination of his pedagogy and thought and compares current educational practices to what Dewey proposed and enacted. Tanner is concerned that there are lessons about the school that have not been learned. In the final part of the entry, we discuss more fully the lessons learned from Dewey's Laboratory School and how Dewey's ideas have fared in today's schools.

Dewey brought developments in the new field of psychology to bear upon the conceptualization of the school and its teaching and learning. He was particularly interested in what we would call developmental and social psychology, particularly George Herbert Mead's social nature of the self. Dewey drew heavily from the Harvard philosopher and psychologist William James, a pioneer in contributing to developmental and educational psychology. Like James, Dewey was a pioneer in the philosophical movement called pragmatism. Pragmatism insists that ideas be tested for their consequences in the everyday world. This way of thinking deeply influenced Dewey's conception of the Laboratory School as a place where teachers would test ideas about teaching. These ideas would be developed into learning activities, where students would observe, learn, experiment, and reflect upon projects and problems offered by teachers but also ones they encountered themselves in the multiple factors and considerations a problem or project may present.

For instance, Dewey thought everyday activities such as cooking, carpentry, and art all presented engaging problems that would require

certain skills to learn and to understand fully. Students learning how to bake would see how numeracy and literacy came alive in the transformation of the ingredients such as flour, eggs, milk, and cocoa into the finished product of a chocolate cake. Students creating paintings would learn techniques that allowed imagination to fashion works of art from the materials of paint and canvas.

Although the school was theorized based upon Dewey's philosophy and psychology, it also owed its genesis in part to Dewey's memories of childhood learning, especially what Tanner calls "the never-ending memory of boredom" (1997, p. 13) of the classroom, particularly rote learning common in nineteenth-century schools in his native Vermont. Dewey recalled good memories of learning outside the walls of the classroom, in the vibrant city of Burlington but also out in nature, and he wanted to infuse the Laboratory School with that kind of active, interesting learning.

Dewey was brought to the new University of Chicago by President William Rainey Harper, to not only chair its department of philosophy, psychology, and pedagogy but to enact the ideas of the new science of psychology with young learners. The school was founded by Dewey and Harper in 1894 and opened in 1896. It fulfilled a dream that Harper had for his new university, where learning would be paramount from early years through graduate study. Harper had enticed Dewey to his new university in part by elevating pedagogy to a university discipline, as part of the department Dewey headed. The new school was finally called the Laboratory School in 1901 to differentiate it from other schools at the university and to stress its experimental purpose. Dewey appointed his wife Alice as principal of the school in 1901, a position she held until 1904 when she was asked to resign by President Harper, an event which prompted Dewey to resign from oversight of the school as well as from the University of Chicago, for a professorship at Columbia University in New York City.

Dewey wanted a school to be like a scientific "laboratory," where theories about education and development could be tested, by teachers devoted

to learning about research and innovation. He saw the most important work of the university discipline of pedagogy as the advancement of ideas about education through conceptualization, trying out, and applying, as he states in *The School and Society*, in a "laboratory of applied psychology. That is, it has a place for the study of mind as manifested and developed in the child, and for the search after materials and agencies that seem most likely to fulfill and further the condition of normal growth" (Dewey 1899, p. 96, as cited in Tanner 1997, p. 19). These teachers would then work collaboratively to develop and enact a curriculum based on problems that would not only engage students with materials and ideas but would prompt and enable these students to take charge of their own learning. Dewey's aim was an active and involved learning experience for all that would serve as a nascent democracy. Thus, the hands-on activities the children did were not only to learn skills and information in a holistic way but to enliven the child's incipient moral and social character.

Learning in the Laboratory School was based upon a simple idea: The natural interests of the child would be shaped and guided by a collaborative teacher attentive to that particular child's learning needs. The well-known epithet about active learning of a teacher being a "guide on the side rather than a sage on the stage" was apt for what Dewey wanted teachers to be and do. He objected to the lifeless rote learning common in his day that he recalled from childhood because it removed learning from life's ever-changing concerns. Dewey stressed the importance of a living, woven-in, psychological connection to learning about matters of interest that stood in contrast to a static, analytic, logical presentation of subject matter in text books.

Dewey privileged the psychological over the logical in education. That is, a child's interest and curiosity would determine if in fact the child wanted to learn in the first place, and the topics, pedagogy, and curricular structure followed. This contrasts to a logical organization of subject matter, where the rationale for a particular subject is described and analyzed in a sensible, logical, linear fashion as is typical in textbook, an object of knowledge that is not intrinsically attached to any

one person's interest in learning. A textbook by itself does not interest us, Dewey might say, as the material has not been psychologized and thus made living and momentous. A simple example will suffice: A child may or may not be interested in a textbook presentation of sedimentation evident in a riverbed, but this topic can be described adequately in a geology textbook. The textbook is logical, descriptive, and static, while the child's interest or disinterest in sedimentation is psychological, developmental, and active. The child, if interested, may ask or be prompted to ask by a teacher why the sedimentation occurred in this fashion. Thus, the topic becomes a problem that invites imaginative and often collaborative thinking to understand, which may include investigation of an actual riverbed, the posing of hypotheses about sedimentation, further library investigation, testing with models of riverbeds, water flow, sedimentation, and so forth.

The English empiricist philosopher John Locke envisioned the mind as a blank slate upon which sense impressions are made. All we perceive etches its particular properties upon the mind. Thus, for Locke education was paramount, as it provided the material content to inscribe meaning and significance on a blank slate. Dewey thought such abstract empiricism was nonsensical and believed we always start learning in the middle of things. Children come into a family and a society already endowed with rich strata of history, lore, and custom. Even the environment is humanized, fashioned as buildings and roads, but also the natural world, what we suppose is wild nature, has been altered by humans, most fundamentally as a creation of cognition, as a human creation.

Thus, since we enter into a world already fashioned and constructed, school learning should be continuous with that world and with the learning developed in family and home and with one's own incipient sense of self and actualization. In the Laboratory School, teachers were more like facilitative leaders who constructed an inviting environment replete with challenging activities in everyday environments such as a garden, kitchen, workshop, or studio. Students encountered puzzling or problematic situations in these

environments, and what they learned through the "occupations" of these settings mimicked everyday life. Skills such as numeracy and literacy were learned as part of holistic topics and the means to meet basic human needs of dress, shelter, and sustenance. Building a small shed utilized numeracy (measurement and calculation in construction), literacy (reading instructions), and social or cultural literacy (learning where the wood was harvested and milled, how the construction of sheds evolved over time and in different places and cultures, and so forth).

As the student and curriculum were reconceived in the Laboratory School, so too was the role of the teacher. Rather than the familiar "egg crate" of isolated instruction behind closed classroom doors common in many schools even today, the Laboratory School teacher taught collaboratively, engaging in close dialogue with colleagues and fostering an incipient democracy through modeling collaborative and dialogic practices among each other, with students and with the community at large. Teachers were to be researchers of their own practice. This is a difficult work, and there is evidence that the Laboratory School teachers were not entirely successful in keeping up the intensity and effort required of such pedagogy. Closer to our time, Vivian Gussin Paley, teaching in the Laboratory School well after Dewey's departure, enacted this aspect of Deweyan pedagogy in her own classroom by working closely with individual students and recording her teaching for analysis and reflection after class each evening, which she then turned into a series of well-known books.

The approach to curriculum and instruction was one of experimentation in which students were encouraged to learn through "first-hand" experience (Mayhew and Edwards 1936/1966, pp. 22, 25), investigation, experimentation, and exploration. The Laboratory School was a progenitor of what became the student-centered approach to teaching and learning that featured small-scale simulations. For example, science classes tended to be structured on the basis of creating meaning through simulations or experiments such as understanding the water cycle by using a sand table and making a river in the sand

table to see how water, elevation, and water speed affect each other. Students would experiment with how much water would affect the ways in which a river formed and changed over time. Another example of using the first-hand experience approach to learning was in the teaching of environmental science. Students would, for example, create physiographic maps using sand and clay to place geological features in proportion. These maps could be used to better understand geological processes in the region.

Dewey's Laboratory School and its practices were not without its critics. The school experienced a crisis in 1901–1902 when its enrollment decreased by 40% (Knoll 2015, p. 23). Some parents and teachers found it difficult to deal with the principal, Alice Dewey, whom they considered “cold, arrogant, and offensive” (Knoll 2015, p. 24). But more than the administration of the school, some parents found the curricular emphasis not to their liking. The core of the active learning in the school was built upon acquainting students with “occupations,” and out of this supposed real-life experience, students would master numeracy, literacy, and other important skills taught more didactically in traditional schools. The emphasis on learning seemingly simple tasks such as cooking, knitting, and weaving at the expense of traditional subjects such as reading, writing, and arithmetic was criticized by some parents and visitors (Knoll 2015, p. 24). Many of these parents who took their children out of the Dewey School enrolled their children at another progressive school:

The children switched to the nearby Parker School where the number of applications surged in 1 year by almost 70%. . . while the Dewey School experienced a decrease of about 60 students, the enrollment of the Parker School rose by 71 students. It seemed safe to say that, in October 1902, most of the Laboratory School parents and students opted for an alternative that they considered equally progressive, but financially less burdensome, curricularly less specific, and emotionally less exhausting. (Knoll 2015, p. 25)

Dewey's Laboratory School only existed for a short period of time, though the school still exists today with its name intact as a private day school. What lasting effect can an educational experiment

have if it lasted for less than 10 years and ended with both Alice Dewey, as principal, and John Dewey resigning and leaving Chicago? Dewey's short-lived experiment has value for what he tried to enact and as a model from which others can learn. On the other hand, we can ask why the Laboratory School as Dewey conceived it existed for only a short period of time and why its practices were not more widely adopted. This is a larger question too regarding Dewey's influence in educational thought.

Laurel N. Tanner gives a summary of three reasons why Dewey's ideas and the practices of the Laboratory School were not and are not more widely applied. All three reasons have to do with classroom teaching: class size, connection between interest and motivation to learn, and the focus on assessment, measurement, and standards of achievement. The Laboratory School was small, and teachers had the opportunity to work closely with students and to collaborate with other teachers to understand and enact best practice. Most public schools do not have the luxury of such small classes. In these larger classes, the teacher simply does not have the time to devote to each student in the way done in the Laboratory School. The second reason Tanner cites is the connection between interest and motivation to learn. Dewey saw this connection and built his theory and practice upon its necessity. However, particularly around the time of Dewey's death in 1952, study of motivation and interest gave way to behavioral modification, where motivation and interest are irrelevant (Tanner 1997, p. 159). The third reason is related to the previous two: Educational policies and goals at the State and national level are focused on assessment, measurement, and standards of achievement, not in fostering interest in learning or learning itself. Teachers are not rewarded for encouraging interest and motivating students to learn; rather, the focus has been on what Tanner aptly calls the “automatic learner” (1997, p. 160), a fiction wished for by many proponents of testing and accountability. Thus, Dewey's belief about the importance of interest and motivation in the psychology of learning may be given lip service by current reform initiatives, but are not important aspects of

educational reform in the last 40 years in the United States.

Even though Dewey had to resort to a departmental administrative organization of the school after an earlier more open arrangement, the curriculum and teaching did not become compartmentalized (Tanner 1997, p. xi). In Dewey's Laboratory School, what was taught, how to teach it, and how to improve both were central activities of all the teachers. Dewey believed that the skills of classroom routine, typified by the oft-cited desideratum of inexperienced preservice teacher education students to know "what to do on Monday morning," would only come in classroom practice and thus after the hard work of thinking through the logic, opportunities, and shortfalls of a particular curriculum. This is how learning occurs in a laboratory, where scientists observe and analyze and reflect upon behaviors and activities of animals, chemicals, or other sources of data, and similarly, in a laboratory school like what Dewey envisioned, teachers would become aware of their own data sources, such as the students, classroom dynamics, and the teacher's own practice and reflection upon it, among other factors at play.

What characterized Dewey's Laboratory School most was its focus upon the teacher as an intellectual leader by the example of analysis and reflection upon curriculum. The work of a teacher is first and foremost that of a curriculum theorist and practitioner. Dewey put the teacher front and center in his Laboratory School, not only as an intellectual but as a moral leader. The teacher communicated with students, parents, and other teachers, in a shared enterprise characterized by active learning and reflection.

Dewey on Democracy

Introduction

John Dewey is not known primarily as a political philosopher, but democracy was a backbone of his thinking and his philosophy of education. It is across his lifetime and his considerable body of work that Dewey articulated the entire scope of his unique democratic theory as it related to education and growth, public life and politics, and aesthetic experiences.

The earliest window into Deweyan democracy is through the now classic 1896 article "The Reflex Arc Concept in Psychology" where he dismantled the stimulus-response theory dominating the then-new science of psychology (Dewey 1896/2003). This article does not mention democracy or political life, but its import to Dewey's emerging democratic concept is now clear. In this article, Dewey is starting to deconstruct the body-mind dualisms and the individualism that has plagued western philosophy and social sciences. Dewey "conceived mind from a biological standpoint as interactive minding: exploring, navigating, reaching, grasping, making" (Fesmire 2015, 49, emphasis in original). If mind is an

embodiment of experiential inquiry rather than a machinery of internal responses to external stimuli, then “we achieve integration and coordination *through* the feedback loop of our relationships, not *despite* our relationships through exertions emanating from the spectral inner space of mind” (Ibid., emphasis in original). Dewey’s early work in deconstructing the metaphysics of western dualisms in epistemology pave the way for *Democracy and Education*, where he situates the democratic concept within processes of individual and social growth.

Democracy and Education (1916) was published after his involvement in Chicago reform movements and in the founding of University of Chicago Laboratory School. The book articulates his philosophy of education, developed after reflection on those experiences in this context of his developing pragmatism. The organization of the text itself is illustrative of how Dewey situates and envisions the democratic ideal. Dewey begins the book with the idea of learner as living organism, and education as a natural process; he explains, in subsequent chapters, the indelibly social characteristic of education, as well as the roles of communication, community, and growth. The concept of democracy grows out of this organic beginning.

Democracy is a social process. All education socializes its members, he writes, but the “quality and value of the socialization depends upon the habits and aims of the group” (MW 3, p. 77). Thus, Dewey advises, we should consider what kinds of habits and aims we should cultivate in education. We should develop criteria for these habits and aims which both aspire to “the desirable traits of forms of community life which actually exist, and employ them to criticize undesirable features and suggest improvement” (Ibid., 89).

The Criteria for a Good (Democratic) Society

In any social group, there are interests held in common, and there is interplay and cooperation between individuals. From this description of

social life Dewey derives the twin criteria, presented as questions, for the associational life in which education should be formed and fostered: “How numerous and varied are the interests which are consciously shared? How full and free is the interplay with other forms of association?” (Ibid.) Dewey has not yet uttered the word “democracy,” but is building an argument for the democratic ideal grounded in forms of associational life that he believes best promote individual and social growth. This kind of society represents a particular type of democratic ideal, one that prizes experience, participation, experimentation, and pluralistic organizational forms.

The first of two social criteria refer to shared interests among group members. Dewey uses the example of a despotic State to illustrate the importance of this criterion. In a State run by a tyrannical ruler or government, shared interests are not organically created because there is a little or no “back and forth among members of the social group,” and people are united in a common interest of avoiding the backlash of their coercive rule or government. Fear indeed unites people in the society, but only in developing their capacity to hide, stay safe, and keep silent. In a free society, however, “all members of the group must have an equitable opportunity to receive and to take from others” (Ibid., 90). These shared communications are especially essential for groups with cleavages such as distinct social classes serving to arrest individual and social growth through isolation. Isolation of individuals or groups leads to isolation of thought and communication, and as a result, stifles growth. Interaction among diverse individuals is essential to growth, adaptation, and flexible responses to life’s changing circumstances. These communications among diverse individuals create shared interests; common interests are discovered and constructed through free and equitable intercourse among members; these common interests will alter or shift over time as contexts change. Dewey’s ideal has within it Darwinian evolutionary roots, after all. And social criteria that are adaptive and flexible need not be chaotic or uncontrolled. Shared interests achieved through free associational exchange are a source of more flexible and humane social control, far

more lasting than those achieved through despotic forms of government.

The second criterion concerns the freer interaction between social groups, which allows for changes in social habits as “continuous readjustment through meeting the new situations produced by varied intercourse”. This criterion, concerned with freedom of individuals and groups, is the flip side of the first, which is concerned with discovering and communicating the common interests of the group. Groups can become antisocial, closed off, and isolated from larger society. Social classes, families, schools, or other kinds of associations quite easily lead to exclusiveness among members. It is this tendency that Dewey wishes to call out and remedy with the second social criterion of his democratic ideal. Isolation makes for “rigidity” and for “static and selfish ideals within the group” (Ibid.). Individuals must freely associate within and across groups; groups achieve growth when our associations are wide, and when our social groups are porous in boundary rather than sealed off.

It is only after establishing the two criteria for social improvement and growth that Dewey defines democracy. The “democratic ideal” here is not set up as a *telos* or ideal end derived from the wisdom of ancient Greek philosophers, or from an Enlightenment metaphysical ideal of individual rights, but from a criterion of what kind of social life is needed to create conditions for individual and social growth. Dewey’s democracy is an extension of his organic experimentalist view of nature, humanity, and social life. It has no grand epistemological or political foundations. In part this is because *Democracy and Education* is a work of educational rather than political theory, but also because Dewey’s political theory was, like his educational theory, arising from his observations of how human beings are constituted and exist in the world as living, changing, growing organisms.

A Way of Living Rather Than Processes of Governance

Dewey defines democracy here more holistically than most: “as more than a form of government;

... a mode of associated living, of conjoint communicated experience” (Ibid., 93). Dewey’s concept of democracy does not refer to any particular organizational or structural forms; that is, there is no prescription as how an organization, system, or society is to be set up or works, so long as the two criterion of common interest and free interplay of individuals and groups are met.

Deweyan democracy is not simply a political ideal but a broadly social one perfectly designed to promote growth in a diverse, changing society. Dewey saw, in his time, the “development of modes of manufacture and commerce, travel, migration, and intercommunication” (Ibid.) rapidly changing the ways in which the previously agrarian United States had functioned. Add to this description forces of social change, such as labor and civil rights movements, the rapid rise of scientific discovery, and the great expansion of State educational systems, all of which led Dewey to articulate a democratic ideal as an open, flexible criterion rather than set social standard, or organizational form. The democratic ideal is served by increasing the “number of individuals who participate in an interest” so that “each has to refer his own action to that of others, and to consider the action of others to give point and direction to his own, is equivalent to the breaking down of those barriers of class, race, and national territory which keep men from perceiving the full import of their activity” (Ibid.). Varied points of contact give a greater diversity of stimuli; they “secure a liberation of powers which remain suppressed so long as the inclinations to action are partial, as they must be in a group which in its exclusiveness shuts out many interests” (Ibid.).

Dewey’s notion of democracy is bound up in his view of how individual and social growth are best produced in a society comprised of a great diversity of individuals, classes, and groups. “After greater individualization on one hand, and a broader community of interest on the other have come into existence [in this era], it is a matter of deliberate effort to sustain them” (Ibid.). The challenge of education is to create the deliberate social effort to sustain communities of interest that can respond to challenges and grow, and adapt accordingly. As Dewey goes on in this chapter to contrast

his democratic concept with the idealism of Plato or the individualism of Rousseau, he continues to criticize the mind-body and individual-social dualisms that characterized his early work in the groundbreaking “The Reflex Arc” article. His own concept of democracy would emerge from this antidualistic thinking, and from his educational starting point of experience, growth, communication, and community life.

Democracy at Work in a Pluralistic, Evolving Political Landscape

Dewey would expand his democratic concept in *The Public and its Problems* (1927). His only book devoted to political theory was written between the Great Wars as an exploration of how the American democratic system was evolving and changing in the face of the enormous challenges: industrialization, urbanization, workers and human rights movements, world war, and growing fascism in Europe; and massive growth of capitalistic structures, producing increased production, consumption, and transit.

The context for this work was the “grave doubts about the possibilities of American democracy,” articulated in part by Walter Lippmann, “who suggested that matters of political concern had become *expert* matters” (Campbell 2008, p. 20). For Lippmann, normal citizens did not have the intelligence to decide upon the increasingly complex problems of the twentieth century. In response to this historical moment, Dewey produced *The Public and Its Problems* (1927), a book in which Dewey makes several important distinctions and expansions of the democratic ideal described in *Democracy and Education* (1916): the notion of the democratic public, the State, and the important distinctions between the two. Dewey also discusses the challenges of democratic problem-solving and association in the modern age, analysis which still largely rings true today.

Instead of beginning with such standard topics of political theory as the citizen or individual rights, Dewey starts with the primacy of the political community over the individual in public life

(Campbell 2008). Dewey defines a public by looking at the facts of human activity and their consequences. There are direct and indirect consequences to our actions. The difference between public and private is not that one is social and the other is not; many private activities are social and a conversation between two people can be public. The public also cannot be equated with “socially useful” because there are plenty of things that are public which are not useful, such as war. Instead, for Dewey “the public consists of all those who are affected by the indirect consequences of transactions to such an extent that it is deemed necessary to have those consequences systematically cared for” (LW 2, pp. 245–246).

The associational view of the citizen, and democracy itself, is central here. “Man is not merely *de facto* associated, but he *becomes* a social animal in the make-up of his ideas, sentiments and deliberate behavior. *What* he believes, hopes for and aims at is the outcome of association and intercourse” (Ibid., p. 283). There are many associational forms of our lives (family, community, etc.) but the public is unique in that it forms in light of consequences that need systematic attention; those that need “special agencies and measures [which] must be formed if they are to be attended to; or else some existing group must take on new functions” (Ibid., p. 253). “Take the education of children: the consequences of irregular, uneven, or unavailable provision of education for all children are socially negative and thus education is a process requiring some special agencies that attend to its quality and distribution.”

Dewey’s distinction between a State and a public is pragmatic. The “State is the organization of the public effected through officials for the protection of the interests shared by its members” (Ibid., p. 256). He elaborates the relationship between State and public:

The lasting, extensive and serious consequences of associated activity bring into existence a public. In itself it is unorganized and formless. By means of officials and their special powers it becomes a state. A public articulated and operating through representative officers is the state; there is not state without a government, but also there is none without the public. The officers are still singular beings, but

they exercise new and special powers. These may be turned to their private account. Then government is corrupt and arbitrary. (Ibid., p. 277)

To return to the example of education, a useful distinction between publics, State, and government can be drawn. Many western democracies began attending to the public consequences of haphazard educational provision for the young more than a century ago. Publics had emerged comprised of citizens who wished for the State to attend to those consequences through means of government-provided education. But even now, publics are still emerging to point out the shared, indirect consequences, perhaps unintended, of some schooling processes and outcomes.

One example is the standardized testing policies in the U.S. public schools; parents, students, and teachers are forming publics around the consequences of so much high-stakes testing, including the Opt-Out Movement comprised of various groups throughout many States. Through inquiry and communication over networks, these citizens communicate around their shared interests related to curriculum and assessment; they work to effectively communicate those interests to government officials responsible for testing policy in hopes that State authorizes government to administer a change to current practices.

Dewey can be seen as a forerunner to associational, participatory, and deliberative democratic theories that have gained popularity in recent decades. Though not all of these are influenced by pragmatist democratic theory, the idea that democratic governance ought to be based in the influence and evolution of citizens' associations is a common Deweyan thread running through deliberative and participatory democratic models.

Challenges and Strategies for Formation of Publics

The Opt-Out movement example shows how the relationship between publics, State, and government changes over time, and associational democracy inquiry and communication are an ever-present part of a democracy society. It is "only through constant watchfulness and criticism of

public officials by citizens can a state be maintained in integrity and usefulness" (Ibid., p. 69). The scope and function of government changes over time. A pragmatic conception of democracy is evolutionary; good government is "defined primarily through its adaptive *function* rather than through some (presumed) *essence*" (Campbell 2008, p. 22). Government must stay flexible in order to respond to the shifting times and problems faced by citizens. Publics will form around erupting problems and conditions, as the opt-out testing public has done in recent years.

But mature publics are difficult achievements, in Dewey's time and in our own. "Thus we come upon the primary problem of the public: to achieve such recognition of itself as will give it weight in the selection of official representatives" (P&P, p. 283). Dewey believed that publics were only embryonic in most places, rarely advancing to politically potent forms. Because publics were largely "inchoate" and "unorganized" in form (Ibid., p. 254), the functions of government seem further and further removed from citizens' concerns or accountability. It is a difficult challenge for citizens to communicate effectively across difference, distance, and extremely divisive political discourses to inquire into a shared problem and develop new ways of thinking about it. The development of a mature public is a democratic achievement.

One remedy for the "lost" public is the wide cultivation of shared aesthetic experiences in a democratic society. Dewey wrote *Art as Experience* (1934) as his treatise on aesthetics. Coming not long after *Public and Its Problems* (1927), the book begins with an analysis of the human experiences of art-making and art appreciation; Dewey argues in the text that these very foundational human experiences are part of communal formation. Waks (2014) takes the example of the literary arts as providing a significant communicative experience in a democratic society, connecting the aesthetic with the democratic. Following Dewey, Waks points out that the unconscious, emotional, holistic immersion into an aesthetic experience of a novel, poem, or story is a powerful part of a diverse community coming together. Art thus can help citizens reimagine and reconstruct

their societies as conditions changes and new problems surface.

All art, Dewey says, “is a process of making the world a different place in which to live, and involves a phase of protest” (LW 1, p. 272). Art grows out of the sense that existing conditions at the very least no longer excite and inspire, and involves experimentation and the search for new forms of expression, for salvation from moral arrest, and the discovery of new possibilities. Works of art both contain new worlds of experience and point forward to future social possibilities through concerted action. (Waks 2014, p. 41).

The literary arts in particular help create expressions where citizens’ individual boundaries and interests can become imagined as having intersections and common spaces. The habits of imagination and empathy created through a powerful play or oral performance can help us identify with others who are otherwise strangers; aesthetic experiences help us imagine and create the communal forms so necessary to public formation, without which State and government cannot adapt and adjust to the times of the moment.

Dewey’s democracy is a theory of adaptive reconstruction to present conditions, requiring a faith in citizens above all to imagine, inquire, and agitate. This view of democracy as a way of life, as a form of civic action in association with diverse others, has never been more relevant. The kinds of political problems we currently face demand the creative, inquiry-based responses of citizens, informed by experts, working across diverse classes, nationalities, and other identities. Deweyan faith in citizens’ abilities to associate, think, inquire, and act with intelligence – the heart of his democratic ideal – continues to inspire and challenge.

Dewey on Educational Aims

Avi I. Mintz

The University of Tulsa, Tulsa, OK, USA

Synonyms

[Aims](#); [Educational ideals](#); [Purpose of education](#)

Introduction

Throughout his oeuvre, John Dewey tackled broad questions about the purposes of education. What does education provide for society? How might education best serve individuals? Dewey’s answers to these questions about educational aims sometimes varied. In 1916, in *Democracy and Education*, Dewey wrote that “the aim of education is to enable individuals to continue their education. . . the object and reward of learning is continued capacity for growth” (Dewey 1916/1980, p. 107). In 1921, in an essay on “Aims and Ideals in Education” contributed to the *Encyclopaedia and Dictionary of Education*, Dewey again defended “growth as aim and ideal” in education (Dewey 1921/1983). In 1930, in the essay “Philosophy and Education,” Dewey wrote that “the ultimate aim of education is nothing other than the creation of human beings in the fullness

of their capacities” (Dewey 1930/1984, p. 289). And in 1938 in *Experience and Education*, Dewey wrote that the “ideal aim of education is creation of power of self-control” (Dewey 1938/1998, p. 41).

To many of Dewey’s supporters and critics, his formulations of ideal educational aims were enigmatic. In the day-to-day life of schooling, what might aiming at “growth” look like? Dewey did not present his educational ideal as an oracle, with the hope that others would revel in and work through the ambiguities of his account. He rather endeavored to explain at length the criteria for good aims generally, and good educational aims specifically, particularly in his most comprehensive work on educational philosophy, *Democracy and Education*. When Dewey was writing in the early part of the twentieth century, others were defending a variety of concrete aims of education – that schooling ought to foster discipline, or cultivate students’ personalities, or serve the State. Dewey prominently critiqued three aims in particular – nature, social efficiency, and culture (discussed below) – in order to elucidate his own conception of valuable educational aims. Before turning to his critique of those aims, Dewey’s own aims and his criteria for good aims must be considered. And his conception of educational aims was rooted in his ideas about the role of education and citizenship in a democracy, so that shall be considered next.

The Democratic Citizen and the Education Necessary for Democracy

Dewey famously argued that “democracy is more than a form of government; it is primarily a mode of associated living” (1916/1980, p. 93). For Dewey, education for democratic citizenship does not merely serve to help people acquire the literacy necessary to cast an informed vote, nor should it be training for one to advance or defend one’s narrow interests, nor should it emphasize how to submit to the rule of the majority. Rather, the democratic mode of associated living is one in which “the interests of a group are shared by all its

members, and the fullness and freedom with which it interacts with other groups” (p. 105). Education for democratic citizenship must prepare people to live well with one another, developing each person’s capacities and simultaneously laying the foundation for mutually beneficial social interaction.

Since Dewey viewed mutually enriching social interactions among the diverse groups in society as critical to the quality of life in a democracy, rigid segregation along socio-economic, religious, ethno-racial, or other lines was an obstacle to genuine democracy. Hence an education that can help develop “shared interests” among citizens will help to weaken divisions in society. Individuals, or a community of people, who view their interests as unique or in conflict with the interests of others, will exacerbate social divisions. They will also be less inclined to seek out opportunities for social interaction with other groups, and those interactions are, for Dewey, one of the best ways for a group’s interests to evolve in light of new experiences. Social interaction is necessary but not sufficient for a flourishing democracy – its citizens must additionally be inclined to observe, investigate, and inquire; in short, they must desire throughout their experiences and their lives to grow, to continue their education.

If one recognizes that the Deweyan conception of democratic citizenship requires a fundamental openness to others as a means for enabling the evolution of interest and ideals, it becomes clearer why his educational aims are somewhat obscure. For Dewey, education must not aim at any fixed, rigid end because society should not aim at any fixed end. Each individual and society as a whole must be responsive to changing circumstances. If education aims at “growth” or “to enable people to continue their education” alone – rather than some fixed end – it might create the kind of citizens who readily accommodate and adapt to new experiences and information, improving their own lives and their society. Developing the fullness of people’s capacities is, in this Deweyan framework, the ultimate ideal of education because those capacities enable people to engage intelligently with one another and with their environment. And intelligence entails a fundamental

willingness to reconsider one's beliefs and ideals in light of changes in the world. Dewey's statement that the "ideal aim of education is creation of power of self-control" is no radical departure from the aim of education as growth. Self-control is essential for intelligent engagement with others and the world – the ability to pursue some particular goal via observation and testing, in the face of distraction or obstacles. As Dewey wrote in *Democracy and Education*, "aims mean acceptance of responsibility for the observations, anticipations, and arrangements required in carrying on a function" (p. 114). A person requires self-control because, in its absence, one merely indulges impulses rather than developing capacities through the power of thinking, reasoning, and investigating. Self-control is necessary to empower people to follow through with their plans. Good intentions alone will not improve the individual or society – one needs the ability to work tirelessly, and intelligently, to achieve one's objectives.

The Criteria for Good Aims in Education

Dewey's conception of an educated person and a democratic society aligned with the criteria for good aims that he outlined in *Democracy and Education*. Dewey wrote that good aims must be (a) an outgrowth of existing conditions, (b) flexible, and (c) an "end-in-view." A good aim in education is sought because it presents some kind of resolution to a difficulty or a question that one faces. A good aim is one that is rooted in a genuine problem confronting a person; it is "founded upon the intrinsic activities and needs (including original instincts and acquired habits) of the given individual to be educated" (p. 114). The educational implication of such an aim is that it is preferable and more pedagogically effective if students are occupied with problems that relate to their lives, particularly so if students come to recognize the problem on their own and then seek its resolution. Consider the following example. Two teachers share an aim – to introduce students to fractions. One approaches the lesson by drawing a circle on the board and dividing it into eight parts. The second purchases pies for the

class, divides the class into groups, and then tasks them with dividing the pies. Both teachers have an aim: introducing fractions. To the students who find themselves in these two classes, both these aims are, to some degree, external, foreign, and therefore not good aims. Yet the pies possess the potential to appeal to students in a way that the circle on the board does not. Dewey was quite concerned about the damage of externally supplied ends which "limit intelligence because, given ready-made, they must be imposed by some authority external to intelligence, leaving to the latter nothing but a mechanical choice of means" (p. 111). However, Dewey does not require that students discover all of their aims on their own (more on that below in the discussion of "nature as aim"). Rather, teachers have, and ought to have, educational aims (in addition to the students' aims). So the question becomes, how well can a teacher connect her aims to students' aims? Doing so would require that the subject matter is actually meaningful to students (as dessert tends to be). Additionally, a good educational aim requires an environment that can be used to "liberate and to organize [students'] capacities" (p. 115) – and dividing pies might help cultivate powers of observation and investigation. Yet even better than the teacher who provides pies would be one who observes students and anchors the lesson in an object or idea in which they are interested. Perhaps the children are not preoccupied with desserts but regularly jostle over marbles. A bag of marbles can easily be substituted for pies, better aligning the teacher's aim and the students'.

The second criterion of a good aim is flexibility. At times in the pursuit of an aim, new information may arise that might cause one to alter the aim. If an aim is the outgrowth of one's conditions, the aim should be responsive to changing circumstances. If I found myself in a colder climate, I might aim to purchase a new winter coat, hat, and gloves. The aim is responsive to my needs and my environment. If I happened to receive a coat as a gift, I would revise my aim to purchase or knit only the hat and gloves. Dewey counsels that all aims are initially a "mere tentative sketch." Teachers' aims for students and students' own aims should be flexible because in the process of

working towards an aim, new information might lead one to refine or revise the aim. Furthermore, the aim must be flexible not only in that it may be revised due to changing circumstances, it must also be experimental in that it is “constantly growing as it is tested in action” (p. 112).

Dewey’s third criterion emphasizes that no aim ought to be final or complete. Indeed, Dewey suggests that we would better think of an aim as an “end in view.” There is no final resting point when we achieve an aim. We are always faced with new information, new ideas, and new challenges because interaction with other people and the world at large will always present us with infinite variety. The student who successfully achieves the aim of learning about combustion in a science class, for example, is not finished. Her goal was “but a phase of the active end. . . a ‘freeing activity’” that better enables her to pursue further goals (p. 112). Dewey argued that “an end which grows up within an activity as plan for its direction is always both ends and means. . . Every mean is a temporary end until we have attained it. Every end becomes a means of carrying activity further as soon as it is achieved” (p. 113).

Dewey’s articulation of the aim of “growth” or further learning meets this criterion because it is not “general” or “ultimate” in that it entails no final accomplishment. Growth and further learning are aims *in* education because they arise out of the students’ and teachers’ activities and are responsive to those activities. He pointed out that education itself, an abstract concept, has no aims; rather teachers, parents, and other people have aims. “Final” aims *of* education, imposed externally on students or schools, will be less likely to connect meaningfully to the students’ and teachers’ experiences. Dewey dwells on his contemporaries’ rival aims *of* education to demonstrate how, when pursued exclusively, they cultivate only a limited range of capacities. Those final aims, however, are not fundamentally misguided, but rather simply too exclusive, too narrow: “One statement of an end may suggest certain questions and observations, and another statement another set of questions, calling for other observations. Then the more general ends we have, the better” (p. 117). Thus, for Dewey, the

aims *of* education that others defend are really compatible. Each aim *of* education – articulated by a particular person or community – is a response to a real or perceived need in a situation. Such aims, therefore, are valuable, as long as they are not conceived of and sought exclusively, at the expense of neglecting other worthwhile aims. Dewey’s critique of nature, social efficiency, and culture as aims helps to make this point clear.

Nature, Social Efficiency, and Culture as Aims of Education

Dewey’s emphasis on “growth” as an educational aim, and the importance of students cultivating the kind of disposition in which they seek to further their education, in school and outside of school, led some of his readers to interpret him as saying that what students learn is unimportant. These readers thought Dewey proposed that teachers should allow students to grow, to become lifelong learners, by discovering their passions and following their interests. Indeed, some of the child-centered, progressive educators whom critics associated with Dewey did believe that teachers must allow students the room to pursue whatever ideas arose out of their circumstances and activities. They believed that students were naturally curious and that students learned naturally and effortlessly in whatever environments they found themselves. Provide students with a rich, stimulating environment and teachers could, to some degree, simply get out of the way and let students’ natures guide them.

“Nature” as an educational aim, for Dewey, captures many important facts about the process of education. Education indeed ought to make the most of students’ natural capacities and interests. But Dewey finds that this educational aim limits the student: “merely to leave everything to nature was, after all, but to negate the very idea of education” (p. 99). There is indeed a strong role for the Deweyan teacher and the curriculum, both of which prepare students for productive engagement with others and their world. Dewey dismisses the idea that the kind of citizen he envisages could arise out of a fundamentally

individualistic education as defended by the “nature” as aim advocates. Dewey’s conception of democratic citizenship emphasizes social interactions and developing shared interests. “Nature” as aim is helpful in that it encourages educators to focus on the capacities of the child, but limited in that nature does not supply the ends of children’s development (pp. 120–121).

Social efficiency as aim errs on the other extreme. Rather than failing to consider how education ought to prepare a student for their broader contribution to and interaction with society, social efficiency as an aim prioritized the State over the individual – that is, the efficient State is one in which schools primarily prepare people for their role in society. The social efficiency advocates of Dewey’s day called for vocational education, among other things. Dewey thought that social efficiency was indeed valuable in that every person who maximizes their potential and finds a place to contribute to their society generates greater social efficiency. But social efficiency as an exclusive educational aim denies the student an opportunity to develop her capacities and interests and would limit the contact between different groups in society.

The proponents of “culture” as aim argued that an individual flourishes via an encounter with the preeminent products of human civilization – great literature, art, and history, for example. Dewey appreciated the recognition that schools should very much introduce students to the great products of human civilization and that these encounters could help students develop their own capacities and interests. However, he worried that culture as an aim *of* education implied a remote curriculum, one that failed to engage students’ interests adequately. Failing to engage their interests, it would fail to expand their interests, and fail to cultivate their capacities for inquiry.

Yet “culture” understood more robustly was indeed worthwhile. A person who productively makes use of the vast riches of culture in her encounters with others is cultured. Culture is fully compatible with nature as aim, because only when a person draws on her interests will she make the best use of a community’s cultural inheritance, and encounters with that cultural inheritance expand her interests. And this sort of

person will utilize her skills and interests to secure social efficiency in that she will be a productive citizen. Thus nature, social efficiency, and culture (and other aims *of* education) are all theoretically compatible, as long as they respond to students’ genuine concerns and are not treated as exclusive.

Conclusion

Dewey’s educational ideal – whether he formulated it in terms of growth, further learning, or self-control – is rooted in a conception of democratic citizenship in which every person has the opportunity to reach her potential and develop varied interests. Each person contributes to society by finding and making use of her unique talents. And she continues to expand her interests and capacities through meaningful interactions with other citizens. The pedagogical implications of such an ideal entail rich experiences in which the student never simply indulges interests but rather observes, inquires, and questions – always growing, always learning.

Introduction

Dewey's philosophy of education reflected his belief that schools could be progressively reorganized through the use of science. For Dewey, education and science are united by the centrality of experience and the importance of inquiry. While education must incorporate and reconstruct human ends and values, science can contribute knowledge of the relations between means and ends and thereby afford greater precision and control in the planning and execution of curriculum, instruction, and school administration. Science can also furnish, in its generalized method, one of the most important goals for teaching and learning.

Dewey's Pragmatic Conception of Science

Science, for Dewey, exemplifies a general trust in experience as the source of knowledge combined with technologies of observation and the control of parameters. "The distinctively intellectual attitude which marks scientific inquiry was generated in efforts at controlling persons and things so that consequences, issues, outcomes would be more stable and assured" (LW 1, p. 105). In Dewey's conception, science is participatory and democratic, reflecting a commitment to inquiry in the service of securing human values and desired ends. It goes beyond any particular scientific discipline or content, but instead represents a general

method or approach to thinking. The "scientific method . . . represents the only method of thinking that has proved fruitful in any subject. . . . It *is* thinking so far as thought has become conscious of its proper ends and of the equipment indispensable for success in their pursuit" (MW 6, p. 78). Because of this general utility across the wide variety of problematic situations, the general method of science is used whether or not the knowledge generated by the disciplines of science is applied or not.

Dewey's conception of commonsense inquiry is a broader application of the methods of science to human problem solving. Inquiry begins when an obstacle in ongoing routines is encountered. Action is interrupted and reflection ensues. The situation is examined and the problem or problems are defined. The situation's "inner active distraction, its elements at odds with each other, in tension against each other, each contending for its proper placing and relationship" (MW 2, p. 328) is identified, thus defining a problematic situation. Inquiry is the process of working toward "the restoration of a deliberately integrated experience from the inherent conflict into which it has fallen" (MW 2, p. 336). In this process, facts are identified and knowledge of the possible consequences of these facts – taken from prior experiences – is used to make inferences about what must be done in order to resolve the conflict. The validity of those inferences is determined by whether the problem is solved (and the situation harmonized) when these actions are implemented.

Science follows the very same structure, except it typically aims to produce scientific knowledge rather than merely solving a particular problem. This knowledge has a particular role in human affairs. Scientific "knowledge contributes. . . the possibility of intelligent administration of the elements of doing and suffering. . . . When there is possibility of control, knowledge is the sole agency of its realization" (LW 1, p. 29). Science is "a search for those relations upon which the *occurrence* of real qualities and values depends, by means of which we can regulate their occurrence" (LW 4, p. 83). Science is able to reveal the connections or relations between things by stripping away the qualities of immediate

experience and abstracting things in their general or idealized nature as objects of thought, as signs and indicators of those relations and the consequences that may ensue.

When they are found to be stable correlations, relations between facts and consequences may be considered the *laws* of science. “These are the formulations of the regularities upon which intellectual and other regulation of things . . . depends” (LW 1, p. 117). Such regularities are also *methods* which represent “power to use a given fact as a sign of something not yet given” and they extend the “ability systematically to enlarge control of the future” (MW 10, p. 15). Through science, “otherwise disconnected” events are connected “into a consecutive history” (LW 1, pp. 112–113) of meaning. These histories allow causes to be inferred (LW 2, p. 361). With such inferences, generalizations taken from past experiences can be applied to the systematic understanding of the possibilities of present and future experience.

Science improves “our capacity to apply intelligence successfully: to produce, adapt, adjust, accommodate, achieve, institute, identify, order, discriminate, and to ‘resolve’ problems in many other sorts of ways” (Manicas 1998, p. 50). Science can also help us avoid the unpredictable effects of self-interest, passion, laziness, and the biases of tradition or false expectations – which may be especially likely in situations that are social, such as education.

Towards a Science of Education

Dewey brooked no sharp divisions between different arenas of human endeavor, so his conception of science applies both in arenas clearly demarcated as “scientific” (such as the physical sciences) and also in areas of life that seem remote from science. Science as an experimental method, for Dewey, provides the surest way toward solving problems no matter the situation (LW 1, pp. 351, 372). “If the pragmatic idea of truth has itself any pragmatic worth,” he wrote, “it is because it stands for carrying the experimental notion of truth that reigns among the sciences, technically viewed, over into political and moral

practices, humanly viewed” (MW 6, p. 31). Thus, science surely has a role in education, as well.

Dewey defines education as “that reconstruction or reorganization of experience which adds to the meaning of experience, and which increases ability to direct subsequent experience” (MW 9, p. 76). Experience is educative if it results in an expansion of meaning and deepened capacity to grow. Teachers and others who work in schools are consciously working to expand the meanings and contribute to the growth of students. In this effort, they need to use all of the resources available to them, including the findings and methods of science, especially the “human sciences that are sources of the scientific content of education.” But “biology, psychology, and sociology . . . are relatively backward” when compared with the physical sciences (LW 5, p. 20), due in part to what Dewey saw as a “retarded knowledge of human nature” (LW 2, p. 358). Despite this – and while advocating increased attention to social science research – Dewey believed that the application of the human sciences in education can result in better control of educational situations, promote improvements in school functioning, and allow for a greater variety of approaches to teaching and learning in different situations (Seals 2004). This possibility motivated Dewey’s attention to what he called “educational science.”

The primary difference between education as an arena of human endeavor and something like physics is sheer complexity. “There is no educational practice whatever which is not highly complex; that is to say, which does not contain many other conditions and factors” beyond just the immediate situation of teaching or learning (LW 5, p. 9). This can be contrasted especially with laboratory experiments, where it is possible to create an idealized situation controlling extraneous variables so as to isolate specific parameters for close study. Educational contexts, on the other hand, potentially involve the influence of all of the students’ prior experiences and everything in his or her environment. For this reason, “educational science cannot be constructed simply by borrowing the techniques of experiment and measurement found in physical science” (LW 5, p. 13).

In the physical and experimental sciences,

The control of conditions demanded by laboratory work leads to a maximum of isolation of a few factors from other conditions. The scientific result is rigidly limited to what is established with these other conditions excluded. In educating individualities, no such exclusion can be had. The number of variables that enter is enormous. The intelligence of the teacher is dependent upon the extent in which he takes into account the variables that are not obviously involved in his immediate special task. Judgment in such matter is of qualitative situations and must itself be qualitative (LW 5, p. 33).

As qualitative, educational situations cannot ever be completely standardized. Thus there can be no simple rules of educational practice derived from the findings of science.

But this doesn't make scientific findings irrelevant. "Material drawn from *other* sciences furnishes the content of educational science when it is focused on the problems that arise in education" (LW 5, p. 18). In sum, "the sources of educational science are any portions of ascertained knowledge that enter into the heart, head and hands of educators, and which, by entering in, render the performance of the educational function more enlightened, more humane, more truly educational than it was before" (LW 5, p. 39).

Of course, just because a finding is "ascertained" or deemed "scientific" does not make it necessarily relevant to education. Scientific investigations made outside of the educational situation *may* provide guidance to the educator, or may not. "Practice alone can test, verify, modify and develop the conclusions of these investigations" (LW 5, p. 17). Dewey emphasized that the educator, in his or her role as practitioner working in the context of ongoing education, is in the best position to gauge the value of any given scientific finding. "To suppose that scientific findings decide the value of educational undertakings is to reverse the real case. Actual activities in *educating* test the worth of the results of scientific results. They may be scientific in some other field, but not in education until they serve educational purposes, and whether they really serve or not can be found out only in practice" (LW 5, pp. 16–17).

Scientific results play their primary role in directing the educator's "*attention*, in both observation and reflection, to conditions and relationships which would otherwise" be missed (LW 5, p. 15). The value "resides in the enlightenment and guidance [science] supplies to observation and judgment of actual situations as they arise" (LW 5, p. 15). Its "value for educational practice – and *all education* is a mode of practice, intelligent or accidental and routine – is indirect; it consists in provision of *intellectual instrumentalities* to be used by the educator" (LW 5, p. 14). Elsewhere, Dewey specifies these intellectual instrumentalities as "those concepts, general principles, theories and dialectical developments which are indispensable to any systematic knowledge [and are] shaped and tested as tools of inquiry" (LW 2, p. 362).

Research in Practice

Scientific knowledge is the best protection available against the dangers to knowledge mentioned above, including laziness and bias. By offering "a patient and prolonged apprenticeship to fact in its infinite variety and particularity" (MW 12, p. 99), science can counter bias and other enemies of truth. Of particular concern to Dewey was bias that was social or traditional in origin. To defend against that, he applauded Francis Bacon's call for "the organization of cooperative research, whereby men attack nature collectively and the work of inquiry is carried on continuously from generation to generation." Bacon's "great positive prophecy of a combined and cooperative pursuit of science...characterizes our present day" (MW 12, p. 100).

Dewey also supported more localized research, and is often cited as an originator of the concept of action research, in which a practitioner studies his or her own practice in order to "change practices, people's understandings of their practices, and the conditions under which they practice" (Kemmis 2009, p. 2; see also Greenwood and Levin 1998). Dewey wrote about "the method of intelligence," which is the application of the scientific method (or, more broadly, reflective thinking) to practice.

A man is intelligent not in virtue of having reason which grasps first and indemonstrable truths about fixed principles, in order to reason deductively from them to the particulars which they govern, but in virtue of his capacity to estimate the possibilities of a situation and to act in accordance with his estimate. In the large sense of the term, intelligence is as practical as reason is theoretical (LW 4, p. 170).

Through apprehending educational possibilities and estimating them in the light of shared values, the educator can apply his or her intelligence, judgment, and knowledge to setting up “conditions favorable to learning” (LW 3, p. 267). When observation of the consequences of these conditions is reflected back into the ongoing practice, research and practice become joined. The knowledge generated in practice is then applied to practice and thereby tested and further refined in a process that Schön (1983) referred to as an “epistemology of practice.”

As knowledge relevant to educational practice is generated in an ongoing cycle of action and reflection, it begins to cohere into a system of facts and laws. This is so-called educational science. It is important to understand that this emerges from practice and isn’t just imposed from outside. In Dewey’s view of education as growth, attention to both the general conditions in favor of learning *and* the particular needs and interests of each individual student must determine the educator’s actions. “Operating under the auspices of Dewey’s ideas, both researchers and teachers contribute materially to the logic or methodology of the science of education: the former formulating universal ways of acting on which teachers can depend, the latter fashioning methods by which those universal ways of acting may be applied to particular instances of instruction” (Seals 2004, p. 24). Science helps render “those who engage in the act more intelligent, more thoughtful, more aware of what they are about, and thus rectify and enrich in the future what they have been doing in the past.” But the science has to take account of the educator’s “own ideas, plans, observations, judgments. Otherwise it is not *educational* science at all, but merely so much . . . information” (LW 5, p. 39).

The Teacher as Investigator

On this conception of educational science, the classroom teacher is both a “connoisseur” of research (Seals 2004) and a researcher (Grumet 1990). “If teachers are sufficiently alert and intelligent, they go on to notice conditions of the same general nature, but more subtle, and set a problem for further more refined inquiry” (LW 5, p. 19). One of the sections of Dewey’s *Sources of a Science of Education* is labeled “The Teacher as Investigator” (LW 5, p. 23). This role is critical, as teachers are “the ones in direct contact with pupils and hence the ones through whom the results of scientific findings finally reach students. They are the channels through which the consequences of educational theory come into the lives of those at school” (LW 5, p. 24). Without their assessments of what these consequences are, there can be no improvement in educational science.

Also of central importance to Dewey was his belief that one of the most valuable outcomes of inquiry is the discovery of “what values are worth while and are to be pursued as objectives” (LW 5, p. 38). This applies especially to educational inquiry. Dewey was particularly bothered by the setting up of “a fixed and final set of objectives, even for the time being or temporarily. Each day of teaching ought to enable a teacher to revise and better in some respect the objectives aimed at in previous work” (LW 5, p. 39). Dewey is concerned that if teachers are seen merely as “channels of reception and transmission” for subject matter objectives that are determined outside of the actual educational situation, teaching itself will be conceived as following predefined procedures or rules, with standardized goals or methods formed without regard for “personal potentialities” (LW 2, p. 360). Such a limited conception of teaching misses the opportunity to address the actual students in any given educational situation, or to resolve their actual problems.

Readymade objectives reduce the teacher to technician rather than investigator/researcher. They ignore the teacher’s intimate knowledge of the actual situation and devalue his or her capacity for “constructive imagination and invention”

(LW 5, p. 29) and the possibility of “suggesting new ends, new methods, new materials” (LW 5, p. 30). Allowing for objectives to be worked out – or at least modified – in the context of practice respects the capabilities not only of the teacher, but of the student as well. It also ensures that teachers and students can respond to whatever factors in the situation are relevant, whether they can be predicted in advance or not.

Of particular worry to Dewey was the tendency of people outside of the classroom to believe that what goes on within the classroom could be adequately assessed and thereby controlled by the standardized measurement of prespecified outcomes (Seltzer-Kelly 2008). For him, that which is measured can *never* be taken as the whole of the outcome of education. More important than “forming specific skills and acquiring special bodies of information” were the “*other* things in the way of desires, tastes, aversions, abilities and disabilities [that the student] is learning along with his specific acquisitions” (LW 5, p. 33). Only an observant teacher who knows his or her particular students is in a position to assess these collateral outcomes and make adjustments for the benefit of the students.

The parent and educator deal with situations that never repeat each other. Exact quantitative determinations are far from meeting the demands of such situations, for they presuppose repetitions and exact uniformities. Exaggeration of their importance tends to cramp judgment, to substitute uniform rules for the free play of thought, and to emphasize the mechanical factors that also exist in schools. They contribute at most to the more efficient working of present practices in some subjects. . . . But they do not give any help in larger questions of reconstruction of curriculum and methods. What is worse, they divert attention and energy from the need of reconstructions due to change of social conditions and the inertia of the school system (LW 5, pp. 33–34).

In the final analysis, Dewey’s conception of the science of education is rooted in his democratic faith in the intelligence and resourcefulness of all persons, especially teachers who are entrusted with the education and care of the next generation. By granting these teachers the autonomy as well as the responsibility of research-practitioners,

education can be continuously improved for the benefit of all.

Dewey on Ethics and Moral Education

Douglas J. Simpson

Texas Christian University, Fort Worth, TX, USA

Texas Tech University, Lubbock, TX, USA

Introduction

John Dewey's views of ethics and moral education, like his democratic ideals, arise in part from his naturalistic and pragmatic philosophy. In turn, he integrates these ideas with his political and educational philosophy, creating a picture of the means to and the nucleus of a good life. This life is tied to what he (1937/1987, p. 298) deems "the fundamental principle of democracy": "the ends of freedom and individuality for all can be attained only by means that accord with those ends." His (1916/1980, p. 370) idea of a good life is marked by an intensified and expanding consciousness that enjoys "a continual beginning afresh." Likewise, this life involves a deep-seated interest in the common good that entails addressing a web of interconnected philosophical, scientific, economic, social, political, and educational concerns. More than, perhaps, most pragmatists, he offers the advantages and challenges of a nuanced system of thought as he reconstructs the meanings of many philosophical and educational questions and concepts (Menand 2001; Pappas 2008). Because his ideas regarding ethics and moral education overlap, they are discussed, sometimes simultaneously, under the headings: Broad Fields of Inquiry, A Moral Science, Educators and Learners and Problematic Ethical Situations.

Broad Fields of Inquiry

Dewey (1916 1980, 356–357; 1922 1983, 220–222) thinks ethics is a broad field of inquiry that may examine any question that bears upon human interactions, not a narrow inquiry that focuses on identifying and justifying

transcendental moral standards. Hence, there is hardly any human relationship that is outside the scope of ethics and moral education, because each is concerned with questions regarding the wellbeing of individuals and groups (Dewey and Tufts 1932 1985, pp. 230–231). The scope he gives ethics and, thereby, moral education is rooted in his belief that human nature includes social propensities and, therefore, moral experiences with others. Ethics and moral education, as well, are concerned with warranted or merited knowledge claims. Therefore, the regulative or normative force of statements is a focal point for him. Recommending standards – whether epistemically or behaviorally – ought to be based on cogent data and reasons that emerge from open inquiries. Free inquiry and its allied values are key elements of a liberal democratic society and its educational institutions are primary safeguards of reflective moral theory, moral education, and an ethical life (Dewey 1916/1980, pp. 343–355).

Building on ethical inquiry and the science of education (Dewey 1929/1984b, pp. 1, 40), moral education is a wide-ranging area of both research and practice which includes formal moral education and everyday interactions (Dewey 1916/1980, pp. 356, 370). As a field of inquiry, moral education is concerned with identifying and fostering effective and ethical ways of promoting moral growth. As a field of practice, moral education is interested in providing the conditions for teaching and learning, including but going beyond the personal qualities of open-mindedness, tolerance, fairness, and cooperation (Dewey 1916/1980, p. 366). Any normative value claim that emerges from ethics and moral education is an instrument that informs efforts to make worthwhile differences in the lives of individuals and groups. Stated differently, ethical prescriptions and prohibitions that emerge from research and deliberation ought to promote the betterment of individuals and society. He thinks anyone – e.g., educators, politicians, social workers, and economists – who contributes to the theoretical development of ethics and moral education is at least partially responsible for the differences her ideas and interventions generate (Dewey 1933/1986, pp. 137–138).

Theory, inquiry, and education, consequently, are not merely manifestations of reflection; they are instruments to be employed for social justice (Dewey 1922/1983, pp. 15–20). Those involved in the development and implementation of policies and practices concerning education ought to identify and evaluate their contributions to a good life. They should evaluate outcomes to determine how laws and policies impact the lives and experiences of children and families, which ideas and practices work for the common good and when and how ideas and their applications influence equitable opportunities. To do less, Dewey indicates, is irresponsible, because such indicates that the common good is not really a matter of public interest (Dewey 1922/1983, pp. 155, 170).

A Moral Science

For Dewey, the field of ethical inquiry constitutes a moral science that emerges from transdisciplinary investigations, e.g., philosophical, psychological, sociological, biological, and educational. Inquiry should be characterized by rigorous or scientific practices: observation, exploration, reflection, experimentation, evaluation, modification, and reapplication (Dewey and Tufts 1932/1985, pp. 179–185). The warranted knowledge claims that become apparent during these investigative processes may gain greater security (Dewey 1929/1984b, pp. 106–107) and, thereby, applicability as the bodies of knowledge expand. Knowledge claims that are repeatedly tested and confirmed over decades or generations may yield empirical generalizations, relational universals, and widespread epistemic agreement (Dewey 1920/1982b, pp. 256, 277). A very high degree of warrant for knowledge claims may result in certainty and truth statements, but all assertions are qualified and revisable since all knowledge is partial and fallible (Dewey 1925/1984a, pp. 11, 13).

The connection of scientific knowledge development to ethics, education, and moral education is pivotal. The evolutionary nature of schools and communities, Dewey thinks, indicates the need for ongoing inquiry into the multiple conditions, changes, and continuities that relate to moral

theory, applied ethics, and moral education. An understanding of the dynamic nature of society and the growth of knowledge, however, requires more than a traditional understanding of ethics and moral education. The scope of these fields also encompasses, for instance, a need for growing bodies of understanding about human diversity, desires, and collaboration; familial development; economic planning; and political integrity (Dewey 1916/1980, pp. 310, 315). Democracy demands, if Dewey is correct, that the rigorous reflections, inquiry, and experiments that go into this transdisciplinary research be open to public scrutiny and evaluation and that the discoveries be communicated effectively to all segments of society. Parents, educators, coaches, religious leaders, and health care professionals should be recipients of and contributors to accessible and relevant research (Dewey 1933/1986, pp. 157–158).

Ethics, then, involves exploring and critiquing past, present, and prospective associations of individuals and groups to determine how social-moral interactions have been, are and may be used for personal and social enhancement. In addition to the discoveries and the clarifications of other fields, history enlightens ethical development and education too: it allows researchers to look back through more impartial lens, ask questions, and suggest hypotheses for study (Dewey 1901/1990, p. 318). Historical inquiry may also draw more of the general public – a critical aspect of democratic engagement – into disputes. But studying ethics is more than seeking to gain an intellectual grasp of logical arguments, scientific data, and associated theories. Learning also involves attitudinal and behavioral change and, thereby, affects a person's reflections, affections, and actions (Dewey and Tufts 1932/1985, pp. 269, 271).

Educators and Learners

Moral educators, whether in educational institutions or community entities, may wish to make learners aware of at least three educational expectations. First, the fact that learners will examine

issues and have experiences that could result in a reconsideration of their beliefs and behaviors is important. Education is deeply and intrinsically interested in change that adds value to life. Second, making clear that moral growth entails more than mere change is necessary. Educative growth is both immediate and prospective and involves growth experiences that open windows of seeing and doors of doing in the present and create abilities and habits that enable continued growth in the future (Dewey 1916/1980, pp. 46–58). Third, understanding that democracy, education, and morality are largely inconceivable without open inquiry and that it is the ethical lynchpin that cultivates freedom of thought underlines the importance of everyone being a reflective learner (Dewey 1903/1977, pp. 230, 228–239). Hence, “respect for freedom of intelligence” must be defended as well as utilized (Dewey 1946/1990, p. 473).

An understanding of the complexities of ethics and moral education also necessitates a rethinking of antiquated and counterproductive beliefs and practices (Dewey 1922/1983, pp. 43, 59). First, for instance, custom should carry little if any epistemic weight when one decides on the merits of moral assertions or practices, such as when dualistic beliefs lead to bifurcations in understanding the student and moral education (Dewey 1916/1980, pp. 357, 370). Second, traditional moral theory – like any field – is mistaken at times. Identifying supreme ethical principles or ends (e.g., good, right, or virtue) that are supposed to drive all ethical thinking and decision-making is an example. Also, precise ethical principles (e.g., respect and honesty) may need reconstruction or rejection in particular circumstances (Dewey and Tufts 1932/1985, pp. 232, 275–283). Third, the idea that moral development is merely a natural phenomenon is simplistically wrongheaded. Likewise, development is not a lockstep set of cognitive stages (Dewey 1916/1980, pp. 59–74, 118–130). Fourth, questions concerning human nature go beyond issues related to reasonableness, intention, choice, and self-control and extend to how, why, and in what conditions some people learn and others do not. Moral education, finally, is distorted and

ineffective if it concentrates principally on teaching concepts, communicating information, instilling rules, and implanting values (Dewey and Tufts 1932/1985, pp. 132–145).

Dewey (1938/1988a, pp. 31–47), therefore, thinks that understanding ethics both intellectually and experientially is an ideal worth pursuing. Understanding the import of human impulses, desires, plans, and purposes is also a crucial aspect of ethical and educational theory and practice. Otherwise, neither learners nor educators will understand the importance or the process of converting impulses into desires and transforming desires into considered purposes and plans. More pointedly, the person who fails to appreciate the robust role played by human impulses and desires will fail to comprehend the process of effectively teaching others. Guiding instinctive tendencies and cultivating informed desires into personally and socially productive purposes and activities entails elements of both moral development and education. Yet, educating a person morally has particular characteristics that nurturing, fostering, guiding, and developing may or may not incorporate.

A person may develop through casual enculturation; a guide may lead without giving attention to habit formation; a coach may focus almost exclusively on fostering abilities and skills; a parent may nurture caring while employing contradictory means. An educator, however, has responsibilities that are distinctively educational (Simpson et al. 2005). She, while developing, nurturing and guiding, is concerned with educational methods and aims; she has ends in view that are frequently different from casual acquaintances and parents. If she concurs with Dewey, she understands that student characteristics (including their impulses and desires, strengths and weaknesses) are connected to her educational effectiveness. She also knows which existing classroom conditions (e.g., technological, material, procedural, social, human) inhibit moral understanding and growth and which new conditions need to be added to expedite moral growth. She constructs classroom activities and conditions that facilitate educative experiences. She gains student participation so that they become engaged

in thinking ethically and making ethical decisions about live situations, not about artificially designed problems. She promotes an understanding and utilization of ethical problem solving skills so that students learn transferable attitudes, methods, questions, and habits. She embeds educative experiences in her democratic learning communities; and she demonstrates that each person's opinion is worth hearing and enhancing. By the same token, she provides information and provocations as she engages students about the application of ethical principles, the importance of developing virtues, and the values of a reflective democracy. She stretches student understanding by introducing ideas and controversies, previously outside of but on the cusp of most students' experiences, and incorporates their knowledge into the informal curricula to enrich the formal epistemic, aesthetic, ecological, and pedagogical curricula (Simpson 2011).

Dewey adds another pedagogical task: facilitating learners' change in attitudes, dispositions, and behaviors. This task reconnects with an earlier point about the cycle of learning (Dewey 1901/1990, pp. 213–225). In short, the educator is obligated to see that intellectual understanding is supplemented by experiential understanding, which may be secured by actual experiences and simulated ones by means of dramatic rehearsal, a hypothetical examination, and deliberation of an impending decision (Fesmire 2003, pp. 69, 91). Educators can foster holistic change by acting on the knowledge that most students are immediately sympathetic to the practical problems and pains of others and that they can easily become empathetic with others, seeing into their experiences as they feel for them (Simpson and Sacken 2014). Sympathy, then, can begin a reaction that adds empathetic insights and, thereby, helps transform itself into intelligent sympathy. Educators can nourish sympathy and empathy as they guide students' everyday interactions. According to Dewey (Dewey and Tufts 1932/1985, pp. 297–303), the flow of moral education is intrinsically a part of formal and informal education, and all social and educational experience and is potentially moral education. Thus, three

complementary sciences – ethics, moral education, and education – can collaboratively contribute to the moral growth of students and societies.

Problematic Ethical Situations

Another aspect of moral education is students' learning how to analyze and evaluate problematic ethical situations (Dewey and Tufts 1932/1985, pp. 280, 291). Dewey rejects the idea that ethical problem solving is largely or exclusively a matter of (a) intuiting a higher good, (b) using ethical principles to conclude moral thinking, (c) collecting data which lead to the identification of persons who exhibit virtues, (d) ascertaining the satisfaction level of concerned parties, or (e) examining data to uncover good or bad consequences. Dewey notes that each problematic ethical situation is unique and that its good is determined by the situation as a whole (Dewey and Tufts 1932/1985, pp. 275, 280–281). The perception of virtuous behavior, application of ethical principles, collection of relevant facts, maximization of satisfaction, and identification of particular consequences usually provide significant insights, but inquiry into a particular situation is necessary too. The desires and intentions, actions and reactions, conditions and contexts, and disvalues and goods in the situation need to be understood too. Questions may include: What exactly are the problems to be addressed? Who disclosed an attitude of disregard for the interests of others? Were there voices for the common good? Which interactions revealed the greatest tensions? Who were the primary influencers of behavior? Was there a dominant quality in the situation? How do these considerations promote problem-solving abilities?

Because each problematic ethical situation is unique, it requires a fresh analysis and evaluation, not a reflexive judgment. Because there are important epistemic and ethical continuities in each situation, ethical analyses are informed to some degree by existing bodies of experimental and experiential understanding. Reflectively using these continuities to analyze unique situations better enables educators and learners to address

new experiences and, ideally, to modify thinking and behavior (Dewey 1916/1980, pp. 4–5, 335–336; Dewey 1938/1988a, pp. 13, 20, 25, 31). Even though problematic ethical situations produce tensions and anxieties, moral growth would be less likely without disconcerting factors. Disequilibrium nurses reflection, decision-making, and moral growth. Thus, those examining problematic situations should investigate contributing conditions and subtilize their conclusions regarding particular situations. Among the assorted conditions that ideally contribute to particular situations are democratic beliefs, methods, and practices (Dewey 1938/1988b, pp. 136–155).

Democratic conditions encompass but are not limited to means that promote, sustain, and appraise civil freedoms, social justice, fraternity, and peace (Dewey 1916/1980). Likewise, conditions that cultivate government impartiality and accountability, corporate openness and social responsibility, personal curiosity and open-mindedness, political and economic intelligence, and institutional equity are educative means that help answer the questions: What kind of person do I wish to become? What kind of society and world do I want to help construct? The kind of self or person Dewey hopes will inherit and advance democratic means, ends, and qualities needs both the conditions that facilitate a dynamic and deep democracy and the dispositions and habits that promote democratic thought and action (Dewey 1920/1982, pp. 172, 186; Dewey and Tufts 1932/1985). An initiation into reflective democratic thought and practice, therefore, is a part of moral education and may occur in nearly any problematic ethical situation, whether found in the home, school, theatre, museum, park, alley, or stadium. Each person and entity is inescapably a moral educator. The ecological moral curricula include ordinary as well as extraordinary interactions. A challenge of society is to plan, create, and evaluate educative experiences so that informal and formal and unintentional and intentional activities and endeavors more readily result in an intensified consciousness that fosters personal and social-moral growth.

Conclusion

Dewey's approach to ethics and moral education – and the science of education – is comprehensive in the sense that these fields may engage any ethical question that has a bearing on the promotion of individual betterment and the common good. Each is a broad transdisciplinary field of inquiry or science that stimulates deliberation on both theoretical and practical problems. Ethics is often, perhaps, somewhat more theoretical while moral education is frequently somewhat more practical. But researchers and educators in each field should seek to influence the reflections, affections, and actions of people who benefit from and contribute to the wellbeing of one another. Correspondingly, researchers and practitioners should shape laws, policies, structures, and processes that foster ethical reflection, moral education, and educative experiences. More inclusively, Dewey (1938/1988b, p. 155) asserts that the duty of everyone who believes in “the intrinsic moral nature of democracy” and in democracy as “a way of life” is to realize experientially that democracy is “a way of personal life” that “provides a moral standard for personal conduct.” In this way, the cycle of learning and living will be completed, episodically and continually.

Dewey on History and Geography in Education

Scott L. Pratt

University of Oregon, Eugene, OR, USA

Introduction

In this 1897 pamphlet, *Ethical Principles of Education*, the subject areas of geography and history are introduced as examples of how the aims of education intersect with the division of the “facts” to be taught. In contrast with the received conception of geography as “a description of the Earth’s surface,” Dewey proposed that geography had “to do with all those aspects of social life which are concerned with the interaction of the life of man and nature.” History, he declared, was valuable to the extent that it affords “insight into what makes up the structure and working of society.” By 1916, in *Democracy and Education*, Dewey’s account of the value of geography and history appears to have transformed from a school-based study of social interactions relevant to local concerns to an instrument in service of education’s progressive “civilizing” mission. In the years following, geography disappeared as a topic in Dewey’s discussions of education. History, however, continued to be an important theoretical concern and became an essential part of Dewey’s theory of inquiry.

Maps, Narratives and the Importance of Boundaries

Geography and history were of central importance in Dewey’s vision of school curricula. Geography, in his view, was the study of human environments, the material connections that sustain human life and culture, while history was the study of human connections. Despite their differences, however, “these are only emphases in a common topic, namely, the associated life of men” (MW 9, p. 218) (Citations of Dewey’s works are to his 38-volume collected works: *The Early Works*

(EW), *The Middle Works* (MW), and *The Later Works* (LW), published as Dewey 1969–1990). Together the subjects served as the link between individual experience in the context of local, experienced problems and the abstract, problem-solving resources of the sciences.

In *Ethical Principles Underlying Education* (1897), Dewey identifies four subfields of geography: commercial, political, physical, and mathematical. The first marks the study of daily life and the ways in which human beings concretely flourish, how they support themselves, and by what means. Commercial geography, he claimed, is “the beginning” because it attends to “the consciousness of two persons, or two groups of persons, who are at once separated and connected by the physical environment” and “includes whatever relates to human intercourse and intercommunication as affected by natural forms and properties” (EW 5, p. 69). Political geography, by contrast, is the study of connections between people in their places as they have developed, “as temporarily crystalized and fixed in certain forms” (EW 5, 69). Later, in *The Public and Its Problems* (1926), “publics” can be seen as a term of political geography in that it marks the formation of groups with shared concerns in order to solve problems in common. Physical geography is the study of “conditions which determine human action,” that is, of what is taken as common among the publics. Shared climates, soil types, water resources, and so on all affect what is required in order to carry out conjoint action across diverse locales. Finally, mathematical geography (detailed measurements of topographical features, generalizations about climate and ecosystems, standardized systems of measurement, and so on) are both abstract and useful as tools in understanding physical geography, planning and assessing conjoint actions, and solving local problems. Mathematical geography shows “that the physical conditions themselves are not ultimate, but depend upon the place which the world occupies in a larger system” (EW 5, pp. 69–70).

In the context of schools, as Dewey points out in *Democracy and Education*, geography begins with the study of the students’ hometowns, “the familiar fences that mark the limits of the village

proprietors” (MW 9, p. 220), the boundaries of their communities, the topographical features of the neighborhood, and the stories of local people. However, if such local “facts” are presented as all that is necessary to know in geography, or that the facts in each subfield are presented as disconnected facts to be memorized, then geography becomes an obstacle to student learning. When, however, such “facts” are presented as part of an integrated system of relations – relating local places and people to larger events, events in the past, and to events in the present – geography becomes a transitional subject matter alongside history. Rather than reifying the boundaries that mark students’ local communities, the subject matters (properly taught) become openings to larger connections. In this sense, geography and the complementary study of history become essential to what is good in education – the promotion of growth, that is, the widening of human experience (LW 13, pp. 11, 28). Geography and the other school subjects are, for Dewey, tools for framing educative experience that begins with the students’ own. As he explains in *Experience and Education*, his conception of education is, “to paraphrase the saying of Lincoln about democracy, one of education *of, by, and for* experience” (LW 13, p. 14).

Dewey presented significant discussions of geography and history on two occasions: *Ethical Principles Underlying Education* and Chapter 16 in *Democracy and Education* (MW 9, p. 1916). (There is also a third discussion in “Educational Lectures at Brigham Young Academy” in 1901 (LW 17) that follows the same lines as his 1897 discussion.) *Ethical Principles*, in many ways lays the foundation for Dewey’s more fully developed theories of education, ethics, and politics in *Democracy and Education*. The general claim of the essay was that contemporary education was framed by divisions between ethical principles (those for inside and those for outside the school), between form and content, and between intellect and emotion. As a result of these divisions, schools failed in the central function of teaching: bringing about “conclusive moral content” in the lives of its students, that is, of serving as a “character-making agency” (EW 5, p. 75). The division of ethical principles marked the failure

of educators to understand that continuity between schools and the communities of which they are a part. "Society is a society of individuals and the individual is always a social individual. He has no existence by himself. He lives in, for, and by society, just as society has no existence excepting in and through the individuals who constitute it" (EW 5, p. 55).

Dewey offers geography, history, and science to illustrate the "abstract" point that information, discipline, and culture are continuous: information is "educative only in so far as it effects definite images and conceptions of material places in social life;" while "discipline" is "educative only as it represents a reaction of the information into the individual's own powers;" and culture is educative only as it "represents the vital union of information and discipline" (EW 5, p. 68). Geography, history, and science "have all to do with the same ultimate reality, namely, the conscious experience of man" (EW 5, p. 68).

While geography "has to do with all those aspects of social life which are concerned with the interaction of the life of man and nature," history "reveals" "the main instruments in the way of discoveries, inventions, new modes of life, etc., which have initiated the great epochs of social advance," that is, "the *methods* of social progress" (EW 5, p. 71). Together, the subject matters support the "formation of habits of social imagination and conception," and make it possible for students to form "the habit of interpreting the special incidents that occur and the particular situations that present themselves in terms of the whole social life" (EW 5, p. 72). On this account, what constitutes good in a community is first the process of understanding complex social situations, identifying problems, and seeking solutions. In this sense, "history rightly taught is the chief instrumentality for accomplishing this, it has an ultimate ethical value" (EW 5, p. 73).

Moral content beyond the value of moral imagination, however, is not found outside the situation present in the schools, but rather in the students' own experiences: "the subject matter of the curriculum, however important, however judiciously selected, is empty of conclusive moral

content until it is made over into terms of the individual's own activities, habits, and desires" (EW 5, pp. 77–78). Although this aspect of Dewey's ethical theory is often cited as a weakness (by making moral deliberation an instrument by which to realize the moral prejudices of a community), it is central to Dewey's wider notion of social intelligence (LW 13, p. 47): "Ultimate moral motives and forces are nothing more nor less than social intelligence – the power of observing and comprehending social situations – and social power – trained capacities of control – at work in the service of social interests and aims" (EW 5, p. 75). Schools, then, are charged with fostering the social intelligence that identifies the values that organize the community through the subject matters of geography and history. But schools also necessarily challenge and undermine those values when they are found to block the potential for wider experience that is central to the process of growth.

Geography was a relatively new school subject when Dewey presented it in 1897. The divisions of geography he presented owed much to the new scholarship of the day. Kant had introduced six divisions of geography in his work: commercial, political, physical, mathematical, moral, and theological. These had been reduced in the mid nineteenth-century to three: political, physical, and mathematical, though commercial geography was also recognized as a distinct field of study that was then recombined with the other subfields to form the four divisions described by Dewey and others (see Maury 1907). Dewey's citations of geography texts in 1897 includes some standard textbooks and several critical accounts of the field including one by J. C. Redway (1894), who argued that although the field was becoming a standard school subject, it was rarely taught by teachers with knowledge of the field. In at least some cases, Redway observed, geography was used to reinforce views that were actively dismissed by geographers (including simple mistakes in defining geological features and the use of geography to validate theological claims).

Dewey's discussion of geography in *Democracy and Education* expands the function of

geography as presented in *Ethical Principles*. Properly taught, geography begins in the local community but aims to connect such local knowledge to wider contexts. “When the familiar fences” are taken as “signs that introduce an understanding of boundaries of great nations, even fences are lighted with meaning” (MW 9, p. 220). This process of meaning-making “measures just the difference of civilization from savagery” (p. 215). “To ‘learn geography,’” he argues, “is to gain in power to perceive the spatial, the *natural*, connections of an ordinary act; to ‘learn history’ is essentially to gain in power to recognize its human connections” (p. 217). Nature, in this sense, “is the medium of social occurrences” and civilization is “the progression of its varied energies” (p. 219). Geography is no longer a subject matter just dedicated to fostering social intelligence, but an engine of human evolution, a means of fostering progress. Limits – boundaries – are only potentially productive obstacles to be overcome in the quest for an expanded, unified future. “Geography and history are the two great school resources for bringing about the enlargement of the significance of a direct personal experience,” they are the “most direct and interesting roads out into the larger world” (p. 226).

The treatment of history in Dewey extended past his discussions of history as a school subject. It also marked a theoretical contribution to the development of his general conceptions of metaphysics and epistemology. In *The School and Society* (1900), Dewey reemphasized the purpose of history as a study “to enable the child to appreciate the values of social life, to see in imagination the forces which favor and let men’s effective cooperation with one another, to understand the sorts of character that help on and that hold back . . . History must be presented not as an accumulation of results or effects, a mere statement of what happened, but as a forceful and acting thing” (MW 1, p. 104). This notion of history as “a forceful and acting thing” reemerges indirectly in several discussions in the 1900s. In 1902, in the essay “The Evolutionary Method as Applied to Morality,” Dewey proposes that “History, as

viewed from the evolutionary standpoint, is not a mere collection of incidents or external changes, which something fixed (whether spiritual or physical) has passed through, but is a process that reveals to us the conditions under which moral practices and ideas have originated. This enables us to place, to relate them. In seeing where they came from, in what situations they arose, we see their significance” (MW 2, p. 9). History, in this case, is not a recounting of “facts,” but the practical construction of future significance and the “truth” of history that warrants its teaching is found in how it leads students to new experience.

In 1909, Dewey presented a pragmatist “catechism” at a meeting of the Philosophy Club at Smith College in the form of a dialogue between a student and a teacher (later published in *The Influence of Darwin on Philosophy* in 1910). After a preliminary presentation of pragmatism, the student worries that since the truth of historical claims relies on what happens in the future, “you commit yourself to the most fantastic of philosophies” (MW 6, p. 6). The teacher responds that such things as “the Carboniferous age, the discovery of America by Columbus are not truths; they are events.” Some judgment about them is needed before there is a question of truth or falsity, and once that question is raised it is something to be resolved, that is, it becomes matter of some next or future event and not of the event long past (p. 6).

Arthur Lovejoy responded to this conception of historical knowledge in a 1920 essay attacking pragmatism (and Dewey in particular). Referring to an example in Dewey’s catechism, Lovejoy objects that when we talk about “yesterday’s rain,” “It is yesterday that I ‘mean,’ not to-morrow, and no logical hocus-pocus can transubstantiate the meaning of ‘yesterday’ into the meaning ‘to-morrow’” (1920, p. 67). A correct understanding of historical knowledge, Lovejoy argued, requires a distinction between the event or object in the past and the claim that is made about it. The claim is true just in case it relates properly to the real past event. Dewey rejects the distinction: “The past by itself and the present by itself are both arbitrary selections which mutilate the complete object of judgment” (MW 13, p. 46).

Dewey instead asserted that “mere presence in experience is quite a different matter from knowledge or judgment, which always involves a connection, and, where time enters in, a connection between the past and future” (MW 13, p. 47). History, as a subject matter, is not the acquisition of facts about the past but rather the development of the ability to interpret a selected past in order to “go forward,” to seek a future that affords “more” and richer experience than would otherwise occur by chance or by focusing on a disconnected past.

Dewey’s conception of geography can be read in a similar way. Learning the facts of the physical and human environments in isolation undermines the aims of education. It risks collecting isolated and arbitrary facts as though they provide some objective or accurate picture of the world in which students live. Following Dewey’s theory of historical knowledge, geographical knowledge will likewise be arbitrary and isolated unless they too are connected to a larger context that will afford wider experience. Geography and history are at the center of Dewey’s conception of the school because they together provide the transformative method that allows students to come to understand their own experience in order to change and widen it. Knowledge, to the extent it is part of what is taught in school, is not merely an epistemic project bound to the acquisition of facts; it is also an ontological project that, at its best, will transform the world. This is both the promise and the danger of education.

The danger is especially apparent in the tension that emerges in Dewey’s treatment of geography and history in *Democracy and Education*. On one hand, geography and history are essential to a civilizing project understood primarily as the transformation of inquiry from one framed by local concerns to a process that encounters no boundaries that cannot be crossed. On the other, they are part of a conception of inquiry that is constrained by the situation at hand. The former seems problematically connected to the practices of what has come to be called settler colonialism which may be defined (in at least one sense) as practices that recognize all boundaries (geographic, political, cultural, and epistemic) as regions that can be crossed. The latter notion of

inquiry, by contrast, recognizes the necessity of at least some boundaries. In order to make sense of knowledge claims, problems to be solved, values, and so on – that is, ends in view in the context of problems to be addressed – some boundaries must be recognized and respected. One cannot, for example, address the problems of racism without recognizing the lived boundaries of race. One cannot recognize the problems of climate change without recognizing the boundaries of diverse ecosystems. It is this latter notion of inquiry that provides the framework for Dewey’s 1938 *Logic: The Theory of Inquiry* (LW 12) and sets the stage for Dewey’s importance in twenty-first-century education. Where geography and history are part of a civilizing project in *Democracy and Education*, the theory of inquiry as it develops in Dewey’s work has the potential to make them part of a critical practice that begins with the recognition of the value and necessity of diversity among students, subject matters, communities, and educational ends in view.

Introduction

The American philosopher John Dewey influenced the educational sector of many countries around the world apart from the USA, notably Japan, China, Australia, Germany, Austria, both pre- and postrevolutionary Russia, and Turkey. In Sweden, which will be discussed as an example below, his influence is still palpable in the national curricula. An important part of Dewey's work concerns the role of education in societal reform and progress: more specifically, in the progress toward a more democratic society. Thus, the formation of democratic character lay at the heart of Dewey's philosophy of education. For Dewey, this is far more important than teaching children how a democracy works, since the development of a democratic character entails more than knowing a set of facts or rules; it is rather about fostering a sociable and intelligent (receptive and open-minded) individual, someone who can learn not only to vote at certain intervals but to change and shape society in the best possible way for every one of its members. On this view, which still has relevance today, one aspect of democracy is not just as a form of government but an ethos, a culture, and a way of living in a society where people work together for the common good.

Forming a Democratic Character

Dewey is commonly associated with the progressive education movement that started in the USA at the turn of the last century as a protest against pedagogical narrowness and one-sidedness. The movement was pluralistic and related to broader currents of social and political progressivism resulting from societal changes such as urbanization, industrialization, and large-scale immigration. One of the social currents underlying this movement was the changing perception of children and the growing interest in children's rights. Part of the progressive movement was strongly child centered, maintaining that school should provide children with the freedom to express their true human nature rather than create citizens.

Another fraction, which has been called social reconstructionism, emphasized community and society rather than the individual and saw school as central to creating a more just social order, whereas the so-called social engineering strand (or "administrative progressives") focused on social efficiency and teaching the students to earn a living. It is difficult to place Dewey in any of these categories: for the child-centered educators, Dewey was too academically and socially oriented, whereas the social constructivists thought that he lacked a sense of direction when he refused to blueprint a new social order (Karier 1986). For Dewey, it was enough that school should foster alert, sensitive, and socially competent adults, capable of making sound decisions about the future. These decisions could not be dictated by school or by authorities, since we live in a changing world: "a world which is not all in, and never will be, a world which in some respect is incomplete and in the making, and which in these respects may be made this way or that according as men judge, prize, love and labor" (Dewey 1993). The importance Dewey placed on individual growth was also at odds with the social engineering strand that advocated separate vocational education. For Dewey, manual training was not mere trade training but an important step in elucidating the practical and the theoretical aspects of every subject, and he thought that everyone should have the chance to grow intellectually – not just those destined for an academic career.

Dewey's philosophy of education has mostly been misunderstood and misapplied. Learning through experience has become mere vocational education, and Dewey's emphasis on the interest of the child has come to be synonymous with permissiveness. But it is important to remember that many of the practices that Dewey introduced have become more or less mainstream: the practices today called "problem solving" or "inquiry method," for example. Furthermore, many of Dewey's concerns still retain their resonance today, as the website of the Progressive Education Network testifies. The principles listed include preparing students "for active participation in a democratic society," and the principles drafted by

the steering committee in 1990 includes the school as “a model of democracy and humane relationships, confronting issues of racism, classism and sexism.” Even if most of the child-centered progressive schools in the first half of the twentieth century comprised private schools, of late these reforms have centered mainly on public schools. But questions concerning the meaning of “democratic” education have been raised, as the progressive schools often are set in homogenous, white neighborhoods. Critics have ascribed the success of progressive schools to the new middle class rather than the model itself, and doubts have been raised whether disadvantaged children are helped by progressive education or rather disadvantaged further (Semel and Sadovnik 1999).

However, in the USA, there remain some successful examples of progressive schools, or as they are called today, “alternative” or “critical” schools, notably Central Park East Secondary School (CPESS) in New York, which enjoyed high levels of success with low-income and minority students. CPESS has been called a critical small school, which attempts to connect with oppressed students and create productive and democratic citizens. One of the obstacles these kinds of schools face is the difficulty to measure dispositions and habits of mind through traditional metrics, for example, the ability to think critically and to form strong personal and professional relationships, something Dewey thought essential for the ability to fully participate in a democratic society. Therefore, it might seem easier to foster a democratic spirit and at the same time meet the politics’ demand of effectiveness with the kind of teacher-led programs that have recently been integrated into school curricula across the country, such as Character Counts!, 11 Principles of Effective Character Education, and KIPP’s Teaching Character and Creating Positive Classrooms. In Character Counts!, for example, students are taught the Six Pillars of Character, i.e., trustworthiness, respect, responsibility, fairness, caring, and citizenship. Trustworthiness means here to “stand by your family, friends, and country”; responsibility means to “do what you are supposed to do”; citizenship

means to “obey laws and rules,” and so forth (Spector and Prendergast 2015).

Without a doubt, this kind of approach is antithetical to Dewey, for whom the ideal aim of education is the power of self-control. This entails what Dewey calls freedom of intelligence, what we today would call critical thinking, rather than blindly obeying rules or doing what you are supposed to do. The formation of democratic character involves learning how to think, how to form one’s own opinions, and how to fully partake in society. For Dewey, this does not mean that the teacher is less important or that the children should not be required to learn what is on the curriculum; to the contrary, rational freedom and rational intelligence are itself the fruit of objective knowledge and understanding (Karier 1986). For Dewey, there was no opposition between student activity and interest, on the one hand, and the teacher’s authority, on the other. He emphasized the importance of the role of the teacher in identifying the interests and needs of the pupils, as well as imparting to them new learning and objective knowledge. In this process, the child is indeed taught discipline, but the discipline, as well as the interest, is internal to the subject: “To satisfy an impulse or interest means to work it out, and working it out involves running up against obstacles, becoming acquainted with materials, exercising ingenuity, patience, persistence, alertness, it of necessity involves discipline – ordering of power – and supplies of knowledge” (Dewey 1959). This kind of discipline is the source of freedom, since real freedom presupposes the faculties of judgment and self-expression. Since, according to Dewey, learning is an active undertaking, children should be initiated from the beginning into the “mode of associated living” characteristic of a democracy, in which social sympathy and deliberative moral reasoning can develop. Thus, classrooms in a democracy had to be not only communities of inquiry but *democratic* communities of inquiry (Westbrook 1991).

In Sweden, the Deweyan ideal of democratic education has guided school authorities ever since the Second World War. Dewey can be said to have influenced all Swedish school reforms up until at least the 1970s, and even if the emphasis on

democratic education has diminished as a result of more recent school reforms, his ideal of education as a way of imparting democratic values through participation is still manifested, as in a formulation from the national grammar school curriculum guidelines which stipulate that it is not enough that education imparts knowledge of democratic values but should also be conducted with democratic methods and prepare the pupils for active participation in society. The pupils should thus take part in planning and evaluating their education and choose courses, subjects, themes, and activities, so as to develop their capacity to exert influence and take responsibility. The importance of discussion about society's base values is also emphasized. The Swedish National Agency for Education stresses the importance of discussion where there are conflicts of values, and the efforts of the individual and the collective to listen, reflect, seek, and evaluate arguments, and a collective effort to find the values and standards that everyone can agree on.

This consensus-based model has been criticized for making teachers apprehensive about disagreements. In classrooms with pupils from many different cultural backgrounds, it can be difficult to find agreement. And since the curriculum requires that the teacher should instill democratic values in the pupils "in accordance with the ethics borne by Christian tradition and Western humanism" and emphasizes the Swedish-based values, the ideal of an open discussion can easily turn into a directed one with a right and a wrong outcome.

The idea that there should be a fixed end to deliberation is antithetical to Dewey's views, since for him education should cultivate a spirit of criticism and the habit of inquiry, rather than conventional idealizations. Because of our need for ongoing evaluation and criticism, we need to foster ongoing inquiry, to harness the potential of lived experience rather than appeal to a singular common good. So a democratic character is not formed by learning a set of truths or even learning how to reason but through practical activities that require listening to others, confronting our own prejudices, and expanding our viewpoints.

Multicultural Society: Broadening Horizons

Opinions about Dewey's relation to the different values embodied in multiculturalism vary, often due to the usual interpretative problems posed by the complexity of, and transitions in, Dewey's thought over a long career. But even if Dewey thought that there was an inherent tendency to conflict in multiculturalism, he identified himself as a multiculturalist and rejected the idea of America as a "melting pot." In a letter to Horace Kellen, the author of the term "cultural pluralism," Dewey wrote that he wanted to see his country as American, which meant reducing the English strain to "one along with others." He likened the USA to a symphony, where any assimilation is to and between the different instruments playing with each other, not to some prior Anglo-Saxon orchestration (Eisle 1992). For Dewey, it is essential that communication and openness are mutual, so that no group can force its conception on another. Agreement, on the other hand, does not seem to have any intrinsic value for Dewey; rather, it is the process of communication and learning from others that is important.

Dewey saw schooling as an important tool in counteracting segregation and in promoting communication between different groups, since he saw democracy as grounded in practical concerns and social ties, rather than in abstract ideals or reasoned arguments. Dewey contends that ultimate moral motives and forces are nothing more than "social intelligence," i.e., the capacity to observe and comprehend social situations, tempered by trained self-control, in the service of social interest and aims. Morality, as well as democracy, is not a *thing* as much as a *way*, something that we *do*. Dewey makes the case that the formation of the desired attitudes and dispositions cannot be achieved through the direct inculcation of beliefs, emotions, and knowledge. Just as children learn through participation in the affairs of the family, school is a place where children learn valuable social skills through interaction. At school they can learn to take different perspectives into consideration and thus acquire greater knowledge than they could achieve at

home or in isolation (Dewey 1966). This is why one important educational task is to bring children from different backgrounds together.

The Democratic Practice of Life

Working together, “breaking down the barriers of class, race, and nationality which keeps men from seeing the full import of their activity,” can therefore help us to understand not only the consequences of our own actions better but also to *perceive* other people, in the pregnant sense Dewey gives the term. Through conjoint activity, we develop the sensitivity that Dewey called “intelligent sympathy,” which he describes as not merely a feeling but a cultivated imagination for what we have in common with others (Dewey 1966). It could be described as a sensitive responsiveness to the interests, sufferings, and rights of others. Dewey thinks that duties and loyalties will naturally grow from these kinds of personal ties and stable relationships.

The idea seems to be that the virtues of the democratic character can be fostered, not necessarily by talking about values but by cultivating friendship and respect through doing things together. As we work together, we create social ties, develop sympathy, and learn to respect each others’ strengths and weaknesses. Genuine cooperation entails listening to others and making compromises in order to find a solution that satisfies everyone – skills that are important in the “mode of associated living” called democratic society. For Dewey, moral knowledge is what is learned and employed in any occupation that has an aim involving cooperation. Shared aims build up social interest and “confers the intelligence needed to make that interest effective in practice” (Dewey 1966). Democracy thus grows from within: from what is local, spontaneous, voluntary, and direct. The sort of communal loyalty and civic-mindedness needed in a democracy can emerge as a natural outgrowth of strengthening and nurturing local ties (Pappas 2008).

This “ethics of democratic relationships” (Pappas 2008) or “democratic practice of life”

(Dewey 1993) is what school should foster. If democracy and our choice of how to live were primarily a question of rationally accepting certain principles, then we should indeed primarily address the values that we think underlie our way of life. But Dewey does not assume that there is a specific set of underlying values that cause or direct our behavior; rather, he thinks that important democratic values such as tolerance, sympathy, and openness *grow out of* an environment in which we work together toward a common goal. For Dewey, lived experience is the only reliable avenue by which to pursue the development of social intelligence and meaningful democracy. Therefore, it would seem that in Dewey’s view, democratic education is better pursued through making pupils from different backgrounds cooperate in different tasks, giving them a chance to get to know each other as they work together, rather than having them sit down to discuss abstract ideals.

Democracy as an Ethical Ideal

A crucial difference between Dewey and other models of deliberative democracy such as that of, e.g., Rawls, is that Dewey does not aim to generate final principles or once and for all overcome the impediments of democracy. For Dewey, democracy should be created anew by each generation, and the kind of democracy he envisions entails difference and an openness for different alternatives. This is why Dewey can perhaps better accommodate Chantal Mouffe’s critique of the deliberative democracy model, which she considers too focused on consensus. Such models, in her view, ignore the positive potential of difference and disagreement. Similarly, Dewey’s ideal would seem to resist Iris Marion Young’s criticism of deliberative democracy models as excluding emotional-imaginative methods and reasons from political discourse.

In Dewey’s view, the good can never be demonstrated to the senses but always involves the will and an interest in what is unseen and incalculable. On this understanding, democracy is an

ethical ideal. As an idea, democracy is the idea of community life itself. Such an idea is not, and cannot ever be, a matter of fact (Dewey 1954). Democracy, for Dewey, necessarily entails freedom, fraternity, and equality (Dewey 1993), ideals that may never become facts and that are difficult to justify on a merely rational basis, and even more difficult to measure with standardized tests, but which most would agree are indispensable aims for any ethical society and thus vital for our children to learn.

Dewey on Science and Science Education

Christine L. McCarthy

University of Iowa, Iowa City, IA, USA

Introduction

The term "science," for Dewey, can refer either: (a) to the particular inquiry process by which one can achieve genuine *knowledge of nature* or (b) to the body of genuine knowledge produced by that inquiry process. I will disambiguate the term by referring always to "scientific inquiry" or to "scientific knowledge."

Dewey holds that the method of inquiry is the only means of coming to have knowledge about real thing/events and that scientific inquiry is the most highly developed form of inquiry. Dewey conceives knowledge to be a set of beliefs well warranted to be true about the dynamic interactive events that constitute the natural world. Knowledge with respect to any subject matter can be developed through the process of inquiry.

Scientific inquiry is a natural investigative activity that developed as an elaboration of practical common-sense inquiry, the process by which certain complex organisms act in response to their environment. The aim of practical inquiry is the survival and well-being of the organism; the aim of scientific inquiry is the same, via intellectual action to develop a body of knowledge. Dewey uses the general term "inquiry" to refer to scientific inquiry and to ordinary practical inquiry.

Inquiry

Dewey sets out his position on the relation of ideas, facts, and knowledge, first, in 1902, in *Studies in Logical Theory*, then in 1907, in *"The Control of Ideas by Facts,"* in 1916, in *Essays in Experimental Logic*, in 1925, *Experience and Nature*, and, most thoroughly, in *"Logic: the Theory of Inquiry"* (1938). In both 1939, in *"Experience, Knowledge and Value: A Rejoinder,"* and in

1941, in "*Propositions, Warranted Assertibility, and Truth*," Dewey responds at length to his critics, who often misinterpret his position, rather than engage in criticism of it.

Dewey explains inquiry in this way: inquiry "begins in doubt, [and] terminates in the institution of conditions which remove need for doubt." (1938, p. 15). The conditions of doubt that call forth inquiry occur when one finds oneself in a situation in which one intends to act to achieve a desired end but finds that one's existing knowledge and habits of action are inadequate to the current situation, that is, they have proven unable to effectively guide one's actions in pursuit of the desired end.

Having noticed that one's actions have become ineffectual, or counterproductive, one should temporarily stop action in pursuit of the desired end, and act instead to determine the nature of the situation, to understand the dynamic interrelationships that constitute it. Only by acquiring such knowledge will one be enabled to act effectively in the situation.

The current situation is indeterminate, in that one does not know what actions to take in that situation to effectively pursue the desired end. Dewey uses the term "indeterminate" to refer to a situation that is "disturbed, troubled, ambiguous, confused, full of conflicting tendencies, obscure, etc." (1938, p. 109). It is the situation itself that is indeterminate, and thus, full of doubt, or "doubtful." The indeterminacy of the situation is an objective state of affairs, inhering in the situation; the subjective state of "doubt" of the person in the situation is only secondary, in response to the indeterminateness of the situation. Dewey further explains: "Even were the existential conditions unqualifiedly determinate in and of themselves, they are indeterminate in *significance*: that is, in what they import and portend in their interaction with the organism" (1938, p. 110).

Having recognized the current situation as doubtful, one begins the inquiry process. Dewey gives a formal definition of inquiry: "Inquiry is the controlled or directed transformation of an indeterminate situation into one that is so determinate in its constituent distinctions and relations as to

convert the elements of the original situation into a unified whole" (1938, p. 108). Inquiry is competent to the extent that the initial indeterminate situation actually becomes, at the end of inquiry, determinate, a situation which is well understood.

In the inquiry process the person is required to *act* in the situation, in his or her current environment. It is only by physical action, by becoming a factor in the set of dynamic interactions that is the situation, that the objective environing conditions can be transformed. Inquiry is not an "inner mental" process; it is an overt activity. Dewey writes "[t]he organic responses [of the person] that enter into the production of the state of affairs that is temporally later and sequential are just as existential as are the environing conditions" (1938, p. 110). As the person acts in the indeterminate situation and observes the results of his or her actions, the situation gradually becomes more determinate.

Dewey refers to the temporally developing indeterminate situation as a "problem situation"; the "first result of the evocation of inquiry is that the situation is taken, adjudged, to be problematic" (1938, p. 111). Making this judgment is the preliminary step in inquiry. Subsequent steps must then be taken. "The first step. . . is to search out the *constituents* of a given situation which, as constituents, are settled" (1938, p. 112). The active process of observation of the existential conditions is begun. The observed conditions "taken together constitute 'the facts of the case'. . . they are conditions that must be reckoned with or taken account of in any relevant solution that is proposed" (1938, p. 113). These conditions, as they are observed, suggest possible solutions to the problem, plans of action that if taken might resolve the situation, and effect the desired determinate and nonproblematic situation.

Ideas, in Dewey's sense, are plans of potential action. "Ideas are anticipated consequences (forecasts) of what will happen when certain operations are executed under and with respect to observed conditions" (1938, p. 113). With continued observation of the situation's features and the corresponding suggestion of ideas about the dynamics of the situation, the ideas entertained

become better grounded and more precise. The best of the entertained ideas is then used to direct one's active intervention in the problem situation, and the newly resulting existential conditions are again observed. Action, and observation of the results of action, constitutes the test of the idea.

It is through the use of the ideas that the meanings of the ideas begin to be understood. A reasoning process is undertaken, to clarify more fully the meanings and to discover their conceptual relations to other meanings in one's existing knowledge. For this examination, the new meanings must be formulated in propositions and compared to other formulated meanings. The goal is to discover the logical relationships of the various meanings. Without this examination of meanings and their interrelationships, the inquiry process is not properly completed.

Scientific inquiry takes exactly this form. Dewey writes: "An hypothesis, once suggested and entertained, is developed in relation to other conceptual structures until it receives a form in which it can instigate and direct an experiment that will disclose precisely those conditions which have the maximum possible force in determining whether the hypothesis should be accepted or rejected" (1938, pp. 115–116).

How are the observed facts of the situation, which are existential, to be related to the ideational content, the meanings, which are non-existential? Dewey's response is that both the existential facts and the nonexistential meanings are operative factors in the developing situation. "Ideas are operational in that they instigate and direct further operations of observation" (1938, p. 116). Facts are also operational. The relevant facts are selected for their capacity to serve as evidence: "their evidential quality is judged on the basis of their capacity to form an ordered whole. . ." (1938, p. 117).

Observed facts suggest ideas; the ideas when used to direct action generate new observations of fact; these new facts suggest other ideas, leading to new observations, and so on. The inquirer, throughout, attempts to find the ordered whole that would link together the facts and the suggested meanings. The provisional facts are tested, just as the provisional ideas are tested.

Science

Adherence to this general process of active experimental inquiry, leading to highly tested meanings and determinations of facts, is the definitive criterion for science, in Dewey's philosophy. In scientific inquiry, as opposed to common-sense practical inquiry, the intellectual focus is on the development of an always growing and continuously tested body of interrelated meanings. "In science, since meanings are determined on the ground of their relation as meanings to one another, *relations* become the objects of inquiry. . . scientific objects are strictly relational" (1938, p. 119).

In the system of relations that constitute scientific knowledge, the relations discovered to obtain are generalized and are highly abstract; given this, the propositions that set out symbolically the patterns of interrelations that constitute nature are widely applicable to many different qualitative contexts. "The generality of *all* scientific subject-matter as such means that it is freed from restriction to conditions which present themselves at particular times and places" (1938, p. 120).

The method of science, in Dewey's words, "is but the systematic, extensive and carefully controlled use of alert and unprejudiced observation and experimentation in collecting, arranging and testing facts to serve as evidence. . ." (1938, p. 57).

Knowledge

Dewey calls his theory of knowledge "instrumentalism." This name is intended to direct attention to the instrumental nature of propositions in the process of inquiry. In *Logic: The Theory of Inquiry* (1938) and in 1941, in "Propositions, Warranted Assertibility and Truth," Dewey draws a conceptual distinction between "propositions" and "judgments." The term "judgment" refers to the thoroughly tested belief that emerges as the conclusion of inquiry. A judgment is asserted to be true, and that assertion is warranted by the inquiry process.

Propositions, in contrast, are among the tools of inquiry; propositions are affirmed, but they are

not asserted to be true. Propositions are used to advance the inquiry, but it is acknowledged explicitly that those propositions may turn out to be less than useful, perhaps completely irrelevant to the problem situation at hand. Some propositions will likely need revision or replacement with other propositions that do advance the inquiry. This is what it means to say that propositions are instrumental in the process of inquiry. The propositions that are affirmed, provisionally, are the results, the judgments, of prior inquiry processes or of observation of the features of the problem situation. In scientific inquiry, detailed and quantified observations about the problem situation may be set out in propositions. Dewey writes: "Propositions, then, on this view, are what are affirmed but not asserted. They are means, instrumentalities, since they are the operational agencies by which *beliefs* that have adequate grounds for acceptance are reached as the *end* of inquiry" (1941, p. 175).

Scientific knowledge is the product of the operations of experimental inquiry. "The very conception of cognitive meaning, intellectual significance, is that things in their immediacy are subordinated to what they portend and give evidence of. . . the character of intellectual meaning is instrumental" (1925, p. 105).

Meanings and the Objects of Science

Dewey uses the term "objects" in a distinctive way. Objects are "events *with* meanings" (1925, p. 240, emphasis in original). Objects, in this sense, "are precisely what we are aware of" (Ibid) whenever we are conscious of something. We are conscious of thing/events only when the *meanings* of the thing/event, the meanings currently accepted as true meanings, have become doubtful, and one is in the process of revising one's beliefs about those meanings. It is not events themselves that occur in consciousness. It is the *meanings* of events that are in consciousness. Dewey specifies that his thesis is "the common-sense belief that universals, relations, meanings, are of and about existences, not their exhaustive ingredients" (1925, p. 241). It is the human being

that actively seeks for the meanings of events, and, in an attenuated sense, can be said to "construct," i.e., to form, beliefs about meanings. But in no way, except through physical interaction, does the human being "construct" the existences that he or she thinks about. The actual meanings of thing/events are objective; they are determined by the interactivities of the existent thing/event in question with other thing/events (including human thing/events). Because of this, the beliefs that humans might have about the dynamic relations obtaining, or potentially obtaining, among existences, beliefs about the meanings of thing/events, can be false, incorrect, or untrue. "The ownership of meanings or mind thus vests in nature; meanings are meanings *of*. The existence of error is proof, not disproof, of the fact that all meanings intrinsically have reference to natural events. . . . Error involves a possibility of detection and corrections because it refers to things, but the possibility has an eventual, not a backward reference" (1925, p. 219).

Knowledge as Warranted Assertibility, Truth as Correspondence

In 1941, in "*Propositions, Warranted Assertibility, and Truth*," Dewey states his conceptions of knowledge and truth very clearly. Dewey is responding to misinterpretations of his position set out by Bertrand Russell. He begins by stating: "my analysis of "warranted assertibility" is offered as a *definition* of the nature of knowledge in the honorific sense according to which only *true* beliefs are knowledge" (1941, p. 169). For Dewey, the warrant for any assertion made about the world comes from the process of inquiry. Since inquiry is most highly developed in scientific inquiry, the strongest warrants for the judgments about the world result from scientific inquiry. The "warrant" in question is the epistemic right to accept the judgment as true.

There is no guarantee possible, and so no complete certainty, about the truth of the scientific judgment. But a judgment is *well warranted to be true* by the quality of the inquiry process that led to the judgment. Persons asserting that

judgment to be true are well warranted in their assertion. To “know” is to have a body of belief that is well warranted by the inquiry leading to the body of belief. And knowledge in the abstract is, by definition, warranted assertibility, in Dewey’s view. Dewey’s view of the inquiry process requires both thought and activity, which are intimately linked. Dewey states that his position “holds that the presence of an *idea* – defined as a possible significance of an existent something – is required for any assertion entitled to rank as knowledge or as true” (1941, p. 170). The required idea is present in the form of a hypothesis, which is used to direct the existential activities by which the hypothesis is tested.

The question remaining is what is Dewey’s conception of truth? Dewey, again in response to Russell’s misinterpretation of the position of “instrumentalists,” is very clear.

In a footnote, Dewey sets out a categorical statement of his conception of truth: Instrumentalists “do *not* believe the test of truth is coherence; in the operational sense, stated later in this paper, they hold a correspondence view” (1941, p. 172, fn 7; emphasis in original). This key point is often misunderstood in the secondary literature on Dewey’s conception of knowledge. Dewey’s position is that the assertions warranted at the end of inquiry are to be accepted as true, in the correspondence sense of truth. “. . . the pragmatist holds that the relation in question is one of correspondence between existence and thought; but he holds that correspondence instead of being an ultimate and unanalyzable mystery, to be defined by iteration, is precisely a matter of cor-respondence in its plain, familiar sense . . .”. The agreement, or correspondence, between thought and existence is like that of agreement “between purpose, plan, and its own execution, fulfillment; between a map of a course constructed for the sake of guiding behavior and the result attained in acting upon the indications of the map” (1907, p. 84).

How does one test for this correspondence? Dewey holds that there is only one way. “What kind of comparison is possible or desirable then, save to treat the mental layout of the whole situation as a working hypothesis, as a plan of action, and proceed to act upon it, to use it as a director

and controller of one’s divagations. . . one uses the idea – that is to say, the present facts projected into a whole in the light of absent facts – as a guide of action”. If the anticipated interactions do in fact occur, and the new situation is as it was predicted to be, then “one may say, my idea was right, it was in accord with facts; it agrees with reality. That is, acted upon sincerely, it has led to the desired conclusion; it has, through action, worked out the state of things which it contemplated or intended” (1907, p. 84).

The Social Need for Scientific Knowledge

All living organisms, humans no less than others, must act in the context of their environing conditions, to maintain life and to secure a desired quality of life. The interactions of organism-in-environment are determined by the objective nature of reality, the world. Error in belief and in action, a mistaking of the nature of the dynamic interactions of oneself and others in the environment, is eminently possible and is regularly found to occur. In order to act effectively in the world, in the short term and in the long run, the organism that can acquire knowledge of the interactive dynamics constituting nature, can organically embed that knowledge and use it to guide its actions, will be far better off, more successful, in dealing with the problem situations that regularly arise. But, human beings collectively have acquired a great deal of scientific knowledge that is not put into use to guide social action. To teach persons to understand, value, add to, and use scientific knowledge in problem-solving is the proper aim of science education.

Dewey on Teaching and Teacher Education

Kyle A. Greenwalt
Michigan State University, East Lansing, MI,
USA

Introduction

This entry describes the relationship between Dewey's thoughts on *teaching* and *teacher education*. Because teachers are committed to the growth and development of learners, a discussion of *learning* must also necessarily be brought into play. This entry therefore describes how Dewey sought to conjoin the topics of learning, teaching, and teacher education under the common heading of the human potential for growth.

The entry starts with a discussion of Dewey's view of teaching and learning, particularly as it relates to the teacher's ability to intelligently direct the stream of unfolding experience of the learner. The entry then extends Dewey's views on teaching through a discussion of his views on initial teacher preparation. In particular, the entry focuses on how Dewey described the preparation needed for initial teacher candidates to be able to awaken and sustain inner attention among learners. In this way, the place of the school curriculum, instructional methods, and classroom management are located within Dewey's thought.

The entry concludes by emphasizing the role of coordination and integration in Dewey's thought.

Dewey on Teaching

For Dewey, all education has as its proper aim the promotion of growth and development. Growth happens through the experiences of the learner. Teaching is the ability to assist learners in organizing, directing, and maximizing the stream of developing life experiences. As Dewey stated, teaching relies upon "the educational significance of social arrangements [as] means used to educate the young" (1916/Dewey 1997a, p. 89).

Dewey's view of teaching and learning are firmly grounded in his naturalism. For Dewey, education-as-growth is continuous across the lifespan and there is no absolute sense in which anyone ever becomes fully educated. Dewey therefore rejected both absolute distinctions between teachers and students and viewing children as lesser adults. As he noted, "a living creature lives as truly and positively at one stage as another, with the same intrinsic fullness and the same absolute claims" (1916/Dewey 1997a, p. 51). The recognition of such "absolute claims" demonstrates the degree to which Dewey respected not only children as learners but also adults as learners in their own right – indeed, Dewey's naturalism committed him to respecting the integrity and sanctity of all people, cultures, and life forms. All are capable of growth. Therefore, the goal of any educational project is "the enterprise of supplying the conditions which insure growth" (1916/Dewey 1997a, p. 51).

Dewey asserted that such growth happens through experiences which are properly educative. If growth is the aim, then experiences are its means, and the criterion by which any experience is judged runs along a continuum that moves from educative to miseducative (1938/Dewey 1997b, p. 25). On the negative side, Dewey noted that some experiences may "engender callousness," "produce lack of sensitivity," or "may increase a person's automatic skill in a particular direction and yet tend to land him in a groove or rut" (1938/Dewey 1997b, pp. 25–26). On the

positive side, due to the plasticity of the living creature, experience can engender newer, richer, more profound future experience (1916/Dewey 1997a, p. 44). An experiential path of growth can be laid out on which the living creature journeys.

In more conventional terms, educative experiences are those that allow the learner to go on learning in the future: to become both more open to the world and more responsible in shaping and directing it. When education is viewed in this way, the job of the teacher is to assist in the process of the learner's growth through the progressive development and expansion of experience. Dewey summarized this task for the teacher when he stated that "the central problem of an education based upon experience is to select the kind of present experiences that live fruitfully and creatively in subsequent experiences" (1938/Dewey 1997b, p. 28).

Dewey's teacher can be characterized as the master of the timely intervention. Dewey was certainly concerned about teachers imposing upon learners, but he was equally concerned about a tendency in progressive educational circles for teachers to make themselves absent.

For Dewey, the only aims worth pursuing were those that grew out of the conditions that learners find themselves in. Aims – or more properly, the act of taking aim – is something that only the individual learner can provide. He or she must use aim to assist "observation, choice, and planning in carrying on activity from moment to moment and hour to hour" (1916/Dewey 1997a, p. 107).

On the other hand, teachers play a vital and essential role in helping learners select, organize, and choose among aspects of the environment that increase and broaden aims. Teachers are a force for suggestion. Their power resides in their ability to suggest tactfully and fruitfully. As Dewey stated, "it thus becomes the office of the educator to select those things within the range of existing experience that have the promise and potentiality of presenting new problems" – new problems that can lead the learner to new ways of looking, new ways of thinking, and new ways of acting (1938/Dewey 1997b, p. 75). "Connectedness in

growth," says Dewey, must be the educator's "constant watchword" (1938/Dewey 1997b, p. 75).

Dewey on Teacher Education

Given this characterization of teaching and learning, what type of professional formation will give teachers the ability to inspire and direct learning? How should the time of initial teacher preparation be spent?

Dewey argued that, "the wise employ of this short time [of initial teacher preparation] is in laying scientific foundations" (1904/1965, p. 316). The goal should be to assist the teacher candidate in becoming a "thoughtful and alert student of education" (1904/1965, p. 320). Initial teacher education seeks to assist teacher candidates in the experimental development of a set of educational principles that will clarify the aims and means of their work.

Dewey argued that all teacher education courses should have a practical component and that the practice had in such courses should be "typical and intensive, rather than extensive and detailed" (1904/1965, p. 315). By "typical and intensive," Dewey meant that practical work should serve a laboratory purpose. It should enliven and awaken teacher candidates to the meaning and vitality of educational principles. Rather than equipping a candidate who is immediately ready to enter a classroom and teach with a great deal of technical proficiency, Dewey aimed to *ultimately* build the technically proficient educator by *first* building knowledge of the method of intelligence.

Dewey was therefore not concerned that teacher candidates quickly achieve technical mastery over all aspects of the profession. His notion of what it means to be ready to teach did not involve immediate displays of technical proficiency. Dewey worried about teacher candidates that "seem to strike twelve at the start" (1904/1965, p. 321), but that did not go on growing over the course of their entire careers.

Dewey thought that teacher candidates need to solve two main problems. On the one hand, they

need to figure out how to teach subject-matter to students; on the other hand, they need to figure out how to manage a classroom. Both of these are important for the success of any teacher. Yet in terms of the education a teacher candidate receives, Dewey thought it important that teacher candidates direct their attention toward the former: “mastery of subject-matter from the standpoint of its educational value and use” (1904/1965, p. 318).

Dewey stated that conformity of outward attention is no mark of learning. Therefore, teacher candidates must concern themselves with a form of inward attention that signals the “giving of the mind without reserve or qualification to the subject at hand” (1904/1965, p. 318). Indeed, the ability to induce, sustain, and recognize such inward attention in the learner is the truest and most genuine mark of the teacher:

To be able to keep track of this mental play, to recognize the signs of its presence or absence, to know how it is initiated and maintained, how to test it by results attained, and to test *apparent* results by it, is the supreme mark and criterion of a teacher. It means insight into soul-action, ability to discriminate the genuine from the sham, and capacity to further one and discourage the other. (1904/1965, pp. 318–319)

Initial teacher preparation has no other purpose than this: the ability to recognize, inspire, and direct mental activity.

For Dewey, knowledge of subject-matter is knowledge of teaching. For subject-matter is what induces and gives meaning to mental activity. There is no method without material nor anything for mind to attend to without subject-matter. Subject-matter is, by definition, organized – it is matter that has been *subjected* to a controlling intellectual principle, a method. This method, the scientific method, is the very workings of the mind itself: “the classifications, interpretations, explanations, and generalizations which make subject-matter a branch of study do not lie externally in facts apart from the mind” (1904/1965, p. 328). Mind, method, and matter in this way are different aspects of a single relationship. It is the teacher’s business to understand and put this insight to work.

Dewey expected from teachers expansive and profound knowledge of subject-matter. Only then would the teacher have the tools to identify the potential and tendency of the intellectual stirrings of learners. Only then would the teacher be able to provide materials and learning conditions that assist learners in developing their knowledge, skill, and character. Only then would the teacher be able to assess the nature of learners’ past educational experiences when contemplating directions for their future growth. “Only a teacher thoroughly trained in the higher levels of intellectual method . . . will be likely, in deed, not in mere word, to respect the mental integrity and force of children” (1904/1965, pp. 328–329).

In this way, the practical work that Dewey expected teacher candidates to engage in was premised upon inquiry into how organized subject-matter (i.e., the curriculum) may result in sustained, organized, and systematic growth among learners. For Dewey, this meant avoiding the sporadic teaching of individual lessons in favor of practice work that resulted in the ability to see how progression and development may instead be promoted.

On the one hand, this practice work might simply involve deep reflection upon the scope and sequence of the school curriculum across multiple years. It is not enough to consider a single lesson or even a single unit in the social studies or in the math curriculum; rather, teacher candidates should think about the possibilities inherent in the curriculum for mental development across several grade levels. “What is needed is the habit of viewing the entire curriculum as a continuous growth, reflecting the growth of mind itself” (1904/1965, p. 332). In this way, subject-matter itself provides rich lessons in learning how to teach.

On the other hand, actual practice teaching before students, in classrooms, is an important part of what Dewey envisioned for the education of teachers. Such teaching – both in early practicum experiences as well as during a phase of traditional student teaching – should itself be intensive and continuous rather than spread out and haphazard. Only in this way, Dewey thought, would teacher candidates “get a body of funded experience” that would allow them to in turn “get a feeling for the movement” of learners and

subject-matter in their joint coordination of mental growth (1904/1965, p. 335). Such practice teaching would also, Dewey thought, help develop the type of technical expertise that all teachers must eventually obtain.

All phases of initial teacher preparation should be sustained by, and fully directed at, the need to awaken the teacher candidate to the realization that what truly matters is “how mind answers to mind” (1904/1965, p. 324). If the early stages of the education of teacher candidates are successful, the student teaching experience should ultimately happen with a minimum of interference and criticism from supervisors. Student teaching under these ideal circumstances, Dewey suggested, might have very modest aims indeed: to find “persons who are unfit for teaching” so that they “may be detected and eliminated more quickly than might otherwise be the case” (1904/1965, p. 336).

Teaching and learning are processes founded upon convergence, concentration, and coordination. Initial teacher preparation works by a proper coordination of theory and practice in the unfolding experiences of the teacher candidate. It seeks to bring practical and theoretical study, of both school subject-matter and the psychology of the learner, into communion. In this way, Dewey claimed, teacher candidates grow in their ability to carry all knowledge back “to its common psychical roots” (1904/1965, p. 329). They can see in the stirrings and graspings of the young child the potential for the highest forms of human achievement:

The subject-matter of science and history and art serves to reveal the real child to us. We do not know the meaning either of his tendencies or of his performances excepting as we take them as germinating seed, or opening bud, of some fruit to be borne . . . The art of Raphael or of Corot is none too much to enable us to value the impulses stirring in the child when he draws and daubs. (1902/2001, pp. 112–113)

Teachers are masters at seeing the present in light of the past and in hope for the future.

Conclusion

Dewey’s work on the nature of teaching and teacher education are vitally relevant to those

engaged in the work of teacher education today, in that they present a profound challenge to much conventional wisdom about how new teachers are best prepared to enter classrooms across the globe.

Dewey on the Concept of Education as Growth

Sarah M. Stitzlein

University of Cincinnati, Cincinnati, OH, USA

Introduction

To be educated, especially in particular ways, such as for a vocation or citizenship, is often seen as the end of schooling, a terminus of classroom learning. Likewise, growth is often seen as having an end, as having some final point of termination, like reaching adulthood, or of achieving some aim, like mastering a skill. Intriguingly, Dewey disrupts these common understandings to suggest that growth itself is an end and education should be understood as growth.

Growth as an End

Most people understand ends to be fixed points that can be reached through an orderly progression with certainty and clarity. They have a

specific mark in mind that they hold as a goal or see as an outcome of a process. For Dewey, however, trajectories tend to be more complicated and precarious. The complexities of life are such that marching toward a specific fixed end can be challenging and even achieving such an end unlikely, especially as one's environment shifts and changes. Moreover, doing so may be undesirable because holding such a fixed end may entail a limited or even a foreclosed vision of the future. As changes occur in the world, Dewey believes people must continually inquire into their shifting circumstances, develop new hypotheses about them, and revise their aims. For Dewey, this "educative process can be identified with growth when that is understood in terms of the active participle, *growing*" (1938, p. 19, emphasis in original).

Dewey believes some people wrongly hold "a false idea of growth or development – that is a movement toward a fixed goal. Growth is regarded as *having* an end, instead of *being* an end" (1916, p. 55, emphasis in original). For example, when we think of children as reaching a final end of growth, a terminus, in adulthood, we place a static end on growth rather than focusing on the process of growing as itself educative. Dewey's notion of growth is not linear, and it lacks a narrowly defined teleology. Growth describes how continuous experiences and reconstructions of them can develop one's physical, intellectual, and moral capacities, actualizing them and helping them inform one another so that they continue in a chain of continuity that enables one to live satisfactorily. For Dewey, "when and *only* when development in a particular line conduces to continuing growth does it answer to the criterion of education as growing" (1938, p. 20, emphasis in original). Education as growth, then, entails an ongoing succession of educative experiences that shape and develop a person, igniting curiosity and inquiry, and carry him over future struggles, leading into new opportunities for reflection and learning. Education as growth cultivates one's capacities to meet new and unpredictable situations.

In chapter four of *Democracy and Education*, Dewey offers his most extended discussion of education as growth. There he claims:

Our net conclusion is that life is development, and that developing, growing, is life. Translated into its educational equivalents, that means (i) that the educational process has no end beyond itself; it is its own end; and that (ii) the educational process is one of continual reorganizing, reconstructing, and transforming. (Dewey 1916, p. 54)

Education, then, is the ongoing reconstruction of experience where we learn by inquiring into our circumstances, coming to understand them better, and employing that understanding to shape our future experiences. This is the process of growth, one to be celebrated in and of itself, not for some exterior or fixed goal.

We grow as learning, inquiry, and reconstruction create opportunities for ongoing development and education. Educative experiences produce growth because they carry people from one situation to the next, expanding their understanding and their connections, opening them up to opportunities. Or, in Dewey's words, they "prepare a person for later experiences of a deeper and more expansive quality" (1938, p. 28). Good and authentic growth, then, is that which provides conditions for ongoing growth, rather than foreclosing opportunities that would enable a person to further flourish. It enables a person to respond flexibly and intelligently to novel future situations so that those situations can be transformed into further educative experiences. Again, in Dewey's own words, "If education is growth, it must progressively realize present possibilities, and thus make individuals better fitted to cope with later requirements. Growth is not something which is completed in odd moments; it is a continuous leading into the future" (1916, p. 60).

This definition of education as growth is admittedly rather cryptic, especially as it appears in one of his most famous accounts: "Since in reality there is nothing to which growth is relative save more growth, there is nothing to which education is subordinate save more education" (Dewey 1916, p. 56). Situated within his rather counterintuitive discussion of ends and the conditions for growth, statements like these may contribute to some of the criticisms that the notion of education as growth has received. Dewey is criticized for not providing specific ends for education or criteria

for assessing growth, which can be malignant – a criticism echoed in the significant work of Richard Hofstadter (1963). He is also criticized for operating under the assumption that growth is ultimately geared toward democratic problem-solving, even though Dewey’s actual depiction of it is open to much broader and conflicting interpretations of growth without normative guidelines as to whether that development might be good (Callan 1982). Such criticisms may reveal a lack of understanding his notion of education as growth or the criteria he provides for determining whether education as growth is effectively occurring. Or such criticisms may be uncovering inconsistencies and problems in Dewey’s account. To better understand how education as growth works and to clarify the foundations related to these criticisms, let us turn to the counterintuitive conditions for growth that Dewey offers.

The Conditions for Education as Growth

Dewey suggests that education as growth is initiated and sustained through immaturity, plasticity, habits, and inquiry. He details the first two primarily in *Democracy and Education* and expands greatly upon the third in *Human Nature and Conduct* and the fourth in *Experience and Education*.

Immaturity

Dewey begins by claiming, “The primary condition of growth is immaturity” (1916, p. 46). Whereas immaturity is commonly understood negatively, as an absence or lack, Dewey surprisingly emphasizes the positive element of immaturity as a capacity for growth. Immaturity entails “the *ability* to develop” and “the *power* to grow” (p. 46–47, emphasis in original). It is immaturity that goads us to come to understand our surroundings and increasingly develop control over them. It is immaturity that supplies the inquisitive drive to explore the world and to cultivate skills for living within it.

Dewey similarly argues that while children are typically thought of as being dependent – another negative connotation – dependence actually

provides the conditions that urge children to develop new abilities. Children constructively build new proficiencies and acquire new knowledge through a process of interdependence, whereby children employ social skills that elicit cooperative help from others despite and, importantly, because of, their physical dependence on adults. Immaturity and dependence force children to engage in interdependent transactions with those around them, initiating learning and ultimately helping them to become better members of a community. In this regard, rather than seeing children as lacking or as “not yet adults,” Dewey locates great potential within their unique position.

Plasticity

Dewey goes on to explain “The specific adaptability of an immature creature for growth constitutes his *plasticity*” (1916, p. 49, emphasis in original). Plasticity enables us to learn from our experiences, change our activities and our environments to meet our needs, and develop habits that allow us to function well. It is plasticity that allows children to adapt to their world and ushers growth from one educative experience to the next. When we adapt to the changing world as we try things out in varied situations, we cultivate a habit of learning – we learn how to learn (p. 50).

Habits

This discussion of learning how to learn leads Dewey into describing another condition of growth: habits. Habits begin as impulses, located in the nexus of immaturity and plasticity in children. Impulses are natural activities that are shaped and collected into habits as children interact with and inquire into their surroundings, including cultural norms that dictate typical and accepted ways of behaving. Habits are dispositions and ways of acting that are performed largely without effort or conscious attention.

Significantly for Dewey, a habit should be understood as a predisposition to act or as sensitivity to ways of being, rather than as merely an inclination to repeat identical acts, as many people more commonly understand habits. Dewey explains:

Any habit marks an inclination—an active preference and choice for the conditions involved in its exercise. A habit does not wait, Micawber-like, for a stimulus to turn up so that it may get busy; it actively seeks for occasions to pass into full operation. (1916, p. 53, emphasis in original)

Habits are active, projecting themselves into the world to pursue desires and to continue the chain of educative experiences. This is partially enabled because habits “do all the perceiving, recognizing, imagining, recalling, judging, conceiving and reasoning that is done” (Dewey 1922, p. 124). Habits are the mechanisms that enable us to inquire into our world and provide the working capacities that help us to know how to act in the world.

Inquiry

Habits and thought are closely related insofar as habits enable us to implement thought – to test it out. In return, reflecting on one’s actions and experiments allows for the development of new and better habits. We employ intelligent reflection and inquiry not only to reconstruct our world and our experiences but also to reconsider and reshape our habits when problematic conditions or novel situations arise. It is the intellectual aspect of habits that gives them meaning and keeps a person elastic and growing. Or, in Dewey’s words:

The habits of mind involved in habits of the eye and hand supply the latter with their significance. Above all, the intellectual element in a habit fixes the relation of the habit to varied and elastic use, and hence to continued growth. (1916, p. 53)

Good habits are intelligent and flexible, enabling us to appropriately respond to our changing world and carrying us over from one experience to the next, thereby enabling growth. By the same token, bad habits are those that become fixed and disconnected from intelligence. They are restrictive, having a hold on us, rather than us on them. Bad habits stop plasticity, disabling the conditions for growth. Dewey explains:

the acquiring of habits is due to an original plasticity of our natures: to our ability to vary responses till we find an appropriate and efficient way of acting. Routine habits, and habits that possess us instead of our possessing them, are habits which put an end to

plasticity. They mark the close of power to vary. (1916, p. 54)

Here Dewey brings together immaturity, plasticity, and habit, which leads into his discussion of inquiry as guiding these three elements in the process of growth.

It is inquiry that helps us understand, control, and reconstruct our environments and our experiences. We grow when we learn from our experiences and cultivate better, more flexible and more intelligent, habits because of them. Forming hypotheses and testing them out are central steps in Dewey’s process of inquiry. When habits themselves are formed tentatively as hypotheses in light of intelligent consideration of the present and informed predictions into an admittedly uncertain future, habits can be flexible agents of change whose form emerges as situations unfold. In this way, habits, facilitated through intelligent inquiry, are projective and sites of agency. They can be changed in ways that develop the person as a part of educative growth while effecting change on the world as well.

The Communal Nature of Growth

Importantly for Dewey, habits, inquiry, and the growth they enable should not be understood merely in terms of individuals. Rather, they are located within communities, the practices of democracy, and collective inquiry. Habits develop as individuals transact with their surroundings, including other people, laws, and traditions. Although each person acquires a unique set of habits and ways of enacting them, our shared experiences and similar transactions with our world lead many people’s habits to be alike. These similar habits may then become customs because they are typical ways of behaving within a social group and often they come to be seen as good or appropriate ways to act, which we intentionally pass on to children. Habits are most overtly cultivated in schools, where children watch, imitate, and interact with others as they learn through both direct and indirect teaching. Teachers there oversee the inquiry process, helping children to best use the relationship between

thought and habit to improve themselves and to learn. Reflecting upon habits and inquiring into surroundings often entail interacting with others to test out different ways of acting in order to determine which secure satisfactory living for oneself and flourishing for one's community. One element of growth is that of becoming part of the human tradition that is continually being reshaped anew. The growth of individuals is sought alongside growth of the community.

Dewey on Thinking in Education

Andrea R. English

Moray House School of Education, University of Edinburgh, Edinburgh, UK

Introduction

The concept of thinking plays an important role throughout Dewey's work, yet his educational theory is commonly associated with the idea of "doing." This association comes about for at least two reasons. For one, Dewey is part of the philosophical tradition of pragmatism, a term derived from the Greek root *pragma* (πράγμα), which

refers to the "deed." For another, Dewey has become connected to child-centered notions of education, which, in their more radical iterations, equate learning with activity and thus on the surface can appear to be aligned with his notion of "learning by doing." However, too much emphasis on these ideas gives us a one-sided picture of Dewey's understanding of education; it causes readers to overlook the significance of his concept of thinking. For Dewey, thinking is both the aim and the condition for the possibility of education. But, what is thinking? This entry discusses Dewey's concept of thinking in its relation to three other concepts: "experience," "learning," and "teaching."

Thinking and Experience

Dewey's central statement on the connection between "thinking and experience" is found in his chapter by the same name in *Democracy and Education*. A claim that permeates Dewey's work is that all experience involves both "doing" and "undergoing." "Doing" expresses the active side of our experience, in which "we act upon something" (1916/2008, p. 147). Undergoing expresses the passive side of experience, in which we "undergo the consequences of our actions" (1916/2008, p. 147). But, as Dewey notes, we do not always make connections between these two sides of experience. That is a problem, because without making this connection, we limit the extent to which we can learn from experience. In order to learn from experience, thinking has to come into play. Thinking is what connects what we do with what happens to us in return; by making this connection, thinking adds value to the experience (1916/2008, pp. 147, 152).

Dewey differentiates between two types of experience, "trial and error" and "reflective experience." Both involve thinking, but to differing degrees (1916/2008, pp. 147 ff.). In trial and error forms of experience, we try something and on the basis of this trial, we learn whether or not we were successful in meeting our aims; we continue trying until we meet our aims. Dewey views this method of experience as limited, because it primarily helps us learn *that* we failed to meet a particular aim, but it does not fully help us to learn *why* we failed. The thinking involved in trial and

error forms of experience is minimal; it helps us grasp that there is a connection between what we did in the world (doing) and what happened in consequence (the perceptible response we receive from the world). However, trial and error thinking processes do not extend to inquiring further into the nature of this connection between doing and undergoing.

Thinking comes into play in experience in a more extensive sense when we seek out the reasons for the connections between what we do and what we undergo. When thinking is incorporated into our experience in this way, our experience becomes what Dewey calls “reflective.” The method of reflective experience, in contrast to the method of trial and error, involves trying to understand how activity and consequence are connected, that is, how what one does is connected to the world in which one is acting. Reflection, on Dewey’s account, is a particular type of thinking. All thinking begins in situations which are “incomplete” (1916/2008, p. 153). The situation is incomplete because we do not know how best to move forward; we have reached a limit to our knowledge and ability, and thus we find ourselves in a state of “doubt,” “confusion,” or “perplexity” (1916/2008, p. 157). For Dewey, “reflection” is an inquisitive form of thinking that holds us in “suspense” in order to analyze the limits of our given knowledge and ability. To reflect is to ask ourselves why we are perplexed or in doubt: “The perplexities of the situation suggest certain ways out. We try these ways and either push our way out, in which case we know we have found what we are looking for, or the situation gets darker and more confused, in which case we know we are still ignorant” (1916/2008, p. 155f.; see English 2013).

Dewey contends that by cultivating this phase of thought – analyzing our given perplexity or difficulty – thinking itself becomes an *experience* (1916/2008, p. 152 and p. 159ff.). Dewey proposes a general structure of reflective experience that follows that experimental method of science (1916/2008; see also 1933/2008; and, 1938a/2008). A reflective experience begins with a basic form of experience, in which we are actively trying something in the world and encounter a

difficulty or stopping point in our activity. We then consider all the “data” or resources and knowledge at hand that can help us deal with the difficulty. Following this, we formulate hypotheses and develop new “ideas” that may help explain what has happened. We can then formulate a plan of action and test our hypothesis, either imaginatively in thought, or in action, to verify its validity.

Thinking that follows this general structure is itself “an experience” because we learn something new. In such processes of thinking we are making a “back and forth” motion, looking “back” or reflecting on what we have done and what we know, and looking “forward” to what might be true, that is, to valid ideas that can help us in future attempts at interacting with the world. Thinking is thus what Dewey calls a “method,” from the Greek μέθοδος, meaning, “way of proceeding.” While all thinking involves having certain aims or ends in mind when assessing new situations, reflective experiences enrich our ability to identify what is significant in new situations so that we can either find the right means to meet our established aims, or potentially decide that our aims need to be modified. Thinking processes that follow the method of reflective experience allow us to gain foresight, such that we gain the ability to make judgments about what is possible or necessary to do in a particular situation. Thinking is involved in both determining the means to meet previously established aims and in creating new aims; it allows us to act with “an end in view” (DE, 152, see also pp. 107–117). The more foresight we have, the better we can formulate our aims to meet the expectations of the situation. For Dewey, thinking “*is* the method of intelligent learning” (1916/2008, p. 159); it instructs us.

Thinking and Learning

For Dewey, how human beings learn is based in how they experience the world, and our experience of the world is based on a reciprocal relationship between mind and body. Dewey’s discussion of the connection between thinking and experience is part of his general epistemology that shifts focus from knowledge toward inquiry, or “coming to know,” which he equates with the

process of learning (see e.g., 1938a/2008). Dewey's view of reflective experience, which he also calls "reflective activity" (1933/2008), inquiry (1938a/2008) and "the experimental method of intelligence" (Dewey and Childs, 1933/2008), connects his work to that of other pragmatists. A central tenant of pragmatism is that it is important not only to find out that we are in doubt, but to inquire into why we are in doubt. For example, well-known pragmatists such as, Charles Sanders Peirce, emphasized the importance of "real and living doubt," as a starting point for inquiry. Real and living doubt, as opposed to Cartesian doubt, arises from our interactions within the world around us (Peirce 1994, §3, 374 and 375). William James developed the concept of "leading ideas" which are ideas that guide us out of moments of doubt and difficulty (James 1907/2008, p. 102). Also, George Herbert Mead, discusses what he terms "problems for thought" as starting points for inquiry and underscored the social nature of such problems. As human beings we have shared experiences, and thus we may develop similar problems that are in need of solutions that can help us as a group, not just as individuals (Mead 1964, p. 341). In the pragmatist tradition, doubt, difficulty, and the like are signs that we have arrived at the limits of our existing knowledge and ability, and in order to learn, we have to understand these limits (English 2013).

Dewey's notion of "learning by doing" understood in the context of pragmatism takes on new meaning. "Doing" becomes the starting point for learning and therefore the starting point for thinking, when thinking is considered an experience. But "doing" alone is not an experience according to Dewey, and just the same it does not comprise the whole of learning. By doing something, we can find out what does not meet our expectations. But, unless we actively think about why the reaction from an object or another person did not meet our expectations, we do not transform the activity into a learning process. Dewey makes this point on several different occasions using a simple example. He writes, if a child touches a hot object, and does not connect what he did with the resulting pain of a burn, then he did not learn (e.g., 1916/2008, pp. 83, 146). Learning by

doing thus describes neither the aim of learning nor its general method, but rather a starting point for those types of learning processes that can initiate reflective experiences (English 2013).

A further significant concept connected to Dewey's learning theory is that of "plasticity" (1916/2008, p. 49ff.), which he also calls "educability" (1916/2008, p. 81). The idea that human beings are "educable" connects Dewey's thinking to a long tradition of educational philosophy, e.g., Rousseau discusses *perfectibilité* in *Emile* (1762/1979) and Herbart discusses *Bildsamkeit* [educability] in his *Allgemeine Pädagogik* (1806/1887). These terms refer to the fact that human beings are capable of learning. Dewey connects human plasticity to the idea of "growth." Growth for Dewey is ateleological; it has no predetermined end (1916/2008). Plasticity or educability is possible on both an individual and social level. Accordingly, each human being can change and grow as an individual, and groups of people can transform their ideas and forms of interaction in ways which better serve the group. For Dewey, a central characteristic of democratic societies is that they offer human beings this possibility for individual, and social, change and growth.

Thinking and Teaching

Thinking and teaching are connected in important ways for Dewey, two of which I will discuss here. First, Dewey contends that the task of teaching and formal education on the whole is to initiate processes of thinking in learners: "The sole direct path to enduring improvement in the methods of instruction and learning consists in centering upon the conditions which exact, promote and test thinking" (1916/2008, p. 159). Dewey is known to be critical of transmission style methods of instruction. He believes these do not initiate reflective thinking, rather overload the minds of learners with facts to be memorized and this dulls the mind (e.g., 1916/2008, p. 159). On such models of teaching, learners are viewed as passive recipients of prepackaged knowledge and the classroom is made into a space for such passive reception, which is seen for example, when learners are placed in rows of desks designed to focus their attention on listening to the teacher

(see e.g., 1916/2008 and 1899/2008). Dewey contends that this model of teaching largely results from educational theorists' and psychologists' problematic attempts to translate John Locke's theory of the mind as a blank slate (*tabula rasa*) into educational practice.

Dewey describes the teacher's responsibility in the classroom as one of creating opportunities for "educative experiences," which he contrasts with "miseducative experiences" (1938b/2008). Miseducative experiences are those types of experiences that have the effect of "arresting or distorting" a person's chance at further growth. Educative experiences support one's chances for further growth. These follow two principles: continuity (experiential continuum) and interaction (1938b/2008, pp. 10, 17). To have continuity in our experience means that a person has reflectively examined the connections between what one did and what happened in consequence, in order to expand one's framework of anticipations. Creating such a continuum presupposes that one has interacted with one's environment and located something that was discontinuous with one's expectations (English 2013, pp. 93ff.).

Aiming to avoid miseducative experiences and help create educative ones does not entail that the teacher make everything easier for the child. Rather, as Dewey writes, the "art of instruction" is to find the appropriate challenges for learners that initiate reflective thinking and learning processes, that is, to neither over challenge or under challenge learners (1916/2008, p. 164). Dewey also emphasizes that learners must engage with problems they find within their own process of reflective inquiry, which he calls "genuine problems," in contrast to prepackaged problems handed to them by the teacher. Genuine problems engender learners' thinking processes, in which they have the opportunity to come to analyze their difficulties and learn to find solutions to these. Teaching does not become easier on this model. Rather, Dewey seeks to make clear that teaching in this way is more difficult than teaching to a script, because the teacher cannot always know in advance what kinds of questions, assignments or activities will properly challenge the learners; many of the learners' needs and capacities become known to

the teacher within the moments of interaction and the teacher has to respond to these needs and capacities. In this way, on Dewey's model, the learner co-constructs the situations of education. For these reasons, Dewey writes "the teacher becomes a learner, and the learner, without knowing it, a teacher" (1916/2008, p. 167).

This brings us to the second important connection in Dewey's work between thinking and teaching. Thinking is involved in teaching during the process of designing the lesson plan and developing possible aims for the learners to meet, but also during the teacher-learner interactions which require the teacher to reflectively shift the aims of the lesson, and thus the challenges and questions designed for the learners, in the moment that learners' needs becomes apparent. The teacher has to not only properly plan for learning but also engage with learners in ways that require the teacher's own thoughtful reflection on the learning situations that come about. This notion of teaching as involving reflective thinking that is guided by principles of teaching practice connects to Aristotle's (2000) notion of *phronesis*, that is, the art of making wise decisions in-the-moment, and to the notion of "pedagogical tact" found in the work of Herbart (1806/1887). The idea that teaching is a profession that demands thoughtful interactions and decision-making guided by principles, as discussed in Dewey's work, has influenced contemporary notions of teaching as a reflective practice (e.g., Schön 2005).

Thinking and Education

Dewey's notion of education takes up the ideas of thinking, experience, and learning discussed above. His definition of education contrasts with what he considers the standard or common sense notion of education as transmission of knowledge. On his view, education means the "reconstruction and reorganization of experience," which both "adds meaning" to our present experience and "increases" our ability to direct future experiences, that is, to make choices about how we want to proceed in subsequent actions, which includes choices in the moral realm concerning how we treat others (1916/2008, p. 82, see also 1938b/2008). Meaning is added to our experience when we genuinely seek to take in

and understand the ways our environment (i.e., objects and other people around us) has affected us. In *Art as Experience*, Dewey emphasizes, the reconstruction of our experiences in this way can be “painful”; it involves changes made in us and in the world around us (1934/2008, p. 47; see also, Dewey 1938b/2008, p. 18).

Dewey, John (1859–1952)

Jim Garrison

College of Human Resources and Education
Virginia Tech, Virginia Tech University,
Blacksburg, VA, USA

John Dewey (1859–1952) was a pragmatic philosopher, psychologist, and educator commonly regarded as the founder of the progressive education movement. Dewey was born in Burlington, Vermont, on October 20, 1859. His father was a grocer and Civil War Veteran, his mother a strong-willed evangelical Congregationalist noted for her work with the city's poor. John was a shy and self-conscious boy, and as a man, he never entirely lost these qualities. In 1875, he enrolled in the University of Vermont where he took his BA degree. Although his interest in philosophy emerged as an undergraduate, he was uncertain about his future. He taught high school for 2 years in Oil City, Pennsylvania, and then 1 more year back in his hometown of Burlington where he arranged for private tutorials in philosophy with his former teacher H. A. P. Torrey.

Doubtful of his own ability, Dewey sent two essays to W. T. Harris, editor of the *Journal of Speculative Philosophy*, asking if they showed any talent. Encouraged by Harris's acceptance of these papers, Dewey applied to the graduate program in philosophy at the newly established and innovative Johns Hopkins University. His acceptance did not include a fellowship, so he had to borrow \$500 from an aunt to pay tuition.

At the time, the Johns Hopkins philosophy department was not highly regarded. Three young lecturers carried out the teaching duties. The first was G. Stanley Hall, who became a distinguished child psychologist. The second

was Charles Sanders Peirce, the brilliant, if eccentric, originator of philosophical pragmatism. The third was George Sylvester Morris, a Hegelian. Dewey did not seem particularly interested in the work of Peirce, and the psychology of Hall did not greatly attract him at the time. His passionate desire for organic unity led him to study with Morris, and he completed a dissertation on Kantian psychology under Morris's direction.

Eventually Hall received the only available professorship in philosophy, so Morris left for a position in the philosophy department at the University of Michigan. After several difficult months of unemployment, Dewey joined his mentor in 1884 at Michigan as an instructor. He spent the next decade there, except for 1 year at the University of Minnesota. During these years, Dewey wrote, although with decaying conviction, in the Hegelian tradition of idealism as he found it expressed by British Idealists such as Thomas Hill Green.

At Michigan, Dewey was active in the Student Christian Association and was a member of the First Congregational Church where he taught Bible classes. Dewey's interests in social, political, and economic issues grew increasingly radical as he continued to struggle with issues of unity and religion. He also formed a close personal friendship with the young sociologist George Herbert Mead after Dewey hired him in 1891. Collaborating with Mead further piqued Dewey's interest in the social nature of the mind and the self. In his eulogy for Mead decades later, Dewey would call their friendship "one of the most precious possessions of my life" (LW 6, p. 22) (see Dewey date for abbreviations EW, MW and LW). He married the self-reliant and politically progressive Alice Chipman in 1886. She seems to have awakened Dewey's deeply ingrained sense of social justice and encouraged his entrance into the world of public affairs. Many years later Dewey would say, "the forces that have influenced me have come from persons and from situations more than from books" (LW 5, p. 155). He even agreed to edit a weekly magazine with a socialist orientation called *Thought News*, though it never reached publication. During this time, Dewey's interest in education found stimulation through his membership on a committee that evaluated the State's high schools.

In 1894, Dewey moved to the University of Chicago to head the department of philosophy, psychology, and pedagogy. Mead joined him shortly afterward. Significantly, Dewey did not join a church in Chicago. It was at this time that Dewey began to consider the philosophy of education in a serious and systematic way. In 1896, he founded the University Laboratory School now better known as the "Dewey School." The latter title is unfortunate given all of those that were influential in contributing not only to the running of the school but the ideas developed there. Foremost among these were Ella Flagg Young, the first woman president of the National Education Association. Dewey freely acknowledged her influence on his educational thinking, especially "the translation of philosophic conceptions into their empirical equivalents." The Laboratory School was not a model institution; rather, it truly lived up to its name. It was a place for educational experiments in the genuine etymological sense of experiment, that is, to make a trial of something. Theories and practices were developed, tested, criticized, refined, and tried again. Experimentalism became increasingly important as Dewey's philosophy matured. For him, not only were these experiments falsifiable, but in a contingent evolving world, their generalizability was always subject to revision. There is no end of inquiry for Dewey; nonetheless, he believed it the best way to render human experience intelligent.

The Laboratory School was not the only site for educational research in Chicago at that time. Jane Addams and her work at Hull House, for which she eventually received the Nobel Prize, greatly influenced Dewey. Rosalind Rosenberg writes, "for Dewey, Hull House was a laboratory and an example of what he was trying to accomplish in education" (1982, p. 34). Dewey visited Hull House even before moving to Chicago. Upon his arrival there, Dewey actively participated in the life of Hull House. There he met some of the most influential early feminists whose involvement in the political issues of the day caused by massive immigration, the social and economic effects of urbanization, and rapid technological advance exercised considerable influence. He

also mixed with workers, trade unionists, and political radicals. Some of his most influential educational works emerged out of these laboratories including “My Pedagogic Creed” (EW 5, pp. 84–95), *The School and Society* (MW 1, pp. 1–109), and *The Child and the Curriculum* (MW, pp. 271–291). These works not only set out Dewey’s practical pedagogy, but they also outlined the psychological and philosophical principles upon which it relied. These principles devolved from the trial-and-error experiments that occurred within and without the walls of the Laboratory School.

Dewey left Chicago for Columbia in 1904 because of a controversy over the administration of the Laboratory School. By then, he was a nationally prominent philosopher and educator. *The Journal of Philosophy*, then newly founded at Columbia by F. J. E. Woodbridge, soon became a frequent forum for the discussion of Dewey’s ideas. Teachers College, Columbia, was a magnet for educators around the world. Dewey’s affiliation with this institution contributed to his continuing interest in educational issues and helped assure the dissemination of his theories throughout the world. *Democracy and Education* appeared in 1916 and quickly became a classic work in the philosophy of education.

Dewey never cared for rote memorization of facts, formulas, or mere job training. He did not, however, think educators should ignore issues of social control and classroom discipline or the control implicitly contained in the academic disciplines and skilled practices. He recognized that freedom implies both negative freedom, or freedom from constraint, as well as positive freedom, or freedom for something, some value, some goal. Freedom for requires personal discipline. His 1938 *Experience and Education* was written to correct the excesses of those progressive educators who seemed to think “almost any kind of spontaneous activity inevitably secures the desired or desirable training of mental power” (LW 8, p. 153).

Ensnared in the journalistic capital of the nation, Dewey began to write for influential popular magazines such as the *New Republic* and *The Nation*. Constantly before the public eye for

decades, Dewey was the most public university-based philosopher of the twentieth century. This uncloistered scholarship is consistent with both his personal commitments and his educational philosophy.

Dewey soon gained an international reputation. In the years 1919 to 1921, he lectured in Japan and China. His reception in China was stunning; having survived Maoist communism, his educational theories remain influential there today. He also visited schools, carried out educational studies, or made educational reports in Turkey, Mexico, South Africa, and Russia. In 1937 at the age of 78, Dewey presided over a commission in Mexico that found Leon Trotsky “not guilty” of the crimes alleged by Stalin in the Moscow trials. Dewey voted several times for the Socialist party in the 1930s. Nonetheless, he clearly recognized that orthodox communism as practiced in the Soviet Union was inconsistent with his commitment to fully participatory democracy. For him, the dictatorship of the proletariat was simply dictatorship. Dewey officially retired in 1930, although he continued as professor emeritus until 1939; thereafter, he remained amazingly active until his death in his New York home on June 1, 1952.

Dewey’s philosophy of education is extraordinarily comprehensive. In *Democracy and Education*, Dewey wrote,

If we are willing to conceive education as the process of forming fundamental disposition, intellectual and emotional, toward nature and fellow-men, philosophy may even be defined as the general theory of education. Unless a philosophy is to remain symbolic—or verbal—or a sentimental indulgence for a few, or else mere arbitrary dogma, its auditing of past experience and its program of values must take effect in conduct (MW 9, p. 338).

At first, this may seem nonsense. How can the general theory of education possibly encompass the entirety of philosophy? Dewey’s answer would go something like the following. Societies reproduce themselves in only two ways, biologically and culturally. Education is the site of cultural reproduction. One’s general theory of education is her theory of what is culturally valuable enough in thought, feeling, and action as to

deserve transmission to the next generation. What Dewey offers is philosophy as education.

In Dewey's philosophy, loving and creating surpass mere knowing. "Philosophy" means "love of wisdom"; it derives from the Greek *philein* (to love) and *sophia* (wisdom). Dewey insisted that wisdom is not "systematic and proved knowledge of fact and truth, but a conviction about moral values . . . [It] refers not to the constitution of things already in existence . . . but to a desired future which our desires, when translated into articulate conviction, may help bring into existence" (MW 11, p. 44). It is our fundamental disposition, intellectual and emotional, that, through action, brings into existence future values. That is why philosophy in its etymological sense is the general theory of education.

Dewey is a philosopher of reconstruction who reconstructed his own thinking several times in the course of his life. Dewey would want his readers to approach his philosophy with the same critical and creative attitude. Rather than attempting to state exactly what that philosophy is, and how the orthodox should follow it, it is better to introduce some of the central themes of Dewey's philosophy. This approach allows the reader to decide how to construct, or better still, reconstruct Dewey's educational philosophy into an edifice that satisfies the needs of the reader's time and place.

Dewey was a very private man; however much he may have explored what was surely a spacious psychological interior, he shared little of it with others. One of the few places Dewey did discuss some of the personal as well as intellectual influences on his philosophy was in the essay "From Absolutism to Experimentalism" (LW 5, pp. 147–160). We will draw on this essay to help us trace the influences on Dewey's development. One of the earliest influences was that of T. H. Huxley who Dewey read during his undergraduate days at the University of Vermont. Huxley was Dewey's introduction to Darwinian thinking. Dewey remembered deriving "a sense of interdependence and interrelated unity that gave form to intellectual stirring that had been previously inchoate" (p. 147). Dewey dated the awakening of a distinctive philosophical interest

from this time. The theme of dynamic, open, evolving unity, ranging from the unity of the organism to the unity of a work of art, remained a guiding principle of his philosophy as education. In some important sense, Dewey was an organic holist from the beginning. The influence of Darwin eventually led Dewey to embrace an experimental naturalism wherein human nature is perceived as a part of nature. Dewey's antidualism went very deep.

Darwinian thinking greatly influenced Dewey's philosophy. It was where he first acquired the notion that a human being or community is like a highly complex natural organism that must function within its environment. Successful functioning requires the organism to adapt itself either passively to an existing environment to meet its needs and desires or actively to transform the environment. Indeed, Dewey thought, "The entire process of education may properly be regarded as a process of securing the conditions that make for the most complete and effective adaptation of individuals to their physical and moral environment" (see MW 6, pp. 364–365). In an ever-evolving universe, education is an endless experiment wherein educators aid students in creating ways of actively transforming themselves to secure the most complete and effective adaptation possible. There are no fixed and final laws of education; things are different in different nations and localities or the same place at different times. An educational generalization that holds in one place or for one group of people at one time may not hold for another at another place or another time.

Dewey explicitly rejected "Social Darwinism" with its self-serving and antidemocratic rhetoric about the survival of the fittest. The question is always, fit for what? Dewey learned from Huxley that even laissez-faire economists must weed their garden if they want lovely flowers. Reflective creatures such as we can come to know the environmental contingencies that determine conduct. Through creative inquiry, we can transform the world according to our desires. We can create a world where everyone is fit to survive and thrive, not just those who excel at crude capitalism. Human beings often determine the conditions of

selection, and there need not be any single scale of success.

The community needs individuals to perform a large array of vital functions if it is to thrive. That a given community elects to reward only a small number of those functions, say, entrepreneurial success, is a condemnation of that society. As a neo-Darwinian, Dewey knows the key to survival is diversity, not homogeneity; he knows the racist is simply scientifically wrong. Dewey acknowledged individual differences and inequality in the physical and cognitive performance of various tasks, but a democratic community is primarily concerned with moral equality. Dewey remarks, “moral equality means incommensurability, the inapplicability of common and quantitative standards” (MW 13, p. 299). For Dewey, every individual has a unique potential, regardless of any given physical or psychological inequality. The goal of education is to aid every individual to achieve their unique potential that they may make their unique contribution to society. The result is an aristocracy of everyone:

Democracy in this sense denotes, one may say, aristocracy carried to its limit. It is a claim that every human being as an individual may be the best for some particular purpose and hence the most fitted to rule, to lead, in that specific respect. The habit of fixed and numerically limited classifications is the enemy alike of true aristocracy and true democracy (MW 13, pp. 297–298).

The only way Social Darwinism can gain a foothold is by convincing the community that there are only a very few hierarchies. Social Darwinism has remained influential in the political lives of almost all capitalistic nations. It fails to understand the community as a functionally complex organism in a complex, diverse, and ever-changing environment.

Many overlook the effect of the Romantic poets on Dewey; that is a mistake (see Goodman 1990). In “From Absolutism to Experimentalism,” Dewey recalled that the University of Vermont prided itself on its philosophical tradition, especially that of “the speculative and dubiously orthodox seas of German thinking—that of Kant, Schelling, and Hegel,” though the venture “was largely by way of [Samuel Taylor] Coleridge”

(LW 5, pp. 147). In another reflection on philosophy at the University of Vermont, Dewey notes, “Coleridge in common with the German school which he represented conceived social institutions as essentially educative in nature and function” (LW 5, p. 190). A nation’s schools were, for Dewey, the most obviously important of the educative institutions. Broadly speaking, he embraced Hegel’s thesis of the primacy of *Sittlichkeit* (etymologically related to the German *Sitten*, or custom), the idea that the practices and institutions of the community express the most important norms central to the construction of its members’ identity, over Kant’s *Moralität* (related to the Latin *mores*, or general moral principles). *Sittlichkeit* revolves around our moral obligations to the healthy functioning of a community of which we are a part. On the other hand, in *Moralität* we have an abstract, principled obligation to actualize something that ought to exist not because of participation in a community but because of our individual, fully decontextualized, and rational will. Dewey, though, was wary of too great an identification between a culture’s social institutions and the State. He rejects Hegel’s identification of the community and the State along with the idea that the central role of the community is to express the Idea of Spirit as a manifestation of absolute rational necessity connecting humankind to the world. Dewey entirely naturalizes Hegel, but it is an emergent naturalism and not a reductive materialism. He thought the “subordination of the state to the community” essential in a democracy (p. 193).

Dewey gratefully acknowledges the influence of George Sylvester Morris and the British Hegelians. Dewey never cared much for Kant, his dualisms, or his devotion to the a priori. Dewey thought it important that Morris “came to Kant through Hegel instead of to Hegel by way of Kant” (LW 5, p. 152). The appeal of Hegelianism, for Dewey, lay in its demand for unity. In spite of the artificiality of Hegel’s dialectic Dewey thought, “Hegel’s synthesis of subject and object, matter and spirit, the divine and the human, was, however, no mere intellectual formula; it operated as an immense release, a liberation” (LW 5, p. 153).

Dewey makes much of the fact that Morris “used to make merry over those who thought the existence of this world and of matter were things to be proved by philosophy. To him the only philosophical question was as to the meaning of this existence” (LW 5, p. 152). This wry observation holds as well for Dewey himself. In a certain sense, Dewey was a naïve realist who thought we cannot fail to experience reality, if we are experiencing at all. Where we could go wrong is in our interpretations about its meaning, or our inferences regarding the connections among our experiences of reality. From the very real experience of flying by flapping our arms in a dream, we must not foolishly infer that we can do the same in other situations.

In “From Absolutism to Experimentalism,” Dewey identified “four points that seem to stand out” in his “intellectual development” (p. 156). The first one he mentions is “the importance that the practice and theory of education have had for me” (p. 156). Education holds a central and synthetic place in Dewey’s philosophy. According to him, “This interest fused with and brought together what might otherwise have been separate interests—that in psychology and that in social institutions and social life” (p. 156). Dewey steadfastly asserts his philosophy as education by proclaiming that “philosophizing should focus about education as the supreme human interest in which, moreover, other problems, cosmological, moral, logical, come to a head” (p. 156). Let us examine the fusion of psychology and social life here while taking up some of the many other interests later.

Early in his career, Dewey articulated what he calls “The ethical postulate.” It reads,

In the realization of individuality there is found also the needed realization of some community of persons of which the individual is a member; and, conversely, the agent who duly satisfies the community in which he shares, by the same conduct satisfies himself. (EW 3, p. 322)

Note this is a postulate. It is not a postulate in the sense of a taken-for-granted truth as the basis for reasoning but as a condition necessary for further operations and requiring further experimental inquiry to determine its consequences. It is a contingent and falsifiable statement that

Dewey thought well warranted throughout his career. It is a statement of his reconstructed understanding of Hegel’s *Sittlichkeit*. Dewey thought that the best kind of community for social self-realization was a participatory democracy, which we will take up later. Here, our task is to connect this early statement about social life with Dewey’s later psychology.

For Dewey, to have a mind is to participate in the sociolinguistic practices and institutions of the community that express the most important norms, ideas, and actions central to the construction of a mind. Language is crucial to Dewey’s naturalized account of the emergence of mind: “Through speech a person dramatically identifies himself with potential acts and deeds; he plays many roles, not in successive stages of life but in a contemporaneously enacted drama. Thus mind emerges” (LW 1, p. 135). One acquires a mind by entering the social drama of society, recognizing the roles others play, and playing roles others can recognize. Dewey makes a distinction between “individual minds” and “just individuals with minds” (p. 169). The latter are simply docile and conforming reproductions of the existing social order. Because of conformity to existing social institutions, they have failed to recognize their unique individual potential. Hence, they are unable to make their unique contribution to the realization of some community as indicated by the ethical postulate.

Dewey, as we have seen, is concerned with both negative and positive freedom in the relation between the individual and the community. Educators are responsible for disciplining the individual to understand and appreciate the existing norms and practices of a culture. However, they should do so in such a way as to realize unique individual potential. This implies educating the individual’s creative and artistic ability as well as their ability to engage in critical inquiry and, if necessary, carry out the reconstruction of the existing social order to evolve a better society in the future.

The second influence on his intellectual development that Dewey acknowledges is his concern over “the intellectual scandal of dualism in logical standpoint and method between something called

‘science’ on the one hand and something called ‘morals’ on the other” (LW 5, p. 156). This concern led to his elaborating a position he called “instrumentalism.” Educators usually acquire their familiarity with Dewey’s instrumentalism from his *How We Think* (MW 6, pp. 177–356); revised version (LW 5, pp. 105–352), although a far more complete and detailed account is offered in *Logic: The Theory of Inquiry*. That Dewey’s *How We Think* does not provide his entire theory of inquiry is understandable since he wrote both versions specifically with the needs of educators in mind (see LW 12, p. 3).

The first version acknowledges, “My fundamental indebtedness is to my wife, by whom the ideas of this book were inspired, and through whose work in connection with the Laboratory School, existing in Chicago between 1896 and 1903, the ideas attained such concreteness as comes from embodiment and testing in practice . . . [A]nd to Mrs. Ella Flagg Young, then a colleague in the University, and now Superintendent of the Schools of Chicago” (MW 6, p. 179). This acknowledgment underscores the fact that the Laboratory School really was a site of practical experimentation carried out in collaboration with other researchers with whom Dewey exchanged ideas.

In *How We Think*, Dewey presents a version of his logic, or theory of inquiry, for educators. Dewey did not separate thinking and feeling from acting. In *How We Think*, Dewey presents a five-step analysis of effective inquiry.

1. The first step involves the occurrence of a problem. Like other pragmatists, Dewey thought all inquiry began with a genuine doubt. Peirce showed that Cartesian doubt was insincere; we cannot place ourselves in doubt at will, we are thrust into doubt when our habitual ways of acting fail us in some situation. The initiation of inquiry occurs when we feel a disruption in activity and do not know how to go on. Actually, Dewey is quite clear that the “unsettled or indeterminate situation might have been called a problematic situation. This name would have been, however, proleptic and anticipatory” (LW 12,
2. Next comes the specification of the problem. Dewey remarks, “It is a familiar and significant saying that a problem well put is half-solved. To find out what the problem and problems are which a problematic situation presents to be inquired into, is to be well along in inquiry” (LW 12, 112). To achieve this, data is selected (it is never “given,” for Dewey), structured, its conditions specified, operations carried out, and consequences noted. In most cases there are no rules governing the selection of data or the determination of conditions and consequences. This does not mean that students cannot refine their selectivity or sharpen their intuitions through reflective practice. Among the good habits of inquiry that Dewey thought we could teach, or at least reinforce, are curiosity, orderliness, alertness, and flexibility.
3. The third step involves introducing a supposition, a hypothesis, or a suggestion that, if correct, would solve the problem. The construction of hypotheses involves the creative use of imagination to develop possible solutions. It also requires careful analysis of data. Further, the hypothesis must be testable. Formulating a hypothesis is not an entirely rule-governed activity, but it does require self-control, skill, and precision. Students must learn to distinguish between carefully constructed hypothesis and wild guessing based on uncontrolled emotions, whimsical imagination, and wishful thinking.

p. 111). Elsewhere, in “Qualitative Thought,” the most crucial single essay for understanding Dewey’s aesthetics, he observes that “intuition precedes conception and goes deeper” (LW 5, p. 249). Earlier, in “Affective Thought,” Dewey wrote that “reasoning is a phase of the generic function of bringing about a new relationship between organisms and the conditions of life, and like other phases of the function is controlled by need, desire and progressive satisfaction” (p. 106). For Dewey, reason, or better still the “general method of intelligence,” was practical reasoning, and practical reasoning is always reasoning for some value, some desired object, some “end-in-view” that arises in some specific context.

4. Fourth, the hypothesis requires elaboration as to possible consequences. It must be compared to other hypotheses to determine its relative value among them. Inferences and implications need drawing out. Is the data quantifiable? If so, how? Does quantification help or hinder? Measurement and quantification is never an end in itself, only a means to solving the problem. Inquirers should ask if qualitative techniques might work better. Is it possible to generalize the hypothesis? All this calls for finesse as much as technique.
5. Having elaborated the hypothesis by a course of reasoning it is time to test it experimentally. The inquirer must carry out operations that establish conditions in accordance with the dictates of the hypothesis to see if the idea actually works out and the consequences intended occur. If they do, then there is warrant for believing that the idea or course of action is true, or as Dewey preferred to put it, has “warranted assertibility” (LW 12, p. 15). Elsewhere, Dewey states, “[T]his is the meaning of truth: processes of change so directed that they achieve an intended consummation. Instrumentalities are actually such only in operation” (LW 1, p. 128). Dewey emphasized not only the falsifiability of scientific claims to truth, he allowed for their complete contingency.

Because Dewey praises the achievements of scientific methodology and experimentalism in both versions of *How We Think* and other works, many have mistakenly critiqued him for being scientific. One such critic was Laurence Buermeyer, himself an instrumentalist and a pragmatist. Buermeyer thought Dewey five “steps” too linear and simple to capture the true complexity of inquiry. Dewey agreed and suggests that Buermeyer “was handicapped by the fact that the analysis which he takes as the subject of his criticism was written for pedagogical purposes rather than for strictly logical ends” (MW 13, 61). In his response, Dewey makes it clear that the “steps” are not “chronological” or even absolutely distinguished. The “steps” are just useful distinctions within one body of inquiry; we separate them as we may the heart, lungs, and circulatory system.

The distinctions are useful only for analysis, explication, and pedagogy. That does not mean the pedagogical distinction is not important.

In *Democracy and Education*, Dewey is clear that method is not separable from subject matter. For him, method, or structure, is structure for a purpose: “Method means that arrangement of subject matter which makes it most effective in use. Never is method something outside of the material” (MW 9, 172). When the use is pedagogical, we should arrange the subject matter to make it most effective for teaching others. Dewey clearly states, “The subject matter of the learner is not . . . identical with the formulated, the crystallized, and systematized subject matter of the adult” (p. 190). The same holds for any pedagogical situation. That is, “the teacher should be occupied not with subject matter in itself but in its interaction with the pupils present needs and capacities. Hence simple scholarship is not enough” (p. 191). Subject matter knowledge alone does not make a good teacher. Teachers teach subject matter to students. It is a triangle enclosing a pedagogical space. Just teaching the subject matter does not mean one is teaching well. To teach well, the teacher must connect the subject matter to the needs, desires, interests, stage of cognitive development, etc. of the student, within the physical, social, and political context that the students and teachers find themselves. Good teaching requires moral as well as cognitive perception of the needs and abilities of the student. It also requires a complete and confident command of the subject matter to reconfigure it to meet the needs of every individual student. When Dewey wrote *How We Think* he repeated a strategy he used often; he wrote pedagogically. That is, he adapted his subject matter for his audience to meet their needs and interests. Ignoring the pedagogical component that pervades much of Dewey’s work leads many to misunderstand it terribly. They misunderstand it because they misperceive the audience a given work addresses.

Recall that Dewey thought his instrumentalist logic could bridge science with morals. Dewey insisted that “rationality is an affair of the relation of means and consequences, not of fixed first principles as ultimate premises” (p. 17). The

consequences that most concern us are values, including moral values. A complete discussion of the relation between science and morals is beyond the confines of an encyclopedia entry. Dewey explicates most of the connections in his *Theory of Valuation* (LW 13, pp. 189–251) where he explicates the role of inquiry in distinguishing immediate, unreflective values from those values worth retaining upon reflection because their consequences contribute to human flourishing. Students who learn to use the five steps found in *How We Think* are better able to distinguish objects of immediate desire from the truly desirable. For Dewey, the key to freedom is intelligence. If we can become aware of the contingencies of our environment that control our conduct, then we can alter those contingencies, thereby altering ourselves. The most important contingencies derive from the community in which we live and actualize ourselves.

In his 1938 *Logic*, Dewey gave his most complete definition of inquiry:

Inquiry is the controlled or directed transformation of an indeterminate situation into one that is so determinate in its constituents distinctions and relations as to convert the elements of the original situation into a unified whole. (p. 108)

Individuals or societies are not in a situation like flies in a jar. Situations are an intimate, interconnected functional relation involving the inquirer and the environment. The resolution of a problematic situation may involve transforming the inquirer, the environment, and often both. The emphasis is on transformation. Dewey insisted that “science itself is but a central art auxiliary to the generation and utilization of other arts” (LW 10, 33).

The third influence identified by Dewey in “From Absolutism to Experimentalism” is the “biological conception of the psyche” as found in the *Psychology* of William James (LW 5, 157). Combined with his neo-Darwinianism, James confirmed Dewey’s naturalism while appealing to his desire for organic unity. Dewey observes, “Many philosophers have had much to say about the idea of organism; but they have taken it structurally and hence statically. It was reserved for James to think of life in terms of life

in action” (p. 158). The etymology of pragmatism flows from the ancient Greek *pragma*, meaning act, deed, affair, although pragmatists are most interested in intelligent action. The crucial idea connecting biological functioning with mental functioning, for James, is habit. This continuity breaks down the modern dualism between mind and body. James borrows this idea from his close friend Charles Sanders Peirce. Peirce (1992) thought that “learning, which is the preeminent ingredient and quintessence of reason, has its physiological basis quite evidently in the most characteristic property of the nervous system, the power of taking habits” (p. 264). From his reflections on habit, James (1890/1950) draws a valuable pedagogical principle:

The great thing, then, in all education, is to make our nervous system our ally instead of our enemy . . . For this we must make automatic and habitual, as early as possible as many useful actions as we can . . . The more of the details of our daily life we can hand over to the effortless custody of automatism [habit], the more our higher powers of mind will be set free for their own proper work. (Vol. I, p. 122)

Purely cognitive psychologists who separate mind from body and thought from feeling can never arrive at such a powerful conclusion. One only has to look at the almost exclusively cognitive curriculum in most schools to realize James’s immensely powerful, though simple, principle is still underappreciated. Usually we confine the body to gym class; elsewhere emotions are the source of disciplinary problems teachers must suppress. The result often destroys the desire to learn. We may understand much of Dewey’s educational philosophy as the result of experimenting with the conditions and consequences of applying James’s principle.

Dewey’s understanding of the functioning of habit is not mechanical and rationalistic. He writes, “Rationality . . . is not a force to evoke against impulse and habit. It is the attainment of a working harmony among diverse desires. ‘Reason’ as a noun signifies the happy cooperation of a multitude of dispositions” (MW 14, p. 136). For Dewey, ‘Reason’ is not an antecedent force which serves as a panacea. It is a laborious achievement of habit needing to be continually worked over”

(p. 136). The laborious achievement of a working harmony among diverse desires is an aesthetic comprehension of rationality.

James succeeded in developing a functional psychology that overcame the dominant idea of the mind as a substance. As James V. Wertsch (1985) has observed, “much of [Lev] Vygotsky’s admiration of William James stemmed from the fact that the latter had rejected substantialism” (p. 200). It is here that Russian and North American psychology, including recent developments in educational psychology, meet. Dewey (1911a/1978) provides the following definition of a function: “Any process sufficiently complex to involve an arrangement or coordination of minor processes which fulfills a specific end in such a way as to conserve itself is called a function” (MW 6, p. 466). He continues, “The sum total of functions, in their reciprocal adjustment to one another constitute life, which accordingly, is defined in the same way as a function” (p. 467). These functionally coordinated living processes develop naturally from and with the rest of nature. At the University of Chicago, Dewey and his colleagues succeeded in developing this biologically based functional psychology to the point that today it is the most prominent presupposition in most kinds of North American psychology.

Besides habit, Dewey’s biologically based functional psychology emphasizes action, need, desire, and interest. Again, the relation of the individual to her or his world is functional, we may separate them for methodological purposes, but we cannot understand what motivates someone without understanding them as an active functional unity of organism and environment. That is the clue to understanding Dewey’s definition of interest: “Any concrete case of the union of the self in action with an object and end is called an interest” (LW 7, p. 290). Organic, functional interdependence is also the key to understanding Dewey’s theory of internal motivation:

Because an interest or motive is the union in action of a need, desire of a self, with a chosen object, the object itself may, in a secondary and derived sense, be said to be the motive of action . . . It is true enough when we take the whole situation into account that an object moves a person; for that

objet as a moving force includes the self within it. Error arises when we think of the object as if it were something wholly external to the make-up of the self, when it operates to move the foreign self (LW 7, pp. 291–292).

The transactional functional unity of the self (organism, knower, subject, and mind) and the world (environment, known, object, and body) is Dewey’s full solution to Cartesian dualism. It is also an original contribution to understanding educational motivation.

Development, including educational development, for Dewey did not involve an unfolding of latent potential. Indeed, Dewey rejected the very notion of latent potential:

To say that an apple has the potentiality of decay does not mean that it has latent or implicit within it a causal principle which will some time inevitably display itself in producing decay, but that its existing changes (in interaction with its surroundings) will take the form of decay, if they are exposed to certain conditions not now operating. (MW 8, p. 11)

For the apple to realize its potential it must engage in definite interactions, or better still, transformative transactions, with its surroundings. This viewpoint has immense implications for physical, psychological, and moral development. Acorns do not become oak trees because that is their latent potential, their immanent telos. Rather, what acorns become depends on the transactions they engage in. Acorns often become food for squirrels that need and desire them to survive. For acorns to become oak trees, they must engage in many harmonious transactions with air, water, soil, and sunshine. The same holds for a human being. If they are to grow healthy and strong, they too need to engage in harmonious transactions, especially with other human beings.

Regarding the fourth influence on him, Dewey notes, “The objective biological approach of the Jamesian psychology led stright to the perception of the importance of distinctive social categories, especially communication and participation (LW 5, 159).” The connection is easy to see; James (1890/1950) writes, “Habit is thus the enormous fly-wheel of society, its most precious conservative agent” (p. 122). We acquire our habits from our habitat, especially our social habitat.

Significantly, the first chapter of Dewey's *Human Nature and Conduct* is titled "Habits as Social Functions" (p. 15).

We have already seen that, for Dewey, to have a mind is to participate in the discourse practices of a community. Together, Dewey and Mead worked out the notion that to have a self is to take the role of others in interpreting one's acts. Both the mind and self are entirely social, although, as noted earlier, one may come to have an "individual mind" if they do the hard work of critical reflection on, caring connection with, and creative transformation of their culture.

On such a philosophy, the "other" is always already present within our "selves." One way to understand freedom is to think of it as being open to the possibility of telling an original story of our lives. We will never acquire the vocabulary, grammar, spelling, or plot lines necessary for telling an original story from those who are just like us. Pluralism and difference is the key to becoming an individual mind, not just an individual with a mind. We need others to become free. A pluralistic democratic community that encourages dialogues across differences best meets this need. Dewey's ideal of a participatory community is one of pluralistic community. This position is different from that of Habermas. There are no transcendental ideals of "rational" communication, only the meliorist hope in a value that may function as an "end-in-view" to guide inquiry in the quest to realize desirable consequences in the particular situation we find ourselves.

For Dewey, education is a social function. Until we know what sort of society is best, we do not know what sort of education is best. Dewey develops two criteria for evaluating any society. They are "How numerous and varied are the interests which are consciously shared? How full and free is the interplay with other forms of association?" (LW 9, p. 89). Oppressive societies, such as those devoted to Social Darwinism, eliminate diverse interests in favor of the special interests of the powerful few. Such societies are maladaptive because they are unable to respond agilely to environmental change. Diversity provides alternatives, thereby funding freedom. We should deliberate upon all modes of life intelligently, even if

ultimately we reject them as unable to satisfy our needs and dreams. The danger in a society having narrow interests is that instead of attending to the interests of others and the possibilities they express, the prevailing purpose becomes, as Dewey puts it, "the protection of what it has got, instead of reorganization and progress through wider relationships" (MW 9, p. 91). Isolationism reduces freedom because it reduces our capacity to imagine the alternative possibilities that aid free choice and action. Isolationism is self-oppression. Dewey concludes,

The two elements in our criterion both point to democracy. The first signifies not only more numerous and more varied points of shared common interest, but greater reliance upon the recognition of mutual interests as a factor in social control. The second means not only freer interaction between social groups . . . But change in social habit — its continuous readjustment through meeting the new situations produced by varied intercourse. (MW 9, p. 92)

By the standards of freedom, creativity, and dialogue, pluralistic democracy is, for Dewey, the best possible society we know of for sustaining growth. We may wonder what Dewey means when he says that the first element signifies mutual interests as a factor in social control. These lines should clarify:

The reasonable act and the generous act lie close together. A person of narrow sympathy is of necessity a person of confined outlook upon the scene of human good. The only truly general thought is the generous thought. (LW 7, p. 270)

It is worth noting that sympathy for Dewey has a logical function. It limits universal generalizations in the social and moral sciences. This logical limitation may also serve to encourage democratic and pluralistic dialogue at the limits.

Dewey understood democracy as moral, economic, and educational, not just political. His pluralistic conception of democracy leads him to the following definition of democracy:

A democracy is more than a form of government; it is primarily a mode of associated living, of conjoint communicated experience. The extension in space of the number of individuals who participate in an interest so that each has to refer his own action to that of others, and to consider the action of others to

give point and direction to his own, is equivalent to breaking down barriers of class, race, and national territory which kept men from perceiving the full import of their activity. (MW 9, p. 93)

The governmental structure assumed by a democracy is of secondary concern. It does not matter as long as it promotes communication. Conversation for Dewey is about creating and sharing meaning; it is about growth. We may secure and continue the conversation in many diverse ways, and diversity is the key to creative conversation; it is also the key to good classrooms.

For Dewey, democracy is the most logical form of government. Further, he asserts that democracy is the best way to pursue logic. Dewey affirms that for logic, “The final actuality is accomplished in face-to-face relationships by means of direct give and take. Logic in its fulfilment recurs to the primitive sense of the word: dialogue. Ideas which are not communicated, shared, and reborn in expression are but [monological] soliloquy, and soliloquy is but broken and imperfect thought” (LW 2, p. 371)). Dewey’s etymology here is correct: *Logos* derives from the ancient Greek for speech or word. He believes that “Logic is a social discipline . . . Man is naturally a being that lives in association with others in communities possessing language, and therefore enjoying a transmitted culture. Inquiry is a mode of activity that is socially conditioned and that has cultural consequences” (LW 12, pp. 26–7) By adding different voices to a conversation, we may alter the conditions of rational inquiry; we may also reconstruct social conditions. So, also, will the canons of rationality. Dewey holds a communicative theory of rationality and democratic social action.

The goal of Dewey’s philosophy as education is to release the human potential for growth. Growth through freedom, creativity, and dialogue is, for him, the all-inclusive ideal, the greatest good. For example, in *Democracy and Education* he asserts, “Since growth is the characteristic of life, education is all one with growing; it has no end beyond itself” (MW 9, p. 58). For Dewey, the capacity to cultivate growth is the criterion for evaluating the quality of all social institutions.

Dewey believes that democracy is the social structure that contributes most to freeing intelligence to grow, and, therefore, education should be democratic. He writes,

The aim of education is to enable individuals to continue their education . . . the object and reward of learning is continued capacity for growth. Now this idea cannot be applied to all the members of a society except where intercourse of man with man is mutual, and except where there is adequate provision for the reconstruction of social habits and institutions by means of wide stimulation arising from equitably distributed interests. And this means a democratic society. (p. 107)

Dewey favors a planned over a planning society. He thought an education that emphasizes community, communication, intelligent inquiry, and a reconstructive attitude can best serve the citizens of an ever-evolving world. For him, it is clear that a democratic society is the best choice in the long haul.

Dewey’s philosophy is far from exhausted. In the last 20 years, there has been a great renewal of interest in his philosophy as education. Richard Rorty’s (1979) reliance on Dewey in *Philosophy and the Mirror of Nature* is a landmark. The publication of an authoritative biography by Robert B. Westbrook (1991) has greatly aided this renaissance. Steven C. Rockefeller (1991) also provides an in-depth study of the more personal side of Dewey, one which concentrates on Dewey’s religious thought.

We may conveniently divide the new scholarship on Dewey into two kinds. The first identifies and develops themes already present in Dewey’s work, though previously overlooked. Examples include: Larry Hickman’s (1990) *John Dewey’s Pragmatic Technology* shows that there is an implicit philosophy of technology in Dewey’s work that plays a central role in his entire philosophy, including his philosophy of education. Hickman is the director of the Center for Dewey Studies at Carbondale. Thomas M. Alexander (1987) did the groundbreaking work on Dewey’s struggle in the last decades of his life to develop an aesthetics that would unify his entire philosophy. There are many direct applications of Dewey’s aesthetic to education in Jim Garrison’s (1995) *The New Scholarship on Dewey* and

Phillip W. Jackson's (1998) *The Lessons of Art*. Jim Garrison's (1997) *Dewey and Eros* has identified the crucial role played in Dewey's educational philosophy by the classical Greek concept of educating eros, or passionate desire, to desire the good in Dewey's theory of education.

The second kind of work constituting the new scholarship involves creative extensions and reconstructions of Dewey's philosophy. The development of a transactional theory of literary interpretation by Louise M. Rosenblatt (1978) is a fine instance. Another good example is Charlene Haddock Seigfried's (1996) criticism and creative reconstruction of Dewey in initiating her program of feminist pragmatism. Finally, Hans Joas (1996) has used Deweyan pragmatism to develop a theory of creative action that he claims unifies communicative, interpretive, and instrumental action, thereby going beyond the work of Habermas.

It will require an entire generation of research to integrate this new scholarship into a practical philosophy of education. That, however, seems appropriate given that Dewey is a philosopher of endless reconstruction in an ever-evolving, never-ending world. There is no rest for those who live by means of creative action.

Dewey's Social Philosophy

Lynda Stone

University of North Carolina, School of Education, Chapel Hill, NC, USA

Introduction

John Dewey was known as America's quintessential philosopher of the early twentieth century. Along with William James and Charles Sanders Peirce, he was one of the founders of the philosophical tradition known as pragmatism. This tradition grew out of a distinct US context; it rose and fell in prominence across the century. A late-century renaissance in Dewey and pragmatism especially demonstrates its significance as a social theory. Across the same decades, Dewey's importance spread worldwide as an educational reformer. This is ironic as he was first and foremost a philosopher and not an educator.

Dewey and his first wife Alice were heavily involved in the practice and theorizing of

schooling at the turn of the twentieth century when their own children were young. The laboratory school that they founded at the University of Chicago and Dewey's talks to parents and public essays for educators remain significant today. Across his writings, Dewey's focus in education shifted; however, he paid much less attention to schooling and much more attention to a broad social conception of a society in which education in and for a democracy is paramount. It is this conception, from Dewey as social philosopher, that is the focus of this entry. Given a twenty-first century mentality seemingly worldwide on a narrow view of schooling on measurable achievement and competitive credentialing (and turbulent global times), this socially focused theorizing may be the best educational vision for a better world.

A Philosophical Context

In 1979 a publishing event occurred that changed the face of philosophy although some scholars in the discipline continue today to refuse to face its significance. Analytically trained, Richard Rorty's *Philosophy and the Mirror of Nature* appeared. Therein he takes on the leading American philosophers of his generation, pointing to fissures in the paradigm of logical positivism by the works of Willard Van Orman Quine, Nelson Goodman, and Wilfrid Sellars. Rorty's project overall undermines philosophy's traditional search for certainty and foundations (Rorty 1979; West 1985). A multi-genre discipline emerges post-analytic, neo-pragmatist, and post-structuralist blurrings that redefine philosophy by inserting influences from literary culture, science, and moral theory (Rajchman and West 1985). This new tradition is best described as social theory. It is social because, as becomes obvious across the twentieth century and as described by neo-pragmatist Cornel West, knowledge originates in the use of language that is public and intersubjective.

The contributions of Rorty and others produce a sea change beyond philosophy that is known as the linguistic turn. In *Mirror* Rorty joins Dewey to Heidegger and Wittgenstein as the most

significant philosophers of the twentieth century. This entry on Dewey's philosophy is premised on the historicist belief that one cannot read him today without taking the linguistic turn into account. Moreover, the thesis is that Dewey's philosophy is social philosophy that presages more contemporary developments. Dewey is not a social theorist in today's terms but his work has strong affinity. A basis for this thesis is a conception of social context that actually can be found throughout his writings. The entry is organized as a set of descriptive social contexts, biographical, philosophical, and democratic. While education does not appear until the end, the underlying purpose of the entry is expressed by philosopher Steven Cahn: "For Dewey, all social philosophy was at bottom philosophy of education implicitly or explicitly" (Cahn 1991, p. xvii). Understanding Dewey's social philosophy locates education within a broader vision of a social order and of democracy. As indicated in the introduction, this vision may indeed offer insights for educators that extend beyond but can reform schools and the lives of teachers and students.

There are other ways to interpret Dewey and his place in the history of philosophy and for education. After all his speculative writings are very comprehensive, incorporating modern sub-topics such as epistemology, ethics, and aesthetics. For example, interrogating his writings on knowledge has led to one neoclassical characterization for educational research based in Dewey's psychology and focused on science, inquiry, and action (Biesta and Burbules 2003). Additionally, the change introduced above also has had different broad interpretations such as a Deweyan "post-postmodernism" (Hickman 2007).

As part of the history of philosophy, Dewey responds to writings that come before his time. Not quite in Rorty's later idiom, his view is anti-systemic, anti-absolutist, and anti-dualist. One way to see his position is precisely what Dewey writes about when and how a philosopher and his theory comes to be written; these are historical – and thus social – conditions. Rather than immutable knowledge, Dewey posits that philosophers such as Plato and Locke write in their own times of strife and conflict. Ironically

each proposal for a system for all time has been superseded by another (Dewey 1988b). Dewey comes to see the seriousness of history in his own work most clearly in a reintroduction to his programmatic essay, *Reconstruction in Philosophy* (Dewey 1988e). He writes,

the distinctive office, problems, and subjectmatter of philosophy grows out of the stresses and strains in the community life in which a given form of philosophy arises... and vary with the changes in human life that are always going on and that at times constitute a crisis and a turning point in human history (p. 256).

Dewey means here that all philosophy is historically contextualized and so must his own that does include the significance of World War I in his life (Ryan 1995). A first social category in his philosophy is thus biographical.

Biography

Dewey lived a long fruitful life as professor, public intellectual, and philosopher, born in 1859 and dying in 1952 at the age of 93. Raised in New England's Vermont, Dewey attended public schools, elementary through college – the University of Vermont in his hometown of Burlington. His first unsatisfying occupation was school teacher. Receiving some encouragement about philosophical acumen, he then attended the first US graduate school, the Johns Hopkins University, and it is noted with a virtual lack of personal financial backing. Graduating, his first professorial positions were at the new public universities at Michigan and Minnesota. His excellent early productivity led to his appointment also at a new institution, the University of Chicago. As the university gained prestige so did Dewey and following a tumultuous event involving the leadership of the laboratory school, he moved to Columbia University in 1904. New York City was to be his home for nearly 50 years. While he did have an appointment in pedagogy at Chicago and was associated with Teachers College at Columbia, he is best recognized as a philosophy professor.

Dewey's writings reflect dominant American values even as he most often reinterprets them.

They include rewritings of individualism, community, and democracy. He was a man of his time, what is known as the Progressive Era, roughly 1870–1920 (McGeer 2003). Life in these decades was complex, of great societal inequalities arising from vast changes in American immigration, urbanization, and industrialization. Dewey's own reform efforts were local as well as international: for example, from working at the Hull House settlement of Jane Addams in Chicago to joining President Woodrow Wilson in advocating America's entry into World War I. He belonged to many social groups. Indeed he helped found the American Federation of Teachers and the National Association for the Advancement of Colored People. In later life he considered himself an American socialist. Dewey was a well-intentioned radical of his day even as the era and the man were not without fault. Of note, the most important and comprehensive intellectual biography is Robert Westbrook's *John Dewey and American Democracy* (Westbrook 1991).

Contemporary historian Louis Menand offers a useful characterization of pragmatism that focuses on the founders, Peirce, James, and Dewey, and adds the contributions of several others. Of note, Dewey recounts his vital debt to James in his only autobiographical essay, "From Absolutism to Experimentalism" (Dewey 1988c). Significantly different from traditional philosophy, each theorist poses a singular philosophy. Logic, religion, science, law, and societal conditions are all topics written about by classical pragmatists. Pragmatism, according to Menand (1997), is an account of the way people think in actually coping with the world. Dismissed are abstractions or formulas of rationality and truth. There is no absolute truth, no absolutes of any kind upon which to base everyday life. Coping entails action, and all action is to be judged by its consequences, its effects by what it "dictates or inspires," Menand writes (p. xiii). A final point, given an American culture with all of its integral and enduring diversity, pragmatic action exhibits a down-to-earth quality, a practicality and utility, and a tenacity in working with problems. In its less than best actions, it is anti-intellectual and crassly utilitarian – settling for "what works" as short-sighted solutions.

Social Philosophy

Following an early interest in absolute idealism influenced by mentor neo-Hegelian scholar George Sylvester Morris, Dewey became increasingly interested in thinking about and responding to what he termed “the social subjects” as the focus of his pragmatism. Across his career, a set of concepts emerged to characterize his philosophy in both the abstract, disciplinary sense, and in the concrete, everyday problem-solving sense. Some are more directly contextual and some more indirect, and both, as they overlap in his writings, can be understood as integral to his social philosophy (see Toulmin 1988).

Dewey's first published article appeared in 1882 and the last posthumously in 1953. His collected works comprise 37 volumes brought together in three chronological series, Early, Middle, and Late Works (1969–1991). In recent years, American philosophers have subdivided his writings into traditional categories, such as moral philosophy and political philosophy. For them a “social” category may be too broad, too unfamiliar in the times of analytic dominance, or implied but lacking significance. From above, Rorty does support a social interpretation with his statement that “‘justification’... for Dewey’s conception of knowledge... [is] a social phenomenon rather than a transaction between ‘the knowing subject’ and ‘reality’” (Rorty 1979, p. 9). Westbrook offers his own rendering of Dewey’s “social philosophy,” although demurring that his text “is not quite... [a] full intellectual biography” (Westbrook 1991, p. 9).

Dewey’s biography, especially in its historic times, forms an external context for this social philosophy. A second context internally organizes his philosophy and is constituted of a set of “social” concepts that make his philosophy like no other. Of significance, Dewey does write about context, primarily with regard to language and its use. It is the background that is taken for granted in understanding words, symbols, and the like (Ratner 1989, p. xi). In the essay, *Context and Thought*, published in 1931, he first critiques analytic philosophy for ignoring context and then turns to a general discussion of “selective

interest.” It extends from spatial and temporal background to existential and theoretical interest (Dewey 1989). Of special importance is Dewey’s beginning attention in this essay to culture: thus culture for him prefigures language and not the other way around.

In an initial internal category, Dewey’s philosophical intent is problem resolving, practical, provisional, and especially skeptical. Foremost in this category is a premise that life is inquiry, a flow of constant meaning making. This flow is dynamic, moving within bounded problematic situations that are indeterminate, confusing, and conflictual even. These brief or protracted moments require resolution that is provisional since within the flow a next situation “always” arises. Moreover since flow is life, situations are always potentially practical, requiring action as part of what Dewey identifies as the denial of any a priori model of knowledge in favor of “the actual reasoning practices of human thinkers” (Toulmin 1988, p. xxii).

Next, Dewey’s philosophical form is organic, holist, and isomorphic. Organic for Dewey means natural from nature, with all life and thought arising in a Darwin-inspired context portending a modernist progress. In Dewey’s holism types of thought processes or domains of intellectualism are not distinguished. His stance is that philosophy is always fully funded and value-laden in which, for instance, a particular moral import cannot be separated from thought and action. Isomorphism refers to a repetition of basic organization of social processes and forms; the problem-solving of an individual is replicated in that of any larger group.

Lastly, Dewey’s philosophical process is, first, in thought that is abstract and reconstructive and, second, in the concrete that is experiential, experimental, and consequentialist. Perhaps reconstruction is Dewey’s singular methodological contribution. Appearing across selected writings, he delves into philosophical pasts for positions and proposes a reconfiguring of one contemporary – reminiscent of a dialectic. Most characteristic of the pragmatism of Dewey’s time and influenced by James, experience is Dewey’s basic process unit. Experimentalism takes

experience into the realm of problem-solving; in Dewey this reflects an idea in how human thought and action function and from that in science. Finally consequentialism is the means and ends of problem-solving: it is only in the carrying out of action that effects can be recognized and, at the utmost, serve as warrants for truth claims.

At this point, one might say that Dewey's philosophy is social "all the way down." Elaborating on the central idea of experience, this is manifest in a basic organic process of interaction, of organism and environment: the social enters when the organism is a human being interacting with all sorts of environments and typically with other humans. Dewey takes this process into discussions of human organization. Differing and responding to an emphasis on the personal psychology of his day, Dewey's writings do refer to the individual but increasingly focus on active groups. The individual is always in interaction with others; contemporary debate concerns whether interaction or transaction best conceptualizes this process.

Democracy

The final context in Dewey's social philosophy is democracy, often described as his overall project (Westbrook 1991; Bernstein 2010). This commitment surely has roots in his middle class, Vermont background. His writings begin with an essay "book review" in 1888 in which democracy is characterized as a social and ethical unity and not just political. Dewey continues the latter idea in his most renowned work, *Democracy and Education* (Dewey 1985). Therein he offers this definition: "democracy is more than a form of government; it is primarily a mode of associated living, of conjoint communicated experience" (p. 93). Further, association is created by voluntary disposition and interest and itself furthered democratically by the action of social groups. Participation that is democratic is in depth in one's own group and by extension in contact with groups that are different. Beyond this textbook presentation, Dewey elaborates on association with other works especially in the 1927

volume, *The Public and Its Problems* (Dewey 1988a). For him association is organic; it is social and societal in modes of organization and conduct, and importantly it contributes to other, more intentionally, moral forms of human life. *Public* is acknowledged as Dewey's most political work; reconstructions of the public, the State, and the community – for him a search for the great community – are central.

It is in this context of democracy that Dewey most clearly identifies his philosophy as social. Two addresses from different but "similar" times are exemplary. First from 1918 he asks if there is a philosophy that is "distinctive of a social order, of democracy" (Dewey 1988d, p. 43). His answer, interestingly, differs from other modern philosophers in "returning" to a classical root, to emphasize desire and wisdom herein rather than knowledge and science. Discussing in his own way liberal values of liberty, equality, and fraternity, he restates his basic definition of associated individuals in intercourse with others that "makes the life of each unique" (p. 53). "Creative Democracy – The Task Before Us" (Dewey 1991b) is the better-known second address read in his absence at an eightieth birthday party in his honor.

Dewey's writings on democracy, it should be clear, appear at various historic moments but perhaps exhibit special urgency during international crisis; in these two pieces, one cannot help but recall the historical contexts of 1918 and 1939! In the second, short essay, Dewey does call for deliberate attention to democratic institutions and duties that, once again, are more than political. What is especially significant is the need for individual commitment through expression of character and attitude especially across differences and conflicts. One emblematic statement is this:

The heart and final guarantee of democracy is in free gatherings of neighbors on the street corners to discuss back and forth what is read in uncensored news of the day. . . . Intolerance, abuse, calling of names because of differences of opinion about religion or politics or business bars [sic] freedom (p. 227).

In this essay, Dewey also turns to education: for him such experiences are educative and are

part of the “knowledge of conditions” that foster free and full communication.

Education connects to democracy as integral to this social context. Education is the vehicle for democracy and democracy ensures the appropriate conditions for education. Education appears in writings across most decades; there is the shift of emphasis mentioned in the introduction. What is significant might also be the belief that schools could not be the vehicle for democracy that he initially envisioned. His most direct writings about schooling concern life at the laboratory school. In them, Dewey's organization, curriculum, and pedagogy are primarily social. The most famous statement from the talks to parents describes the school as a community. He says, “What the best and wisest parent wants for his own child, that must the community want for all of its children. Any other ideal... is narrow and unlovely; acted upon it destroys our democracy” (Dewey 1900, 1915, 1976, 1990, p. 7). An accessible redux about schooling, *Experience and Education*, in the late 1930s, builds on the social contexts and philosophical concepts overviewed above and fundamentally incorporates individuals in social groups (Dewey 1991a). Concepts that educators have found inspirational and one hopes applicable include the following inexhaustive list: educative as the value for learning that contributes to the social order, continuity that refers to the connections and indeed broadening of educational experiences, and social control that describes the socializing effect of such experiences in which a social group and its participants “order” itself. It is important to note that the lab school was to be a pragmatist educational experiment and not a model for others or for all time. The two texts from 1916 and 1938 were invitational endeavors and exceptions to his general stance toward schools.

Conclusion

Today educators as well as philosophers and other social theorists read Dewey for insights into living in a different context than was his. Central to intellectual life and social practices that “result”

a new conception of making sense of the world has emerged following from the linguistic turn. A more flexible and more open conception – denial of the need for certainty – fits a twenty-first century complex world. Dewey's philosophy conceived as social philosophy can be seen as presaging contemporary intellectual and social life. This entry has offered an interpretation based in a series of social contexts found in Dewey's writings: biographical, philosophical, and democratic. In the latter education is central since democracy and education are integral to each other. Reformers, in education and elsewhere, can gain insights from Dewey. Conceptualizing his philosophy in a social light can actually suggest new directions, so needed in these complex tumultuous times.

Dialogic Education

Nimrod Aloni

Kibbutzim College of Education, Technology, and the Arts, Tel Aviv, Israel

Dialogue occupies a place of honor in educational tradition. The most renowned context is Plato's philosophy, which was written in dialogic form and offers dialogue as Socrates' principal educational and teaching method. The second distinct context brings us into the heart of the twentieth century and includes the existential philosophy of Martin Buber and the critical counterhegemonic pedagogy of Paulo Freire. Other forms of dialogue that are held to be inspirational and relevant to education include the following: of the classical models, most notable are the Confucian and Talmudic dialogues; and in the modern age, the existentialist Nietzschean dialogue, the pedagogic dialogue of Janusz Korczak, the therapeutic dialogue of Carl Rogers, the hermeneutic dialogue of Hans-Georg Gadamer, the care dialogue of Nel Noddings, the Habermasian deliberative dialogue of communicative action, the ethical dialogue of Emmanuel Levinas, as well as the dialogic practices that developed in the context of democratic education, environmental education, and education for a culture of peace and shared life.

Dialogue is a form of speech – distinguished in various aspects from other forms such as conversation, discussion, and discourse – and commonly associated with positive and pleasant qualities of

intimacy, trust, respect, and reciprocity. Etymologically, the word comes from ancient Greek and is made up of *dia* – which means between – and *logos* – which means speech. This explains the accepted meaning and “feel” of dialogue as a pleasant, meaningful, respectful, and constructive conversation.

In order for us to achieve good understanding of the nature of Dialogic Education – of dialogues in education as much as of educational dialogue – let us first posit the distinguishing marks of educational processes and practices. It is my contention that in the beginning of the twenty-first century and in light of the formally accepted ideals of humanistic and democratic culture (embedded in the UN’s universal declaration of human rights and of the rights of the child), the practice of education should be identified with facilitating people to lead autonomous, full, worthy, and flourishing lives. More specifically and informed by the normative tenets of humanism and democracy, educational practices are characterized by the following elements: (a) cultivation of one’s innate powers; (b) providing a social atmosphere of intellectual freedom and human dignity; (c) initiation into worthwhile modes of thought and action (including virtues of intellect and character); and (d) empowering one’s autonomous and authentic self-realization as much as one’s meaningful and responsible participation in the natural, social, and cultural spheres of life.

On the bases of the above notions of dialogue and education, let us move now into consideration of the distinguishing marks of educational dialogue. Our examination begins by pointing, by means of negation, at those features that are alien and offensive to educational dialogue, namely, **what educational dialogue is not**:

1. Educational dialogue is not small talk or a casual conversation held in a cafeteria or in the street. It always involves significant content or statements.
2. Educational dialogue is not a shouting match or a confrontational and vocal argument, in which each side tries to call attention to itself at the expense of the other. It is pleasant and

respectful, open to hearing different views and conceptually flexible.

3. Educational dialogue is not authoritative, such as the speech between a master and a subject or a commander and a subordinate. It evinces a nonhierarchical approach and a spirit of democracy, reciprocity, and solidarity.
4. Educational dialogue is not the giving of instructions or delivery of a lecture between a teacher and student, or the impartation of some form of knowledge and the testing of the extent to which the students have internalized it. It is a form of shared learning, both about the world of the other and of new content.
5. Educational dialogue is not a functional or technocratic performance-oriented speech, the entire purpose of which is to produce results. It is a process and does not necessarily produce clear, obvious results toward which the speech is oriented.

Let us now move from the negative to the positive – to what educational dialogue is and focus on *educational dialogue’s chief characteristics*:

1. Respect for the other by virtue of his or her humanity.
2. Interest in their personality and world by virtue of their singularity or otherness.
3. A point of departure based on mutual trust and openness (not power games or competitions involving status and prestige).
4. Debate or exchange of ideas among the speakers that invites joint thought and a mutually beneficial exchange of ideas.
5. It aims at mutual enrichment and inspiration through the widening of the capacities to better understand one’s own life, the lived reality of the other, and the circumstances that they share.

In light of these features, I would like to adopt the following “working definition” of dialogue: *Dialogue is a conversation in which those involved are attentive to one another and exhibit a mutual interest on the basis of their shared humanity and individual personalities; out of a*

shared sense of trust, respect and openness, they jointly advance to a more comprehensive understanding of themselves, others and the circumstances they share.

As I noted in the opening paragraph, dialogue occupies a place of honor in educational tradition and in recent years it has become significantly more dominant due to the growing frustration at the dehumanizing effects of the “standardization and achievements” approach. The large repertoire and manifold forms of dialogue have naturally challenged educational theorists to analytically and critically scrutinize them and to introduce various typologies of educational dialogues. One can look, for example, to Burbules’s typology which covers four kinds of dialogue in the practice of teaching: as Conversation, as Inquiry, as Debate, and as Instruction. Haroutunian-Gordon focuses on what she calls Interpretive Discussion, and Skidmore uses the typology of Dialogic Instruction, Dialogic Enquiry, and Dialogic Teaching. It is widely agreed, however, among educationists, that no one typology is final and exhaustive and that it is best to judge them by their edifying and pragmatic value. Along this line, not siding with any one typology of dialogues yet stressing the existing and growing diversity, I have listed in the following fifteen different types of dialogue on a largely chronological continuum, some of which are quintessentially pedagogic in nature, while others have some relevance to education and are implemented in various and sundry ways in the educational discourse and practice.

The Confucian dialogue: Named for the sixth century BCE Chinese philosopher, it represents a moral humanistic stance that considers the highest form of human good to be *altruism*: a benevolent, caring, amiable, respectful, and fair attitude toward others and the intent to live a higher life that includes “loyalty to oneself and reciprocity to others.” The Confucian stance also stresses “seeing everything in its proper context,” moral rigor and the establishment of practices and arrangements that contribute to harmony in personal behavior and in the social circles of life. The dialogue figures as a major means through which

the teacher and pupil pave and broaden the path to a full and proper life.

The Socratic dialogue: Named for the fifth century BCE Athenian philosopher, this is an educational dialogue that arose from the pursuit of dialectics: the art of the discourse, directed at attaining conceptual clarity and consistency, and ultimately progress toward a truer perception of reality and wisdom in the art of living. The Socratic dialogue stimulates the interlocutors to practice reflective and critical thinking, and “births” truths conceived within them. It is a dialogue of intellectual and moral empowerment to promote a life of moral rigor and self-reflection, a rationalist pursuit “to make yourself as best as you can.”

The Talmudic dialogue: The central method used in Jewish tradition, this is a communal discussion and learning method through which the students acquire knowledge and shape their characters by means of written texts as well as living texts – who are of course flesh-and-blood teachers – in everything they say and how they live their lives. Among the basic assumptions of the Talmudic dialogue, one can find approaches relating to human dignity and equality as well as to the tension between personal autonomy and conformity to norms of the community and the precepts of tradition. Another major feature that arises here is the recognition that the educational act has no boundaries: it exists in the study partnerships, but no less so in the intimate expanse between the teacher and student in the context of being a role model in the practice of proper living.

The Nietzschean dialogue: Named for the nineteenth-century German philosopher Friedrich Nietzsche, this dialogue emanates from the rich personality, creative drives, and generous spirit of the educator, who seeks out “fellow creators” – those that add meaning and value to life through their creative self-perfection and self-affirmation. The continuation and aim of the dialogue is to expand the students’ cultural richness as well as their intellectual and creative powers, to enable them to reject herd conformity and conceptual dogmatism, so that they can instead take their own path, accept responsibility for their

lives, and shape their personalities and paths as a demanding act of art and morality.

The Buberian dialogue: Named for the German–Israeli philosopher Martin Buber, it is derived from the “I-Thou” concept in Buber’s philosophy and based on interpersonal encounters in which the dialoguers are present with the full force of their personalities and existence: on the one hand, without the armor or closed shutters of prejudice, conceptual fixations, and selfish interests; and on the other, with full psychological and spiritual attention to the other. The “I-Thou” relationship that Buber offers serves as a genuine means to protect our own human dignity and that of others, especially in view of utilitarian and technocratic trends, and power-driven and manipulative relationships.

The Korczakian dialogue: Named for the Jewish–Polish educator Janusz Korczak, who more than any other educator actually lived among his pupils, and when their fate was sealed during the Holocaust of the Jews of Europe, chose to die with them. This dialogue refuses to embellish the nature of the child or idealize his characteristics and tendencies, but at the same time, emphatically underscores a love of childhood and respect-based esteem for the child and his rights as a whole human being. The Korczakian dialogue is not guided by theoretical doctrines and teachings but rather by a commitment to address concrete needs: On the one hand, stands the adult educator, who has a unique personality, possesses pedagogical skills, and has mastered the art of fostering his pupils’ growth, while on the other are children with strengths and weaknesses, whose psyches are complex and vulnerable. In the educational matrix designed as a microcosm of an egalitarian and respectful society, each child has his own place, suited to his own singular nature, within an educational climate of unconditional acceptance, social solidarity, and mutual forgiveness.

The Rogerian dialogue: This dialogue originated in the “client-centered therapy” typical of the practice of humanistic psychology, especially that of Carl Rogers. The dialogue is founded on

certain basic propositions regarding the intrinsic goodness of humanity and the basic drive of all humans to realize their full potential – to develop one’s capabilities, realize one’s inclinations, and widen one’s repertoire of knowledge and behaviors. To these should be added characteristics of reliability and authenticity, mutual respect, trust, acceptance, and empathy, with an emphasis on meaningful experiential learning – all these are conditions that enable and empower the students to believe in themselves, achieve healthy self-esteem, and find the strength to plan and lead full and satisfying lives.

The Freirean dialogue: Named for the Brazilian educator Paulo Freire and also known as a dialogue of empowerment and liberation. This counterhegemonic dialogue is directed at helping students that belong to weakened and oppressed populations to develop critical and political literacies that would facilitate their emancipation from oppressive and disempowering factors that prevent them from actualizing a complete and dignified life. The Freirean dialogue is based on the humanistic elements of love and respect for humanity, mutual trust and hope for change, together with neo-Marxist elements of political action to pave the way for social justice and true participatory democracy. It encourages the students to establish a sense of self-worth, develop a “personal voice” and community narrative, social solidarity, critical literacy, and political action – all this in order to free the world from oppression, which includes the desire to control and subjugate any other person or group.

The Gadamerian dialogue: Named for the German philosopher Hans-Georg Gadamer, this dialogue seeks to rehabilitate the fabric of human discourse and partnership by means of shifting the emphasis from the scientific method – which is oriented toward acquiring facts and revealing the laws of nature – to a hermeneutic method that widens the student’s ability to understand and appreciate fellow individuals, diverse cultures, and great works of art and intellect. This dialogue’s point of departure is that we are all the products of our history and culture and we all have

preexisting perspectives that have been shaped by social and cultural conditioning and structuring. In a society in which different groups seek recognition for their own unique cultural narratives, an approach that emphasizes the hermeneutical dialogue between the student's cultural horizon and the other horizons is especially important as a key to complex understanding and the creation of a shared normative consciousness.

Habermassian dialogue: Named for the German philosopher and key figure in Critical Theory, Jorgen Habermas, this deliberative dialogue aims to reconstruct the trust and competencies required for rational, open, and fair public discourse. Contrary to postmodern tendencies to give up the ideals of enlightened worldview, moral conduct, and just social order, the Habermassian dialogue insists on creating the conditions of the ideal or most fruitful speech situations out of which truth, goodness, and justice have the best chances to emerge and be accepted by rational consensus (equity, freedom, pluralism, tolerance, reasoned arguments, critical reflectiveness, good will, and multiculturalism).

The Noddingsian dialogue: Named for the American educationist Nel Noddings, this dialogue occupies a central position in the ethics and pedagogy of caring – an area that Noddings developed and which in recent years has gained recognition and appreciation in the field of education. The point of departure of this kind of dialogue is that of “maternal caring” – as a moral feminist category – characterized by sensitive and supportive caring toward people, care for the welfare and respect of others, and a willingness to help them fulfill themselves and realize their full potential. This educational dialogue seeks to shift the emphasis from the disciplinary pursuit of acquiring knowledge, from the obsession with the cognitive skills evinced in scientific discoveries and the presentation of compelling arguments, as well as from the ethics of virtue. The alternative is the pursuit of real life issues and urgent problems – all based on interpersonal relations that advance the welfare, dignity, well-being, and development of people.

The Levinasian dialogue: Named for the French philosopher Emmanuel Levinas, its point of departure is the primacy that Levinas assigns to ethics above any other philosophical or scientific investigation, and certainly above any self-indulgence or utilitarian action. According to this moral approach, at the heart of the human encounter lies not human rights and individual freedoms – as important but also alienating and distancing elements – but the duty of the individual to be responsible for preserving the human dignity of other individuals, and especially to defend their otherness and unique nature. In this context, the commandment “Thou shalt not murder” refers rather to refraining from taking a functional approach based on personal interest or an educational-paternalistic approach to others, since in both the singular nature of the other is eclipsed and obscured, and the other's humanity and identity are erased and nullified.

The ecological dialogue: This dialogue seeks to “cross the species barrier” and renew the covenant between humanity and nature. Out of an awareness of mistakes and the heavy toll exacted by humanity's alienation from nature, including the ecological catastrophes we have brought upon ourselves, a dialogic and ecological position is presented that exhibits empathetic care for our natural environment. This approach views humanity as an integral and essential part of nature, and couples awareness of human and individual conditions for growth with an attentive and caring awareness for the thirsty tree, withered leaf, the turtle that has found itself on its back, the beached whale, extinct or captive species, the cleanliness of the oceans and rivers, and the preservation of primordial natural landscapes.

The dialogue in democratic education: This dialogue arose and developed as a result of a tradition of progressive education and in the context of child-centered concepts, self-realization, active and experiential learning, inner motivation, self-direction, and a democratic culture. The basic assumption of this dialogue is that since knowledge is analogous to a huge ocean, and since learning best occurs when it is associated with

the students' strengths and is motivated by their own inner curiosity, a curriculum should be constructed around these strengths to help the students aspire to broaden knowledge, rather than subjugate them to subject-oriented "knowledge islands" of one kind or another. Further features of this dialogue include a social climate of acceptance and safeness, in addition to democratic participation involving all decisions that are related to the personal fate of the students and the shape that the educational institution will take.

A dialogue of peace at times of conflict: Although this dialogue can teach us about education toward good neighborly relations and coexistence, it is specifically oriented toward the resolution of prolonged and intractable conflicts between enemies and rivals: between communities, peoples, and States. Conflicts such as these develop and escalate by means of processes involving the demonization of the other, denial of his arguments and logic, and alienation toward his heritage and culture. The alternative posed by the dialogue of peace includes processes of learning about the world of the other through academic study and interpersonal communication, the granting of legitimacy to the other's perspective and collective narrative, acceptance of partial responsibility for the source of the conflict, empathy for the predicament and suffering of the other, and the rejection of prejudices and stereotyping.

By means of concluding, relevant to all the various forms of educational dialogue and adhering to the contemporary notions of humanism and humanistic education, I wish to propose four principles or regulative ideals which could serve well present day teachers in their employment of the manifold forms of educational dialogues.

- **The first principle** affirms that speech is the principal medium through which human beings present their humanity, and that educational dialogue is the best forging ground for the emergence and growth of humanity – especially in the case of the most marginalized, neglected, and unconventional children.
- **The second** holds that **humanistic morality** and in particular interpersonal caring, social responsibility, and human solidarity lie at the

core motivation and guiding principle of educational dialogue.

- **The third** contends that an important goal of empowering dialogues in education is to create bridges between others and build common denominators, but this should be carried out while avoiding the dangers of flattening cultural differences or effacement of identity.
- **The fourth** and last regulative ideal offered here is that in order for dialogical pedagogy to be both humanistic, holistic, and effective – reaching all children, providing them with relevant and meaningful educative experiences, and influencing them in edifying, empowering, and liberating manners – our educational practices should involve multiple forms of empowering educational dialogues: creating avenues to the souls and minds of all our students and introducing them to varied educational experiences in the emotional, intellectual, moral, social, cultural, and political spheres of their lives.

Dialogue and Critical Pedagogy

Nicholas C. Burbules

Department of Education Policy, Organization
and Leadership, University of Illinois,
Urbana-Champaign, Champaign, IL, USA

Introduction

Ever since Plato's dialogues, and the focus on a "Socratic method," dialogue has come to hold a central place in Western views of education. Under the Socratic approach, dialogue teaches how to think in a way that produces an autonomous, skeptical learner. More recently, the Brazilian educator Paulo Freire added a further dimension to this tradition: for Freire, dialogical teaching is more democratic, egalitarian, and liberating (compared with didactic, and for Freire oppressive, "monological" modes of teaching). For Freire, a teacher committed to liberatory, progressive values *must* rely on dialogical methods or something like them. Through Freire's work, dialogue has become a central theme in the *praxis* of critical pedagogy.

Questioning the Tradition

However, the Freirean tradition of critical pedagogy, with its emphasis on dialogue, has come under criticism from feminist, post-structural, and post-colonial perspectives. Perhaps the most important of these criticisms is from Elizabeth Ellsworth, beginning with her essay "Why Doesn't This Feel Empowering? Working Through the Repressive Myths of Critical Pedagogy," and then elaborated more fully in her book *Teaching Positions*. The central issue raised by Ellsworth can be described as interrogating the *unconscious* of dialogue: to look beneath the surface of overt meanings and expressed intentions to examine what is *not* being acknowledged or talked about. The problem with the idealized conception of dialogue, which represents itself as an open conversation in which anyone can speak and

any topic can be broached, is not only that certain people may in fact not be speaking, certain things may not be spoken (and may not even be speakable under the implicit terms of a dialogue), but that, precisely because the surface level of the engagement *is* so apparently reasonable, inclusive, and well-intentioned, what gets left out, or who gets left out, remains not only hidden but is subtly denigrated. If you cannot (or will not) express yourself in this manner, the fault lies with you. Yet, as in other sorts of communicative struggle, if one is forced to express one's objections in a vocabulary or manner that are not of one's choosing, the effect may be either to suppress some of those objections or to force them through a semantic filter that changes their meaning. Ellsworth and other critics draw from a wider body of literature that wants to look at the reserve side of ostensibly "inclusive" educational practices, such as dialogue, to examine what is, in practice, *exclusive* about them. Critical pedagogy, it appears, is not sufficiently critical about itself.

Alison Jones highlights a related problem of dialogue in contexts of cultural difference. The *desire for dialogue*, as she puts it, can carry its own kinds of coercive influence. When people from different backgrounds try to discuss their experiences and differences – as often happens in multicultural classrooms – they are put in asymmetrical positions of risk and self-disclosure. Who are these conversations for, and who do they benefit? When critical educators talk about the virtues of cross-cultural understanding, this is tilted almost always in the direction of the supposed benefits for dominant groups of coming to better understand or empathize with members of non-dominant groups. Jones challenges this aspiration: because groups are nondominant, they often have to expend much more time and effort explaining themselves to the dominant groups than vice versa. The benefits of assuaging liberal guilt or reassuring members of dominant groups of their open-mindedness and good intent are reinforced by such conversations – benefits not necessarily extended to the members of nondominant groups themselves. One could even call this a kind of voyeurism: "Dialogue and recognition of difference turn out to be access for dominant groups to

the thoughts, cultures, lives of others” (Jones 2004, p. 65). For Jones, “the desire for the embodied other. . . may also be a desire for redemption, or forgiveness, on behalf of the white students. . . [T]he dominant group seeks its *own* inclusion by being rescued from its inability to hear the voices of the marginalized” (Jones 2004, pp. 64, 65). In such cases, Jones says, members of nondominant groups may choose to hold back from participating in the conversation, remaining silent as a strategy of self-protection – or even seeking to withdraw from the common classroom space entirely. A question raised here for the critical pedagogue is: Whose side are you on?

Megan Boler, along with Jones and other contributors to Boler’s *Democratic Dialogue in Education: Troubling Speech, Disturbing Silence*, examine some pedagogical responses to these difficulties. Two are especially pertinent here. One is the creation of separate spaces in the classroom, where members of nondominant groups can withdraw and speak safely with others who share their experiences and backgrounds, where they do not have to explain themselves to others or re-educate them at the cost of their own effort and trouble. The other response involves requiring some participants to refrain from speaking in a discussion in order to create a space for others, who may have been silent, to feel encouraged to speak. (In some cases, this may be joined with the intention to make dominant group members “see what it feels like” to be in a silenced position.) Both of these approaches can be viewed as constraints on fully open dialogue of the idealized type, in which participants ought to be able to participate in any way and to any extent that they choose, but these also can be viewed as provisional compromises made *in order* to encourage more and better dialogue, albeit dialogue of a different sort than the fully open, participatory ideal. It is the inability of that idealized mode of dialogue to accommodate the involvement of diverse others that has made some progressive teachers adopt strategies that identify different rules of engagement for different participants. Boler terms this “affirmative action pedagogy.”

This issue can be viewed in another way. An underlying ethos of the idealized conception of dialogue is that while problems certainly can crop

up during an exchange (misunderstanding, conflict, hard feelings, disagreement about the purpose of the discussion, and so on), these can and should be redeemed *within* the framework of dialogue itself. The solution to problems encountered in dialogue should be pursued through. . . more dialogue. Jones, in her essay in Boler’s book, and Suzanne de Castell, in her contribution, both term this approach “the Talking Cure,” as if all problems should be talked through until a solution presents itself. Yet such a valorization of dialogue expresses a number of culturally bounded assumptions about how people ought to communicate and express themselves. Instead, Jones and others want to examine when withdrawal from dialogue and/or silence may be the more appropriate response.

Huey-li Li, in another chapter of Boler’s book, explores the issue of silence from a different cultural orientation. Many critics regard the issue of silence either through the lens of asymmetrical power (groups or individuals are “silenced”) or as a pointed refusal to participate, an active or passive withdrawal from participation. Li wants to argue instead for the *expressive* possibilities of silence. Silence is not the opposite of speech; rather, there are different kinds of silence, and those truly interested in cross-cultural understanding need to take on the burden of hearing what these different kinds of silence might mean. Forcing others to speak, to articulate what they think and feel in explicit words, is in Li’s phrase “silencing silence,” and she means this as a rebuke to well-intended pedagogues who believe they are serving the interests of those groups by “privileging their voices” or continually pressing them to speak up and “contribute.” For Li, the socially committed classroom is often too preoccupied with verbal dialogue to listen to its silences. In the rush to fill empty discursive spaces with more talk, real if subtle connotations are missed, and cultures that *privilege silence* (she mentions Navaho, Zen, and Indian yoga as examples) are effectively “silenced” themselves by an ethos that says, In order for you to be heard, you must speak in our way.

Li places the responsibility squarely on dominant groups to spend more time cultivating in

themselves the capacity for listening (including listening to silences) and less on trying to “give voice” to those who may not want it under the terms on which it is offered. Silence can be of many sorts; and if one takes silence as an indication of a problem, something to be remedied or compensated for, this depends greatly on what type of silence one takes it to be. Silence can be voluntary and self-imposed, or it can be the result of external pressures and constraints; silence can be expressive, or it can be empty, unreadable; silence can be temporary, situational, or it can represent a consistent, problematic pattern; silence can signify active withdrawal from a conversation, or it can be an indicator of attentive, thoughtful listening; and so on. As Li makes clear, assaying silence and deciding whether it is educationally pernicious or beneficial requires attention to cultural and situational specifics and cannot be diagnosed with broad, dichotomous categories (either one “has voice” or one “is silenced”). How can a teacher know what kind of silence she or he is dealing with? Whose silence is a cause for concern, and why? Li’s central point is that our tendency to denigrate silence, or to see it automatically as a sign of some deeper problem, overly valorizes the chatty dimensions of participation; this poses a substantial challenge to the ways we think about dialogue.

Rethinking Dialogue

Standing back from these particular criticisms, what has shifted in the educational literature is a move away from an idealized conception of dialogue to a cultural politics of dialogue: dialogue is neither a good nor a bad thing, in itself, and the decision about whether to teach with dialogue, when, how, and with whom – or, on the other side, the decision to participate in it, or not (whether, when, how, and with whom) – needs to be made within a broader political analysis of identity, interest, and purpose. We think of the educational context as a generally altruistic one, given to the promotion of freedom, the open expression and exploration of ideas, and personal as well as group or community development and

advancement, for all participants. In critical pedagogy, these values are embedded in a larger vision of social liberation and teaching as an expression of political commitment; here it can be particularly difficult – and threatening – to explore the possibility that one’s own teaching and good intentions can be part of the problem of exclusion and oppression.

But when these questions get resituated in recognition of diverse styles of communication, diverse identities, and diverse political interests and purposes, good intentions derived from even the most liberatory sentiments no longer suffice. Suddenly dialogue reappears as a potentially restrictive, possibly even hegemonic norm and constraint. The educational purposes of promoting mutual understanding, tolerance, and empathy, while clearly of value, may not be the overriding values in all circumstances.

This way of reframing the question regards the development of dialogical relations as itself a political project, one in which there may be necessary reasons to resist or challenge even the terms and conditions of dialogue itself. But at the same time politics is always *for* something, and it is difficult to imagine any conception of social justice that does not at some level seek dialogue and more open, responsive communicative relations as an end point. Hence even challenges to dialogue must entail, at some level, a commitment to dialogue itself. The question, then, becomes dialogues of what *kind*?

One of these potential outcomes, whether implicit or explicit, is captured in expressions like “dialogue *across* difference.” Such bridging metaphors express two key assumptions that need to be re-examined. The first is that a goal of dialogue is to achieve connections of understanding and agreement – which may not be unworthy goals, especially in many educational settings, but which cannot be taken as unproblematic even when they spring from good intentions. Alison Jones’ work, discussed earlier, provides several reasons for this suspicion. Apart from issues of good intention, certain kinds of difference may simply be of an order that cannot be bridged. Some differences resist exploration and reconciliation; they cannot be explained in terms that

“bridge” misunderstanding and agreement. Other differences are overtly oppositional and refuse the very aim of bridging itself. By encompassing all sorts of difference within the norms of communicative interaction, dialogue can have a tendency to *domesticate difference*, which, in the case of certain kinds of difference, is to fail fundamentally to come to grips with the challenges they represent.

Critical pedagogy tends to view differences as constituted within relations of power, and usually power of a dyadic sort: oppressor and oppressed, ruling class and working class, hegemon and victim of false consciousness, and so on. This framework may have some advantages from a political standpoint, identifying clear enemies and clear victims, clear lines for organizing a movement of solidarity against the powerful. But ever since Foucault, this theory of power has proven less and less satisfactory. For Foucault, power is not something one group has and another group lacks: it is a system that catches up all social participants in a network of relations of complicity and compliance. Nor is there just one polarity of power acting at one time: in a social situation, gender may constitute one dimension of power, but race and class may cross-hatch those relations in complex and contradictory ways. Power is not unidimensional and does not always flow in one direction. All of this is commonplace now; but what is important for this discussion is how these understandings of power underlie conceptions of difference. Critical pedagogy generally continues to frame difference in the context of dyadic relations of power: a difference is a difference *between* contending individuals and groups. Hence the challenge of maintaining dialogue *across* difference. A more multidimensional conception of power yields, in consequence, a more multifaceted (and often contradictory) conception of differences: differences are constituted *against* certain normalizing expectations; they operate *within* nonunitary identities; they press *beyond* dyadic choices. From this perspective, critical pedagogy of a Freirean variety suffers from a limited theoretical framework from which to understand the complexities of differences and how they work within and against structures of

power, and its idealized conception of dialogue is insufficiently attuned to how these differences play out in communicative norms and practices.

When one begins with a dyadic view, when dialogue “succeeds” in drawing radical or oppositional differences into the norms of communicative interaction, certain beneficial compacts may be forged, new knowledge and understandings may be established – but at the risk of cooptation and normalization. By being drawn into working within those communicative norms, some differences may have to be given up or compromised, so that, while *within* the dialogue a measure of tolerance and inclusivity might obtain, the *framework* of the dialogue has its own biased and exclusionary effects. Ironically, it may be that those very communicative relations which try to be most open and inclusive *for that very reason* are more difficult to diagnose in terms of their blind spots and, hence, more difficult to resist. Who can be against openness, tolerance, and inclusivity? But for that reason these modes of dialogue may be the most subtly co-opting and normalizing. Dialogue is never simply, then, operating *across* a divide between two persons or groups; it comprises internal tensions and contradictions as well.

These criticisms raise further questions about the typical aims of dialogue: understanding, consensus, shared knowledge, mutual recognition, learning, and inquiry. They raise questions about the form of dialogue and its implicit norms about how reasonable, polite, and respectful discourse ought to proceed. They raise questions about the asymmetrical positions between the participants in dialogue: not just relations of unequal power but relations of unequal risk, unequal effort, and unequal benefit gained from the “successful” results of such dialogue. As I have argued previously, there are different types of dialogue, with different purposes and different norms attached to them. But who decides what kind of dialogue a present dialogue will be? Once implicated in a dialogue, who gets to decide to change it, to redirect it, or to leave it? Critical pedagogical dialogues are often pursued within contexts where the authority (and patent good intentions)

of the pedagogue, the expectations of other participants, and the broader norms of the educational setting all can place coercion on resistant partners to participate and to participate in a particular manner and spirit. In this way, the benign expressed purposes of critical pedagogical dialogue can put resistant partners in a defensive, reactive position: the burden is on them to explain why they will not participate in the appropriate manner and spirit, in a process that someone else thinks is directed to their benefit. When critical pedagogical dialogue is invested not only with the benign purpose of educational exploration and discovery but also with the aim of political solidarity and liberation, resistance to these benign objectives sometimes gets framed as recalcitrance, false consciousness, or obstructionism. What happens when an emancipatory endeavor comes to understand itself as potentially impositional and exclusionary?

Conclusion

It may be uncomfortable to hear words like “coercion” attached to the polite, respectful conventions that govern participation in dialogue. But the criticisms I have reviewed here challenge advocates of dialogue to view these norms from the outside, from the perspective of those to whom they are neither neutral nor benign. For them, the gentle invitation into dialogue can sound like this: “Speak up! Participate. Talk this way. When things become difficult, keep talking. Expose yourself. Explain yourself. Justify yourself. Stick to the subject (a subject chosen and decided by someone else). Answer all questions. Be polite and respectful, even to those who may despise or miscomprehend you — this is your chance to change their minds. Listen to all points of view — we’re all here to learn from each other.” A truly critical pedagogy, therefore, has to go deeper in interrogating how its aims and methods are actually felt and experienced by participants. Subjecting these to questioning and criticism *within* the pedagogical space requires a willingness to abandon certain a priori assumptions and

aims about whose “liberation” one is seeking to promote and what that liberation means. Promoting dialogue is not irrelevant to that critical process, but sometimes such criticism needs to encompass the form, the tacit rules, and the aims and purposes of dialogue itself.

For Jacques Derrida, Claude Lévi-Strauss – like Ferdinand de Saussure, Plato, Aristotle, and Jean-Jacques Rousseau – among others, excluded writing “as a phenomenon of exterior representation, both useless and dangerous” (Derrida 1981). This, of course, was a metaphysical judgment safeguarding the reduction of the exteriority of the sign and difference for the sake of the sameness of voice. To Saussure, for example, the logocentric favoring of the seeming presence of one (the *phone*) over the absence of the other (the *graphie*) must have been justified by the model of “phonetic-alphabetic” script used to delimit language, a “type” sustaining the impression of *presenting speech* while simultaneously erasing “itself before speech” (Ibid., p. 25). Conversely, Derrida has tried to show “there is no purely phonetic writing, and that phonologism is less a consequence of the practice of the alphabet in a given culture than a certain ethical or axiological *experience* of this practice” (Ibid., p. 25) that posits the resistance of difference. Within this practicability of metaphysics, its pedagogy of the cultural politics of the sign, the implication is clearly as follows:

Writing should erase itself before the plenitude of living speech, perfectly represented in the transparency of its notation, immediately present for the

subject who speaks it, and for the subject who receives its meaning, content, value. (Ibid., p. 25)

The most significant point for Derrida is “not only not to privilege one substance – here the phonic, so called temporal, substance – while excluding another – for example, the graphic, so called spatial, substance – but even to consider every process of signification as a formal play of differences” (Ibid., p. 26).

The enigmatic modification deconstituting and dislocating the “linear expressivity” of the sign reinforces the need to ask the question, How does “grammatology” incite a rethinking of difference and destabilize the traditional boundaries of “writing” and “text” or “textuality” in the deconstructive sense of the articulation of a “non-” or “anti-disciplinary object,” when there seems to have been a neutralization of “every substance, be it phonic, graphic, or otherwise?” (Ibid., p. 26). We may possibly receive the following answer from Derrida: “Of course it is not a question of resorting to the same concept of writing and of simply inverting the dissymmetry that now has become problematical” (Ibid., p. 26). And, to be more specific, the broader and more radical redefining of the concept of writing that is proposed to encompass every kind of expression, communication, and coding (phonic, graphic, artistic) “can be called *gram* or *différance*” (Ibid., p. 26). The distinguishing characteristic of this “semio-scriptology” would be the “play of differences” and meaning deferrals involving the interweaving of syntheses and references, but not to the extent that a “simple element” of its signification-psyche generation would be “present in and of itself, referring only to itself” (Ibid., p. 26) as the auto-affective arbiter of complete, unmitigating and unrelenting, sense.

As such, the “text” or “textuality” of this writing is a *chaining of signs*, not simply sign functions standing in for a (cultural) center of mediated meaning, but “only, everywhere, differences and traces of traces,” (Ibid., p. 26) within which the “gram” would come to be *the most general sign and semiology would be therefore reconstituted as grammatology*. This is the clarification of the outline Derrida has presented for the *science of a new*

writing. Since the gram “is a structure and a movement no longer conceivable on the basis of the opposition presence/absence” (Ibid., p. 27) and flourishes within the codic play of differences, it is as *différance* that the grammatological conversion of semiology takes place via deconstruction. There are some crucial sticking points however that we must address.

On the basis of the above function, *différance* is incompatible “with the static, synchronic, taxonomic, ahistorical motifs in the concept of structure” (Ibid., p. 27), and yet, contrastingly, it is *not* “astructural.” Derrida insists on this, because the “systematic and regulated transformations” (Ibid., p. 28) in the specificity of its general workings are able to develop, in certain cases, “the most legitimate principled exigencies of ‘structuralism’” (Ibid., p. 28). That would be, for example, in the extended concatenation of syntagmatic units of expression whose traces are *deferred* and *multiplied* to some degree within the *differential* or *fragmented* proportionality of discursive or narrative structures. And here we come to the crux of the matter we must next follow to gauge the ethicity of the sign in this mode of an always already immanently refracted referentiality, as Derrida defines it. It cannot be said, from this vantage, that some “present and in-different being” (Ibid., p. 28) in any shape or form “precedes *différance* or spacing” (Ibid., p. 28), for example, a subject “who would be the agent, author, and master of *différance*,” (Ibid., p. 28) or upon whom *différance* would impose itself. Why? Because, to Derrida, “Subjectivity – like objectivity – is an effect of *différance*, an effect inscribed within a system of *différance*” (Ibid., p. 28). We can now begin to evaluate the implications of this claim – the effectivity of why and how it is made – for the phenomenality of the writing of Being, the being written, all that relates deconstruction and the institution of pedagogy in the cultural politics of the sign and its ethicity. Since, it would seem, at least for the moment, that the ethico-axiological agency of the “being present” of the sign, *its being as presence*, is forever undercut as such, and with it is summarily extinguished the metaphysical light of both the educational edifice

of a valuation of truth and the psychological comfort of a sense of origin.

The most affable text for engaging the complexity of these ramifications is “Différance,” the lecture Derrida addressed to the *Société Française de Philosophie* on January 27, 1968. (Although the text of this discourse has appeared in many different places, the version of “Différance” I will be using is found in Derrida (1973).) As is noted in the preamble to the discourse “proper,” the French verb *différer*, like the Latin *differre*, suggests two meanings of association, “to differentiate” and “to delay,” thus relating the idea of difference in two unsimilar ways:

On the one hand, it indicates difference as distinction, inequality, or discernability; on the other, it expresses the interposition of delay, the interval of a spacing and temporalizing that puts off until “later” what is presently denied, the possible that is presently impossible. Sometimes the *different* and sometimes the *deferred* correspond [in French] to the verb “to differ.” This correlation, however, is not simply one between act and object, cause and effect, or primordial and derived.

In the one case “to differ” signifies non-identity; in the other case it signifies the order of the same. Yet there must be a common, although entirely *différente*, root within the sphere that relates the two movements of differing to one another. We provisionally give the name *différance* to this sameness which is not identical. (Ibid., p. 129)

Using the letter “a” from the present participle of the verb *différer*, e.g., “*différente*,” Derrida constructs the noun *différance*, a new word, a “nonword” that is, in his estimation, a “non-concept” – profoundly ametaphysical – precisely because it cannot be either “narrowed down” or “fixed” to a single part of both of its meanings. It is perhaps the “penultimate” of deconstructive terms, if that were possible in this *poststructural* sense, given that the difference of *différance* is only perceptible *in writing*, since the change of spelling is inaudible – the “e” for which the “a” is substituted being silent to the (French) ear. Thus, the “semanteme” that is “neither a *word* nor a *concept*” (Ibid., p. 130) expresses both meanings of differentiation as spatiotemporality and as the movement that structures each kind of dissociation in the “middle voice” between passivity and activity like the penumbra of an irreducible origin

of production. It is perhaps the offspring of the monstrosity Derrida predicts at the end of his famous lecture at Yale University, "Structure, Sign, and Play in the Discourse of the Human Sciences" (1966), deconstruction already having given form in itself to a *species of non-species marking the unnameable in the alterity of a philosophical subject metaphysics cannot stomach or mouth*. And here it would be tempting – yes it is – to consider *différance* an operating principle, to criticize it as the ambivalent counterpart to a philosophy of origin upon which the Other must rely or fall. But this would also be to misunderstand, not to do justice to the interpretative formativity of a "doubling commentary" Derrida has said is possible at some minimal parameters of signification (see Derrida 1988. The chapter entitled "Afterword: Toward an Ethic of Discussion" is most clear about the misrepresentation of Derridean undecidability and the play of the sign), by representing *différance* as external to identity instead of it being always already within the non-indicative self-relation of the being written of Being, modifying the here and now "at the zero point of the subjective origin" (Derrida, *Speech and Phenomena*, p. 94). What it is that it does to the sign – for our purposes *the trace of the writing of the Self as Other* – is evident in the semiological prospectus of signification: the structural necessity of its repeatability or reiteration, beyond a single, unitary point of expression. If we acknowledge, as we should, a "sign" can signify *only through the force of repetition*, the consequences of *différance* render the sign relational rather than identical (e.g., not the selfsame, or "iconic," possessing the properties of its "referent"), thus bringing indication into line with expression to undo the Husserlian idea of a "pre-expressive intentionality" of pure consciousness. This line of argument decenters the subject, which brings it out of the shell of the Cartesian cogito that shelters its attempt at realizing the security of a self-discourse with itself – what Derrida shows to be an instance of noncommunication, because in the equating of self-hood with self-presence, the Other is effaced to the point where an inner

monologue with one's "Self" is not really an instance of transmissibility at all, but the self-deceptive verification of the desire for auto-affection or an attempt at the reduction of *différance*. In order to ascertain the existence of itself, a subject must refer outside of itself to the *world of the signs of the Other* using the resources of what does not begin "within" itself, therefore striving to refrain from obliterating itself just as it seems to have authenticated the uniqueness of its (own) existence. It is this relational aspect that Derrida makes us aware of about the ethical grounding of *différance* by referring to the constitutive function of the *sign trace* of the Other, the deferring difference between presence and repetition, self and nonself, which reveals itself as undecidability at the proliferative core of identity.

Derrida suggests that *différance* is or can stand for "the juncture – rather than the summation – of what has been most decisively inscribed in the thought of what is conveniently called our 'epoch'" ("Différance," p. 130). A poststructural age – that of the irreducible play of the sign – marks the delimitation of onto-theology, the decline of the metaphysics of presence (phono-logocentrism), and the possibility of an ethical opening of the subject toward the difference of the Other. But we must remember however the role of tradition in the formation of new thought. The following are given by Derrida as examples of the turns of difference within the reason of the prototypical thinkers that led to *différance*: "the difference of forces in Nietzsche, Saussure's principle of semiological difference, differing as the possibility of [neurone] facilitation, impression and delayed effect in Freud, difference as the irreducibility of the trace of the other in Levinas, and the ontic-ontological difference in Heidegger" (Ibid., p. 130). All of these individuals have no doubt figured greatly in the elaboration of the *working of deconstruction*, but more importantly the list displays the "discoveries" or "inventions" of varying fields from the history of philosophy to theology, linguistics, and psychoanalysis that have changed or altered perceptions of the ethics of Western metaphysics

in their refusal to be subdued or dominated by the dizzying substitutions of master signs within its self-enclosed system of truth and meaning. The exposition of the breadth of the contributions to the theory of *différance* makes a previous point quite clear: *différance* is not only “irreducible to every ontological or theological – onto-theological – reappropriation, but it opens up the very space in which onto-theology – philosophy – produces its system and its history. It thus encompasses and irrevocably surpasses onto-theology and philosophy” (Ibid., p. 135). The alogicality of its structure also prevents an afore-planned linearity within the reading of the writing of signs, for example, the ordering of a “reason” of strategy or of finality of purpose, a tacticality toward teleology, “philosophical-logical discourse,” and its symmetrical opposite “logico-empirical speech” (Ibid., p. 135). The alternative to these more or less traditional discourses of epistemological fortitude and forbearance is a “semiotics” of the play of difference as *différance*, a subject Derrida favors and has little difficulty in handling regarding the elements of difference in the teachings of Friedrich Nietzsche, Sigmund Freud, Saussure, Martin Heidegger, and Emmanuel Levinas.

Diffusionist Model of Adoption of Digital Learning, The

Petar Jandrić

Department of Informatics and Computing,
University of Applied Sciences, Zagreb, Croatia

Introduction

In the contemporary network society, human learning is dialectically intertwined with digital technologies. Instead of talking about adopting computers in education (and formal educational systems, in particular) therefore, theorists of the early twenty-first century are increasingly using the integral perspective of digital culture which provides “a richer engagement with the ways education is shaped and practiced with and through the digital” (Knox 2015, pp. 1–2). Yet, as newer versions of technologies continuously replace their older counterparts, and as conceptually new kinds of gadgets (such as tablet computers or smartphones) and web products (such as various sharing platforms) enter the scene, it is still important to understand the dynamics of digital innovation within educational systems. Historically, the first digital technologies have been invented within institutions of education and research – for instance, the first e-mail in history was exchanged between computers at UCLA and Stanford. Immediately after their public release, however, digital technologies have been taken up by the marketplace and then returned to educational institutions as vehicles of progress. It is within this dialectic that schools and universities have become recipients of digital technologies, including but not limited to specialized products developed for teaching and learning.

The adoption of digital technologies within educational systems can be described by several models and theories including the Gartner Hype Cycle, the Technology Acceptance Model, domestication theory, etc. Arguably, however, the oldest and the most influential model is the

theory of diffusion of innovations developed in early 1960s by Everett Rogers (1986, 1962/1995). Based on Rogers's theory, Zemsky and Massy developed the e-learning adoption cycle (2004, pp. 9–12), which has quickly been taken up by worldwide educational community (Duan et al. 2010; Zhang et al. 2010; Soffer et al. 2010). This article consists of three main parts. In the first part, it uses the diffusionist model developed by Zemsky and Massy to describe the history of adoption of digital learning into educational systems. In order to account for complexity and diversity of the relationships between digital technologies and human learning, it replaces the term e-learning originally used by Zemsky and Massy with the broader concept of digital learning (in the Encyclopaedia of Educational Philosophy and Theory, Hayes (2015) analyzes these differences in more depth). The second part of the article analyzes theoretical issues associated with the diffusionist model of adoption of digital learning, and the third part of the article analyzes its practical applications.

The Diffusionist Model of Adoption of Digital Learning

Zemsky and Massy's cycle of adoption of digital learning statistically distributes populations according to the Gauss curve into the following

categories: innovators, early adopters, early majority, late majority, and diehards (2004, pp. 9–12). Figure 1 represents the cycle of adoption of digital learning according to cumulative percentage of population, while Fig. 2 represents the cycle of adoption of digital learning according to relative percentage of population. This section applies Zemsky and Massy's model to the history of development of digital learning in formal educational systems such as schools and universities.

Human learning has had a prominent position in works of the early innovators of the computer industry (the so-called "digerati") such as Sherry Turkle, Howard Rheingold, Stewart Brand, Kevin Kelly, John Markoff, Jaron Lanier, Richard Stallman, and others. However, following fast penetration of broadband Internet in western homes during 1990s, the convergence between digital technologies and learning had been rapidly gaining importance in wide formal educational settings. The cycle of adoption of digital learning starts with *innovators*. In worldwide schools and universities, typical innovators were computer experts and enthusiasts who simultaneously developed and used digital technologies for learning. The stage of innovators is abundant with fresh ideas and small individual projects started mostly in technical schools, research laboratories, and private enterprises. Larger-scale projects for development of digital learning had mostly been conducted in computer laboratories of a few elite

D

research institutions such as MIT and Stanford. Following such lack of institutional opportunities, worldwide innovators adopted “the lone-ranger approach” (Anderson and Elloumi 2004). The community of practitioners of digital learning was in its infancy, and research results were (if at all) published on the fringes of conferences and journals oriented to traditional research areas. Consequently, the stage of innovators is marked by significant overlapping between various development projects. For instance, during the early 1990s, almost every progressive educational institution had been developing its own virtual learning environment. For all those reasons, early research in digital learning was predominantly focused on technologies.

Moving on to the stage of *early adopters*, the population of digital learning practitioners had slowly shifted from technology experts toward teachers with special interest in information and communication technologies. Development had still been strongly technologically oriented. However, specialist licensed and open source tools for digital learning had slowly but surely flooded the technology marketplace. Classroom implementations of digital technologies had increased in size and scope. Research focus slowly had shifted from technology toward pedagogy, thus creating a widening gap between technology-oriented and pedagogy-oriented communities. Development and maintenance of learning technologies had still been dominated by the lone-ranger approach. However, there had been an

increasing number of larger interdisciplinary collaborative projects between individuals and institutions in specialized fields such as pedagogy and technology.

The stage of *early majority* had strongly reinforced these trends. The gap between technology and pedagogy had become deeper and wider. Specialized software companies and open source projects had rapidly grown in number and size, causing professionalization of technological development and support. Consequently, most educational institutions had discontinued their own production of learning technologies and switched to ready-made market products. Teachers and institutions had rapidly embraced digital learning: near the end of the phase of early majority, total penetration of digital learning in traditional educational systems had reached 50%. Development of digital learning had switched from small lone-ranger projects to large (r) collaborative projects. Consequently, the scope and extent of the supporting activities had exponentially increased. In order to fulfil the growing demands for labor, educational institutions had created new types of jobs such as e-learning managers, administrators of e-learning systems, and learning technologists. The new positions require specialist skills and knowledge: in order to satisfy the increasing demand for experts, educational institutions had introduced appropriate degrees.

By the beginning of 2016, arguably, the majority of educational institutions in the First World have entered the stage of *late majority*. In this

stage, trends identified in the stage of early majority have stabilized. Digital learning has a firm position in educational administration, teaching, and research. There are specialized conferences, journals, schools, departments, and communities of practitioners and researchers. The fields of learning technology and digital pedagogy have become highly developed. Research in digital learning has grown beyond issues related to school settings – at the beginning of 2016, new research frontiers are in the fields of digital cultures, critical theory, epistemology, and social studies of technology. According to Knox, these developments have brought about two main developments: “the diversity, nuance, and strangeness of culture, as opposed to the rational universalism of education, combined with useful perspectives from the philosophy and theory of technology, which are able to account for more complex notions of our relationships with the digital” (Knox 2015, p. 1).

The last population in the diffusionist model of adoption of digital learning are *diehards* (sometimes also pejoratively called *laggards*). For one reason or another, diehards will never adopt digital learning in their practice or will adopt the necessary minimum for normal functioning in the workplace. While Zemsky, Massy, and other early theorists of development of digital learning have sported slightly negative attitudes toward diehards, the perspective of digital cultures offers a more cautious approach. In saturated digital environments, it is the balance between the offline and online that matters, and diehards do have an important contribution to achieving that balance.

Theoretical Issues

The diffusionist model is overly simplified in several important ways. Firstly, the diffusionist model was developed in mid-twentieth century for analyzing the introduction of relatively simple agricultural techniques into farming (Rogers 1986, p. 117). In the context of digital cultures, however, digital learning is much more complex than any particular (agricultural) technique.

Secondly, people and institutions may belong to different categories in the context of two or more innovations. For instance, an innovator who took up using e-mails decades ago might be a diehard in the context of virtual learning environments – either by his or her orientation to technology or because of technological affordances or because of any combination of these factors. Thirdly, the diffusionist model does not recognize the objective obstacles to adoption of digital learning such as the Digital Divide.

The diffusionist model classifies past and present events. It places human adoption of digital learning into a proverbial Gauss curve, thus reapproving the universality of simple abstract mathematical laws in the context of various human activities. However, the diffusionist model is unable to predict whether yesterday's and today's trends will remain for the future. While it is easy enough, and often seducing, to extrapolate abstract mathematical curves, such extrapolations do not have theoretical grounding and result in mere speculations. Furthermore, it is impossible to predict the viable extent of digital learning in the future. In spite of continuous efforts, learning in areas such as painting, dancing, or music has proved more resistant to digitalization than fields such as languages and sciences.

Information and communication technologies constantly evolve. Today's computers bear little resemblance to dishwasher-sized machines of the 1970s or simple home entertainment tools of the 1980s. However, such mutations are not included in the diffusionist model. Recent history is full of examples where more advanced technologies, such as virtual learning environments, disrupted development of less advanced technologies, such as CD-ROM-based courses. However, the diffusionist model does not include disruptive technologies within an adoption cycle. In later works, Rogers tried to resolve the first problem by describing technology development using several diffusion curves and the latter by connecting several successive adoption curves (Rogers 1986, pp. 116–125). Such remedies improve accuracy of the diffusionist model, yet the inherent tension

between evolutionary and diffusionist models remains.

Ontologically, the concept of diffusion implies penetration of one medium into another (in biology and physical sciences, it usually refers to penetration of denser into less dense liquids during the process of osmosis). Therefore, the main prerequisite for diffusion is the ability to make a clear distinction between the two media, which, in the process of osmosis, is represented by a semipermeable membrane. In the age of digital cultures, however, it is impossible to divorce pre-digital learning from its digital counterpart. At the ontological level, therefore, the diffusionist model does not correspond to the reality.

Practical Applications

In spite of theoretical limitations, the diffusionist model of adoption of digital learning has many successful practical applications. In order to illustrate the main bases for such success, this section shows three applications of the diffusionist model of adoption of digital learning and analyzes reasons for their success. In the first study, Duan et al. (2010) successfully utilize an innovation adoption perspective in order to examine Chinese students' intention of taking up e-learning degrees at UK institutions. In the second study, Zhang et al. (2010) investigate "people's perceptions and attitudes toward adopting e-learning to explore the key factors affecting the e-learning adoption behavior in China. Based on Rogers' innovation adoption theory," they identify 33 factors of the perceived innovative attributes of e-learning and analyze them using advanced statistical methods. In the third study, Soffer et al. (2010) look deeper into the past and explore "long-term web-supported learning diffusion among lecturers at Tel Aviv University (TAU), from an organizational point of view" within the period of 8 years.

Duan et al. (2010) focus on the very specific group of Chinese students who consider taking up online degrees provided by UK universities. Zhang et al. (2010) ignore the temporal dimension and horizontally investigate 33 factors relevant for the adoption of e-learning here and now. On the

opposite side of the spectrum, Soffer et al. (2010) investigate the few factors relevant for the adoption of digital learning through the period of 8 years. These studies have been designed to minimize the impact of theoretical restrictions. For instance, it is reasonable to expect that students who seriously consider taking up an expensive overseas online degree possess elementary access to computer and the Internet – thus, in their research, Duan et al. (2010) could safely eliminate concerns related to the Digital Divide. Similarly, Zhang et al. (2010) can safely hedge the model's inability to make predictions, because their research question is firmly situated in the present. Applied to narrow questions, where theoretical restrictions have minor impact to studied phenomena, the diffusionist model of adoption of digital learning provides useful results. More generally, the usefulness of the diffusionist model of adoption of digital learning decreases in inverse proportion with size and complexity of the researched phenomenon.

The diffusionist model is phenomenological and unable to provide prediction of the future. However, formal educational institutions are traditionally inert. Therefore, as can easily be seen from Soffer, Nachmias, and Ram's analysis of 8 years of e-learning at Tel Aviv University (2010), the diffusionist model of adoption of digital learning enables sound short-term and mid-term educated guesses. A similar line of argument can be applied to the remaining theoretical restrictions, such as the model's failure to account for technological evolution and, more specifically, to account for disruptive technologies. Information and communication technologies do not evolve overnight; even the most disruptive technologies take few years for a complete market takeover. For instance, long after virtual learning environments powered by broadband Internet have disrupted their adoption curve, CD-ROM-based courses could still be found in various educational institutions. Theoretically, accuracy of the diffusionist model of adoption of digital learning decreases in inverse proportion with timescale. In practice, however, there is a fairly long "safe period" where the model provides accurate or near-accurate results. Therefore, the diffusionist model of adoption of digital

learning has proved instrumental in short-term to mid-term strategic and managerial decisions (Zemsky and Massy 2004; Bates 2000; Anderson and Elloumi 2004).

Conclusion

The diffusionist model of adoption of digital learning is instrumental in describing small-scale and time-restricted phenomena such as the implementation of this or that technology to a school or university. Theoretically unable to make predictions, the model does offer fairly accurate small-scale and mid-scale educated guesses. Therefore, the diffusionist model of adoption of digital learning is widely used in technology-related change management in worldwide educational institutions. However, the model does not offer an insight into the evolution of digital learning and the emotional work of teachers in adopting digital tools in their practices. It cannot explain why people take up one technology and abandon another; it does not provide a window into the future. The diffusionist model of adoption of digital learning is based on a simple statistical method – the Gauss curve – which merely distributes populations according to certain criteria. For as long as the research problem is framed in ways that avoid the main theoretical restrictions, and for as long as results returned by the model are interpreted phenomenologically, the diffusionist model will yield accurate and useful results. The praxis of education equally consists of everyday practical improvements and grand theoretical achievements. Firmly situated in the first domain, the diffusionist model of adoption of digital learning provides an important tool for managing technological change in educational institutions.

Digital Learning and the Changing Role of the Teacher

Hamish Macleod and Christine Sinclair
University of Edinburgh, Edinburgh, Scotland,
UK

Introduction

Even though educational institutions have been key to the development of digital practices, teachers are sometimes regarded as late adopters,

often with good reason (Cuban and Jandric 2015). At the start of the twenty-first century, there was little direct use of digital technology for teaching in schools or universities. However, teachers worked within cultures and societies already becoming reliant on digital technologies and increasingly defined by them.

Contemporary writing traces shifting relationships across teaching practices, digital mediation, and the influence of globalization. There are debates about the resulting impact on who teachers are, and what they (are able to) do, in the era of digital learning. The emergence of newer forms of technology to support and mediate the processes of teaching and learning has also led to a reexamination of the theoretical underpinnings of those practices – educational purposes, values, and structures – and the forms of literacy associated with these. Several strands of critical research literature highlight changes in the society's relationship with teachers and pedagogy. Historical analyses of the repressive impact of the print era, political inquiries into the effects of neoliberalism on universities, and pedagogical calls for emancipatory approaches to teaching and learning all present evidence of the teacher's changing role.

An initial broad look at the context sets the scene for considering definitions around digital teaching, mediation effects, and cultural and political influences.

The Changing Context for Learning

Educational systems have always been dependent on the prevailing technological affordances of recording, transmission, reproduction, and communication of their era. Biological, mechanical, and electrical means of achieving these basic functions have all made their mark on the practices of teaching and learning, although when changes in these are gradual, they may go unnoticed. However, “the digital” is regarded by many commentators as different in kind, with the impact of the technological change comparable to that from the oral tradition to literacy, or from written communication to mass dissemination

through print. As in previous eras, the newer forms of technology retain features of those which they supplant; in addition, older forms find new avenues, as exemplified by Walter Ong (2012/1982) who refers to the “secondary orality” as demonstrated, for example, in television, which would not have existed without writing and print. Digital technologies have brought even more oral culture than television, including changes to television that have rendered it interactive, asynchronous (and differently synchronous), remixable, and ultimately unrecognizable from its original form.

As education in the twenty-first century has begun to emerge from the 500-year dominance of the printed word, some commentators have identified a restoration of more democratic and dialogical approaches to teaching and learning. This fits with Pettit's (2012) notion of the “Gutenberg Parenthesis” – the relatively short period of modernity where the printed book was the source of authority and control – creating a digression from the former and now renewed oral communication mode. At the heart of the escape from the print era are issues of voice, agency, and connection – not new ideas in themselves but given new opportunities to flourish – not least in education (Wegerif 2013). Less optimistically, some writers suggest that neoliberal policies and practices in educational institutions and beyond are stifling debate about teaching and privileging an economic and utilitarian perspective on education over a pedagogical or intellectual one. Technology might be a mediating factor in either case: digital technology has the capacity to support communication and openness, as in the open source movement; it also supports automation, which might lead to commodification and closure. While these examples illustrate potential contradictions and tensions about the role of technology, they do not represent a simple binary: technology does not only promote communication and automation. Support functions for education from digital technology include, *inter alia*, acceleration, administration, automation, calculation, communication, design, display, learning analytics, simulation, surveillance/observation, and storage/

retrieval. These inevitably affect a teacher's role and status, as do social changes that have accompanied such technological functions.

Defining the Teacher and Teaching Practices

The advent of the expression "student-centered learning" suggested a shift in focus from "traditional" subject-based curricula. It emerged in the 1980s, peaking around 1999–2003, but fitted well into the narratives around digital learning that followed soon after. In 1993, the title of a short article entitled "From Sage on the Stage to Guide on the Side" (King 1993) prompted many citations and adaptations even two decades later. Thus the teacher's role was already being questioned by writers on educational development, and by educational policy makers, just before the arrival of popular awareness of the Internet through the World Wide Web. As digital learning became possible, then, there was already a mood to move from transmission of knowledge to construction of knowledge – from instructivism to constructivism. While either or both of these might be enhanced by digital technology, some teachers saw technology as a potential "Trojan horse" to introduce more progressive teaching methods.

Metaphors and other tropes around teaching bring out competing understandings at a time of change. The simplest conceptualization is that teaching involves the transmission of knowledge. The teacher possesses knowledge in a particular domain, works to structure it in an accessible way, and transmits that knowledge to the learners. A radical constructivist position would suggest that knowledge cannot be simply transmitted from one individual to another, but must be constructed anew in the mind of every learner. The debate between instructivism and constructivism raises questions about the teacher's role as a repository of domain knowledge, especially when there are digital alternatives to this. The implication might be that what is important in the teacher is the generic skill in supporting learning – and perhaps the cultivation of generic

scholarship in the student – as opposed to disseminating high levels of domain specific knowledge.

"Guide on the side" has not, however, become a job title. "Facilitator" sometimes has, though it is more likely to refer to the role in a very specific context, such as in resource- or problem-based learning. The education sector globally has had some difficulties with terminology, and these increased with new roles emerging with the use of technology. Differences could be local, or they may reflect changes in emphasis. For example, "tuition" might be something that a teacher gives you (UK) or something that you pay (USA). Some countries refer to course or curriculum design, others to instructional design, an expression that was widely used in the USA from the 1980s. Early in the twenty-first century, the notion of "learning design" began to gain momentum. The person who does that design might be a teacher, but might instead have the title "instructional designer" and be considered not to be a teacher or instructor but someone who supports the teacher, especially if digital technology has an impact on the complexity of the design of educational activities. Another title that has developed with digital technology has been "learning technologist," which has raised a number of discussions, not least among learning technologists themselves, about what the expression really means and thus what the role encompasses. In some contexts, learning technologists will be directly involved in teaching; in others, not at all.

Other titles related to the teaching role are facilitator, demonstrator, tutor, faculty, lecturer, and professor – all words that can have different connotations in different times, places, and contexts. The definitions relate to what people do, but also to their status, both of which are significant to their role at a time of change. Just as the word "lecturer" has evolved from its original application to a person who reads a text, before the printing press rendered that unnecessary, it may be that some words will change their reference and other new words may be required to describe teaching in the age of digital learning. This may have implications for individuals' career and professional development and remuneration.

Phrases saying “what people do” in education might hint at tools used for mediation, though they can be more subtle than that. While *e-learning*, *technology-enhanced learning*, and *digital learning* emphasize that the teacher and/or the student is using technology, another terminology perhaps offers a greater indication of how the learning is to be done. The shift from transmission to construction clearly involves a change of metaphor, and constructivism, especially social constructivism, is seen as particularly appropriate for digital learning. Technologies have also offered metaphors for the way in which educational engagements should proceed. Ideas such as *networked learning* and *connectivism* have called upon notions of nodes, linkages, and communication as a way to understand, and to provide prescriptions for, pedagogic design and action in a highly connected world. However, it is interesting that in their continuing emphasis on student-centered learning, these expressions do not explicitly say anything about what the teacher does. For more details on what the online teacher actually does, see Sinclair and Macleod (2015).

These debates suggest potential confusion about expectations of teachers, especially in relation to subject knowledge, which is now readily available digitally and no longer needs to be transmitted. This should not be seen to imply that subject knowledge in teachers is not required; in the more dialogical context, it is still essential for diagnosing conceptual problems to enable the teacher to steer conversations or structure learner experience in a coherent way. Indeed initial and sustained learner motivation comes through the manifest enthusiasm that is displayed for the subject by those influential others – frequently teachers – in the student’s world. The teacher might thus be positioned as a model of academic values and behavior. Those values and associated actions now take place in digital academic environments as well as in physical locations.

There are other concerns about teachers’ roles, such as long-running arguments over whether what the teacher wants to achieve will be the same irrespective of medium. From a wider political perspective, there is also the question of

whose business it is to define the role the teacher should play and whether that is changing through digital technology. Definitions of teachers and teaching will inevitably be filtered through perspectives on these questions. A person who thinks that technology is a neutral tool to deliver a standardized curriculum will see the teacher’s role very differently from one who thinks that a digital environment offers a new opportunity for intensive critical dialogue in which the teacher plays the role of senior colleague.

Effects of (Digital) Mediation on Teaching

A teacher looking for guidance on “what to do” in digital learning might then be influenced by the idea of giving instruction online to students or of creating an activity for students within a network – or by any other theories that relate to student learning, such as the promotion of emancipatory learning through technology. There are a number of possible frameworks stemming both from the pre-digital era and from the wish to develop practices that exploit the potential of digital technology, such as the ability to scale or to “flip” the classroom by having the students engage with transmitted material in their own time, followed up by a more discursive session where knowledge is more fully constructed and assimilated.

New forms of mediation have led to a reexamination of processes of teaching and learning. This is nowhere more evident than in the debates surrounding the rise of the massive open online course (MOOC) and its associated and derivative practices, as this rise was so rapid and widespread. The speed of change has made it more obvious just which parameters have been changing. As a consequence, technologically supported (and other innovative) practices in education are debated and critiqued in a way that is rarely faced by traditional and established practices. Participation in such debates can serve to revitalize education as a whole, and it has done so as much in the public domain as in more abstract academic (printed) publications.

The variation in MOOCs brought out further arguments about instruction versus construction and connection – it soon became clear that this discussion had not disappeared with the advent of digital learning. As already suggested, a conception of teaching as transmitting information can be well served by technology. The potential of the MOOC reignited debates about the role of the teacher, including a perennial one about whether teachers are necessary at all. However, most notably for our purposes here, it has highlighted the role of teacher presence and its relation to learner motivation, particularly how it can be sustained both at scale and at a distance. By “presence,” we mean the sense in which people feel that they and others are in a shared context.

Presence, in the educational context, is most fully developed in the “community of inquiry” theoretical framework of Anderson and colleagues (Garrison and Anderson 2003). This framework considers social presence, cognitive presence, and teaching presence, mapping onto a social constructivist understanding of learning, and accounting for the role of the teacher in designing, initiating, focusing, and sustaining discourse directed toward a learning outcome or outcomes. Particularly significant here is the role of the teacher in orchestrating the experience of the learners such that learning is motivated by the emergence of some “triggering event” in the student(s)’ experience.

Presence is an important topic because it relates to what teachers do, how they do it, and how this is perceived by students, employers, and other stakeholders in education. Lack of teacher presence was seen as likely to be one of the biggest barriers to the acceptance of digital learning; as a difficult concept to quantify, metrics such as “contact hours” have been offered in lieu.

This is at least in part a result of the broader political, social, and cultural environments in which education takes place. As with education, effects on these are partly constituted by digital technology, but also in part predate that technology, bringing in effects from earlier times, which continually merge. Teachers have to teach within a technology-saturated context as well as through using the tools that it has to offer.

Teaching in a Technology-Saturated Context

Continuing to focus on the idea of teacher presence – and indeed student presence – allows illustration of some of the emergent dilemmas of digital learning already alluded to. When digital technology enables fully online courses, and blended learning with a mix of classroom and online activity, it draws attention to the problems of providing equivalence between these activities for purposes of measurement and quality assurance. In fact, some have argued that it illustrates the futility of measurement of activities of teaching and learning in this way at all. Some writers such as Chickering and Gamson (1991) prefer to emphasize the importance of relationship with faculty as a key dimension of quality educational experience.

The notion of “contact hours” is complex, in a setting in which access to a period of “video lecture” might be equated with the student’s participation in an equivalent period in a “live” lecture room. It has an impact not only on what is fair for students but also for how lecturers are performing within their contract of employment. Graham Gibbs (2014) has pointed to students’ and their representatives’ flawed reasoning about the value of contact hours, suggesting association with a commercial neoliberal approach that regards the student as a customer.

Technologies supporting access to resources, and communications between actors in the pedagogic process, inevitably bring with them opportunities for surveillance and monitoring. Such monitoring may be neutral, or even benign, in its intent, as in the development of the domain of learning analytics which seeks better to understand the processes of learning, and the behavior of students in networked spaces, and thus to improve and support the student experience. The same data may, of course, also be used to call students and teachers to account.

Learning analytics may be directed to provide information about the behavior of cohorts of students as a whole or to generate information about individual learners. This could help to identify students who are “at risk” in some important way, perhaps of academic underperformance, or of

withdrawal from study altogether. There have been associated questions about data protection and rights to access to the information held about students. Thus legal rights and ethical considerations can affect the way information might be supportively interpreted through the lens of the teacher's experience.

The teacher as employee of the institution or the State is open to the pressures of monitoring of performance and productivity. In the past teaching has been seen as a profession, implying a high degree of autonomy and discretion in the conduct of one's duties. The early twenty-first century saw a rhetoric of regulation, audit, and accountability, by which other interests dictated to the teacher how they should conduct themselves. This situation has not been "caused" by digital technology, but it may well have made it easier for it to occur.

Introduction

In recent decades, digital technologies have seen widespread use across global society and adoption at all levels of education. *Digital learning* might therefore simply be described as learning that is facilitated by digital technologies, but to discuss digital learning *only* in this way obscures important complexities linked to language, culture, politics, and the economy. To talk or write about learning as if it were directly facilitated by technology of any kind, places a strong focus on what technology has, or seems to be, achieving. At the same time, this marginalizes, or reduces the visibility of, human roles within the academia and beyond (Hayes and Jandrić 2014). Digital technologies are often introduced into educational institutions amid simple assumptions, or *ideologies*. Related policy *discourse* may suggest there will be economic improvements, such as educational performance and efficiency. This is linked to what sociologists and anthropologists have referred to as an "audit culture," (Shore & Wright 1999) where, since the late 1980s in both education and wider society: "the techniques and values of accountancy have become a central organizing principle in the governance and management of human conduct – and the new kinds of relationships, habits and practices that this is creating" (Shore 2008, p. 279). These new principles of organization are said to be serving a "Knowledge Based Economy" (KBE), which is a widely used

metaphor, without precise definition. It suggests that knowledge and related digital technologies have now overtaken human physical labor, to drive productivity and global economic growth. A KBE discourse, which assumes economic enhancement from technology, is very different to one that existed prior to the mid-nineteenth century, when technology was closely associated with the Greek concept of “*techne*,” referring to broader human interaction and knowledge, related to arts or craft.

A discourse of a KBE (Jessop et al. 2008) that treats technology *only* as a simple tool to drive and enhance economic productivity is described here as an example of: (1) an *antihumanist*, or a *technologically* deterministic viewpoint. It focuses on what *technology* is doing, to impact positively on digital learners, as if this were a simple, “outside intervention” (Knox, Education and Digital Cultures). A discourse that places more emphasis on *human* practices with technology in society is described as (2) a *humanist* perspective, which is *socially* deterministic, because it discusses humans as separate from the technology, objects, and other nonhuman things they use in practice (Knox, Education and Digital Cultures). Alternatively, a discourse where technology and humans are considered to be mutually shaping of each other is described as (3) a *posthumanist* position (Matthewman 2011). This entry treats these three categories as distinct, but overlapping, ideological stances that can be found in discourse about digital learning.

Discourse and Ideology

Critical linguistic studies suggest discourse carries particular values or ideologies that together with other elements in society may reinforce or disrupt a current state of affairs. A *humanist* perspective on education has links with poststructuralism, but this limits our understanding of the agency of technology, because poststructuralists treat the human *subject* as a bounded entity whose actions are completely separate from the outside world of objects, technologies, and other “nonhuman” things (Knox,

Education and Digital Cultures). In an *anti-humanist* perspective though, digital learners are treated as passive beings, and technology simply impacts upon them, so this conceals human agency to act. Norman Fairclough suggests that by approaching technology, ideology, and social practice through *Cultural Political Economy* (CPE), semiotic, or “meaning-making” relations between these elements might be understood as “dialectical,” (Fairclough 2007). In other words, not as entirely separate from each other, as in either a humanist or antihumanist perspective, but shaping of each other culturally, politically, and economically in a manner that moves closer towards a *posthumanist* position. This acknowledges that there are cultural dimensions to any economic crisis, economic dimensions within culture, and a political character to both in related discourse (Castells 2011).

Discourse then might be understood as written or spoken language, dialectically linked with human practices, in real contexts of use, where cultural, political, and economic elements affect each other. In this entry, discourse covers the meanings, effects, and strategies people use, as well as production and interpretation of actual texts that describe the role of technology and humans in digital learning. *Ideology* in this context refers to ways that people’s beliefs and values come to intersect with technology and human practices through discourse. Ideology may lead to forms of knowledge that appear to be freed of political interests to construct certain meanings that are presented as “common sense.” As with ideological claims generally, unquestioned assertions can have powerful and significant social and political implications (Friesen 2008). Choices made in discourse, to express ideologies about technology, or human practice, in digital learning contexts are often framed as if they were self-evident facts, or objectively “true.”

Varied terms are used to describe digital learning including: *e-learning*, *networked learning*, and *Technology Enhanced Learning (TEL)*. While e-learning is short for electronic forms of learning, and networked learning suggests learning that takes place across digital networks, the term Technology Enhanced Learning (TEL) has

recently become widely adopted in policy, and also critiqued. Criticisms of TEL question an inbuilt assumption of a direct economic connection between bringing technology into education and automatically “enhanced” learning, or productivity. Critically examining how digital learning is framed in discursive constructions that link technology with ideologies about learning is one way to confront such arguments (Fairclough 2007). Approached via critical social theory about technology and language, *discourse* and *ideology* are key concepts in linguistic study of how human understandings of *digital learning* are shaped.

Antihumanist, Humanist, and Posthumanist Reasoning About Technology

In the broadest sense, technology (including digital technology adopted in education) might be said to encompass everything, to affect human history and learning, and can be basically defined as: *objects, activities, and knowledge* (Matthewman 2011, p. 2). A body of literature that acknowledges technology in this way (Winner 1980, p. 122; MacKenzie and Wajcman 1999) is distinguished from more dominant antihumanist or humanist reasoning that suggests either technology, as a neutral entity, simply drives history to determine what humans *know*, or that human agency drives technological change.

Langdon Winner undermined both of these forms of logic by arguing that technologies *themselves* carry design choices that either open or close social options. Therefore taking a CPE approach, when adopting technology, people also make cultural, political, and economic, as well as technological, decisions (Winner 1980). These decisions can then manifest as ideologies too in discourse about digital learning, to alter how certain qualities are attributed to either technology, or to humans. As technology contributes to the economy, recognizing that related values are expressed culturally and politically in written policy discourse about education aids a linguistic

exploration of digital learning, as a “scene of struggle,” rather than as a *fait accompli* (Friesen 2008).

Arguments about the role of technology can be examined then through the three broad categories already mentioned (*antihumanist, humanist, and posthumanist*) to notice what values are emphasized in discourse. Already applied by Matthewman to critically theorize technology more generally (Matthewman 2011, p. 15), firstly, antihumanist views would suggest digital devices *themselves* define how people use these to learn. This very common way of thinking is a form of technological determinism and contains a partial truth (MacKenzie and Wajcman 1999). Secondly, the humanist concept is a form of social determinism, which also presents a partial truth by treating technologies as “neutral” entities but placing emphasis on ways that *society* chooses to use them. Prior to the mid-nineteenth century, technology was associated with the Greek concept of “*techne*,” referring to broader human interaction and knowledge related to arts or craft. In this understanding there is room for varied and individual human interpretations of what people come to know through using technologies, and how in turn, human actions might shape changes to technologies and society. This approach to theorizing technology is closer to the third category (posthumanist), which does not choose to privilege either the role of technology or society. Instead, each might shape the other, in a manner that is “mutually constitutive” (MacKenzie and Wajcman 1999). In a posthumanist discourse about digital learning, technology is treated as an “ongoing encounter” (Matthewman 2011, p. 8). Humans coevolve with technology (Matthewman 2011, p. 176) in individual, material, and discursive encounters, where human and nonhuman actors shape and alter each other.

A Knowledge-Based Economy and Critical Theory About Knowledge

Having established three broad forms of discourse through which to examine ideologies about digital learning, these can be explored with reference to

critical theory about knowledge. Buzz phrases such as *Knowledge Based Economy* (KBE) and *Technology Enhanced Learning* (TEL) might be interrogated linguistically.

Deterministic arguments tend to attribute technology with inherent and unquestionable “value” to improve human contexts (including learning). Examples can be noticed where discourse suggests technology enhances “student engagement” or “employability.” These phrases are things that might then be “audited,” evaluated, or scrutinized institutionally, or by government agencies. A phrase like “the student experience” when mentioned often in the media becomes treated as a social “problem,” discussed publically, with judgments made about the performance of teachers in relation to these “issues.” However, these forms of reasoning also frame students as passive consumers in a competitive market, rather than active participants experiencing technology in diverse contexts of learning.

In policy texts we may find “presuppositions,” where understandings about technology and what it does are discussed as “given.” This then enables further arguments to be constructed from this “given” position and treated as if it were a generally held “truth.” Particular relationships between technology and people may be represented through grammatical constructions that become hard to question but which obscure alternative understandings (Hayes 2015). Digital learning as a concept can be productively explored through a critical analysis of reasoning about technology in any surrounding discourse. This enables certain ideologies to be noticed and categorized. Without a close analysis, common sense arguments that become generally accepted to shape a particular view, for example, a logic that technology (rather than the human labor of teaching) enhances learning (Hayes 2015) may simply go unnoticed.

Findings from linguistic analysis can be articulated with reference to critical social theory. Firstly, in a macro overview, literature from critical theory applied to knowledge is examined. This builds on the body of work of the Frankfurt School, where all knowledge is considered to be political in nature and shaped by human interests (Habermas 1968). The widely referenced

“knowledge-constitutive interests” of Habermas suggest human interests are “instrumental,” “practical,” and “emancipatory” in nature.

Instrumental knowledge relates to technical human interests that are associated with work, labor, production, or the natural sciences. *Practical knowledge* is more about interpretive ways of knowing, through which everyday and social human activities are coordinated and given meaning. *Emancipatory knowledge* is the kind of knowledge that critical theory itself seeks to generate, and it is articulated in terms of power, control, and emancipation (Friesen 2008). In critical theory these three forms of knowledge and interest are never entirely separate, and emancipatory or political knowledge is considered to be all pervasive and central to the critical theoretical concept of *ideology*. Therefore, ideology is *any* kind of knowledge (whether technical, practical, or emancipatory) that *appears* to be freed of political interests (Friesen 2008).

Secondly, in exploring assertions about a KBE, social change since the Industrial Revolution has seen rapid mechanical developments, alongside changes to political and organizational structures, and the emergence of digital technologies across global society. Where “capital” from physical labor had once been the dominant factor of production in industrial societies, in postindustrial societies, a focus has emerged on the role of “knowledge” (Bell 1999). Bell identifies four trends: (1) a shift from manufacturing to services, (2) an increase in the general importance of education, (3) the increased importance of technological infrastructure as a foundation for an electronically mediated global economy, and (4) the theory that knowledge now creates value-added and increasing returns. In this last point, Bell shifts the focus from Marx's, “labor theory of value,” where human physical labor in capitalist economies adds value to commodities and products that can then be sold at a profit, to a “knowledge theory of value,” where the exchange of knowledge in educational and research contexts now plays a value-adding, profit-making function (Friesen 2008).

This has implications that can be noticed in policy literature for educational technology.

Schools, universities and teaching staff can find themselves being discussed as following outdated principles and methods, with reform and enhancement recommended, for greater efficiency in a KBE is recommended. In a knowledge theory of value, certain ideologies are spread through discourse (language-in-use) (Fairclough 2007) and these tend to privilege some characteristics of knowledge over others. Knowledge becomes characterized as a kind of service or utility to be bought and sold, used, enhanced, and reused as a “super commodity,” a thing that has market value like physical commodities but that also transcends even the products of physical labor (Friesen 2008). Consequently in government policy and in university strategy discourse, there is discussion of learning objects and learning outcomes, as knowledge that has been broken down into exchangeable packets within contemporary capitalism.

A further consequence is that the complex, contestable nature of knowledge emerging from varied human constitutive interests (Habermas 1968) becomes suppressed, as knowledge gets linked simply with “performance” within a culture that audits only the elements deemed to be useful, to support a KBE. New media enables the logic that we are now in a KBE and as humans must quickly adapt, to travel swiftly via technology, as well as discourse, spreading persistent values. Therefore, how digital learning is routinely discussed, in spoken and written discourse, can quickly reinforce powerful ideologies about learning through technology.

Ways to Critique How People Are Positioned in Discourse About Digital Learning

Economic, technical, cultural, and historical conditions surrounding digital learning are complex. A student or a teacher (online or in a classroom) is an individual who is cast into predefined relationships and structures, which are reproduced and reinforced through even the most trivial statements and actions (Friesen 2008). In order to examine these values as they play out in

discourse, the following basic steps might be followed for an ideology critique:

1. Identify ideas or claims that are presented as obvious, common sense or inevitable, sources of knowledge.
2. Scrutinize these ideas or claims in the context in which they arise.
3. Reveal where behind dominant claims there are politically charged and often contradictory ways of understanding an issue or phenomenon.
4. Use this underlying conflict as the basis for developing alternative forms of understanding and point to concrete possibilities for action (Friesen 2008).

If claims of ideology in discourse about digital learning are to be supported, and not simply suspected, then under (2) a detailed linguistic analysis can help to demonstrate where particular patterns of discourse are often repeated. One approach is to build a large corpus, or bank of words, and to use software to reveal what quantitative patterns emerge. From here, one might undertake a more qualitative analysis to look more closely at patterns to suggest what might be happening, with reference to critical theory.

An example of this is to undertake Critical Discourse Analysis (CDA), which is best understood as an interdisciplinary approach, where researchers choose from a range of linguistic tools some ways to shed light on what is happening in the discourse. Through CDA techniques some researchers have found that there are strong repetitions of nominalization in policy texts about digital learning. Nominalization is noticeable where nouns stand in for verbal processes in texts. A common effect is a reduction in human agency. It becomes hard to detect who a proposition refers to, or who has declared it to be so. This then can lead to human labor being attributed to technologies and strategies, or to terms such as Technology Enhanced Learning (TEL), or e-learning, rather than to the actual people who are really enacting tasks, such as teachers and students (Hayes and Jandrić 2014; Hayes 2015). Therefore, if claims are to be made about ideology

then empirical inquiry of this kind can help to pinpoint oversimplified presuppositions about digital learning in discourse (Fairclough 2007; Hayes 2015).

Conclusion

This entry has discussed how critical theory around discourse and ideology has emerged to challenge a dominant “marketized” view of how digital learning takes place in a KBE where “taken-for-granted” economic narratives (Jessop et al. 2008) can spread rapidly through digital media. Shifts in master economic narratives such as the KBE need to be understood at the macro level of capitalist markets, to notice where a culture of audit has arisen Shore (2008), leading to subordination of teaching and research to economic imperatives (Jessop et al. 2008). Policy discourse might then be examined at the micro level, in close linguistic analysis. CDA is just one approach that might be taken to confront contradictions and suggest alternative forms of discourse. This section classified three ways human practice in digital learning might be discussed and constituted through discourse. Some forms of close linguistic analysis were described as ways researchers might disrupt the more simplistic accounts, given the complexity around those learning through digital technologies.

Digital literacy; Digital literacy practices; Multi-media literacies; Multimodal literacies; Techno-literacies; Technoliteracy

Introduction

The notion of what constitutes digital literacies in the present knowledge economy is debated. Some view digital literacies as the set of skills needed to

successfully engage with digital technologies. Others would argue they are the skills required to code software and the computational thinking skills of programming, designing, collecting, and analyzing data and the system-based literacy practices needed to communicate with simulations and games. New voices argue digital literacies encapsulate the proficiency to use digital technologies, as well as the soft skills needed to engage in co-creative endeavors, with humans and machines in creative, wise, and ethical ways. Regardless, Bill Green's "3D" (dimensional) model of literacy remains a salient point of reference to think about and understand the operational, cultural, and critical dimensions of digital literacies. The aim of this entry is to present an overview of the complexity of digital literacies in a future characterized by rapid and uncertain socio-technical change. It also explores how digital literacies, when viewed as anticipatory, can be leveraged to ensure children, young people, and adults engage in co-creative endeavors with each other and machine to maximize their potential for lifelong learning in ethically sound ways.

Digital Literacy Origins

Before the term digital literacies was embraced across educational contexts, Paul Gilster introduced the singular form, digital literacy, in 1997 to describe students' or learners' abilities to understand and use information presented via computers in multiple formats from a diversity of sources (Gilster and Glistler 1997). Yet digital technologies, particularly Web 2.0., have and continue to extend understandings of digital literacy, calling for a much broader view. The New London Group (1996) highlighted this idea more than 20 years ago when they introduced the term "multiliteracies" to describe the multiple literacies children, young people, and adults need to access, negotiate, and communicate across their working, public, and private lives. Multiliteracies as a new approach to literacy pedagogy at the time highlighted individuals' competencies to critically, confidently, and creatively use print and nonprint literacy practices to achieve

their own goals and participate in society. At that time, proponents of multiliteracies argued meaning making requires becoming proficient in using different semiotic modes to communicate across a diversity of technological devices, but they did not explicitly refer to these as digital literacies.

The term digital literacies, in the plural, was first introduced by Linda Labbo, David Reinking, and Michael McKenna in 1998 to describe workplace abilities where individuals collaborate to access information, manage and manipulate data, purposefully navigate through multimedia, and critically read and write digital texts (Labbo et al. 1998). A year earlier, Colin Lankshear coined the term "technological literacies," essentially the same as digital literacies, to highlight the social practices in which a multiplicity of texts are designed, modified, and shared digitally (Lankshear 1997). Later, Lankshear and Knobel (2003) furthered the plural use of the term digital literacies to highlight the diversity of social and cultural practices and ways of knowing required to successfully use digital technologies. Most literacy scholars still adhere to this definition of the term where they view digital literacies not as individual skills but as social practices embedded within a given sociocultural context regardless of whether it is face-to-face or virtual.

Thinking About Digital Literacies in 3D

In 1988, Bill Green put forth a 3D (dimensional) model of literacy that has become extremely influential when thinking about literacy and digital literacies. From a sociocultural perspective, Green's 3D model contends that literacy needs to be seen as having three interlocking dimensions: the operational, the cultural, and the critical. Importantly, these dimensions bring together language, meaning, and context where no one dimension dominates the others. How digital literacies might be described using Green's 3D model is outlined below, with the understanding that digital literacy practices are always in flux, much like technology-driven transformational changes taking place across society.

The *operational* dimension of digital literacies includes how to use technologies in the basic sense. This includes the functions of turning devices on, installing and configuring software, wirelessly networking devices to each other, downloading apps for use on mobile devices, and using search engines. This dimension also includes the abilities of sending emails, using authoring software, managing data, and supporting new ways of learning, collaborating, and communicating across devices, interfaces, time, and space (e.g., through virtual reality and augmented reality). For many children, young people, and adults, this could also include using social networking; designing systems; coding, modifying, and/or hacking systems, prototyping digital solutions, cloud computing, and software and web development. In many ways, the operational dimension of digital literacies is skill oriented with a ranging understanding of the major concepts that support the functionality of digital technologies and software or how they work.

The *cultural* dimension of digital literacies requires understanding and competence of how to operate digital technologies and also how to use digital literacies to consume, design, or produce and interact with a variety of digital technologies to make meaning in particular contexts. This can be either real time or virtual. By making meaning, users understand that digital technologies assist them in gathering unlimited knowledge and intelligence in real time to predict, prevent, and solve their problems. Users also recognize that the use of digital technologies is not neutral and that humans have an increasingly complex relationship with machines. For example, users understand digital technologies are designed and networked in particular ways to create new services and products. They also understand how digital technologies do things in the world and how they can either promote a user's or users' agency to engage in beneficial or harmful practices using their digital literacies. Whether users learn, communicate, experience pleasure (increased dopamine release in the brain triggered by playing, interacting, and communicating in virtual worlds), or engage in active learning through simulations alone or with others, they

are aware of what they are using digital technology for. Socioculturally, their digital literacy practices are working to shape their digital identities and are largely reflective of their lifeworlds. More simply, the cultural dimension of digital literacies is understanding that digital technologies are used to make meaning but, more importantly, do something in the world within a particular context.

The *critical* dimension of digital literacies includes being able to assess and critique software, hardware, and other digital technologies, knowing they are designed to be used for particular purposes across diverse contexts. Here users draw on their digital literacies to make sense of complex ideas and engage in design and computational thinking to solve problems they identify. Users also understand they can redesign, modify, or appropriate digital technologies for purposes they articulate themselves. By doing so, they understand how to anticipate, develop, and exploit digital solutions and knowledge to solve problems in the present and into the future. From this critical perspective, they are aware of their digital literacies and the implications of their use as they design, redesign, or modify current and emerging systems and practices. Understanding this critical dimension situates children, young people, and adults well to solve problems or dilemmas and use strategic foresight and anticipatory digital literacies to meet future challenges. This is because an anticipatory stance allows them to acquire new digital literacies to serve their own interests. Paramount to the critical dimension is highlighting that users learn soft skills, particularly the ability to learn and engage in emergent leadership through problem solving, being flexible and adaptable, and possessing a degree of foresightedness. Because many children and young people are now socialized into digital literacy skills and practices outside of school, they understand they must play an active role in learning new digital literacies to adapt and innovate to work, live, and predict in "smarter" ways outside of school.

Thinking about digital literacies in 3D emphasizes that digital literacy proficiency is achieved as people individually, collaboratively, and communally participate in the social and cultural practices of making meaning and using digital

technologies to take action for “real” purposes. But thinking about literacy in 3D highlights critical ethical issues. This is because humans are facing serious global challenges explicitly linked to advances in digital technologies. The question “digital literacies for whose ‘real’ purposes and to what end?” is imperative. When making meaning and taking action is increasingly about having the anticipatory digital literacies to use digital technologies, it is equally important to consider how digital literacies can be used productively to improve life on Earth for all living things, as well as to do harm.

Rethinking Digital Literacy Proficiency

It is difficult to predict what digital literacies will be needed in the future when all things or physical objects are assigned an IP address, and sensors have the ability to transfer data over the Internet of Things (IoT). The IoT is characterized, in part, by objects such as washing machines and fridges using the Internet to collect and exchange data, self-driving cars that rely on sensors, and implanted chips that can monitor body functions and report them directly to doctors. Also known as the Internet of Everything (IoE), the IoT represents a transformational shift to society and understandings of digital literacy proficiencies as literally *everything* becomes “smart.” The IoT is important for all educators, especially literacy educators. As more people and “everything” is connected to the network and harvesting more data from the network, individuals need increasingly sophisticated digital literacies to harness that data to improve decision-making at the school, in their daily lives, and in future workplaces. The IoT highlights that much of the world’s knowledge is already at users’ fingertips and accessible from mobile devices. The implications for literacy education are immense. The IoT highlights what is important to teach is not the retention of knowledge, coding skills, or simply operational skills. What is more important is being able to rethink digital literacy proficiency to understand how technologies and coding languages work, what they are most useful for, whose interests they

likely serve, and how to use new and emerging technologies with ethical foresight.

It is disconcerting how many digital literacy practices, some of which require users to engage in complex meaning-making activities, remain largely ignored in educational institutions that still focus on learning discrete skills that will likely *not* be needed in the yet-to-be imagined educational institutions, industries, and professions of the future. This presents a serious dilemma in regard to children, young people, and adults’ digital literacies because they are often not using their digital literacies to manage uncertainty. Rather they are still taking exams, writing essays, and giving presentations where they essentially regurgitate knowledge. They are less likely to be using their digital literacies to apply available knowledge in real-world settings where they are required to use critical thinking and written and oral communication skills to engage in entrepreneurial, sustainable, or ethical pursuits.

As educational institutions begin to catch up and transform their teaching and learning spaces to more closely mirror the spaces individuals in the real world use to solve pressing problems (e.g., sandboxes and makerspaces also known as DIY spaces where individuals can gather to cocreate, coinvent, and co-learn), students will need robust anticipatory digital literacies to share, collaborate, and experiment with each other, their teachers, and machines’ artificial intelligence (AI). As classrooms become more participatory – where participation is largely mediated by technology – educators need to rethink literacy instruction. This means new spaces must be designed to foster individuals’ digital literacy skills, practices, and proficiencies on a daily basis. This calls for strategic foresight when (re)conceptualizing literacy education in complex, changing, and ambiguous times.

Strategic Foresight to Separate Hard and Soft Digital Literacy Trends

Strategic foresight is needed to separate hard digital literacy trends from soft trends. A hard trend is

based on measurable and concrete information or events. This means it is something that will almost certainly happen (e.g., the increasing use of mobile apps, the announcement of new government regulations, strategies or action plans, etc.). Applying strategic foresight based on the certainty of hard trends is strategic because it is low risk. Hard trends allow individuals, organizations, and governments to predict what digital literacies they need to capitalize on to access emerging opportunities and avoid *disruption* as they cocreate and coexist with ever-smarter machines. A soft trend is a less certain prediction based on statistics that might happen. To only focus on these without separating them from hard trends increases risk and the potential for disruption. Importantly, when individuals, organizations, and governments use strategic foresight to identify soft trends, they can use their digital literacies to influence and change these trends as they work for a preferable future over a probable one. In times characterized by uncertainty, educational leadership needs to actively separate hard trends from soft trends to accurately appropriate ongoing rapid technological advances so that students of all ages recognize their capacity to use their digital literacies to act as a force of change in their communities, nations, and the world.

In many ways, strategic foresight is akin to what Anna Craft calls (2014) “possibility thinking,” where individuals – drawing on their “little c creativity” – ask “what if?” and “as if?” questions to solve the challenges they face in their everyday lives. She views this kind of strategic foresight or way of thinking as critical to fostering a wise, humanizing creativity (WHC). This is creativity guided by ethical action that is mindful of its consequences and pushes individuals to vision, scan, map, forecast, and plan their future. When individuals use strategic foresight to analyze, perceive, and separate hard digital trends from soft trends, they can articulate what digital literacies they need to become proficient with to tap into their individual, collaborative, and communal creativity to prepare for and cope with change toward a common good.

Anticipatory Digital Literacies

A digital literacy proficiency that is anticipatory is fundamental to successfully navigate technological advances that are bringing about hyperchange. Anticipation can be viewed as a literacy practice or an essential competency when it comes to thinking about the digital literacies needed to use digital technologies to adapt to new realities in working, public, and private lives. One could even argue that anticipatory digital literacies are currently needed by individuals, organizations, and governments to adapt to new realities just to survive in the world characterized by risk and uncertainty where humanity faces serious transnational global challenges.

As machines, clothing and body parts become “smarter,” humans’ digital literacies need to be anticipatory. This means they need to learn how to engage in strategic foresight exercises to anticipate and incorporate new digital literacy practices into their present literacy practices. They also need to understand this anticipatory stance will help them learn, design, and work smarter – not harder – individually, collaboratively, and communally. If digital literacy proficiency is predicated on anticipation and being open to uncertainty, individuals can use their digital literacies to make plans, test ideas, and enthusiastically engage in strategic foresight activities to identify hard digital literacy trends.

Such an anticipatory stance toward digital literacies is desperately needed to address the global challenges all living things face as they witness and participate – intentionally or unintentionally – in the destruction of the Earth (e.g., climate change, sustainable development, clean water, violence against women, global ethics, terrorism, etc.). With computers gathering information from overlapping data sets on just about everything in real time, anticipatory digital literacies are needed to successfully use new and emerging analytic methodologies to make disparate information and data useful. Such an anticipatory stance better prepares individuals to simultaneously manage change and address global challenges as they collectively march into an uncertain future where threats to equality, democracy, peace, and survival are certain.

The Ethical Dimension of Digital Literacies

Humans have a complicated relationship with digital technologies because of the unforeseen way they can complicate or improve life on Earth. This highlights why Green's critical dimension of digital literacies now needs more attention than ever. The critical dimension is also, to some extent, an ethical dimension where users of digital technologies need to understand their digital literacies can be used for good or evil. And that behavior, including which occurs digitally, and not necessarily in the physical realm, always has impacts and consequences on the welfare of self and others as users are both making and being made. Yet, this is much easier said than done. It could even be argued that for a future characterized by uncertainty, what is actually needed is a 4D (dimensional) model of literacies that also includes an ethical dimension. This is because ethics is about behaving and living properly. Increasingly ethics involves not only relationships with people but also machines' AI. An ethical dimension includes individuals, organizations, communities, and countries using anticipatory digital literacies to adapt to new realities in wise and humanizing ways. This would be characterized by children, young people, and adults using their anticipatory digital literacies toward a common good where they balance their own interests, other individuals' interests, and larger communal and global interests over both the short and long term to transform the world they share into a better place.

While Green's critical dimension highlights the need for individuals to be able to assess and critique new technologies, knowing they are designed to be used for particular purposes in the present, a critical stance is not usually anticipatory. Thus, individuals do not know, or likely even think about, whether they are leveraging their digital literacies to design solutions that have the potential to be equally beneficial or destructive into the future. One example is the rapid and encompassing pervasiveness of social media that is not only used to boost motivation in classrooms and students' proficiency with technologies but is also quickly eroding citizens' privacy as they are

constantly coming under 24 h surveillance. Another could be the use of drones that make military action and bombing more acceptable and routine because a machine is taking action. But who or what is responsible for the devastation or loss of life? More importantly how are they/it responsible? These examples highlight why the ethical dimension of anticipatory digital literacies is both timely and paramount. Students, regardless of their age, need to be taught to think in anticipatory ways about how their use of digital literacies can positively or negatively affect each others' and the Earth's well-being.

Conclusion

A new increasingly seamless interaction between humans and machines is unfolding at an astounding pace. Unprecedented uncertainty characterizes the kinds of digital literacies that are, and will be, needed to participate not only in the workforce but also in education across primary, secondary, and tertiary settings. That is, schools in these settings need to offer a different kind of education that is no longer largely reflective of the old industrial model and not preparing them for the jobs of the future. New technologies are continuing to disrupt all aspects of lived existence in most parts of the world. As a result, many businesses and organizations are adapting and transforming to meet the needs of diverse individuals. Conversely, most educational institutions continue to resist any transformational change as well as new technologies. Instead they focus on reforms that aim to raise standards through standardized testing and increased accountability rather than provide students (regardless of their age) a personalized, supportive, and nurturing education. Rarely do schools encourage students to actively scrutinize socio-technical trends with the goal of behaving in responsible, sustainable, and ethical ways to tackle the interdependent global issues humanity faces. The time has come to be more intentional about the ethical dimension of digital literacies and how they are fostered (or not) in educational institutions. Paramount is

also considering how they work and whether what digital literacies can do or achieve is something an individual should strive for. The ethical dimension of digital literacies has been relatively ignored until recently, and what scholarly discussion that has occurred mostly revolves around using digital games to teach ethics and ethical thinking.

At a time when young people are increasingly mobilizing technology and peer-to-peer networks for their own purposes, the ethical dimension of digital literacies becomes more important than the operational, cultural, and critical dimensions. When individuals use strategic foresight and view their digital literacies as anticipatory, then business as usual in educational institutions, businesses, and organizations will have to change. This is because anticipatory digital literacies will help them understand the myriad ways present institutions and systems – including schools – are not serving their essential needs (education, employment, access to clean water, free Internet, etc.). This will likely push them to acquire the digital literacies they believe they need, whether it is to find work, solve pressing problems, foster collaboration by promoting collaborative goals, or just survive. This is already happening. But it is important to remember that the forces of globalization, interdependence, and disruption are forcing people to manage risk, uncertainty, and change in very different ways. The growth of disruptive technologies that are changing life on Earth forces one to recognize what could be termed the dark or harmful side of digital literacies. Because digital literacies can be used for either unequivocally good or deliberately harmful ends, a new global challenge emerges. Education must help individuals understand the ethical dimension of their anticipatory digital literacies so they use them thoughtfully and with respect for others and the Earth, recognizing the interconnections between all human things and machines. Such a disposition is crucial for the greater good.

Digital Scholarship: Recognizing New Practices in Academia

Cristina Costa¹ and Mark Murphy²

¹University of Strathclyde, Glasgow, Scotland, UK

²University of Glasgow, Glasgow, Scotland, UK

Introduction

More often than not, novelty is met with suspicion. The status of “newness” is very rarely given a particularly high value not only because of the unfamiliarity it carries but also because of the threat it poses to established norms. Digital technologies in the context of a global knowledge society may no longer be news, but the transformation of scholarly practices with the support of the web still is.

Digital scholarship practices encompass a wide range of knowledge activities and approaches online which ultimately encourage practices that diverge from established academic norms. More precisely, through the affordances provided by the web, agents are slowly challenging the canons of knowledge production and distribution with practices of open content, self-publication, and public discussion. Although the adoption of digital scholarship practices by academics is increasing, its acknowledgment as a legitimate academic contribution is still minimal.

The lack of support and acknowledgment of digital scholarship practices is problematic, given their role in transforming academic practice,

professional identity, and forms of public engagement. In this entry the authors turn to theories of *recognition* to explain the politics surrounding digital scholarship practices, in particular the work of Pierre Bourdieu and Axel Honneth. Bourdieu’s understanding of (mis)recognition provides us with a structural and institutional (field) concept of the role that symbolic capital, especially in the form of reputation, plays in the reproduction and transformation of academic life, whereas the recognition theory of Honneth – built on the assumption that the drive toward personal autonomy, self-esteem, and respect can only be achieved intersubjectively through a process of recognition from significant others – invites us to rethink the role of affect and social capital with regard to professional recognition. The paper looks to explore the interplay between this “recognition turn” of Honneth and Bourdieu’s emphasis on distinction, in effect examining the intersection of intrapsychic and social locational understandings of recognition. It is argued that, combined, Bourdieu’s and Honneth’s concepts can be used to develop new understandings of digital scholarship practices and its relation to concerns over reputation, prestige, and respect which are core to the recognition of academic practices.

Digital Scholarship: Landscapes of Change and Conflict

Scholarly activities are gradually being changed through the inevitable process of digitization. Yet, the greatest differentiation digital scholarly activities present in comparison to more conventional ones lies in the almost ubiquitous accessibility academics have to distributed knowledge networks and the practices of openness that derive from participating in such social systems. The encounter of academics with the web can thus result in scholarly activities that are supported and enhanced by the use of the web and the ideas and movements associated with it. Digital scholarship practices, in this context, are heavily influenced by a growing culture of participation and sharing, openness, and transparency, of which

the open access movement is one of the most prominent outcomes (Jenkins 2009). Another aspect associated with the participatory culture, and which is key to understanding the recognition dilemma digital scholars face, is related to the gatekeeping of ideas and knowledge production. The web with its read and write features weakens the power of established gatekeepers – for example, publishers and academic journals of great renown and long-standing tradition – as it gives its users the autonomy to circumvent publishing conventions through self-publication practices. This “do it yourself” (DIY) approach disturbs the canons of academic publishing while raising questions about intellectual authority, ownership, and recognition.

Looking at the web beyond its functional use as a tool and interpreting it simultaneously as a field of practice and a space of empowerment lead to new understandings of digital practices. From a digital scholarship perspective, the web thus represents a new, alternative space where intellectual work can be discussed, published, and made openly available to a wider range of communities. Yet, such practices do not come without challenges, given that they mark a departure from the conventions with which higher education institutions are often associated.

This is especially the case with research, a field in which digital practices can be viewed as a threat (Costa 2013). Digital scholarship practices associated with research activity are held in less regard because they tend to represent a break with the rules of the institution and with what is at stake (Costa 2014a), i.e., the reputation of the academic institution with regard to how institutions expect research outputs to be assessed and recognized formally by its funders. The potential for conflict, therefore, is immense.

In exploring the roots of this conflict over digital scholarship, one can borrow Bourdieu’s concepts to understand the impact of the web (as an emergent social field) on academic practices (habitus) and explore how it changes or conflicts with academia as the structure where scholarly work achieves formal recognition (see, e.g., Bourdieu 1977, 1990). Bourdieu’s work represents a well-founded interpretation of social (re)

production and change, with his key concepts offering “... an ideal framework for theorizing about the ways in which social, cultural, and material forces intersect to produce particular types of social action” (Elam 2008, p. 18). This requires an understanding of the social spaces (its written and unwritten rules) where practices take place, and which Bourdieu designates of fields. It also requires an appreciation of the different forms of capital (economic, social, cultural, and symbolic) that engender a set of dispositions toward practice, the habitus. In the context of digital scholarship practices, this set of dispositions can be defined as a commitment to openness and innovation of academic knowledge work (see Costa 2014b), an emergent feature in the academic habitus that is trying to find its place in academia.

The field of scholarly practice encompasses at least three distinctive activities: teaching, knowledge exchange, and research. Although not completely dissociated from each other, each sub-field of academic practice features different rules with the former two being less regulated than the latter. This has to do mainly with economic and symbolic interests that are at play in the academic game with academic institutions – especially in the UK – being mainly subsidized and recognized for their contribution to research, a contribution that is mainly recognized by publication of research in long-established, high-ranking journals.

The particular approach to academia’s contribution to research thus results in a tighter regulatory approach as to how such activity should be conducted, ultimately stifling innovative approaches to knowledge production and distorting the strategies of what and where to publish instead of supporting the use of alternative channels available via the web to extend the reach of academic research to different audiences.

Understanding digital scholarship practices from a research perspective then requires one to interpret the interplay between these two fields and the practices developed on each one of them, and its relation to what is at stake, i.e., the reputation and status academic institutions will win or lose for supporting digital research

practices. With publications in high-ranking journals – because of its long-standing tradition – still being one of the main mechanisms through which the quality of research is judged, digital scholarship practices are not seen as a priority but rather as a risk at the eyes of the institution. The misalignment of digital habitus with the rules of long-established academic norms leads to the understanding of the web as a mechanism of deviance from the norm rather than a tool of innovation (see Costa 2015).

This misalignment, or misrecognition as Bourdieu would put it, suggests that the intersubjective world is a key battleground when it comes to the struggle over digital scholarship. And why wouldn't it be, given the importance placed in academia on status, reputation, and prestige, in other words, forms of distinction? In order to flesh out the importance of this world for understanding digital scholarship, it is necessary to develop Bourdieu's buried intersubjective analysis as a second and parallel strand to his more well-known and adopted "social location" approach to relational sociology. The work of Axel Honneth can prove extremely useful in this regard, allowing us to further explore Bourdieu's contention that the "real is relational."

Digital Scholarship: Honneth and Recognition

Through publications such as *Disrespect: The Normative Foundations of Critical Theory* (2007), the work of Axel Honneth has gained prominence in fields such as sociology, political science, and philosophy. The current interest in Honneth's work revolves primarily around his contribution to this praxis-oriented version of social science and social philosophy. This takes the form of a theory of *recognition*, a comprehensive and paradigm-shifting approach to reconnecting the micro and macro, agency and structural levels of social thought. Developed over at least two decades, the work of Honneth on recognition finds strong connections to previous theories of recognition, particularly that of Hegel. In summary, recognition theorists such as

Honneth argue that the drive toward personal autonomy and self-realization can only be achieved intersubjectively – through the process of recognition from significant others.

This shift away from the atomistic tradition in philosophy allows Honneth to explore traditional Frankfurt School themes like individual freedom within a relational context, leading him to develop an elaborate theory of social justice and freedom. Most importantly it provides him with a normative grounding upon which to build a distinctive version of critical theory, one which connects everyday human concerns about identity and respect to broader struggles over power and inequality.

Honneth on Recognition and Intersubjectivity

Honneth has gone back to the thought of Hegel, especially his early ideas, in order to build his overarching concept of recognition. Crucially, within Honneth's theoretical model, there are three types of relation to self, all of which are crucial to the development of identity and self-realization. These are:

- Self-confidence: elementary level, context of family and love
- Self-respect: level of rights and solidarity
- Self-esteem: context of labor and societal recognition

Distortion to these forms of recognition leads to three forms of *disrespect*, the term "disrespect" importantly signifying the "denial of recognition" for Honneth (1995, p. 131). In this regard, Honneth (1995, p. 13) argues that "negative concepts" such as "insult" and "humiliation" are used to designate behavior that represents an injustice not simply because it harms subjects or restricts their freedom to act "but because it injures them with regard to the positive understanding of themselves that they have acquired intersubjectively." He goes on to suggest (1995, pp. 131–132) that the experience of being disrespected "carries with it the danger of an injury that can bring the identity of the

person as a whole to the point of collapse.” The key societal problem, then, according to Honneth, is the experience of various forms of disrespect, based on various forms of misrecognition.

By acknowledging the affective domain and its significance to a relational analysis of social processes, Honneth legitimizes existing strands of research that take the intersubjective domain as their starting point (Murphy 2011). This emphasis on intersubjective recognition as a worthy subject of academic study in its own right has had an increasingly strong influence on a variety of research areas, including education, although it has not made great inroads into theories of digital scholarship. This is a shame as such an affective take on recognition has much to offer when it comes to understandings of the academy and the conflicts associated with technology-related change. Specifically his theory of social struggle is ready made to complement that of Bourdieu, his horizontalized understanding of relations of recognition offering a useful counterpoint to Bourdieu’s more verticalized analysis of power and recognition. On this point, it is interesting to note that Honneth himself saw much of value in Bourdieu’s *The Weight of the World* (Bourdieu 1999), particularly as a source of empirical evidence to support his diagnosis that the modern world is imbued with struggles over recognition.

So what, specifically, can a theory such as Honneth’s offer Bourdieuan analyses of power in the academy? By aligning these two thinkers, one is also aligning two different basic conceptions of power – i.e., “one which construes power as a patterned structural inequality of resource and another which construes it as an interpersonal phenomenon” (Dennis and Martin 2005, p. 205). Although Dennis and Smith were referring to symbolic interactionism when it came to the latter conception, it also works for Honneth, as his intersubjective take on social pathology is also very much a theory of power. The ability to view the struggle over digital scholarship as the intersection of these different conceptions of power and recognition allows researchers to situate changing academic identities within both forms of structural transformation and emotionally charged workplaces and professional contexts.

The symbolic violence resulting from forms of misrecognition to use Bourdieu’s language have so far been explained through recourse to the language of capital, fields, and cleft habitus – conceptual tools that go some way to helping one understand the power of reputation and status in institutional life. But they only go so far in this regard: reputation and status are prized commodities not only at an interinstitutional level but also at an intersubjective one; as forms of control, their sources of power emanate from emotional contexts, as reputation and status at a professional level constitute respect. And following Honneth, without respect, recognition is denied.

Digital scholars are not immune from the need for this form of recognition and are as much at the mercy of peer review, if not more so, than traditional scholars. Investing time and effort in digital forms of scholarly activity is a precarious game to play for academics, given that such activity offers little reward and legitimation in the court of academic judgment. Indeed, the jury is out on whether such forms of scholarship such as microblogging will ever gain acceptance in a notoriously conservative professional culture. The risks, at a recognitional level, are potentially great, while also difficult to quantify.

It is fair to say that institutional life in the academy operates on the basis of a prestige economy, but the task of maintaining and protecting this economy does not fall solely on the shoulder of locational forms of recognition; the engine of growth here finds its fuel in an emotional terrain that is impossible for academics to avoid and yet remains invisible to those that see power through a locational lens only.

Theoretical Contribution and Conclusions

As is the case with digital scholarship, the understanding of recognition is dependent both on the way it is conceptualized and on the context to which it is applied. The Bourdieuan tradition arrives at understandings of recognition from a perspective of legitimized distinction. Academia

as a social field operates as a site of legitimation of scholarly practices, with agents “fighting” for symbols of reputation and power which ultimately endow them with a given social status (or lack of). From a Bourdieuan perspective, the (mis)recognition of digital scholarly practices occurs at a vertical level, given that academia, as a normative field of intellectual work, establishes the properties of distinction that are adopted (or not) by the agents in and of the field. The higher the incorporation of these distinctive dispositions by the individual, the higher his/her distinctive position and the stronger her/his sense of belonging with regard to the site where their practices achieve the highest acknowledgment, i.e., the academy itself. Although useful, Bourdieu’s conceptualization of (mis)recognition accounts mainly for spatial distinction between the place of legitimation and the place of practice, i.e., recognized places of academic work. This explains the need of individuals in deliberately aligning their dispositions with the rules of the academic game in order to acquire symbolic capital.

However, Bourdieu’s theory is less effective in accounting for a horizontal and symmetrical perspective of recognition. Honneth’s work offers a much needed complementary approach to Bourdieu’s theory by exploring the concept and practices of recognition relationally. Recognition, in Honneth’s perspective, is social and consists of a mutual appreciation among individuals and for the rules they establish for themselves. With digital scholarship practices being a more complex phenomenon than one that is merely regarded or disregarded by academia this perspective provides a new dimension to the understanding of digital scholarly practices as one that goes beyond the binary explanation of digital scholarship practices being “powered” or “neglected” by the rules of the institution or “strengthened” or “weakened” by the respect and appreciation individuals show toward the work of their peers. From a Honnethian point of view, this conception of mutual recognition results in a type of social freedom which allows for the development of (digital) dispositions that may lie outside or at least at the periphery of academic legitimation. Yet, such practices are increasingly acquiring a place within

knowledge and intellectual networks precisely because there is a mutual respect for the practices of digital scholars. Mutual recognition thus introduces a different pattern of legitimation of practices which is less formal and more democratic.

Both the vertical and horizontal axes of recognition are important when exploring the different aspects that drive or hinder individuals’ engagement with digital scholarship practices, because they both provide insights into the social realities of which academics are part. Ultimately, legitimate authority, as exercised by the institution, may have greater power. Yet, we cannot overlook the influence social and mutual recognition has on individuals that are fighting to establish new practices. Both approaches provide a more informed understanding of digital scholarship activities as this part seems a bit stretched out space wise acknowledgment.

Dine (Navajo) Philosophy of Community as K'é

Hollie Anderson Kulago

Indigenous community; Indigenous philosophy; communal existence; Indigenous philosophy of relationships; Indigenous epistemology

Introduction

Indigenous methodologies have emerged in response to an old order of Western research practices. Stuart Hall (as cited in Smith 1999) identified four functions of an old order of Western research that show how the positivist research paradigm has guided research in the name of science. These functions have:

- 1) Allowed researchers to characterize and classify societies into categories; 2) condensed complex images of other societies through a system of representation; 3) provided a standard model of comparison, and; 4) provided criteria of evaluation against which other societies can be ranked. (Smith 1999, p. 42)

These functions reflect a Western value system and underpinned theories of research on indigenous

populations in which categories have already been identified as common sense and by which representations and evaluations of indigenous peoples have been created (Deloria 1969; Smith 1999). Ultimately, Western research was utilized to dominate, restructure, and have authority over indigenous people without any regard for the indigenous communities' goals of self-determination and control over their own resources (Smith 1999).

Researchers who employ indigenous methodologies center the needs of the indigenous communities and nations within research and value their knowledges and ideas as they contribute to the process of sovereignty and nation building. From this paradigm and through these processes, indigenous researchers have resisted contributing to the colonizing ways of Western research and continue to work towards retrieving and remaking themselves and their communities. Philosophies and theories of indigenous communities are alive and intact, found in the collective knowledge contained within the languages, stories, songs, and ceremonies of the people. As these philosophies and theories of the indigenous communities are used as the frameworks throughout the research process, deeper understandings are achievable because of the ontological and epistemological alignment within the process and to the goals of self-determination. As an example of how indigenous knowledge can be centered within the philosophies and theoretical frameworks of research, a Diné *philosophy of community* was articulated to investigate what community meant from a Diné (also known as Navajo of the Southwestern USA) perspective for one research study (See Kulago 2012).

The Diné, just like other indigenous communities, have philosophies that have guided and sustained them throughout their existence. The philosophy of community for the Diné has been established as the concept of k'é (Kulago 2012). *K'é*, simply translated as a term meaning *family* in English, is a concept that also means compassion, cooperation, love, kinship, claniship, friendliness, kindness, unselfishness, peacefulness, thoughtfulness, and all those positive virtues that constitute intense, diffuse, and enduring solidarity through respectful relations with nature and humans.

Author Note Hollie A. Kulago is an Assistant Professor of Childhood Education at Elmira College in Elmira, NY. She is Diné and originally from Arizona.

In what follows, first, the qualities of k'é are explained as a Diné philosophy of community. Then, the ontology and epistemology of the Diné philosophy of community is contextualized through the Diné Kinaaldá ceremony. It is within the ceremonies that Diné people are able to honor, interact with, and be engaged in the teachings of their deities and ancestors. Within the description of the Kinaaldá that the qualities of k'é are highlighted.

Framing K'é as Community

A definition of k'é for the purposes here is summed up by a Diné grandmother describing what "good thinking" means when she states, "Good thinking means teaching our children that we must know one another in the family. We must maintain harmonious relations. We must share with one another. We must be able to depend on one another" (McCloskey 2007, p. 51). Pulling from the statement made by the Diné grandmother, the definition of k'é is made up of four qualities that a Diné community should embody (Kulago 2012). The first quality in the framework of k'é is the basic knowledge of each other in the family. Recognizing kinship through clans demonstrates knowledge of who you are, how you should relate to people, and how other people relate to you. Also, we recognize relationships with certain natural and spiritual elements. The second quality is that of maintaining harmonious relationships by expressing respect, love, compassion, friendliness, kindness, and peacefulness as one would to family members. The third quality is sharing with one another and being generous, unselfish, and thoughtful of others. The fourth quality is being able to depend on one another and being able to be depended on.

The Kinaaldá ceremony expresses the emphasis of these teachings. The description of the ceremony was not broken apart to fit nicely into the specific qualities of k'é because the teachings are ongoing throughout the entire process. To take them apart would make the ceremony incoherent. As one reads the description through the framework of k'é, parts of the ceremony will speak

directly to certain qualities of k'é and emphasize a philosophy of community; however, there are multiple interpretations.

Ontological and Epistemological Contextualization of K'é

To investigate what community means from a Diné perspective, the Diné ontology and epistemology needs to be understood. The description of the Kinaaldá ceremony exemplifies the concept of k'é by identifying what is possible to know (ontology) and how knowledge is known and demonstrated (epistemology). What can and should be known within this philosophy are the relationships and interconnectedness between multiple entities of the natural and spiritual worlds. These entities are interconnected at various points throughout the four components that make up a person: mental, emotional, spiritual, and physical. To contextualize the ontology within this philosophy, the following description of the Kinaaldá ceremony is framed as an educational experience with knowledge and understandings of relationships and interconnectedness as the overarching goals.

Epistemologically speaking, a person is knowledgeable and considered a good, beautiful, and "educated" person when she or he can consistently keep all relationships and interconnections harmonious. Everyday situations require various types of knowledge and can change due to age, gender, clan, place, or other characteristics. The way one acts within those situations indicate what kind of person she or he is. Furthermore, when one is educated and virtuously embodies k'é, she or he is able to recognize others who are educated in k'é. If k'é exists, then the Diné community exists.

Conception of the Kinaaldá

In the Diné creation story, the first man and the first woman found a female baby who became known as *Aszdaanáádlehi* (Changing Woman), a deity who represents the Earth and motherhood and is identified with reproduction, sustenance, and nurturance. The Holy People (deities)

performed the first Kinaaldá ceremony for her to celebrate her ability to bear children and to mold her into the ideal woman and mother (Frisbie 1967; McCloskey 2007). After her Kinaaldá, Aszdaanáádlehí became the mother of two sons whom she taught to take responsibility, maintain a strong sense of identity, and be independent, resourceful adults who ultimately made life on earth safe and possible for human beings (Frisbie 1967; McCloskey 2007). Because of the mothering that Aszdaanáádlehí achieved, she is the ideal woman that Diné women should grow up to emulate. It has been stated that “Motherhood is defined by the acts of giving and sustaining life to create strong bonds of solidarity. The strong and close mother-child bond serves as a model for the enduring relations of kinship” (McCloskey 2007, p. 18). In other words, the relationship between a mother and child is considered the prime model of how people should relate to others, including nature. For both daughters and sons, their mothers were their first teachers of k'é, and the ceremony is the educational experience that sustains the community.

Kinaaldá as an Educational Experience

The Kinaaldá is a ceremony that is an educational experience that calls attention to the importance of k'é. It is a puberty ceremony that is held for a Diné girl when she first starts menstruating. This 4-day ceremony focuses on the girl's mental, emotional, spiritual, and physical endurance as she undergoes an intense course on the responsibilities of being a Diné woman. This ceremony includes major events within the 4 days: running to the east three times a day; ritual washing of the girl's hair; baking ceremonial corn cake; and all night singing conducted by a medicine man on the final night. This ceremony and the teachings within it have been passed down from Diné ancestors for generations.

The Kinaaldá ceremony is a crucial time in any female's life because the ceremony is the ultimate educational experience that will shape the girl's adult life and those of her children. The 4-day ceremony traditionally starts and ends inside a Diné hogan. The hogan is a significant site because it is the traditional dwelling that opens

to the east to allow the first sunlight and all good things to enter in the morning and has a dirt floor to allow offerings to be made to Mother Earth and all of the elements such as the sun, water, mountains, etc. Songs are sung and offerings are made to show respect for the hogan. The hogan is considered alive. Additionally, the Diné incorporate many sacred places into the teachings during the Kinaaldá. Multiple offerings are made during this ceremony in many different ways to continue the relationship in a reciprocal way, meaning that the universe will offer the things the people need to exist, and the people will continue with their offerings to the universe.

The girl, who is called “Kinaaldá,” is dressed in traditional Diné attire and adorned with silver and turquoise jewelry, which symbolizes a prosperous future. People often offer their jewelry for her to wear so that it acquires good blessings for the girl and themselves. Her hair is ceremoniously tied by an older woman who will mentor the girl during these 4 days and who should mentor her throughout the rest of her life. This woman also massages the girl, so as to “mold” her into a physically healthy woman. The woman, whom the parents choose, is usually a respected elder based on the kind of woman she is and the life experiences she has had by which the parents of the girl determine as “good.” This woman is the person they want their daughter to emulate. It is believed that the girl will inherit this elder's traits and characteristics, so it is a very important decision, and it is an honor to be chosen.

Throughout the 4-day ceremony, the girl is taught many lessons, by many different people. The girl is the most important person in the ceremony, and the lessons revolve around the goals of keeping respectful relationships. First and foremost, through spiritual belief, the girl is considered “holy” as she is surrounded by the Holy People who are believed to be with her during the 4 days. She must remember her relationship to the Holy People as she should exhibit the kind of person she wants them to see her as. She is also told that her actions affect all of the contributors so she must do things correctly. She is told to be gentle, grateful, generous, caring, and kind. She is told not to be mean, jealous, mad, or stingy.

Through her actions, she demonstrates her knowledge of and respect for the Holy People and her family's wellbeing.

Physically, the girl is told to have a healthy relationship with her body. She should eat as naturally healthy as possible, without any unnatural sugars found in such junk foods as candy or soda. She also runs out of the hogan, to the east, then back into the hogan, three times a day. Each time she is tested to push herself to run farther. She also must keep busy throughout the 4 days. She should be hard working, strong, and not lazy. As one Diné grandfather stated, she cannot help others if she is not healthy and strong (McCarty and Bia 2002).

Intellectually, she is taught the "how to" of many tasks such as cooking, weaving, and sewing, and she is also taught lessons through stories shared by people who attend. Emotionally, she is told to be happy, positive, and strong. She should be motivated, disciplined, and supportive. She is told to think positively towards others, all throughout the ceremony. She is even told to think positively as she prepares food because she feeds those thoughts to the people. These are just some of the basic teachings that are specifically taught during the ceremony through basic everyday activities. Through observation and involvement in all the activities related to the home, the herds, and the fields, she gradually assumes the responsibilities of an adult (McCarty and Bia 2002). The woman who has tied her hair is primarily in charge of these teachings, but other women and men also offer teachings from their experiences.

The greatest emphasis is on k'é. The girl gains and strengthens relationships with all who have contributed to her ceremony as they demonstrate their concern for her future. Respectful relationships that are cooperative, generous, and appreciative are demonstrated through the support offered to her from relatives, family friends, and other community members. During the 4 days, she should be experiencing and internalizing the positive qualities she must adhere to because she is told it will affect all who are involved. Part of the sacredness of the ceremony is the feeling of family closeness and cooperation and the

ceremony could not be possible or successful without these attributes.

Support for her wellbeing can be demonstrated in many ways. People are appreciated for anything that they can contribute. No one is required to do anything, but because it is for the wellbeing of the girl and her future contributions to the people, the people participate. People donate their labor by butchering sheep, cooking, cleaning, chopping wood, grinding corn, sewing, etc. People also donate goods such as treats to giveaway, sheep for meat, groceries to feed people, cloth for the girl's clothing, money, firewood, corn, corn husks, pots and pans, and other items specific to the ceremony. People also sing their songs of prosperity, health, and strength during the final night of the ceremony. Some people show their support by just being present and talking to her. From lectures, storytelling, and participation in the socialization of the ceremony, she can experience the roles, relationships, and ideals of a good and full life (McCarty and Bia 2002).

If present at the time when the girl runs, people physically show support as they run behind her and encourage her to stay strong. The distance, endurance, and perseverance she demonstrates during the run are symbolic of her approach to her life's goals as her support system is always behind her. They do not pass her because at that point she is setting the pace. The phrase, "to run after them" is a phrase Diné use when talking about helping each other and is considered a paraphrase for "helping or giving aid" (Lamphere 1977).

There is a final giveaway at the completion of the ceremony when the Kinaaldá gives away the ceremonial corn cake and other treats as a way to give thanks and blessings of prosperity to all who contributed. A piece of the cake is offered to Mother Earth to ensure that the relationship between humans and the earth continues in a reciprocal way. All the people helped in their own way, demonstrating that the ideal is to contribute what you can for the success of others. As she becomes an adult and able to contribute to the community, she will be able to contribute what she can. The girl is able to feel the responsibility of her family and although many people helped,

the success of the ceremony depended upon her. From this ceremony, she officially becomes a part of the social relationships of reciprocity in the community and prepared to teach the next generation.

To Be a Good, Beautiful, and Educated Person

The Kinaaldá ceremony is meant to mold girls into beautiful, educated women. To be beautiful in the Diné society is to be good and useful which implies friendliness, unselfishness, kindness, strength, ambition, and capability of enduring much (Frisbie 1967). Most importantly, she will be a kind mother. To be educated is to know how to act in every situation in a positive way. People often conclude that one is uneducated if she does not know how to respond in various situations in a good and useful way. To be good, or have good thinking, as a Diné has also been described as “helping” and living under the moral obligation to give aid when requested or when it appears to be needed.

After a girl has her Kinaaldá, the ultimate test of the knowledge she gained from this educational experience is demonstrated by her actions from then on. In any situation she enters into, her knowledge and understandings of the relationships and interconnections will be demonstrated by the way she proceeds through relationships with all entities and people that are around her. Most significantly, when she becomes a mother and/or wife she will demonstrate her knowledge by nurturing and sustaining her family and teaching them k'é. Thus, mothers who have experienced the teachings of the Kinaaldá are the most essential determinants of the existence of k'é and consequently of the Diné community.

Conclusion

Although k'é, the Diné philosophy of community, is present within Diné communities, its presence within educational theory and research is minimal. As with the Diné community, it can be argued that all indigenous communities have their own philosophies of community as well that set protocol of relationships. This exact

example should not be attributed to all indigenous communities but should demonstrate the complexities and deeply rooted understandings that guide the everyday protocol of such communities. The complexities and nuances that emerge from an articulation of this philosophy invalidate the generalized theories of research on and about indigenous peoples that have operated through the four colonizing functions of Western research.

Disability and Samoa

Juliann Anesi

University of California, Berkeley, Berkeley, CA, USA

Synonyms

Citizenship belonging; Global disability; Health; Illness; Schools

Introduction

Certainly not all disabilities are the same, and societal reactions vary greatly from one disability to another. Likewise, disability is defined in various ways, depending on who is defining the term and for what purpose (Taylor 2001). In the US context, it is only since the last century that society used disability to socially construct or refer to a distinct class of people. Historically, disability has been used as a cover for inability and as a reference to legally impose limitations on rights and power dynamics. The genealogies of understanding bodies with disabilities as “broken” are greatly influenced by the medical approach to disability. Such approach holds that disability results from an individual person’s physical or mental limitations and is largely unconnected to the social or geographical environments. Whereas, the social model views disability as a consequence of environmental, social, and attitudinal barriers that prevent people with impairments from participating in society.

Disability is constructed in a similar way in Samoa, an independent State in the Pacific, where it is understood as *ma’i*, or sickness. *Ma’i* is a term that describes all sicknesses, as well as someone with a disability or impairment. This approach to disability is also influenced by the medical model, which understands disability as a physical or mental impairment of the individual and its personal and social consequences. The medical model places the source of the problem within a single impaired person and concludes

that solutions are found by focusing on the individual. The medical model assumes that the first step solution is to find a cure by making disabled people more “normal.” In contrast, the social model of disability is understood as a relation between an individual and her social environment. Accounting for the geographical, social, and political views, which consider the locations and positionality of disabilities, can expand our constructions of differences. As Erevelles (2011) suggests, the need to link disability to discussions of the economic and social transformations occurring at the global framework is affected by colonialism, postcolonialism, and neoliberalism and the impacts of these transformations on disabled bodies. Hence, connecting such complex understandings of disability and sickness to Samoa’s historical relations as a nation to other Western countries is a crucial part of the conversation. Noting unequal colonial relations between the Pacific Islands and Western countries are critical in the dialogue of abilities and disabilities. Moreover, understanding disability from a Samoan context can be a potential model for thinking about various cultural meanings and interpretations of disability in society.

Samoan History

Samoa’s long history is interwoven in oral traditions, legends, songs, recorded writings, and dances traced to certain gods. Samoa’s indigenous institutions of governance are associated with certain paramount titles and traditional political districts. Even with Samoa’s contact with the non-Polynesian world in the eighteenth century, the *matai* (chiefly) system of governance continues to maintain authority throughout the districts. This section briefly addresses the indigenous reference points and colonial histories that influence Samoan understandings *ma’i* or sickness and disability.

In the 1800s, the German, American, and British commissions were economically invested in copra, cacao plantations, and shipping ports. As a tripartite government, these governments existed over a group of small islands. The three powers of government generally allied with opposing chiefly

factions, which often fueled civil unrest (Meleisea 1987). The disputes among the three governing powers and the local Samoans never seemed to end. Consequently, the Treaty of Berlin in 1889 divided the Samoan islands into two halves: the eastern and western islands. The Samoan archipelago was split into two regions by the United States and Germany, each of which formed separate political systems. The eastern islands were placed under the US rule, which is currently known as American Samoa, an unincorporated territory of the USA. For the western islands, they were placed under separate German and New Zealand administrations. The German colonial administration ruled Western Samoa from 1900 to 1914. New Zealand ruled Western Samoa under five different military administrators from 1914 to 1962. At the outbreak of World War I in 1914, military forces occupied Samoa and instituted a military administration. A League of Nations mandate placed the country officially under New Zealand administration in 1920. On January 1, 1962, Western Samoa, today called Samoa, became an independent State and the first UN trust territory in the Pacific to decolonize and become sovereign (Meleisea 1987).

Ma'i or Sickness

To understand disability in the Samoan context of sickness, one must examine the area's dominant medical institutions: indigenous medicine as explained in the fa'a Samoa (Samoan way of life) and Western medicine. Thus, analyzing how these longstanding institutions inform ableist, hegemonic, and economic policies that define normalcy (Davis 2006) and/or productive citizenry (Campbell 2009) reveal how ma'i (sickness) is underscored by ableism, nondisabled bodies as the normal human condition. Issues of translation and linguistic nuances between English and Samoan are central to conversations about disability and sickness. Ma'i can also allude to someone's illness because of misdoing. For example, some Samoans believe that a spirit or an ancestor possesses people when social convention has been violated. Traditional social

conventions such as changing dress codes, changing attitudes by young people, challenges to the role of the elders and chiefs, and diminishing adherence to family duties can result in frustration and confusion, and, at times, possession. Although there is no direct translation of the word disability in Samoan, the word ma'i (sickness) is one term used to refer to people with disabilities. Sickness does not fully capture the complexities of disability, but the ideologies behind calling a disabled person "sick" are very much linked to medical understandings of disability.

Systems of Healthcare

Samoans use two systems of healthcare services: Western and local medicine. Most people in Samoa use the services of a local taulasea (healer) to remedy their illness. The taulasea believe that Samoan culture dictates humans to live within three worlds: a natural world, social world, and spiritual world. The human condition and healing is at any one time influenced by relations between individuals and the natural, social, and spiritual realms. The desired state is that of harmonious relations between humans and each of these worlds (Macpherson and Macpherson 1990). Many Samoans believe that when such equilibrium exists (among the natural, social, and spiritual world), so too, will Samoans experience a feeling of wellbeing. However, when such logic is applied to people with disabilities, they are often represented as subhuman, shameful, special, holy, and pitiful. These dehumanizing ideas can also pertain to medical care as normative institutions in which marginalized communities are forced to abide by in order to restore the standard of normal communities. For Samoa's case, indigenous and Western philosophies of healing are institutions with different set of beliefs and practices that have coexisted despite geopolitical, social-political, and postcolonial histories. Most Samoans believe that indigenous medicine is not a single unified body of belief and practice. In addition, Samoans share a set of beliefs about the nature and causes of sickness according to their beliefs about their environment. Another set

of beliefs about the nature and causes of particular illnesses also differs significantly, in both depth and content, from one healer to the next (Macpherson and Macpherson 1990). The coexistence of western and indigenous beliefs, despite both being built on different epistemological foundations and practices, continues to inform how Samoans understand *ma'i* (sickness). Historically, western medicine and health programs were implemented in Samoa in limited ways and in a manner where Samoans controlled some degree of their practices. For instance, in order for public health programs to be implemented into villages, the permission of the *mata'i* (chief) must first be obtained. Thus, the making of western medicine depended heavily on the cooperation of Samoans. In fact, this gave some control over the form of these practices and the terms on which they were offered within villages (Macpherson and Macpherson 1990).

Indigenous Care

Herbal medicine and *fofo* (massage) were used to assess the illness or spiritual mishap (Whistler 1992). Even when Samoans leave their homelands, they maintain these attitudes towards disability as a sickness. For Samoans living in the Los Angeles, California area, *ma'i aitu* (spiritual sickness) and *ma'i valea* (mental illness) are common "sicknesses" in which remedies are sought (Lazar 1985, p. 163). The *taulasea* also specialize in illnesses caused by the *aitu* (spirits), supernatural powers, and *fofo* (Lazar 1985). The notion of "fixing" or "curing" an illness came with the introduction of Christian notions of healing and prayers, many of which added to the practices of the *taulasea*. In short, the *taulasea* attempts to make right whatever was making the spirits restless or angry, thereby helping the sick and bringing balance to the Samoan worlds of the living and nonliving. This organizing of spiritual healing and social structures again reiterates the idea that there is a standard to maintain with those outside of these boundaries taking up the category of the other. People with disabilities continue to occupy the category of the "other" in this structural organization because their condition appears

"incurable." Or as some elders in the community convey, "It is God's will" that one is disabled, reflecting histories of Christian missionary influence on suppressing traditional religious beliefs. Today, Samoa is politically and religiously independent, and churches such as the Congregational and Methodist are more inclined to acknowledge the role of *taulasea's* pre-Christian views and practices. Likewise, active members of various churches are now openly recognizing that they visit traditional spiritual healers. *Taulaseas* are also active church members while simultaneously acting as mediums for pre-Christian divinities and familial ancestors. Most of the healing for illnesses was traditionally done by a *taulasea*. What is noteworthy is that most healers do not consider their models as less effective than those of Western medicine. From a *taulasea's* view, each exists to understand and manage different types of illness. For healers, the favorable outcome of their healing practices is their success in restoring harmony among the worlds we live, not in how they are integrated or structured (Macpherson and Macpherson 1990).

From a Western view, however, the medical model has historically represented people with disabilities as "broken" and in need of "fixing" or "curing." Medicine has often relied on the deficit-model of disability. The historical goal has been to make the human race perfect by eliminating people with undesirable characteristics from the population (Kluth 2006). The challenge with such medical practices is that it fosters overt and covert eugenic ideologies that seek to control and eliminate certain undesirable populations. The importance placed on the *taulasea* healing practices was initially questionable with the arrival of Christian missionaries, who often equated a *taulasea's* work to witchcraft or "savage" practices. From a *taulasea's* view, Western medicine practices have coexisted in Samoa since colonization. From a Western medicine perspective, most medical professionals consider *taulasea* healing practices as "primitive" or unscientific. Therefore, understanding indigenous causality concepts, including the distinctions between supernatural and natural etiological categories of disease, is so important when talking

about disability in Samoa. As disability studies scholars Paul Longmore and Lauri Umansky (2001) astutely points out, a sociopolitical or minority-group model approach to disabilities, which investigate the relationships between meanings, attributed to bodies and the organization of power in society is an important focus. This means that an investigation of the body can illuminate its complexities, its politics, its lived experience, and its relation to subjectivity and identity (Wendell 1996). It is possible that this claim of understanding the body and the institutions, which define and redefine it, can bear light on a more inclusive understanding of disability.

Global Realms of Disability

In addition to cultural understandings of disability in Samoa, geopolitical, sociopolitical, and post-colonial components play a role in disability notions. Here, I point to Helen Meekosha's (2011) work on situating disability in a global context, which requires an analysis of power relations between the global North and global South. She relates that based on geographical location, such relations and power dynamics also produce, sustain, and profit out of disability (p. 668). Meekosha argues that there has been a one-way transfer of ideas and knowledge from the global North in the field of disability studies, thus constituting a form of scholarly colonialism that reinforces a production of impairment in the global South. Work in disability studies fails to mention the imperialistic, militaristic, and colonial processes responsible for disabling millions of people across the globe. Disability and poverty are inter-related, as the fundamental business of colonization involved structured, cultural, economic, and political domination. People from northern European metropolises usually impose such colonial structures over peoples from the south. Likewise, Nirmala Erevelles (2011) suggests the analysis of disability be framed within political economy located in a Marxist claim of historical materialist concept of labor – central to the shaping of social production of life. Besides, the historical materialism seeks to expose the concrete material

conditions that have produced these attitudes and meanings systems about disability. In addition, a materialist analysis suggests the (re)inserting of the category of disability into social history which tends to mark the shifts, the changes, and the movements that coincide with historic construction and economic structures. Hence, understandings of disability and *ma'i* (sickness) in Samoa are not straight forward, and factors such as colonization, indigenous and western medicines must always be interrogated based on these contexts and historical and cultural legacies.

Normalcy

Thus, Samoan understandings of sickness or disability are also influenced by ideologies of ableism and normalcy. Fiona Campbell (2009) defines ableism as a form of discrimination based on the perception that being able-bodied is the normal human condition. Hence, the production of ableism and the sites of resistance to norms and practices are essential to discussing disability in these contexts. Disability is a social construct with relations between physical and intellectual impairment that is neither fixed nor a permanent status. These statuses are closely interconnected with social, cultural, and economical milieu. Hence, the relationship between impairment and disability are fluid and rethinking how disability is measured or counted must be accounted for. More aptly, understanding the disabled body forces one to return to the concept of the norm, the normal body, or compulsory able-bodiedness as having a body free from disability and assuming able-bodied as natural or a desired identity (McRuer 2006). Since most writings about disability have focused on the disabled person and construction of disability, another focus by disability studies scholar has shifted to focus on the construction of normalcy. A common assumption is that the concept of the norm has always existed and, but the idea of the norm is less a condition of human nature than it is a feature of a certain society. As the social process of disabling arrived with industrialization in the USA and with the set of practices and discourses that are linked to the

eighteenth and nineteenth century notions of race, gender, criminality, nationality, and sexual orientations (Davis 1995). The term “normal” continues to filter into various aspects of our lives and a configuration that arises in a particular historical moment.

Drawing on the analytical framework of taulasea medical beliefs (Macpherson and Macpherson 1990), historical materialism of disability (Erevelles 2011), the concept of ableism (Campbell 2009), and compulsory able-bodiedness (McRuer 2006) to explore how the body, particularly the disabled body from the global South, is constituted within the social relations of production and consumption of transnational capitalism. These frames situate how concepts of ableism, sickness, and oral histories move across borders and cultures as a means of reinforcing normative structures that are perceived as orderly and appropriate. Lastly, understanding the translations of disability and sickness across communities can foster reciprocal conversations and learning.

Introduction

Disability oppression is well documented in the extensive body of literature of disability studies (DS). Common debates include definitional arguments about what counts as disability from purely medical models of disability to social models of disability. The medical models are usually institutionalized within society's major institutions both ideologically (e.g., the problem lies in people's neurology) and materially (e.g., inaccessible buildings and the speed at which lectures are presented by educational agents such as teachers to students with disabilities). The social models are traditionally lauded antithetical to the medical ones that situate disability, and hence disability oppression, originating from the social

environment (e.g., social relationships and/or physical environment). From a DS lens, both the medical and social models of disability point to sources of disability oppression, however, to the direct opposite sources. Nevertheless, both the medical and social models, according to the DS scholar Carol Thomas (1999), fail to theorize the psycho-emotional aspects of disability oppression.

This entry will summarize the literature on this gap that Thomas (1999) has pointed out as it relates to the educational philosophical and theoretical writings about the psycho-emotional aspects of disability oppression coming from the most recent field of Disability Studies in Education (DSE), an outgrowth of the interdisciplinary field of DS that shares its characteristics. Although DSE scholars' foci are within the field of education, and the related field of inclusive education, both DS and DSE scholars are interdisciplinary in nature at their approach toward their scholarship. Taylor (2006) pointed out "like the area of inquiry on which it is based—Disability Studies—Disability Studies in Education existed before it had a name" (p. xiii). Here Taylor dates the historical intellectual roots of DSE beyond professional and institutional effort to give it such a name, but to the historical-material realities of people living with disabilities that he continued to foreground as being socially constructed in society, "if one prefers, [a] creation" (Taylor 2006, p. xiii). In other words, "disability" is epistemologically, ontologically, and axiologically a creation of social, historical, and cultural construction. This premise sets the philosophical and theoretical platform that the past, current, and, most likely, future DS and DSE scholars will begin to grapple with the meanings of disability oppression.

Similarly, distinctions between the concepts of disability and impairment are critiqued when the former is usually characterized as a condition resulting from a social construction (i.e., a person becomes disabled by society's views and/or physical structures) and the latter as an "organic" disabling aspect of the body (a part of the body or mind that does not function as typically expected). For example, Shakespeare (2006) asserts that

even impairment is a function of judgment, expectations, and arrangements given a sociocultural context of meaning as it relates to the individual and the "values and attitudes of the wider society" (p. 35). Some scholars within the DS community, like Shakespeare, reject the distinction between disability and impairment on (a) philosophical grounds to squarely undergird both from a social constructionist perspective and (b) avoid the medical model of impairment as existing within and on the body. Nevertheless, even though the historical roots of DS and DSE are in foregrounding a social constructionist approach to disability or a social model of disability, taking into account the psycho-emotional as it relates to disability has been a tenuous relationship at best (Thomas 1999). Again, said differently, this entry summarizes this tenuous relationship by unpacking the study of disability oppression and its psycho-emotional aspects philosophically and theoretically.

Within this entry, both the terms "people with disabilities" and "disabled people" to refer to people with impairments and disabilities are used. Person-first language, such as people with disabilities, has traditionally been associated with the field of special education, and it indicates that they are a person, first, and not the disability per se. The norm within DS, on the other hand, is placing "disability" first, such as "disabled people," to indicate that disability is a social identity and something to be celebrated (Linton 1998), akin to being gay and feeling proud of one's sexual orientation or to being Black and feeling proud of one's racial orientation. Lastly, in this entry, the terms disability, dis/ability, and disability and ability are used interchangeably to signify the socially constructed nature of the term and phenomena of "disability." Disability and ability denote that both are ideologically contested terms and socially and culturally value-laden phenomena.

Disability Studies Versus Disability Studies in Education: A Short Synopsis

As suggested above, within DS and DSE, given the central assumption of the social models of

disability versus the medical models, the psychology and well-being of disabled people have been under-theorized since the disability rights movement (DRM) of the 1970s Civil Rights Movement. While the academic field of DS grew from the inspiration and activism for human rights and dignity for disabled people, DSE is a more recent development that specifically seeks to focus on the educational contexts of students with disabilities from K-16 and beyond.

Both the academic and political activisms coming from DS and DSE adhere to similar tenets:

- (a) Claiming to social models of disability as opposed to medical models, where negative ideological (e.g., stereotypes) and physical (e.g., inaccessible architectural environments) material barriers of society are the cause of the “disability,” distinct from disabled people’s impairments, nevertheless within both DS and DSE, there are scholars who view impairment as a social construction as well.
- (b) Values interdisciplinarity in approaches to theory, research, policy, practice, and action about dis/ability.
- (c) Honors the voices and experiences of disabled people themselves as epistemologically valid forms of evidence, encourages disabled people to be researchers and/or co-researchers, and has disabled people theorize about disability – characteristics that reflect the epitome of the DRM’s slogan: “Nothing About Us Without Us” (Charlton 1998).
- (d) Documents, critiques, and subverts instances of ableism (Linton 1998), recognizing it as a form of dehumanization and violence that stem from a medical-psychological model of disability that situates the problem within individuals and their neurology.
- (e) Acknowledges the experiences of disabled people themselves as part of interlocking systems of oppression with other markers of socially constructed identities such as race, gender, sexual orientation, and class. Also, within DSE, the history and culture of disabled people are seen as an integral part of the school curriculum.

The Psychological Turn Toward Disability Oppression

Academically and historically, the psychological dimensions of disability oppression have been written within DS, and they have increasingly been included in writings within DSE. However, for DS, due to its focus on the social nature of disability oppression, disabled people’s psychological effects have been largely framed as resulting from the social processes that both DS and DSE interrogate. Reeve (2012) speaks to this historical omission:

Although early disability writers such as Paul Hunt (1966) documented the impact of stigma and internalized oppression on the psyche of disabled people, these problems have largely remained a difficulty for the individual to manage whilst the disabled people’s movement addressed the more material forms of disadvantage such as exclusion from employment, education and the built environment. It was the naming of these personal experiences as psycho-emotional disablism which has allowed for a sociological analysis of these aspects of social oppression, rather than leaving them in the hands of psychologists and other professionals ‘who would not hesitate to apply the individualistic/personal tragedy model to these issues’. (Thomas 1999, p. 74; Reeve 2012, p. 78)

In her 1999 book, *Female Forms*, Carol Thomas introduced the concept of psycho-emotional disablism. However, Thomas (1999) was inspired by Tom Shakespeare’s observation that “few have raised the issue of individual psychology” within DS (1996, p. 103, as cited in Thomas 1999). The term that was usually used before psycho-emotional disablism was “psycho-emotional dimensions of disability,” designed “to make connections with other forms of social oppression such as hetero/sexism, ageism, and racism” (Reeve 2012, p. 79). From a feminist perspective, Thomas (1999) critiqued the Union of the Physically Impaired Against Disability’s (UPIAS) definition of disability (UPIAS 1976) by seeking to move away from a purely materialist and environmental critique of the phenomena of disability with the crying call of *the personal is political*. Thomas (1999) foregrounded the psychological aspects of disability oppression or disablism by defining disability as “a form of social oppression involving the social imposition

of restrictions of activity on people with impairments and the socially engendered undermining of their psycho-emotional well-being” (p. 3). Thomas undergirds the psychological as the fallout of the insidious social processes of disability oppression, acknowledging disability as disablism as being *both* an individual and structural phenomenon. The structural aspect of disability as disablism regards the environment as the source of disability oppression. The structural aspects of disability as disablism, then, are well identified, documented, and critiqued by adherents to the social model of disability. In other words, Thomas reframes the structural phenomena of disability as disablism as having an impact on the individual psyche and well-being of disabled people. This reframing of disability oppression or disability as disablism that foregrounds the psychological has also been understood as a *social relational definition of disability* (Reeve 2006).

Accounting for External and Internal Forces for Disability Oppression

This social relational definition of disability, hence, takes into account the external and the internal aspects of disability oppression (Reeve 2006). Reeves (2006) contends that this dialectical relationship of social oppression due to disability has helped illuminate the economic and social disadvantage disabled people confronted. Reeves (2006) reminds us of the feminist tradition that has influenced our understanding of disability oppression and their critique of the social model of disability because it focused on the “public” experiences of oppression as opposed to the more “personal” experiences of oppression. Reeves (2006) underscores that these more “personal” experiences of oppression “operate at the emotional level” (p. 95). Reeves (2006) states: “consequently, an extended social relational definition of disability has been proposed which attempts to address this criticism by explicitly including both barriers ‘out there’ and those that operate ‘in here’” (Reeve 2006, p. 95). The “out there”/public

social forces do not exist in isolation to the “in here”/private forces – the personal is political – of disability oppression. A flight of stairs is the environmental mechanism in which a person in a wheelchair is disabled by, while, being stared at or bullied due to one’s physical or ability differences “can leave disabled people feeling worthless and ashamed, and may end up preventing them from participating in society as effectively as physically inaccessible environments” or classroom spaces (Reeve 2006, pp. 95–96). Both the “out there” and “in here” dimensions of disability oppression are enveloped by the “cultural representations and disabling images” in society about people with disabilities. The dialectic between the internal and external disabling mechanisms has resulted in internalized oppression by people with disabilities.

Internalized Oppression, Language, and Self: *The Case of Labels*

People with disabilities, hence, are not only oppressed by external/“out there”/public social environments and others, but disability oppression includes the internal/“in here”/private dimensions. This latter domain of disability oppression can be understood as internalized oppression. Language, specifically the language of the dominant cultural representations and images of who counts as disabled and what counts as a disability, is one major reason internalized disability oppression exists. From a Marxist historical-materialist perspective, Charlton (1998) writes about the consciousness of disabled people as they experience internalized oppression through their alienation by the hegemonic and dominant worldview of the status quo that “naturalizes superiority and inferiority, power and powerlessness” that he argues characterizes “the internalization of oppression that creates an emasculation of the self” (p. 69). Charlton (1998) continues by defining this latter social process as disabled people incorporating a false consciousness due to their internalized oppression that results in a sense of powerlessness. Incorporating the hegemonic

perceptions of institutions, such as the educational system, into one's self-concept or perceptions is an example of the power of labeling and the language of the label to define children and youth as "disabled" (Baglieri and Shapiro 2012). For example, the labeling of children and youth as "emotionally disturbed" or "learning disabled" or any other more "subjective" category within Special Education is a case in point to illustrate the power of labels about disability and their psycho-emotional impact on the lived experiences of children and youth labeled. In the next section, we further this discussion and turn to DSE regarding the psycho-emotional aspects of disability oppression through the case study of learning disabilities (LD).

The Psycho-Emotional Oppression of LD Labeling

According to Vehmas (2012), philosophy has much to teach us about disability and disability oppression. Vehmas (2012) describes philosophy as a tool that investigates the "conceptual boundaries of human thought by means of examples and counter-examples. This means that 'it is done just by asking questions, arguing, trying out ideas and thinking of possible arguments against them, and wondering how our concepts really work'" (p. 298). For example, Vehmas (2012) juxtaposes how disability scholars and activists might approach disability oppression versus what a philosophical interrogation would be. Vehmas (2012) notes that a philosophical perspective on disability as disablism or disability oppression would ask what count as oppression or disability, "people with disabilities," and what makes them such a group or identify as "disabled" – thus examining the ideas that are taken for granted, philosophy stretches the boundaries of one's understanding of the world. Vehmas (2012) argues that "the basic use of philosophy for disability studies is to question and examine carefully its essential concepts and conceptions, their rational credibility, logical tenability and normative soundness" (Vehmas 2012, pp. 298–299). This philosophical

interrogation of disability as disablism is compatible to how DS and DSE scholars have resisted medical-psychological models of disability that reproduce a false consciousness about the nature of disability. Within DS and DSE, scholars have put forward indirect philosophical arguments in deconstructing what counts as ability and disability within society; however, they might not have framed it from a direct and explicit philosophical tradition and perspectives such as what Vehmas (2012) asks us to consider. There are exceptions to this, however, such as the critical special education and DSE scholar Deborah Gallagher.

Historically, the nature of LD has been from a quantitative positivist philosophical worldview, where the traditional field of LD and the dominant master narratives within it, due to its epistemological, ontological, and axiological beliefs, adhere to a medical-psychological model of disability (Gallagher 2007). Nevertheless, there has been a growing body of work from critical special education, DS, and DSE scholars who question the positivist worldview about the nature of LD. For example, these scholars also adhere to pluralistic and interdisciplinary perspectives that interrogate the philosophical underpinnings of not only the nature of LD but also the field of LD and the larger field of Special Education. For example, Ferri et al. (2011) ask the following critical philosophical questions about the academic side of LD: *"What is considered acceptable knowledge about learning disabilities? Who decides? What are the origins of this knowledge? Who uses it, and toward what ends? Who, in the end, benefits?"* (p. 229). Less so has there been a critique of similar positivist world view and lack of pluralistic methodologies within the subfield and literature of the social and emotional dimensions of LD. This latter literature has found that students with LD have not only academic deficits but also social and emotional ones such as lower self-concept and suffer from anxiety, depression, suicidal thoughts, and difficulty making friends which leads to loneliness (Bryan et al. 2004). This body of work has documented the social and emotional dimensions of LD, which has

contributed to what we know about the nature of the social and emotional aspects of LD, that is, its etiology, *its cause*, and ontology, *its being*.

However, just like critical scholars who have critiqued the field of LD for not taking into account culture and sociocultural contexts (Artiles et al. 2011), there is a lack of scholarship as it relates to the social and emotional dimensions of LD from a DS and DSE lens – hence a psycho-emotional disablism perspective. For example, these sociocultural contexts include disability, race, ethnicity, gender, social class, immigration status, and language to interrogate the hegemonic norms of white-male middle-class, English-speaking, Judeo-Christian, citizen and able-bodied identity group(s). However, the budding field of DSE has begun to produce a body of literature on the practical implications of DSE perspectives about the nature of disability and, hence, disability oppression.

Disrupting Psycho-Emotional Disablism in Schools

Troublesome Ideologies Within Schooling Policies and Practices. Historically within DSE the dominant ideologies of sociocultural markers of difference as it relates to disability have been critiqued and advocated to be subverted in order to engage in a politics of education and disability that leads toward freedom, liberation, and more inclusive schools and society (Gabel and Connor 2014). For example, from a philosophical and DSE perspective, Gallagher (2006) notes the following as it relates to educational debates and what she terms the “natural hierarchy” that undergirds the social construction of sociocultural contexts that schooling policies and practices do not take as the root causes of inequity and injustice in education as it relates to disability and ability difference:

Education debates over tracking/inclusion, testing, and “accountability,” curriculum, pedagogy, and so on, are essentially debates over two opposing ideals of what constitutes a “good” society. On the one

side are those who view social hierarchy as natural and therefore, if not good, then certainly inevitable. On the opposing side are those who not only see nothing natural about social hierarchy but also view it as inimical to the ideals of social justice and equality. From the latter perspective, the concept of the natural hierarchy has provided the crucial leverage necessary for those in powerful positions to decide through schooling who would be afforded advantages and privileges and who would not. As Brantlinger (2004) cogently points out, “in our present educational and economic ranking systems, some have to be subnormal for the seemingly desirable hierarchies to survive” (p. 491). The concept of natural is important because...its power stems in large measure from the authority of science, which, in turn, derives its power from epistemic assumptions immersed so deeply into western culture that the questioning of them strikes many people as either benignly delusional or overly inflammatory. Thus, the idea of a natural hierarchy is situated at the gravitational center of debates in education and special education, serving as an invisible hand that defends, exonerates, and affirms social/educational inequality. (pp. 65–66)

Gallagher (2006) exposes the common sense of the “natural hierarchy” by firmly placing it in the epistemological matrix within schooling and education that marginalizes and excludes any difference from the norms within schools and society. These ideological exclusions, as Gallagher (2006) notes, often times go unquestioned or untroubled. As framed by Ferri (2006), DSE is about *teaching to trouble* (p. 303), that is, *teaching to trouble* the common sense assumptions as it relates to the dominant representations, images, and policies and practices in both school and society about disabled people and students. These former assumptions are institutionalized by the direct opposite epistemological, ontological, and axiological assumptions and tenets that undergird both DS and DSE (see “[Disability Studies Versus Disability Studies in Education: A Short Synopsis](#)” section for those tenets). In addition to troubling the historical and ongoing paradigms within schooling policies and practices as it relates to education debates, there is a growing literature and mobilization as it relates to the tenuous relationship between disability, psychology, and the psycho-emotional aspects of

disablism or what Dan Goodley and his colleagues also write as disablement (e.g., Goodley and Lawthom 2006).

Toward a Psycho-Emotional Inclusive Praxis. Disability can no longer be considered in isolation from the psycho-emotional aspects of disability oppression. Structural, hegemonic forces in society and schooling, directly and indirectly, influence how individuals and students with disabilities, such as students with LD, experience disablement. In turn, the relationship they have with their disability and how they might conceptualize their “disability identity” or not does not exist in isolation from how they make sense of the macro circulating narratives about what counts as disability.

Inside and outside of the DS and DSE literature, there are narrative and discursive-based approaches toward addressing the psycho-emotional dimensions that persons with disabilities, such as students with LD, have experienced and suffer from (e.g., Lambie and Milsom 2010). Further, Goodley and Lawthom (2006) call for an alliance between DS and psychology through the following 11 objectives: (a) rethink impairment, (b) recognize and resist the exclusive psychological elements of disablement, (c) promote socially valued understanding of disabled identities, (d) assume an active/activist vision of people with disabilities, (e) acknowledge the complex relationship between individual and social worlds, (f) work toward enabling psychological practices, (g) transform institutions, (h) promote a psychology of inclusion, (i) critique therapeutic assumptions, (j) seek radical psychological theories, and (k) develop emancipatory research practices (see Goodley and Lawthom (2006) for an extended discussion on each objective). Overall, taking a DS and DSE lens and honoring the local contexts of people as they enact their agency on the ground – within their cultural-historical conditions – and using what Artiles (2011) has called an interdisciplinary prism to addressing the intersectional nature of disabled people’s multi-dimensional identity markers and their psycho-emotional disablism can enable a praxis, the

coupling of reflection and action, by all stakeholders, disabled people, and students with disabilities toward deconstructing disability as psycho-emotional disablism for liberation, freedom, and social justice.

Introduction: Disability Studies in Education as Critical Special Education

Disability Studies in Education (DSE) is an international academic research field that is a sub-discipline of the larger field of Disability Studies. DSE was formalized as an independent field in the United States in 1999, when a group of Disability Studies scholars formed a special interest group in the American Education Research Association. Although there is no singular theoretical framework used in DSE, a theme undergirding the scholarship is to critically examine practices at the intersection of disability and schooling (Baglieri et al. 2010).

This focus on disability and schooling aligns DSE scholars with the existing research field of Special Education. While there is overlap between the fields, the critical orientation of DSE is a key element that distinguishes the field from Special Education; DSE scholars are critical of many school practices promoted by the field of Special Education as well as of the knowledge base of the

research field. DSE can therefore be understood as a form of *critical special education* in that researchers in the field are highly critical of the theoretical frameworks and practices used in Special Education, yet many still locate themselves within the field of Special Education (Ware 2005; Connor 2013).

Epistemological Critiques of the Ontology of Disability

The rise of DSE over the past two decades is a direct response to long-standing ways of producing knowledge in the field of Special Education. Accordingly, many of the theoretical contributions of DSE scholars are *epistemological critiques* of the field of Special Education. Epistemology refers to the study of knowledge. Epistemological critiques question the knowledge base of disciplines, asking how we know and what we know about a given topic or what the assumptions are that underpin legitimate knowledge within a given field. DSE scholars have critiqued several aspects of the knowledge base of Special Education, including how disability is conceptualized and the effort to establish best practices that are linked to specific disability labels (Connor et al. 2011; Gallagher 1998, 2004).

A key impetus for such critiques is the perception of DSE researchers that the field of Special Education holds an epistemological monopoly on the intersection of disability and schooling (Connor 2013). This is of critical concern given the *institutionalized knowledge* that is produced in Special Education. To varying degrees, the research field of Special Education influences, and is influenced by, the institution of Special Education – governmental mandates regarding the provision of services to children identified as having a disability. Because legislation leaves many of the specific aspects of implementing Special Education up to local schools (in collaboration with parents and children), the knowledge and beliefs of trained professionals situated in the culture of schools largely dictate the meaning of disability and associated practices. Special Education researchers are thus uniquely

situated to produce knowledge that impacts everyday school practices via the actions of these trained professionals.

Concerned about the history of Special Education dictating knowledge about disability and schooling, critiques by DSE researchers begin at the very foundation of Special Education knowledge: the ontology of disability. In the field of Special Education, the existence of disability is generally understood to emerge from deficits on or within the body. From this perspective, disability is an individual problem that exists in some students and not others. The task of researchers in Special Education is therefore to understand the nature of the deficit and to promote practices that will ameliorate it through remediation or treatment. Establishing this knowledge base involves a slow accumulation of scientific knowledge about what are presumed to be discrete conditions, coupled with a base of accepted “best practices” aimed at remediation. In this paradigm, disability is viewed as an unwanted and undesirable characteristic of certain schoolchildren.

Often referring to this conceptualization as the medical model, researchers in DSE generally reject the understanding of disability as a deficit within individuals that must be fixed or cured by professionals. Instead, many acknowledge physiological differences in students but view disability as primarily the result of the interaction of an individual student and an inaccessible or inflexible schooling environment. From this perspective, the disability is not something that exists on or within certain students; the existence of disability is a social phenomenon. Different physical or learning characteristics among children are often reframed as neutral differences that reflect diversity, not inherent disability.

Social Constructionism as a Response to Positivism

Differences in conceptualizing disability are indicative of the stark contrast of epistemological orientations between the fields of Special Education and DSE. The knowledge base of Special Education has long been rooted in a *positivist*

empirical framework. Positivism refers to an epistemological orientation that posits that all claims about what is true (legitimate knowledge) can be scientifically verified. Empiricism refers to the belief that all knowledge can be discovered through sensory experience. Truth, in a positivist empirical framework, is therefore objective and singular. Determining what is true is a matter of refinement of a gradually accumulated base of knowledge using the scientific method.

The use of positivist empirical orientation in Special Education is owed to the influence of other disciplines on the field. As an independent field in the United States, Special Education only emerged in the 1960s, rising to prominence in the 1970s when specialized education and related services were mandated through federal legislation for all students identified as having a disability. Since its inception, Special Education has been particularly influenced by the fields of behavioral psychology and various branches of medicine. The influence of behavioral psychology explains the tendency of Special Education researchers to frame behaviors of students as a finite set of skills (e.g., social, academic) that can be altered through behavioral modification. Special Education overlaps with medicine in its aim to discover the etiology of certain disability labels as well as methods of treatment or remediation. In turn, the fields of medical science and psychology also largely influence Special Education as a system in countries around the world; by defining and setting the parameters of disability, these fields influence which children fall under the purview of Special Education professionals and researchers.

Psychometrics is another discipline that has significantly influenced the epistemological orientation of Special Education. Psychometric tools are used in Special Education research in an attempt to both objectively define the criteria for disability labels and to determine evidence-based instructional strategies for remediating deficits. In attempts to define disability, the influence of psychometrics can be seen in the use of the normal curve in Special Education. The existence of disability is predicated on identifying deviation from a set of normative criteria that are expected from

school children at a given age. For example, deviation from expected social behaviors (framed as “skills”) serves as justification for the use of a number of deficit-based labels (such as Autism Spectrum Disorder [ASD] or Attention Deficit Hyperactivity Disorder [ADHD]) and in turn justifies the use of interventions aimed at modifying a child’s behavior.

Psychometrics is essential to the ontology of these disability labels and others in the field of Special Education because there is no definitive test to determine that these differences exist as discrete disorders. Rating scales and other psychometric tools are used as a way to establish differences as deficits. This approach also reflects *developmentalism* – a worldview based on developmental psychology that establishes normative criteria for how a child should develop. Children who exhibit behavior outside this trajectory are therefore apt to fall under the purview of Special Education professionals for the purposes of remediation.

Both DSE and Special Education researchers have acknowledged that despite its theoretical commitments, the field of Special Education has been unsuccessful in achieving its goals through a positivist empirical framework (Kauffman 1994; Gallagher 1998). Researchers have been largely unable to create the type of scientific knowledge that can serve as a basis for lawlike generalizations about the existence of disability. Furthermore, the field has been unable to establish a set of evidence-based practices that are linked to effectively remediating certain disability labels. Researchers in the field have responded with calls for incremental changes, including a stricter and more consistent adherence to a positivist empirical framework in research (Kauffman 1994).

DSE researchers have responded differently to the failure of Special Education in building a positivist knowledge base. They have questioned whether building such a knowledge base is desirable or even possible (Gallagher 1998). This critique stems from DSE’s rejection of the positivist epistemological orientation of Special Education. Rather, DSE researchers take a *social constructionist* approach to theorizing knowledge about

disability and schooling. Social constructionism refers to a framework rooted in sociology, in which knowledge about a given topic is contingent on certain shared and evolving understandings that are specific to the cultural and political contexts of a society. From this perspective, disability is framed as a social construct. Following Hacking (1999), claims about disability as a social construction can be understood as a reaction to claims about its inevitability. More specifically, DSE's use of social constructionism is a response to the idea that the *meanings* and *practices* associated with disability are inevitable. A social constructionist framework for defining disability takes a sociocultural view, highlighting the ever-shifting social, cultural, historical, and political contexts that give meaning to the existence of disability as a social phenomenon. As with social constructionist theories of gender and race, viewing disability through a sociocultural lens illustrates that disability, as it is currently known, is anything but inevitable.

As evidence of this, DSE researchers point to the many disability categories whose definitions and methods of diagnosis are highly subjective and have been altered in accordance with cultural and political factors (Baglieri and Shapiro 2012). These socially constructed categories of disability include labels such as Emotionally Disturbed, Learning Disability, and Intellectual Disability. Often referred to as “soft” disability categories, DSE researchers have attempted to show how the emergence and maintenance of these labels over time primarily reflect changes in sociocultural factors, rather than discrete physiological differences. For example, race, class, and gender discrimination have long been documented in the use of certain disability categories. In several States around the United States, students of color and of low socioeconomic status have been found to be overrepresented in categories such as Learning Disability and Emotionally Disturbed (Harry and Klingner 2014). Critiques have not been limited to these “soft” disabilities. Disability labels that are based on more consistent, discrete, physiological differences (e.g., deafness, Down syndrome) have also been the focus of criticism that examines the types of knowledge and cultural meanings that are

promoted by scientific research (e.g., Kliever 1998). A key theme undergirding DSE critiques of the scientific knowledge of disability is the idea that science exists *within* culture, rather than in a vacuum. Thus, the knowledge produced by researchers in Special Education (and related fields) through framing differences and organizing research protocols to come to scientific conclusions is seen as a cultural by product, rather than as objective observations. Special Educators are becoming increasingly aware of these critiques and have responded, defending the use of a positivist empirical framework and critiquing the sociocultural approach to the ontology of disability (e.g., Anastasiou and Kauffman 2012).

A social constructionist epistemological orientation thus serves as the jumping-off point for reconceptualizing the epistemology of Special Education. In other words, if the goal of Special Education is incremental progress while maintaining the same epistemological framework, then the goal of DSE is to recreate the framework that guides the production of knowledge in Special Education. This effort is motivated by a belief that a positivist empirical framework is a self-imposed limitation that unnecessarily and detrimentally narrows what counts as legitimate knowledge regarding disability and schooling and limits how educators might respond to the diversity of abilities in children. The later issue – responding to the diversity of children – has been a chief concern of DSE researchers, who (along with other Special Educators) have largely advocated *inclusive education* as an approach to support diversity of all students in general education. DSE researchers have recently suggested that the knowledge base of Special Education – with its roots and ongoing orientation in psychometrics and behavioral psychology – is not suitable for the further development of inclusive education practices, in part because it was never intended to foster inclusive practices. Despite an increase in research and practices aimed at supporting all students in general education classrooms, the theoretical underpinnings of Special Education still ground the discipline in discourses of deficit and remediation and provide a scientific rationale to justify more

restrictive learning environments for certain students (Danforth and Naraian 2015).

More broadly, DSE researchers have expressed at least two central concerns about the self-imposed limitations of a strict adherence to a positivist empirical framework in Special Education. First, a positivist empirical framework attempts to make claims about the objective and absolute truth about the existence of disabilities. The concern for DSE researchers is that in the search for this truth, Special Education researchers are apt to overlook the sociocultural influence on disability because it is incongruent with claims about the absolute existence of disability on or within certain individuals. DSE researchers have therefore framed the unwillingness of Special Educators to address sociocultural elements of disability as a form of self-imposed ignorance (Poplin 1987). Special Education researchers have rebuked this idea, arguing that a narrow epistemological framework is the best means to achieve the type of scientific rigor in the field that they believe will produce knowledge sufficient to remediate disability in students.

Secondly, DSE researchers have critiqued the epistemological orientation of Special Education for imposing unnecessary limitations on acceptable research methodologies. Research in the field of Special Education is rooted in a philosophical framework that is modeled on physical and behavioral science. As such, acceptable research methodologies in the field are those that reflect a positivist empirical approach, in which the research maintains neutrality and produces objective knowledge. DSE researchers have concurred with other scientific philosophers who argue that such a value-free research process is a fallacy. Instead, they argue that all research is value laden and influenced by the researcher, from the framing of research questions, to methodological choices, to interpretation of data (e.g., Gallagher 2004).

Accordingly, DSE researchers have called for broadening the parameters of acceptable research methodologies in the field. They have argued for a plurality of methodologies that will diversify highly quantitative state of the research field (e.g., Connor et al. 2011). These include the use

of qualitative and mixed-methods studies that bring forth the lived experiences of individuals labeled as having disabilities. Additionally, DSE researchers point to the need to depart from the focus on strictly defining disability labels, which are often used as a departure point for research studies that make claims about the reality of a specific disability. They argue that if disability labels are shifting sociocultural constructs, then beginning a research study by framing a disability label as an objective, static characteristic of certain individuals avoids the cultural influence and value-laden nature of the research. Therefore, useful as disability categories may be in organizing research protocols for positivist science, DSE researchers argue that such methodological tendencies do little to produce valuable knowledge, nor do they illustrate the complex truths about lives of the populations under study. Broadening the parameters of methodologies in Special Education therefore involves both expanding how research is done (e.g., quantitative, mixed-method, single-subject research) but also altering the framework of research such that it acknowledges and embraces the value-laden nature of research and the sociopolitical realities of disability.

Learning Disabilities as an Example

The phenomenon of *Learning Disabilities (LD)* provides perhaps the most comprehensive example of the epistemological differences described thus far. LD is first and foremost a political category. In several countries, LD (or some variation) is a label that provides students access to specialized instruction and services. In the United States, LD is the largest of all disability categories in K-12 public schools, representing approximately 41% of all students who receive Special Education services (Learning Disabilities Association of America 2015). LD is also a disorder within the psy-sciences, though under different names and which differs to varying degrees with the institutionalized definition and criteria of LD in schools. The research field of Special Education draws in part from the research of these behavioral and

medical sciences, as well as from the field's own traditions and research base, to build knowledge about LD.

For decades, researchers in Special Education have attempted to prove that LD exists as a discrete disability, which manifests itself in a minority of schoolchildren. Stemming from a long-held presumption that LD is a disorder of the central nervous system, this effort has involved an ongoing hunt to locate LD inside the brain. Such an effort focuses on the deficits of certain children (i.e., what they are presumed to be unable to learn) and has been proposed as an attractive explanation for the “unexpected” or “unexplained” failure of children to learn. Over time, Special Education researchers have used a positivist empirical framework to frequently redefine the definition of LD and the criteria determining who does and does not have LD. In the absence of a test of “hard” proof about the discrete presence of LD, the parameters of LD have been a moving target. Nevertheless, this has not dissuaded Special Education researchers from attempting to develop a scientific knowledge base that will uphold the existence of LD. In fact, several researchers have argued that despite a lack of clear understanding about what exactly LD is, it is best to agree on some criteria in order to disseminate information about detection and remediation, which can support teachers, parents, and children (e.g., Hammill 1990; Scanlon 2013). This perspective is reflective of the aforementioned “medical model” in which learning differences are understood through the lens of pathology; LD is viewed as a deficit that must be remediated.

While acknowledging differences in learners, DSE scholars have been highly critical of the medical model of LD, as well as efforts to build a scientific knowledge base about LD. Many DSE researchers view LD as a sociocultural and political category (e.g., Gallagher 2010; Skrtic 2005; Sleeter 1987). They understand the birth of LD and its evolution over time as more of a reflection of the cultural practices on how schools respond to differences, rather than about differences within children. For example, the economic reality of limited resources in schools may encourage teachers to use a one-size-fits-all approach,

rather than cater to differences in their students. DSE researchers further argue that the very concept of LD is based on invented concepts about how children should learn, relative to their supposedly non-disabled peers. Thus, LD is seen as a category that upholds a mythical normal child, while pathologizing differences among children. DSE researchers seek to disrupt the concept of normalcy and reduce its influence in school practices, rather than support school practices that uphold it.

Conclusion

LD is but one example of many that illustrates the stark epistemological chasm between Special Education and Disability Studies in Education. In the past quarter-century, there have been increasing critiques of special education, cementing the emergence of a vocal minority of “critical special educators” who find serious faults in the positivist empirical framework employed in Special Education research. Ultimately, however, the tradition that has been the knowledge base of the field – rooted in a medical model of disability – continues to be the dominant epistemological orientation espoused by the vast majority of Special Educators.

Introduction

The discourse of diversity is frequently used in higher education and is today “Embraced as a holy mantra across different sites” (Puwar 2004, p. 1). Yet, disagreement persists in how diversity is defined, what it represents, and what it is supposed to accomplish. For some, diversity refers to the social categories of race, gender, ethnicity, socioeconomic status, and sexuality, while others assume diversity denotes all differences. Others believe that the term is a remedy for social injustice and the basis for affirmative action policies. There is also the view that diversity is a means to prepare students for life in a pluralistic society without any reference to social justice. Across these debates, the question of whether or not disability is considered part of what is referred to as diversity is hardly mentioned. Some scholars argue this is reflective of disability’s position as the last civil rights movement, citing better known groups have long(er) established legal statues, fields of study, scholarship, and histories of activism. The field of disability studies contends, however, that “Rather than an issue of timing, the issue is in fact structural” (Davis 2015, p. 42). Movements for racial and gender justice moved from a focus on antidiscrimination to incorporate the examination of cultures and practices that addressed heritage, diverse bodies of knowledge, standpoint theory, structural inequality, and intersectionality. The framing of disability in higher education, by contrast, has largely been

one of legally mandated, individualized, biomedical interpretation.

One argument for this difference is that scholars, practitioners, faculty, and administrators do not identify those labeled as disabled as a social group. In Iris Marion Young's *Five Faces of Oppression* (1990), a social group is defined as a "special kind of collectivity" whose affinity is shaped by similar experiences. Difference from a privileged norm constitutes association rather than any inherent feature of the individuals who make up the collective. Members thereby affiliate with one another because of this shared experience more than with those who do not identify as such. Guldvik and Helge (2014) argued that disability should be considered a social collective given that persons with disability are defined not by any inherent feature but rather their difference from able-bodied and able-minded norms. Studies find that professionals in higher education do not see disability constructed this way and diversity and disability thereby remain separate concerns.

Entrenched preferences for normativity also serve as one reason for this division. Siebers (2011) argued "Disability marks the last frontier of unquestioned inferiority because the preference for able-bodiedness makes it extremely difficult to embrace disabled people and to recognize their unnecessary and violent exclusion from society" (p. 6). These entrenched practices of exclusion are upheld by ableism, an institutionalized system of discrimination and exclusion that oppresses people who have mental, emotional, and physical disabilities (Hehir 2002). Ableism also constructs the status of other identities as inferior by assigning the label of disability to justify discrimination anew: "When categories of citizenship [are] questioned, challenged, and disrupted, disability [is] called on to clarify and define who deserve[s], and who was deservedly excluded from, citizenship" (Baynton 2013, p. 33). Therefore nondominant groups are framed as biologically inferior and intellectually substandard while the construct of normalcy upholds white, middle-class, European, able-bodied standards (Davis 2015). Even as biological characteristics of inferior intelligence and embodiment for racial, ethnic, sexual, and gendered minorities have been

disproven, disability is still tethered to this concept. Civil rights movements dismantled the false applications of normalcy but many remnants of scientific interpretations of ability continue to be used to segregate people with disabilities.

A second argument for the existing division between disability and diversity is the singular focus on legal interpretation. By in large, colleges and universities maintain a strict focus on compliance with Section 504 of the Rehabilitation Act of 1973 and the Americans with Disabilities Act of 1990. The dominant view of disability as interpreted by case law is one of an individualized, biomedical condition. There is little sense that disability-related accommodations would "benefit more than the individual who requests them" (Emens 2013, p. 43). In higher education, there is the added requirement of confidentiality, student initiated disclosure, and letters of accommodation, which are not mandated requirements for other social groups. This hyper-individualization moves the construction of disability away from a social group status and outside of the purview of diversity work.

The institutional shifts resulting from changing demographics of college-going students, faculty, and staff fostered identity centers, fields of study, resources, admissions and recruitment practices, and scholarships for social groups connect at race, gender, sexual orientation, ethnicity, religion, and nationality. Disability, however, is not regarded as a similar cultural or social identity due to the highly individualized, biomedical, legal framework. This is not to say that legal protection is entirely purposeless knowing that disability civil rights statutes have made important inroads for the world's largest minority group. However, an institution's singular focus on legal interpretation reinforces constructs of ability difference that have proven unhelpful, and compound the exclusion of disability from diversity work.

Diversity and Higher Education

Efforts to achieve greater diversity in higher education largely began in the mid-nineteenth century. The Morrill Acts of 1862 and 1890 allocated

land so colleges and universities could serve African Americans students in Southern States where they were not allowed to enroll in State institutions. Diversity, predominately understood as access, was dominated by race for centuries but this shifted dramatically after World War II with the introduction of the GI Bill of 1944, making higher education accessible to wider demographics. The federal regulations and social movements that followed challenged institutionalized discrimination and opened pathways for marginalized groups. The Civil Rights Act of 1964 provided federally mandated anti-discrimination statutes, Title IX provided protections on the basis of sex, an applicant's race could be considered in the college admissions process, and executive orders for affirmative action worked to redress past discrimination in admissions, employment, and hiring. There was also parallel growth in different types of postsecondary institutions including minority serving institutions (MSIs), women's colleges, community colleges, and historically black colleges and universities (HBCUs).

Diversity, specifically in terms of race and the black/white binary, was also shaped by Supreme Court rulings on affirmative action. Affirmative action endeavored to at least partially remedy racial inequality, first as a presidential executive order. The evolution of court cases from the 1970s to present day debated the use of quotas, strict scrutiny, and compelling government interests as they pertained to establishing more representative college-going populations. The argument that diversity benefited all students became the leading claim for the continuation of affirmative action, even as the procedures by which it was enacted continue to be contested in the courts of legal and public opinion. Throughout this trajectory and in court cases on school desegregation, social science research underscored the value of affirmative action by demonstrating how the benefits of diversity had the potential to positively influence societal culture and practice (Orfield 2001). In his ruling in *University of California v. Bakke* (1978), US Supreme Court Justice Lewis Powell wrote "The atmosphere of speculation, experiment and creation – so essential to the quality of

higher education – is widely believed to be promoted by a diverse student body. . . It is not too much to say that the nation's future depends upon leaders trained through wide exposure to the ideas and more of students as diverse as this nation of many peoples" (p. 2760).

Yet the 1990s brought a surge of backlash against affirmative action even as college populations began to reflect the economic and racial demographics of society. Affirmative action was enacted with the hope of redressing past racial inequality but has since evolved into two camps who believe college admissions should be based on merit and another who acknowledge the benchmarks of merit cannot be achieved equally based on structural injustices in the United States (Gosh 2012). Scholarship on demographic and enrollment changes initially described diverse student backgrounds as "risk" factors. This has since moved to an understanding of ecological perspectives about inhospitable campus climates and academic departments. The social and academic integration of students has been the recent focus of efforts to address retention and persistence. Part of bridging academic success and social supports included the establishment of cultural or identity centers, learning communities, and academic fields of study. The interactions fostered by these arrangements have been found to promote positive attitudes toward literacy, critical thinking, socially responsible leadership, intercultural effectiveness, and psychological well-being. Such outcomes were further maximized by positive campus climate features involving the inclusion of diverse students, faculty, and administrators, a curriculum reflecting historical and contemporary experiences of underrepresented groups, programs that supported the retention of diverse students, and a mission that reinforced institutional commitments.

Altogether postsecondary diversity efforts intended to dismantle colorblind policies, acknowledge widespread discrimination of women and people of color, and disrupt the status quo of institutions that worked to maintain social inequality. As this trajectory of diversity work demonstrated, disability was largely omitted from these frameworks. There is little sense that the

inclusion of disability provides any “larger benefit,” for example, While ecological perspectives have been employed to address academic and cocurricular supports for historically underrepresented groups, persons labeled with a disability are all too often addressed on a case-by-case basis by an office that administers services and accommodations in accordance with disability law.

Disability and Higher Education

Prior to 1973, the only federal law that granted extensive protection for persons with disability was the Fourteenth Amendment of the United States Constitution. This required equal protection of citizens in life, liberty, and property, yet failed to administer specific protection for persons with disabilities in legislation that addressed discrimination on race and gender. Before the civil rights movements of the 1960s and 1970s, colleges and universities could legally deny admission and hiring based on a person’s race, gender, sexual orientation, and ability. Repeated efforts in the 1970s attempted to include the category of disability in the Civil Rights Act of 1964 but disability-specific regulations were eventually established in Section 504 of the Rehabilitation Act of 1973 and the Americans with Disabilities Act (ADA) of 1990.

The protections established by Section 504 of the Rehabilitation Act of 1973 made institutions that received federal funding accountable for providing equal access and opportunity for persons with disabilities. This was later extended to all public and private educational institutions in Title II and Title III of the Americans with Disabilities Act of 1990 (ADA). The ADA of 1990 incorporated verbatim regulations of Section 504 and went even further to establish reasonable accommodations in such areas as academic programming, examinations and evaluations, housing, and recreational facilities on college campuses. Together Section 504 and the ADA granted students, faculty, and staff who qualified as disabled the right of equal access to participation, essential information, and avenues of communication in public and private sectors.

In legal terms, disconnects between the spirit of antidiscrimination law and social and cultural acceptance are not unfamiliar to other groups. As such, scholars have asked if Section 504 and the ADA attempt to do something different from the rest of antidiscrimination law: Emens (2013) argued that “United States antidiscrimination statutes covering classifications like race and sex – such as Title VII of the Civil Rights Act of 1964 – involved costs to the employer and changes to policies and practices that operated *like* an accommodation (e.g., putting women’s restrooms in a formerly all-male work place may cost money)” (p. 45). In this sense, both Title VII and the ADA required employers to “absorb costs and make structural changes” (Emens 2013, p. 45). On the other hand, “The ADA obliges employers to respond to *individual* requests, supported by medical documentation, initiated by the students and employees themselves, thereby requiring a different kind of interaction” (Emens 2013, p. 45). Here, situated among the landscape of diversity work, antidiscrimination statutes, and identity-based programming, the requirement of medical documentation to secure an accommodation makes the category of disability stand apart from other group identities who are more commonly understood as collective social, cultural, and political groups. Even as scholars challenged wholesale assumptions about identity and essentialism in higher education, disability remains constructed as an individual request with generalized beliefs about capability attached to one’s label.

For persons with disabilities to access rights afforded by Section 504 and the ADA, they must first meet the legal definition of disability as defined in the statutes. This requires proof of a physical or mental impairment that substantially limits one or more major life activities. The reliance on individualized inquiry and medical documentation constructs categories of disability apart from those employed in diversity work and affirmative action policies. This medical model is especially influential in shaping interpretations of disability on college campuses. By definition, the medical model predominately focuses on an individual’s diagnosis and functional limitations.

Outside of a campus's office of disability services, there is little awareness of ability difference and diversity. Faculty and administrators are not mandated to address disability or participate in related trainings. Disparities between IDEA's Part B Child Find mandate (IDEA 2004) and the ADA's individual mandate (ADA 2008) also make transition to higher education challenging. Under the ADA, college students must seek out services and accommodations. In K-12 schools, students meet annually with a multidisciplinary team to review and assess Individualized Education Plans (IEPs). The differences between K-12 and higher education represent a point of difference that other racial and gendered social groups do not have to account for in their civil rights statutes. This point of difference is compounded by discourses about "reasonable accommodations" to meet an individual's needs. In K-12 settings, Individualized Education Plans (IEPs) are legal documents that provide services and accommodations to students and involve a multidisciplinary team, parental and student involvement, and annual review of goals. Accommodations in higher education are incumbent on a person's self-disclosure and the administration of letters of accommodation to faculty and staff. College students must also bear the cost of medical documentation of their disability. The means by which this documentation is interpreted also varies greatly as there are no degree or licensure systems to serve as a case manager in a college's disability services office. Altogether this positioning portrays disability as an individual problem in need of "reasonable accommodations" rather than a symptom of systemic and institutionalized structures supporting able-bodied and able-minded norms.

The institutional shifts resulting from changing demographics of students, faculty, and staff fostered identity centers, fields of study, resources, admissions and recruitment practices, and scholarships for categories of race, gender, sexual orientation, ethnicity, religion, and nationality. Disability, however, is not regarded as a cultural or social identity on par with ethnicity, race, gender, and socioeconomic status because of the highly individualized, biomedical framework.

The field of disability studies contends, however, that the experience of being labeled as disabled functions similar to other social group identities and that the presence of disability can altogether create a different picture of identity and competence. Emerging research on diversity in post-secondary settings speaks to the necessity of intersectional analyses, but this work is almost impossible when disability is not considered part of the constellations of identity on college campuses.

Introduction

With the emergence of the Internet, we have witnessed a massive growth in (online) distance education since the 1990s. Distance education – often perceived as an isolated form of individual learning – has now clearly moved into the mainstream. Today, almost all educational institutions offer programs that integrate digital media in an online environment to provide flexible learning opportunities, independent of time and place. However, distance education is not a new phenomenon. Educational technologies have been used to bridge the distance between learners and teachers or teaching institutions for over 150 years. Hence, it is important to build upon theories, practice, and empirical research into distance education when new forms and modes of delivery are developed with new and emerging media.

Therefore, after a definition of distance education and related terms, this chapter sets out to provide an overview of the historical development of distance education and generations of technological innovations associated with it. It will then elaborate on the major theories and models in the context of distance education that were developed

over time. Distance education matured as a professional field of practice and scholarship. At the end of this chapter, a framework of 15 research areas is briefly described to provide a foundation to the discipline of distance education.

Definition of Distance Education

A particular characteristic of distance education is that teachers and learners are geographically separated from each other. Teaching and learning are therefore enabled through various forms of electronic media. Brindley et al. (2004) state that “distance education” or “distance learning” is “the overarching term for media-based learning and teaching” (p. 13). The central concern of distance teaching pedagogy has always been how best to bridge this distance, since distance between students and teachers was regarded as a deficit, and proximity as desirable and necessary. Early pedagogic approaches specific to distance education aimed to find ways by means of which the spatial distance could be bridged, reduced, or even eliminated.

The origins of distance education go back to what were called “correspondence” courses (correspondence study). With the development of new media, which were also used for distance teaching (e.g., telephone, fax, radio, video, computer, etc.), the term “correspondence study” became too narrow. In North America, the terms “independent study” and “home study” were therefore used as competing designations, until the notion of “distance education” finally prevailed. This was formalized in 1982 when the international association of distance teaching institutions changed its name from the International Council for Correspondence Education (ICCE) to the International Council for Distance Education (ICDE).

In 1980 Desmond Keegan proposed a widely accepted definition in the first issue of the journal *Distance Education*. He refers to five characteristics of distance education, which mutually influence one another: (1) the separation of the teacher, learner, and teaching institution; (2) the role of an educational organization in the planning and

development of learning materials and the provision of a student support system; (3) the use of technical media, in particular; (4) the two-way media for communication throughout the learning and teaching process; and (5) the absence of the learning group (Keegan 1980). While learning in groups was not a constituent element of distance education in the 1980s (although it has been possible to meet other students in study centers), the development of online computer conferences has assisted the breakthrough of collaborative learning with networked computers.

The central attribute of distance education is that teachers and learners are separated and technical media are used to bridge the distance between the parties involved in the learning process. The capability of media to afford two-way communication for interaction between learners and teachers and among learners is an essential part of the process. This requirement is reflected in the more recent definition by Simonson et al. (2011): "Distance Education is institution-based, formal education where the learning group is separated, and where interactive telecommunications systems are used to connect learners, resources, and instructors" (p. 126).

The various types of technologies used for teaching and learning are collectively referred to as "educational technologies," and this term includes printed study materials as well. The term "e-learning" generally means learning with electronic media, i.e., via the Internet, but also via television and radio, audio, and video. E-learning is therefore defined more narrowly than distance learning, since the latter may also include print-based study materials and correspondence communication. E-learning can therefore be regarded as a particular form of distance learning, but not all distance learning is necessarily electronic. Online learning is learning and communication via networked computers (online distance education).

With the proliferation of digital media, the traditional boundaries between distance education and face-to-face educational practices are blurring. Hence, terms such as "blended learning," "flexible learning," or "distributed learning" have become prevalent. All these terms describe a continuum between traditional distance education and contact

education, in which pedagogical approaches, methods, and technologies are used to enable extended and more autonomous, individualized, and self-directed learning opportunities.

Historical Development of Distance Education

The development of distance education is closely linked to the advancement of information and communication technologies. Distance teaching institutions have always been spearheading the integration of innovations in educational technology to facilitate the learning and teaching process. Garrison (1985) distinguished between three generations of technological innovations that initiated a paradigm shift in distance education practices. From a historical perspective, the three milestones of technological innovations are print media, telecommunications media/multimedia, and the personal computer. One-way media, such as radio or television, are described as ancillary media: "The main reason is the non-instructiveness of media such as radio and television broadcasts, audio and video cassettes, laser videodiscs, and audiographics. For this reason, these media are viewed as being in a separate category, since they are incapable of providing two-way communication" (Garrison 1985, p. 239). Depending on the flow and direction of information (one-way, two-way media) and the temporal dimension of the interaction (asynchronous, synchronous media), educational technologies can be described as a function of interaction and independence that they afford.

Reflecting Garrison's concept of technological innovations, the development of distance education is briefly portrayed along the following three generations:

- Correspondence generation (since the 1850s)
- Multimedia or Open University generation (since the 1960s)
- Computer and online generation (since the 1990s)

The first generation was print-based distance or correspondence education, in which self-learning

materials were sent via the postal system to the students, who were supported by a tutor via letters. The University of London established the “University Correspondence College” in 1858 for the people in the colonies of the British Empire. The first dedicated distance teaching university was the University of South Africa, established in 1873 in Pretoria, which is still in operation and caters to over 400,000 students. First-generation distance education was characterized by high flexibility and independence of time and space but also by very limited two-way communication.

The second generation is strongly linked to the foundation of the Open Universities to widen access to higher education. Peters (2008) emphasizes the success of the UK Open University established in 1969: “The Open University [...] became famous for its open entrance policy, its focus on teaching adults, and for its extraordinary success in producing more graduates than all other universities of the country put together” (p. 227). This generation was characterized by the development of nationwide distance education system with networks of study centers and the application of a wide range of educational (multi)media, including educational TV, radio, and video conferencing.

As early as 1988, a computer-conferencing system (“CoSy”) was introduced at the UK Open University to support about 1,300 students via online tutoring. The so-called Internet-based learning management systems and virtual campus environments emerged in the middle of the 1990s. With the proliferation of personal networked computers, (online) distance education really moved into the mainstream. The computer or online generation of distance education is characterized by independence of time and space but also by a high grade of interactivity, social interaction, and collaboration via asynchronous and synchronous information and communication tools and applications.

Major Theories and Models of Distance Education

Distance education is rather young as an academic discipline. For the professionalization of the field, it is important that research activities are based on

a solid base of theory as “scholarship can be defined a research grounded in theory” (Moore and Kearsley 2005, p. 220). Major theories and models in the context of distance education began to emerge in the 1960s and 1970s.

Charles Wedemeyer conceptualized distance education as “independent study” (Wedemeyer 1971), in which students are not only independent from time and space but also responsible for managing and controlling their own learning process. Distance education provides opportunities for independent and self-directed learning. However, independent learners do not exist per se. Students need support and guidance to develop into autonomous learners. Therefore, the production of high-quality study materials, the facilitation of independent learning, and the provision of a student support system along the student’s life cycle gained importance. Delling (1971) described distance education institutions as “helping organizations.”

In order to inform policy makers in Germany, Otto Peters carried out a comparative study about distance teaching institutions in more than 30 countries in the 1960s and 1970s and developed his theory of distance education as the most industrialized form of education. He observed the separation of the production of learning materials from the instruction, the division of labor, the use of standardized and rationalized procedures, and the mass production processes. Thus, he conceptualized distance education as follows: “Distance study is a rationalized method – involving the division of labour – of providing knowledge which, as a result of applying the principles of industrial organization as well as the extensive use of technology, thus facilitating the reproduction of objective teaching activity in any numbers, allows a large number of students to participate in university study simultaneously, regardless of their place of residence and occupation” (Peters 1983, p. 111). The application of industrial practices will result in higher quality at lower costs, thus providing increased access to (higher) education.

Börje Holmberg recognized communication, the learner-teacher dialogue, as a core element in distance education. He proposed a conversational theory, which he called “guided didactic

conversation,” as the pedagogical model for distance education: “My theory implies that the character of good distance education resembles that of a guided conversation aiming at learning (. . .). There is a constant interaction (“conversation”) between the supporting organizations (authors, tutors, counselors) and the student, simulated through the student’s interaction with the pre-produced courses and real through the written and/or telephone interaction with their tutors and counselors. Communication is thus seen as the core of distance education” (Holmberg 1986, p. 54).

Also acknowledging the importance of interaction and dialogue, Michael Moore developed the theory of transactional distance (Moore 1993). He derived his definition of transactions from Dewey’s notion of “transactions” between the learners, teachers, and environment. The separation of learners and teachers in distance education leads to special patterns of learner and teacher behaviors: “With separation there is a psychological and communications space to be crossed, a space of potential misunderstanding between the inputs of instructor and those of the learner. It is this psychological and communications space that is the transactional distance” (p. 22). Thus, the term transactional distance refers not only to geographical but also psychological distance between learners and teachers, which is influenced by the extent of structure in the instructional design of a course, the extent of autonomy of the learner, and the extent of interaction (dialogue) between the learners and the teacher.

With the emergence of computer-mediated communication and online learning, Garrison et al. (2000) designed a model for distance learning, in which the educational experience occurs in a “community of inquiry” focused on critical thinking through the interaction of three core elements: (1) cognitive presence, the extent to which learners “construct meaning through sustained communication” (p. 89); (2) social presence, the ability of learners in the community of inquiry “to project their personal characteristics into the community, thereby presenting themselves to the other participants as ‘real people’” (p. 89); and (3) teaching presence, which consists of two main

functions – the planning and instructional design of a course and the orchestration and moderation (“facilitation,” p. 89) of the interaction between the learners, the teacher, and among the participants of the learning experience. Garrison et al. (2000) argue that the learning community is only viable in a computer conference if all three elements are present.

Research Areas in Distance Education

As noted above, research questions should be posed within a theoretical framework and quality research should be embedded within a holistic structure of research areas within a discipline. Furthermore, the structure, culture, history, and past accomplishments of a research discipline form the foundation for identifying gaps and priority areas for researchers. As distance education theory and practice matured, various authors carried out reviews of the research literature and discussed potential categorizations of research areas in the field. Zawacki-Richter and Anderson (2014) suggested a framework of 15 research areas based on a Delphi study along three major lines of research (p. 2):

Macro level: Distance education systems and theories

1. *Access, equity, and ethics:* The democratization of access to distance education afforded by new media and finding ways to deliver high-quality education to those who have limited resources and poor infrastructure. Issues that refer to the (sustainable) provision of distance education in developing areas. For example, what is the impact of distance education (e.g., via mobile learning) on narrowing (or broadening) the digital divide and what is the role of ICT (information and communication technologies) and/or OER (open educational resources) in terms of access to education? Should distance education have an inherent and explicit goal to reduce inequality and promote both high-quality and affordable educational opportunity?

2. *Globalization of education and cross-cultural aspects*: Aspects that refer to the global external environment and drivers; the development of the global distance education market, teaching, and learning in mediated and multicultural environments; and the implications for professional development and curriculum development.
3. *Distance teaching systems and institutions*: Distance education delivery systems, the role of institutional partnerships in developing transnational programs, and the impact of ICT on the convergence of conventional education and distance education institutions (hybrid or mixed mode).
4. *Theories and models*: Theoretical frameworks for and foundations of distance education, e.g., the theoretical basis of instructional models, knowledge construction, interaction between learners, and the impact of social constructivism, connectivism, and new learning theories on distance education practice.
5. *Research methods in distance education and knowledge transfer*: Methodological considerations, the impact of distance education research and writing on practice, and the role of professional associations and higher education institutions in improving practice. Literature reviews and works on the history of distance education are also subsumed within this area.

Meso level: Management, organization, and technology

6. *Management and organization*: Strategies, administration and organizational infrastructures, and frameworks for the development, implementation, and sustainable delivery of distance education programs. What is required for successful leadership in distance education? Distance education and policies relating to continuing education, lifelong learning, and the impact of online learning on institutional policies, as well as legal issues (copyright and intellectual property).
7. *Costs and benefits*: Aspects that refer to financial management, costing, pricing,

and business models in distance education. Efficiency: What is the return on investment or impact of distance education programs? What is the impact of ICT on the costing models and the scalability of distance education delivery? How can cost-effective but meaningful learner support be provided?

8. *Educational technology*: New trends in educational technology for distance education (e.g., Web 2.0 applications or mobile learning) and the benefits and challenges of using OERs, media selection (e.g., synchronous vs. asynchronous media), technical infrastructure and equipment for online learning environments, and their affordances for teaching and learning.
 9. *Innovation and change*: Issues that refer to educational innovation with new media and measures to support and facilitate change in institutions (e.g., incentive systems for faculty, aspects referring to staff workloads, promotion, and tenure).
 10. *Professional development and faculty support*: Professional development and faculty support services as a prerequisite for innovation and change. What are the competencies of online teachers, counselors, and support service staff and how can they be developed?
 11. *Learner support services*: The infrastructure for and organization of learner support systems (from information and counseling for prospective students to library services and technical support to career services and alumni networks).
 12. *Quality assurance*: Issues that refer to accreditation and quality standards in distance education. The impact of quality assurance requirements and regulation and the impact of quality learner support on enrolments and dropout/retention, as well as reputation and acceptance of distance education as a valid form of educational provision.
- Micro level: Teaching and learning in distance education*
13. *Instructional or learning design*: Issues that refer to the stages of the instructional

design process for curriculum and course development. Special emphasis is placed on pedagogical approaches for tutoring online (scaffolding), the design of (culturally appropriate) study material, opportunities provided by new developments in educational technology for teaching and learning (e.g., Web 2.0 applications and mobile devices), as well as assessment practices in distance education.

14. *Interaction and communication in learning communities*: Closely related to instructional design considerations is course design that fosters (online) articulation, interaction, reflection, and collaboration throughout the learning and teaching process. Special areas include the development of online communities, gender differences, and cross-cultural aspects in online communication.
15. *Learner characteristics*: The aims and goals of adult and younger students studying at a distance, the socioeconomic background of distance education students, and their different approaches to learning, critical thinking dispositions, media literacies, and special needs. How do students learn online (learner behavior patterns, learning styles) and what competencies are needed for distance learning (e.g., “digital literacy”)?

According to a large-scale literature review (Zawacki-Richter and Anderson 2014), over 50% of research papers published in major journals of the field deal with topics and issues on the micro level of teaching and learning in distance education, while the most neglected research areas are on the meso and macro level, particularly costs and economics of distance education, innovation and change management, and globalization of education and cross-cultural aspects of distance education. As distance education theory and practice develops further, it will continue to address new themes by enlarging its scope of research areas.

Doping and Anti-doping in Sport

Dennis Hemphill
Victoria University, Melbourne, VIC, Australia

Introduction

Doping in sport is recognized as a crisis within government, academic, professional, and media circles worldwide. Doping, which can include performance-enhancing drugs such as anabolic steroids, growth hormones, and amphetamines, is considered to be a significant threat to the integrity of sport because it undermines the fairness of contests, the health of athletes, as well as sport's character/team building and role model function for society. The public good at stake in sport is thought to be so high as to warrant preventative education programs, but also increasingly tougher penalties and broader policing powers.

There are a number of key arguments and counterarguments in the philosophy of sport and

sociology literature on the topic of doping and doping control, which have been critically discussed at length in Hemphill (2009) and are summarized in this entry.

Anti-doping Arguments in Sport

Naturalness

On this account, sport is thought to be the testing of natural abilities, and performance-enhancing drugs and methods (PEDMs) should be banned because they introduce synthetic, foreign substances, or even one's reinfused oxygen rich blood, into the body to help produce training adaptations or performance enhancements that could not be achieved otherwise. However, there is an inconsistency by singling out drugs for prohibition when there is a range of "unnatural," yet acceptable, performance enhancers in sport. That is, in sport, as in daily life, performance is routinely aided by substances (e.g., caffeine, vitamin supplements) or by prosthetic devices that can be considered artificial and external to the athlete (Brown 1980; Lavin 1995; Roberts and Hemphill 1988; cited in Hemphill 2009).

Fairness

On this account, PEDMs should be banned because the use of a prohibited substance is cheating, that is, gives the user an unfair advantage over other athletes. PEDM rule violations not only change the conditions of play without consent, but they undermine the "level playing field," that is, relatively balanced conditions of play. However, the fairness argument is also thought to be inconsistent because there are many advantages that favor the performance prospects of some athletes over others, yet remain unquestioned (Brown 1980; Parry URL; Simon 1995; Roberts and Hemphill 1988; cited in Hemphill 2009). For example, some athletes are born with a preponderance of fast-twitch fibers, which give these athletes a natural advantage over those with less of them. More significant is the fact that some athletes have access to more funding, better facilities and equipment, as well as to greater coaching and other sport science support.

Health

On this view, PEDMs should be banned because they pose significant short- and/or long-term health hazards to athletes. However, it may be inappropriate to judge athletes by a standard of health thought to be more appropriate to a “normal” population (Brown 1980; cited in Hemphill 2009). That is, athletes are already “abnormal” in terms of their performance aspirations and what risks, hardships, and injuries they are prepared to accept and overcome in their quest for sporting excellence. Moreover, it appears inconsistent to single out PEDMs for exclusion when there are a range of acceptable short- and long-term injury and health risks associated with sports participation.

Harm to Others

On this account, athletes who use PEDMs should be banned because they coerce or force other athletes to break the rules and risk their short- or long-term health just to remain competitive. In addition, adult PEDM use in sport should be prohibited on the grounds that adult athletes are influential role models for young athletes who, in turn, may make uninformed choices about PEDM use. However, it is not clear why PEDMs should be banned when other competitive pressures (e.g., weight training, high-tech equipment) are not (Roberts and Hemphill 1988; Simon 1995; Tamburrini 2000; cited in Hemphill 2009). It also seems inconsistent to ban PEDMs when there are other adult behaviors (e.g., alcohol consumption, poor diet) that may also set a bad example to children (Roberts and Hemphill 1988; Simon 1995; Tamburrini 2000; cited in Hemphill 2009).

There are basically three courses of action to deal with the logical inconsistencies laid out above. The first is to ban any and all performance aids (e.g., technology, facilities, coaching) that are considered unnatural, unfair, unhealthy, or cause harm to others. The second is to provide universal access to any and all performance aids so as to level the playing field (Brown 1980; Savulescu et al. 2004; cited in Hemphill 2009). However, both options would likely be too expensive and impractical for implementation. The third option

is to make a special case for why PEDMs should be banned when there are so many other acceptable performance enhancers that may be unnatural, unhealthy, unfair, or cause harm to others.

In spite of these conceptual and logical problems, there still appears to be “pervasive disapproval” of PEDMs in sport (Lavin 1995; cited in Hemphill 2009). The following sections will summarize additional ethical arguments as to why this may be the case.

Respect for Persons

On this account, PEDM use in sport undermines personal autonomy and responsibility. That is, PEDM use should be condemned because it is seen as a crutch or as a shortcut that diminishes self-reliance, hard work, and perseverance (Pound 2005; cited in Hemphill 2009). Moreover, PEDM use can also undermine the ideal of competition, conceptualized as a mutually challenging quest for excellence between persons (Simon 1985, 1995; cited in Hemphill 2009). While the outcome of a sport competition can be influenced by luck or injury, there is still a significant value attached by athletes, spectators, and other stakeholders to the link between success and personal effort. Competition, then, should involve the disclosing and testing of the athletic and tactical prowess of an athlete in response to the valuable challenges served up by the opponent, not their responses to, say, performance-enhancing chemical agents.

There is also the opposing view that PEDM use is consistent with the nature of persons and the spirit of sport. For example, by speeding recovery from training fatigue or injury, PEDMs may permit athletes to train more frequently, for longer periods of time, and with more intensity. PEDM use can be seen as consistent with the Olympic ethos of “faster, higher, stronger”, and several authors argue that PEDM use is consistent with the human drive to expand capacities, self-knowledge, and freedom (Brown 1980; Konig 1995; Shogan 1999; Savulescu et al. 2004; Tamburrini 2006; cited in Hemphill 2009).

However, when PEDM bans are enforced on informed and consenting adults, it seems to disrespect them, that is, deny in adults the very feature of self-determination that is valued and expected

of them as “persons.” On this account, if athletes weigh up the pros and cons of PEDM use and make a voluntary choice, external interference with their freedom of choice seems unwarranted (Simon 1995; cited in Hemphill 2009). There is one qualification to the respect for persons argument. PEDM bans are warranted in the case of children who, due to lack of education and experience, are not fully aware of the consequences of their action (Brown 1995; cited in Hemphill 2009). In other words, soft paternalism is warranted where it can be shown that a person cannot make a voluntary, informed choice.

The notion of respect for persons has some normative force. However, when applied to the doping control issue, this individualistic notion of what it means to be a person renders two seemingly contradictory results. On the one hand, the appeal to self-determination makes the use of PEDMs appear as a prop that diminishes personal effort and responsibility. On the other hand, the appeal to self-determination suggests also that restricting the voluntary and informed choice of adult athletes when it comes to PEDM use is ethically questionable (Hemphill 2009). The following section will summarize a practice conception of personhood and its implications for understanding anti-PEDM arguments.

Practice Goods and Virtues

To speak about sport as a practice is to see it as a cooperative social activity that promotes the pursuit and achievement of goods and virtues internal to the activity (MacIntyre 1984; cited in Hemphill 2009). Internal goods are the shared standards of technical, ethical, or aesthetic excellence, while virtues refer to valued traits or dispositions (e.g., trying to win, courage). On this account, winning at all costs, including the use of banned PEDMs, is unacceptable. Winning in sport has value not simply because of the external rewards (e.g., fame and fortune) it can generate for champions, but because it stands for excellence in a valued community form of life.

While standards of excellence and virtues are sport specific, and may undergo historical shifts, they are thought to provide an internal framework for judging when an individual action is thought

to be acceptable or when it is considered cheating or unsporting. On this cultural relativist-tending position, out the window goes the view that there is anything like a universal notion of personhood or timeless ideal of competition that can settle the issue once and for all about legitimacy of PEDM use in sport. Rather, the practice goods need to be seen more as a historically grounded, but no less powerful, set of collective sentiments or widely accepted beliefs about what sport is or what it should be (Burke 1997; Burke and Roberts 1997, Lavin 1995; cited in Hemphill 2009).

The appeal to collective sentiments and democratic preferences goes some way to making a special case for sport in terms of the “pervasive disapproval” of banned PEDMs and overcoming the ethical inconsistencies cited above. In other words, the sentimental attachment to notions such as fairness, health, and the link between success and effort is still strong enough to uphold the view that PEDMs are largely antithetical to sport.

War on Doping

Government and sporting authorities have gone to extraordinary lengths to increase penalties and expand policing powers to uphold integrity in sport. It is often propped up by the rhetoric of war, which can stigmatize dopers, highlight the righteousness of the anti-doping campaign, and justifying the firm resolve and forceful measures required for its success (Lakoff and Johnson 1980; Scarry 1985; Lakoff 2003; Dingelstad et al. 1996; cited in Hemphill 2009). This section summarizes some of the ethical costs of the “war” and “fight” metaphors.

Some of “collateral damage” of the “war” is thought to relate to the loss of athlete rights to privacy, as when athletes must submit to witnessed urine sample collection, year-round random drug testing, as well as report their whereabouts to drug testing authorities when traveling (Thompson 1995; Schneider 2004; cited in Hemphill 2009). The policy of strict liability means that athletes are “guilty until proven innocent” if found with drugs in their body, regardless of intent. Fairness is also at issue when sport authorities replace the legal precept of “beyond reasonable doubt” with

“comfortable satisfaction,” thus lowering the standard of evidence required to charge and convict athletes (Morgan 2006; Burke 2005; cited in Hemphill 2009). In a view shared by Savulescu et al. (2004; cited in Hemphill 2009), Tamburrini (2006; cited in Hemphill 2009) suggests that global doping sanctions allow for no gradations of guilt or responsibility; a doped athlete from a poor country coerced into using drugs by a totalitarian government is treated the same as a doped athlete from a wealthy country who has access to a wide range of legal performance-enhancing substances, methods, and other resources.

Further to this, Houlihan (2004; cited in Hemphill 2009) argues that athletes are marginalized in the debate by sport authorities who (falsely) presume that athletes’ interests correspond to that of sport governing bodies. Moreover, the war can stifle debate on alternative strategies for drug control (e.g., harm minimization), suppress research on safe performance-enhancing drugs, or reduce the autonomy of national or local sport institutions to develop policies that suit their particular traditions and conventions (Dinglestad et al. 1996; Tamburrini 2000; cited in Hemphill 2009).

Normalizing PEDM Use

There is an alternative way of looking at doping use and control. This final section covers a view that focuses less on athlete responsibility and culpability and more on the impact of high-performance sport culture.

To set the scene, it is not difficult to understand the institutional pressures, expectations, and enticements of elite, professional sport. Mass media, government, and commercial investments in sport accentuate the monetary or publicity benefits of sporting success and raise the expectations for players and all those involved in managing, sponsoring, and watching sport. On this view, as the commercial value of sporting success increases so too do the temptations for players, coaches and managers, and sponsors to employ dubious means (Hemphill 2009).

However, the choice to use PEDMs may not pose a moral dilemma for many athletes. Athletes

operate in a sporting culture where the expectations, norms, and incentives to enhance performance are already in place. Several authors have discussed how athletes can be socialized into a high-performance sport culture (Roberts and Hemphill 1988; Houlihan 1999; cited in Hemphill 2009). When socialized into a culture that fosters trust and reliance on the expert knowledge and methods provided by coaches, physiologists, doctors, psychologists, nutritionists, and a host of other sport science professionals, athletes may see PEDMs as consistent with the sporting culture of performance.

This raises a number of interesting issues. For one, PEDM rule violations may represent less of a moral failure on the part of athletes and more of a culture shift within sport that normalizes PEDM use. Athletes over-socialized into a culture of performance enhancement can make sport seem akin to a syndicate performance, with outcomes less attributable to individual effort and increasingly to a host of external performance-enhancing substances, methods and sport science, and management personnel. As a result, it is questionable to what extent individual athletes are solely responsible and culpable for PEDM rule infractions.

Conclusion

There still appears to be a widespread disapproval of doping in sport, which seems to fuel global efforts to control it by harsher penalties for athletes (and now for support personnel), more sophisticated testing protocols, increased surveillance techniques, as well as information sharing between law enforcement agencies to stem supply. All of this comes at a cost, financially and in terms of athlete rights. It is not clear whether the hard-line approach to achieve pure sport is sustainable, and there is a growing body of knowledge suggesting that other doping control approaches (e.g., harm minimization) might be worth exploring. The increasing use and apparent normalization of performance and appearance enhancing substances and methods in work and everyday life, plus the growth of gene technology, is also making it difficult to insulate sport from PEDM use. Doping and its control is a complex

issue, and there is no doubt that competing social interests and values will continue to jostle and nudge each other in the conversation to define sport and how it should be played.

Early Childhood Sector

Sandy Farquhar
University of Auckland, Auckland, New Zealand

Synonyms

Curriculum; Early childhood education; Knowledge; Metaphor; Sector

The rise of early childhood education (ECE) as both a unique sector of a country's education and social policy and as an important part of nation's economy is a feature across many nations. Historically, each country develops its own local context, although increasingly shaped by global political and economic agendas. Aotearoa New Zealand's ECE system is the focus of this entry, where the metaphor of the *sector* (as ECE is frequently referred to) is explored to interrogate ambivalent claims to knowledge and practice. This short study by way of a singular metaphor – *sector* – explores more than 20 years of intense development that reflects a curious con-fabulation of complex discourses dominated by various forms of neoliberalism.

Almost without exception, ECE developments globally have centered around the notion of quality – an important aspect of production and consumption in economic discourse but arguably less applicable to education as an ethical enterprise involving personal engagement and respect for the dignity of its human subjects. For consumers, standardized products of uniform consistency constitute the basis for relying on particular products to perform their prescribed functions. In the marketplace, standardized quality benchmarks establish the basis for assessing the suitability and usefulness of such products, with consumer guarantee legislation now ensuring that products are fit for their intended purpose. Although quality benchmarks and indicators may be necessary, even beneficial in the service and manufacturing sectors, their application to the education of young children is, at best, problematic, in that it is not clear what the word actually refers to. Although heavily critiqued by educationalists (e.g., Dahlberg and Moss 2005), the idea of quality has underpinned significant policy development in New Zealand.

New Zealand's early childhood education has been heralded by many scholars as a world leader for its development of curriculum, policy, and practice. Especially celebrated are its bicultural curriculum document *Te Whāriki* (Ministry of Education [MoE] 1996) and related planning and assessment practice *learning stories* (MoE 2004). The cause for celebration is as much the collaborative process of its development as the inclusive

nature of its contents. Since policy developments of the late 1980s, and the inception of the curriculum in the 1990s, a comprehensive policy and regulatory framework (in the form of specific policies, strategies and funding) has annexed ECE, now largely privatized, to the stronger State-funded compulsory education sector. Although attendance is still voluntary, recent government initiatives (including financial incentives) intensify the pressure on families for their children to participate in formal, licensed early childhood education programs. Various social services have been recruited to help meet the government's escalating targets for participation rates, currently set at 98%. The onus is increasingly being shifted onto early childhood centers to make themselves desirable enough to attract sufficient numbers of enrollments to ensure economic viability. New Zealand's early childhood education sector has clearly been marketized and can be seen as a forerunner for the marketization of the compulsory education sectors in New Zealand, including recent growth in government funding to support and develop special interest charter schools.

The economic reforms of the 1980s and 1990s inexorably altered the face of early childhood education in line with other areas of social policy in New Zealand. These reforms largely followed a new right political and economic direction, effectively decentralizing government departments, including health, education, and social welfare, to form self-managing units run according to marketized principles. This neoliberal reformulation of the social services entailed proliferation of the dominant values of modern capitalism, including competitive individualism, commodification, and consumption, along with entrepreneurial flexibility in reinventing ourselves to meet the demands of economic intensification. Within this new reality, early childhood is now seen as a mechanism for facilitating women's reentry into the workforce, as an alternative to dysfunctional families for the socializing of children, as an observation and monitoring site for early intervention and protection of vulnerable children, and as a pathway for building a healthy and wealthy State. The recent intensification of

interest in early childhood by government, parents, employers, and communities marks out early childhood as an increasingly contested site for implementation of social policy and renders early childhood as a clearly identifiable sector in New Zealand's education. The idea of early childhood education as a sector has been around, then, at least since the integration of early childhood services in the mid-late 1980s. Early childhood education in other OECD countries has received similar economic emphases and undergone parallel developments, although for manageability, the policy focus of this entry is deliberately limited to developments within New Zealand.

With that background in place, the entry now turns to the conceptualization of early childhood as "sector" and some implications of such a concept for early childhood knowledge/discourse. To frame our thinking within particular concepts in any knowledge domain is necessarily to shape or delimit how we might think about that domain, and by extension, the way we understand knowledge. The converse is also true: what we mean by "knowledge" shapes the way we understand the domain. The rest of this article focuses on the way the word *sector* is used to describe early childhood education, and how the resulting discourse then impacts reflexively on that sector. Such theorizing acknowledges that a particular representation is never an accurate depiction of reality, suggesting that describing early childhood education as a sector is, at best, a metaphor that (like all metaphors) conceals as much as it reveals about its referent. Belying the homogeneity captured or implied in a label such as "sector," the various individuals and organizations that comprise the early childhood sector are members of diverse communities, constructed by a variety of discourses – unique subjects "precariously and temporarily sutured at the intersection of those subject-positions" (Mouffe 1988, p. 44).

Sector as a Metaphor

Metaphor is generally understood as understanding and experiencing one thing in terms of another, for example, we may attribute an intelligent person

with a *razor* wit. Metaphor is not a matter of playing with language; how we perceive, how we think, and what we do are largely metaphorical (Lakoff and Johnson 2003). Metaphor use is systematic – it shapes understanding, experience, and the way we talk. Most concepts are partially understood in terms of other concepts. The *razor* wit metaphor attributed to the intelligent person in the above example provides a conception of the person as having a *sharp* mind who could perhaps *cut* this argument to *ribbons*. Metaphors such as the *razor* wit, the *keen* mind, the *sharp* thinker, and the person who can *cut right to the heart of things* with a *cutting* remark are so pervasive that they are often taken as self-evident. That they are metaphorical may not occur to us, yet it is the way most think and operate. Metaphorical thought then is normal and ubiquitous, conscious and unconscious, yet provides a coherence to our thinking. As principal vehicles for understanding, metaphors play a central role in the construction of social and political reality through a “coherent network of entailments that highlight some features of reality and hide others. The acceptance of the metaphor, which forces us to focus only on those aspects of our experience that it highlights, leads us to view the entailments of the metaphor as being true” (Lakoff and Johnson 2003[1980], p. 157).

Dictionary definitions generally refer to a sector as representing a distinct part of something – in particular a part of society such as a nation’s economy, the housing sector, the educational sector, etc. This involves an understanding of sector as a group with some sort of shared perspective (“we”) with appeals to ideals of community and belonging – an appeal to being part of that group with affiliations and ties. This interpretation sits comfortably with the community and family focus of ECE. There are a range of other entailments, which, in the following exploration, provide interesting perspectives on some of the developments in ECE. The rest of this section explores the etymology of the word *sector*, along with other entailments in the metaphorical use of the word. Space limits the number of possibilities for exploration, but there are, it is hoped, sufficient to support the claim made here for multiple nuances in our understanding of early childhood and the

sector that purports to act as its representative and its champion.

Sector as “Cutting”

The word *sector* is derived from the Latin *sectus* (past participle of *secare* to cut). So a sector may be thought of as resulting from some kind of cut. Our choice of cutting instrument has a significant bearing on the kind of cut we make. Chainsaws and scalpels are both perfect instruments for cutting, albeit for different purposes. In everyday language, we refer to various types of cuts often with metaphorical allusion: clean/clear cut (decisive action), cold cuts (pieces of meat), sweeping cuts (radical changes), and cut throat (unscrupulous violence). Cuts may refer to variations to the way resources are apportioned (salary or funding cuts).

Cuts are made with various intentions: perhaps to segment or to reshape, to make something look different, to make a structure smaller or weaker (as in cutting down a tree), or to make a large object more manageable by being able to manipulate its pieces. In the medical surgery, a cut from the surgeon’s scalpel may be associated with putting something right, curing an illness – the skillful and incisive crafting to put right injured/diseased organs in order to heal and to make better. Although the cut ostensibly causes further damage, the intended outcome is repair – short-term pain for long-term gain – a metaphor carried through to many familiar social situations involving delayed gratification, such as saving for long-term spending goals, working hard to achieve peak fitness, or having a rest after the work is complete. The nature of a cut, then, depends on who is making the cut, their intentions, and their ability to carry out the incision properly.

In defining the early childhood sector, a significant instrument of identification is the curriculum, *Te Whāriki* (MoE 1996) – the result of cutting or dividing up areas of knowledge, socio-cultural development, and pedagogical theories to align with expressed aspirations for competent, capable children. In terms of the current “cutting” metaphor, the curriculum could not be adequately justified in terms of weakening, manipulation, or mere reshaping of knowledge. Arguably, there is

surgical intention in segmenting the curriculum as a specific area of knowledge to engage in skillful and incisive crafting with the intentions of making things better – an intention which many working with *Te Whāriki* would argue is largely successful.

Another aspect of curriculum is evident in our “cutting” metaphor, though, in the phrase “cutting someone off” when driving a car or engaging in a conversation. When we cut people off, we get in their road, usurp their place, try to reach a destination faster than them, or superimpose our version of how things are/should be over and above others. Within the ECE sector, it may entail prescription from positions of formal authority about curriculum or procedural policy. Complying with such prescription is often prerequisite to institutional funding, or even organizational survival, since satisfactory audit reports and continued funding are generally conditional upon such compliance. Compulsory compliance is an issue if one considers curriculum as contestable, with decreasing choice allowed about whether to adopt standards, pre-specified learning outcomes and performance targets as the course for young children to follow under the name of education. For government and for efficient management, imposition of authority may facilitate achieving a preferred outcome with speed and efficiency. Similarly, measurability may provide indications of progress toward targets in imposing strands, dispositions, and stories as specific teaching interventions, but it is doubtful whether superimposing particular prescriptions on others does justice to education in its fullest sense.

Sector as a Geometric Segment

In various MoE statistical publications, the early childhood sector is represented as a segment of a circle, like a wedge of cheese or a pizza slice. The size of the slice represents the level of privilege or the comparative funding of each sector. This is a quantifying reference, in that it is the significance of a sector that is assessed relative to the proportion of the circle compared with other sectors. Within the early childhood sector, similar figures are used to represent the comparative importance of the

various services that comprise the sector, serving as a de facto ranking mechanism. This kind of segmented pie chart signifies the spread of limited available resources among the represented sectors, providing a “zero sum” model of allocation that sets each sector off against all the others. In other words, the problem is made into a competition among sectors for a given and limited resource rather than calling into question the whole basis for the model. Problems in geometry often start with the “given” within which one has to solve particular problems; it is not a legitimate move in geometry to ignore the givens or to challenge the geometric nature of the problem. By analogy, it is not considered legitimate to contest the overall level of resource allocation. Despite government and OECD rhetoric about the importance of early childhood education, a recent NZEI campaign grew wings on the slogan “The biggest cuts to the smallest people.” It may be legitimate, though, to question the intentions of the cutter.

Sector as Territory

From the Greek for area or division, the word *sector* was used in WW1 to refer to the part of a military zone based on a circle around a headquarters. Such an area is designated by boundaries within which a unit operates, and for which it is responsible, such as a division or headquarters. In reference to early childhood, we might think in this way about ministries, government agencies, the early childhood center, or the home as centers of various sectors. In each case, we might impose boundaries and designate a bounded territory using physical walls, fences, buildings, an abstract line, or merely an idea. The idea of territoriality appeals to our human instincts: we are physical beings bounded by our skins, we experience the world as outside ourselves, and we have familiar boundaries inside which we belong. This idea is inherent in the very notion of early childhood centers as places marked out for children. It may be stretching the metaphor too far to describe as a sector the space prescribed for ECE centers in the MoE where licensing regulations require a minimum of two square meters per child. It would

mean each time a child moves, the boundaries are redrawn – perhaps a very productive metaphor for the flexible, playful possibilities of early childhood.

Conclusion

Within this exploration of the early childhood sector and its various entailments is a serious observation that marking out a sector constitutes both a set of discourses and a set of practices, shaping our experience and the way we talk about it. Reflexively, the resulting discourse impacts on that sector in a dynamic and formative way. The ubiquity of metaphor within discourse means that our daily conversations and “common sense” dialogue mask a range of metaphorical entailments that may remain hidden but continue to impact on the way we interpret our experience.

Despite the supposedly homogenizing impact of globalization, New Zealand is one of many countries whose population is increasingly multi-ethnic/multicultural. This complexity is amplified by neoliberal economic demands for a flexible workforce, comprised of competitive individuals, able to solve future problems that do not yet exist and able to thrive amid the plethora of visions for our social and technological futures. Even if it were possible to pin down the early childhood sector within a static, literal definition, it would be an immense problem to secure agreement among the myriad voices about how to respond in any meaningful way. Compounding the issue infinitely is inevitability of metaphorical allusion to represent the future visions and the current actions of what we call the early childhood sector. Possibly, the best we are left with is to acknowledge the problematic and complex nature of early childhood contexts and their competing forms of knowledge and to be aware of the metaphorical imposition of our individual and collective pleasures, fears, and desires on the constitution of early childhood. Whether we are promoting the rhetoric of quality, the politics of participation, or a particular prescription for the early childhood

sector, it is important to acknowledge that each of us has different views about what these things mean and what we might expect from them.

Education and Big Data

Maggi Savin-Baden
University of Worcester, Worcester, UK

Synonyms

[Analytics](#); [Big data analytics](#); [Large data set](#); [Learning analytics](#)

Introduction

Big data is a significant concern for many academics, largely because it is complex, unmanageable, and open to misuse. While there is a tendency to believe that “big data” might be bad and possibly dangerous, many types and uses for it exist. The challenge of big data for higher education is that it has been, until fairly recently, portrayed as something that is straightforward, clear, and easily delineated, when in fact it is none of these, and there is still relatively little consensus about how it might be defined. This entry explores how big data is defined, described, and utilized in different contexts. It explores different notions of analytics and suggests how these are having an impact on higher education. The entry then explores the claims that are being made about the objectivity of big data and sets these claims in the broader context of what can be claimed and what cannot. In the context of such claims, the way in which the ideas about what is plausible, possible, and honest in the use of big data is examined, and suggestions are offered about what may be useful and realistic uses of big data. The final section explores the possible futures for research and use of big data in the context of higher education and offers some suggestions as to ways forward.

Definitions of Big Data

For many researchers in higher education and across the disciplines in general, big data is

invariably expected to offer new insights into diverse areas from terrorism to climate change. Yet at the same time, big data is also troublesome, since it is perceived to invade privacy and increase control and surveillance. Definitions of big data are wide and varied, for instance, there are definitions that concentrate on scale or diversity and others that focus on the economics of big data. For example, Taylor et al. (2014, p. 3) cite examples such as the number of variables per observation, the number of observations, or both, given the accessibility of more and more data – what Varian, Chief Economist at Google, referred to as “fat data, long data, extensible data, and cheap data.” However, Einav and Levin (2014) argue for three main features of big data:

1. Sources are usually available in real time.
2. The scale of the data makes analysis more powerful and potentially more accurate.
3. Data often involve human behaviors that have previously been difficult to observe.

Kitchin (2014, pp. 1–2) delineates big data as:

- Huge in volume, consisting of terabytes or petabytes of data
- High in velocity, being created in or near real time
- Diverse in variety, being structured and unstructured in nature
- Exhaustive in scope, striving to capture entire populations or systems ($n = \text{all}$)
- Fine grained in resolution and uniquely indexical in identification
- Relational in nature, containing common fields that enable the conjoining of different data sets
- Flexible, holding the traits of extensionality in that it is possible to add new fields easily, as well as expand in size

There is little consensus about what counts as big data, but many across the higher education sector see it as worthy of attention. Conceptions of big data tend to fuse across the realms of collecting large data sets and the processes of managing such data sets as well as examining how, by whom, and for whom the data sets

might be used. For scientists, Kitchin’s stance (Kitchin 2014) seems a good fit, but those in social sciences and humanities tend to use the term data differently. For example, researchers in the social sciences see big data encompassing not just large data sets but also the complexity of how data are synthesized, the ways in which tools are used, and who makes which decisions about management of possible imbalances between data collection, management, and synthesis. Sometimes, assumptions and uses related to big data can be naïve (Brynjolfsson and McAfee 2012). Further, there are a number of difficulties with big data analysis such as the shortcomings of off-the-shelf packages, the storage of data, and possible efficiencies in distributed processing. Table 1 summarizes different ways in which disciplines are seeing and using big data.

Assorted Analytics

There are currently many different types of analytics in higher education, but it is only relatively recently that it has been termed learning analytics. However, learning analytics is in fact rooted in a longer tradition such as educational data mining and academic analysis. Currently (in 2015), learning analytics in education and educational research focuses on the process of learning (measurement, collection, analysis, and reporting of data about learners and their contexts), while academic analytics reflects the role of data analysis at an institutional level. For many researchers in higher education, learning analytics and data analytics are seen as fields that draw on research, methods, and techniques from numerous disciplines ranging from learning sciences to psychology.

This melange of ideas, constructs, and approaches is reflected in the varieties of methodologies being used across different institutions. For example, in the process of analyzing big data, discipline-based pedagogy and disciplinary difference are often transposed in ways that do not necessarily reflect the nuances of the discipline. Furthermore, it is evident that different institutions are using different approaches to collecting and analyzing data. These include Oracle data

Education and Big Data, Table 1 Big data in different disciplines

Context	Understanding and use of big data	Characteristics
Economics (Taylor et al.)	Specific terminology seen as fairly recent – some were working with what is now being termed “big data” a decade ago and believe it has not gained much traction within academic economics	Seen as a class of data which was particular in terms of its size and complexity, although there were several different points of view as to which features rendered it genuinely new
Digital humanities (Manovich 2012)	The use of data analytics to analyze and interpret cultural and social behaviors	Complex overview of data, visual representations of images and videos, exploration of patterns of representation
Education (Sclater 2014)	Use of data to analyze student retention, student engagement, and identification of risk and to examine student progress	Data seen as useful for gaining information, tracking possible problems by student, tutors, and senior management
Business (Brynjolfsson and McAfee 2012)	Use of data to make predictions and management decisions	Information from social networks, images, sensors, the Web, or other unstructured sources are used for decision making in business
Journalism (Lewis 2015)	Journalism that incorporates computation and quantification in diverse ways, for example, computer-assisted reporting	The implementation of mathematical skills in news work as well as the critique of such computational tools
Maths and statistics (Housley et al. 2014)	Creating mathematical tools for understanding and managing high-dimensional data	Tools, algorithms, and inference systems seen as vital for analysis of data within maths and statistics but also other disciplines using big data
Computer science (Rudin et al. 2014)	Use of methods for statistical inference, prediction, quantification of uncertainty, and experimental design	Use of multidisciplinary teams with statistical, computational, mathematical, and scientific domain expertise with a focus on turning data into knowledge
Medicine and health (Lee and Yang 2015)	Predicting and modeling health trends	Locating health patterns Understanding prevalence and spread of disease
Psychology (Moat et al. 2014)	Predicting and modeling trends and the use of data sets to examine behaviors, influence, and use of language	Analysis of trends, behaviors, judgment, and decision making as well as spheres of influence

warehouse and business intelligence software, the use of QlikView to analyze data held in Microsoft SQL Server, and also Google Analytics, Google Charts, and Tableau (Sclater 2014). While there have been various attempts to classify analytics into a clear typology, Table 2 illustrates that issues in higher education are murky and complex. Thus, it is possible to see multiple and overlapping types, including (big) data analytics, text analytics, web analytics, network analytics, and mobile analytics.

Objectivity and Context

There have been suggestions that big data and analytics are necessarily objective. However, the

complexity of their use in different disciplines means that there is little unity about how these data should be analyzed and used. It seems for many researchers, particularly in areas such as economics, that the focus is on complex analysis of big data, rather than asking critical questions about whether big data is new and what can and cannot be done with it. The result is that across the literature there is a wide range of positive and negative claims, which need to be acknowledged, including but not limited to:

Claim 1: Big data speaks for itself. This is clearly not the case since analysis and mapping are researcher driven. There is a need to ask not just what might be done with big data but why (and if) it should be used in particular ways – as

Education and Big Data, Table 2 Assorted analytics

Form of analytics	Context	Purpose
Learning analytics	Module/course level Departmental level	Analysis of student engagement, predictive modeling, patterns of success and failure
Academic analytics	Institutional National International	Analysis of learner profiles, performance of academics, knowledge flow, research achievements, ranking
(Big) Data analytics	Commercial contexts and data warehousing	Development of data mining algorithms and statistical analyses
Text analytics	Information retrieval and computational linguistics	Discovering the main themes in data such as in news analysis, opinion analysis, and biomedical applications
Web analytics	Commercial and academic context and cloud computing	Integration of data across platforms for social research and/or commercial gain
Network analytics	Academic contexts, such as mathematics, sociology, and computer science	Examination of scientific impact and knowledge diffusion, for example, the h-index
Mobile analytics	Commercial contexts but also increasingly in areas such as disaster management and health-care support	To reach many users but also increasing productivity and efficiency in a workforce
Knowledge analytics (this term tends to be used with learning analytics but is generally defined)	Commercial settings and to some degree academic settings	To manage knowledge within an organization and to use organizational knowledge to best effect

well how big and small data might be used together.

Claim 2: There are many good exemplars of big data use. This is not the case, particularly in the social sciences and education, where the landscape is complex and varied. For example, in 2013 Snowden disclosed that the US National Security Agency was monitoring domestic “metadata.” The archive released by Snowden indicated that the e-mails, phone calls, text messages, and social media activity of millions of people around the world had been collected and stored and then without consent been shared and sold (Rodriguez 2013). Although this has brought to light a number of other forms of monitoring and surveillance practices, the US Government argued that it was only “metadata.” The Snowden examples introduce questions for those who work in higher education about how data they collect and are data that collected about them and their students are used in covert ways. It would seem that increasingly government agencies are using big data in ways which focus on economic

outcome results in unhelpful social, political, and cultural bias for educational activities. Such a stance would seem to indicate that there is increasingly a neoliberal agenda shaping higher education, with a growing belief in competitive individualism and the maximization of the market.

Claim 3: There is integration and understanding across the disciplines. While some universities have shared forums for big data, much big data remains in disciplinary silos. There is a need for greater interdisciplinarity and large teams to work together coherently.

Claim 4: There is a coherent view about how learning and academic analytics should be used. It is evident that institutions already seem to be finding themselves having to balance students’ expectations, privacy laws, tutors’ perspectives about learning, and the institution’s expectations about retention and attainment.

These four claims exemplify the need to consider issues of plausibility and honesties in big

data research. What is often missing from claims and debates is how power is used, created, or ignored in the management and representation of big data, or where and whose voices are heard or ignored, privileged, or taken for granted.

Plausibility and Honesties

Ethical issues connected with using big data are complex and muddled. It is often assumed that just because data are public, ethical concerns can be ignored. The open, accessible, and online society has resulted in various kinds of uses of big data, one of which is tracking. For example, many people inadvertently leave tracking devices switched on their mobile phones or leave the Wi-Fi on overnight. The result is that people do not realize they are being tracked, while feeds from social networks are analyzed and visualized, personal movements tracked, and shopping behaviors noted. There is thus a serious lack of privacy, which occurs through the aggregation of users' online activities. Companies can track and aggregate people's data in ways previously impossible, since in the past people's data were held in paper-based systems or company silos. Now, personal data can be mined and cross-referenced, sold, and reused, so that people are being classified by others through sharing their own data. This use of big data is often disregarded – but it is relatively easy to discover most things about most people, and blue chip companies can use such large data sets to ensure market advantage. In day-to-day life, this open but hidden knowledge is already both accepted and ignored. There have been discussions about the need for better formal regulation and changes to the way social media are designed. Yet, almost a decade after the concerns were first raised, the suggested changes are unlikely to occur, and it is difficult to decide how security might be maintained in a post-security world. Now, as time marches on, most people are encountering various forms of liquid, participatory, and lateral surveillance (Savin-Baden 2015).

There are still questions about what it is possible to “know” from big data analyses and ethical challenges concerning what is done or not

done with such analyses and findings. In higher education, the focus and interest in big data have resulted in many researchers rebadging their work as “big data research,” when in fact it is not. Particularly in the humanities, this has resulted in criticism of big data research. Some years later, the pertinent criticisms and concerns of many higher education researchers still seem to have resonance. Big data has changed how data are seen, how they are used, and how they are defined. Such shifts are changing how knowledge is seen and managed in higher education. At the cusp of higher education and commerce, big data tend to be located as neutral, objective, and reliable. This, in turn, obscures the ways in which big data are covertly managed and used and the ways in which people become constructed by and through big data.

Big data, as aforementioned, can be linked to neoliberal capitalism, and engaging the current performative enterprise practices has shift the focus in higher education increasingly toward consumerism, the marketization of values, and the oppression of freedom. Thus, criticality and questioning are being submerged in the quest for fast money and solid learning. In areas of higher education that reject neoliberal capitalism, there is a tendency to shift away from the idea of big data as a resource to be consumed and as a force to be controlled and instead to ask questions summarized below.

How Accurate or Objective Is Big Data?

As a result of the way big data are constructed and used to make policy decisions, it is vital to recognize that these data can easily be a victim of distortion, bias, and misinterpretation. Driscoll and Walker (2014) illustrate how data access and technological infrastructure can affect research results. For example, they demonstrate how differences in timing or network connectivity can result in different results for the same experiment.

Is Big Data Better Data?

While it would be easy to suggest a binary relationship here, it is important to note that big data is not always representative, nor is it necessarily presenting a complete picture of the issues, nor

may it meet high enough standards of rigor and quality. Administrators, faculty, and managers in higher education may find the promise of big data alluring. Assumptions that big data is objective, with clear outcomes that will improve retention, increase student numbers, and ensure there is more money in the university coffers, make this promise highly seductive. Yet these data are not necessarily reliable, and using them for monetary ends in a sociopolitical system such as higher education brings high risk.

How Are Issues of Context To Be Dealt With in Big Data Research?

Big data sets need to be located contextually and there is a need to understand how big data are being used and understood and what is being claimed for them. There is a need for more robust studies and examples across higher education to provide an examination of issues of context by defining and critiquing how big data and definitions of it have changed over time.

What Are the Ethical Issues Associated with Big Data?

The ethical questions relate not only to how data are obtained, as in the Snowden affair (Rodriguez 2013), but who and what is subject to analysis. Ethical considerations also extend to how and where data are reported. For example, Eubanks (2014) researched the electronic benefit transfer card and food stamp use in the United States and suggested that those in poverty are already “in the surveillance future.” The result is that the poor and marginalized that are more easily tracked are already being judged and assumptions made about them, which may or may not be just.

To What Extent Is Big Data Creating Digital Divides?

It seems that the expense of gaining access to big data has resulted in a restricted access to this data, with higher education necessary being marginalized as a sector. Yet the abovementioned study by Eubanks (2014), as well as other studies concerning surveillance, illustrates not merely digital divides but also suggest surveillance divides.

Big Futures

Big data is useful, yet multifaceted, and offers few, if any, quick fixes for new fields of research or data management. In education, social sciences, and humanities, it would seem that relatively few researchers are engaged in analyzing massive data sets. Perhaps the most important considerations in future big data research are to:

- See big data as part of a repertoire of data collection and analytical options.
- Use big data as a means of locating areas that can or need to be explored on a smaller scale.
- Use big data in multi-methodological ways so that the research undertaken is both wide and deep.
- Recognize the advantages, disadvantages, challenges, and power issues of working with large data sets alongside small, fine-grained data.
- Acknowledge that large real-time data sets, such as those produced by social networks, often do not provide a clear or representative picture of realities.
- Recognize that full documentation of how big data were collected will probably be unavailable, and therefore the validity of such data is likely to be unpredictable and tenuous.

Conclusion

There is a prominent expectation that big data can and will deliver more than is really possible and that its questionably clear outcomes will necessarily make a difference to the complexity of human life and experience. The contrasting view questions whether big data can offer anything particularly new or innovative while being concerned about the management of big data and how they are being used in persuasive and pernicious ways. What appears to be a consistent message is that big data is difficult to manage, analyze, and evaluate. Therefore, it is uncertain how robust findings and assumptions, as well as what has been learned, might in fact be. It is vital to recognize that big data is neither good nor bad but useful in

different ways if collated and presented with honesty and plausibility at its core.

Education and Political Theory: Prospects and Points of View

Rille Raaper¹ and Mark Olssen²

Synonyms

Democracy; Inequality; Political theory; Power

Introduction

Education, philosophy, and politics can be seen as the *tripos* in Western tradition, defining the canon and practices of political and educational institutions (Peters 2012). In the light of recent educational research, it could also be argued that the relationship between politics and education is gaining particular popularity. Various international journals such as *Discourse: Studies in the Cultural Politics of Education*, *Journal of Education Policy*, and *Critical Studies in Education* confirm these trends in scholarly discussions. Furthermore, many critical theorists see themselves grounded in Paulo Freire's (1921–1997) work on the political nature of education, particularly made visible in his collection *The Politics of Education: Culture, Power and Liberation* (1985). However, the field of politics of education is highly diverse, often depending on a theoretical approach taken. Some go back to Plato, Aristotle, and Ancient Greek philosophies or find guidance from Enlightenment theories and the work of such scholars as John Locke (1632–1704), Jean-Jacques Rousseau (1712–1788), or Immanuel

Kant (1724–1804). Others might focus on more recent economic theories of Marxism, human capital theory, meritocracy, or philosophical movements of post-structuralism and postmodernism. The theories of Michel Foucault (1926–1984) and Pierre Bourdieu (1930–2002) are particularly widespread in contemporary perspectives on political nature of education. However, the differences in political research are not only limited to theoretical approaches taken, but they vary depending on the questions asked. Some educational studies explore macro-politics of education: educational politics and policy making at global and national levels. These studies tend to be interested in the ways in which political decisions and strategies are developed and how these could be improved. However, Simons et al. (2009a) also argue that educational research is increasingly shifting from macro questions related to economic and organizational theories to critical policy studies in which the focus turns to micro-politics of education inside and outside educational institutions. These researchers distance themselves from the kind of educational research that was aiming to improve existing policy mechanisms, and they rather examine policies and politics in relation to social context, power, and experiences (Simons et al. 2009a). In short, critical studies have brought educational research closer to micro-politics in which the political concepts of power, autonomy, freedom, and resistance receive increasing attention.

The key focus in studies on micro-politics of education lies on the question of democracy and educational formation of citizens. These studies are concern oriented and often confrontational to policies and politics that actively aim to reorganize schooling and education based on the market and managerialist practices (Simons et al. 2009a). Dating back to the end of 1970s and bound with the development of the critical orientation to education policy, studies on micro-politics of education tend to be driven by societal challenges such as globalization, managerialism, and neoliberalism (Simons et al. 2009b). Our own political research has explored these challenges and argued that the processes of neoliberalization and

globalization are particularly evident in higher education contexts with the consequent de-professionalization of academic work, standardization of academic practices, and the marketization of higher education (see Olssen and Peters 2005; Raaper 2015; Raaper and Olssen 2015). It could therefore be argued that educational research on micro-politics is not directed in the first place toward policy but toward the purposes and operation of education and schooling. Scholars inspired by critical policy studies believe that education fulfills a fundamental role in ensuring democracy and democratic formation of citizens. From this perspective, it is not policy or State government that can “save” the society, but it is education that offers an opportunity for emancipation from oppressive policy mechanisms. Furthermore, most studies on micro-politics of education can be regarded as democratic acts in themselves; they are committed to education and society as vividly explained by Simons et al. (2009a, 31):

The critical ethos is not in opposition to democracy, but is perhaps a way of living a democratic life, and a way to be concerned with or to be part of “the public and its education.”

It could therefore be argued that the relationship between education and political theory is complex, and it varies across different dimensions: from macro-politics to micro-politics, as well as from ancient philosophies to contemporary theories of post-structuralism and postmodernism. These dimensions, however, cover a wide range of topics, theories, and theorists. This entry aims to map and introduce some of these political theories that are informing as well as transforming educational research. Furthermore, the entry guides the reader of this encyclopedia in exploring the relationship between education and political theory. We demonstrate the ways in which theories have informed recent scholarly work in education and our understanding of political concepts such as power, autonomy, identity, and resistance. The rest of this entry outlines a selection of entries included in this encyclopedia, creating an excellent starting point for anyone interested in educational research and political theory.

Theoretical Insights: From Ancient Theories to Postmodernism

The entry “► [Mapping the Terrain of Political Theory in Education](#)” by Jeff Stickney demonstrates the complex nature of political theory in education and its historic development from Plato’s *Republic* (1991) and Ancient Greek philosophies to Enlightenment theories of John Locke, Jean-Jacques Rousseau, and Immanuel Kant, as well as to more recent work of political theorists such as Paulo Freire, Michel Foucault, and Pierre Bourdieu. However, Stickney does not promote a linear understanding of political theories in which one theory transforms into another – a progress from “combat to combat” toward universal reciprocity as Foucault (1977, 151) would critique it – but he relates these theories to various schools of thought such as founding theories, liberal analytic philosophy, and Hegelianism. Stickney also emphasizes the more recent political work in education, particularly the contribution of critical theorists such as Henry Giroux, Michael Apple, and Peter McLaren. We admit that our selection of entries below is not sufficient to cover the extensive map created by Stickney; however, the theories of social liberalism, meritocracy, and human capital as well as postmodernist and feminist approaches aim to provide some food for thought to anyone interested in exploring the political nature of education.

The entry “► [Green, Public Education, and the Idea of Positive Freedom](#)” by William Mace explores social liberalism in education and introduces the work of British idealist Thomas Hill Green (1836–1882). Green’s contribution to public education and the idea of positive freedom cannot be underestimated. Inspired by Green’s work, Mace explores the ways in which Green was influenced by earlier political thoughts of Ancient Greek philosophy as well as by the eighteenth century German idealists Georg Wilhelm Friedrich Hegel and Immanuel Kant. The entry highlights Green’s response to the Industrial Revolution in nineteenth century and his understanding of education as a common good that requires State intervention and funding. Mace concludes by emphasizing the value of Green’s theory to

contemporary understanding of education: education is central for good life, “and [this idea is] especially pertinent today, where rapid technological advances, transnational economic markets, and international terrorism, are again challenging traditional conceptions of freedom and opportunity”.

The entry “► [Meritocracy](#)” by Ansgar Allen explores the legacy of Michael Young’s dystopian essay “The Rise of the Meritocracy” (1958). Allen critically reviews the essay and highlights its relevance to contemporary educational debates. The entry argues that meritocracy is highly fluid and context-specific concept that depends on wider technologies of government. Allen argues that meritocracy as we experience it today is highly neoliberalized: it operates based on individual effort rather than on institutional intervention or social engineering proposed by Young (1958). Meritocracy for Allen is therefore “a descriptive term, and as an educational ideal, meritocracy exhibits remarkable, perhaps dangerous fluidity”.

Like Allen’s analysis on meritocracy, the entry “► [Human Capital Theory in Education](#)” by Donald Gillies questions the societal value of education. Gillies explores the work of Theodore Schultz (1902–1998) and Gary Becker (1930–2014) and argues that the human capital theory has transformed the ways in which we understand education: education has turned into an investment that is believed to produce individual value as well as to increase the quality of economic workforce. Gillies brings examples from the Organization for Economic Cooperation and Development and the European Union policy developments and argues that “Human Capital Theory has become one of the most powerful underpinnings of education policy discourses worldwide”. The entry critiques this narrow understanding of education and the impact it has on schools, learners, and teachers. Gillies also questions the economic significance of the theory and argues that human capital theory does not produce clear economic value to justify its popularity.

Shifting toward postmodernist theories, the entry “► [Foucault, Confession, and Education](#)” by Andreas Fejes explores the work of Michel Foucault (1926–1984) in relation to contemporary confession culture in education. Fejes provides a

genealogical overview of confessional practices from Ancient Greek culture to Medieval Europe and modern societies. Contextualized in the past, Fejes argues that confessional practices today are understood as productive forces necessary for ensuring productivity of education, learning, and societies. More specifically, confessional practices (as these become evident from various assessment technologies) make “the innermost thoughts of the learner available for correction”. Guided by a Foucauldian theorization, Fejes critiques that confessional practices in education allow subjectification and normalization of students: they create specific types of subjects who can be corrected and normalized. Fejes encourages educational researchers and practitioners to explore these often hidden confessional practices in education.

Putting Theory into Practice: Examples of Educational Research

The selection of entries below aims to demonstrate the ways in which particular theories can inform educational research and our theorization of political concepts such as educational leadership, inequality, citizenship, inclusion, and autonomy. The entry “► [Feminist Theories and Gender Inequalities: Headteachers, Staff, and Children](#)” by Kay Fuller explores feminist theories in relation to gender inequalities and school leadership. Fuller introduces the four historic waves of feminist theories: from suffragette movement in nineteenth century to the fourth wave located in twenty-first-century political concerns of sex work, transgenderism, and social media. However, Fuller also argues that each wave has something to offer to contemporary understanding of gender inequalities. Fuller explains her view by introducing the research project on headteachers’ understandings of diversity among school populations in the UK. By drawing on the examples of headteachers Isabella and Katherine, Fuller argues that a single feminist theory is insufficient to explain the contemporary “nuances and complexities of gender as it is socially constructed”.

Dina Kiwan theorizes the concept of “citizenship” in the entry “► [Citizenship, Inclusion, and Education](#).” Guided by a wide range of political theories, Kiwan argues that “the concept of citizenship is a highly contested one; one which has been contested throughout its intellectual history.” Like many other authors in the field, Kiwan goes back to Ancient Greek philosophy and explains the ways in which the early Greeks understood citizenship as a relationship between a person and the city-State or “polis.” Kiwan also traces the understanding of the concept in feudal Europe and in the work of Thomas Hobbes, Jean-Jacques Rousseau, and John Locke. The entry finishes by exploring contemporary challenges around inclusion and citizenship, particularly in educational settings. Kiwan argues that there are multiple understandings of citizenship that draw on various educational approaches: “moral,” “legal,” “participatory,” and “identity-based” conceptions of citizenship. However, the entry also notes that Western liberal democracies tend to rely on participatory transformative pedagogies when promoting inclusion.

The entry “► [Universities and the Politics of Autonomy](#)” by Mark Murphy explores more recent issues of academic freedom, academic identity, and institutional democracy in higher education settings. Murphy draws on critical theory and explains that “political debates concerning the university are numerous and usually rancorous”. The entry argues that highly popular Foucauldian and Marxist theories in university studies might not be sufficient to portray an adequate picture of contemporary university politics and processes. Murphy argues that the scholarly debate requires a more nuanced account of institutional autonomy in which the question of how do universities balance the competing demands for autonomy and control becomes the key focus of the critique and discussion.

Cristina Costa and Mark Murphy continue with the focus on university practices in the entry “► [Digital Scholarship: Recognizing New Practices in Academia](#).” Costa and Murphy apply Pierre Bourdieu’s (1930–2002) theory of practice and Axel Honneth’s (born 1949) work on recognition and identity to explore the implications

digital practices have on academic profession. The authors theorize the web as “a new alternative space where intellectual work can be discussed, published and made openly available to a wide range of communities”. The authors demonstrate the ways in which two theoretical perspectives can complement each other when theorizing digital scholarship and the struggle for recognition. By using the work of Bourdieu and Honneth, the authors argue that changing academic identities should be seen within an intersection of different forms of power and recognition that relate to structural transformations as well as to emotionally charged workplaces.

Conclusion

As the work of various academics demonstrates, the relationship between education and political theory is widespread and complex. Educational researchers and practitioners can be guided by a variety of theories and theorists when exploring a wide range of educational topics and issues. One thing is certain, the use of political theory in education is gaining increasing popularity and scholarly attention. This is possibly because political theories allow us to question the role of education in wider society, particularly when the society is facing major material crises such as population growth, climate change, nuclear, and other forms of terrorism, economic recession along with more recent refugee crisis, and mass migration from developing countries. Therefore, the political issues in education such as power, the purposes of education, citizenship and inclusion, and educational and gender inequalities among many other concerns require increasing scholarly attention. We hope that the overview above provides guidance and food for thought to anyone interested in exploring the political nature of education.

Educational Administration and the Inequality of School Achievement

John Clark
Massey University, Palmerston North,
New Zealand

Introduction

One of the biggest and most pressing educational problems confronting many countries around the world today is the inequality of school achievement. Although the problem has long been with us, in recent times, it has become far more transparent through the use of international measurements such as the Progress in International Reading Literacy Study (PIRLS), Trends in International Mathematics and Science Study (TIMSS), and especially OECD's Programme for International Student Assessment (PISA). All three report their 3- or 5-year findings in ways which not only rank the performance of the participants from top to bottom, above and below a central standard (e.g., a score of 500) but also identify the range of scores within individual countries between the highest and lowest achievers. Some nations rank consistently well or poorly, while others rise and fall in the rankings; some countries have a very narrow range of scores between top and bottom students, while others have a very wide distribution. For many countries, the range of scores are distributed in ways which reveal that certain groups of children perform well, while other groups of children do not; in countries such as Australia, Canada, New Zealand, the United Kingdom, and the United States, white/Asian/middle-class children tend to do well, while brown/indigenous/immigrant/working-class children tend to do less well. The data, although not beyond justified criticism, does point to some uncomfortable conclusions about differences in school achievement which reflect underlying social inequalities.

What to do about the inequality of school achievement in countries where it exists to any

significant extent is something which continues to exercise politicians, policy makers, teachers, and commentators, especially when a new set of results is made public. One country has become so concerned about the problem that the Minister of Education not only established a Ministerial Cross-Sector Forum on Raising Achievement but also took a document to Cabinet seeking support for a new initiative, Investing in Educational Success:

New Zealand has an achievement challenge. Our top students are doing as well as students anywhere in the world, but there is a big gap between our top performing students and those who are not doing so well. International studies also tell us that we are not keeping pace with other high performing countries and jurisdictions and are falling short of our own previous results. We must do better and raise the quality of learning and achievement across the board. Doing this requires whole of system improvement. (Parata 2014, s4)

The document continues:

Evidence demonstrates that investing in the profession by raising the quality of teaching and leadership provides the best opportunity to deliver the improved educational outcomes we seek. (Parata 2014, s5)

This captures the problem various countries face.

Addressing the achievement challenge requires two things: explanations which causally account for the inequality and solutions which can have a significant impact on the causes. Given the search for a “whole of system improvement” then educational administration looms large. And never far away from it all lurk philosophical problems. Surprisingly, however, this is an issue which attracts very little philosophical attention, partly because of the scope of the achievement challenge. To be sure, much has been written on discrete elements of the issue (e.g., equality, learning, causal factors, educational administration), but these tend to be treated in isolation rather than connected as part of a coherent and systematic whole. Consequently, there is a dearth of philosophical literature which explores the matter from first to last.

Achievement: Education or School?

Facing up to the achievement challenge depends very much on what sort of achievement is being considered. Sometimes it is cast as educational achievement (Snook and O'Neill 2010, 2014) but this seems to spread the achievement net too wide when education is conceived in the broadest of terms as the qualities of an educated person. Making any progress on this account of achievement would be overly ambitious, even though highly desirable. A narrower definition of achievement, restricted to school learning of the kind which can be measured in some meaningful way, as with PIRLS, PISA, and TIMSS, has the advantage of greater empirical precision but does come at the cost of capturing a very limited range of what students have learned and can do which may not always be to their advantage.

Difference and Equality

Differences are one thing; inequalities are another. Differences abound, in schools no less than other social institutions, but not all differences amount to inequalities. Differences in hair color, when it comes to school achievement, count for nothing. But when differences in school achievement are along, for example, class, ethnicity, or gender lines, then equality comes into consideration, and conceptual trouble enters. Winter (2010) defines the “attainment gap” as “the inequalities in schools in terms of educational outcome between learners with different backgrounds and capabilities” and considers it important because “benefits accruing from an education are substantial and where such a gap exists, it leads to large disparities in the quality of life many young people can expect to experience in the future” (pp. 276–277). She makes reference to “equal educational opportunity,” this being the idea that “every learner should have equal access to an equally good education, requiring on most accounts, the same allocation of educational resources” (p. 277). This requires some refining.

Equality of Access or Opportunity

In a very simple sense, equality of opportunity entails that all are permitted to step up to the starting line and enter the race, so to speak. No one is denied the opportunity of entering but this is about as far as equality of access takes us. Beyond this, future achievement or success is very much a matter of personal effort coupled with a measure of good luck. The problem is that initial inequality is maintained, even exacerbated rather than diminished.

Equality of Treatment

If unequals are treated equally, then it is clear that the initial inequality will be maintained and possibly, in practice, widened. This would be manifestly unjust if the original state of inequality was unjust. It seems reasonable to treat unequals unequally on the understanding that unequal treatment must be to the advantage of the least advantaged child if a measure of equality is to be obtained.

Equality of Outcomes

If unequal treatment is to be justified, it must be on the grounds of achieving some end state such as the equality of outcomes cashed up as the life chances all children should enjoy which neither significantly advantages nor disadvantages them by virtue of their gender, social standing, economic wealth, health status, religious conviction, political status, or right to human happiness.

A Simple Model

A simple (and perhaps simplistic but nonetheless useful) model helps to understand the various parts of the problem and how they connect, albeit in complex ways:

Inputs – Process – Outputs – Outcomes.

Outputs: Where things begin, being that which children produce as a result of learning – their performances in, for example, PIRLS, PISA, and TIMSS.

Outcomes: The sorts of lives children will live in the future when adults which will be marked by differences in health, wealth, housing, status, influence, longevity, and the like. Philosophers have had much to say, too much to list here, about the aims and ends of education, of living a good life, of being life-long learners, of being good citizens, and the nature of a good society.

Process: Learning lies at the very heart of the inequality of school achievement – the external world is experienced through our senses (as inputs) and captured in learning, while the outputs are produced from learning stored in memory.

Inputs: From the stimulation of our senses, we posit things beyond us, in the world, to account for the sensory experiences. So is built our theory of the world, of what exists, and it is from this that we begin to explain what we learn and how we learn.

Causes

Addressing the achievement challenge requires careful consideration of the causes of and solutions to the inequality of school achievement. One of the most detailed analyses of the inequalities in school achievement is to be found in the collected work of Nash (2010) who provides a painstaking realist account of a very wide range of causal factors. Another is Reardon (2011). However, all too often the issue is framed by the within/beyond school dualism: within-school factors include teacher and leadership quality, curriculum and assessment, school learning environments, and various reform initiatives such as charter schools, while beyond school factors include family circumstances (income, health, housing, neighborhood), employment conditions (business decisions), and government policies (taxation, revenue distribution). However, the distinction is flawed.

Snook and O'Neill (2010) examine the within/beyond school distinction in some detail. They point out that there is both a strong relationship

between home background and educational achievement and that teachers can make a difference to student achievement. What is at stake, however, is the relative weight to be given to the two sets of factors. They make some important observations: (1) consideration must be given to both the broad social patterns at the macrolevel of analysis and specific individual lives at the micro-level if a full account is to be given of why it is that many children in poverty underachieve, but not all, and why some children underachieve when not impoverished, and (2) although the focus is on the mechanisms of social class which generate the inequality of school achievement, this may lead to identification of “broader social and economic policy that also need to be changed” (p. 12). They conclude that radical changes to schooling have a limited effect on achievement inequality, and while schools can make a difference, this is not enough.

The within/beyond distinction, largely accepted by Snook and O’Neill, comes in for criticism from Brighouse and Schouten (2011) who identify some problems with the dichotomy. They argue that while some important factors fall neatly into one side of the dualism or the other, others do not: some fit neatly into neither category, and others seem to fit into both. An example they give of the latter is the lengthening of the school day and year which is clearly a within-school initiative but is also a neighborhood-changing reform impacting on parents where their longer periods of employment can earn them more money and their children have less time for risky activities. They conclude “. . .because many policy and practical interventions influence what happens both within and outside the school, the dichotomy does not help” (p. 508). But they offer no alternative theoretical conception.

Clark (2011) does. He rejects the dualism, advancing instead a proximal/distal continuum as a more powerful explanatory account of causal factors. The proximal (closest to the action) grade off to the distal edge. The proximal need not be the most powerful explanatory factors and the distal least so. Some furthest out may be some of the most important causal mechanisms. All relevant

factors range across the continuum with weightings distributed where they fall, varying from one student to the next within the general class of all students. This would allow for fine-grained explanations of individual student achievement contained within larger groups of differentiated achievement.

Deficit Theory

The extension beyond within-school measures to include beyond school factors means, as Nash (2010) made plain, fronting up to the charge of “deficit theory” leveled against those who seek causal explanations in families and communities rather than in schools. Deficits, in a descriptive sense, arise when something is lacking which is needed in order to proceed to something else. If a new entrant child lacks some prior learning (phonetic awareness) required for more advanced learning (competent reader), then there is a learning deficit, and this is an empirical matter. So too is the cause of the deficit, usually located in the home such as parental illiteracy which itself may be a causal consequence of factors further out in the distal past (low parental school achievement in a climate of poverty and unemployment). Intervention with remedial programs in the school can go some way to alleviating the deficit, but not all the way. More is required well beyond the school.

The charge of “deficit theory,” however, often carries with it a pejorative element that those who locate the causes of inequality in the family and community are also laying blame on parents and communities for the deficit, when the culpability really lies with schools. But moral responsibility is inescapable for it is human conduct which creates the policies and distributes the resources which generate and reproduce the inequalities. It is easy with the within/beyond school dualism to apportion blame such that all of it is attached to teachers and principals and none on politicians and educational administrators, but the proximal/distal continuum places blame where it may fall, be it the waywardness of the child, the neglect of the parents, the poverty of the community, the policies of governments, or their implementation

by officials. In short, this is not to blame the victim, the child, but to hold to account all those in the causal chain deemed culpable and, giving due weight to each, hold them all variously responsible for what they have done and what they could do.

Learning

Learning lies at the very heart of the inequality of school achievement. What children learn (inputs) and remember becomes important at some other time (sooner or later) when they informally (response to a teacher's question) or formally (PISA) demonstrate the extent of their learning. An important distinction comes into play – the etiological and the constitutive, with the senses being the boundary. The former are all those factors which fall along the proximal/distal continuum, for it is they which bear directly on experience and are learned, remembered, and forgotten, drawn upon to display learning (outputs) which impacts on the outcomes where they too are located in the etiological. The constitutive is where learning takes place, and here things get philosophically murky. Davis (2004), for example, is critical of brain-based learning, advocating instead an explanation of learning in terms of mental states (intentional ones about real things) and propositional attitudes, or the attitudes we have towards propositions (e.g., hope, wish, believe). Others are more sympathetic to the claims of neuroscience. Schrag (2013) is one such. He offers a reasonably balanced view of the strengths and weaknesses of neuroscience for teachers. Neuroscience may do better at explaining learning as a neural activity which on occasions may generate new findings which feed into decisions about enhancing learning. It is more unlikely that neuroscience will make new classroom pedagogies available to teachers. In short, neuroscience is strong on explanations of learning which contribute to the background information teachers draw upon to make practical decisions about learning and teaching but on its own it has much less to offer by way of practical interventions which can improve teaching practice to

effect raised student achievement. Yet all is not lost for neuroscience and brain-based theories of learning, as the use of cognitive enhancers (medicines such as those used with Alzheimer's patients being taken by students to improve their short-term memory in high-stakes assessments) indicates.

Solutions

All too often, the policy initiatives proposed, and sometimes implemented, are disconnected from the causes and so fail to do the work required of them. It is noticeable how "solutions" come and go while the achievement challenge remains because the interventions do not home in on the causes of the inequality (Brighthouse and Schouten 2011; Snook and O'Neill 2010). The reason for this has much to do with the stranglehold that the within/beyond school dualism has on thinking about the inequality of school achievement. It is easier for politicians and policy makers if solutions are restricted to the within-school variety for responsibility can then be placed firmly on schools and their teachers to be held accountable for the success or failure of their students. Interventions take various forms, for example, curriculum reform (Winter 2014), new types of schools (charter schools), behavioral change programs, innovative learning environments (flexible, digitally based, open-plan classrooms), school-based initial teacher preparation courses, in-service workshops to raise teaching and leadership quality, and the like. Like the pillars of ancient Greek temples, each initiative stands in isolation, disconnected from the rest so there is no coherent and unified strategic approach.

A better way to proceed is to adopt the idea of a web where all the parts are interconnected. Initiatives right across the board form a seamless whole, ranging from those which have a distinct school flavor (such as those above) to those far removed from schools but which impact so significantly on the inequality of school achievement (government policies and resource provision in such things as health, employment, welfare, job training, and the like). If the State is to successfully address the

inequality of school achievement, then it must address the wider inequality embedded deeply in the social fabric of society.

Administrative Action

What are educational administrators at the national level to do if they are to introduce systems-level interventions designed to significantly reduce the glaring and growing inequalities in school achievement of a nation State? A very clear message has emerged, early and late. Evers (1993) observed that administration includes “a grasp of the politics necessary for understanding what is required for implementation” (p. 259), while more recently Snook and O’Neill (2014) argue that “There must also be changes in the wider community and this will require changes in social and economic policy” (p. 38) which include but are not limited to parental support and the enhancement of family and community well-being. And it is here where educational administrators come face to face with an unwelcome reality:

The widespread acceptance of the essentially political view that the educational system is responsible...for social disparities in achievement makes it unnecessary in certain respects to develop an account of the mechanisms that actually generate the inequalities it fails to correct. If the initial disparity is actually rooted in home resources and practices, then...the implications for educational policy are minimal. (Nash 2010, p. 256)

If educational administrators at the national level are to confront the achievement challenge, then they face their own achievement challenge when it comes to whole of system improvement designed to redress the problem of the inequality of school achievement.

Educational Leadership as a Political Enterprise

Introduction

Educational leadership is a political enterprise. Scholars in the field first acknowledged the political nature of educational leadership around the middle of the twentieth century. Since that time the study of politics in education has expanded and flourished, becoming a staple of inquiry in leadership and educational administration studies. Not all scholars, however, approach the study of politics in the same way; the manner in which they explore this realm is associated with the meaning they attribute to politics and the research traditions with which they identify. This entry explores how scholars have approached the political aspect of educational leadership over the years. It reviews the various traditions, the meanings associated with them, and the research on politics and leadership that they have generated.

Politics in Education

Inquiry into leadership has a long and varied history. While scholars have focused most of their attention on individual leadership, they have also acknowledged the collective side of leadership, that is, group and institutional action that influences what happens in organizations and beyond. Scholars have also explored leadership in education, including its political aspects. But inquiry into leadership and politics has a decidedly shorter life span than research into politics

generally. This is due, in part, to the belief in much of the Western world that education is, or at least should be, an apolitical enterprise. This belief took shape as a response to the excessive presence of politics in educational institutions of the past.

At the beginning of the twentieth century, reformers sought to put an end to the abuses associated with political interference in school systems, by introducing reforms that would leave education to the professionals and keep it away from politicians. For a period of time, many believed that these changes removed education from politics. Academics bought into this apolitical myth, seeing little need to explore politics in education where none existed. It was not until the mid-twentieth century that scholars began to recognize that the education system and the leadership that governed it was indeed political. They acknowledged that the earlier reforms had merely exchanged one type of politics for another; politics were still present, but they took on another form (Scribner and Englert (1977). The first significant move toward acknowledging and studying politics in education was the work of Elliot (1959).

A field of educational politics eventually grew out of Elliot's efforts. Its initial focus revolved around government- or State-related activities. In time, however, it expanded its horizons to more informal and less legal-centered phenomena. Even so, the meaning of politics was contested and continues so even to this day. One "definition" that many who studied politics agreed upon, however, was as practices associated with "who gets what, when and where" (Laswell 1936). Another way of putting this, as a number of scholars who studied educational politics did, was as "the set of interactions that influence and shape the authoritative allocation of values" (Scribner and Englert 1977). Both of these definitions highlight the distribution processes in communities and schools. As subunits of State government, educational jurisdictions and leaders have the authority to allocate values and can influence the process and outcomes. In this sense they are engaged in political activity.

Over the years, scholars have attempted to categorize the various approaches to politics in a number of ways (e.g., Scribner et al. 2003). The

categories they proposed, however, were contestable and, in practice, often overlapped. For the purposes of this entry, three ideas are identified. Two of these approaches – systems and micropolitics – emerged from what has come to be known as the field of educational politics; the other, equity politics, has taken a different route, although more recently scholars have associated it with the politics of education field (e.g., Cooper et al. 2008). Each of these perspectives approaches politics – the allocation of values – in a different way, and each is associated with a research tradition that shapes the purposes of scholars' inquiries, the manner in which they understand politics, and the ways in which they inquire into them.

Systems Politics

The first studies in education politics took place in the mid-1900s, and they provided the basis for the field of the same name. Many of these inquiries took their lead from the longer-standing discipline of political science. The preoccupation with science at the time was firmly entrenched not just in research into politics but also inquiry in other social domains, like education. Most academics believed that in order to generate authentic knowledge of social phenomena, scholars had to explore the terrain as a science. This was as true for the discipline of educational administration and leadership as it was for most other areas in education. In the struggle to ensure the legitimacy of this form of (social) science, scholars adopted the methods, frameworks, and theories used by the physical sciences and techniques that they believed would allow them to distance themselves from the social phenomena that they were studying and convey in neutral terms accounts of an objective social world. Adherence to these procedures would supposedly allow them to generate generalizable laws that could explain and predict human behavior.

Positivist approaches were attractive for more than just legitimacy reasons; scholars also believed that they could provide social engineers, including leaders, with the keys to control their respective social or physical domains. In order for

them to do this though, social scholars had to integrate functionalist/systems theories into their inquiries. These theories allowed scholars to isolate and measure the relationships of important elements/variables. Information about these relationships could then be relayed to leaders who could use this knowledge to predict the outcome of their actions. This ability to predict the future was predicated on the not-always-acknowledged assumption that human beings were more or less determined by their circumstances and had little choice but to respond to the stimuli that leaders and others initiated.

Like many other social science disciplines of the time, educational politics embraced systems theories and positivism. Systems theories were particularly influential in this regard. In fact the institutions on which political scholars focused actually became known as (political) *systems*. This had two consequences for the study of politics in education; it had an impact on what was studied and how it was studied. This systems approach dictated that research into educational politics focused on institutions rather than individuals as systems were to be found at an organizational rather than an individual level. And so scholars concentrated on large-scale politics including government processes and educational institutions. They studied conflict, struggles for power, pressure group activities, government institutions, structures and actions, policy and policy making, influence attempts, decision making, political parties, and voting behavior. These researchers did not question the allocation processes associated with these phenomena or who benefited from them; they simply took for granted the neutrality of these processes.

The adoption of systems theories also influenced the way in which scholars studied educational politics. Researchers considered educational institutions as if they were systems. For example, many looked at how inputs (demands, supports) were converted (through a political system) into outputs (e.g., authoritative decisions) which resulted in certain kinds of outcomes (e.g., consequences of the decision) that in turn fed back into the political system as new demands or supports (Scribner and Englert 1977). Scholars

routinely measured relationships between power structures and educational decisions, the impact of community contexts on political processes, and the effects of political and economic inputs upon policy outputs. While some employed case studies, most employed surveys and quantitative analyses to confirm these and many other causal links.

The first researchers to study politics in education, then, saw politics as institutional phenomena that could best be studied by employing systems frameworks and positivist methods. Subsequent approaches to politics challenged this position. The first that emerged came to be known as micropolitics.

Micropolitics

Micropolitical approaches first emerged in the 1970s and were prevalent in the 1980s and 1990s. Although they varied, most differed from systems approaches in a number of ways. While system theorists concentrated on institutional phenomena, micropolitical scholars studied the actions and interactions of educators, often within schools. This approach was made possible by changing trends in forms of inquiry. After many years of positivist domination, the field of educational administration and leadership embraced, slowly at first, other theories of organization and methods of inquiry, following the lead of social scientists in other disciplines. In doing so, they paved the way for different ways of understanding educational organizations, leadership, and politics.

The research tradition that first challenged the systems approach in educational leadership studies was known as subjectivism. Much of the subjectivist criticism of systems/quantitative inquiry targeted the assumptions on which these latter approaches rested. Thom Greenfield (Greenfield and Ribbins 1993) was perhaps the most articulate advocate of subjectivism in educational administration and leadership. Greenfield claimed that organizations were individual constructions originating in the minds of people. For him, people were not in organizations; organizations were in

people. In marked contrast to the systems/positivist approach, organizations were constructed entities, the product of the perceptions, wills, and values of the people who worked and learned in them. Students, teachers, administrators, and trustees interpreted what they saw about them, often in very different ways, and then acted on the basis of these interpretations. Unlike the automatons of the systems/positivist world, these individuals could decide for themselves what they wanted to do.

The idea that the willful perceptions and values of people shaped organizations seriously undercut the possibility of establishing causal relationships in organizations. If people were responsible for making the organizations of which they were a part, capable of deciding for themselves what they wanted to do, and thus unpredictable, how could one reasonably establish causal relationships in organizations? Critics like Greenfield argued that people did not obey general laws, but simply did what they felt like doing. The conclusion that he and others reached was these input/output system models, attractive as they were to those seeking control of their organizations, did not adequately depict the world in which educational leaders worked. This subjectivist view also ushered in another, perhaps more realistic way of seeing and studying organizations and leadership. If organizations were constructed by people, then tapping into their perceptions and experiences could reveal what really happens in these places. While these methods might not generate the useful (yet illusory) generalizations that systems advocates sought, they could nevertheless provide useful insights into practice.

Motivated by a desire to compensate for the shortcomings of the systems approach and a wish to explain the failure of current reforms, these academics looked for politics not at an institutional level, but within schools. While not denying that politics existed at a systems level, they nevertheless sought to understand how allocation processes played out on an interactional level within educational institutions – in what people felt, said, and did. Unlike systems scholars, they assumed that these organizations were conflicted entities, populated by people who employed power

to promote their own interests. Those who explored politics from a microperspective painted pictures of organizational life from which leaders could learn. Unlike systems scholars, some researchers specifically studied individual (school) leaders – how they used power to realize their interests and influence the way in which values were allocated in their institutions.

Micropolitical approaches differed from systems politics in two key ways. Shunning methods that sought to establish causal relationships and predictability, they attempted to illuminate allocation processes within schools by revealing how they worked on the ground, in the daily grind, and in the thoughts, words, and actions of the people involved. Although they acknowledged the impossibility of achieving objectivity in their studies, they nevertheless sought to distance themselves from these political practices, neither questioning these processes nor advocating for particular practices. Another way in which they distinguished themselves from systems researchers was in the role they attributed to individuals. Microresearchers looked at micropolitical practices through an individualistic lens; they assumed that individuals or groups of individuals, not processes or structures, were responsible for shaping allocation practices. Unlike systems scholars, they assumed that power, interests, and conflict were largely individual products. Advocates of yet a third approach to politics would react critically to this undue emphasis on individuals and an implicit endorsement of allocation processes in schools.

Equity Politics

A third approach to politics in education focused on the fairness of the allocation process. In education, this view of politics was the last to emerge, although it is somewhat puzzling that it did not appear earlier, given its explicit focus on distribution. This perspective draws on a long history of ideas about critique and fairness. Central to this tradition is Marx who drew attention to the inherent unfairness in the quickly expanding nineteenth-century capitalist production system.

One of his fundamental conclusions was that a few benefit from social arrangements that penalize many others. Subsequently other scholars, most notably those associated with the Frankfurt School, broadened Marx's critique, targeting, among other things, rationality and positivism. Scholars in education eventually embraced a number of these ideas, including a critique of current social structures and a desire to engender change.

In contrast to systems and micropolitical approaches that implicitly and explicitly endorsed the current distribution of values in educational organizations, equity scholars questioned the manner in which these processes occurred. They believed, first and foremost, that these processes were unfair and that inequities occurred systematically both within organizations and communities. The result was that some groups were persistently, consistently, and systematically marginalized, while others continued to enjoy privileges. Unlike Marx who concentrated exclusively on social class, though, scholars in education illustrated that these unfair practices also cut across gender, race, sexual orientation, and many other structures of opportunity.

The first scholars to introduce these ideas to education drew on Marx and the Frankfurt School and others like Freire and Dewey. They emphasized that education played a crucial role in the generation of wider inequities that were the product of wider systemic structures. A particularly influential early inquiry by Bowles and Gintis (1976) provided a wealth of empirical data that demonstrated that the education system both reflected and reproduced wider inequalities. Other scholars (e.g., Giroux 1983), however, took issue with this overly deterministic approach. They maintained instead that these inequalities played out in more intentional and subtle ways in the day-to-day interactions in schools. Policies and practices generated unique cultures where taken for granted practices – such as the hidden curriculum – provided advantages for some students at the expense of others. As a result already-marginalized students continued to be disadvantaged, while the privileged continued to benefit from the system.

It was not until the 1980s that scholars in educational administration and leadership

imported these views. Drawing on sociology of knowledge and Frankfurt School ideas, scholars (e.g., Bates 1980) exposed the inequities associated with management and leadership practices. In doing so, they both critiqued current approaches to inquiry in leadership and advocated for change. Among other things, they demonstrated how the research at the time – positivist, postpositivist, and subjectivist – was not neutral, but worked to prop up leadership practices that sustained an inequitable status quo. Others identified leadership practices that generated equity in educational organizations. Operating under the social justice leadership banner, these scholars both critiqued the idea that leadership practices are naturally neutral and fair and studied leaders who promoted equity, inclusion, and social justice.

Only recently has equity politics been embraced as a legitimate part of the field of educational politics. The first substantive offering appeared as part of a *Politics of Education Yearbook* (Marshall 1991), and the chapters were described as representing the new politics of race and gender. Other articles, book chapters, special issue journals, and edited books have followed. They have explicitly targeted the allocation of value processes in education, educational administration, and leadership. They have explored issues of school finance, segregation and desegregation, school services, gifted students, and urban governance. These and other scholars make the point that many school policies, and, in particular, recent reform efforts are not neutral, but highly political and value laden, often obscuring race, class, and gender inequalities (Cooper et al. 2008)

Conclusion

To this day, political inquiries continue to be a staple of research in the field of educational leadership and administration. The research traditions that provided the foundation for systems, micro-, and equity political approaches still guide these inquiries, although contemporary approaches continue to develop and transform. Whatever the approach, it is evident that

scholars have come to acknowledge the place and importance of politics in educational leadership in education.

Critical practice; Critical scholarship; Educational leadership; Social interaction; Theory/practice divide

Introduction

The aim of this entry is to introduce the turn to practice in the social sciences that has occurred in recent years and examine how and why this turn has been taken up by scholars in the field of educational leadership. This entry outlines major trends in emergent scholarship which adopt a “critical” approach to educational leadership as a form of practice, that is, one which embraces an explicitly political, humanistic, and transformative agenda in its theorization of practice. It examines the different approaches to theorizing educational leadership as practice drawing on recent developments in practice theory and philosophy that have emerged in the field as a result of this turn, including practice scholars such as Pierre Bourdieu, Michel Foucault, and Theodore Schatzki. This entry summarizes the key contributions that a critical practice approach has made to the field and concludes with possible future directions for this trajectory.

Turn to Practice

In the past two decades, there has been a turn to practice in the social sciences as an alternative way of understanding the social world. This “practice turn” (Schatzki 2001) has renewed interest in what might appear at first glance to be ubiquitous and often overlooked, taken-for-granted phenomena underlying human life and social interaction – the everyday practices of human beings. One of the major reasons for this resurgence of interest in practice are attempts by social scientists and philosophers to move fields of research beyond the dualisms that still characterize much Western thinking, for instance, mind/body, theory/practice, objectivity/subjectivity, logic/emotion, individual/society, and masculine/feminine. The thinking underlying this practice in turn rejects notions of external social structures and systems framing social interaction and derives from a range of fields, most particularly the field of philosophy and thinkers such as Martin Heidegger and Ludwig Wittgenstein.

Practice theorists are drawn from a wide range of disciplines and constitute a broad array of understandings and conceptualizations of what they mean by practice. However, practice approaches to the social world are characterized by some central and shared understandings. A key feature of practice accounts is that they accord primacy to the everyday practices in which humans engage as a fundamental part of daily lives. They view the social world as made up of practices and utilize practices as their fundamental unit of analysis. This is in contrast to analyses which afford primacy to individuals' accounts of the social world – that is, social phenomena are constructed by the thinking and conceptualizing of the sovereign individual.

These practice accounts are in contrast to analyses which view the social world as composed of social structures and systems – which shape power relations between human beings. Moreover, practice approaches reject the rationalism – the commitment to a form of technical reasoning – that underpins modernity, as encapsulated in the Cartesian binary of the mind/body. As feminists have noted, such dualisms and forms of reasoning privilege particular forms of knowledge and ways of understanding the world. For instance, dominant discourses of leadership and management as rational, orderly, and linear processes reify forms of knowledge that are traditionally associated with constructions of (white) masculinity. This privileging locates critical and practice-based theorizing of leadership, which examines leadership as embodied, gendered, classed, racialized practices, composed of non-propositional knowledge and tacit understandings – as “other” to these dominant paradigms.

Practice approaches represent what has been termed a practical ontology, rooted in the intelligibility of practices. In order for humans to make sense of our social world, we are crucially reliant on *shared* understandings of how to go on in this world. This practical intelligibility allows us collectively to make sense of, function in, and potentially transform the world in which we live. The centrality of everyday practices as described

switches the researchers' gaze from a functionalist and systems perspective – where the world is apprehended via objectified systems and structures, or from an individualistic cognition perspective – to one where the world is apprehended from the perspective of the individual acquiring knowledge and understanding.

For sociologists such as Pierre Bourdieu or Anthony Giddens, a practice approach to understanding the social world assists theorists in transcending traditional social science divisions in which human activity is constructed as a dialectical interplay between individual human agency versus external social structures. For philosophers and literary theorists such as Michel Foucault and Jean-Francois Lyotard, understanding language as practice means reconceptualizing it as a “discursive activity” (Schatzki 2001, p. 10) of shared meaning-making made possible through people using and mastering the language. Mastering and employing a language is not an individual property, nor does language correspond to an external social structure or system. Rather, language and learning a language is a collective social phenomenon that shapes our social world. As a social phenomenon, it is thus steeped in and productive of power relations – to enter a discourse means learning what forms of knowledge and knowing are valued and foregrounded and, implicitly, which forms of knowledge are marginalized.

The centrality of practice to our social world is a key assumption that underpins more recent *critical* approaches to understanding educational leadership as a collective social phenomenon. A practice approach to educational leadership that adopts a critical lens views leadership as constructed by discursive understandings and forms of knowledge about this thing called “leadership.” It constructs leadership as a set of social practices which compose our understandings, know-how, and relationships with other human beings with whom we interact in the practice and in the material world in which the practice is enmeshed. Critical approaches to educational leadership posit leadership practice as invariably an effect, and productive of, power relations and as inherently political – situated in civil society

and the institutions which compose that society. It is to how and why this approach has been taken up in educational leadership that we now turn.

The Emergence of Critical Approaches to Educational Leadership

Educational leadership as a field has been critiqued for its uncritical borrowing from the sciences and management, beset with questions of its legitimacy and dominated by a positivist approach in which researchers attempted to establish the field as a scientific discipline in its own right. The field has tended to be dominated by individual agency/structure and systems dualisms as a means of understanding the social world of educational organizations and their performance. Individualizing approaches to understanding the phenomenon of educational leadership and the performance of educational organizations such as schools have drawn on the “great man” theories of leadership. These theories predominantly valorized the traits of (male, white) individuals. More recently, notions of the individual, heroic transformational leader have been utilized as explanatory lens for why some schools may be more effective in their outcomes than others. The valorization of leaders and leadership has become a dominant tendency in the past two decades, supplanting an earlier dominant systems tendency in which educational institutions were viewed as part of complex systems, and educational leaders as the role incumbents in organizations. Thus a focus on systems as an external organizer of human practice became the main explanation for a school’s (or other educational organization’s) performance.

As part of an endeavor to establish itself as a science, educational administration scholars drew on technical and functionalist approaches to administration, in order to produce generalizations about schools as organizations. Post World War II, systems theory became a particularly popular explanatory lens by which the functioning of schools could be conceptualized. Schools as organizations were theorized as complex social systems composed of interrelating and

interdependent sets of activities in which the formal role of educational leaders was but one aspect of the organization’s functioning, albeit an important one. The search for “law-like generalisations” (Evers and Lakomski 2012, p. 60) about the shared characteristics of educational leadership was premised on the belief that the structure and organization of schools could be controlled and predicted through scientific methods. This endeavor for prediction can still be seen in the many current attempts to produce Principal Standards that characterize many contemporary education systems in Anglophone nations.

Thomas Greenfield’s arguments in the 1970s for subjectivist and humanist approaches to the study of educational organizations represented the first major rebuttal of the positivist orientation of educational administration as a field of practice and scholarship. From the 1980s onwards, as a reaction to dominant positivist and functionalist accounts of educational organizations, and drawing on developments in the social sciences, as well as social movements such as civil rights and feminism, a range of scholars emerged, writing in what has come to be known as the “critical tradition.” This scholarship represents a broad range of approaches including feminism, humanism, post-positivism, postcolonialism, postmodernism, and critical policy. It examines the social and political impacts of educational organizations and of educational administration and leadership scholarship.

From a critical perspective, one of the major weaknesses of systems theory is that it conceives of organizations as abstract units, decontextualized from considerations of power relations, politics, and the specific historical and material contexts in which they are situated. Similarly, individualist accounts of the transformational leader who is able to transform a failing school are critiqued for they fail to consider the asymmetrical power relations within which leadership as a practice is exercised, such as the impact of gender and race on how leadership and leaders are conceived and represented. Nor do they consider the varying and specific contexts in which schools and other educational institutions operate. In short, critical scholars argue that educational leadership is not a politically neutral practice,

exercise, or process. Nor is it a property that is owned and wielded by a solitary individual over others. For critical theorists schools and other educational organizations are not power-neutral and decontextualized sites which can be subject to a purely scientific gaze, but rather are a critical component of the broader social relations of ruling. The managers and administrators who lead them therefore are not politically neutral role incumbents exercising a technical and managerial “science” – the organizational outcomes of which can potentially be controlled and manipulated. Rather, they are social and political agents whose practices have educational, social, and political implications, operating in organizations where different kinds of practice only make sense as part of the collective meaning-making exercised by its agents.

Schools, universities, and other educational organizations are viewed as sites of permanent struggle and contestation over meaning, with educational administrators occupying a crucial role in frequently reproducing social and power relations as part of the status quo. Conversely, critical theorists point to the opportunity that administrators have for challenging and subverting institutionalized power, given the authority and power they hold. Hence, there is a body of literature that has emerged examining the role that educational leaders can play as social activists and community advocates. In the educational leadership field, critical theorists have played an important role in examining the potentially deleterious social impacts of major schooling movements, such as the shift towards school self-management that has occurred since the 1980s as a result of the spread of neoliberalism as a dominant ideology.

The Turn to Educational Leadership as Critical Practice

Drawing on the turn to practice emerging in the social sciences, a small body of work has begun to emerge in critical theories of educational leadership which examines leadership from a range of practice perspectives. Predominantly the “thinking tools” of French sociologist, Pierre Bourdieu

(Wacquant 1989, p. 50) have been employed. Initially, Bourdieu’s research with Jean Claude Passeron was widely employed by educational sociologists in the 1970s to examine how education acted as a site of cultural reproduction via the hidden curriculum. More recently, in educational leadership scholarship, Bourdieu’s concepts of habitus, field, capital, misrecognition, and strategy have provided an alternative lens with which to conceptualize the classic agency/structure dilemma of sociological theory. In other words, it has assisted in thinking beyond binaries, that is, how we take into account the role that social structures such as class, gender, and “race” play in shaping individual practices – while also recognizing the impact of individual practices – on these structures. It has provided useful tools with which to critique dominant tendencies in the field towards individualist accounts of the leader as transformational leader and manager, which overlook issues of the embodied nature of power, for instance, how social categories such as class, gender, “race,” and sexuality are socially constituted and embodied in the white male habitus of the principal. Alternatively, it has been employed to critique more positivist accounts such as the dominant school effectiveness movement. The latter attempts to isolate the key factors which effective schools and leaders exhibit but has tended to assume schools as socially and politically neutral sites and to overlook or downplay the impact of broader social and political contexts on schools and effective school leadership practices. It tends to reproduce essentializing and homogenizing constructs of the leader and leadership which are culturally decontextualized and empty of considerations of how schooling, as a field of social practice, is marked by struggles for legitimacy by differing agents who bring varying levels of capital to this field.

A number of insights have been gained through the employment of a Bourdieuan lens. It has helped us to understand leadership as a form of social practice which is constituted by the dialectical interplay between one’s individual habitus (the internalized social structures of individuals which embody how they view the world and which shapes one’s tastes, perceptions, and the

principles which underlie our actions) and the fields of power (structured, socially constituted spaces such as schools and universities). The notion of the habitus of the effective principal, for example, suggests that educational leaders are not aggregates of personal qualities or traits, divorced from the social contexts in which they have been raised, but instead come to the field of practice of schooling with their tastes, preferences, and dispositions already shaped by the social categories of class, gender, and ethnicity which their habituses embody. Their habitus is activated by encounters with the particular logics of practice which are at play in the schooling field, such as in Anglophone nations, the application of neoliberal economic principles which valorize a competitive and individualistic logic of the market, in which improved test results are a crucial part of the stakes over which schools and systems struggle in their quest for legitimacy. These logics of practice locate principals as business managers, entrepreneurs, and corporate leaders, rather than educational leaders.

In addition to Bourdieuan analyses, alternative practice approaches have begun to be employed by critical practice scholars in educational leadership. For instance, Foucault's analysis of knowledge and power has been used to examine how a market discourse of education and educational leadership "systematically forms that about which it speaks," by legitimating "certain forms of leadership for certain purposes ascribed to leadership." Thus, it is argued, such discourses produce "effects of power such as knowledge about what counts as leaders" and by implication, what does not count, what is delegitimated (Lingard et al. 2003, pp. 128–129).

Another recent approach is a site ontological perspective. One of the criticisms of Bourdieuan analyses of educational leadership practice is that concepts such as fields and habitus discursively suggest practices as "always and already structured" (Wilkinson 2010, p. 42). Ironically, then, this approach can draw the gaze away from the social practices that constitute educational leadership. The site ontological perspective instead argues that organizations such as schools can be conceived of as social phenomena unfolding

through the "happening" of practices and activities' (Schatzki 2006). Rather than analyzing educational leadership as interactions between participants in a practice, or as socially constituted and constructed fields and habitus, educational leadership practices are "sites of the social" (Schatzki 2002), interconnected with professional learning, teaching, and student learning practices, and needing to be analyzed as they unfold in specific school sites in all their "happeningness" (Kemmis et al. 2014).

Conclusion

The study of educational leadership as critical practice rejects the traditional theory/practice divide and the premise of the rational model of science, in which scientifically derived knowledge provides the basis for theories that are then applied to practice. Rather it refocuses the analytic gaze by bringing theory into the lifeworld of educational practices. It emphasizes the social and purposive nature of educational leadership as a practice, arguing that leadership practices can only ever be understood in the specific sites in which they occur – through the words, ideas, and discourses that construct knowledge/power relations; and through their performance in social spaces and in relationship with others and the material world. Adopting a critical practice lens to examine educational leadership practices over those of agents does not suggest a rejection of the agency of human beings. Instead it foregrounds a political, humanistic, and transformative agenda, by suggesting possibilities for dialectical explorations of the simultaneously reproductive and transformative nature of leadership practices in their moment by moment unfolding within social organizations such as schools.

Educational Leadership, Change, and the Politics of Resistance

Karen Starr

Faculty of Arts and Education, Deakin University
Burwood Campus, Burwood, VIC, Australia

Synonyms

[Educational leadership](#); [Micropolitics](#); [Organizational change](#); [Resistance](#)

Introduction

Educational leaders are pivotal players in change and reform activities. However, despite the proliferation of literature on change management, most major change efforts disappoint. As Grey (2005, p. 97) argues, “[t]he most striking thing about change is that it almost always fails.” Obstacles, setbacks, and resistance are the norm.

To begin, it is important to distinguish between first- and second-order change processes (Watzlawick et al. 1974). First-order change

concerns modifying or adjusting existing practice to improve effectiveness without consequential alterations to the educational institution or its work. Second-order change, however, involves systematic organizational restructuring and renewal, incurring fundamental or radical departures from usual practice. Educational institutions easily manage most first-order change initiatives which occur frequently, but second-order change is often problematic. Change is about improvement, solving problems, and confronting challenging issues, but the greater the change required, the greater the levels of resistance with concomitant impacts on productivity, work satisfaction, and loyalty.

Resistance to Change

The notion of “resistance” is a common theme in research about change. “Resistance” refers to social actors embedded in opposing power relationships wanting to challenge, disrupt, and/or overturn organizational decisions, discourses and/or power relations, and the social norms through which they are maintained. “Resistance” is usually described in negative terms, referring to oppositional responses (actions and nonaction), such as ill will, resentment, defensiveness, or confrontation.

Evans (1996) argues that it is human nature to oppose change unless individuals are involved in its creation. Major change requires people to give up feelings of comfort, long-held values or beliefs, and established routines. It entails new thinking, extra time, and effort; hence those affected try to retain comfort and quell confusion by practicing caution, constraint, and subversion, thus protecting the status quo. Abelson (1995) adds that individuals are defined by their strongest beliefs, so when major change challenges long-held attitudes, values, or assumptions, it becomes a threat to identity, making resistance inevitable. Machiavelli (1998) famously maintained that everyone is motivated by self-interest, so reform perceived as being personally disadvantageous presents itself as a risk to be contested. And while coercion heightens

resistance, even the most reasonable and necessary change efforts are often met with resistance.

Blase (1991) describes resistance to change as a micropolitical activity that is always present but which intensifies during periods of major change, making change efforts more complex and messy. Defining micropolitics as “the use of formal and informal power by individuals and groups to achieve their goals in organizations” (Blase 1991, p. 11), micropolitical structures and activities involve both convergent and divergent processes (those that enable and distract from achieving change). Resistance encapsulates the latter. Change evokes micropolitical defensiveness because it shifts power arrangements and can highlight inconsistencies and inadequacies associated with past behaviors or performance.

Rogers’ (1995) work on the diffusion of innovation presents a bell curve of change adoption responses (from “laggards” to early adopters). Rogers cites homophilous systems (such as educational institutions) as those where change is most likely to be met with skepticism, suspicion, and resistance. In these situations, individuals from similar backgrounds achieve cultural convergence through their adherence to norms and values, and resist changes perceived to upset these arrangements and assumptions. Rogers has his critics, however, who point to problems with post facto definitions and suggestions that individuals (or organizations) fall into one particular change adoption category regardless of different change contexts and situations.

The “grief cycle” (Kubler-Ross 1969) is commonly used to describe change resilience, inferring that individuals experiencing major change undergo similar emotional phases as those who have lost a loved one: denial (disbelief), anger (change is unnecessary), bargaining (attempting to alter activities to suit preferred outcomes), anxiety, sadness, disorientation (insecurity), depression (despair), and finally acceptance, action, and going along with the change.

Resistance can stem from ideological, psychological, sociological, or logical factors. Ideological resistance can be the result of opposition to the political positioning or values underpinning education policy or strategy. Psychological resistance

can be the result of personal emotional associations, for example, educational leaders may perceive barriers in communications with those harboring negative views about leadership or leaders (where other factors such as gender or race also play a part). Sociological resistance may result from deep-rooted institutional or community beliefs and coalitions. Resistance can also be based on criticisms of the rationale for change or the logic behind change processes being introduced (such as a lack of time or consultation).

All forms of resistance are political and influence the extent and nature of micropolitical activity within the educational institution and are often justified as professionalism (Blase 1991; Sarason 1990). However, while people can oppose change on many grounds, some may not be against change per se, but oppose the way change leaders go about it. Others still may be ambivalent about change, which can be construed as resistance.

Criticisms about the notion of “resistance to change” are based on the implicit hegemonic, hierarchically biased assumptions associated with the term: inherent connotations of virtuous, holistic, visionary educational leaders advocating change in contention with myopic and self-interested opponents who disrupt the achievement of strategic goals. Critics argue that change resistance can derive from various intentions and motivations, not all of which are “bad.”

A further criticism is that the failure to probe the roots of resistance may be a result of institutional “undiscussables” – a term used by Argyris (1980). Undiscussables are topics that are too uncomfortable for open conversation with social actors being reluctant to raise “risky and threatening issues, especially if these issues question underlying organizational assumptions and policies” (Argyris 1980, p. 205) or reflect badly on leaders. Undiscussables promote conformity while skewing data and subsequent change efforts.

“Resistance” to change is acknowledged as a predictable political phenomenon in educational leadership and a worthy focus of research in this field. To date, however, there is little research available focusing on educational leaders’ own resistance to change.

Why Educational Institutions Are Resilient to Change

It is human nature to resist change, unless implementers are involved in its creation (Evans 1996). Individuals are comfortable with the way things are; they are familiar with the way things work; they have established routines; and organizational cultures operate to maintain the status quo. Initiating change requires people to give up something – feelings of comfort, long-held values or beliefs, or ways of working. The change may entail encountering a different environment or new collaborations or reduced budgets – in extreme cases people may lose their jobs. Whatever, there will be some break from the past, new effort and thinking required, and extra time needed to implement the new pursuit. Uncertainty is never welcomed – it is easier to remain the same.

While change is difficult in all organizations, there are a number of barriers that are particular to the field of education that make major change especially difficult. Some relate to the nature of teachers' work. Teachers' work is complex, demanding, and requiring untold interactions each day and attention to the varied needs of large numbers of students, many of whom have learning or social difficulties. Schools have never served such diverse student populations. With current expectations that no student can fail, teachers are expected to tailor courses and pedagogy to individual needs to ensure optimal learning for every student. Some argue that students are becoming more challenging and can be harder to motivate, with teachers having to perform well in order to grasp and retain students' attention and cooperation to ensure learning engagement (see, e.g., Evans 1996). Curriculum expectations are constantly changing and expanding. On top are the daily, unexpected requests, complaints, demands, and queries from students, parents, and others. Hence, the quotidian of educational life is messy, busy, and exhausting and stakeholders are many. Time for prolonged planning, reflection, or problem solving is always lacking.

Educational institutions are also expected to enact mandatory policy change agendas that are

extrinsic to internal priorities, which add to workload and steal time. The technical-rational-structural approach often adopted by education bureaucracies further exacerbates problems about change. Change is ongoing and uncertain and time is pressured, but imposed directives regularly ignore this fact. Top-down mandatory change often assumes a straightforward, logical, predictable implementation with prescriptive timelines and procedures, thereby failing to grapple with the complexity and dynamism of educational life. An unintended consequence is it diverts efforts from teaching and learning.

Another salient factor is that practitioners are rarely involved in policy or change agenda formulation. They are acted upon – they are not cosponsors of change – and are often portrayed as a part of the problem rather than as the solution to educational problems.

For many reasons it is common for older individuals to be more cynical and resistant to change (Evans 1996; Grey 2005). This is understandable since life often becomes more, not less, complicated with aging: family responsibilities increase (with pressures from children and aging parents), financial commitments present restraints, personal health issues may emerge, and eventual retirement plans must be made. Older staff can also be more confident, vocal, and visible dissenters, and seeing it is in their interests to maintain the status quo.

It is also a history of failed reforms that makes some experienced practitioners very cynical and resistant to change. Long-standing staff members are custodians of stories about the unintended, unanticipated, negative consequences or side effects of change. Educational leaders initiating change are often told that “this is the way we do things here” or that “we tried that once before and it didn't work.” And in terms of the latter comment – in most cases this would be accurate.

While issues of low morale and disengagement may emerge from the nature of teachers' work, these are not helped by regular media attacks from politicians and public commentators. Politicians often cite purported problems to gain legitimacy for new reforms and restructurings, which erodes public confidence in education even further. In

addition, parents are more demanding, placing increasing responsibility on educational institutions as increasingly they are spending less time with their children (Evans 1996). These conditions are hardly conducive to inspiring change and innovation. Reform requires effort in an atmosphere of trust.

Governments' responses to global forces to ensure national economic competitiveness can release "dark" micro repercussions. Educational leaders cite ongoing external interventions; intensified workloads; insufficient resources; the timing, nature, volume, and disruption of externally imposed initiatives; and union objection as hindrances to change that exacerbate resistance and antagonism (Gronn 2009). Further exacerbating factors include a lack of agreement about policy or direction, increasing stress and burnout, widespread disenchantment and disengagement, rapidly changing student populations, a lack of collaboration in education policy making, and insufficient professional learning, preparation, and induction for principals focused on change, micropolitics, and resistance (Evans 1996; Gronn 2009).

Experiences of Educational Leaders

In education, resistance to change can come from within or outside the educational institution. Overwhelmingly, however, educational leaders view resistance as a negative, disruptive phenomenon stemming from self-interest, with perceptions being highly influenced by the behaviors exhibited by resisters. Resistance to change evokes differing responses among the people involved and can be active or passive and severe or less interfering. Specific behaviors include vandalism or violence, professional sabotage, disrespectful or discourteous conduct, clandestine caucusing or social exclusion, formal complaints, the withholding of information, rumor mongering, slander, and blackmail. Resistance behaviors can have institutional effects such as an increase in resignations or transfers, lowered productivity, increased absenteeism, and a general sully of the workplace culture.

Resistance is exacerbated when factionalism and divisions appear within a group where there is more at stake for individuals holding strong views one way or another and when a sense of common purpose or collective vision evaporates. Crucial throughout major change is cohesive leadership – disloyalty or disunity makes the change process even more difficult. Educational leaders may, however, harbor their own opposition to change imperatives such as policy interventions or accountability procedures. Hence compliance is a conscious agential act – one that may not stem from honesty or integrity, whereas resistance may (reinforcing the view that not all resistance acts are unjustified).

A leader's tenure within an educational institution can influence the nature and extent of change resistance, with the early stages of tenure in a new institution being the time when the most robust forms of resistance are likely to be experienced. Leaders with long-standing tenure appear to experience fewer examples of aggressive resistance the longer their tenure. This indicates that education communities may experience difficulty in coming to terms with a new leader, new ideas, and unfamiliar *modus operandi*, whereas over time, a leader's views and processes become known, expected, and accepted. The initial years of a leaders' tenure are when the most radical reforms are likely to be undertaken (through necessity or choice) which may also explain this phenomenon. Further, educational leaders with long experience report more confidence in their position, major change processes, and outcomes. Overall, however, resistance to second-order change appears to be part of the change territory in education.

A culture of complaint is seen to have superseded an era of greater compliance in education and is viewed as an outcome of consumer choice, competitive individualism over collectivism, political and media appeals to students and parents as consumers of education, and an emphasis on market forces emphasizing responsiveness to consumer power. With a greater range of interested parties and higher community expectations, legal or procedural rights are more likely to be pursued to procure desired outcomes, with

complainants being more convinced of the effectiveness of these strategies.

Protestors increasingly seek restitution through power brokers such as boards/ councils, external supervisors or regulators, or unions. Others may seek to disrupt support networks within internal institutional leadership. Formalized resistance strategies increase the workload of educational leaders through meetings, negotiations, deputations, and formal documentation requirements, having to ensure procedural compliance or attend reconciliation or court appearances. The processes are stressful but effective in delaying or allaying mooted changes. While stakeholders and staff members can express a range of emotions, educational leaders feel constrained to act confidentially, diplomatically, and courteously. Educational leaders have to be adept at appearance management, hiding true feelings to present a steady, “bulletproof” persona, which is not always easy.

Opponents of change have considerable formal means of resistance available to them – means enhanced through localized knowledge, cultural resources, and associations. When change fails, resistance tactics have proven worthwhile.

Addressing Change Resistance

Change resistance in education can emanate from a number of sources: an overload of change initiatives; cynicism; a lack of ownership, consultation, or communication; insecurity and anxiety, a lack of support and recognition; or doubts about the benefits of change. Given that major change is difficult to enact, there is a considerable body of literature that attempts to address and reduce change resistance. Commonly mentioned ameliorative behaviors include:

- Articulating and communicating a clear rationale for major change based on transparent information
- Focusing the rationale for change on benefits for students
- Involving and negotiating with stakeholders who will be most affected by the change in

the development of common understandings, goals, and processes

- Being respectful of past practices
- Identifying and co-opting key people to lead aspects of the change activities and work with others through change processes
- Negotiating expectations – being transparent about what is going to happen, when, and how
- Developing role statements, responsibilities, and realistic timelines
- Widely communicating and reporting progress toward goals through formal and informal means
- Providing necessary professional learning and other resources
- Inducting newcomers to the change process
- Providing encouragement and support, with change leaders being personally available and involved
- Encouraging discussion about difficulties and devising solutions collectively
- Maintaining a strong focus on professional learning – growing talents, interests, skills, and knowledge, while fostering mentoring and coaching activities
- Being magnanimous with thanks, praise, encouragement, acknowledgment, and rewards (Evans 1996; Sarason 1990)

Conclusion

Opposition and resistance are to be expected in major educational change, with emotionality often overriding rationality. Resistance is exercised in myriad overt and covert ways, and educational leaders cannot underestimate how difficult change is to manage, or how antagonistic some people will be. And no matter how well planned, change can have unforeseen repercussions (positive and negative), which may incur further upset. Power struggles, political intrigue, ideological difference, and the maneuvering of knowledge and personal agendas make for micro-political messiness in school life and thwart change efforts (Sarason 1990). Resistance tactics are deployed because they often have the desired effect.

Resistance must be anticipated and acted upon. Educational leaders require political astuteness to lead and manage change successfully, yet many researchers reveal the lack of essential knowledge and skills of school leaders as the cause of change failure (Blase 2005; Evans 1996). As governments place more emphasis on measurable performance outcomes, leading and managing change will become even more important for educational leaders, with concomitant implications for their selection, appraisal, and longevity in the job. As Buchanan and Badham (2008, p. 18) argue, “the change agent who is not politically skilled will fail.”

Introduction

Discussions of the emotions have recently become prominent in educational leadership research which advocates the belief that emotions are important for leadership to be effective. A central part of this research is the common sense concept of emotion that underlies the empirical studies of emotion and leadership. This notion, however, is part of folk psychology which, as a failed empirical theory, is unable to answer some of the most fundamental questions raised in the education and leadership literature: how emotions are generated, what they are, and how they are shared between people. This entry presents an overview of why emotions are believed to be important for leadership in education, how emotions are understood in the education literature, what is known about the history of the concept of emotion, and what the neurosciences can tell us about the nature and origins of “emotion.” The entry concludes by indicating in which ways new neuroscientific knowledge contributes answers to the questions raised in the educational leadership literature.

Leaders and Emotions

Unlike the fields of organizational behavior and general leadership studies with their established

research literatures, the turn to the emotions as integral, and hence legitimate, components of leadership in education is relatively recent. At the same time, however, philosophical treatments of emotion have had a long and controversial history (Solomon 2010). Two features of emotion continue to shape the contemporary discussion: the view of emotion as primitive and dangerous, therefore in need of control by reason and, secondly, the very distinction between emotion and reason itself as constituting two different and opposing “natural” kinds. The emphasis on emotion as nonrational has been a characteristic of traditional, rational decision-making theory, prominently represented in educational administration by Herbert Simon, while the renewed focus on emotions and leadership represents a response to the predominant cognitive orientation in leadership and organization studies generally.

The discussions of emotions in education accept implicitly the nonrational – rational distinction as a true characterization of both emotion and reason – but focuses on one side of the dichotomy by investigating the emotional experiences of teachers and principals, without questioning the dichotomy itself. General themes in the empirical educational (leadership) literature are the presumed impact of teacher/leader emotions on students, educational outcomes, and teacher education programs. Topics include the emotional aspects of teachers’ lives, emotions in teaching, and emotions and leadership more generally where emotions and leadership are considered as shared influence (Zorn and Boler 2007). A strong theme running through educational leadership discussions is the assumption that emotions are situated in social–political contexts, are therefore more than an individual’s personal psychological property, and thus need to be investigated from within a social–political framework. In addition, there is a strong emphasis on gendered power relations that are said to shape the emotions of leaders, in particular women leaders, who are forced to adjust their emotions to the dominant rational, male administrative culture. Such adjustment requires emotional labor, which means suppression of genuine emotion or inducing emotions not felt in accordance with the requirements of the

workplace. Further to the empirical studies conducted on emotions and leadership in education, the concept of emotional intelligence provides a theoretical framework based on the belief that the emotional skills of leaders are imperative for effective leadership. Although the meaning of emotional intelligence remains ambiguous, its definition of emotion is that of folk psychology.

In the empirical literature, four reasons are offered in particular to support the claim that emotions are relevant for understanding leaders in education (Berkovich and Eyal 2014). (1) Emotional experiences and their displays express leaders’ reactions to social reality and how that reality relates to their goals; (2) leaders’ behaviors affect the emotions of teachers and others with whom they interact; (3) leaders’ affective abilities are precursors of their emotions and behaviors, and as such, of desired work outcomes; and (4) leaders’ emotions are also influenced by societal factors that have contributed to making administrative work more complex and political in unstable and competitive environments. The emotions referred to are generally those we describe in words such as fear, anger, disgust, surprise, sadness, and happiness. Explicit definitions of emotion are rare in the educational leadership literature, and where they occur, they are in keeping with folk psychological theories of emotion as in Berkovich and Eyal’s account (2014, pp. 2–3) who describe emotions as affective experiences that include individual emotions such as fear or joy, and can be accompanied by bodily expressions, and sometimes lead to action.

The current state of knowledge of emotions in the education and educational leadership literature is descriptive in nature and largely presents phenomenological studies of how emotions are seen and experienced in teaching, learning, and leading contexts. Questions considered important for future research, raised but not addressed in the current literature, concern how agents manage to transmit emotions, or “catch” the emotions of others, as in emotional contagion. Above all, the current literature takes for granted the common sense understanding of emotion. While it is true that principals and teachers (and everyone else) have developed their own repertoires of how to

deal with their own emotions and those of others, given their general understanding of how the language of folk psychology and the meaning of its concepts works in everyday life, when these repertoires break down, as they often do, predictions of expected behavior can go badly wrong, with sometimes devastating consequences. This problem cannot be solved within folk psychology as emotions are not identical with the words we use to describe them. What we call emotions are mental states generated by and instantiated in biological brains and bodies. They are thus amenable to scientific investigation, as has long been recognized by Darwin. Recent work, especially in emotion science and affective and cognitive neuroscience, has contributed much to a better scientific understanding of the nature, origins, and functioning of emotion and what we call the emotions generally. It helps clarify whether or not, or in which sense, emotions can be said to be important for leadership to be effective. But first it is necessary to get an idea why folk psychology presents a false theory of mental states.

Folk Psychology and the Ambiguity of “Emotion”

Following Dixon (2012), the term “emotion” has not become applied to the systematic study of mental phenomena until the mid-nineteenth century. As we now use the term, it subsumes two distinct categories of mental states that had held sway since Aristotle and St. Augustine: troubling desires and passions on the one hand and the milder and less dangerous affections and sentiments on the other (Dixon 2012, p. 339). This distinction became blurred through the works of the moral philosopher Thomas Brown (cited in Dixon 2012) whose conception of “emotion” comprised quite diverse mental states. Ever after, “emotion” was treated as a significant *theoretical* category for the systematic study of the mind but remained difficult to describe, with a view of emotion as vivid feelings, on one hand, and emotion as expressible in bodily motion, on the other. This ambiguity has plagued emotion research to the present day. It is a source of contention in

contemporary accounts of emotion theory as the meaning of “emotion” changes depending on the theoretical frameworks adopted by psychologists. For folk psychology, however, this does not matter. As the oldest framework that purports to explain our mental phenomena, it is pervasive, deeply rooted, and denotes:

the prescientific, commonsense conceptual framework that all normally socialized humans deploy in order to comprehend, predict, explain, and manipulate the behavior of humans and the higher animals. This framework includes concepts such as *belief, desire, pain, pleasure, love, hate, joy, fear, suspicion, memory, recognition, anger, sympathy, intention*, and so forth. It embodies our baseline understanding of the cognitive, affective, and purposive nature of people. Considered as a whole, it constitutes our conception of what a person is. (Churchland and Churchland 1998, p. 3)

Debates about how to appraise folk psychology’s nature, what functions it has, and whether it can evolve have crucially centered on the question whether it is like an empirical theory or merely a social practice whose generally shared vocabulary makes possible a myriad of social activities such as the ones referred to in the above quote. Its purpose was said to be normative rather than descriptive, and unlike empirical theories its general sentences or laws were not seen to lend themselves to causal explanations. Delimited in this way, folk psychology was said to escape the kind of scrutiny to which every empirical theory can be subjected and which could in principle lead to its rejection, reduction, or even elimination.

It is now generally accepted that our common sense conception of mental states is theoretical in exactly the same way that the physical phenomena of science are, with the *propositional attitudes* (...believes, desires, fears that *p*) showing the same semantic structure as scientific theories (Churchland and Churchland 1998). Crucially, as folk psychology makes claims about the nature of mental states as representable in linguistic form, in light of both evolutionary knowledge of the late development of language propensity, and recent knowledge of actual brain architecture, functioning, and information processing, this claim has turned out to be unjustified. The basic units of

human cognition are not sentence-like structures, but patterns of excitation levels across a large population of neurons. Information processing does not consist of deductive inference between sentences but synaptic firings across activation vectors that transform them into yet other such vectors. None of the above comments deliver a fatal blow to folk psychology. But it does follow that if folk psychology is as theoretical as other theories of science, then mental phenomena, including our emotions, are a proper subject for scientific investigation. On the other hand, the folk psychological understanding of emotion/s continues unabated in everyday life.

Emotion Naturalized

While the study of the nature and origins of emotion is a common goal of both folk psychological science (the new emotion science) and affective neuroscience, the historical tension and definitional ambiguity more clearly affect the former. Emotion science is concerned with specification and classification of emotions, a difficult enterprise due to unstable shifting definitions. It focuses on such questions as how many emotions there might be and what emotion is anyway so that it can be measured. Affective neuroscience, on the other hand, is interested to explore the underlying neural substrates of emotion and is therefore primarily concerned with causal rather than definition or classification issues (Panksepp 1998). Affective neuroscience can be said to have evolved from the second view of emotion as embodied, drawing on Darwin's theory of emotions, and continued by James and Lange, whose combined views have become known as the James–Lange theory of emotions. In brief, the theory maintains that emotions are embodied. Commenting on the everyday view that emotion comes first and elicits bodily expression second, James says “My thesis on the contrary is that *the bodily changes follow directly the PERCEPTION of the exciting fact, and that our feeling of the same changes as they occur IS the emotion.*” (James 1884, pp. 189–190). According to James, there is no ephemeral substance “left over.” The

common sense sequence, described by James, of “we meet a bear, are frightened and run,” is simply the wrong order. Expressed more formally, as Prinz (2004, p. 44) puts it, “... emotions are perceptions (conscious or unconscious) of patterned changes in the body (construed inclusively).” But as emotions have also been characterized as cognitive appraisal systems, a more comprehensive account integrates both perception of body states with cognitive appraisal of the person's overall situation, so that an emotion can be described as “a pattern of neural activity in the *whole* system . . . including inputs from bodily states and external senses.” (Thagard and Aubie 2008, p. 817).

This broad definition is based on a recent and still controversial conception of brain organization as rather more fluid than previously assumed, being better characterized by dynamic affiliation of neural systems than modularity. Because of such dynamic organization, emotion circuits and cognition circuits are so closely interlinked that it is more appropriate to speak of the cognitive–emotional brain. The traditional, philosophical dichotomy between reason and emotion, on this account, is no longer defensible. When applied to that traditionally most rational of activities, decision-making in educational administration, as elsewhere, this particular result implies that rationality *de facto* depends on emotion for rational decisions to be possible at all (Lakowski and Evers 2010). The most influential argument supporting this claim is Damasio's (1996) somatic marker hypothesis which in essence claims that positive or negative body signals such as gut feelings and hunches subconsciously “presort” how to appraise and thus respond to a stimulus. By signaling a positive or negative valence, the body (racing pulse, sweaty palms, increased heart rate) indicates how to respond to a situation and thereby reduces the potentially infinite decision space. If this thesis is generally correct, then emotions are indeed integral to decision-making and are part and parcel of all the neural machinery that enables humans to make choices and survive. Understood naturalistically, emotions are rational.

Given that emotion is embodied and its definition expanded as indicated, the question asked in

the educational leadership literature on how emotion “travels” between people, or is “caught,” central to the claim that leader emotion affects or “influences” other persons, and work outcomes, can in principle be answered by neuroscience. Unlike folk psychology, it investigates the origins, nature, and mechanisms of emotion and emotion transmission. The most basic form of transmission is known as *emotional contagion*. It refers to the human tendency automatically to mimic another person in regard to facial expressions, vocalizations, postures, and movements. This tendency has been studied especially in regard to empathy, also mentioned as fundamental in the leadership literature. It was found that humans do not empathize all the time and that an emotional connection and response is subject to an appraisal process and thus not merely automatic. Whether the actual neural mechanisms that generate empathy are primarily mirror neurons, as has been suggested, is still a matter for debate. However, there seems to be scientific consensus that human brains are hardwired for emotional, or broadly, social connectivity, regardless of what the actual neural mechanisms are that make this possible.

Conclusion

The discussion of and recent emphasis on emotion in education and educational leadership has rightly drawn attention to a neglected domain of human behavior. As mental phenomena, emotions are described in the language of folk psychology as this is the oldest and most deeply rooted language we have in which to express them. The acknowledgement that emotions, whether positive or negative, have an important role to play in education and educational leadership opens up a new dimension for research. While the phenomenological descriptions of emotion in leadership and classroom studies will continue to be necessary, and while the emphasis on social, cultural, gender, and power frameworks adds important dimensions to understanding emotions in broader contexts, these descriptions do not tell us what emotions are, why they work, or fail to work the way they do, how we can read or misread them,

and how emotions get shared in the first place. The language of folk psychology is not fit for this task, and is likely to be replaced, step by step, by the language of neuroscience that offers a causal account of the nature and origins of emotion and the mechanisms that make sharing between humans possible at all. The investigation of emotion sharing, from neurobiological perspectives to social–political environments, has barely begun. But the better we understand how brains and bodies produce emotion, the better we will be able to understand human behavior in its complexity, including what is referred to as “influence,” a feature commonly believed essential for leadership. The neuroscientific evidence we have so far about biological brain architecture and how brains actually work has already contributed to the elimination of one highly influential philosophical dichotomy, that between reason and emotion, that has underpinned education and educational administration theory and practice. Rational decision-making, it turns out, is not possible in the absence of emotion. Whatever effective leadership may turn out to mean, understanding the causes of such human mental phenomena as emotions is an indispensable prerequisite.

Educational Policy and Administration

Michael A. Olicker
Midwest Philosophy of Education Society,
Chicago, IL, USA

Introduction

In my 1992 Midwest PES paper “Analytical Philosophy and the Discourse of institutional Democracy,” I briefly discussed the hostile criticism of Analytical Philosophy of Education (APE) by Professor Walter Feinberg and contrasted it with

Prof. B. Paul Komisar’s analytical discussion of the various forms of discourse in education. Contrary to Feinberg’s caricature of APE, Komisar does not restrict himself to analyzing “crystallized concepts” nor does he ignore “struggles over meaning.” “Komisar identifies four major categories of discourse in education, one of which is termed “Political Discourse.” The three kinds of Political Discourse in education are (1) Philosophy of Education, (2) Policy Discourse, and (3) Publicity Discourse. All of these uses of language in education can be vague or ambiguous and can serve as the battleground in Feinberg’s “struggles over meaning.”

In this paper, I shall examine some key concepts, images, and ideals that are the subject of controversy in educational policy-making and administration with the goal of showing the contribution that a philosopher of education can make toward understanding “struggles over meaning” in policy and administration. Let me state for the record that I reject the view that the proper task of the philosopher in this area would be to show the “implications for policy and administration” “of various “schools of thought” in academic philosophy and to urge practitioners to make a dogmatic commitment to a single “ism.” I suspect that my writing shows the influence of many of my teachers, colleagues, and students and the different views that they hold.

Policy and Administration

Educational policy and administration deal with the actual conduct and operation of educational institutions. A perennial problem for the philosopher of education is to demonstrate a connection between educational ideas and actual organizational processes. A possible strategy is to show that a particular ideology has become the basis for human action by showing that a proposed system of rules that the ideology advocates is actually followed. According to James E. McClellan (1968), policy-making is itself a rule-directed activity that generates the rules that govern the activities of office holders in an institution. Administration is commonly characterized as the

Author was deceased at the time of publication.

maintenance of the rules that govern an institution (Lipham 1964). For McClellan, the process of policy-making must ideally: (1) acknowledge conflicting interests, (2) be generated by an organization that carries on a public and reasonable debate, and (3) produce rules that can be actually enforced. James M. Lipham contrasts “administration” and “leadership,” identifying “leadership” with activities intended to change the rules of an institution while “administration” maintains those rules. Notice that McClellan’s definition of “policy” is programmatic in that it treats policy-making as a rational process. An older distinction – going back to Woodrow Wilson (1856–1924) – contrasts administration and politics and identifies “administration” with rational organizational analysis and “politics” with irrational social conflict.

Notice that in the above analysis, I employ John Rawls’s notion of an “institution” as an analytical tool. Educational policy and administration take place within the context of educational institutions. For Rawls, an institution is “a public system of rules which defines offices and positions with their rights and duties, powers and immunities, and the like. These rules specify certain forms of action as permissible, others as forbidden; and they provide for certain penalties and defenses when violations occur (51).” While John Rawls is not an analytical philosopher, I shall employ his metaphor in an explanatory fashion (see Pepper 1982). I have already attempted to show conflicting uses of “policy” and “administration” in the writings of McClellan, Lipham, and Wilson. Now I shall use Rawls’s metaphor as a “meta-metaphor” in an analysis of four metaphors that have had major historical influences on the practice of educational policy and administration.

An educational institution may be either an instrumental system (IS) or a noninstrumental system (NIS). In an IS, the institution exists to achieve a goal and the lack of attainment of the goal may threaten the existence of the IS. In an NIS, the institution exists because the activities that go on within the institution are seen as worthwhile – period. Also the rules that govern the institution may be either a tightly coupled system (TCS) or a loosely coupled system

(LCS). A TCS has strict, precisely defined rules that prescribe virtually every activity that office holders participate in. In an LCS, the rules are vague or ambiguous and subject to continual reinterpretation. In the next section, I will describe four metaphors for educational administration that can be put into practice and become full-blown ideologies: the temple, the traditional factory, the human relation-oriented version of the factory, and the jungle (see March 1972; Weick 1982).

1. In the temple, the school is a TCS and an NIS.
2. In the traditional factory, the school is a TCS and an IS.
3. In the human relation-oriented factory, the school is still an IS but has become an LCS.
4. And in the jungle, the school has become an LCS and may be an NIS. (But the jungle institutions may not survive for long.)

Administration and School Images

Terrence E. Deal and Martha Stone Wiske see both policy-making and administration as heavily influenced by one’s vision of schools as organizations or school images. They identify three metaphors – the factory, the jungle, and the temple – as the bases of three contemporary school images. The main section of this article will discuss the history of these school images. The final section of this article will address parallels between the philosophical reflections on educational policy of Thomas F. Green and John Dewey and the policy-making of James B. Conant and his archenemy Frederick M. Raubinger.

The School as a Temple

The metaphor of the school as a temple places the administrator in the role of a priest whose task is to enact rituals and ceremonies that maintain the faith. William Torrey Harris (1835–1909) – a well-known advocate of idealistic philosophy – rose to the position of Superintendent of Schools in St. Louis and subsequently served as US Commissioner of Education. Harris

would have insisted that only those activities carried on through social institutions have educational value (Dunkel 1973). In the nineteenth century, States increased the power of school administrators (Karier 1982). William Estabrook Chancellor (1867–1963) narrowed William Torrey Harris's faith in American institutions to a faith in public schooling. Chancellor was contemptuous of politicians and businessmen. He explicitly compared schooling to religion and superintendents to ministers. Chancellor advocated an increased authority for school administration and the abolition of school boards. Like his hero Woodrow Wilson, Chancellor sought to separate administration from politics. Ironically, in 1920 Chancellor's career temporarily ended because he became involved in a smear campaign against presidential candidate Warren G. Harding. He was dismissed from his teaching position, hunted by a lynch mob, forced to leave the country, and had his book on Harding burned by Harding Administration. Books on school architecture of the late nineteenth century explicitly referred to the school building as a temple (Cutler 1989). After several years as a traveling salesman in Canada, Chancellor returned to the United States and resumed his teaching career (Mason 1986; Russell 1968).

The School as a Factory

Chancellor's textbooks were displaced by those of Ellwood P. Cubberley (1868–1941). While Cubberley was sympathetic to Chancellor's authoritarian views, Cubberley's ideology was based on a different metaphor: the factory. Cubberley sought to establish a profession of educational administration, promoted the use of intelligence tests as a selection device, and urged the increased presence of businessmen on school boards. The rhetoric of the school as a temple was being displaced by the new rhetoric of efficiency (Scott 1915). Like Chancellor, Cubberley deplored the presence of women and minorities on school boards, but unlike Chancellor, Cubberley idolized businessmen. He saw children as the product of the school as factory – designed by the professionals to meet the needs of society. Cubberley saw the American educational

system as the apex of civilization and the professional school administrator as one of history's greatest heroes. But – like Chancellor and Wilson – Cubberley sought to free administrative decision-making from the conflicts of politics. Cubberley believed that the presence of businessmen on school boards would give the professional school administrator greater freedom of decision-making (Callahan 1962).

The Human Relations Approach

Douglas McGregor (1906–1964) opposed the authoritarian inclinations of both the temple model and the factory model. He studied psychology at Harvard during the 1930s – a time when Harvard psychologists sought to identify themselves as scientists and divorce themselves from philosophy. Like many early writers on organizational behavior, he based his views of organizations on means-ends rationality and argued that, in a congenial work environment, employees will seek to integrate personal objectives with organizational goals. McGregor deplored the carrot and stick approach to management. As President of Antioch College from 1948 to 1954, he sought to include students, faculty, and blue-collar workers in discussions of college policy, but his openness left McGregor vulnerable to the machinations of professional anti-communist informers who were willing to spread outright lies about student activities on the Antioch campus. In McGregor's view of management, we see a tension between the rhetoric of the democratic institution and the image of the school as a factory (Oliker 1976).

The School as a Jungle

A 1960 paper by McClellan applauded administrators' efforts to develop scientific administrative theory but warned that the then new behavioral science-based administrative theory assumed a centralized model of decision-making. But the administrative theorists discussed by McClellan may have been engaged in wishful thinking. During the mid-1950s, a popular film (based on a popular novel) introduced a phrase into the national vocabulary that contained a new and disturbing metaphor for the school: The Blackboard Jungle (see Hunter 1955).

The need for constant negotiations, the exercise of power, and the flux of symbolic meaning that are characteristic of the school as jungle seem to be the school image that informs the administrative theory of James G. March – a distinguished social scientist on the faculty of Stanford University. During the 1970s, March conducted extensive studies of college presidents and school superintendents. His resulting works can be understood as a rejection of most of the assumptions of educational administration theory in the twentieth Century. Specifically, March rejects the assumptions that: (1) organizations exist to achieve goals; (2) individuals act on their beliefs; and (3) only actions based on goals or beliefs are rational. He sees schools as “organized anarchies” or “loosely coupled systems” which have ambiguous goals, unclear relations of means and ends, and decisions made in the context of chance interactions of people, problems, and solutions. For March, actions on the basis of intuition and tradition are just as rational as actions toward a goal mind. His work even hints at a convergence with the long-forgotten views of W.T. Harris. March’s disciple Karl E. Weick urges school administrators to consider the leadership style of a clergyman as possibly more appropriate to schooling than that of a management scientist.

Ideals of the Educational System: Democracy or Rationality?

While the metaphors of temple, factory, and jungle do seem to identify four kinds of educational institutions, we lack any clear intuitive characterization of educational systems. And the question of the very existence of educational systems is still controversial in some circles. Philosophical inquiry about educational systems and the making of educational policy at the national level seems to involve at least three central questions:

5. Does nation N have a system of education?
6. Can policy for that system be made rationally?
7. Can policy for that system be made democratically?

According to Thomas F. Green, the Educational System began to take shape around 1910. The System is a well-organized institution defined by rules that operate with the rigor of an Aristotelian practical syllogism. The System as Green sees it as composed of primary and derivative elements.

The primary elements are:

- P1: Schools
- P2: A medium of exchange
- P3: A principle of sequence

While the derivative elements are:

- D1: Size
- D2: A system of control
- D3: A distribution of goods

And the System “behaves” according to such laws as:

- L1: The Law of Zero Correlation
- L2: The Law of Last Entry
- L3: The Principle of the Moving Target

Green paints a picture of the System as a well-programmed computer that will continue to function in spite of the misguided (he thinks) efforts of reformers. This claim may be reassuring to the conservative who fears the breakdown of the System, but it is hardly reassuring to those who see the System as perpetuating social injustices. Green’s L1 asserts that educational credentials become worthless once everyone attains them. L2 can be summarized as the claim that the least advantaged social groups cannot benefit from the System until the higher status groups have exhausted the System’s resources. And L3 maintains that the attainment of educational credentials can change from being sufficient conditions for social status to being necessary conditions.

Why did the System come into being? In the nineteenth century, a wide variety of schools existed with drastically different functions. John Dewey favored the organization of a national system of education as an expression of the evolution

of America into a democracy. In teacher education the normal schools which taught teaching methods existed completely separate from university education departments which prepared educational researchers. Dewey's ideal was a unified college of education that integrated both functions and prepared teachers in the public interest.

Dewey would have rejected Green's suggestion that the logic of the educational system is unassailable by any external standards. He warned in a 1903 paper entitled "Democracy in Education" that the authority structure of any kind of educational institution must be evaluated by the standard of whether it impedes or encourages the freedom of thought that is necessary in a democratic society. Thirty-five years later, Dewey reiterated this point in a paper entitled "Democracy and Educational Administration." In that paper – an address to a group of school administrators – he chided his audience for their failure to develop structures that allowed teachers a sufficient role in decision-making.

The conflict between the views of Green and Dewey on educational policy-making can be termed a conflict between rationalist and democratic philosophies. This conflict is not just a theoretical debate for the philosophy of education classroom. During the 1950s and 1960s, New Jersey State Commissioner of Education Frederick M. Raubinger (1908–1989) attacked the work of the Educational Testing Service – located in Princeton, New Jersey – and its guiding inspiration former Harvard University President James B. Conant (1893–1978) as an undemocratic elite who had seized educational policy-making from public officials. Like Chancellor, Conant was fond of dismissing critics of public education as being misinformed. Raubinger, by contrast, was a firm believer in local control of education (Shine 1975) who devoted an entire chapter of his 1974 educational administration textbook to a discussion of democratic theory. In the early 1970s, Conant sought to establish the Education Commission of the States which took as its mission the expansion of the 2-year community colleges.

Raubinger pointed out in 1972 that the ECS has also sought to increase the power of the 50 State governors over educational policy at the expense of education officials. In his autobiography "My Several Lives," Conant clearly advocated the expansion of the 2-year college at the expense of the 4-year college. Because of the influence of Conant and the ETS, Raubinger was forced to resign as New Jersey State Commissioner of Education in 1966. From 1966 to 1976, Raubinger taught in the Department of Educational Administration at the University of Illinois at Urbana-Champaign.

During the 25 years since Conant completed his autobiography, the 2-year college has continued to be the subject of fierce debate (Levinsohn). The conceptual framework of this entry can illuminate controversies over this new kind of institution. The earliest type of 2-year college – the junior college – satisfied a public demand for access to higher education while rationally fitting into the educational system and enabling students to transfer to bachelor's programs. But the junior college was never seen as a "temple of learning" like the traditional university. Almost immediately, the factory model of administration with greater emphasis on vocational education and a rational fit with the job market became the controlling ideology of the junior college. However, recent demands on these institutions by ethnic minorities have placed faculty in a jungle environment wherein the role of the teacher is poorly defined. Cynical administrators see this situation as an opportunity to deprofessionalize teaching and expand vocational programs that do not terminate either in a degree or in the opportunity to transfer to a bachelor's program. But newer non-degree programs and the reduction of faculty can be seen as antagonistic to the demands of the community for more course offerings. Jungle-oriented administrators' attempts to save money may backfire and antagonize the community and threaten the survival of the institution. Perhaps a return to the more ministerial role by educators that was characteristic of the school as temple could even be defended as democratic (see Weick 1982)!

Introduction

This entry addresses the action theoretical semiotics derived from A. J. Greimas's theory and positions it in the context of edusemiotics. Greimas's narratological theory is discussed and investigated in terms of its fruitfulness for education. The entry focuses on the major features of Greimas's theory such as his famous actantial model as well as the anthropomorphic, or human- and subject-centered, approach in general. According to Greimas, at the core of the meaning of every significant discourse, there lies a typical human situation within which the actants – or entities that assume certain roles in a narrative story – function as Subject and Object, Sender and Receiver, and at times also as Helper and Opponent. Greimas's central analytic tools, the semiotic square and the generative model, are interpreted in dynamic terms and applied to the analysis of education as a meaningful practice. These tools help us see education as a value-based action and shed a critical light on the presupposed dualism between nature and culture in the context of education. For the analysis of

action, Greimas's major concepts prove themselves to be especially useful. The conception of competences expressed, specifically, in modal verbs such as *want*, *can*, *know*, and *must* is significant for education. As such, education becomes an action that strives to develop students' competences. In this action, the roles of teacher and student are dynamically differentiated. While a student acts as a Subject actant, a teacher acts as a Sender. The role of Sender is, however, shifting, thus defying the solely central position it assumed during the beginning and ending phases of the narrative, edusemiotic process.

Why Greimas?

A. J. Greimas (1917–1992) is one of the most important semioticians and the founder of the Paris school of semiotics (Perron and Collins 1989). Starting as a linguist specializing in semantics, he contributed to the Continental semiotics founded by Saussure and was also influenced by such important structuralists as Barthes, Levi-Straus, and Hjelmslev. He then turned to narratology by way of Propp and developed his theory in the direction of the anthropomorphic analysis of subjectivity. In *Structural Semantics* (Greimas 1976) he stated the famous actantial model: Subject, Object, Sender, Receiver, Helper, and Opponent. The most comprehensive, though quite a desultory, presentation of his theory is in *Semiotics and Language: An Analytical Dictionary* (Greimas and Courtés 1982). For Greimas, semiotics is not the study of discrete signs but rather of the continuous signification process: the articulation of meaning that takes place in the two macrosemiotic systems of natural languages and the natural world. Thus, Greimas's theory is not restricted to the linguistic sphere. The concept of a sign as a Saussurean relatively fixed dyadic combination of content and expression is not as important to him as either the smallest signifying elements (semes) of which every sign is composed or the larger signifying wholes, meaningful expressions or discourses, which are the main research object of his semiotics. The two famous

tools for semiotic analysis developed by Greimas are the semiotic square and the generative model.

Like Peirce, Greimas was striving for a theory of semiotics as empirical science using a hypothetical–deductive method with formal metalanguage. Yet he shunned metaphysical speculation and did not, in contrast to Peirce, appreciate any ontological interpretation of his theory (Greimas 1987). Greimas’s semiotics employs three levels of metalanguage. The signifying expression (the whole) is to be translated into a language of description which then must be “interpreted” in methodological language forming the second level. Thirdly, methodology must be explicated in epistemological language. This structure offers a way to keep research under conceptual control and normatively neutral.

The Semiotic Square

The semiotic square is a heuristic device suitable for analyzing both the smallest semes and the fundamental structure of discourse as a whole. Such analytic tool is based on the basic structuralist idea of binary opposition. For Saussure (1983), the meaning of a sign – a word – depends on its negative relation to other words in that it does *not* mean what other words mean. This relationship is not simple; one sign can differ in multiple ways from another. In Greimas’s semiotic square, there are three kinds of relations: contrary (horizontal, incremental, inclusive, permissive), contradictory (diagonal, absolute, exclusive, negation), and complementary (vertical, conditional, presupposing). The term under investigation is placed in the upper-left corner and, if some other terms can be placed in other corners, then its “meaning” is known! (Fig. 1). For example, if the sign being studied (S1) is *masculinity*, then the contrary term (S2) would be *femininity* and a contradictory one would be *non-masculinity*, which is the complementary term to femininity; respectively, non-masculinity is complementary to femininity. It is important to acknowledge that there is a dynamic model built into the semiotic square; a

Educational Semiotics, Greimas, and Theory of Action, Fig. 1 The semiotic square

sign (or thing) can change to the contrary only via negation: from S1 you can get to S2 only via non-S1.

The Generative Model and Values

The generative model is a process–structure used to analyze a discourse as a whole by differentiating between its deep and surface structures. The deepest level represents the fundamental *value* structure analyzed with the semiotic square. At the *semio-narrative* level, the Subject interacts with other actants, eliciting action motivated by the fundamental value structure. This surface level is still abstract. All the concrete details, such as individual actors, their features, and time and space relations, appear at the third discursive level. As a heuristic device, Greimas’s model does not claim to be realistic; rather, it depicts metaphorically the creation of meaning from an abstract idea to the concrete story or expression: from surface to depth. The fundamental, or basic, values can be individual or social, depending on the type of discourse. If the discourse belongs to idiolects (i.e., its meaning is individually based), then the basic value structure is Life vs. Death. The basic values of sociolect (or collective) discourses are Culture vs. Nature. These values can be positioned in a semiotic square, and it can be seen that the value balance can be shaken if the other is negated to contradiction. For example, in the folkloric fairy tale as a traditional subject matter of research in narratology, when a dragon steals the Princess, this manifests a negation of

Culture to Non-Culture, eliciting a strong axiological evaluation: Culture is good, Nature is bad. This imbalance of values is the motivation for the Sender actant, the King, to send the Subject actant, the Prince (usually a foreigner), to negate Nature by killing the dragon and to return Culture to its safe position by rescuing the Princess. The actants' actions can be analyzed as narrative programs and schemas, for which Greimas developed the formal metalanguage of description.

Dispositions are important because all the dynamics of being seems to be based on them. A helpful way to see the relation between dispositions and qualities is that they are just two sides of the same coin. The manifestation of any quality is based on a disposition of being, and any disposition can manifest in a certain situation. Just as the way that any being manifests qualitatively and quantitatively in its environment is based on its dispositions, the Subject's action is based on its competences (Pikkarainen 2014).

Modality and Competence

Greimas's crucial theoretical invention, from the point of view of edusemiotics, is the conception of modalities, specifically related to the concept of competence. The modality is something which modalizes or transforms one sign into another. The basic modalities are *being* and *doing*, which reciprocally modalize each other. The easier case is doing, which means causing something to be. Doing causes a change in the properties of an Object, so it causes this object to be other than it was before, and thus it modalizes its being. Reciprocally, the being of the Subject modalizes its doings. A particular kind of being – certain properties of the Subject which cause or make it possible for it to do something – is competence. Greimas discussed education, and specifically didactics, as an activity that edifies the competence of the student (Greimas 1979). Even more important for the study and practice of education are *modal competences*, which refer to the idea expressed in natural language by modal verbs: *want*, *can*, *know*, and *must*. These modalities also serve as the keys to the semiotics of passions (Greimas and Fontanille 1992).

The concept of competence can be compared to the ontological concept of disposition. The possible properties of any being are often divided in two categories: *dispositions* and *qualities*. The latter are regular features like size, color, height, weight, etc. Dispositions – such as *fragility* – are strange, however, because they are not at all perceivable and manifest only in certain situations. Fragility manifests only when the fragile being breaks. Often a disposition is then also gone.

The Structure of Education

How can the meaning of education as a practice be analyzed using Greimassian tools? Contemporary education has a sociolectal rather than idiolectal character, even though it includes idiolectal meanings (especially from the students' viewpoint). The basic tension of modern pedagogy, known after Kant as the *pedagogical paradox*, is the tension between freedom as a goal of education and coercion as its means. Complementary to this is the tension between an individual and society as a whole. These two dimensions form a cross-table of four areas or principles. Two of these principles are rather traditional content and expression, stemming from the days of Fichte and Herbart. The first is a student's ability for growth as a natural feature, referred to as *perfectibility* by Rousseau and *plasticity* by Dewey. The second is the demand by educators for autonomous action from their students. These are still individual principles. The social side encompasses the principle of contextuality or the effect of prevailing culture on education, hopefully eliciting a better future for society (Mollenhauer 2014).

An analysis of the basic values of education is beneficial at this point. The strongly one-sided axiological evaluation of the value structures of discourses typical to archaic folklore is problematic in the context of contemporary education. The paradoxical tensions in education suggest that one cannot choose either side – Nature vs. Culture – or even strive for harmony between them, because the essence of modern education is based precisely on the dynamic contradiction between

**Educational Semiotics,
Greimas, and Theory of
Action, Fig. 2** Semiotic
square of education

them as informed (even if implicitly) by Cartesian dualism between body and mind. Therefore, positioning the abovementioned principles of the theory of pedagogical action in the corners of the semiotic square is appropriate (Fig. 2). The individual growth-ability (the presupposed competences) represents Nature, the demand for autonomous action (teaching) represents Non-Nature, contextuality represents the prevailing Culture, and a better future represents Non-Culture. According to this analysis, there is in education a double-dialectical process where the negation of Nature (e.g., discipline) makes cultural existence possible and the negation of Culture (e.g., critical education) makes natural existence possible. This dialectic assists in resolving the problem between dichotomized views of education as a tool to radically transform society and also as a tool to secure the cultural status quo.

The Role of the Teacher

In order to construct a semio-narrative actantial structure of pedagogical action, some classical Greimassian conceptions are to be revisited. One concerns the actantial roles: Who is the Hero in (as a Subject of) educational process? If teacher or educator is the Subject, then what is the role of the student, and vice versa? The canonical narrative schema of a Subject posits a sequence of acts or

the Subject's trajectory consisting of three trials or tests: qualifying, decisive, and glorifying. In the first test, or *manipulation*, the Sender evaluates the competence of the Subject and makes an initial contract. In the second test, called *performance*, the Subject, who acts according to their competence and the initial contract, tries to solve the problem. In the third test, called *sanction*, the Sender/Receiver evaluates the competence of the Subject according to their accomplishments and either accepts or rejects them. Hence, the student is the Subject, and the teacher is the Sender. However, from the edusemiotic perspective, the teacher is also subject to analysis in terms of teaching and evaluation, thus becoming both a Sender and a sent Subject trying to advance and protect the Culture (now attuned with Nature) by developing students' competences.

Educators aim to affect the future actions of students by causing changes to their competences. Competence is a strange property: it is not directly perceivable but can only be inferred and assumed according to the perceivable *action* of the Subject. The evaluation of competence is thus complex. To affect someone's competence is even more complex. Three ways to change a Subject's competence can be posited: by pure chance, with no special or known reason; by means of biological maturation, or decay, or physical injury as causally effable properties; and by *learning* wherein competence changes along with the actions of

Subjects. The only efficient way to affect students' competence, therefore, is for teachers to make them do something by sending them to perform (Pikkarainen 2010).

Action, Learning, and Teaching

Greimas describes action as merely a sequence of narrative programs or individual acts where an actant causes something to be. Formally, a narrative program is expressed as $A1 > (A2 \text{ and } Ov)$; this can be read in terms of Actant 1 causing Actant 2 to get a value-object, i.e., some property. This sequence is in line with the classical analytic theory of action. In action theoretical semiotics, however, action is understood broadly as a continuous circular interaction between Subjects and their environment. Such a circle includes reciprocal effects: The deeds or narrative programs travel from the Subject to the environment. As a recursive feedback from the environment, perceptions travel to the Subject. Also, external and internal actions are differentiated, with the latter referring to the Subject's thinking in terms of planning deeds and evaluating perceptions and the former as perceivable by an observer. The deeds affect the objects in the environment, but the internal action is not effable to an observer. Both spheres of action cause, or can cause, some changes to the competence of the Subject. If and when people act, they always learn something. There are no strict laws about what kind of learning follows from particular kinds of action, yet it can be assumed that doing X will develop the competence of something more or less similar to X.

Teaching thus becomes *action* when and where one is trying to make another person do something that would cause the latter to learn what needs to be learned. Even though the two actors can be *one* person (as in the case of *self-education*), the same questions arise: How can someone know which competences are possessed and which are still needed? Exactly what needs to be done to obtain the needed competence and how can this be achieved? While some of these problems can be

partially solved by the curriculum, educators need to develop interpretive skills as a province of edusemiotics so that they can fully tackle their tasks.

Modal Dynamics and the Levels of Learning

Modal competences affect our actions and our learning in a certain structural way. Unlike Greimas's semiotic square, the structure presented here can be drafted as a circle. The natural starting point for the analysis of the circular structure is the modality of *want*. Action is always elicited by some kind of wanting to do, or to get, something. The next modality is *can*, which may be realized or not. If it is realized, then the Subject gets what is desired, but often the trial remains unsuccessful. Both successful and unsuccessful trials in different environments will lead to some kind of knowledge, which would then increase the probability of success. The last modality is *must*, which directly affects *wanting* as a kind of second-order relation. Secondly, the various levels of learning can be differentiated. The lowest level is connected with the material striving for self-maintenance and survival: learning here is *pragmatic*. The nature of the *must* modality is peculiar to this level and can be expressed in the technical, "if...then," terms: if you want X, then you must do Y. The second, and very broad, level is *social learning*, where complex collections of actants participate in different actions. Here, the Subject must take into account the other ways of wanting and acting expressed by all members of society, and the *must* modality can become a form of social norm. At this level, the language develops that creates a special area of shared and public knowledge. This, in turn, leads to the third and highest *existential* level of learning. This is the level at which human Subjects develop proper conscience, i.e., a sense of individual and universal moral responsibility. Edusemiotics not only reconceptualizes Greimas's theory but also calls for the continual research into the modalities of competence that enhance learning and ensure

ethical relations between teachers, students, and larger environments.

Brazil

Technology

There are many ways of understanding technology. In this entry, technology is conceived, in a very broad manner, as any human artifact, method, or technique that is created for the purpose of making it easier for man to work, travel, or communicate or to make life more fun and enjoyable to him.

Technology, in this sense, is not new – as a matter of fact, it is almost as old as man, homo creator, himself.

Not every technology invented by man is relevant to education. Some technologies only extend his muscular physical strength. Other technologies only allow him to move through space more quickly and/or with less effort. Neither of these are greatly relevant to education. Technologies that amplify man's sensory powers, however, no doubt are relevant to education. The same is true of technologies that extend his capacity to communicate with his fellow men. But above all, this is true of technologies, such as are available today, that augment man's intellectual powers: his capacity to acquire, organize, store, analyze, relate, integrate, apply, and transmit information.

Technologies that greatly amplify man's sensory powers (such as the telescope, the microscope, and all the other instruments that amplify man's sense organs) are relatively recent and made modern experimental science possible.

Technologies that extend man's capacity to communicate, however, have existed for centuries. The most important ones, before the nineteenth century, are the invention of typically human (conceptual) speech, of alphabetical writing, and of printing (especially the printed book). The last 200 years saw the appearance of the modern post office, the telegraph, the telephone, photography, cinema, radio, television, and video.

Technologies that augment man's intellectual powers and that are centered on the digital computer are the most recent, since they were developed mostly after 1940. The computer is gradually absorbing the technologies of communication, to the extent that these become digital.

Technology in Education

A variety of expressions is normally employed to refer to the use of technology, in this sense, in education. The rather neutral expression “Technology in Education” seems preferable, since it allows us to refer to the general category that includes the use of every form of technology relevant to education (hard and soft, including

human speech, writing, printing, curricula, programs, chalk and blackboards, and, more recently, photography, cinema, radio, television, video, and, naturally, computers and the Internet).

It is admitted that nowadays, when the expression “Technology in Education” is used, hardly anyone thinks of chalk and blackboards or even of books and magazines, much less of something abstract such as a curriculum of studies. Attention is normally concentrated on the computer, because it became the point of convergence of all the more recent technologies (and of some of the old ones also). And especially after the explosive commercial success of the Internet, computers are hardly ever thought as standalone equipment: the network became the computer.

It is sensible, however, to remind educators that human speech, writing, and, consequently, lectures, books, and magazines, not to mention curricula and programs, are technology and that, therefore, educators have been using various technologies all along. It is only their familiarity with these technologies that somehow makes them transparent (i.e., invisible) to them.

“Technology in Education” is preferable, as an expression, to “Educational Technology,” since the latter seems to imply that there is something intrinsically educational in the technologies involved, which does not seem the case. The former expression allows for the possibility that technology that was invented for purposes totally alien to education, as is the case of the computer, may, eventually, become so tied to it as to make one wonder how education was ever possible without it. Human conceptual speech, writing, and, more recently, the printed book were also invented probably for purposes less noble than education. Today, however, education is almost inconceivable without these technologies. In a few years the networked computer will almost certainly be in the same category.

Distance Education, Distance Learning, and Distance Teaching

Of these three expressions the third is probably the least used and yet, it is the only one that is technically correct.

Education and learning are processes that take place within the individual – there is no way that education and learning can occur remotely or at a distance. Education and learning occur wherever the person is – the person is, in central and very important ways, the subject of the educational and learning process, not its object. So, it is difficult to imagine how Distance Education and Distance Learning are possible, despite the popularity of these expressions.

It is perfectly possible, however, to teach remotely or at a distance. It happens all the time. Saint Paul taught, from a distance, the Christian faithful who were in Rome, Corinth, etc. – using handwritten letters. Authors, distant in space and in time, teach their readers through printed books and articles. It is possible to teach, remotely or at a distance, through motion pictures, television, and video. And, today, we can teach anyone, almost anything, any place, through the Internet.

So, the expression “Distance Teaching” will be used in this article whenever there is need to refer to the act of teaching remotely or at a distance. That education and learning can happen as a result of this teaching is undeniable, but, as argued, this should not lead us into thinking that the education and the learning taking place as a result of remote or distance teaching is occurring remotely or at a distance.

Technology-Mediated Learning

Despite its popularity, distance teaching is not the best application of technology in education today. This place should be reserved to what might be called Technology-Mediated Learning.

As mentioned, there is no doubt that education and learning can occur as a result of teaching. But neither is there doubt that education can occur through self-learning, i.e., the kind of learning that is not associated with a process of teaching but that occurs through man’s interaction with nature, with other men, and with the cultural world. A large portion of human learning takes place in this form, and, according to some researchers, learning that takes place in this form is more significant, that is, happens more easily, is

retained longer and is more naturally transferred to other domain and contexts, than learning that occurs as a result of formal and deliberate teaching processes (i.e., through instruction).

What is especially fascinating in the new technologies at our disposal today, particularly in the Internet, and, within it, in the Web, is not that with their help we can teach at a distance, but that they allow us to create rich learning environments in which persons who are interested and motivated can learn almost anything without having to fall victims of a process of formal and deliberate teaching. Learning, in this case, is mediated by technology alone.

There is no doubt that behind the technology there are other persons, who prepare the materials and make them available in the net. When someone uses the resources now available in the Internet in order to learn in self-motivated, exploratory fashion, he uses materials of different natures, prepared and made available in the most widely diverse contexts, not rarely without any pedagogical intent, and he does it in an order that is totally unpredictable, and that therefore cannot be planned, and in a rhythm that is totally personal and regulated only by the desire to learn and the capacity to assimilate and digest what he finds.

Because of this, it does not seem viable to call this experience Distance Teaching, as if it were the Internet that taught, or as if it were the people behind the materials that taught. What is taking place in a context such as the one described is Technology-Mediated Learning, self-learning, that is, learning that is not the result of teaching.

Consequently, the main categories in which the possible uses of technology in education can be classified are:

- In support of Face-to-Face Teaching
- In support of Distance Teaching
- In support of Self-Learning

The Justification of Distance Teaching

Many people might feel inclined to justify Distance Teaching by simply asking: "Why not?"

However, there are good reasons to discuss whether Distance Teaching is justified, what justifies it, and what its merits are relative to Face-to-Face Teaching.

On the one hand, there are those that assume that Distance Teaching does not substantially differ from Face-to-Face Teaching. If teaching is good, and it is possible to teach at a distance, then we should do it.

On the other hand, there are those who see advantages in Distance Teaching in comparison to Face-to-Face Teaching: greater reach, better cost/benefit ratio, and, mainly, greater flexibility (for both teachers and learners), since they believe Distance Teaching can become so personalized as to become individualized instruction.

Over against these two favorable positions, there are those who think that in Distance Teaching one loses the personal dimension that, even though not necessary for teaching itself, may seem essential to effective teaching.

Are Face-to-Face and Distance Teaching Equivalent in Terms of Results?

Leaving aside, for the moment, the second position, there is an obvious contradiction between the first and the third position, since defenders of the first assume that there are no substantive differences between Face-to-Face and Distance Teaching (the "virtual" character of Distance Teaching not being considered essential), while defenders of the third position believe that the "virtuality" (or remote character) of Distance Teaching removes from the teaching relation something important, or even essential to it, namely, its personal character, which, according to them, is what makes teaching effective.

Who Is in the Right in this Dispute?

A qualified agreement with the first position seems justified. Teaching involves three elements: the teacher, the learner, and that which the teacher teaches the learner (the "content"). For the teacher to teach the content to the learner, it is no longer necessary, today, that they should both be in spatial-temporal contiguity that is, that they share the same space at the same time.

Socrates insisted (against writing-based teaching) that spatial-temporal contiguity between teacher and learner is essential to teaching, but only because he did not know, and could not even imagine, contemporary telecommunications. Because of this, he claimed that distance teaching (in his case, writing-based teaching) prevented dialogue, questioning and answering, real personal communication between the agents involved (teacher and learner). His argument obviously does not apply today.

The personal character of a relationship, today, is independent of physical proximity in space and time. It is possible, nowadays, to maintain extremely personal – even rather intimate – relationships at a distance, using modern means of distance communication, involving text, sound, image (static and dynamic). On the other hand, mere spatial-temporal contiguity is not guarantee of truly personal relationships. The very large classrooms that exist in some schools often lead to a highly impersonal relationship between teacher and learners, despite their proximity in space and time. Many times, in these contexts, the teacher does not even know the name of the students and is totally ignorant of their personal characteristics, which are highly relevant to effective teaching.

This said, it must be admitted that, other things being equal, face-to-face, eye-to-eye communication allows for more effective teaching than does remote communication, even when the most modern means of distance communication are employed. In face-to-face communication one can rather easily detect the nuances of non-verbal sound expressions (the tone, pitch, and volume of the voice, the rhythm of the speech, the pauses, the subtle emphases) and of body language (especially facial expressions [in which eye contact is perhaps the most significant aspect], but also posture, hand, arm, and leg position, the possibility of touch and other forms of physical contact, etc.).

(This consideration is important for something that is going to be claimed below, namely: if a model of teaching does not work under the best conditions, why should it work when conditions are not so favorable?)

Does Distance Teaching Offer Advantages vis-à-vis Face-to-Face Teaching?

Let us consider, now, the second position described above, namely, that there are advantages to Distance Teaching in relation to Face-to-Face Teaching. If this thesis is correct, the advantages of Distance Teaching may compensate the disadvantage to which attention has just been called.

It was said, before, that the defenders of the thesis that Distance Teaching is more effective than Face-to-Face teaching point to its greater reach, its better cost/benefit ratio, its greater flexibility (both to teachers and learners), and its greater potential for personalization and even individualization.

Reach

There is no doubt that Distance Teaching has greater reach than Face-to-Face Teaching. A program of Distance Teaching such as Brazil's TeleCurso 2000 reaches millions of people each time it is ministered (broadcast) – infinitely more than could be reached if the same course were taught face-to-face.

Cost/Benefit Ratio

Here the question is not so easily decided.

The cost of developing (producing) quality Distance Teaching programs (that involve, for instance, television, or even video, or specialized software) is extremely high.

Besides this, the cost of delivery can also be reasonably high. If these programs are broadcast through commercial television networks, delivery costs can even be higher than development and production costs – with the added disadvantage that delivery costs are recurring, not one-time costs.

Because of this, these Distance Teaching programs only offer a favorable cost/benefit ratio if their reach is really great (reaching, for instance, over one million persons).

It is true that development costs can be divided by the various deliveries of the program. A quality Distance Teaching program can be delivered literally hundreds or thousands of times, while its

development costs remains the same. The only overall cost component affected by the recurring delivery of the program is its delivery cost, a fact that makes its development costs/delivery costs ratio proportionally lower as the number of deliveries increases. If the number of deliveries is not high, however, this reduction in the ratio may not be significant.

Many of the institutions interested in Distance Teaching today are searching for “shortcuts” that will reduce development costs. Unfortunately, these are rarely found without reduction in quality. Instead of using costly communication means such as television and video, these institutions are using predominantly text in the development of the programs and primarily the Internet (Web and e-mail) in its delivery (so reducing both the cost of development and the cost of delivery). In addition, lest development costs are increased, the text components are adapted from texts previously published and not prepared with the Web in view. The result is that these Distance Teaching programs are little more than correspondence courses delivered through the Internet instead of through the conventional post.

It is true that these institutions try to add some value to the texts made available through the Web offering the learners opportunities of synchronous communication with the author of the texts and with each other through dedicated chats. But chats are quite ineffective for this sort of exchange when many people take part in it.

When Distance Teaching is understood basically as a process of making written texts available through the Web and following this with discussion through e-mail e chats, it is not difficult to believe that its cost/benefit ratio will be more favorable when compared to that of Face-to-Face Teaching.

It is important to register here that if the texts thus made available are prepared specifically for the Web, being therefore enriched with structures such as links (hypertext), annotations, commentaries, glossaries, navigation maps, etc., then the efficacy of Distance Teaching can be greatly increased. But this means that teaching materials will have to be rewritten, with the consequent increase in cost.

Flexibility

Given the fact that distance teaching can use both synchronous and asynchronous communication, there is no doubt that, especially when the latter are employed, teachers and learners have greater flexibility to define the amount of time and the schedule that they are going to use for the course. Web pages, databases, e-mail are all available 24 h per day 7 days a week, and so can be accessed according to the greatest convenience of the user.

Personalization and Individualization

It is here that the defenders of Distance Teaching place greater emphasis. Here is what Octavi Roca says, in his article “Education Technologies in Educational Processes” (in *Toward an Educational Technology*, edited by Juana M. Sancho [ArtMed, Porto Alegre, RS, BR, 1998]):

Most education professionals are aware of the fact that individuals are different from one another, have different needs, objectives, cognitive styles, etc., and that, therefore, each individual uses the learning opportunities that are offered to him in ways that are most adequate to his needs, objective, learning style, etc. . . . Thus, it is obvious that teaching must be adapted to all these factors. We have known this for a long time. These differences have always been acknowledged. But, before, they were seen as problems to be eliminated – a difficulty for the teacher. . . . Now, however, we have the means to organize our teaching in full recognition of the fact that the diverse capacities of each person represent a great richness and that teaching must start from that. . . . The end result of this recognition is that teaching will be more and more adapted to each person in particular. (p. 185)

Is it possible to implement these desirable features in Face-to-Face Teaching as it takes place in the school? Maybe – but it seems very difficult, unless the school be somehow reinvented.

Let Us See School, as we know it, cannot really take into account the different needs, interests and learning styles of the learners and offer each of them personalized and individualized teaching because this kind of teaching comes into collision with a basic assumption of the school: standardization and uniformity.

To expect that the school will provide personalized and individualized teaching is equivalent to

expecting that a conventional automobile assembly line will produce cars that are personalized to the individual needs and desires of the customers. This will not work. The assembly line, as we know it, was invented to standardize, to allow that identical cars be made with speed and efficiency. The school, likewise, was created to do something similar in relation to its students. Its model is the assembly line. Its end was to be the production of individuals that, from an educational viewpoint, were as standardized and interchangeable as the automobiles produced in an assembly line. If the students preserve some degree of individuality at the end of their schooling, this will be in spite of the school, not because of its work.

The educational model (or paradigm) adopted by the school is centered on the transmission of information, from the teacher to the learner, through teaching.

This model is outdated – and it is not difficult to see why.

This model is centered on teaching. Teaching is a triadic activity that involves the teacher, the learner (“teachee”), and the content that the former teaches to the latter. Because of this the school gives priority to the content to be transmitted (the curriculum), and, consequently, to the transmitter (the teacher), leaving the learner in the last place – his task is merely to absorb whatever is transmitted to him. Because of this, the school is typically centered on contents and teachers, whereas the opposing tendency described above is centered on the learner (adapted to his needs, interests, cognitive style, and learning rhythm).

What is defective in this conventional model adopted by the school is not the fact that it takes place face-to-face: it is the fact that it is not flexible enough to allow for students with different needs, interests, cognitive styles, and learning rhythms.

Can personalized and individualized education be implemented through Distance Teaching?

If the model employed for Distance Teaching programs is the same used for Face-to-Face Teaching, we will end up having Distance Teaching programs that do not differ substantially from their face-to-face counterparts.

If it is known that this model no longer works, even in optimal communication conditions, where the teacher can communicate face-to-face, eye-to-eye with the learner, why should it work in contexts where teacher and learner have to communicate in suboptimal conditions, as it is the case in Distance Teaching?

It does not seem sensible to repeat, virtually or remotely, the errors of a model that no longer works in its face-to-face implementation. A different model or paradigm is needed.

Technology-Mediated Learning: A New Model

The model of education that will become prevalent in the information society will probably not be centered on teaching, face-to-face, or remote: it will be centered on learning. Consequently, it will not be Distance Teaching – it will probably be something like Technology-Mediated Learning.

This model will have to make provision for the different needs, interests, cognitive style, and learning rhythms of the learners. Whoever wants to participate in a nonlearner role in this model will have to make available, not Distance Teaching modules, but rich learning environments to which anyone can come and in which anyone can learn.

The Internet and the Web, or whatever comes after them, will have a fundamental role in this process.

The Internet is rapidly becoming, through the Web, a repository for every sort of information that is made public. Because of this, people will be coming to the Web to satisfy their information needs. The prevailing model, from now on, will not be some (the teachers) transmitting information to others (the learners) but many (students, workers, anyone who needs it) coming in search of information in places where they know they can find it (the Web). In Internet terms, it will be more “pull” than “push.”

The task of discussing, analyzing, evaluating, and applying this information to practical tasks will be, more and more, performed not through the school, but through specialized virtual discussion

groups, where everyone can alternate in teaching and learning roles. What is virtual here is the group, not the learning: this will be real enough to satisfy most people's learning needs.

If the school can reinvent itself and become a learning environment of this type, it may survive. But the Internet, the Web, e-mail, chats, text-based discussions, video conferences, etc., will have to be in the center of it and to become a regular part of its routine. What is said of the school here applies to schools of every level, including universities.

An example of a learning environment of this type is the discussion group EduTec and the site EduTecNet, set up to discuss the use of technology in education. Its URL is <http://www.edutecnet.com.br>.

Educational Technology (II)

Bertram C. Bruce

University of Illinois, Champaign, IL, USA

"Educational technology" refers to a field of study and practice that is conventionally conceived in light of its two constituent words. First, it is concerned with the educational applications of technologies and not the myriad uses of technologies in modern society. Second, it examines those aspects of education that are crucially dependent on (usually new) technologies.

This conventional conception tends to lead along a path focusing on techniques: Research studies compare learning through the use of some new tool versus learning in a traditional way. Cost/benefit analyses are done to measure overall value of the new tools. Training in the use of new technologies is advocated as necessary and sufficient for educational reform. Not surprisingly, behaviorist models of learning have provided the conceptual framework for much of this work; more recently these have yielded somewhat to cognitive or constructivist models but often still with an embrace of *techne* over reflection or critical analysis.

Despite widespread use of the term, the delimitation of "educational technology" is fuzzy at best. Can we say definitively that specific technologies are educational? One way to consider that question is to look at the common use of the term in different historical situations. Today, the "technology" in educational technology is usually assumed to refer to new communication and information technologies but prior to the advent of the World Wide Web it meant stand-alone computer systems or programmed instruction. Before that, people spoke of educational technologies as including film strips, television, tape recorders, globes, and other media. In some discussions, educational technology includes any device, medium, or artifact that is used for instruction, thus both the familiar chalkboard and the textbook. In others, that meaning is extended to include lesson plans, assessment procedures, essentially any form of codified educational practice. As educators have employed more tools in the classroom and as they have looked to the technologies of work practices, it is difficult to identify any technology that cannot at some time be considered potentially educational. For example, the advent of low-cost digital telescopes and the ability to access astronomical photographs through the Web has made the telescope an educational technology in many classrooms.

Alternatively, can we say that technology use is a separable aspect of educational practice? The profusion of courses, graduate programs, journals, conferences, and texts on educational technology suggests that such is the case. However, the characterization of what counts as educational technology is often left unexamined, and the uses of the term are inconsistent. A case can be made that all education involves technologies; indeed, the development of writing systems is often conceived as one of the major technological advances in human development. To the extent that education has evolved along with writing, changes in education can be characterized as the successive emergence of new forms of teaching and learning through the use of new writing tools and systems – manuscripts, printing, typewriting, word processing, email, hypertext, and so on.

It is useful to turn to work in the field of technology studies. There, at least three layers of meaning for technology are typically identified (see MacKenzie and Wajcman 1999). First, there are *physical devices*, such as automobiles, telephones, or oil pipes. Second, there are the *procedures, activities, or organizational systems* that incorporate these devices. These may be represented in user manuals but also in daily habits of users of the technologies. Third, there is the *technical knowledge* that enables particular activities, for example, the accumulation of experiences by a midwife constitutes a technology for assisting in births. The line between these layers is not sharp: Devices can reify procedures, organizations are mutually constituted by their artifacts, and activities can be viewed as both knowledge and practices. This is in fact precisely the reason why people studying technology cannot restrict their view to physical components per se.

Returning to the question of what aspects of education, if any, are technological, the layered conception of technology suggests that technology is not a separable component of educational practice, but rather, a perspective, or set of perspectives, one may adopt on all educational activity. Some of the major perspectives are these:

First, educational technologies can be viewed as *texts*, as symbol systems to be interpreted by users. This perspective has led to a variety of analyses in the tradition of literary criticism. The prevalence and power of technologies as bearers of meaning leads, for example, to Heidegger's question concerning the essence of technology. His concept of *Gestell* (enframing) inscribes technology as a mode of thought prior to the scientific revolution, one which "reveals being" in a particular way. Thus, people are defined by the technological way of thought, and not simply users of technological devices.

More recently, Reeves and Nass present a different notion of reading in their concept of the media equation. They argue that people treat computers, television, and new media just like real people and places. They carry over to the technological realm the social norms of gender, language, honesty, politeness, and so on that they employ in social interaction.

As different as the Reeves-Nass analysis may be from Heidegger's, both recognize that technologies are cultural formations and that their design, distribution, use, and interpretations need to be considered within a sociohistorical perspective and not merely a technological one (see Bruce and Hogan 1998).

A related view sees educational technologies as *bearers of power relations* in society. The essays in Bromley and Apple's collection address this point across issues of gender and class and in terms of the teacher as a worker using technologies. Disembodied power is implicit in Heidegger's analysis and perhaps most strikingly in Ellul's notion of *la technique*. By "technique" Ellul means not simply particular methods for employing a given technology but the inexorable force of a technical way of thinking that threatens humanistic values. Foucault of course is widely associated with the notion of power as exercised through discursive practices. The layered account of technology then accords well with his analyses of the devices, activities, and knowledge needed to maintain institutions such as prisons.

Not all analyses of power in computing take the bleak road. In fact, the beneficent use of "power" and "empowerment" in the discourse about education technology is striking. For example, a widely read US government report (*Power On!*) makes a deliberate play on the idea of electrical power for computers as a way to empower learners. Interestingly, both those alarmed by the uses of new technologies in education and those enthralled by them see a strong linkage between the tools and their meaning, sometimes to the point of becoming technocentric.

Another view of educational technologies argues that the *context of use* is critical for understanding. This perspective leads to the idea of cultures of computing (Star 1995), as opposed to tools with effects that can be considered in isolation from the beliefs, values, norms, roles, and other practices inherent within a social system. It also argues for *situated evaluations* (Bruce and Rubin 1993) of technology use, in which the first task is to determine what a technology is, not to assume that it can be specified independent of a specific sociohistorical context.

In the last decade, a number of writers have extended the biological concept of ecology to that of *information ecologies* (see Nardi and O' Day 1999). From this view, a particular technology, say a computer connected to the Web, must be understood as operating within a complex system comprising people with different bases of knowledge and purposes; organizational rules and procedures; physical components such as walls of a room, tables, and chairs; and various other devices such as clocks, lighting, paper and pencil, and other computers. Here again, the benefit of the technology cannot be ascertained independent of a larger system.

Perhaps the dominant view in current discourse about new communication and information technologies is that of *media*. Not only are there obvious links from the book to television to the Web as media for conveying information, but also many educators are drawn to the *mediational* function of these new media. Extending Vygotsky's sociohistorical theory, they see new technologies providing affordances for learning. They *mediate* between students, between student and teacher, and among task, resources, situation, and student.

One of the most productive views of technologies, especially educational technologies, comes from Dewey (see Hickman 1990). For Dewey, a technology can be seen as a means for resolving a problematic situation, including any impasse on a path of inquiry. That means for resolution can be a physical device, such as a calculator; a representational device, such as the exponent to indicate raising a number to a power; a revised procedure; or a new conception. The appeal of this view is that it provides a unified account across artifacts, procedures, and knowledge. In addition, it shows a way to think of educational technology use in relation to technology use beyond the classroom.

Educational Theorists

Jan Masschelein and Maarten Simons
Laboratory for Education and Society, KU
Leuven, Leuven, Belgium

In 1989, Helmut Peukert organized in Hamburg an intensive seminar on the work of Wilhelm Flitner at the occasion of his hundredth birthday. Flitner who was to die 1 year later had been teaching for almost 30 years in Hamburg and was one of the leading figures of the so-called

Geisteswissenschaftliche Pädagogik. This was a crucial tendency in educational thought which has been very influential far beyond German borders throughout a large part of the twentieth century. And although there are, no doubt, very dubious and questionable aspects related to the entanglement of at least some of its representatives in the NS policies and ideologies, there is also no doubt that the “Geisteswissenschaftliche Pädagogik” has played a very important role in the exploration of the possibility of the elaboration of autonomous educational thought.

It is no surprise then that the central question of the seminar in Hamburg concerned the place of a “general educational theory” (“Allgemeine Erziehungswissenschaft”). And that the central reference was to Flitner’s phrase that such a theory relies on a “basic pedagogical thought” (“einen Pädagogischen Grundgedankgang”) which brings different central and *internal* pedagogical concepts into relation such as “*Bildung*,” “*Bildsamkeit*,” “*Bildungsweg*,” and “*Bildungsziel*” (see Peukert 1992). In fact, the seminar closed a decade in which German philosophy and theory of education (“Allgemeine Pädagogik” or “Allgemeine Erziehungswissenschaft”), after the emergence and tremendous flourishing of critical and emancipatory pedagogy in the 1960s and 1970s, felt itself increasingly colonized by sociology and critical social theory (reducing education in one way or another to ideology or socialization and disciplinary power). It was also a decade also in which it was confronted with what it considered to be a worn-out idea of individual emancipation and a pointless critique of education (as “oppressing” theory and practice) that seemed to imply even the end of educational theory and of education as such, as proclaimed by the anti-pedagogy declarations (“Anti-pädagogik”). In 1983, Klaus Mollenhauer’s “Vergessene Zusammenhänge” (in 2014 translated in English as “Forgotten Connections”) had been one of the first attempts to explicitly deal with these issues. He explicitly stated that the so-called Anti-Pädagogik offered one of the reasons for writing the book. Another crucial reason is the apparent “pathlessness” or *aporia* in which, according to Mollenhauer, educational theory had landed, leading him, one of the most

important German educational theorists, to state 5 years later that thinking about “*Bildung* und *Erziehung*” has become so difficult that we might even say that the pedagogical era has come to a provisional end (Mollenhauer 1986, p. 7).

Nevertheless, Mollenhauer remained strongly concerned for the development of an autonomous educational or pedagogical thought and maintained that we should continue to address the “basic set of pedagogical issues” that nobody can ignore who is dealing with education. It was one of the reasons that he was also present at the aforementioned seminar in Hamburg in 1989. And it is clear that Mollenhauer was establishing himself consciously a (today maybe somewhat “forgotten”) connection to a tradition of educational thought that started with Schleiermacher that was clearly present in the “Geisteswissenschaftliche Pädagogik” and wanted to identify some basic and particular “features,” which would characterize the educational phenomenon and the pedagogical relationship. This should offer the starting point for the elaboration of a proper educational thought or general study (called “Allgemeine Pädagogik” or simply “Pädagogik”). It is also in line with this tradition that Johann Friedrich Herbart claimed and elaborated “*einheimische Begriffe*” (“internal concepts”); that Wilhelm Flitner suggested and requested, as we mentioned before, a “*pädagogischer Grundgedankengang*” (“basic pedagogical thought”); and that Martinus Jan Langeveld stated that educational thought (“*theoretische pedagogiek*”) is no philosophy but “*pedagogics*” (“*Pedagogiek*”) and proposed the “*animal educandum*” as the constitutive pedagogical-anthropological “fact.” But, undoubtedly, also people in other places of the world such as Paulo Freire or John Dewey have been part in this endeavor to invent, create, or establish a particular mode of thinking (conceptualization, problematization, argumentation, criticism) that engages directly with the phenomenon of education and tries to explicate some of its characteristic features.

For us today, taking up or reenacting this intellectual endeavor to indicate a proper place for educational thought seems crucially relevant.

Indeed, in a time where we are confronted not only with a sociological or ideological colonization but with the omnipresence of (bio-) psychological approaches (including the apparently unavoidable “learning discourse”) toward the educational field and, moreover, with an ever-pervasive emptying of traditional frames of reference, the question of “elementary pedagogical issues” and of a proper educational thought deserves to be taken up and emphasized once again.

However, we would like to point also to the risk of a particular philosophical “colonization” of educational thought. Indeed, explicitly taking distance from psychological, biological, or even sociological approaches to education is to a large part central to the actual self-understanding and self-definition of philosophy of education. But one of the reasons for reemphasizing the importance of the tradition of educational thought “proper” is that philosophy of education and educational theory, having the tendency to rely on philosophical master thinkers such as Habermas, Wittgenstein, Levinas, Lyotard, Agamben, Rorty, Arendt, etc., run the risk to be trapped in a movement of instrumentalizing or even marginalizing education and learning. The risk is that education and learning are considered to be foremost a field of application for theories developed elsewhere and for other purposes or to be a field of practice with a function or meaning that is only to be derived from other noneducational practices.

While philosophy of education is often engaged in great efforts to disentangle the complexities of the work of the master thinkers, education and learning are often turned into a field of application, if education and learning as well as a genuine educational concern are not completely marginalized. One could oppose to this thesis and argue that almost all of these philosophies and theories acknowledge themselves that learning and education are important and some of them even explicitly invoke learning processes (Habermas 1981), learning curves (Latour 2004), learning (Sloterdijk 2014), childhood (Lyotard 1988; Agamben 2002), or teaching (Levinas 1998) as crucial phenomena to clarify their understanding of our world and our being. Our thesis is,

however, that this focus on education and learning is often motivated by another than educational concern.

In this respect, we can distinguish between different kinds of philosophers, first, the *learning philosophers* (e.g., Habermas, Latour, Sloterdijk) for whom education and learning seem to be notions that indicate a process of change. However, they always in one way or another postulate these notions as needed to save or Mollenhauer 2014 close their ethical, political, or social intellectual project, that is, to explain how ethical, political, or social changes come about. As such, educational change and the educational meaning of change are either being ignored or ridiculed. And if it is conceptualized, in one way or another, education is narrowed to a form of socialization (habituation, acquisition) or – in progressive circles – an attempt to counter-socialization. Ultimately, the social and cultural theories of these (*social*) *learning philosophers* are theories about grown-ups and about how adults need learning but without becoming a child. Secondly, we could speak about “enfance/infantia” philosophers (e.g., Lyotard, Agamben). Without going into detail, and hence doing injustice to the complexities of the work of these authors, we do think their references to education and childhood often become *images* or *metaphors* to think about what is at stake in adult life. For them, education and learning are at least not the key concern. And if their thoughts are translated to (philosophy of) education itself, it is perhaps not a surprise that education runs the risk of being framed in therapeutic or ethical terms. The risk is a kind of personalization by putting in one way or another a dialogical or analytical relation between persons, that is, the person of the teacher and the person of the pupil, central stage. The pedagogical key issue is not turned into an issue of socialization or counter-socialization but becomes the act of “doing justice” to someone (or even to enfance/infancy as such). In a different way, for sure, we can relate, thirdly, also some *teaching philosophers* to this ethical framing of education. Although we also cannot render it in its complexity, we could point here for example to Levinas’ use of the *teaching* metaphor to describe the way

the ethical demand is inscribed before the subject comes to itself (Levinas 1998). It is a description which in the context of philosophy of education is often turned around so to say, to understand teaching as quasi-identical with an ethical relation. An ethical framing of education is very often related to an understanding of ethics in terms of being summoned before the “face of the other” as the “Law” beyond any law. Perhaps another version of this ethical teaching philosophy is the work of Judith Butler (2005) on the decisive role of an act of interpellation in the constitution of subjectivity. In line with this, there is the interpretation of the act of teaching as working according to the logic of interpellation and focusing on the relational and performative dimension of the child’s subjectivity. Furthermore, such *enfance/infancy* philosophers and teaching philosophers, perhaps, should be distinguished from *game philosophers*. Again without claiming to make a final statement about the complexity of his work, we could think of Wittgenstein (1965), with his concept of language game being the most telling one. Probably here, the focus and concern are already much more on the practice of education, although the experience of education itself and the specificity of educational and learning events and relations are much less outspoken. Education along these lines is not a matter of socialization or capacity to act but a matter of initiation.

As we indicated before, while all these philosophies and theories acknowledge that childhood and change through education are important and while they are postulating the existence of conditions of childhood and childish conditions, education and childhood are at once “instrumentalized,” be it as a temporary condition, a necessary evil, or a logical factor in view of ethical, political, or social change or be it as an image or practice to conceptualize what is difficult to conceptualize in adult life. The risk of/for philosophy of education and educational theory is to be trapped in the same movement of instrumentalizing or even marginalizing education and naturalizing learning. And a maybe unexpected example is offered by the meanwhile influential distinction by Biesta (2009) between qualification, socialization, and subjectification. For him, these are the three functions or roles of education, and often all three of

them are playing a role. Clearly, Biesta wants to focus on the role of subjectification – becoming a person, by finding a place in the world – against the often dominant roles of socialization and qualification. The critical question, however, is whether these are the three roles or functions to be distinguished when looking indeed at education from a pedagogical/educational perspective. Although we recognize for sure that Biesta contributes importantly to emphasizing the role of education in a time of learning, we think this is not the case and that the distinction is the result of combining the three different approaches which are all external to education. It seems as if the qualification function pops up when looking at education from an economic perspective, while socialization (and the process of integration in social norms and values) is the key term when looking through sociological lenses. Subjectification, then, is what appears when approaching education either politically (in line with a certain reading of Rancière: becoming someone which is at the same time challenging the existing social order in terms of equality) or ethically (in line with a certain interpretation of Levinas: becoming someone which is always motivated by a call from the other in terms of doing justice). We think that qualification, socialization, and subjectification represent three versions of taming education: an ethical-personalizing or political-equalizing taming of education that imposes ethical or political standards on change (subjectification), an economical one that imposes an exchange value or investment calculus (qualification), and a sociological one that tames educational change by imposing the rules of social and cultural reproduction – or in a progressive version – the rules of social renewal and change (socialization). In one way or another, part of this taming is that a specific “destiny” (natural, or social, cultural, political, etc.) is put forward as the horizon to think about education or about change through education. From a pedagogical/educational or “internal” perspective on education, we think it is important to link up with the basic idea that human beings have no natural or other destination, and education in one way or another is exactly about “finding” one’s destiny.

In order to strengthen such an internal perspective, i.e., a pedagogical or educational approach and to do justice to the phenomenon of learning and education itself, we suggest that it would be helpful to deal with some major issues in educational philosophy and theory returning to some “early modern” and “modern” key figures in the field of education. It is the authors who have developed an *educational* approach or theory, contributed to an *educational* vocabulary, and expressed a deep *educational* concern in their intellectual but often also their practical work. Some of these figures are really broadly renowned (such as Comenius, Herbart, Dewey, Buber, Peters, Freire, Mollenhauer) and others less known (such as Rodrigues, Deligny, or even Ortega y Gasset and Langeveld), at least in the western Anglo-Saxon and German context. We deliberately mention “educational theorists or thinkers,” or at least philosophers or educationalists who did some substantial work in educational theory or educational philosophy. To give voice again to these authors and their educational ideas would be the first ambition, but not the only one. Another aim would be to show that educational theory and philosophy is not just “applied” philosophy (or any other applied discipline), but could be regarded as a particular mode of thinking including specific forms of problematization and conceptualization. This means that we do not need some extended biography or an extensive bibliography of these key figures, but rather descriptions or indications on the “ethos” and “approach” of these educational theorists and thinkers. What we need is a specific attention on the mode of thinking (conceptualization, problematization, argumentation, hesitation, criticism) through which each of these key authors discusses or engages with the phenomenon of education and the related practices, theories, and discourses. Without exception, the work of these key figures is a way of finding a proper answer to what was at stake in their present, in view of their past and future, and in ongoing discussion with practices of education and other voices in educational theory and philosophy. We could thereby draw attention to the

force, creativity, and originality of their ideas and carefully show or expose what is “educational” in their work and what is still “topical” (without pointing directly at relevance). This could help us to show how educational thinking is not only an abstract (mental) activity but somehow always involves a particular relation to (or care for) oneself, others, and the (educational) world. As such, it could contribute to the development and elaboration of thinking and practice, a “language” of education, and learning itself.

One important issue that such an elaboration of a “language of education” entails considers the aspect of translation. Indeed, although it applies for many fields, especially this field of “educational thought” or philosophy of education deals with serious difficulties of translation, since they concern essential notions such as “pedagogy” and “education” itself. It is, for instance, problematic to translate the German “Pädagogik,” the Dutch “pedagogiek,” the Spanish “pedagogia,” or the French “pédagogie” with the English “pedagogy.” In other languages, pedagogy is not restricted to school education but refers to acting and relationships in other spaces of learning as well. And even when used in relation to school education, in other languages, it can refer to aspects of schooling that have to do with broader aims and practices associated with becoming an adult or becoming a person. An even bigger problem is related to the notion of education. The English term has a broad meaning but remains at the same time closely associated with formal education. However, it is important to keep in mind that it often has a specific meaning and that therefore there is in fact often a hesitation whether to use the notion of “educational” or “pedagogical.” And let us, lastly, point to the (German) notion of “*Bildung*” which is now also increasingly appearing and discussed outside the German context (or the context strongly influenced by it). Although attempts at translation have been tried by philosophers and historians, the notion actually remains mostly untranslated and seems on the way to become part of the language of education more broadly and generally, apparently being able to articulate

concerns that transcend the German context to which it was connected.

To conclude and summarize, we think that, in order to confront and think our educational present, educational or pedagogical thought should not only distance itself from sociology, psychology, or economy but also from ethics, politics, and – and this is the main point we wanted to make – also philosophy (at least philosophy limited to master thinkers). It is not because we consider these disciplines and approaches as unimportant or irrelevant, we do not at all, and we do acknowledge for sure the importance of philosophy but because it could help to elaborate a language, problematization, and conceptualization of education and learning that is itself educational, especially when being today under the spell of the “learning society.”

Educational Theory: Herbart, Dewey, Freire, and Postmodernists

Paulo Ghiraldelli, Jr.

Universidade Federal Rural do Rio de Janeiro, Seropédica, Rio de Janeiro, Brazil

Three Revolutions in Educational Theory

In the nineteenth century, we learned with Johann Herbart that motivation depended on our intellectual apparatus. Then, we built the teaching of thinking into a lesson that started with a scientific or moral issue. The students, since they had a good intellectual apparatus, a good mind, would be able to follow the lesson. Motivation to study would appear in so far as the students themselves used the intellectual apparatus. The teacher would give the matter, in a logical or historical form, and the students, naturally, learned this form. There was the supposition that the mind was a logical thing and the matters of the lessons should be showed in a logical or historical way.

The great revolution in teaching by the end of the nineteenth century and the beginning of the twentieth century was a revolution made by John Dewey. He developed several critiques of old pedagogy. The main critique was that the intellectual apparatus didn't work alone. The intellectual apparatus, Dewey said, actually depended on motivation. Lessons constructed in a logical and/or historical way needed to be changed. The lessons should be put in a psychological way. So, Dewey took once more a theme from Comenius and Rousseau. Lessons should start with the problems of the world – problems that brought interest and motivation for the children. The teachers, of

course, could show the logical and sequence of an issue, but they should know that the child learns this only after a translation of the topics in a psychological way.

This revolution was a potent event. It quickly put Herbart in the past. Of course, a lot of teachers continued doing things in the way Herbart had fixed, but the new books about pedagogy started to tell new things. They told that the child thinks! The books said “the way a child thinks is not wrong, but the child thinks a different way.” Logical and historical ways of teaching should be under the control of the psychological and sociological way of teaching. Dewey and Kilpatrick made a great contribution to teachers and the beginning of the twentieth century: they brought the child forward to become the central point of the school and of teaching. Then, educational theory could gain force from the new psychology and sociology. If Herbart epitomizes the nineteenth century as a century of collective education, so we can say that Dewey epitomizes the twentieth century as a century of pedagogy – philosophy of education and science of education together.

But the twentieth century didn’t see only this. The twentieth century, mainly after the Second World War, watched the emergency in the scene of the Third World. In several countries, a close colonial-type relation with the metropolitan country came to an end, and in the democratic world, the welfare State appeared like an ideal. As a consequence, I see the important appearance of poor and “odd” children inside schools and with this a third moment in the educational theory in the world in the twentieth century: the pedagogy of Paulo Freire.

Paulo Freire didn’t disagree with Herbart about teaching as something that should be done in a collective fashion. He also agreed with Dewey, of course, about motivation, psychology, and sociology. But the new ingredient inserted by Freire into the games of educational theory was the political ingredient.

Freire said that pedagogical action should be a political action but a specific political action: action to make humans free. Dewey also wanted this. But Dewey believed that education and

social democracy walked together. For Dewey the concept of education only made sense in a democracy. Paulo Freire on the contrary, thought of education in a situation without democracy. He thought of education in a place without democracy and thought of education as being like a motor to achieve social democracy. So then, with Freire, educational theory finished a cycle – the modern age in educational theory.

What I wanted to show is that in the nineteenth and twentieth centuries, there were three revolutions in education theory. The first revolution: pedagogy became a science of education with Herbart. The second revolution: pedagogy should be linked to social and psychological life problems with Dewey. Finally, the third revolution: pedagogy would depend on political perspective in order to help the poor people.

But, before the end of the twentieth century, the twenty-first had already started. A new and fourth revolution in pedagogy is in course: the postmodern educational theory.

The Postmodern Age and the Narrative Turn

I think that two books are the protagonists of this new movement: in 1979 the publication of *The Postmodern Condition* by Jean François Lyotard and in the same year the publication of *Philosophy and the Mirror of Nature* by Richard Rorty. I do not believe that Herbart would understand these books. I don’t know if Paulo Freire read these books. But I imagine that Dewey would have liked these books. These books didn’t come to tell us that Herbart, Dewey, and Freire were wrong. They came out to say that educational theory could become more open and free.

My friend Michael Peters likes Lyotard. I also like Lyotard, but I think that Lyotard and Rorty are in agreement in several points, at least in those points that I would take to make educational theory.

Very briefly, what Lyotard and Rorty said in those books is the following.

Lyotard reminds us that a lot of people already did not believe in metanarratives. Therefore, it was

useless that we, the philosophers of education, continue to tell metanarratives to teachers. The teleology of Adam Smith, Hegel, or Marx is a thing of past. They could no longer support all or any educational theory. When I read Lyotard I didn't think that his book implied that Herbart or Dewey or Paulo Freire need be given up but that they need to be read without the foundationalist perspective that we are accustomed to read.

Rorty also reminds us that a lot of peoples did not believe in metanarratives and a lot of philosophers in the pragmatist movement could be used to show that real and technical motifs exist in philosophy which discredit metanarratives. But Rorty, in a stronger way, showed me that Herbart or Dewey or Paulo Freire could be used in a new way to make education. They loved to tell stories about education and loved to talk about books that could make us pay attention in stories, movies, novels, comic books, and music about educational situations. Therefore, I understood that we need rather a cultural appeal to teachers than a new or old educational theory.

Might I be talking about "cultural studies," as Giroux and others are doing? Might I be talking about "counternarratives," as Peter McLaren and others are doing?

Giroux and McLaren's books are to be appreciated. They continue the critical perspective learned from Marxism and that is useful both in the Third and the First World. But what I understand as a postmodern educational theory is another thing. In a lot of places in the Third World and in several places in the First World, the training of teachers – poor or rich – is done with educational theories. But what I don't see in such training of teachers in educational faculties is work with culture: novels, classics, tales, movies, comic books, pictures, and so on. Teachers in various parts of the world are trained in educational theories, in a good or bad way, depending on the country and the university. I believe that is wrong. Better educational theory would say that Herbart, Dewey, and Paulo Freire can be read and must be read, but this is useless without Henry James, Nabokov, Machado de Assis, Julia Roberts, Plato, Donald Duck, Ben Hur, Hilary Clinton, The Simpsons, Umberto Eco, Celine Dion,

and Caetano Veloso. Our teachers, in a world that asks for narratives without metanarratives, do not know tales, films, comic books, and so on. For economic reasons in several places and because of the overwhelming value given to educational theories in other places, our teachers forget the main thing in the school: the culture.

In Brazil, in several universities, in the faculties of education, a lot of teachers who train teachers for elementary and high school don't know our best writer, Machado de Assis (now translated into English). Is this a situation specific to Brazil? No! There are several studies that show that our teachers who train teachers have no love of culture. That is the problem: in a postmodern age, if we want to tell stories that can help the different peoples be close – the ideal multicultural of the postmodern age – then we should have good stories from the several cultures in our hands. But our faculties of education are occupied with educational theories and, so, don't bear in mind the narrative turn of our age (see Martin 1993, pp. 124–143).

The Educative Process in a Comparative Ways

Now, I will try to put what I said into a systematic form, comparing the educational process of the educational theories that I quoted. I will put this in a frame below.

Herbart educational theory (three steps)	Dewey educational theory (three steps)
1. Lesson of yesterday	1. Survey about concern of the students
2. Lesson of yesterday linked to lesson of today. Presentation of the new matter. Theories and examples of questions and answers	2. List of the problems about the concerns of the students. Hypothesis about the problems with suggestion of readings
3. Exercise with new questions	3. Ideal experiments or experiments in laboratory
Freire educational theory (three steps)	Educative and pragmatic action in the age of narrative turn (three steps)

(continued)

1. Survey about common words and issues of community	1. Presentation of cultural, cross-cultural, ethics, and political problems with movies, novels, tales, comic books, music, and so on
2. List of the words and issues of the community. Making problems: making “normal” problems in political problems. Discussion of solutions	2. Relations between the problems above and the problems of the students’ life. Presentation of theories and philosophies (as narratives) about the problems
3. Political action	3. Action: cultural, social,, and political. This action can be the making of other narratives (including narratives with metaphors) and other problems

In the Herbart educational theory, the teacher leads the process. The student pays attention and works on the exercise. The student does the exercises following the models given by teachers. Dewey changed this. In the educational theory of Dewey, the main concern is the students. Furthermore, Dewey insisted on the formulation of problems and hypotheses. Dewey wanted the learned to act like scientists. Freire put the educational process in the hands of militant “teachers.” He wanted the “students” as men and women with ability to think political problems and start political action (see Ghiraldelli Jr. 1990).

In my idea about an educational theory in postmodernity, the teachers are teachers and the students are students. The teachers lead the educational process, but they should be very sensitive about the problems of our age, and they should be very able to realize that the problems can’t be given without means like the movies, tales, novels, comic books, music, and so on. Then, the educative work is a process of identification between the problems of life of student and the problems shown by means of the cultural material. The teachers supervise, in the end, the production of political, social, and cultural action. This action can be a production of a text, of course. The text made by students can be a normal text but can be a metaphorical text. In this case, the teacher should pay attention to the metaphors. Metaphors, as

Rorty says, are indicative of opportunity to invent new rules and new rights in democracy (Ghiraldelli 1999).

Interpretations in the Educational Theory in the Age of Post-narrative Turn

The problem about this new way to see educative action that I am proposing is in the interpretation. If we see “the reality” by means of the narratives, then what is the correct interpretation?

I would prefer that the teachers didn’t follow this line of reason. Of course, we must agree about several things. But the main idea in educative action in the age of the post-narrative turn is that we, the teachers, should know the narratives very well. The main aim in this new way in which we construct the training of teachers is that all narratives should be pointed toward the end of cruelty. So, interpretation needn’t be a special key to find the truth of the narratives. But, interpretation needs a key to drive the students in the identification of cruelty, and, more than this, we must put into the work a strong hand against the cruelty.

I am not thinking about a method of training teachers to be greatly learned – this was the aim of the nineteenth century. I am not thinking about a method of training teachers to be trainers of scientist – this was the aim of the twentieth century. I am not thinking about a method of training teachers to be political militants – this was the aim of several peoples in the twentieth century. I want to train teachers to be people that believe that a demon can’t be a good professor. The demon would be a good teacher if knowledge held only technical aspects (of learning, science, politics), because the demon can be an intelligent animal. But in a new perspective, the important thing is the end of the cruelty, and this, the demon can’t wish (in a meeting of philosophers in Brazil, in homage to Deleuze, all the philosophers present agreed that the new problem of philosophy was cruelty).

However, some objector might say: you want a kind of teaching with good intentions, and with this I agree, but if the teaching is given by stories, we are in the field of relativism.

This text isn't a technical text of philosophy of education. So, I will avoid a great discussion about objectivity. But I think that all people who are thinking about relativism should pay attention to the words of Davidson:

Should we then agree with Hans-Georg Gadamer when he says that what the text means changes as the audience changes: "a text is understood only if it is understood in a different way every time"? I think not. There can be multiple interpretations, as Freud suggests, because there is no reason to say one rules out others. Gadamer has in mind incompatible interpretations. It is true that every person, every age, every culture will make what it can of a text; and persons, periods and cultures differ. But how can a significant relativism follow from a truism? If you and I try to compare notes on our interpretation of a text we can do so only to the extent that we have or can establish a broad basis of agreement. If what we share provides a common standard of truth and objectivity, difference of opinion makes sense. But relativism about standards requires what there cannot be, a position beyond all standards. (Davidson 1993, p. 307)

If we pay attention in the words of Davidson, we will see that relativism is a ghost. Do we believe in ghosts? People that believe in ghosts can't understand anything beyond Herbart, Dewey, and Freire. But people that don't believe in ghosts can understand very well a new way to think about the training of teachers in the next century. I call this "training of the training of teachers in an age of the post-narrative turn."

What Davidson says is the following. All and any people in our age, in a democracy, admit that "difference of opinion" makes sense. Difference of opinion needs common standards that we share – this is our intersubjectivity. But relativism requires all and any position to be a different position and to be equivalent at the same time. This would eliminate our common standard that we share and would become the "difference of opinion" a logically impossible thing.

I think that Davidson's argument is enough in our case. Teachers, students, and cultural means and work have several things in common. These commonalities allow our educative conversation and, of course, our development toward knowing if our problems are better understood with a Disney story or a Henry James story. Then, in my

conception of the new educational process, or in our new educational theory, there is no place for the fear of "cultural industry," as it appears in the old Frankfurt School. Cultural programs that show us "reality" have different viewpoints, as we have different viewpoints. But, although we have our differences, we can understand each other, of course.

My arguments here do not jettison Herbart, Dewey, and Freire. I think that Freire and Herbart would not understand my position concerning relativism, but they would accept my love of narratives. Dewey would not have problems with my position on relativism, I think, but, perhaps, he would say that "reality" is a thing more real than the books, movies, tales, and music can tell us. I think not. "Reality" in education is a cultural reality. Is it a postmodern educational theory? That is what I believe.

Educationalization of Social Problems and the Educationalization of the Modern World

Daniel Tröhler
University of Luxembourg, Esch-sur-Alzette,
Luxembourg

Synonyms

[Educationalisation](#); [Pedagogisation](#); [Pedagogization](#)

Introduction

The catchword “educationalization,” which enjoyed some popularity around 1920, has been used increasingly since the 1980s, first in the German and then in the Belgian and English discussions. Although the uses of and intentions behind the term are far from identical, they all express a perceived intersection between distinct social practices, one of which is education. As a rule, this intersection is interpreted as assigning education the task of coping with perceived social problems. Accordingly, the most popular expression of this mode of thought has been labeled, in an abstracting way, the *educationalization of social problems*. This entry builds on that but suggests a more comprehensive view, less reactive in character by claiming that since the eighteenth century the construction of modernity, progress, and open future depends on an idea of education that promises to be the engine of modernity by means of (new) and broadly disseminated knowledge and technologies and, at the same time, an instance of moral reassurance empowering the individual exposed to these modern conditions and their moral hazards to act morally or virtuously. *Educationalization of the modern world*, in this more comprehensive way, is a key concept for understanding and deciphering the grand narratives of modernity and the modern self.

Educationalization of Social Problems

Even though the label *educationalization of social problems* has been popular internationally for less than 10 years (Smeyers and Depaepe 2008), the notion goes back to a German discussion in the 1980s under the label *Pädagogisierung sozialer Probleme* (see Proske 2001). The matter itself, however, is much older and refers to specific issues of hygiene, economy, delinquency and prisoners, and, later on and very broadly received, children’s sexuality, *pédagogisation du sexe le l’enfant*, or pedagogization of children’s sex (Foucault 1978, p. 104).

Beyond these explicit uses of “educationalization” the issue itself is omnipresent. Sunday schools and Bible classes were organized for workers in the first half of the nineteenth century to prevent moral decay in light of a monetary economy; most automobile drivers in the world attend driver education classes and have to pass a test – institutionalized in Germany as early as in 1902 –, and children of all ages have traffic education at school to protect them against the dangers of increased motorized traffic. These more gradual processes of educationalization are supplemented by more tangible events. When, for instance, the United States saw their nation and the Western world at risk after the launch of Sputnik by the Soviet Union in 1957, it educationalized the Cold War by passing the very first national education law, the *National Defense Education Act* in 1958, expressing the view that “Education is the First Line of Defense” (Rickover 1959). And when, a few years later, the environment had become an affair of public concern, for instance triggered by the book *Silent Spring* (Carson 1962), endangered nature became educationalized, as expressed, for instance, in the *Journal of Environmental Education* (1969) and in educational trails teaching walkers about nature. And when again a few years later in the United States the national crises after the Vietnam War, the oil crises in the 1970s, and the near collapse of the automobile industry in the early 1980s led to the perception of *A Nation at Risk* and the conclusion of an *Imperative For Educational*

Reform, this expressed the educationalization of economy and economic policy. A rising teenage pregnancy rate in the 1960s led to an educationalization of sex through the introduction of sex education in schools, which gained new urgency with the outbreak of HIV/AIDS in the 1980s. Museums were made more attractive by the invention of museum education around 1990. And when immigrant adolescents in the suburbs of Paris and Lyon protested violently in 2005, their behavior was not seen as a reaction to their poor living conditions or poor life chances but as an expression of the wrong education, as France's Prime Minister Dominique de Villepin stated in 2005. Human life is a site of what UNESCO has called "lifelong learning" and propagated since 1962, a phenomenon that was critically noticed (and explicitly labeled "educationalization") as early as in 1929 (Fischer 1929, p. 286).

The expansion of the education system in the 1960s and the 1970s as a Western expression of the educationalization of the Cold War also led to a process self-reassurance of the educational sciences, in which the explicit notion of "educationalization," or *Pädagogisierung*, started to serve as a (self-)analytical tool. In this context the notion of the educationalization of prison inmates has been discussed, profiting of course from the immense discussion of Foucault's account of the *Birth of the Prison* (Foucault 1977). Additionally, relevant research focused on educationalization phenomena in all kinds of contexts, for instance, in human resources, in marketing, and even in developing city districts, and, of course in developing the Third World (see Proske 2001).

Based on these German disciplinary (self-) reassurances, the Belgian historian of education Marc Depaepe suggested using "educationalization" as a key concept to understand fundamental processes in the history of Western education and dedicated a large part of his research to this idea in the first decade of this century (see Depaepe 2012). Depaepe invited also philosophers of education to participate in this disciplinary self-reflection of education (Depaepe and Smeyers 2008; Smeyers and Depaepe 2008), focusing on the *educationalization of social problems*. The

discussion proved to be fruitful in detecting actual educationalization of phenomena such as health, the family and the child, or even philosophy or educational research. By pointing at the fact that *educationalizing social problems* continued to be a part of the educational culture even though schools have repeatedly proven that they are an ineffective mechanism for solving these problems, David F. Labaree (2008) pointed to a larger cultural context than education itself; it is precisely here that the term *educationalization of the world*, a process starting in the long eighteenth century, gets a distinct meaning with regard to the *educationalization of social problems*.

The Educationalization of the World in the Long Eighteenth Century I: The Challenge

Up to the mid-eighteenth century, it was not at all "normal" to interpret perceived problems educationally – that is, to assign the solving of problems to educational practice. What then made this educationalization, this educational turn, possible? This development had very specific requirements that have little to do with education; the increased educational reflexes were reactions to problems that were originally perceived as non-educational. Decisive for the educational turn were changes in the way that people thought about two fundamental things in interpreting their lives: first, how people imagined history and development and second, how they viewed the relation between money and politics. Both of these transformations, which remain important today, occurred around 1700 and replaced older perceptions and core notions that went back to the ancient world. They mark the transformation of the early modern period in history to the modern period. The first of these transitions (history and development) was initiated in France, the second (money and politics) in England. Both together created challenges, "problems," that were addressed in many ways, and the educational way seems to have been deemed the most promising, with effects up to today.

The transformations in the perception of history and development were initiated in France at the court of the King Louis XIV in Versailles, when the ancients' way of looking at things came under attack in the "quarrel of the Ancients and the Moderns." Whereas up to the end of the seventeenth century, time and thus history had been seen, in analogy to the seasons, as an eternal cycle of events; in the eighteenth century a linear way of thinking ("progress") came to prevail that was oriented towards the future and in which outcomes were open. At first, around 1680, this optimism applied only to progress in the sciences, but soon after, progress was seen also as a social and political program: Humanity would develop progressively towards peace, justice, and bliss, and political conditions that impeded this progress had to be destroyed. This was the justification for the French Revolution of 1789. The most impressive interpretation of this rational thinking on progress is probably that in *Outlines of an Historical View of the Progress of the Human Mind* by Marquis de Condorcet (1743–1794). According to Condorcet's interpretation, the French Revolution was the gateway to humanity's final great developmental epoch.

The second transformation has to do with the relation of money to politics, which changed towards the end of the seventeenth century at first in England. Up to that time, an ideal had prevailed in Europe according to which dispassionate reason was supposed to guide politics. At the same time, the commercial economy had been considered as something "lower" or "basier," because it was accused of diverting attention and interest away from the common good and of exposing people to the passionate pursuit of profit: In this system of thought, calm, rational governing was seen as good and passion-driven money-making as bad. But around 1700 and up to the present day, this system of thought was lost, not least because the commercial economy had become a social fact and actually very important for politics. This ideological bias – the idea of dispassionate reason as a condition of good politics and the actual importance of the discredited commerce, connected to passions – had to be

solved in order to legitimate the systems of political power, which depended more and more on money (for instance, to cover the rising costs of the massive expansion of administration or for the standing armies with their mercenaries).

The two transformations not only found enthusiastic supporters, they also gave rise to existential uncertainty, critique, and debates. The most important reaction to the capitalization of politics in a world that all of a sudden seemed to be driving progressively into an open and unknown future was the revival of a political ideal that in research is called classical republicanism or civic humanism (Pocock 1975). This ideal had roots in ancient political philosophy, was brought back to life in humanism in Florence around 1500, and formed the political background of the reformation in Zurich after 1520. Later, it shaped the founding of the Commonwealth of England (1649–1660) as well as the Puritans, who emigrated to the British colonies in North America, and it was particularly revived in the founding years of the United States. It is a firmly antimonarchist – that is, republican – and anti-capitalist political ideal, in which the citizens virtuously stand up for the common good. Their only passion is patriotism, love of the fatherland and its laws, which the citizens themselves have issued in self-government.

The Educationalization of the World in the Long Eighteenth Century II: The Solution

However, the advancement of the commercial society could not be halted by fully developing the ideal of the republican citizen. The natural sciences produced know-how for farming methods in agriculture, and surplus products were exported. Technical advances simplified the production of goods, trade flourished, and the capitalist bourgeoisie pushed for more political influence, especially in France, which ultimately led to the outbreak of the French Revolution in 1789, legitimized by theories of progress. On the other hand, and somewhat paradoxically, over the

course of the eighteenth century the political ideal of the anticapitalist citizen committed to the common good became increasingly attractive. The two opposing ideals were the central issue in a large part of the famous debates between the Federalists and the Anti-Federalists concerning the Constitution of the United States.

In other words, in the second half of the eighteenth century, the contradiction between progress in science and the economy on the one hand, and the popularity of the ideal of the anticapitalist citizen on the other, led to attempts to reconcile the two positions. It was not by chance that this reconciliation was pursued effectively in the Protestant strongholds of Switzerland. Protestantism – notwithstanding its different denominations – had turned from the Catholic emphasis on the institution (the Holy Mother Church) to the individual's soul as the instance of salvation, with no fundamental need of consecrated mediators (priests) between God and the individual. This Protestant focus on the individual's soul became the starting point of the educationalization of the world, insofar as the soul became the central object of education. The difference between German Protestantism (Lutheranism) and Swiss Reformed Protestantism (Zwinglianism and Calvinism) led to two different educational ideologies. Whereas Luther's unworldly political and social ideology led to the political indifferent and antimaterialistic contemplative educational ideology of *Bildung* (Horlacher 2016); the Swiss Reformed Protestantism developed an educational program aimed at active citizenship as a reaction to these fundamental transformations.

The key to accepting the changing living conditions towards a commercial life on the one hand and at the same time to adhering to the republican ideal of the selfless patriotic citizen on the other hand was to focus on the danger zone, so to speak, that is the human soul. Against the background of a commercializing society and the maintained ideal of the virtuous republican citizen, the keyword was "correct modification" of the soul – making the soul virtuous – which was interpreted as strengthening the soul,

developing inner strength. This idea subsequently became the starting point of the educationalization of the world, for it meant that a person with sufficient inner strength or virtue could safely resist all temptations of the (commercial) world and be a virtuous and active citizen. Here, inner strength represented the Protestant internalization of the steadfast Roman warrior hero, fighting not so much the enemy in the battlefield but rather the inner enemy of selfish passion. It was to be expressed as republican virtue in the time of commercialization; in this way it interlaced the common good and commercial society and thereby shaped the future for the welfare of all.

This modification – that is, strengthening the soul towards (civic) virtue – was the program that was to be realized through education. In this cultural transformation process the "self" became the crucial object of the growing subject; it was constantly assessed and monitored through self-reflection, which was often recorded in diaries. Educating the young towards self-examination thus appeared as the key to resolving the conflict between republican politics and the modern economy, as guarantor of an ordered modernity that does not fall prey to the passions related to power but instead is meant to ensure the common good *and* progress. Those who – through education – could strengthen the souls of children did not have to fear the open-ended and uncertain future of a commercializing society. It is this idea that is at the origin of the educational turn, the great transformation process that educationalized the world in a lasting way. Many persons had a part in shaping and popularizing this transformation, but none were as influential as Zurich-born Johann Heinrich Pestalozzi (1746–1827), who through his lifetime became the great promoter of an educationalized world, the star of an educationalizing culture that started to assign more and more perceived social problems to education (Tröhler 2013). This was the basis of the erection of mass schooling as the likely most successful new social subsystem in the Western world through the nineteenth and the twentieth centuries.

Educationalization of Social Problems as Phenomenon of the Educationalization of the World

The overall political, social, and cultural transformations brought about by the American Independence and the French Revolution created manifold uncertainties, in which the educationalization of the world became contextually nourished and demanded educational instruments or methods. Competing methods were propagated: Johann Ignaz von Felbiger's "normal method," Andrew Bell and Joseph Lancaster's monitorial systems, and Pestalozzi's educational method, which promised both harmonious-natural development of all the human faculties and morality and virtues. However, even if the monitorial or the normal method proved, for limited purposes, to be more successful than Pestalozzi's method, it was the latter that became the icon of the educational turn at the turn of the nineteenth century, possibly precisely because his method proved to be not really applicable at schools. The reduction of Pestalozzi's education aspiration – forming the virtuous citizen – to modern schooling was never his intention; his aim was more the educational salvation of Europe against the background of its moral and political decay: Good (virtuous) politics depended on a good education, and good education depended on "face to face and heart to heart" encounters.

Even when after a quarter of a century of political and social upheavals and economic transformations between the outbreak of the French Revolution and the Congress of Vienna, the European countries decided upon a program that was called restoration; Europe was on a track of progression, desperately in need of reassuring social order. Ideas of natural laws and the inalienable rights of every man as well as the local/regional identities of most of Europe's inhabitants had to be made compatible with the newly defined territorial entities called the nation-States. Whereas these nation-States were becoming defined and justified politically by the constitutions and defended militarily by the armies, the inner coherence of the nation-State, the inhabitants' identification with the nation-State, had to be made by education, respectively the school systems. The educationalizing culture in the beginning of the

nineteenth century expressed the hopes and fears of an unknown future that had to be ensured through loyal citizens, resulting from educational processes to be implemented in organizational contexts, the schools. As a rule, all the nation-States defining themselves constitutionally as territorial entities passed encompassing education acts within 2–3 years after passing their constitutions (Tröhler 2016 in press).

It is one of the characteristics of an educationalized culture to react to unfulfilled expectations not only with educationalization of perceived social problems but also with more and allegedly better educational opportunities in general. Compulsory education was continuously extended and teachers trained more and more. The moral part of this teacher training had to be covered through the genre *history of education* and the more practical part through psychology of education. The ennoblement of teacher training to an academic subject/field was largely owed to the ongoing establishment of psychology as academic discipline, whereby it is no coincidence that psychology focuses on the individual's soul and that the earliest psychologists were – with hardly any exception – sons of Protestant ministers and/or had studied Protestant theology themselves (Tröhler 2011). But even when psychology had become an autonomous discipline working with empirical methods, the educational rhetoric remained idealistic, serving moral values deemed relevant for individuals to cope with the manifold challenges of progress, resulting from the enhanced knowledge production and knowledge dissemination in the educational systems.

Against this background, the educationalization of the world was not limited to solving perceived social problems such as health, crime, economy, ecology, traffic, military, teenage pregnancy, public behavior, or drugs and alcohol but was more fundamentally connected to the process of modernization itself, brought about by the modern sciences and ideas of freedom. Both the sciences and freedom seemed to be inevitable and desirable but at the same time under constant suspicion of creating an endangered individual, and it is here that education becomes a fundamental part of the modernist narrative itself and not

only of the process of the history of Western education, which would limit its focus to the educationalization of social problems. The educationalization of the world, transnationally propagated by organizations such as the OECD and globally disseminated by organizations like the World Bank or UNESCO, is the key to understanding the cultural (and ultimately Protestant) construction of modernity and the modern self as a self-reflective lifelong learner in the system of thought that embodies fears and the hopes for redemption at the very same time.

Introduction

Semiotics is the study of signs, especially as regards their action, usage, communication, and signification (or meaning). The word semiotics derives from the ancient Greek words for sign and signal. In ancient times semiotics was a specific branch of medicine, with signs describing symptoms. Later semiotics became a branch of philosophy, with signs describing the nature of things. Semiotics exceeds the science of linguistics, the latter limited to verbal signs of words and sentences, and encompasses both natural and invented signs, such as culturally specific artifacts. Human beings are sign users, and semiotics can also serve as a metalanguage, the function of which is to describe human action. Semiotics both constructs models, or sign systems, and considers them to be its own object of research. Edusemiotics – educational semiotics – is a recently developed direction in educational theory that takes semiotics as its foundational philosophy and explores the philosophical specifics of semiotics in educational contexts. As a novel theoretical field of inquiry, it is complemented by research known under the banner “semiotics in education” and which is largely an applied enterprise. In this respect edusemiotics is a new conceptual framework used in both theoretical and empirical studies. Edusemiotics has also been given the status of being a new subbranch of theoretical semiotics, alongside biosemiotics or ecosemiotics, and it was launched as such at the 12th World Congress of the International Association for Semiotic Studies (IASS) held in September 2014 at the New Bulgarian University (Sofia, Bulgaria) that included participants from Europe, Australia, and North and South America.

History, in Brief

While Ferdinand de Saussure’s structuralist perspective addressed largely linguistic signs, Charles Sanders Peirce’s philosophy did not limit signs to verbal utterances. Signs also perfuse the nonhuman world in a variety of guises. Peirce’s perspective was pansemiotic and

naturalistic and emphasized the process of signs’ growth and change called *semiosis*, representing the action, transformation, and evolution of signs across nature, culture, and the human mind. In contrast to isolated substances, such as body and mind in the philosophy of Descartes, a Peircean genuine sign as a minimal unit of description is a tri-relative entity, referring to something that it is not (its object or referent) via a third category (interpretant). Human experience is always marked by signs, and all thinking and living proceeds in signs.

Preceding the birth of edusemiotics, in 2008 a group of mostly European researchers in education formed an informal online community under the name Network for Semiotics and Education (out of Oulu University, Finland). The Philosophy of Education Society of Great Britain funded two international research seminars conducted by this group: in the University of Cergy in Paris in 2011 and in the University of Bath in 2012. Papers arising from these seminars appeared in two special issues of the *Journal of Philosophy of Education* (JoPE). Some members of the group were also invited to run a symposium at the Finnish Educational Research Association conference in Helsinki, followed by another one at the meeting of the International Association for Semiotic Studies in Imatra, Finland, in June 2013.

As a novel term, “edusemiotics” was coined by Marcel Danesi (the editor in chief of the journal *Semiotica*) as a subtitle to his Foreword to the comprehensive volume *Semiotics Education Experience* (Semetsky 2010). Recent research summarized in *Edusemiotics: Semiotic Philosophy as Educational Foundation* (Stables and Semetsky 2015) and *Pedagogy and Edusemiotics: Theoretical Challenges/Practical Opportunities* (Semetsky and Stables 2014) continues and develops this critical and creative impulse. While the first book is coauthored, the second represents an edited collection of chapters by international researchers including such members of the Philosophy of Education Society of Australasia as Jayne White and Marek Tesar. The seeds of edusemiotics however had been planted much earlier (some of these seminal works are listed in References).

Edusemiotics as an Anti-Dualist Philosophy

Stressing the importance of “sculpting a veritable *edusemiotics for the future*” (Danesi 2010, p. vii), Danesi commented that “until recently, the idea of amalgamating signs with learning theory and education to establish a new branch, which can be called *edusemiotics*, has never really crystallized, even though the great Russian cultural psychologist Lev S. Vygotsky had remarked . . . that. . . ‘human beings actively remember with the help of signs’ . . . In these words can be detected the *raison d’être* for establishing a connection between *semiotics* as the science of signs, *learning theory* or the science of how signs are learned, and *education*, that is, the practical art/science of teaching individuals how to interpret and understand signs.” Danesi noticed that research in education “has traditionally turned to psychology to help it transform teaching into a more ‘learning compatible’ and ‘performance-oriented’ activity” (2010, p. x). The shift to philosophy enabled by edusemiotics started to bring into sharp focus the dimensions of epistemology, ontology, and ethics often missing in educational research, together with existential questions of meaning – positing those as especially valuable for education and in urgent need of exploration.

Educational theory today, even if implicitly, is often haunted by the ghosts of the past: Cartesian substance dualism, analytic philosophy of language, and the scientific method of modernity as the sole ground for educational research. Human subjectivity with its gamut of experiences and purposes is thus excluded. Edusemiotics as an alternative philosophy is marked by several distinctive characteristics, the first being the priority of process over product as especially important for the discipline of education traditionally focused on finite measurable outcomes. Another important feature of edusemiotics as a distinctive conceptual framework is its ability to overcome the principle of noncontradiction and the logic of the excluded middle. The holistic perspective taken by edusemiotics entails relational ethics; expanded experience; emphasis on interpretations surpassing factual evidence; a conception of

language understood broadly in terms of semiotic structures exceeding the linguistic but encompassing images, diagrams, and other regimes of signs; embodied cognition; and the importance of self-formation as a lifelong process, thus having implications for education throughout the lifespan, inclusive of children and adults. Especially significant is edusemiotics for exploring questions of educational policy and practice and alternative research methodologies, including but not limited to phenomenology and hermeneutics with a view to positing multiple recommendations derived from its foundational principles.

In defiance of the fragmentation of knowledge still prevalent in education, edusemiotics construes a unifying paradigm that opens up a range of opportunities for human development and transformative education. Edusemiotics is an *integrative* conceptual framework. Integrative practices are largely absent from the Western educational system and relegated to Eastern traditions and philosophies such as Tao or Buddhism. In the West, philosophy and education continue to suffer from the great bifurcation between sign and object, between man and world, or – at the socio-cultural level – between self and other. Overcoming such habitual dualisms both in theory and in practice is the ultimate purpose of edusemiotics. Edusemiotics continues and reinterprets the intellectual legacy of major philosophers and critical theorists, crossing over from American Pragmatism to Continental philosophy and also revisiting ancient philosophies, for example, Hermeticism. Philosophers in the pragmatic, versus analytic, tradition reject a sharp dichotomy between subject and object, body and mind, as well as epistemology reduced to the spectator theory of knowledge. Keeping this rejection from being just a slogan is indeed a task pursued by edusemiotics. This task is complex and requires the synthesis of cognition and affect, logic and ethics, and ontology and practice.

A minimal unit of description in edusemiotics, like in semiotics in general, is not an individual thing or person, but a sign as a relational – versus substantial – entity, which continuously engages in changes and transformations, thus defying the

perceived binary oppositions between not only Cartesian categories of mind versus matter but between all other dualisms. As a philosophy of education, edusemiotics aims toward ultimately organizing a sense of the relational self, in which a generic other would be integrated. C. S. Peirce's semiotics presents the whole universe as perfused with signs. In such a universe, the human mind is not separate from the environing physical world but is engaged in a continual participation with it, thus forming a holistic process-structure, a network, encompassing sociocultural and natural aspects. People are signs among signs and are sign users. Everything is a sign – still, nothing is a sign unless it is interpreted. This statement sounds paradoxical, yet the presence of paradoxes is one of the characteristics of semiotics and edusemiotics. The modes of inference include, in addition to deduction and induction, also abduction functioning on the basis of the logic of discovery rather than just the logic of justification. Signs, via the dynamics of multiple interpretations and translations into other signs, evolve and grow. Learning is achieved not by an analytic, Cartesian mind that observes the world from which it is detached, but by synthetic – or integral – consciousness that constructs an expanded field of meanings informed by lived experience. Edusemiotics interrogates anthropocentrism, positing an embodied mind connected to the greater, posthuman environment. Education, in semiotic terms, is a relational process of growth as a function of engaging with, and learning from, signs situated in life, in experience, in ethical practice.

Some Practical Implications of Edusemiotics

Experiential learning expands the walls of the traditional classroom and opens it to the greater social and natural world. Edusemiotics partakes of an open-ended practical inquiry that does not aim to attain finite and indubitable knowledge. It problematizes the prevalent role of formal instruction and elicits alternative pedagogies. Pedagogy in

the spirit of edusemiotics is not reducible to teaching “true” facts, but aims to enrich experience with meanings and values. Thus, learning by means of using signs becomes a modality of both formal and post-formal pedagogies that strengthen relations and connections and are oriented to meaning-making practices; the value dimension of edusemiotics is thus implied. This perspective defies the reductionist paradigm and the model of educational research as exclusively evidence based. Edusemiotics posits empirical evidence as always open to interpretations. It creates a novel open-ended foundation for knowledge which is always already of the nature of a process, thus subject to evolution, development, and the intrusion of signs that need to be interpreted anew in the unpredictable circumstances of lived experience for which our old habits of thought and action may be unfit or counterproductive. The process of semiosis that encompasses human beings functioning as signs elicits the transformation of habits as especially important in the context of education.

Logic as semiotics is the science of the necessary laws of thought. It defies the classical principle of noncontradiction that dates back to Aristotle and relates to the law of the excluded middle that “informs” the analytic logic of the propositional (verbal) language: a proposition is either true or its negation is true – that is, there is nothing in between the two parts of the contradiction. All binary opposites become subject to mediation enabled by the paradoxical structure of genuine signs that have an included middle (in this or that guise) which ensures signs' dynamic growth in meanings rather than the attainment of stable truth. In contrast to the law of noncontradiction that continues to haunt education on the basis of which teachers demand unambiguous and singularly “right” answers, edusemiotics asserts that it is precisely logical contradictions (or moral dilemmas that may be embedded in lived experience) that may serve as important learning material. It is the indirect mediation as a semiotic interpretation that establishes a triadic versus dyadic relation. As relational entities, signs defy the logic of *either-or*; and it is the

mediation peculiar to genuine signs that constitutes their most distinctive aspect and amounts to the logic of the included middle, of *both-and*, that characterizes edusemiotics and makes education transformative and creative.

It is because of this logic that the creation of new signs takes place: signs grow, that is, they become other signs within the interpretive, that is indirect, mediated, and recursive, process of semiosis. Such process is the very foundation for the transformation of habits in actual practice. The transformation of habits – both in thought and in action – is embedded in the relational dynamics of “becoming” in contrast to static “being.” Accordingly, edusemiotics as a theoretical framework leads to reformulating the received notion of progress equated with material success and quantitative measures. Edusemiotics changes the perception of standards that serve as the established policy for testing, assessment, and evaluating academic success versus failure. Failure, in accord with the process of signs being transformed into other signs, may turn into its own opposite, that is, carry a positive value by virtue of being a learning experience. The edusemiotic perspective leads to positing new ethics oriented to creating reconciling relations between ourselves and others that can bring about mutual understanding and sharing each other’s values. Signs function as unorthodox “texts” comprising human experiences that can be “read” and interpreted. By responding to, and interpreting, such texts’ indirect and often subtle messages that, rather than being “clear and distinct” Cartesian ideas, often reach us at the unconscious levels only, we ourselves become *more developed signs*.

Human Development

Edusemiotics has a bearing on teacher training and educational policy-making. Because semiosis is a never-ending process of signs becoming other signs, education cannot end when a child grows up: personal development proceeding through the life span cannot be limited to professional training. Edusemiotics demands a continual

engagement with signs inclusive of personal moral and intellectual growth as the transformation of habits. Edusemiotics reconceptualizes adult education in terms of lifelong learning from events and experiences, positing the human subject as a sign among other signs always already engaged in relations comprising the process of becoming. Edusemiotics defines subjectivity as a process. Such process necessarily involves self-reflection. The realization of meanings in lived experience enriches this very experience with its existential dimension and replaces moral norms and binary codes with relational ethics. A semiotic approach to the structures of knowledge leads to reciprocity between ethics and reason, knowledge and action. Teachers’ self-knowledge becomes a must, because without knowing oneself one cannot know others – hence one would be unable to establish a genuine self-other relation as foundational for the *ethics of integration* – a distinguishing feature of edusemiotics.

The edusemiotic process of the evolution and transformation of signs intrinsically determines new opportunities for human development and transformative education and necessarily encompasses the future-oriented dimensions of becoming, novelty, and creativity. These elements were the defining characteristics of Alfred North Whitehead’s process philosophy and need to be taken into account in education. As creative, edusemiotics problematizes the model of teaching reduced to the unidirectional transmission of pre-given content from a generic teacher to a generic student. Rather, teachers and students together are part of the same semiotic process: they form a single relational unit. In other words, teacher and student cannot function as individual and independent entities. When a teacher’s aim is to instruct and a student’s to receive an indubitable instruction, they, unbeknown to each other, put into practice the habitual philosophy of Cartesian dualism. Edusemiotics however posits a teacher and a student as one unified, albeit double-sided, whole – a sign, a relation. They are interrelated and interdependent by virtue of being embedded in the mutual field of signs creating shared meanings.

Conclusion

Edusemiotics demands that the anti-Cartesian logic of signs becomes our new habit in life. However the educational field tends to subscribe to an old dualistic worldview across theory, practice, research, and especially policy! The old habits of thought and action appear to be resilient; indeed we wouldn't call them "habits" otherwise. Even if habits can eventually evolve and grow by virtue of themselves being signs of experience, they tend to become fixed and rigid, thus closing themselves to change and transformation in the manner of genuine signs. To put into practice the program of education in edusemiotics remains a current challenge. Still, research seminars and lectures are being given by "edusemioticians" at conferences around the world, and graduate seminars on the topic have been offered in some universities, notably in the University of Chile. In November 2014, a symposium on edusemiotics took place at the Philosophy of Education Society of Australasia Annual Meeting in Hamilton, New Zealand. A special issue of the journal *Semiotica* titled "On Edusemiotics" is currently in production. And a comprehensive volume *Edusemiotics – A Handbook* is forthcoming with Springer Publishers.

The overall aim of edusemiotics is the creation of "the open society" (Peters 2009, p. 303; Simons et al. 2009) as the transformation of the whole of the knowledge economy. Continuing research in edusemiotics is needed to eradicate old habits and investigate the effects of such a perspective on diverse sociocultural relations. Edusemiotics is educative as it leads us out of old habits. Indeed, the Latin *educare* means to lead out as well as to bring out something that is within, however not confined within the narrow boundaries of Cartesian cogito. Edusemiotics displays radical, expansive reason constituted by signs. This reason should begin to inform educational policies and educational reform.

Introduction

Edusemiotics is a novel direction in educational theory. New materialism is a novel direction in cultural theory. Both areas of research, while "located" in humanities, pay close attention to contemporary developments in natural sciences such as physics and biology. Both are strongly

anti-dualist. However, while new materialism seems to revert to the philosophy of *monism*, edusemiotics emphasizes the irreducibly *triadic* structure of signs that ensures their dynamics and enables their action and evolution. New materialism tends to draw from the continental tradition in philosophy (notably Deleuze), while sources feeding into the latest developments in edusemiotics are plenty, including American pragmatism. Still, both directions have much in common and seem to exit in parallel – their appearance in their respective fields (cultural studies and education) is nearly simultaneous. Being anti-dualistic, they also deny the division between ontology and epistemology. As for the dimension of ethics, both demonstrate a relational, and partaking of feminist, bent. Both problematize all binary divisions and rigid classifications in favor of relations, maps, diagrams, and cartographies. This short entry does not aim to “compare or contrast” edusemiotics with new materialism but rather intends to present some selected conceptualizations in both areas of research, mapping them into each other’s trajectory and thus opening avenues for further cross-disciplinary research. The entry presents human subjectivity as always already posthuman, emergent, continuously learning, and equipped with semiotic competence.

Semiotics and New Materialism

Semiotics – and, by implication, edusemiotics – is not just *about* signs: it concerns itself primarily with the *action* of signs (a point often missed). It was St. Augustine who first stated that the action of signs proceeds in nature and in culture. In modern times, C. S. Peirce proclaimed that the whole universe is perfused with signs which possess the quality of irreducible triadicity. The action of signs is not direct or dyadic but indirect or mediated. The sign stands for something other than itself, by virtue of the existence of some “third” element *between* the two: that is, indirectly. Genuine semiotic action is always relative to this included third; therefore, the interaction between any two subjects is not purely subjective: according to contemporary semiotician John

Deely, it is suprasubjective. Such action cannot be described by the action of any individual agent: a sign is a relation between self and other that presupposes their mutual participation in the same semiotic process and demands what Deleuze and Guattari (1987) called mutual solidarity. As such, a proper semiotic relation is based on intra-action (not inter-action) – a term that Karen Barad (2007) coined for the purpose of defining the metaphysics of new materialism which intends to emphasize the dimension of “between” and constructs, accordingly, onto-epistemology that serves as an unorthodox foundation for ethics. A feminine approach to ethics in education, such as the ethics of care and its follow-up, the ethics of integration (Semetsky 2010), presents relations as being ontologically basic.

The key neo-materialist scholars of today who target dual oppositions are Rosi Braidotti, Manuel DeLanda, Karen Barad, and Quentin Meillassoux (e.g., Dolphijn and van der Tuin 2012). Braidotti continues a feminist tradition in cultural theory that, just like edusemiotics, interrogates logocentrism and anthropocentrism in favor of posthumanism and culture-nature assemblages (signs), thereby positing human subjectivity as unavoidably embodied. Meillassoux’s materialism, while “speculative,” is however not foreign to scientific rationalism: he calls for establishing the absolute scope of mathematics as a formal (rather than vernacular) language to describe reality, albeit under the *proviso* of including the dimension of meaning in science.

Inquiring into the nature of the language of signs (verbal, mathematical, or otherwise) is one of the tasks pursued by edusemiotics (Semetsky 2013) that brings to mind Leibniz’s and Deleuze’s explorations of *mathesis* as the unified science. While Descartes remained skeptical of the project of the *universal language* as it became known, Leibniz had envisaged a formal *scientia generalis* of all possible relations between all concepts in all branches of knowledge taken together. This unified science of all sciences, called *mathesis universalis*, would employ a formal universal language of symbols, with symbols themselves immanent in life, in nature. Deleuze (2007) points out that the “the key notion of mathesis. . . is that

individuality never separates itself from the universal... Mathesis is... knowledge of life” (pp. 146–147) and has liberating and creative power. Such knowledge of life is equivalent to the knowledge of signs “spoken” by life: it partakes of the *intensive* science posited by DeLanda (2002).

DeLanda focuses on the nonlinear dynamics of the (neo-)material world as consisting of matter-energy flows rather than stable physical structures. In turn, edusemiotics does not restrict the semiotic reality to matter and energy but affirms the “third” dimension of information: together they form the triadic signs that perfuse the world, thereby denying that matter is inert or dead (Semetsky 2013). Body is minded and mind is embodied. The premise of ancient Hermetic philosophy (which is one of the precursors of edusemiotics) that matter is alive and grounded in relations is confirmed by new science. Edusemiotics and new materialism alike are “breakthrough” areas of research, and it is the life of signs (human and nonhuman) that literally “breaks through” general categories and rigid classifications. It is the entanglement (the term used by Barad, who borrows it from quantum physics) of matter and meaning that eliminates the remnants of positivism and renders invalid the subject-object dualism. However much earlier, it was John Dewey – one of the theoretical forerunners of edusemiotics – who posited the relation between the observer and the observed via the very *act* of observation, therefore strongly rejecting the method of “objective” science.

The Science of Signs

The developments in semiotics as the science of signs represent the process of recovery from classical physics as the unfortunate heritage of positivism and the paradigm for all other discourses, including research in social sciences. The dynamical structure of a quantum entity is triadic. The apparently opposite terms of A and not-A as its perceived “other” are in a triadic relation in accordance with the semiotic logic of the included middle designated as T (Fig. 1).

Edusemiotics, Subjectivity, and New Materialism, Fig. 1 A genuine triadic relation describing a quantum entity

The cutting-edge science of coordination dynamics (Kelso and Engström 2006) does not separate the world of nature from the human mind but posits a single entity designated as body ~ mind. The symbol tilde (or squiggle ~) creates a new vocabulary to describe the philosophy of complementary pairs (signs) that spills over analytic reason and the mere expression of linguistic truths. This symbol designates the “between” relation as intrinsic to edusemiotics, new materialism, and quantum physics alike. The notation (~) between body and mind indicates a unifying connecting relation as the prerogative of genuine signs. The logic intrinsic to the action of signs demonstrates the radical rationality of semiosis that overcomes widespread dichotomies.

The principle of complementarity (versus opposition) was first posited by physicist Niels Bohr who questioned the “either-or” description of nature (either particles or waves). For Bohr, whose position incidentally inspired Barad’s research, the interplay of *yin* and *yang* tendencies forming one integrated whole in the Chinese philosophy of Taoism was relevant to, and informative for, his new theory. Physicist David Bohm, positing the process of holomovement, emphasized the absence of any direct (mechanistic) causality in lieu of the relations between events interwoven into the whole by the network of quanta. What we tend to perceive as binary opposites at the level of ordinary experience are in fact not contradictory but complementary at the most subtle, quantum, level. They are engaged in coordinated, relational dynamics that makes them a pair, a couple, a double-sided single entity: a sign. It is coupling that demonstrates the continuous balancing act – what Leibniz would call a

dance of particles folding back on themselves – as a property of the relational network of signs that coordinate, or reconcile, nature and culture.

Semiosis is the relational network of signs which are perpetually in action, and quanta (Fig. 1) partake of signs full of implicit information that continuously changes its mode of expression, fluctuating between polar opposites. The logic of the included middle ensures the coordination dynamics that “champions the concept of functional information, and shows that it arises as a consequence of a coupled, self-organized dynamical system living in the metastable regime where only tendencies... coexist” (Kelso and Engström 2006, p. 104). Meaning emerges when such coordination is temporarily stabilized. Signs – as well as quantum entities – are *a priori* virtual tendencies only, and Deleuze was right when he postulated his ontology of the virtual. Yet signs become actual – that is, acquire meaning – when interpreted in practice. It was Peirce who saw that the full development of semiotics as the science of signs required a dynamic view of signification: the process of the production of meanings as included thirds called interpretants. At the practical level, when we step into the lifeworld of experiences participating as such in the action of signs, then, due to the string of interpretants that include our own actions, we begin to understand the meanings of this and subsequent experiences: we learn by actively creating such meaning!

Edusemiotics, Nomadic Education, and Semiotic Competence

The concept of “nomad,” as posited by Deleuze and Guattari, is fruitful for edusemiotics. A nomadic place is always intense because nomads’ existence is inseparable from the region or space they occupy: together they create a rhizomatic network of interdependent relations. The smooth space occupied by nomads is an open-ended relational process ~ structure (with *tilde*) in contrast to a closed striated space ordered by rigid schemata, point-to-point linear connections, and displaying strict boundaries and

borders. The classical episteme of metric systems, technical objectives, and precise measurements and classifications gives way to an experimental and experiential “field... wedded to... non-metric, acentered, rhizomatic multiplicities” (Deleuze and Guattari 1987, p. 381); these qualitative multiplicities (versus quantitative or metric units) are semiotic relations or signs. The action of signs as the primary subject matter of semiotic inquiry extends beyond verbal language, even though it is only through linguistic competence that this range can be brought to light for us as inquirers and learners.

Experiential learning is equated with the development of semiotic consciousness, which is the explicit awareness of the function of signs acting across nature and culture. A semiotic consciousness presupposes fully fledged semiotic competence, of which linguistic competence is only a subset. It is semiotic competence that edusemiotics is designed to elucidate in the field of educational theory and practice. This perspective is important to edusemiotics with its attention also to such expressive “languages” as images, diagrams, graphic symbols, hieroglyphs, as well as signs portending in the world. Such a broad understanding of semiotic systems makes it clear that the notion of “text” exceeds its literal meaning. Texts can be of any physical structure that embodies ideas as signs. The whole of culture, in such a radical sense, is a text and so is the “book of nature.” Both texts can be read, interpreted, understood, and acted upon.

While the notion of “agency” is essential, it is never an individual agent that “acts” within semiosis. As signs are relational entities, so are human agents who are themselves signs and should always be taken in the context of their relations with others, in nature and culture alike. Edusemiotics considers human subjectivity as always already posthuman and situated in nomadic spaces. Barad, in the context of new materialism, advocates the concept of agential realism based on the ontological inseparability of “agencies.” It is the relation that is ontologically fundamental, and such relations (as genuine signs) constitute an unorthodox agency as a community of inquiry. Peirce attributed particular significance

to community in its knowledge-producing practice: “The real, then, is that which, sooner or later, information and reasoning would finally result in, and which is therefore independent of the vagaries of me and you. Thus the very origin of the conception of reality shows that this conception essentially involves the notion of a **community**, without definite limits, and capable of a definite increase of knowledge” (Peirce CP 5.311). Such a community of practical inquiry is theoretically unbounded by space or time and is future-oriented, notwithstanding that as discrete physical individuals we of course remain finite human beings:

Finally, as what anything really is, is what it may finally come to be known to be in the ideal state of complete information, so that reality depends on the ultimate decision of the community; so thought is what it is, only by virtue of its addressing a future thought which is in its value as thought identical with it, though more developed. In this way, the existence of thought now depends on what is to be hereafter; so that it has only a potential existence, dependent on the future thought of the community. (Peirce CP 5.316)

Edusemiotics alerts, however, that what is finally known is bound to lurk in the *future* precisely because a semiotic system remains open to new information, new experiences, new meanings, and new modes of action. A sign’s closure on its meaning is simultaneously an opening to another, more developed, one. The state of complete information, pointed to by Peirce, remains a limit case that, paradoxically, would forever “close” a system by putting a stop to its very dynamics. Achieving a semiotic competence is a never-ending learning process.

Posthuman Subjectivity

Nomadic education proceeds along the lines of signs-becoming-other (read: self-becoming-other) – and human subjectivity, which is itself a sign, emerges amidst the experiential “*encounter*” of the sensible object and the object of thought” (Deleuze 2007, p. 151). Still, the emphasis on individual agency remains a deeply ingrained habit of contemporary philosophical thought

and, by implication, education: either implicitly or explicitly, both tend to carry on the Cartesian tradition with its strict boundary between the dual categories of mind and body, subject and object, self and other, human and nonhuman. The value of relations and the nature of the self ~ other complementary pair as a minimal theoretical unit posited by edusemiotics remain either ignored or underestimated. It is a relation that *extends* human mind into a larger world that includes both socio-cultural and natural aspects. Human subjectivity as community is thus necessarily posthuman and presupposes an ecological awareness. It was John Dewey who persistently argued against separating human experience and the whole of culture from nature. He spoke about the cooperative (or civic) intelligence necessary for associated living which, for him, was what democracy was all about.

For Dewey, experience is never exclusively personal: it is “nature’s, localized in a body as that body happened to exist by nature” (Dewey 1925/1958, p. 231). A semiotic process is cooperative because of the transactional dynamics that involves responses on both sides of the relation and as such “constitutes the intelligibility of acts and things. Possession of the capacity to engage in such activity is intelligence” (Dewey 1925/1958, pp. 179–180). Semiotic competence demands developing posthuman intelligence as a significant part of education that considers “Natural events... messages to be enjoyed and administered” (Dewey 1925/1958, p. 174). When the human mind extends to accommodate the non-human nature, we begin to understand the meaning of such an expansive experience. Dewey’s philosophy is an invaluable resource for edusemiotics.

Edusemiotics demands a shift of perception from static objects and stable structures to dynamic processes crossing over the mind-body dualism and leading to the dynamical “formation of patterns in open systems” (Kelso and Engström 2006, p. 112). It is fully semiotic, anti-dual, reason that is always open to the creation of meanings, and as such it should become instrumental for forming, informing, and transforming education. New, emergent, meanings are the natural consequences of triadic logic on the basis of which

new signs, including ourselves, are created. We are not Cartesian Cogitos but signs possessing eco-centric (not ego-centric) consciousness. Edusemiotic intelligence exceeds even interpersonal reasoning (which remains invaluable for our relations with and understanding “others”) and includes a *transpersonal* aspect, thus bringing into existence the deepest meanings latent in the posthuman dimension of experience, in nature. Edusemiotics would be incomplete without a developed posthuman intelligence, which in turn is a function of growth, learning and developing semiotic competence as part and parcel of edusemiotics.

The ultimate task of edusemiotics is to produce subjectivities that are open to the larger environment (comprising other people, cultures, nations, languages, natural habitats), thus forming with it one organic whole. Taking responsibility for developing a new type of holistic intelligence capable of putting into practice relational ethics, hence sustaining both human and posthuman communities, is one of the many challenges faced by edusemioticians. Educational policy needs to be informed by the semiotic logic of the included middle. Accordingly, policy-makers – rather than merely articulating theoretical goals, missions, norms, rules, and measures – should become aware of the action of signs.

[Affect](#); [Feeling](#); [Passion](#); [Sentiment](#)

Introduction

Cognitive science has shown that emotions are a *sine qua non* for cognition, and nowadays emotions are not anymore understood as irrational or “nonintellectual” feelings. The debate regarding the nature of emotions is still ongoing; however, it would be possible to provide a general definition of emotions as complex states of mind and body, which have an active power – they are not

characterized only as receptivity – that impacts human’s intentionality towards the environment.

The goal of this entry is to highlight the role of emotions in reasoning, focusing on their meaningfulness in learning environments and in those educational practices where emotions work together with rationality to enhance understanding and learning. Following the description of the three main ways to understand emotions in the contemporary philosophy of emotions, this entry will discuss the differences between the standard cognitivist approach and other approaches grounded in the embodied cognition in education.

Emotions as Judgments

Cognitivism in the philosophy of emotion assumes that emotions are identical to propositional judgments. In the *History of Western Philosophy*, Aristotle was the first to highlight the rational valence of the *pathemata*, and the Stoics provided the identification between emotions and evaluative judgment. Many contemporary philosophers ground their cognitivist approach to these ancient roots (cf. Nussbaum 2001) valorizing the intelligence of emotions in practical reasoning.

The arousing of prejudice, pity, anger, and similar emotions has nothing to do with the essential facts, but is merely a personal appeal to the man who is judging the case. (Aristotle, *Rhetoric* 1354 a16–19)

Emotions as Perceptions A quite novel approach is the perceptual model (cf. Prinz 2004), for which emotions are a form of perceptions, i.e., the more primitive and basic form of cognition. This approach has significant consequences for moral philosophy, since it claims that as perceptions are related to judgment about the empirical world, emotions are, therefore, related to moral judgments (Goldie 2007).

The perceptual model emphasizes the “feeling towards,” i.e., the intentional character of emotions: just like perceptions, emotions overcome themselves in order to reach the object they are for. This model has a mind-to-world direction:

The emotions are intentional. By this I mean that the thoughts and feelings involved in an emotion have a directedness towards an object. [...] the object of an

Note: None of the terms mentioned as synonyms carries the meaning that “emotion” has come to bear in cognitive sciences and contemporary philosophy of emotion.

emotion is that onto which one's thoughts and feelings are typically directed, and to which they typically return, so the object of my pride in this example is not just myself, nor just my house, but my-house-which-belongs-to-me. (Goldie 2000, pp. 16–17)

In practical reasoning, emotions are not only a passive stance, but thanks to their intentional and motivational power they are an active force in the “organization” of patterns of actions. As in the cognitivist approach, emotions “could be said to be judgments, in the sense that they are what we see the world ‘in terms of.’ But they need not consist in articulated propositions.” (De Sousa 2014, p. 19). Following this direction many exponents of the perceptual model reply to the main critique toward cognitivism, i.e., the non-conceptual apprehension of the world of beast and babies (cf. Deigh 1994), by binding emotions with desires.

Emotions as Body Feelings and Other Similar Approaches

The criticism towards the standard version of cognitivism has led to new paradigms that share the recognition of the strong value of body experience and environment. Even if these approaches have some peculiar traits creating differences among them, one could still highlight the common rejection of the standard assumption that cognition is instantiated “centrally” by the brain only. Emotions are expressions of the whole living organism embedded in the world and affectivity pervades the mind.

According to William James emotions are body feelings: in the apprehension of reality first comes the body feeling and then the judgment of experience. Physiological changes precede emotions that are the subjective experience of body changes.

If we fancy some strong emotion, and then try to abstract from our consciousness of it all the feelings of its characteristic bodily symptoms, we find we have nothing left behind, no “mind-stuff” out of which the emotion can be constituted, and that a cold and neutral state of intellectual perception is all that remains. (James 1950, p. 173)

Aside from James's account, in this category we could count those approaches emanating from continental philosophy, mainly from phenomenology, existentialism and women's philosophy, and multidisciplinary approaches that combine different disciplines as philosophy, psychology, sociology, biology, and neuroscience. In particular, enactivism (Varela, et al. 1991), that describes an embodied and embedded cognition, and the extended mind hypothesis (Clark and Chalmers 1998), that focuses on the cognitive valence of external tools, have elaborated very promising theories about the role of emotions in general or particular emotions in cognitive processing (cf. Colombetti 2014; Slaby 2014; Candiotti 2015; Carter et al. 2016).

In these approaches, the comprehension of emotions is grounded in an account of the mind that emphasizes its embodied and affective character, making the emotion the more primitive way in which an organism understands, decides, and acts in a particular environment.

Emotions in Education

Generally, the theoretical background of most methodological approaches with regards to the use of emotions in reasoning comes from cognitivism and, partially, from constructivism. Problem solving and multiple intelligences (emotional intelligence, among the perceptual and conceptual ones) are emphasized by cognitive methodologies in education. One such approach suggests that emotional intelligence can fulfill the human experience of life and that its promotion could improve significantly the majority of relational skills. Daniel Goleman (1995) outlines five skills involved in emotional intelligence: (1) being aware of one's emotions, (2) managing emotions, (3) motivating oneself, (4) empathizing, and (5) relating well with others in a group. He explains that these skills can be learned just like any other subject. Many trainings have been developed (i.e., the Life Skills training) in order to make students aware and leaders of their emotional competency, both in their positive and

negative outcomes, providing them some tools for feeling.

If we think of emotions as essential elements of human intelligence, rather than just as supports or props for intelligence, this gives us especially strong reasons to promote the conditions of emotional well-being in a political culture: for this view entails that without emotional development, a part of our reasoning capacity as political creatures will be missing. (Nussbaum 2001, p. 3)

The capability approach, developed by Martha Nussbaum and Amartya Sen, stresses the importance of emotions as inner resources of the human being to develop her/his potentialities and to determine the quality of life – not only for the individual but for the community as well.

For constructivism (Averill 1980) the social context represents the basis of the generation of emotional responses; social epistemology moves beyond the traditional focus on solitary knowers and stresses social and public mechanisms in the quest for truth. A variety of projects were developed in the direction of creation of emotional life in safe learning environments where dialogical communication and sharing cognition were improved (i.e., the Philosophy for Children curriculum created by Matthew Lipman and the contemporary Socratic Dialogue).

[...] what often causes a breakdown of understanding is that the parties involved are able to appreciate only the linguistic or the cognitive factors involved in their interaction with one another but fail to achieve that exchange of emotions that would make their mutual understanding a reality. (Lipman 2003, p. 270)

The experienced and embodied knowledge stresses the external shared dialogical embodiment of the cognitively-motivational state of students. The key idea is that knowledge processes are not abstract but embedded in real practical situations (cf. Ardeli and Ferrari 2014). The social ratiocinating interactions are emphasized in all disciplines, also in the scientific ones. Some learning programs (Prensky 2013) based on the extended mind theory are still at work, often connected to

media education. Extended emotions represent a meaningful hypothesis among the externalist conceptions of mind to design educational programs where knowledge is not understood as the goal of solitary knowers but as the dynamic result of an active and external cognitive and learning process emerging from the interaction inside a group.

The affective dynamics pertaining to a group profoundly transforms the individual group member's emotional experience. Could this process reach the point at which entirely *novel* emotional processes are constituted? This would be a case where goings-on on the group level would function as a phenomenal extension of an individual's emotions. (Slaby 2014, p. 32)

What is crucial to understand about the learning group settings is that the classroom emotional climate (CEC) is not just something good to pursue because it creates a better environment to improve the relationship among students and between students and teachers but, significantly, that it is exactly this learning environment that permits to attain cognitive and learning achievements. That is why emotions are not just shared but also “extended.”

A wide overview – even if not exhaustive – of the many and different programs which have as background what was presented here as the third approach on emotions (emotions as body feelings) could be found in Lund and Cheni (2015).

Conclusion

Discussions about the influence of emotions in learning and in the ability to process information, i.e., if emotions just affect learning or if they are a necessary component of reasoning, are still à la page. Research on the so-called epistemic emotions, i.e., curiosity, love of truth, wonder, intellectual courage, and meticulousness, looks very promising and offers significant contributions to the debate. Moreover, these results are strictly connected to research about the usability of knowledge learned since this kind of emotions could be seen as “facilitating structure” (Immordino-Yang

and Damasio 2007) for the application of knowledge and therefore for practical reasoning.

Another import field of research focuses on transdisciplinary methodologies utilized to improve the emotional skills of the students. Regarding this point the emotion cross-cultural studies, combining art, literature, music, drama, film, etc. are very encouraging.

As the entry has underlined, there are many different theoretical and practical approaches to emotions in reasoning; however, it is possible to highlight a common and general account of the contemporary theories and projects, that is the recognition that emotions really matter, since they make something or someone more prominent, i.e., meaningful in relation to our acts. Then, regarding the learning theory and practice, emotions are very important to improve student's motivation towards learning, their attention to determining salience to the topics, their capabilities to storage information, and to use the knowledge learned in daily life. Emotions have not just an instrumental value for learning – for example, helping to make juicier the process of learning for the students, more connected to their experience, and able to improve the students' participation to the process – but also an intrinsic value, defined by the role of emotions in reasoning, i.e., to be the primitive source for the subject to understand and decide how to act in the world.

Introduction

In the last two decades, there has been growing research challenging the binary between reason/emotion embedded in mainstream literature on educational leadership. For many years, emotions were characterized as irrational, and as such, they were not considered to have a legitimate place in the workplace (Ashforth and Humphrey 1995). But research on emotions in the workplace, including educational organizations, started to flourish in the early 1990s after it gradually became evident that emotions were influential in decision-making, motivation and behaviors in organizations, administration, and leadership. Although the importance of researching emotions for understanding educational leaders is realized, the literature on emotions and educational leadership is still limited (Berkovich and Eyal 2015). In addition, there is still considerable conceptual work to be done in relation to the theoretical approaches that are mobilized to explore emotion in educational leadership.

The aim of the present entry is to review findings and methods about the emotional aspects related to educational leadership during the last two decades. This is not a comprehensive review of specific literature but rather a broad sketch of the landscape to provide an overview of the field. The entry begins by showing how and why emotions are relevant to understanding educational

leadership. Next, it discusses the different theoretical approaches of emotion that have been utilized in educational leadership research; it is also suggested that theoretical assumptions about emotion have relevant methodological implications in terms of how emotions are studied. Then, the entry summarizes some of the most important findings in the study of emotions in educational leadership, outlining the major themes emerging from research. The entry concludes with the implications of these findings for future research about emotions and educational leadership.

How and Why Emotions Are Relevant to Educational Leadership

In the last two decades or so, there have been calls for balancing logic and artistry in leadership (Deal and Peterson 1994), for leading with teacher emotions in mind (Leithwood and Beatty 2006), and for passionate leadership (Davies and Brighouse 2008). Moreover, empirical work has indicated that emotions are powerful forces in school leaders' lives warranting attention (Berkovich and Eyal 2015). There is also growing evidence in the research literature that the affective world of school leaders is both complex and intense (Samier and Schmidt 2009). School leaders are confronted on a daily basis with a variety of emotions that are inextricably linked to personal, professional, relational, political, and cultural issues.

The school leaders' emotional struggles have significant implications for their decision-making, well-being, and overall leadership style. School leaders are constantly engaged in emotion management processes, often with serious implications not only for their emotional health but also for their professional effectiveness (Blackmore 2011); at the same time, however, research also documents how mechanisms of emotion management help school leaders promote their own agenda, survive the high emotional demands of school leadership, and bring meaningful changes to their school (Beatty and Brew 2004). School leaders' handling of the emotions in their own reflective practices and in their relationships with

parents, students, and faculty shapes and reflects the climate and culture of their schools (Leithwood and Beatty 2006).

In general, it has been suggested that emotions are asserted for understanding educational leaders in four ways (Berkovich and Eyal 2015). First, emotional experiences and their displays in educational organizations are manifestations of leaders' visions, desires, and fears. For example, positive emotions may indicate the fulfillment of a desired goal, while negative emotions may be indicative of the opposite. Second, educational leaders' behaviors have an impact on the emotions of those with whom leaders interact. For example, teachers' negative emotions may indicate unfavorable leadership behaviors; on the other hand, teachers' positive emotions may be indicative of favorable leadership behaviors like transformational and supportive leadership behaviors. Third, it has been suggested that leaders' affective abilities (or "emotional intelligence") are more likely to promote desired organizational outcomes, because leaders are enabled to control their own emotions or direct the emotions of others toward desired goals. Fourth, educational leaders' emotions may be influenced by macro-factors and social structures that have made educational leadership work to become more conflicted and political. Thus, economic, social, and political conditions influence the work of educational leaders and their emotional lives, and, therefore, their desired work outcomes.

Approaches in the Study of Emotion in Educational Leadership

Generally speaking, the study of emotions in educational leadership has followed three major approaches: the psychological approach, the sociocultural approach, and finally the feminist and critical approach. The strongest influence has been from psychological theory, management theory, and brain science, particularly Daniel Goleman's work on emotional intelligence; the influence from feminist social theory, critical organizational theory, the sociology of emotions, and critical pedagogy has been less, yet it seems to

gain considerable ground in recent years (Blackmore 2011).

The psychological approach treats emotions as individual, private, and autonomous psychological traits and states. The influence of this approach has been mostly evident through Goleman's notion of emotional intelligence. Emotional intelligence is being mobilized in educational leadership to urge teachers and leaders to handle the emotions of themselves as well as those of others and to develop emotional literacy. The notion of emotional intelligence has been translated into the educational leadership literature as a new source of leadership strength (see Blackmore 2011). Therefore, it is argued that emotional management is important for the success of organizations, including educational ones; in fact, emotional intelligence is linked to the success of one's leadership style. For example, for those who are able to express and manage their emotions appropriately, it is suggested that they are more capable to achieve influence over others and be more effective in creating a productive professional environment. The methods of data collection grounded in the psychological approach are usually questionnaires and emotional intelligence tests; the epistemological assumption embedded in these methods is the notion of emotions as individual, psychological traits.

The psychological approach has been critiqued because it focuses on the leader as an individual and fails to address the limits and possibilities arising from the contextual and situated relationships in which the leader works (Blackmore 2011). Furthermore, the social and organizational cultural dimension of emotions is taken as given with the assumption that leaders work within the frame of existing social and organizational conditions. There is no theorization of the relationship between agency and structure, no theory of how power works in organizations, and little discussion of the emotional economies of organizations; instead the organization and the leader (with his or her individual emotions) are treated as universal concepts, without specific histories or identities formed and negotiated through complex social relations (Blackmore 2011).

Recent studies on emotions and educational leadership are following the growing trends in educational leadership research toward a social and organizational cultural approach (Zorn and Boler 2007). This approach moves beyond a focus on leaders in specialized roles and toward seeing both emotions and leadership embedded in a social and organizational environment (e.g., see, Leithwood and Beatty 2006). Additionally, this is a departure from the view of emotions through individualist and psychological terms toward a perspective that also recognizes the sociocultural dimension of emotions. Research following this interactionist view of emotions and educational leadership emphasizes that emotions and leadership are influencing each other, and thus, there is an interrelation between emotions and their social and organizational setting.

The sociocultural approach has also been critiqued (see Blackmore 2011; Zembylas 2009) for conceptualizing emotions and social settings as individual forces that act upon each other (Zorn and Boler 2007). That is, there is still a dualistic view of educational organizations in which individuals experience private and autonomous emotions which act upon and are influenced by organizational culture. Even Beatty's social and organizational analysis of emotions in educational leadership through a social constructionist lens (see Leithwood and Beatty 2006) makes the problematic assumption that organizations are either constructed or pregiven (Zorn and Boler 2007). Her approach assumes that emotions are still perceived as private experiences located in the psychological self (e.g., successful leadership is associated with personality characteristics), thereby failing to really take into account the power relations and the role of social and political structures in forming feelings in teachers, learners, and leaders.

Recent work in the social sciences (including cultural studies, feminist studies, sociology, political science, and communications) increasingly recognizes emotions as part of everyday social, cultural, and political life (Zembylas 2009). Emotions in leadership, therefore, are not only a psychological matter but also a political space in which school leaders, teachers, students, and

parents interact, with implications for larger political and cultural struggles for change. In the emergent new approach, the social and political dimensions of emotions are recognized, offering important insights in educational leadership, organizational change, and school reform literature. As a theoretical construct, the notion of emotions as relational and contextual – which also implies a move from psychological methods of study to sociological and anthropological perspectives – highlights how culture and politics relate to emotions. This theorization of emotion contributes to a different understanding of educational leadership in which issues related to the social and political factors influencing leaders' emotions, the leaders' emotional practices and their impact on school culture, and the "affective economies" under which educational leadership is enacted become the center stage of interest.

Major Findings of Research

Following the above approaches, there are three core themes emerging from findings on emotions and educational leadership in the last two decades (Berkovich and Eyal 2015; Blackmore 2011): (a) how leaders express their own emotional experiences; (b) what the effects of leaders' emotional experiences are on others; and, finally, (c) whether emotions and leadership are understood as abilities or as social practices that arise within particular social, cultural, and political settings. Each theme is briefly discussed below.

In relation to the first theme, research findings indicate that there are three kinds of factors that influence leaders' emotional experiences and their displays: (a) contextual factors at the macro- and microlevel, (b) leadership role factors, and (c) mission-related factors (Berkovich and Eyal 2015). Contextual factors concern issues of sociocultural power relations at the macrolevel (e.g., gender, race, social class, poverty, ethnicity, and age) that shape emotional norms within a society or an educational organization and influence leaders' emotional expressions and displays. For example, neoliberal educational policies promoting accountability and competition influence

leaders' emotional experiences, evoking negative emotions that have an impact on leaders' work (Blackmore 2011). Similarly, the lack of professional autonomy or sufficient organizational support and positive climate at the microlevel evoke unpleasant emotions in leaders. Furthermore, leaders' emotions may be influenced by several key characteristics of the educational leadership role such as structural isolation and workload (Berkovich and Eyal 2015). Finally, factors that are relevant to the mission of leadership in itself – e.g., resistance and obstacles in the pursuit of social justice and equity – seem to be associated with leaders' negative emotions; on the other hand, positive emotions are evoked when there is some success in overcoming resistance and obstacles. Leaders seem to develop a variety of strategies for coping with the emotional and structural dimensions of mission-related leadership.

In relation to the effects of leaders' emotional experiences on others, findings show that leaders' emotionally supportive behaviors (high or low) appear to be particularly important because they affect others' emotions (Berkovich and Eyal 2015). Thus, relationship-oriented behaviors focusing on supporting others and promoting their needs have a positive impact on others' emotions. These behaviors influence the emotional climate of the school, although there is no evidence whether they directly or indirectly influence the learning outcomes. On the other hand, mistreating behaviors by leaders (e.g., aggressive, controlling, or abusive behavior) seem to have harmful effects on teachers' emotions. The methods used to study the effects of leaders' emotional experiences on others are both quantitative and qualitative, but given the emphasis on behavior, most of the studies are influenced by behavioral and social psychology.

Finally, in relation to how leadership and emotions are understood and enacted as social practices that arise within particular social, cultural, and political settings, there seem to be two different directions followed. On the one hand, there is a focus on leaders' emotional abilities – grounded in the exploration of emotions around the concept of emotional intelligence (see Berkovich and Eyal 2015). Studies are primarily quantitative (e.g.,

using self-reports) and show that leaders' general emotional intelligence abilities are correlated with transformational leadership behaviors. Qualitative studies also indicate that leaders acknowledge the significance of empathetic abilities for the leadership role; empathetic abilities are also valuable for mission-related factors such as social justice transformation. It is suggested that empathetic abilities can make a difference in the organizations climate and professional relations and that such behaviors can be developed by training. Moreover, it is shown that educational leaders use a variety of strategies to regulate their emotions. As such, self-regulation of emotion is considered an important ability in enacting the leadership role in order for the leader to appear in control of himself or herself and the situation.

On the other hand, feminist and critical leadership literature is concerned with how leadership is entangled with emotions as gendered and racialized practices (Blackmore 2011; Zembylas 2009). For example, there is evidence how women have often been pathologized for their emotional expressions, being positioned as emotional and weak and not effective leaders but natural carers/teachers of young children. Emotions, then, in this body of educational leadership literature, are theorized as sites of both social control and power. This perspective challenges the body of work that sees emotions as just located within the individual, but rather recognizes that educational leadership is embedded in social and political structures and unequal power relations. Research that is conceptually grounded in this perspective shows how emotion is displayed, perceived, and understood differently according to the gender, racial, cultural, and political positioning of the leader and the norms of the organization or society. The tensions that arise as a result of the "politics of emotion" within a particular setting also highlight the deeper ethical struggles for those concerned with social justice and transformational leadership.

Conclusions and Implications

This entry focused on findings and methods about the emotional aspects related to educational

leadership during the last two decades. The discussion showed that the field is still in its early developmental stage (Berkovich and Eyal 2015). Although the emotional dimensions of educational leadership are widely recognized in the literature, the dominant approach does not draw from feminist social theory, critical organizational theory, the sociology of emotions, or critical pedagogy, but rather from psychological theory (Blackmore 2011). However, recent work into the “politics of emotions” creates new openings for enriching our perspectives about the dynamics of affective relations in the political landscape of the school culture. These openings have to do with a critical understanding of the role of emotions in the constitution of power relations in educational organizations, how emotion discourses are formed and mobilized, and what their political implications are. To study emotions in educational leadership within this theoretical framework allows the exploration of spaces that move beyond theories that psychologize emotions and treat them as internalized (e.g., psychoanalysis) or structural theories that emphasize how structures shape the individual (e.g., Marxism). In this sense emotions are neither private nor merely effects of outside structures. The role of power relations in how affective economies are constructed directs attention to an exploration of emotion discourses and the mechanisms with which emotions are “disciplined” and certain norms are imposed and internalized as “normal.” This kind of theorization allows educational leaders first to identify such discourses and then to destabilize and denaturalize the regimes that demand certain emotions be expressed and others disciplined.

The contribution of new approaches in researching and theorizing emotions in educational leadership amounts to an intervention in a much larger debate about subjectivities in school culture, in which concepts of affective elements of consciousness and relationships, community, and reform are slowly being reexamined (Zembylas 2009). This sociopolitical dimension of emotions in educational leadership creates the difference between possible and real transformation, and it

is this difference that constitutes the power of the more recent theoretical ideas presented here as critical “tools” to challenge contemporary discourses about emotional intelligence in educational leadership – discourses which are caught in the obsession for performativity, efficiency, bureaucratic rationality, cultural assimilation, moral self-control, and normalization of “emotional skills” (Blackmore 2011). The need for a deeper conceptualization of this sociopolitical character can guide future research on emotions in educational leadership in whatever locality, research informed by a genuine search to understand the power and the limitations of the political merits or demerits of any affective economy within an educational organization.

Introduction

Environment and education have been primarily understood in two main ways in educational philosophy and theory in much of the English-speaking world. In brief, these ways tap into (a) questions of surroundings and relations to those, and (b) what is worth knowing, valuing, and doing about patterns and changes in our interactions with our environments.

The connection between the two is most apparent when environmental educators consider the positive and negative effects of human-environment interactions and livelihoods on the conditions for living and flourishing on earth for all its inhabitants – human and otherwise – more broadly, not just those in which people dwell. Thus, in this entry, while the main focus in environmental education is on the second aspect, the first will be sketched too, as it sets the scene for various cross-cutting considerations about environment and education.

Experiencing a World Around Us

The first sense mentioned above taps into the familiar conception and meaning of environment as *that which surrounds* and to which *an organism responds and adapts*. Implicit within this is a sense that people's engagement with their

surroundings has multiple dimensions (Ingold 2000): it is intellectual as well as sensuous, aesthetic as much as a matter of ethics, involves volition and emotion and not simply cognition, and is historically conditioned even if it also remains indeterminate, i.e., open to the possibility of change.

Following this line of reasoning, an environment forms the grounds and sources for various options and activities of dwelling, personhood, security, reciprocity, economy, and identity formation (and their disruption), for individuals and groups. In other words, for this entry, it behoves us to recognize that all education takes place in an experiential space, and following phenomenological considerations, *being in place* is where one comes to know others and is known to others.

As Bonnett (2004) notes, terms such as *oikos* (as home), *khôra* (as a key root for understandings of space), and *topos* (the equivalent for place) communicate much of the existential dimensions to a sense of both the conditions and contexts of talk of environment. They also hone attention on what is concrete, specific, and particular to people living in habitable places, in contrast to what is abstract, idealized, or mythic for our experiences in and across some of the diverse environments, lifeworlds, and possibilities for life on this planet. Thus, an “environmental education,” as an important way of bringing these matters together, may involve elements of environmental awareness and nature appreciation (e.g., fostering a sense of awe and wonder, grasping the aesthetics of the sublime and picturesque), as much as lead to a questioning and even rejecting of certain ways of living in particular places, by becoming aware and appreciating their connections to others, e.g., through colonialism, globalization, and accelerating consumptionism.

To return to the first sense though, in educational and developmental psychology, a key concern is what an environment affords a learner during different phases of an individual’s lifespan, taking into account their motivations, intentions, ableness, and behaviors when interacting with an environment. Thus, from early childhood studies and experiential education to many of the models of developmental psychology and

phenomenology that can inform aspects of educational philosophy and theory, a key focus is on the gaining of capabilities and insights to interact with an environment, particularly through motor skills and cognitive development. These might include through the discovery of new opportunities for movement shifts in perception and worldview, and novel forms of interaction for an individual with an environment into adulthood (see, Sheets-Johnstone 2009), e.g., through outdoor education, environmentally sensitive arts programs, or a “green skills” training syllabus for adults in the vocational sector. Teaching and learning in a range of high-quality environments – and ensuring those afford rich educational experiences – are key corollaries for this sense of linking environment and education.

However, the “baggage” associated with such a view must also be elaborated, by recognizing that environment is typically assumed to require a degree of naturalness to the spaces surrounding an individual, e.g., in outdoor settings or in places for play, discovery, navigation, adventure, instruction, and gainful employment. For educators, while this “intentional field of significance” (Bonnett 2004) is usually recognized as co-constructed, for an individual learner, the environment may still be assumed to be one beyond the traditional classroom setting. Indeed, it may be on *terra firma* rather than (say) water, often in rural settings rather than urban ones, in relatively pristine environments in preference to degraded ones, and with the teacher’s and learner’s attention steered towards the ecological rather than, for example, the economic realities of ways of living. This is despite a long tradition of a variety of approaches to studying environment and society, such as in geography, biology, and “home economics,” as well as in alternative approaches, e.g., urban and built environmental education. Some of these can be traced to, for example, anarchist traditions of thought (e.g., Ward 1978) and more contemporary expressions in psychogeography with its interests in liminal and problematic environs (e.g., rooted in situationist perspectives). These alternatives tend to invite (or require) more of a focus on the experiencing and shaping of environmental consciousness and reflexivities

and, more recently, questions of affect and materiality in offering critique of human-environment interactions, as in exploring and our responses to (typically) urban, postindustrial, and derelict environments. Thus, a key area ripe for development in educational philosophy and theory is examining the significance of everyday places, spaces, and life to environment and education. These include how environments are appropriated, imagined, inhabited, and reworked through diverse intentions and interpretations of places and spaces; their shifting affordances and interactions, including in relation to those environments that might be marginal and/or hidden from society at large, including to its educators and learners (e.g., risky, mundane, ambiguous, paradoxical, ecophobic or unattractive environments, as well as “non-places” – see Augé (1995), on the significance of motorways, hotel rooms, airports, and shopping malls to learning about “super-modern” ways of life).

Other new directions for educational philosophy and theory in this regard include incorporating insights from ecological anthropology and the environmental humanities. These shift the focus away from that of an individual’s senses and meaning-making in two key directions, namely, towards (i) the sociocultural beliefs and practices in both adapting and maintaining environments and ecosystems, and (ii) studying and learning from a wide range of human responses to environmental challenges and problems and how these are represented – and possibly addressed – in historic, contemporary, and possible societal formations and worldviews, e.g., given currents in politics, economics, history, epistemology, and demographics.

A major concern can be voiced though, regarding the degree of environmental *determinism* that can be embedded in some of the assumptions at work in associated philosophies and theories of education, including within a broad sweep of “ecopedagogies.” In brief, that exposure to selected and primarily biophysical environments can be assumed to predispose people to develop particular values, insights, behaviors, or societal trajectories, or put more strongly, that ecopedagogies inculcate these. We return to this concern in the next section,

but at this point, we note this situation contrasts with the emphasis in much social thought on *possibilism*, which seeks to recognize anthropological and democratic constraints and limitations, including matters of contingency and negotiation in the construction and outcomes of meaningful environmental educational experiences, e.g., in empowering eco-identities, sharing or deconstructing unsustainable social relations, and challenging environmental injustices. In other words, a possibilist focus affords a stronger emphasis on concerted and complex configurations of human interactions given, for example, various facets of structure and agency and on notions of success and failure in this regard, e.g., when learning from our mistakes with the environment. It also serves to shift the emphasis away from simplistically “reading off” pedagogical priorities from environmental conditions, e.g., the “earth education” of the 1970s and 1980s in the USA and the United Nations’ versions of “education for sustainable development” of the 2000s. In both, while a sense of interconnectedness and transformation is strongly expected, in fact, neither has had the wide-ranging and far-reaching uptake and impacts that their sponsors and advocates have expected.

Given these observations, a key area of critique of “deterministic” readings of environment and education involves rejecting the uncritical promotion of what amounts to an adjustment mode in education, e.g., by “acclimatizing” to contemporary social issues. This approach is largely discredited in political and educational philosophy as symptomatic of an ideological project akin to neo-colonialism and, in relation to ecophilosophies more specifically, often harbors an unwitting continuation of majority lifestyles that exploit the earth. To illustrate, climate change education is not mainstream education, and it tends to focus attention primarily on strategies of *adaptation* or *mitigation* to what is largely unseen and unfelt, even if it is comprehensible and occasionally tangible or probable as a phenomenon. Its marginal status and the former strategy are critiqued as largely business-as-usual economically and politically; they also tend to ignore ecocentric and biocentric possibilities, particularly those interested in pursuing deeper forms of

environmental activism beyond reformism. However, the latter strategy is also critiqued too, because it seems to require such large-scale rethinking of the conditions conducive to the survival and flourishing of communities (biotically and abiotically) into the future (with concomitant major shifts in environmental policy, economic organization, and cultural configurations). Thus, it leads some commentators to wonder if educators have the capacity or traction to address these in the contemporary public sphere (see Orr 1994). An alternative, as Gruenewald (2003) puts it, is to further emphasize the spatial aspects of social experience in the form and substance of curriculum, via *critical pedagogies of place*. These require addressing the twin objectives of *decolonization* and *reinhabitation*, so as to challenge “all educators to reflect on the relationship between the kind of education they pursue and the kind of places we inhabit and leave behind for future generations” (p. 3). But again, questions can be asked as to whether the post-naturalistic turn in environmental philosophy has yet to been taken into account in such ecopedagogical thinking or even the post-humanistic turn in educational philosophy more generally (e.g., Haraway 2013).

For educators and educationalists then, key questions might arise regarding the educative value of contemporary forms of environmental education and the visibility or otherwise of environmental topics in education in general, including how these are conceived and construed. Orr (1994) once observed that it is the most educated in conventional Western forms of schooling who have the largest footprint on the planet, given their careers and lifestyles, but also their perpetuation of the prevailing economic system, built as it is on continuing to strain both the resources and capacities of people and planet to be resilient and diverse. Thus, rather than focus on questions of whether exposure to, for example, wilderness as part of a person’s formal education is an essential requirement for schooling, or whether field-based experiences offer extrinsic and intrinsic value to teaching and learning, key questions for educational philosophy and theory can become those of the relation of people-environment interactions to larger social structures of community, culture,

society, economics, and politics – and education’s role in all this.

All Education Is Environmental Education: For Good and Ill

The second understanding identified in the introduction crystallizes many of the preceding concerns. It relates to the modern concept of relation and response to environmental conditions, particularly in light of their degradation and destruction, at local to global scales. The primary concern for education here is exploring, understanding, and appreciating the extent of the consequences these changes have for human and other (mainly animal) species, and the ecosystems on which all depend in the immediate to longer term. Given the severity of some of the threats associated with the so-called environmental crisis, key questions for educators and educationalists include the following: Can education address all aspects of the environmental crisis? What should be the focus and priority of such work? And, when do interventions to address the crisis become “uneducational”? Put otherwise, a counterintuitive question is, is education as much part of the problem as part of the solution, including via an “environmental education” that seeks to address this?

In the remainder of this entry, we briefly consider some of the intellectual resources for responding to such questions.

First, scholarship on key environmental issues typically traces a wide range of shifts in conditions, understandings, the sciences, and the histories of awareness and action about environmental problems. In brief, in the West, the birth of the Romantic movement and the Industrial Revolution has become emblematic of early concerns about air pollution in industrial centers, where awareness and understanding eventually lead to legislation to curb emissions. During the mid- to late nineteenth century, the conservation movement associated with forestry in India, Europe, and North America provoked fuller considerations of such principles as stewardship and sustainability, and an emphasis on the role of civic

and scientific responsibilities to manage natural resources for current and future generations. Environmental protection and wilderness preservationist societies as well as restorationist and “back-to-nature” movements sowed many of the seeds for what has become modern environmentalism (most often associated with figures such as John Ruskin, William Morris, John Muir, Henry David Thoreau, Gifford Pinchot, Patrick Geddes, Aldo Leopold, Rachel Carson, and Ansel Adams) including its extension, some would argue, into the environmental education movement, in the 1960s. Thus, within education, the content knowledge about such key concerns has often come to focus on sifting through the various phenomena and impacts of contemporary and prevailing patterns of human-environment relations and identifying the scale, interconnectedness, likelihood, and urgency of their effects on conditions for living now and into the future.

Typical environmental concerns since the post-war period have ranged from growth in human population and resource demands; pollution of air, land, and water; overfishing of the oceans; destruction of tropical and temperate rainforests; extinction of entire species; depletion of the ozone layer; build-up of greenhouse gases; desertification; wind and water erosion of topsoil; disappearance of farmland and wilderness because of encroaching development ... yet as the nature educator, David Sobel (1996, p. 10) has cautioned, “what’s important is that children have an opportunity to bond with the natural world, to learn to love it, before being asked to heal its wounds.”

Second, more recent strands and splinters of academic activity have continued to raise questions of praxis, particularly in relation to themes of environmental health and justice, political ecology, Gaia theory, biophilia, deep ecology, ecofeminism, anti-consumerism, eco-socialism, post-materialism, ecotheology, weak and strong sustainable development, ecological economics, environmental aesthetics and hermeneutics, greenwashing, ecojustice, permaculture, animal rights, the Slow movement, among many others. In their own ways, these raise important considerations for educational philosophy and theory

(Luke 2001), most notably, the range of ideas and assumptions in play that reinforce or critique the anthropocentric bulk of what counts as knowledge and knowing, and the priorities for teaching and learning particularly in relation to human and “more-than-human” well-being in times of pressing and acute environmental problems, locally to globally.

Third, how anyone responds to such lists is often seen to be a feature of how “green” a person is, in recognition that various shades of environmental (and) educational thought are available. For example, “light green” conservationists are likely to be more anthropocentric than the ecocentrically oriented “dark green” deep ecologists, while ecofeminists may have overlapping strategies and tactics for change with some but not all of the approaches taken by social ecologists, militant “ecoteurs” in “monkey wrench gangs,” if not the gradualists aligned with nongovernmental organizations such as the Sierra Club and the North American Association of Environmental Education. However, while views on the role of lobbying vs. direct action and their educational relevance and rigor may differ considerably, what unites many environmentalists and educators in this field is the idea that humans are part of nature and members of a larger and more inclusive “biotic community” than crude human exceptionalism suggests. Thus, people have obligations or duties to each other in the present, and to future generations, to support biological and cultural diversity, and to work for justice and peace in human actions and practices. Exactly how these themes and their prioritization are worked out has been picked up most recently in debates about the scope and reach of the UN’s Sustainable Development Goals, including in relation to Goal 4 which is focused on Education.

Conclusion

Attempts to environmentalize education can be readily understood alongside other notions in curriculum theory that try to intuit a matter of concern and a curriculum response. Thus there is an explicit curriculum in this area, but this may or not contain

aims and content related to (all) environmental topics. Then, given the notion of a hidden curriculum, we must also recognize this may go against the grain of those or offer a supplement or corrective (e.g., by greening the educational institution's grounds, buildings, supply chains, community relations, etc.). Also noting the received curriculum, we can recognize that what is proposed may not transpire in the experience of students or staff, perhaps because it is interpreted and possibly contradicted by other dominant interests in education. In other words, these features trouble simplistic notions of indoctrination in education by "environmentalists," the likelihood of technocratic authorities coercing particular responses to environmental problems, and that the current generation in schools will automatically be able to address the intra- and intergenerational aspects of environmental issues, even if the problems are largely those they've inherited.

Introduction

Discussions concerning environment and pedagogy are typically located within fields related to environmental education (EE) and education for sustainability (EfS). These fields work across spheres of outdoor, experiential, and critical ecopedagogy as well as ecofeminist pedagogy, philosophy of education, and curriculum. They ultimately rely on philosophical positionings that relay various culturalist and materialist perspectives, reveal complex socio-political commitments, and occupy discourses that govern specific educational contexts.

Nevertheless, environmentally and culturally sensitive pedagogy is practiced within educational situations where ideals of plurality are also adapted to align with educational and societal metanarratives (typically patriarchal, neocolonial, capitalist). Thus, environment-related pedagogy freights various tensions and contradictions into the general education of young people and life-long learners.

In such circumstances, environment-as-pedagogy would most likely work to foster caring relationships at several levels of consciousness. These range from learning about meanings of

direct experience in natural places to those of values that implicate certain worldviews within knowledge structures of education and society. Recently, however, several commentators on the fields of EE/EFS have suggested a need to expand our repertoire of “pedagogical arts” in ways that reconceptualize and practice critical pedagogies across a growing range of applications, including in ways that challenge extant sociocultural and socioecological agendas. What seems most difficult to grasp concerning a broadened pedagogy – particularly when conceived as emotional, embodied, and emplaced – is how this implicates learning experiences in identity construction (i.e., subjectification processes).

An initial response might be to introduce complexity into talk of pedagogical practices, using sensitizing strategies that are at once intercultural, natural, action oriented, community based, and interdisciplinary. More theoretically innovative and politically crucial, however, is thinking beyond the limits of pedagogy, including in ways that will not foreclose on those moments of intersubjective articulation of environment and pedagogy but also interrogate the performative.

New Beginnings?

Environmentalism, it is said, conveys an ethico-historical imperative that connotes humanity’s ecological responsibilities. Indeed, a variety of shades of environmentalisms have emerged, ranging from discourses of sustainable development to those of deep ecology, the common assumption being that are broadly united by a growing desire for action towards a more socially and environmentally just world.

As an ethical base for educators, environmentalism can serve as a justification for teachers’ existential, political, professional, and personal quests toward embracing pedagogy beyond traditional educational discourses and practices. With an historical and intellectual dimension too, these can be mapped at several levels of thought, including by implicating imperatives of care and responsibility for the natural world.

This caring for the environment resonates with the pastoral concern for future generations and thus for pedagogical care as part of an educator’s ethical responsibility. The concept of responsibility encompasses expanding levels of care from personal and social values to include environmental values. In these terms, all forms of pedagogic care have sociocultural and political dimensions and may also connote forms of critical pedagogy that work both within and against traditional education.

In this regard, critical forms of pedagogy, including ecopedagogy, interrogate taken-for-granted interrelations across cultures, environments, and governance structures that produce ideological and hegemonic mainstream educational theory and practice. Critique is intended to not only reveal social inequalities and disadvantages but to also provide means for change as participatory actions for a more socially just and ecologically sustainable world. The point is that if concerns about social and environmental justice are warranted, they must remain part of the argument for pedagogical change and by implication, curriculum change.

In Freirian (2013) terms, the philosophical challenge for education, as for society, is stark: how to penetrate the thick wrapper of existential, political, personal, and practical commitments that always already occupy societies. Environmentally sensitive pedagogies are thus implicated in micro-politics that expose macro social, and thus educational, forces of power. Questions of purpose for environment and pedagogy become questions of social and environmental values fundamentally grounded in ways of knowing and being (i.e., onto-epistemic positionings).

A deeper and broader view of “eco”pedagogy also draws attention to operations of politics and power at educational policy levels and how policy discourses become curriculum and praxis. Not seeing “culture-nature” as fixed but as something that changes as young people’s identities are (trans)formed means that crucial issues of pedagogy and learning must be addressed, be they institutional priorities or teachers’ usually tacit pedagogic beliefs. Even if such perspectives were manifest as curriculum imperatives

governed by societal values, there also remains the question of clarity of teachers' positionings and roles in "educating" and making sense of curriculum/policy, such as in relation to perpetuating a "politics of unsustainability." Accordingly, matters of teaching/learning strategies, interactional methods, community and cultural environmental responsiveness, and spaces/places/learning contexts must also be addressed.

To illustrate, environment and pedagogy intersect as "emplaced" EE. This involves stepping out of school to explore what counts as knowledge production in diverse learning environments. In such places of learning, says Ellsworth (2005), we must explore what it means to think of pedagogy not in relation to knowledge as a thing made but as knowledge in the making. Thus it may be in spaces between emotion and cognition that sensation has ontological priority over language and knowledge, including in pedagogy.

Environment-Pedagogy and Learning

Pedagogy has become, in recent years, a notoriously elusive construct at the heart of complexities of educational change. In the writings of many environmental educators, there is a suggestion that something is missing that surfaces at the interface of environmental theory, pedagogy, and change. Empirically, numerous articles in EE/EfS periodicals have raised questions about the theoretical groundings of educational inquiry and generated thinking about ends-means questions. In EE research journals, questions also concern how theoretical and political agendas are informed by particular research agendas. However, important questions remain about environment-related pedagogy, questions about the complexity of theory-practice thinking or of postcritical ecological ontology and pedagogy and about the politics of difference that demands material engagement across hybrid subjects in transformative and performative (environmental) education.

In order to merge questions of inquiry and pedagogy, it seems timely to (re)consider what may emerge more explicitly from onto-epistemic

assumptions and critical praxis emplaced and replaced as materialist performative and post-human perspectives. Of course, overriding political questions remain about why a long-desired integration of "environment" with general education pedagogy has not been achieved and does not seem imminent – why an anthropocentric worldview has not been replaced with an ecocentric one, for instance. The response in educational policy struggles regarding environment and pedagogy is limited: it remains within dominant discursive/material structures of society. But it is equally important for educators and curriculum policy authority to retain a critical attitude in relation to pedagogy, environment, and learning.

A key postcritical concern is how to be ethical, generous, and kind when the playground of academia resembles "Hunger Games" (Koro-Ljungberg et al. 2015). Overlooked in the management of education systems is the level of theorizing that tends to separate production of knowledge (i.e., matters of fact) from the production of subjectivities (i.e., matters of concern) in contexts of teaching and learning. If environment-related education and pedagogy is as concerned as it says it is with the production of eco-identities and subjectivities, and if educational inquiry has matured beyond attitudes and values, then postcritical notions of teaching as becoming ethical, as generous/kind and generative (even when the playground of education is not), become important. Teachers more pedagogically savvy of the theoretical/conceptual importance of connecting goals of education (including EE/EfS goals) have purchase in enabling experiences strategically, within almost any educational framework, to (re)construct their curricula accordingly.

Treating teachers as intellectuals capable of theoretical work within the power relations of educational systems is possible if teacher education programs, reconceptualized as pedagogical spaces for collaborative (teacher-student) constructions of meaning, can get beyond the divides of theory/practice, science/aesthetics, and mind/body. Making layers of past ideologies visible in nondeterminist and nonessentializing modes of both feminist poststructural and new materialist approaches may go a long way toward

engaging identities/subjectivities as part of reconceptualizing socio-cultural-environmental frameworks for pedagogy. At issue is engagement of theory at levels of consciousness that trouble concepts such as environmental discourse, nature, and the environment itself that are themselves changing, as are concepts of (environment-related) pedagogy. Thus, for environmental theorists and educators it would seem unwise to ignore onto-epistemic dimensions (an ethics of being and knowing) in constructions of EE.

Bridging Theory-Practice Gaps

An overwhelming impetus from critical education of the 1980s and 1990s was to challenge colonization and oppression of teachers and students from every angle. If poststructural theorists were right in describing the subject as a discursive process, then pedagogy as an attempt to intervene in ongoing processes by which the subject was fashioned should also have purchase in fashioning environmentally sensitive subjects, even if in “willful contradiction” to dominant social discourses.

Nonetheless, education is never a neutral process, as Paulo Freire (2013) pointed out. Either it facilitates integration into the present system or facilitates change or transformation. For the last half-century, educators who have “environment in mind” have been anticipating new pedagogies, at once relational, experiential, and community oriented, as projects shared with critical, feminist, and posthumanist educators engaged in practicing “alternative” pedagogies. Many of these pedagogical encounters were intended to go beyond previous critiques of education, cognizant of the dangers of perpetuating the very forms of authority that environment-related programs sought to “modify.” Yet stories of EE, full of good intentions, were then subsumed by institutional cultures and research that ignores theory-based pedagogical shortcomings.

Many critical environmental educators have continued to work toward reconfigurations of pedagogy outside community values of competitive individualism, anthropocentric knowledge

structures, and neutral inquiry methodologies across identity positions of race, class, gender, culture, and environment. In fact, in the larger fields of education, new theoretical trajectories portray pedagogy as incomplete unless characterized by some form of intervention in the unconscious through interchange between the teacher and learner (Ellsworth 2005). Teaching is implicated in the very formation of the personal unconscious self, as a kind of unmeant knowledge which escapes intentionality and meaning and which the subject cannot recognize. To engage with authority is most effective (in willful contradiction) but has been least calculated. What feminist materialist pedagogies have recognized is that EE, if practiced as traditional pedagogy, cannot get at this unmeant knowledge. Rather, in assessing relationships between teacher and student, it is argued that both can learn how to theorize rather than simply recount their experience. In such forms, both teachers and students can reflect critically on how that experience is woven into the fabric of the unconscious discourses of traditional educational and social systems.

This is where critical pedagogy becomes postcritical. “Post” takes on meaning in moving the “critical” beyond resistance narratives to view relational ethics, aesthetics, and politics as performative of social agency. Agency, so reconfigured, at once implicates the onto-epistemic governance of the subjective effects of pedagogies. Thus if we assume that an environment-pedagogy connection implies agential forms of pedagogical praxis in transforming education, inclusive of environmental ethics, then changes have to occur at all levels of educational provision but especially within the performativities of teacher educators and teachers themselves.

For Todd (1997), the crucial question concerns the indeterminacy of desire for change, the notion that we cannot make others want to take on an ethic no matter how socially or environmentally just. However, because we can assume that people are not immutable to the educational experiences and contexts provided, nor unaffected by systems of representation, teachers can create the kinds of pedagogical spaces and places that impact identity and ethics in certain ways.

Transformative educators recognize language games and learning environments, as well as conscious selection of particular spaces and places, as part of the pedagogical dynamic in transforming the “discourse” of the class and the identities of participants. These educators often go out on an institutional limb to make particular experiences part of the subject matter. While this may not sound different, incorporating discussions of values and ethics and worldviews into (re) interpreting the “discourse” of the class (in terms of one’s public identity and political commitments) can open discussions of unconscious desires and conditioned responses. Notwithstanding the danger of abuse/indoctrination in open discussion forums, it is argued that such activity offers no greater risk than currently exists as desires/identities circulate within and without education. Even so, pedagogy is always risky but risks might be viewed differently if desire and identity theory become subjects of the debates. The pedagogical point is to allow space for self-interpretation in ways that make evident how that self is profoundly connected to social roles, discursive systems, and intersubjective relations implicated in other people’s lives. This requires a different kind of pedagogical understanding in order to interpret the interchange between teachers and students.

Environment-Pedagogy Reconsidered?

An ethically generous post-ecocritical turn as part of a new generation of agentive realist inquiry understands pedagogical thinking as between bodies and agents rather than as localized inside the mind of an isolated teacher. Pedagogical knowing is a matter of going beyond the human/nonhuman divide and acknowledging our coexistence with the rest of the world. The relationality of pedagogy as a locus of ethical responsibility opens toward qualitative dimensions of learning in which we also attend to affective dimensions of knowing. For environmental educators to engage transformative educational agendas requires conceptual exploration of a range of cognitive and

affective tensions, such as onto-epistemic breaks with discursive practices that limit the possibilities of new knowledge. While environmental educators continue to press for greater school emphasis in curriculum and pedagogy, these deeper philosophical arguments cannot be assumed to have already taken place. Exploration of ways that our pedagogies represent knowledge and being in the world (our onto-epistemic groundings), as warrants for curriculum and pedagogy, become central questions for a renewed educational philosophy and theory. Questions of the politics of change and individuals’ professional self-narratives, as well as the discourses that these narratives valorize, require levels of self-reflection that can expose and address tacit philosophical alignments and pedagogical preferences. In other words, environment as theory/discourse (within one’s subjectivity) requires the development of strategies that illustrate how new emerging methodologies may transform practice through differentiated engagements with pedagogy.

Finding alternatives that work toward social-relational environmental goals to bring new ideas and perspectives to education implicates, for example, public argumentation concerning new theories and practice. The common ground becomes the theoretical-pedagogical meeting place for collaborative dialogue and planning to introduce and critically engage new perspectives. Within environment-pedagogy framings, questions of how we are to teach and learn, understood as relational collaborative processes within different onto-epistemic frames of knowing and learning, are no longer simply about human but the nonhuman material world as well, profoundly aware of the learner’s identity formation/subjectification. Challenges for pedagogues with environment in mind go beyond the traditional and “alternatives” polarization. In point of fact, one could regard environmental educators’ earlier attempts as a kind of archaeological pedagogy of attempts for changes in education systems related to profound global changes in knowledge, environments, and societies over half a century.

These changes have generated new knowledge about knowledge networks (Peters 2004) that have provided the substance for rethinking what counts as knowledge. They have created conditions for rethinking formal education through lenses of reconceptualized pedagogy grounded in both philosophical and practical debate. Although arguably the field of EE has had few theoretically based inquiries, it could be argued that a field somewhat under-theorized and under-researched can be reengaged with epistemic and ontological ideas, as Latour (2004) says, from matters of fact to matters of concern.

What might become of pedagogy if educators were to reconsider it in terms of the “responsible uncertainties” (Sellar 2009) of multiple onto-epistemic inquiries? If environment-related pedagogy, for example, could be framed as relational processes in ways that privilege intra-activity beyond normalizing discourses, then researching the in-between spaces and edges of identity limits may afford students the opportunities to narrate and reflect on what has occurred. Such is the new literature framed on relational processes that have ontological primacy over the knowledge and identities produced. Even as elusive concepts, environment and pedagogy demand complex inquiry of the unpredictabilities of the pedagogical relations as social and contextual. As Ellsworth (2005) says, pedagogy teaches but does not know how because we come to know onto-epistemically as learning only after it has taken place – as affect prior to cognition – in relationship.

Environment-related pedagogy, whether or not its practitioners know it, have always been caught up in Bateson’s (2000) idea of “breaking away” from traditional prescriptions of curriculum, instruction, and pedagogy. The message for fields of study such as EE/EfS is to become more cognizant of the depth of their own problem and to engage pedagogy with transformative agendas in relation to shifting worldviews as a base for shifting praxis. As Hipkins et al. (2010) argue, unless environment-pedagogy relations in theoretical and practical

work actually “get” the profound philosophical shift in conditions of knowing, then EE practice may continue to do what it has always done. Rethinking pedagogy in terms of onto-epistemic referents may be regarded as developmentally appropriate growth in epistemological sophistication (Egan 2008).

Environmental Activism

Jeppe Læssøe

Aarhus University, Campus Copenhagen, Aarhus, Denmark

Synonyms

Activism and environment; Environment and education; Environment and pedagogy; Environmental action competence; Environmental social movements; Sustainability and education

Introduction

Environmental activism is primarily linked to studies in the fields of environmental political science, environmental sociology, and environmental psychology. However, in this entry, the focus is on the relationship between environmental activism, on the one hand, and learning and education, on the other. Roughly speaking there are two major approaches to addressing this relationship. One belongs to the studies of social movements within the research fields mentioned above. The other is within educational research with a focus on environmental and sustainability education (ESE). However, before discussing these further, the concepts of environment and activism are briefly introduced.

The Concepts of Environment and Activism

Neither environment nor activism are strictly defined concepts nor are they interpreted consistently by scholars. For some, the environment is synonymous with nature, while for others, it is more specifically about conflicts of interests regarding humankind's stewardship of the natural environment. The concept is also blurred by the varying interpretations of nature over time, place, and culture and the intertwining of considerations of nature and culture, e.g., as nature-culture.

Furthermore, in relation to activism, environmental efforts are typically not restricted to the critique of environmental problems but also include efforts to solve those problems, leading to a broader concern with the policies and politics of sustainable transitions.

The concept of activism is also interpreted in diverse ways. A key issue here is whether activism can be considered more or less synonymous with the basic human competences of activity, action, and/or agency or whether it instead constitutes a specific form of agency. Activism is certainly an expression of human agency and consists of activities. Moreover, these activities are intentional and goal directed, which is often regarded as a key characteristic of actions. As a sociological category though, activism commonly (but not always) refers to collective, intentional actions aimed at changing a policy, societal institution, socio-technological or economic system, and/or culturally embedded practices.

Thus, there are several ways of differentiating environmental activism. For example, Bronislaw Szerszynski suggests a matrix to differentiate contemporary forms of environmental activism. One dimension distinguishes between purposive and principled action – the first aiming to achieve direct political results and the second concerned with changing values or behavior – while the orthogonal dimension differentiates countercultural and mainstream forms of practice. Inspired by this matrix, Andrew Jamison differentiates environmental activism as follows:

1. *Community environmentalism* which is oriented toward changing policies by creating spaces for dialogue between factual scientific information, technical suggestions for solutions, and local knowledge leading to the empowerment of local citizens
2. *Professional environmentalism* which is likewise oriented toward changing policies but mainstreamed in its professionalized organizational forms and techniques so as to gain success in concrete cases
3. *Militant environmentalism* which is characterized by a morally driven countercultural activism taking place in the public medialized space

4. *Personal environmentalism* which is value oriented but mainstreamed in the sense that it takes place within the established societal institutions as individuals' personal efforts to change their habits and green their lifestyle

These different ideal types have obvious consequences for the kinds of learning and educational efforts taking place, but before considering those in detail, we need to consider how these issues have been addressed by scholars in the field of social movement theories.

Environmental Activism in Social Movement Theory

The scholarship of "social movements" ranges from classical approaches focused on contradictions between social classes (such as when movements are collectively organized efforts to promote class interests) to approaches reflecting the sociocultural tensions of postwar Western societies where, for example, social movements are understood as agents of revolt against existing societal structures and cultures more broadly. Associated theories have developed quite differently in relation to environmental activism, with one primarily European socioculturally oriented strand standing in marked contrast to a primarily conventional empirical and psychological-oriented strand in the USA.

In Europe, Alain Touraine and Alberto Melucci are key figures in the historical reconceptualization of social movements. These movements were understood to challenge dominant cultural codes, acting with levels of information and communication also used by technocratic powers. Touraine and Melucci also characterized social movements as collective identity formations containing sets of values and beliefs that empower those who share and identify with them.

In concord with this conception of social movements, but also inspired by Jürgen Habermas' work on different types of knowledge interests, Ron Eyerman and Andrew Jamison (1991) developed what they termed a cognitive approach to the analysis of social movements.

Although it is a general approach to studying social movements, it was initially developed in relation to an empirical study of environmentalism and knowledge. For Eyerman and Jamison, the cognitive praxis of social movements is the social action from which new knowledge originates. By focusing on social movement agency as a matter of challenge to dominant sociocultural knowledge as well as a praxis for developing new knowledge and sociocultural identity, their approach focuses directly on the relationship between movement, learning, and education. Environmental activism is approached as creating, as well as taking place in, new public learning spaces. In these spaces, new cognitive practices are developed in struggles targeted at environmental improvements, while as a praxis, it also implies criticism of societally dominant forms of knowledge as well as new knowledge formation.

Inspired by Habermas, Eyerman and Jamison also analyze the cognitive practices of environmental activists, to explore their cosmological, technological, and organizational knowledge interests. Their work shows how social movements are not restricted to specific organizations with a permanence over time; rather, they occur in certain phases of societal transformations in which their strength as movements is dependent on their ability to learn and develop alternatives. These alternatives include all three types of knowledge interests in ways that are able to challenge and transform prevailing knowledge interests. However, this differentiation means that environmental activism does not necessarily develop into a social movement. For example, in his later work, Jamison points to a polarization of environmentalism into those working inside a green business or ecological modernization approach and those who use environmental issues to fuel their militant political activism. However, in his view, none of them offer new, alternative forms of knowledge. Rather, Jamison finds the potential for this among those sporadic environmental agents whom he describes as "hybrid agents," transgressing the affirmative and radical opposing poles of environmentalism. Potentially, education might provide platforms for such hybrid innovative knowledge making.

One objection to Eyerman and Jamison's approach is that it remains primarily inspired by analysis of environmental activist modes rooted in the 1960s and the following decades. Meanwhile, it is less appropriate to understand the forms of social movements, environmental activism, and knowledge production of the social media saturated societies of today in this manner. Alternative analytical lenses include those that draw on the comprehensive work of Manuel Castells on the network society. Castells suggests understanding social movements in terms of networks of agents, whether at local levels and/or virtually connected across spaces. In line with this network approach, the political scientist, Christopher Rootes, has studied the use and production of knowledge among environmental activists pointing to the relationship between local activism and transnational environmental organizations. Rootes (2007) shows how local activists draw on the discourses of transnational organizations and have learnt to act in ways that are more likely to confirm these discourses than dissolve concrete environmental conflicts. In a later study, he adds that environmental activists do not simply transfer knowledge from each other across the globe but interpret and adapt the knowledge to fit their own context.

In the USA, a focus on the analysis of collective behavior often seeks to conceptualize social movements as observable empirical phenomena developing according to their own inner logics, such as from spontaneous crowd actions to the formation of publics and social movements. While this approach has enabled both structural-functionalist and symbolic interactionist contributions, the focus on resource mobilization of recent times has challenged the automatic starting point of a collective behavior perspective, in focusing its analysis on organizations and not the individual. However, the collective behavior approach persists as part of US social psychology, when scholars employ in the study of environmental activism by focusing on the motives, attitudes, and behaviors of environmental activists and their groups. For example, Paul Stern et al. (1999) developed the value-belief-norm theory, based on empirical research documenting

how individuals not only accept the values of a particular environmental movement but also believe that these values are under threat. Their individual and collective actions are believed to help protect those values, and they experience an obligation for pro-movement action. Other studies have gone deeper into exploring how these values and beliefs are created and sustained. They point to the importance of "significant life experiences" derived from, for example, direct encounters with nature, peer role models, and community-based programs enabling collective action as crucial factors in fostering the values and beliefs that will later motivate environmental action and even activism.

Contributions from Environmental and Sustainability Education Research

As indicated in the introduction, the relationship between environmental activism and education/learning has also been addressed in relation to environmental and sustainability education (ESE). While there are only a few contributions within this field of research explicitly addressing environmental activism, several contributions to the development of ESE theory are of relevance to understanding the role of education in relation to environment activism. This issue has been extensively debated in ESE research, not least in response to the politics of the field and its boundaries but also the widespread practice of prescriptive and individual behavior modification-oriented educational practices of environmental NGOs. Four strands of response are identified, and each draws on generic theories of educational and learning into the development of ESE theory, in their own way. They also offer unique contributions to how the relationship between education and environmental activism is framed.

The first strand, often presented as "education for the environment," belongs to the tradition of critical pedagogy inspired by the work of Paulo Freire (among others) as well as by critical theory. Education is inevitably understood to be political. However, the departure point for critique is recognizing that the human interests and ideologies

underlying the dominant positivist and technical rational approach to education (such as via schooling), as well as to the environment, are hidden and hegemonic. In light of this, the political role of a critical-emancipative pedagogy is to scaffold learner's critical thinking on structures of powers and decision making and, in ESE, to "increase pupil's awareness of the moral and political decisions shaping the environment and to give them the knowledge, attitudes and skills that will help them to form their own judgements and to participate in environmental politics" (Huckle 1983). Hence, the role of ESE is to enable what critical theorist Oskar Negt has described as "exemplary learning" in order to promote critical environmental activism.

Partly inspired by the same critical theoretical tradition but also influenced by German "*bildung*" theory and John Dewey's work on democracy and education, Karsten Schnack and Bjarne Bruun Jensen developed an action competence approach to ESE. In contrast to the "education for the environment" approach, it abstains from demanding a starting point in the critical historical analysis of the educational system and the environmental issue. Rather, they state explicitly that the role of education is not to offer environmental solutions but, in an educationally constructivist way, to enable pupils to engage with human environmental conflicts and to learn by doing how to become active citizens in democratic societies (Schnack and Jensen 1997). One way to operationalize the approach is to apply the IVAC method, by which pupils learn from investigating an issue, visioning on problem-solving, acting as societal agents in their local community, and experiencing the effects of their attempts to promote changes. IVAC, it is suggested, integrates environmental activism as part of education although with the aim of socializing students to becoming "action competent" citizens rather than to necessarily solve a specific environmental problem.

While the two theoretical strands mentioned above are both oriented toward educating students in formal educational settings to become critical and engaged citizens in relation to environmental and sustainability issues, other strands are primarily oriented toward enabling environmental

activism in nonformal educational spaces for social change and learning.

First, we must again recognize that social learning is a concept that has been used and understood in several ways. In ESE, it is partly inspired by Jürgen Habermas' theory of communicative action and related ideas of deliberative democracy in political science. In this respect, social learning is about providing spaces for dialogue between agents with different positions and attitudes on environmental or sustainability matters, whether it is with the ambition of gaining consensus or providing a platform for agonistic mutual clarification of disagreements (Wals 2007).

Another source of inspiration comes from the social learning tradition in public planning and organizational learning theory, such as that tracing its origins to the work of social psychologist Kurt Lewin and his successors, and which is also a living part of contemporary environmental and sustainability planning and management theory. The social learning space in this approach is not just a space for deliberative communication but oriented toward innovative co-thinking and problem-solving. Consequently, the social learning strand of ESE is about providing spaces in public planning, in communities, and at workplaces that enable participants to act together in relation to environmental and sustainability issues and to learn from each other. This may be through organized dialogues and workshops which are not only about routine problem-solving but, similar to Jamison's thoughts, enables innovative hybridity between multiple actors.

Closely related to social learning theory, the fourth strand addresses the request for fundamental sociocultural changes and paradigm shifts in worldviews, such as in debates about climate change and other global risk issues, by focusing on the necessity of transformative learning. While the potentials and challenges of transforming existing knowledge and wider mental structures are a well-known topic in psychology and learning theory, ESE scholars do not necessarily pay much attention to the individual oriented contribution on transformative learning from Mezirow and his successors. Rather, they tend to draw on a

range of other theoretical contributions emphasizing transformative learning as a relational and collective process. To illustrate, besides drawing inspiration from the capability approach and critical phenomenology, Heila Lotz-Sisitka et al. (2015) look to the post-Vygotskian work of Yrjö Engeström on expansive learning. They pay special attention to the insight from expansive learning research of focusing on the identification of “germ cell” activities, that is, activities that embody a potential response to deep-seated societal contradictions, which can foster and lead to new forms of agency and to substantive social change at multiple levels. Drawing on the work of Michael Neocosmos, among others, Lotz-Sisitka et al. (2015) suggest a supplement to the concept of transformative learning with the concept of transgressive learning. This stresses that transformative processes can only “search for emancipatory inspiration in the exceeding of culture through the contradictions it itself engenders.” Change-oriented and transformative ESE, in this sense, must highlight the importance of disruptive competences, which are developed in relational reflexive movements focused on the transformative elimination of absences in and through learning processes.

Where the other three strands of ESE contribute to the theoretical exploration of the relationship between environmental activism and learning/education by pointing to the importance of critical-political, action-experience, and social-dialogical qualities, the transformative-transgressive strand raises critical question of the relevance, potentials, and problems of environmental activism as collective efforts that promote transformative learning and change.

Environmental Activists as Educators and Learners

As shown above, both social movement and ESE scholars have pointed to public learning spaces as potential platforms for deliberations, innovative cocreation, and transformative learning. Recent ESE research supplements this by focusing more specifically on the role of environmental activists

as educators and learners. In particular, environmental activists’ learning can be understood as fundamentally tensioned given their feeling of a call to act and yet being overwhelmed and exhausted. Navigating this tension, besides learning new information and developing new skills, activism can disrupt and deepen one’s sense of self-identity. Jonas Lysgaard (2016), for example, has explored the strong relationship between activism, learning, and processes of identity formation. Drawing on Slavoj Žižek and Jacques Lacan, he points to a double-layeredness which includes an exclusion of one’s own “bad practices” from the narratives environmental activists tell about themselves. Similarly, Katrien Van Poeck and Joke Vandenabeele (2014) have shown how environmental activists take on a particular mode in their role of educators, through what Maarten Simons and Jan Masschelein have labeled, “teachers-as-masters.” Of note is how this role is characterized by relations of care for an issue from which the teacher-as-master invites learners to respond and learn from, in the joint exploration of the issue. However, as Pierre Walter (2009) found, liberal, progressive, behavioristic, humanistic, and radical approaches to adult education all exist among environmental movements, be those of North America or beyond.

Introduction

Environmental education (EE) in Brazil is part of the ecological turn in Western societies, led by ecological movements that emerged in the middle of the twentieth century. EE goes beyond the notion of the public sphere as an exclusively human common space, including the presence

and the agency of the other nonhumans (e.g., the planet, the interspecies relations, biodiversity, forests, water, climate) in the common ground of life.

There are important differences between EE practices in relation to the understanding of the environmental issues. The research field of EE in Brazil has been developed under the influence of national policies and of global governance over the past decades. A recent proposal aiming to set new national goals for education and rebuild curriculum propositions has questioned the presence of EE as a compulsory discipline in Brazil. The debate raised between educators and policy makers has been marked by controversies motivated by political interests.

The environmental field is a concept based on the notion of “social field” defined by Bourdieu (1989) as a relatively autonomous space of social relationships historically situated. It produces a set of ethical values, identifying features of an ideal subject, and naturalizes certain ways of seeing and behaving that triggers the rules of the game established within the field. In this context, the environmental field can be defined by the extensive diversity of players and social interests that it engages.

The beginning of the EE field in Brazil dates back to the 1970s, during the earliest environmental movements and the emergence of organizations toward the conservation of nature. In relation to government actions addressing EE, there was the establishment of the National Secretary of Environment (Secretaria Nacional do Meio Ambiente – SEMA) in 1972. It was created as a response to the international debate raised in the United Nations Conference on the Human Environment, also known as the Stockholm Conference. However, it was only in the 1980s that EE was expanded through the increasing number of environmental organizations.

The countercultural environment of the 1960s and the revolutionary principles of the 1970s drove the emergence of the environmental field in the 1980s. The environmental movement was guided by a romantic and revolutionary utopia in the face of environmental issues and as a reaction to rationalist thought and technocracy that prevailed in the 1980s (Carvalho 2010). In Brazil, it

was only from the 1980s that educators started being called “environmental educators.” Since then, an increasing number of national, and more recently Latin American, meetings have been organized indicating the construction of a social identity related to educational practices concerning the environment.

From the 1990s, partnerships between civil society (e.g., activists, intellectuals, and scientists) and the State were established in nongovernmental organizations (NGOs). This cultural environment sought to improve environmental practices, which was enhanced by the Conference of Environment and Development in 1992 in Rio de Janeiro (ECO-92). The “Earth Charter”, created in the ECO-92, was completed in 2000, as a declaration of fundamental ethical principles for building a fair, sustainable, and peaceful global society.

During the preparatory process of the Civil Society Conference – Global Forum – concomitant to the ECO-92, the Brazilian Network of Environmental Education (Rede Brasileira de Educação Ambiental – REBEA) was established in Rio de Janeiro with members from all regions of Brazil. The REBEA encouraged the first Journey of Environmental Education, as well as the Environmental Education Treatise. This institution also organizes the Bi-annual Regional Forum and the National Forum of Environmental Education. Also, the “Treaty of Environmental Education for Sustainable Societies and Global Responsibility” was created during the International Day of Environmental Education, at the Global Forum. In the 2000s, educational changes following the National Curricular Parameters and Guidelines established in 1997 also contributed to the institutionalization of EE in Brazil. In the last two decades, the developments of the research field, as well as public policies for EE, have expanded in Brazil, as shown below.

EE Policies in Brazil

The EE institutionalization process through public policies begun in the 1980s and was consolidated in the 1990s. The proposal of a National

Environmental Policy approved in 1981 included EE as a discipline in all educational levels. The importance of EE was strengthened with the Constitution of the Federative Republic of Brazil, enacted in 1988. This Federal Constitution included a specific chapter on environmental issues where the EE was established as a civil right. In 1994, the National Environmental Education Program (Programa Nacional de Educação Ambiental – ProNEA) was created, in line with the Treaty of Environmental Education for Sustainable Societies and Global Responsibility and in order to “ensure, at the educational level, the balanced integration of multiple dimensions of sustainability – environmental, social, ethical, cultural, economic, spatial and political.” Then, the National Policy for Environmental Education (Plano Nacional de Educação Ambiental – PNEA) was implemented in 1999, with the understanding that environmental education is an essential and permanent component of national education and should be present in an articulated manner, at all levels and modalities of the educational process. Launched by the Brazilian Ministry of Education in 2001, the “Parameters in Action Program” included EE as a theme required for all levels of education. In 2002 the government launched the Brazilian Agenda 21, organized by the Commission for Sustainable Development Policies (Comissão para o Desenvolvimento Sustentável – CPDS), supported by the Ministry of Environment.

By the 2010s, there was already a well-structured legal framework to regulate the EE, and public policies for EE have been improved. In 2012, the National Council of Education (Conselho Nacional de Educação – CNE) elaborated the National Curriculum Guidelines for Environmental Education. In 2013, the Direct Money in School Program was launched by the Ministry of Education with a specific section aiming to support Sustainable Schools. This program aimed to offer financial support for the improvement of environmental sustainability in public schools. Under the motto of transition to sustainability, this program promotes Environmental and Quality of Life Committees, called

COM-VIDA, as a local key element in the transformation of these schools into sustainable educator’s spaces. The COM-VIDA improve the participation of the whole school community seeking to promote social and environmental actions of sustainability as well as establishing relationships between the school community and its territory. In 2014, the National Education Plan was approved for the period of 2014–2024. The National Education Plan is a law, guaranteed by the Federal Constitution, which sets guidelines, goals, and strategies for the national education every 10 years. Currently, the National Education Plan unfolds the construction of the Common National Curricular Basis (CNCB). This aims to establish the essential knowledge and skills that Brazilian students should learn throughout their basic education. The Ministry of Education is the institution in charge for the development of the CNBC. It launched a first version document in 2014 in the form of public consultation for analysis and suggestions. Brazilian researchers and educators have spoken out in favor of including EE in the CNCB. In that document, sustainability is cited as an integrating theme, but there is no specific reference to EE.

The case of Brazil corroborates with a debate raised in Latin America in relation to concepts of sustainability and environmental education in the area of education. In Brazil and in most Latin American countries, the most suitable concept is environmental education and not education for sustainability or education for sustainable development (Sorrentino and Portugal 2016). This argument is shared by the majority of Latin American environmental educators who acknowledge that environmental education is the concept that bears the entire history and the social context in the area. Thus, even the United Nations Organization sought to disseminate the concept of education for sustainable development; environmental education was mostly kept in specialized literature, legislation, and everyday school and community actions in Brazil and Latin American.

Finally, despite the entire legal framework and the attempt of public policies in reiterating the

importance and even the obligation to EE in all levels of education in schools, the EE practices are still punctual and discontinued. Two factors contribute to the difficulty of establishing EE in schools. First, the emphasis of these policies was on the crosscutting nature of EE. The legal framework prevented, for example, the creation of an EE curricular discipline in school, allowing it only in higher education and keeping EE as a peripheral issue in the formal curriculum system. A second factor is the complexity of laws established at the federal level to be implemented in the local realities by the State and local levels of governance, in a large country like Brazil.

A summary of the main public policies for EE in Brazil is presented in Table 1.

Environmental Education in Brazil, Table 1 Key public policies for EE in Brazil since the 1980s

1988: The Brazilian Constitution establishes that EE in all level of education is a citizenship right and a duty of the State
1989: Establishment of the National Environmental Fund to support EE projects
1992: Establishment of the Ministry of Environment
1994: Launch of the National Environmental Education Program in line with the Treaty of Environmental Education for Sustainable Societies and Global Responsibility
1997: Establishment of the National Curricular Parameters and Guidelines with environment as one of the crosscutting themes
1999: Implementation of the National Environmental Education Policy that determines the inclusion of EE at all educational levels
2001: Launch of the Curricular Parameters in Action Program that included EE as required for all levels of education
2002: Implementation of the National Environmental Education Policy by Decree 4.281/2002 and launch of the Brazilian Agenda 21
2012: Establishment of the National Curriculum Guidelines for Environmental Education
2013: Launch of Direct Money in School Program for Sustainable Schools
2014: Implementation of the National Sustainable Schools Program
2015–2016: Development of Common National Base Curriculum

The Research Field of EE in Brazil

Research in EE has increased in Brazil in recent decades. Scholarly works have been developed in different areas of knowledge, addressing the mainstreaming of environmental education as a research field in the country. Many researchers agree to address the problems environmental in the school curriculum, but point out that this discussion should place these problems in wider contexts like democracy, autonomy, quality of life, sustainability, relationships society and nature. Discussions on the theme also raise the need for a curricular subject of EE or to assert it transversally.

In the 2000s, the number of graduate programs in Brazil increased and included EE research. There has also been an increase of national scientific events, which include EE in their working groups (Carvalho and Farias 2011). These events include the participation of institutional research groups and specific journals for publication in the field.

In 2005, the Ministry of Education launched the survey “What do schools do when they say they offer environmental education?” in order to map out the presence and trends of EE in basic education. The survey conducted by Trajber and Mendonça (2006) revealed an increase in the number of schools that included EE between 2001 and 2004. It was established that the main methods applied in schools were projects, followed by Special Subjects and insertion of environmental issues in subjects. As for motivation to include EE, 59% of schools participating indicated that this was due to the initiative of teachers, and 35% said that it was a result of the implementation of the national curriculum standards.

In higher education, the University Network of EE Programs for Sustainable Societies (Rede Universitária de Programas de Educação Ambiental – RUPEA) was created in 2001, with the aim of expanding spaces of action and dialogue of university groups in the field of EE, as well as disclosing environmentalization experiences of higher education. A survey conducted by RUPEA between December 2004 and June 2005 indicated a controversy surrounding the interdisciplinary and transversal insertion of the

environmental dimension in the curriculum, since many of the surveyed universities used a specific course in EE as a strategy.

Carvalho and Farias (2011) conducted a survey of the papers presented at the Meetings of the National Association of Graduate Studies and Research in Education (ANPEd), at Meetings of the National Association of Graduate Studies and Research in Environment and Society (ANPPAS), and at Meetings of Research in Environmental Education (EPEA) between 2001 and 2009, as representative of the research output in environmental education (EE) in the period. The outcome of the survey indicated that the most highlighted topics were the theoretical and methodological discussion on the fundamentals of EE in ANPEd, popular and community EE (e.g., EE focused on specific communities and social groups such as women, indigenous, black people descendants of slaves – the *quilombolas*) in ANPPAS, and EE in formal education in EPEA. Examining the themes of the three events, they found that the concern with EE in formal education was constant in all of them, representing 22% of the work. The authors emphasize that the presence of research production in EE in the researched events was a factor of legitimacy as a research area. It highlights the demand of researchers in EE as to the acknowledgment of this as a practice sustained by rigorous knowledge.

Another reference on the research field in Brazil is the Theses Bank of the Coordination for the Improvement of Higher Education Personnel (CAPES) and the Brazilian Digital Library of Theses and Dissertations of the Brazilian Institute for Information in Science and Technology (IBICT) where master’s dissertations and doctoral theses conducted in Brazil in recent years are deposited. The search for environmental education in the IBICT shows a total of 3,763 theses and dissertations in this decade (between 2010 and 2016), being that 468 related to formal education. In the CAPES bank there are 1,221 publications in EE registered between 2011 and 2012, 736 related specifically to formal education. The majority of research comes from the field of education, with the remaining distributed in 79 other areas of knowledge. It can be observed that more than 60% of the records are related to formal education,

reinforcing the importance of this research focus in Brazil in recent years, which also reported Carvalho and Farias (2011).

Concepts of EE

Facing the controversy emerged from the environmental education, EE could be characterized generally as the production and reproduction of the belief in nature as “good” (i.e., “good” in the philosophical sense) that should be preserved above the simple interests of society. That is an eminently ethical question. This belief sustains the utopia of a symmetric relationship between the interests of society and natural processes. This utopia is challenged precisely because we still live inscribed in a paradigm of human/nature dichotomy. This reference is historically constituted, especially in relation to the legacy of modernity, which was founded on the constitution of a “great divide” between nature and culture (Latour 1994; Descola 2005). To maintain alive this great division, it becomes necessary a permanent effort of “purification,” especially by normal science, in order to separate natural and cultural phenomena. However, this effort is not always successful, because in the plan of material life the permanent overlap between society and nature insists on creating difficulties for the modern project of objectivity that is intended to separate nature and culture into two distinct ontological zones. This epistemological crisis has led philosophers, anthropologists, and other thinkers to discuss this separation, claiming a symmetrical ontology (De Landa 2003) or a symmetrical alternative (Escobar 2007). It can be argued that the tension between nature and culture gives rise to a new modern epistemology. Corroborating with this idea, Steil and Carvalho (2014) proposed the concept of “ecological epistemologies” to identify the region of convergence of non-reductionist thinking that opens up new possibilities to operate within this tension, reordering the dualities without resorting to determinisms, whether culturist or biological. Ecological epistemologies oppose both the idea of a the dilution of culture in nature and an assimilation of nature by culture, considering that

the coproduction of human and natural history makes us all human and nonhuman, guests, and “co-citizens” of the same world.

Another perspective of EE is its justification as a pedagogical action necessary to confront the environmental crisis. One of the substantive arguments in this case relies on the criticism of the consequences of industrial capitalism. Again, the criticism refers to modernity and the rise of industry; intensive use of natural raw materials, based on the exploitation of labor; and the concentration of population and urbanization. The more intensified the processes of industrial society became in order to allow access to material goods in larger scales, the more risks are produced. An example is the contamination of food with pesticides, which is an “invisible” risk, even if it is a well-known fact. In this sense, Beck (2011) believes that nowadays the social production of wealth brings with it the social production of risks, which affects everyone regardless their social class. Although joining in the criticism of the legacy of modernity, authors take different positions in the field of actions. While Beck (2011) tends to seek a departure from the paradigm of modernity, presenting political and normative solutions for environmental issues, Latour (1994) and Descola (2005) choose a less radical approach. For Latour, the project of separation between humans and nature was never accomplished; therefore, “we have never been modern.” Thus, by investing in the utopia of symmetry between humans and nature, we walk alongside an ethical evolution of thought, which considers nonhuman as political agents that interact with humans. Descola (2005) believes that the concern with the effects of human action on the environment points to a change in this modern thought. Furthering the debate, Ingold (2012) proposes the notion of meshwork to think about material culture and relations of communication, integration, and flows between “things.” These “things” or “nonhumans”, unlike “objects”, are porous and fluid, laden with vital flows and integrated with the cycles and dynamics of life and the environment. In this sense, the author criticizes the theory of actor-network of Latour, Law, and Callon (Latour 1999), understanding that it still preserves a metaphysical division

between subjects and objects, since it gives objects a fetishized agency and disregards the unequal distribution of flows and senses along the network.

This way of understanding nature and non-humans from the concepts of flow, symmetry, continuity, and coevolution brings potentially new opportunities for environmental education practices in contrast to the predominantly normative practices in EE. Perhaps we could call this educational attitude as post-humanist, since it takes the human decentralization in the hierarchy of environmental determinations seriously. Thus, in this perspective, the recognition of the non-human is due to an aesthetic and ethically oriented attitude and is not exclusively cognitive or based on technical and instrumental rationality of what is recognized as “environmentally friendly” to the greater benefit of human life.

We must, however, consider that inside the general concept of environmental education, various particular notions of EE still remain, disputing the particular meaning of environment in a field of social conflicting interests and epistemologies. So, the diverse ways to understand EE bring to educational sphere the great division and the ways to overcome it. On the other hand, the different EEs pursue to influence on the ways society understand and make use of the nature, producing specific social environmental conditions in relationship between the universal and the particular, that is, between the society as a whole and the education in particular coproducing relationship.

Introduction

Facing the current consumption and production patterns associated to neoliberalism, environmental education (thereafter EE) is a controversial and contending field in different levels and modalities. This field is composed by a wide repertoire of pedagogical practices that pursue supposedly common objectives, but actually has qualitative different scopes. This repertoire fluctuates between approaches that question the (*à la mode*) civilizing trajectory and approaches that only tend to mitigate some of the problems caused by a certain way of life. In its more critical versions, it is a field of explicitly subversive social practices in confrontation with the establishment. Thus, even from its apparition, EE has fought for defining its own identity.

Due to these characteristics, EE has been directly attacked – even since the early 1990s – by a series of discourses that question its pertinence and validity by formulating proposals such as education for sustainable development (ESD), in tune with groups of interest and multinational corporations that intend to impose a *pensée unique*, that is, a single way of thinking (Ramonet 1995) in order to govern social and political life.

Background

EE originates hand in hand with the social preoccupation as a consequence of the enormous environmental deterioration that took place during the second half of twentieth century, as a consequence from industrialization expansion and urbanization in global scale, as well as demographic explosion. Some authors appeal to the main importance of environment in some previous philosophical and pedagogical traditions and currents, even if with heterogeneous arguments (i.e., Rousseau, Locke, Vives, Rabelais, Comenius, Pestalozzi) that may be considered as valuable contributions in order to understand the role played by the environment in the socialization processes of individuals, as well as in the understanding of the world and of the place we occupy in it. However, the

acknowledging and recognition of the environment as a vital good to be preserved and ameliorated is a social construction than appeared only recently – in the decade of the 1960s – thanks to educational processes that seek to face socio-environmental problems and the complex causes that overdetermine them, by promoting certain values, attitudes, competences, and behaviors (Caride and Meira 2001).

The very notion of EE was expressed for the first time in a meeting of the World Conservation Union (IUCN) in 1948, even if its acceptance only took place some years later since it had to compete against some other concepts such as mesology education and education for conservation. It was at the United Nations Conference on the Human Environment (Stockholm 1972) where environmental education got its international patent when it was referred in Principle 19 of the Final Declaration as a desirable task in every population sector in order to induce a sense of responsibility towards the environment in all its human dimension. Recommendation 96 of the same Conference recognized EE as one of the fundamental elements to confront seriously world environmental crisis (cfr. Belgrade Charter 1975).

From then on, multiple meetings and organizations have contributed to develop a corpus of principles and criteria for action around the recognition of the environment as a complex entity in which elements and processes of diverse nature interact (i.e., biophysical, political, socio-cultural, historical). Thus it requires holistic, cooperative, interdisciplinary, and transdisciplinary approaches for its adequate comprehension, as well as the assumption of a permanent education, innovative and critical, able to transform educational systems. This is a priority in order to develop necessary knowledge, abilities, values, and attitudes in students; to intervene individual and collectively; and to prepare citizens in the prevention and effective solution of problems.

As it usually occurs in the social field, EE has been transversalized by numerous discourses (Sauvé 2005). It has been so charismatic that it has generated enthusiasm in grassroots organizations that work on diverse topics. However, it has

not become a priority in public policies of many countries, since they have only taken them into account in instrumental terms to reach what they consider more transcendent goals. Perhaps this has occurred because it is a field that contends against the conventional curriculum as well as the economical interests that govern national policies.

In regard to school educative processes, the debate about environmental education typology as thought by Lucas (1979) was prevalent many years. Such typology was based in the differentiation between education *in*, *about*, and *for* environment, with the purpose of understanding the different meanings given to the concept. From our point of view, only the last one could be called EE. However, the most frequent treatment has been the incorporation of subjects and discrete topics in the curriculum closely linked to Science Education. Some other proposals that are more creative are based in critical arguments that provoke questioning the usual ideological and scientific basis of conventional knowledge, as well as the place occupied by environment. Among these innovative proposals, we can also find the strengthening of affective – and not only cognitive – processes in regard to environmental topics; an effort to open students' mind in order to hear usually excluded voices (i.e., feminism, indigenism) and, to try to construct new meanings for the educational act. Unfortunately these proposals have been hindered by refractory educational systems, sedimented schemes that are focused on transmissional disciplines and methods, as well as a group of teachers that are not well prepared for the necessary change. Summing up, EE tends to be reduced to a mere aspect of contents adapted to the traditional curriculum; its real potential as a learning strategy and process for social change is thus wasted.

Stages and Approaches

EE's trajectory can be summarized into four general historical stages. The first one is foundational and covers the end of the decade of the 1960s as well as the decade of the 1970s. Its main focus is the contribution of education for the conservation

of natural environment, the solution of environmental problems, and the training of specialists in order to improve its management. Theoretical and institutional basis for EE are settled in this stage, thanks to a process headed by United Nations (UN). After UN Conference on the Human Environment (Stockholm 1972), UNESCO and UNEP were in charge of the International EE Programme (1975–1995) and organized a series of regional and international meetings and designed pedagogical inductive materials that were useful to establish a common ground in regard to objectives, instruments, and strategies of educative actions for contributing to solve environmental challenges. In this phase, guidelines resulting from Belgrade Charter (UNESCO-PNUMA 1975) and the Intergovernmental Conference on Environmental Education in Tbilisi (1977) are very relevant. The latter established that EE “should provide the necessary *knowledge* for interpretation of the complex phenomena that shape the environment, encourage those ethical, economic and aesthetic values which, constituting the basis of *self-discipline*, will further the development of *conduct* compatible with the preservation and improvement of the environment; it should also provide a wide range of *practical skills* required in the devising and application of *effective solutions to environmental problems*” (UNESCO 1978, p. 25; our italics).

The second stage covers the decade of the 1980s. It is a time for transition that coincides with the end of the Cold War and the consolidation of a new World Order characterized by a neoliberal ideological and economic hegemony. It underlies the need to create awareness in the entire population, and mainly in the youngest generations, about the environmental problems, as well as to train them in knowledge and habits that contribute to their solution. The research gives priority to positivist methodological and quasi-experimental approaches, with a great influence of conductive psychology. The 1987 UNESCO-UNEP International Conference on Environmental Education and Formation on Moscow established the basis for EE in the 1990s that identifies four priorities: “(i) the search for and implementation of effective models of

environmental education, training and information; (ii) general awareness of the causes and effects of environmental problems; (iii) general acceptance of the need for an integrated approach to solving these problems; (iv) training, at various levels, of the personnel needed for the rational management of the environment in view of achieving sustainable development at community, national, regional and worldwide levels” (UNESCO-UNEP 1988, p. 6). As underlying ideas of this approach we find the attribution of environmental problems to the supposedly irrational behavior both of individuals and social collectives. Also in 1987, *Our Common Future* (WCED 1987) was published. Best known as *Brundtland Report*, it inaugurated sustainable development as the articulating approach in the global environmental policy. The prescriptive irruption of this concept has been crucial for the evolution of EE during the last three decades.

Third stage beginnings can be situated with the UN Conference on Environment and Development (UNCED, Rio Summit 1992). The Stockholm approach which dated from 20 years ahead was given an important transformation at the Rio Summit. The concept “environmental education” disappeared from Rio Declaration and in the approved official documents, mainly “Chapter 36” of *Agenda 21*. The EE concept is also left behind due to the belief that it ignores the social and economic dimensions of environment and for having caused a naturalistic educational praxis and thus is replaced by Education for Sustainable Development (ESD). Simultaneous to Rio official Conference, the NGO’s Global Forum was held (1992) giving place to the *Treaty on Environmental Education for Sustainable Societies and Global Responsibility*. It criticized EE’s role in regard to a globalizing market to which operational logic inequity generation and biosphere deterioration are mutually linked, as direct effects of human pressure on natural resources and drains. Sustainable development, a key concept in the official discourse, is strongly questioned since it nurtures the belief that sustainability and equity as priority goals can be answered back without doubting about the hegemony of a mode of production, distribution, and

consumption that ignores the limits of the biosphere to satisfy with dignity the needs of every human community.

Rio Summit (1992) generated a bifurcation in the field of the educational responses to the environmental crisis that is still valid today. The Third International Conference on Environment and Society: Education and Public Awareness for Sustainability (Thessaloniki 1997, also known as Tbilisi+20) made an effort to stop this fracture by means of promoting the inclusive concept of EE for sustainability. However, the achieved consensus was ignored by the UN Commission on Sustainable Development (CDS), a high-level UN forum that examines and supervises the national, regional, and international progress of *Program 21*. Consistently, RIO+10 Summit on Johannesburg recommended to give impulse to education on sustainable development (ESD). In harmony with this line of thought, the UN General Assembly (2002) approved the establishment of the ESD Decade (2005–2014).

Nowadays we are in the fourth stage. It responds to the dialectics established between the aforementioned approaches. Such dialectics polarizes the field of educational response to environmental crisis between reformist positions that affirm that it is possible to find answers to such a crisis without really questioning the established development style, on the one hand. On the other, there are postdevelopmental positions that assume the impossibility of solving the challenge of environmental crisis without questioning the basic assumptions of the dominant economic order. The first ones are based on the belief that a development sustained on a finite world is possible, as well on the idea that poverty can be eliminated without questioning the models of production, distribution, and consumption that give access to high figures of welfare and richness in the affluent societies (most developed countries and the wealthy group of developing countries and emerging economies). The second ones challenge the ideological, political, and economic substratum that connects both faces of contemporary crisis: environmental and social. From this point of view, EE should focus on revealing the structural nature of the crisis and train citizenship

in the necessary competences for a social and political action that is responsible and democratic. Challenging the link between education, growing, and development established in Rio+20 Summit (2012), in regard to the Green Economy concept, the necessity for a certain EE appears. This approach should be focused on the construction of social, economic, and cultural forms for decreasing, by preparing communities and societies for resilience in a future of scarcity (of fossil energy, food, drinking water, etc.) where it will be necessary to adapt human life to the changes that unavoidably will be produced as a result of the human habitat transformation as a consequence of climate change and other concurrent transformations of the biosphere. Diverging with ESD, EE confirms the necessity to politicize once and again the social praxis “to develop political-pedagogical itineraries depending on the unmet needs of populations and the sustainability requirements of specific territories, from each one’s own cultures, local economies and a more just relationship with global markets, each one’s own structures of employment, the carrying capacities of their ecosystems, allowing to build the human well-being in harmony with life and mother earth” (Rio+20 Educational Group 2012).

Conclusion

As it has been explained, a dominant discourse of EE now characterized by the discourse of ESD has prevailed. It marginalizes and makes other discourses and agents invisible, focused on a way of life that praises the Western urban way of life, the knowledge legitimized and institutionalized that tends to standardize the recipients of education and privileges individual instead of collective action, without really questioning neither the grounds of this hegemonic lifestyle nor its comfort zones. This discourse has colonized the discourses of multinational organizations that disseminate it as valid and safe recommendations. In this respect, A. Gough (1997) denounces, “The dominant discourses in environmental education threat the subject knowledge as homogenous and unitary because knowledge must be consistent

and coherent (163)... [then] English-speaking Western male-developed worldviews have dominated environmental education discussions to date” (xix).

As it can be observed in the new UN *Agenda 2030* for Sustainable Development, organized around 17 objectives approved in 2015 UN General Assembly (cfr. Objective 4.7), ESD continues being regarded as an education oriented towards promoting a change of attitudes and habits in coherence with the market economy functioning, which underlying logic is never questioned, based on ideas of growing as a development and richness premise in terms of going beyond poverty. This view ignores the fact that we live in a resource-finite world that cannot absorb the manifold impacts generated by human activities. This approach is openly aligned with the prevailing development style but is, however, disguised with an institutional and colonizing discourse that states it can place the world in the way towards an inclusive, sustainable, and resilient development.

Climate change is the most evident fact that demonstrates we have surpassed the biosphere limits with devastating consequences for every human society and, above all, for the most vulnerable ones. In this new scenario, some challenges faced by environmental educators, mainly the ones belonging to the most vulnerable countries, are to develop the necessary abilities and competences in order to promote actions and projects in respect to adaptation, disasters risk prevention, vulnerability, integral risk management, and strengthening social and community resilience.

Having said all this, an EE that puts criticism into practice is certainly skeptical about change possibilities at the margins of market economy system. This kind of EE, disconnected from such system, becomes postdevelopmental or post-apocalyptic or postcolonial, emphasizing the political dimensions and, therefore, the urgent need to get involved with the new social movements with an alter-world character. In convergence with some intellectual and organizational waves such as the emerging degrowth movement, the movement of communities in transition and with the Andean living well (*sumaj kawsay*)

movement, makes evident this disconnection: educational practice is focused on community-life, people and social groups empowerment, the formation of citizenship, experiencing alternative lifestyles, as well new forms of production, distribution, and consume that actually take into account the biosphere limits and the need to equally distribute natural resources and environmental carrying, to promote democratic practices and collective decisions that are made in a more participative way.

Introduction

Learning about an environment can be achieved through a wide array of senses, contexts, and situations. This entry explores what environmental learning entails, how individuals make meaning in that learning, and key contexts, intersections, and challenges in environmental learning.

Environmental Learning

We start our explorations by noting that an individual is not always cognizant of the environment around them at any given point in time. Yet one's senses constantly take in data the body then processes, including on how an environment may become intelligible to them and others, and in what ways an environment may be “disturbed.” This fundamental automatic processing mode suggests that what is well learned and encoded in long-term memory in relation to “the environment” demands attention only when something is different, changed, or unusual. Indeed, lack of critical attention to a familiar environment can lead to assumptions and held beliefs or knowledge that are not necessarily true.

Why does this situation arise, and what does it mean for environmental learning? First, understanding self and self's relationship to an environment is in great part *learned* through lived

experiences and possibly reflections on those, starting with formative affect and the processes of adaptation involving the whole person (Kolb and Kolb 2012). For Bronfenbrenner (1977), this can be understood through a series of intersecting frames. The present setting of an individual acts as the *microsystem* for learning, with other concurrent settings in the person's life suggestive of a *mesosystem*. Environmental learning amplifies the meaning of the setting as learning and setting are often intertwined and explicitly related. What Bronfenbrenner refers to as the *exosystem* is the formal and informal social structures around the individual, parallel to the notion of ecosystems of learning offered by Uden et al. (2007). Finally, the *macrosystem* refers to the overarching institutional patterns and values of the individual's culture, a major determinant in one's approach to human-environment interactions.

With this framework in mind, it is clear that regardless of one's understanding of an environment, we understand that humans learn to exist within a particular environment through normed behaviors, beliefs, and attitudes. For example, people may learn about how things work through the trials and tribulations of experience, but also how to acclimate to and shape perspectives about an environment through the interaction of their culture and dispositions. Thus, the capacity for reflexive mobility should also be recognized: it emerges through a human's sociocultural capability to weigh options, choose lifestyles, express identities, and compare alternative merits of places to live and visit.

An easy route into further considerations of such reflexive learning about environments, their conditions, and their affordances comes from recognizing that because the environment is always present, humans are prone to pay attention to what is outside their norm. For example, when traveling or vacationing, people may acclimatize or accommodate to the norm of the setting and scene around them. Taken together (as "acclimation"), an individual's sensorium aids their scanning of the environment for things that are different or out of place. Thus, an unexpected stimulus of a smell creates a sudden awareness of hunger, while an odd sound in the background may force a change in focus to what

had previously been ignored. In other words, we can recognize that a change in the usual is what triggers a sense of danger for the human brain in an environment (the automatic detection aspect in automatic/controlled process theory).

Natural Learning

However, while the natural function of being unaware to becoming aware of an environment can afford a complex system of ways to learn about a place, notions of reflexivity also flag that intentionality may be directed toward enabling a fuller sensorial engagement in a wide range of settings. These include experiencing a wide range of emotions in a natural environment – awe, fear, contentment, threat, happiness, connectedness, aloneness, and more. But is this all there is to how one comes to know about an environment and how an environment in turn shapes learning?

Many models of experiential modes in environmental learning can be readily simplified to three basic cognitive components: of data intake, processing, and retrieval. Data are taken in through the senses then processed through filters of prior experience to understand if the data are comparable to held understandings or expectations, challenge what we "know," or are simply beyond comprehension because the data have no filter. Then, a choice is made to act or not use the data to further expand understanding the phenomenon, reject the information, or let go of the information as not relevant. In such models, learning is typically understood as a spiraling, generative process of creating and transferring meaning for stimuli and events from a person's experience or understanding to other contexts (Wittrock 1974).

Yet because everyone has a distinct embodied, sensed, and encultured way of taking in and processing information, the way one learns or makes meaning of information is unique. People see colors and things differently, taste differently, and have differing abilities of smell, touch, and hearing. This is not to suggest that there are no shared general processes or preferences for learning but that an individual's unique sensory filters ensure any common environmental experience is felt and interpreted differently. Such differences

increase over time as one's filters amplify data recall through complementary, cumulative life experiences and challenges of reconstructed and reproduced memories and culture which lead to how one "chunks" data into preexisting filters.

Coupled to this, the ways in which one becomes aware of and respond to the world and human learning in general presupposes a specific social nature and process by which we grow into the culture around us. Fundamentally learning is a social act involving relationships between people and the modes and tools of communication between them (Boud et al. 2009). Shared meanings are socially constructed and contextualized using cultural lenses, and environmental experiences are interpreted through socially constructed mores, norms, and ideals. Such understandings are transmitted through modeling, stories, language use, and culturally approved play.

Why does this matter for environmental learning? Environmental data do not always mesh with the culturally grounded narratives internalized in childhood, including those messages about what to do in an environment or about environmental issues that are subsequently reinforced or challenged during the experience of everyday life. Indeed, as Henry (2009) suggests, interpretations can be biased, incorrect, or impossible to falsify, but they are learned "in the sense that they are assimilated as truthful knowledge and impact consequent behavior. Relatedly, consider also the transmission of ideas or knowledge with no empirical component whatsoever. Values can be powerful drivers of human behavior and must similarly be learned, whether at church, around the dinner table, or on the street" (p. 133).

In school, children learn both facts and cultural interpretations of "environmental facts" without distinction. Equally, changes in the natural world are not necessarily comprehensible or easily reflected in how the world is sensed or interpreted in everyday life. Consider the concept of cultural amnesia related to the environment wherein an individual assumes that the quality of the environment in which they moved through childhood is the baseline of a good, healthy, or quality environment. Through the lifespan, what one learned at one point is held to be constant, regardless of

changes in the environment. Thus, while taking in data is constant, making meaning of these data can be intentional, tacit, or dismissed.

Contexts for Environmental Learning

Environmental learning can also be understood through a fraying framework of postindustrial, Western orientations which tend to assume that learning is largely limited to the formal arena of schooling (Strauss 1984). One reason for this assumption is that since learning is commonly and culturally defined as what happens in schools, it is logical to assume that what is learned or obtained outside of school is discredited or dismissed as inferior. Yet learning does not stop during the course of one's life, even as interpreting the experience of life as learning may be dismissed, along with the understanding of learning as engagement with one's environment.

What distinguishes learning from knowing is critical here, particularly for appreciating the significance of the contexts and preferred experiences for environmental learning, such as via outdoor education. A child's earliest experience of the sky may change over time from questions of why is it blue (the social construct of color) to why the sky is crying (projecting what is known about self to another object) and then later, becoming enmeshed in a more complex understanding of gasses, water vapor, weather patterns, and climatic perturbations. Equally, knowledge can change temporal understandings of what one feels, experiences, and learns. Every new experience in one's life has the potential to change who the person is and reshape how the individual remembers what was in the past. As an adult, for example, it is impossible to recall a memory of outdoor play from childhood without casting that memory through the alterations of repeated telling and adding to or taking away details by others who offer alternate elements to the story.

This blurring of the quixotic, exceptional, and abstracted and the associated meaning-making typically plays out against the backdrop of people being continually exposed to their environments and others sharing these environments in everyday life. Educators seeking to focus on **everyday learning** and its critique highlight that the scope

and textures of people's lived experiences are best understood through explorations of daily living and its parameters. For environmental learning, what may appear trivial or innocuous moments provide countless opportunities for interacting with and learning about the environment and environmental issues (Ardoin and Heimlich 2015).

This is because in daily interactions, people engage with natural and built environments, even as they find themselves talking about seemingly random things, memories, or events. But in every exchange, there is the potential for new data, insights, or connections made related to an environment. Whether at a farmers' market or a restaurant, taking a walk in a park or walking down a crowded sidewalk, one never knows when an idea or experience with the environment will add to understanding an issue, challenge something considered known, or delight, surprise, or affect one deeply. In such contexts, examples of learning possibilities might be insights into the carbon load for different foods, challenges of quantity, and quality of food production for restaurateurs, an awareness of invasive species locally or a sudden connection to understanding heat islands.

This suggests that **incidental learning** is a key to understanding environmental learning too. We learn from those things around us that contain messages shaped by others, even if this is unintentional. Television, news programs, radio talk shows, movies, magazines, social media – there are many sources from which individuals take information and add to their chunks and networks of understanding. A key challenge of incidental learning for educators is that people pay attention to sources of information with which they are most likely to agree, and in that way reinforce rather than challenge held understandings, beliefs, or attitudes. Thus everyday and incidental learning are often sources of knowledge or affect with no specific source for the individual – they become things that are just “known.” Jarvis (2012), in writing about the inability of adults to realize present learning, notes that a great deal of such learning is “incident, pre-conscious and unplanned. In a sense we respond to events in a living manner – but then learning is about life” (p. 1).

Broadening this out, **informal** and **nonformal** learning and learning settings are often used to address how formal learning processes connect with incidental ones. In adult education, the non-formal and informal are usually defined by who sets the agenda and who determines the outcomes. In environmental education, informal typically refers to any out-of-school organized or structured learning. Other definitions suggest implicit, unintended, opportunistic, and unstructured learning and the absence of a teacher, or establishing what the knowledge structure or tradition is and who holds primary agency (the teacher?).

Although the literature continues to debate the definition and scope of informal environmental learning, there is relative agreement on the contexts in which such learning might occur. For environmental learning, the long list of informal learning settings includes nature centers, parks, science centers/museums, natural history museums, zoos, arboreta, aquariums, botanical gardens, forests, nature preserves, animal refuges, and more. These often hold the status of cultural institutions too, and as such, are not passive repositories but places of cognitive and affective change where, for example, visitors are challenged to sense and question the status quo or are introduced to alternative ways of perceiving the world.

Learning at the Intersections

For most individuals, environmental learning does not consciously fall into categories of formal, informal, nonformal, incidental, or everyday learning. Rather, what one knows, believes, and values about the environment is a product of living life. An interesting and confounding variable is that of the subjects/topics/issues that exist in the margins of disciplines or foci. Consider health and the environment. What is good for the environment is often good for public health and vice versa. In work on the conceptual landscape of environmental education, the concept of bridging has emerged as an important metaphor. Bridges are where individuals as learners or participants can enter an exchange from two differing perspectives. Public health could focus on an issue such as brownfield sites and related programming from

the perspective of reducing sickness, while environmental education could see the issue as related to cleaning the environment. An outdoor program for children could be intentionally driven by environmental learning, or it could be about getting children outdoors – a goal of the “children in nature” movement. Bridging suggests activity and learning may appear to be the same, but the intention is different depending on the desired outcome. Thus, some environmental learning may be intentional learning, but through a different discipline.

Learningscapes

As suggested above, environmental learning is unlikely to be a clean, linear process but rather a function of being a person, a complex construct in itself. People are constantly exposed to stimuli and data, and as learning is cumulative across experiences and time, individuals are challenged to be meaning-makers of these experiences across contexts. The concept of a *learningscape* offers a way to bring environmental learnings together through focusing on how a person moves through the world and has the potential for meaning-making across, among, and between myriad experiences of one’s life, including in relation to the social roles through which the individual has those experiences.

Social role theory tells us the individual within the context will determine many of the behaviors one performs, including how one knows, thinks they know, feels and believes, values, and acts toward the environment. Equally, the role an individual plays at any given time greatly influences the lenses through which they interpret intake data. Consider the different experiences and outcomes for an individual when visiting a nature center with a small child as ward versus with friends out for a good time versus as a professional looking at the facility, programs, and interpretation. Thus we note, social role influences how an individual engages in institutions, structures, society, recreation, and what they take away cognitively, affectively, and skill wise from all their experiences, and then how they construct meaning, especially around understanding and action on environmental concerns. As Lave and Wenger

(1991) emphasize, “learning is not merely situated in practice – as if it were some independently reifiable process that just happened to be located somewhere; learning is an integral part of generative social practice in the lived-in world” (p. 35).

Breaking Traditional Learning Constructs

What typically distinguishes schooling from other sites for environmental learning is that what is taught is not necessarily for the learner’s interest or immediate use. Additionally, environmental education has historically been reliant on the “knowledge leads to attitude leads to behavior” or “attitude leads to knowledge leads to behavior” constructs of behavioral learning. Even though the myth that knowledge or affect alone can lead to behavior change has been repeatedly challenged, the field continues to be overly reliant on cognition-affect-performance models and meaning-making that privileges one over the other, as if causality rather than correlation had been established too (see Heimlich and Ardoin 2008).

In brief, an oversimplified focus on behavior mistakes focusing on behavioral outcomes rather than (1) the steps required to reach those outcomes or (2) readiness of the individual to move toward an action or a change in a behavioral routine. The goal of any behavior may be met through multiple pathways and by varying motivations, not the single action being promoted by the educator. For environmental learning to be integrated within a person’s life, it is necessary to understand the grounds for that within the person.

To elaborate, the concept of conation highlights the importance of volition or the will/desire to do something. It merges what one knows, whether factual or held belief, with what one feels about something. Organizing environmental learning into cognitive, affective, and psychomotor outcomes is good for schooling and evaluation, but separating domains of learning does not resonate with how people naturally learn. Thoughts, beliefs, facts from assumed authorities, skills, values, passions, and so on are brought into learning, and their interactions determine what we take in and the meanings we make. Thus attention to the conative raises important questions for an environmental educator’s focus

on behavior – whether as habits of mind or habits of the body. Can their work incorporate and teach both, and the intersection of both, while is integration more a matter of rhetoric than reality?

Conclusion

Environmental learning is a natural, human process. We live in and with complex systems and we interact with those systems constantly. Rethinking *how* we learn and engage with and within our environments, and how we learn to make meaning of that engagement, can facilitate more authentic learning about the world around us. Schools, informal institutions, media, and others conveying messages about the environment have an obligation to help the receiver of the information make meaning of the content/message within the individual's life. Part of that meaning is through understanding how knowledge, affect, and behavior intersect to shape one's environmental behaviors and learning.

[Theory of knowledge and educational administration](#)

Introduction

This entry explores in detail the ways in which epistemology shapes both the structure and the content of some of the major theories of educational administration. It does this by examining the epistemological assumptions that lie behind the kind of methodologies required to justify such theories or those epistemologies that query, on epistemological grounds, the relevance of a justificationist framework. Theories to be examined include traditional science approaches that assumed logical empiricism, traditional critical theory approaches that adopted transcendental forms of justification, humanistic approaches that saw values as central, perspectival Kuhnian approaches that advocated subjectivism, post-modern views based on a challenge to the notion of justification, and those that saw coherence as a model of justification. There are many more possible examples, but these well-known theories provide useful exemplars of a more generally applicable thesis.

The Theory Movement

In the early 1950s, in the USA, a concerted and well-funded effort (by the Kellogg Foundation) was made to upgrade research in educational administration with the purpose of improving schools. The aim was to make research more scientific. The model of “scientific” was one borrowed from logical empiricism, in particular,

a version of Herbert Feigl’s view that he had taken from the natural sciences and had adapted for social science. And there was a major exemplar of these ideas in the field already: Herbert Simon’s book *Administrative Behavior*, first published in 1945. The model had three distinctive features:

1. A theory was to be seen as a hypothetico-deductive structure. Roughly speaking, a theory’s most general claims are at the top of the structure with less general claims appearing further down the structure. Phenomena could then be explained by showing that they could be subsumed under relevant claims in the theory.
2. Justification of a theory’s claims proceeds by a process of empirical testing. That is, the theory implies particular empirical outcomes. If these are observed, the theory is confirmed. If contrary outcomes are observed, the theory is disconfirmed. Justification is a matter of accumulating many confirmations and no disconfirmations.
3. Operational definitions of all theoretical concepts are required. This amounts to being able to give empirical measurement procedures for these concepts.

The nature of these claims is driven largely by epistemology. On the matter of operational definitions, it is a question of how do you know what the terms mean, with meaning being given by some empirical measurement procedure. Empirical testing lies at the core of justification. And recasting a theory as a hypothetico-deductive structure is done precisely to facilitate testing.

There are two significant consequences for the content of theories in educational administration. The first is the total exclusion of ethics that arises from belief in a sharp distinction between facts and values. A science of administration is one that deals in knowledge about the way the world is, that is, what can be observed or known through observation. Claims about what ought to be the case, in the sense of a moral “ought,” lie outside the domain of science. This ethics-excluding partition continues even to the present day where perhaps the most influential textbook in this

tradition, Hoy and Miskel's *Educational Administration: Theory, Research, and Practice* (2013), now into its ninth edition, omits ethics. You would think that this would be perceived as a serious omission because administrators are constantly dealing with the question "What ought I do?" In response, it is tempting to push the answer off into outside goals, construing means as the province of scientific administrative theory. However, even among alternative means, they may not be equivalent on moral grounds.

A second significant consequence is the focus on administrator behaviors, due to the fact that these are observable. In social science, it is hard to make this work even for the simplest behaviors. Consider, for example, Skinner's attempt to give a behaviorist account of language learning. He begins with a *reductio* argument as follows. Suppose we have inputs in the form of stimuli that causally impinge on a black box (the mind) which in turn causally impinges on output behaviors. But if there are any significant relations between inputs and outputs, we can methodologically just dispense with the black box assumption and theorize in terms of the linked observable inputs and outputs.

To this argument, Chomsky raised two key objections. The first concerned the definition of a stimulus. How is a stimulus to be distinguished from the many other features of the environment in which a person is causally enmeshed? The required answer is that a stimulus is something that a person attends to. The problem is that the notion of attending to is a mental property or at least something that resides inside the black box. The second objection queries the possibility of establishing systematic links between stimuli and behaviors. For example, how would you ever know that seeing a Renoir on an art gallery wall is more likely to produce the spoken behavior "That's a Renoir" as opposed to "That matches the carpet" or indeed any arbitrary number of other spoken responses.

These kinds of criticisms helped usher in the cognitive revolution that began in the early 1960s. Nevertheless, social science requires more. Consider the behavior of quickly raising one's arm with added descriptors specifying rotation, length,

angle from the vertical, angle from a person's front, and so on. None of this is sufficient to meet the explanatory requirements of social science which operates on more fine-grained distinctions. Is the person swatting at a mosquito, bidding at an auction, signaling to a distant acquaintance, or suffering from a tic?

Subjectivism

While traditional science of educational administration continued to flourish, largely by ignoring some of the more drastic strictures its logical empiricist epistemology imposed, from the mid-1970s, more systematic alternatives began to be developed drawing on different epistemological positions. The first of these to gain traction as a major challenge was that proposed by Thomas Greenfield. In his classic paper – (Greenfield 1975) – his initial target was the purported objectivity of theories in natural science. His familiarity with the work of Kuhn provided the relevant philosophical ammunition. His various arguments were pitched at establishing the conclusion that empirical evidence was never sufficient for rationally choosing among competing scientific theories, especially those that are paradigmatic. Rather, it is those theories that determine what counts as appropriate empirical evidence. Scattered throughout his paper are three characteristic arguments. First, the fact/theory distinction blurs because observations are always theory laden. Second, theories are always underdetermined by empirical evidence. That is, it is always possible to draw an arbitrary number of different curves through a finite number of data points. Finally, test situations are always complex making it often hard to determine which particular claims or set of claims is being disconfirmed by observations. For Greenfield, if all the evidence there is for a theory is empirical evidence and if empirical evidence is never sufficient for rational theory choice, then what counts is a matter of human subjectivity.

Greenfield then extends this idea to social science but with a further consideration. Because the relevance of human subjectivity is essential for interpreting and understanding the actions of

others, the entire apparatus of natural science explanation and justification is entirely inappropriate in social science. Organizations are not realities out there to be fitted into a hypothetico-deductive framework of empirical lawlike generalizations being subject to testability conditions, a view that still manifests within the systems-theoretic approach to theory building and testing. Rather they are human inventions, the result of collective interpretations and interpretations of others' interpretations. There is no quest for lawlike generalizations. Rather the quest is for sets of meanings that people use to make sense of their different worlds. If there is a switch in these meanings, then there is a corresponding change in organizational reality (Greenfield 1975, p. 7). Greenfield's arguments ushered in the notion that traditional science of administration was just one possible paradigm for understanding the social world. There were others, including Greenfield's subjectivism.

Ethics and Educational Administration

Another approach provided a way to incorporate values into administrative theory. This was first pioneered in the field by Christopher Hodgkinson in his *Towards a Philosophy of Administration* (1978). In this work, Hodgkinson accepted fully the claim that there is a sharp separation between fact and value. However, what followed next for Hodgkinson was a complete reversal of the argument that traditional science of administration advocates had used to exclude ethics from educational administration. For Hodgkinson drew attention to the many ethical issues that arise in administrative life, including both the setting of organizational goals and the making of choices about how to achieve them. Rather than ethics being peripheral to organizational life, he argued that it was central. The result was both simple and profound in its consequences. If science excludes values and if values are central for administration, then educational administration is not a science at all. Rather, it is a humanism.

Hodgkinson developed an account of organizations based on his epistemology of values. He

posited four types of values that formed a hierarchy. At the bottom were type III values whose justification depended just on human affect, what people felt. At the next level were Type IIb values, those justified by appeal to the collective will or a shared solidarity. At the next level, Type IIa values were justified by appeals to rationality. This category could include both utilitarian arguments, including the more arcane methods of utility maximization, and Kantian, or deontological, arguments based on transcendental deductions of what norms are presupposed for ethics to be possible. At the top of the hierarchy of values were those classified as Type I. Called "transrational," their epistemology took the form of a superior kind of intuition. Although not justified by an explicitly Platonic appeal to the abstract forms, the affinity with Plato's ideas is clearly there.

This account of values was much more than just a taxonomy of the kinds of ethical decision-making that might exist in organizational life. It was also presumed to offer a structure for understanding organizations based on the kinds of ethical decision-making that existed at each level of organizational life. Thus, at the bottom of the organizational hierarchy could be found the rank and file whose characteristic decisions were Type III. At the next level, a more collective dynamic prevailed. The next level was where rationality dominated, the province of management. And at the top was where the big decisions on organizational purpose and means for achieving it could be found, administrators exercising Type I judgments.

Critical Theory

A further illustration of the role of epistemology from the history of the field can be found in the influence of critical theory, the most systematic expression of which can be found in William Foster's *Paradigms and Promises* (1988). The epistemology derives from the early work of Habermas, particularly his *Knowledge and Human Interests* (1972). For critical theorists in this incarnation, the principal weakness of traditional science of educational administration lay in

its assumption that there was only one type of knowledge, namely, scientific knowledge. Habermas, employing Kantian style arguments, identified three fundamental human interests: an interest in manipulating and controlling the world, an interest in communication, and an interest in freedom. More explicitly, scientific knowledge, in presupposing the requirement of manipulation and control, when applied to people, places a premium on treating people as means rather than ends in themselves. Hermeneutical knowledge has, as a presupposition for communication, an ideal speech situation where barriers to communication such as power and inequality are to be resisted and removed. Finally, emancipatory knowledge presupposes social and political arrangements that support the promotion of human freedom.

When this view of knowledge is applied to theories in educational administration, the structure of theories is affected by needing to accommodate these types of knowledge, and the content of such theories is transformed. Thus, critical theory implies accounts of administration that include an ethics of respect for persons, for treating persons as intrinsically of value rather than their value residing merely in their contribution to the organization. It stresses more democratic forms of organizational practice and participation, but in the cause of communication and in honoring the freedoms associated with democratic practice. Moreover, it counsels a wider sense of organizational responsibility with goals being set not just under the constraints of organizational functioning, but with an ethical constraint for promoting the betterment of society.

Postmodernism

A fifth, more recent view reflects postmodern influences on educational administration. There are two main varieties of this. The first is a sociological thesis, best described using the term postmodernity, where a society is fragmented, boundaries are unclear, geographies are de-centered, controls are less prevalent, and the

present is a possibility of chaos. This is an empirical thesis about the nature of society. The second variety is primarily a philosophical thesis, with a central component being a view of epistemology. Again there are differences within this variety. The one to be dealt with here derives from Richard Rorty's book *Philosophy and the Mirror of Nature* (1980). The book defends three characteristic theses. The first is that there are no foundations to knowledge. This anti-foundationalism is taken to compromise the task of justifying knowledge, to render the task otiose. The second is anti-essentialism, a gesture toward the fluidity of ontological boundaries. It comes with the notion that many of our familiar categories to do with gender, handicap, race, and class are social constructs that are malleable. The third is anti-representationalism, the notion that our theories are not representations of the world and that they do not mirror nature.

The earliest systematic expression of these ideas in educational administration can be found in Spencer Maxcy's edited volume *Postmodern School Leadership* (1994). Because of overlapping skeptical epistemologies, there are some similarities between Greenfield's subjectivism and philosophical postmodernism. However, while Greenfield was content to leave open the kinds of nonempirical factors that might influence theory choice, a number of postmodern writers in the field have settled on the importance of aesthetics. The most recent book-length example of this is Fenwick English and Lisa Ehrich's work *Leading Beautifully: Educational Leadership as Connoisseurship* (2016). What needs to be looked at closely is whether aesthetic criteria for leadership have an implicit epistemological function. That is, can these criteria be used to make good decisions in the same way that inferences from data can be helpful. There are ways in which the epistemology can be implied without being able to be specified. One classical example is Aristotle's practical wisdom – unable to be specified in rules but visible in wise outcomes. Another is Hodgkinson's account of leadership as a moral art. On his view, something that is an art cannot be specified by a procedure or an algorithm. And so it may be with leading beautifully.

Naturalistic Coherentism

The final approach to be considered is that developed over a 25-year period through a series of books and many papers by Colin Evers and Gabriele Lakomski. (For a recent overview, see Evers and Lakomski 2015.) Their epistemology is known as naturalistic coherentism. The coherentism is based on the notion that there is more to justification than empirical adequacy. In addition to empirical adequacy, what else is important is that theories need to be consistent, they need to be comprehensive, the various parts need to cohere, and there is value in simplicity which tells against the addition of ad hoc assumptions to bring the theory into line with empirical evidence. This combination of epistemic virtues makes for a coherentist account of justification. Although this epistemology is not foundationalist and leaves open the question of essentialism, it is representationalist. That is, it claims that our best theories are like maps that help get us around our social and natural worlds at better than chance or coin tossing. The naturalism is a tilt against so-called armchair epistemology. It is the requirement that the epistemology is sanctioned by our best natural science. Furthermore, a science of administration is also required to cohere with natural science. In developing accounts of decision-making, expertise, leadership, the role of emotion, and practical reasoning, Evers and Lakomski's naturalism draws on work in cognitive neuroscience to account for the dynamics of knowledge acquisition and change and of knowledge representation. On this view, the best administrative theory would be one that accounts for administrative phenomena in the most coherent way. But note a caveat. Administrative phenomena occur in material contexts. So, for example, the most appropriate theory of leadership in one school can be entirely inappropriate for another school. This result leads to an emphasis on theory building. Because a lot of knowledge in social science is both provisional and context dependent, this approach sees building an account of leadership as a trajectory of trying out theories that are believed to be useful, applying them and then if they are unsuccessful, using the coherentist

epistemology to make improvements for the next iteration of application. The result is a process view of administrative knowledge rather than a content view. In terms of what the epistemology allows in a theory, its holism permits both ethics and considerations of human subjectivity to be part of the resulting web of belief. And in the matter of structure, a theory is best seen as a web, as Quine imagined, with the most central, least revisable parts at the center and the most easily revised parts toward the periphery.

Conclusion

Although the above five examples provide clear evidence of the role of epistemologies in shaping both the content and the structure of theories in educational administration, it is arguable that this is something that applies to many other approaches to educational administration. This will be evident from the various contributions to the encyclopedia's section on educational administration.

Introduction

Ethics are concerned with choices about interhuman relationships (Barrow 1982), but educators situated in a multicultural global mass media cannot avoid confrontation with the dominant bourgeois patriarchal Western values which they learnt as unconditional truths of logic or fact. Actions based on either deontology or utilitarianism remain rationally indeterminate, requiring a judgement involving the context in which the rational choice must be made. This article presents a complex triad of ethics to balance competing ideologies of ethics.

Educators in particular are exhorted to make space for previously marginalized voices to recognize values other than their own. But to what extent can they question the value of their values? Inability to move outside one's contingent practices and assumptions can prevent teachers from recognizing oppressive practices, especially their own. Yet recognizing relativism can lead to a terror of exercising independent judgement, so that one takes refuge in the rules of others, the dominant local conventions. This professional

implementation of the conventional rules and sanctions of the system can ironically be unethical, leading to impositions of power which can be seen as unfair if routinely applied. Authoritarian control lies directly counter to a view of ethics as professional powersharing, though it is compatible with and often concealed within an economic rationalist framework of increased and controlled efficiency. Any systematic ethical theory runs the risk of being labeled modernist, dogmatic, or insensitive to other cultures. The Kantian shift to idealist categorical imperatives or an Aristotelian appeal to ends which justify means seem to militate against simplistic appeal to logic or fact. Professional ethics requires ongoing judgements, interpretations of codes of conduct.

Where will the educator locate ethical codes of conduct or guiding rules for conduct? In ethics, we build up a rational frame composed of concepts such as good, honesty, justice, blame, and bullying, which help us to see connections between certain types of action and practices and for which often tacitly we generalize rules for good and bad behavior through social agreements. These concepts may well be transcendently necessary before we can get any notion of a social being off the ground. As Rawls (1989) noted while we can agree about concepts, the conceptions which link these to our daily practices are more culturally contingent. What makes ethics more than a matter of mere “intuition” or haphazard choice is that it is connected by these common concepts, which means that we can talk about our different conceptions by using a vocabulary of shared concepts, showing by examples what we mean by our conceptions.

Ethical explanations and theory are traditionally polarized: the Aristotelians versus the Platonists, the utilitarians versus the Kantians, or the consequentialists versus the deontologists (Stout 1988; Strike and Ternasky 1993; Frankena 1963). In a postmodern era, it is less useful to treat them as oppositional theories than as frameworks which simply identify different aspects of morality.

Wren (1993, p. 81) identified two major forms of morality: the deontic and ethical. The central

features of the deontic group, he says, are keyed to the notion of right action (relatively impersonal features such as justice, judgements, criteria of fairness, duties, rights, claims, and so on), and it therefore includes juridical, proceduralist, and intuitionist conceptions. The teacher who identifies with this will probably place more emphasis on the development of students as good citizens with a sense of civic duty. The ethical group (teleological, self-actualizing, and romantic) is so-called because its central features are keyed to the various personal notions of the good (such as happiness, self-actualization, personal excellence, authenticity, autonomy, and other forms of human flourishing) but will probably be favored by the teacher who seeks students’ personal happiness.

To separate out the ethical from the deontic, private from public, intra-moral from extra-moral, however temporarily, may distract us from seeing their interdependence. An autonomous or self-actualized person must have a personal commitment to public duty for it to be meaningful for him.

Many philosophers now present tripartite theories of philosophy which lend themselves more easily to a conversation about differences rather than a conflict between them. Beck (1994) names caring as the central concern of ethics, but says it is justified by both deontological and consequentialist arguments. Strike and Ternasky (1993, pp. 13–66) distinguish an Aristotelian perspective, a liberal democratic tradition, and a feminist perspective. Nozick (1990, pp. 151–156) identifies three basic stances to value questions – the egoistic, the absolute, and the relational which connects the first two stances.

A triadic taxonomy is proposed (Haynes 1998) in the form of an evolving spiral of judgement in which there is no prior value or end point.

1. **consistency:** a “subjective” aspect in which one internalizes practice to shape intentional actions. Here ethical acts are deliberate, chosen, shaped, and made justifiable by the personal coherence of internalized rules and concepts, meaning and values,
2. **consequences:** the “objective” aspect of ethics which sees practice as externalized individual

or social behavior, in terms of its known and anticipated causes and consequences, both immediate and long term and

3. **care:** in which the carer attends to the cared-for in a special mode of nonselective attention or engrossment which extends outward across a broad web of relations. It is a holistic and responsive making of reciprocal connections in order to help others in a special act of receptivity.

Kohlberg outlined a neo-Kantian hierarchy based on a Piagetian notion of thought as interiorized action, leading from concrete to formal operations, from egocentrism to rational autonomy. He believed that moral judgement and moral behavior were conceptually as well as causally reciprocal, two moments of a single personal unity and that moral unity was the cognitive career of an individual subject or self. Each individual moves through reflection on disturbances to equilibrium from an egocentric and concrete level to a universal and abstract level of reason, through the three distinct levels of moral development (preconventional, conventional, and post-conventional). This is consistent with a constructivist epistemology, in which an individual builds language systems from their engagement with a physical reality, ignoring political and social influences.

A similar rational developmental model underpins most national curricula, requiring students to abstract from the particularity of their circumstances to the universal principles apparently underlying each subject area. The principle of respect for persons defines the moral sphere. The more consistent one's actions are with one's self-constructed principles, the more ethical one is. The principle of respect for persons requires the subject to consider all persons as morally equal, which is also a matter of consistency. It means that you must do unto others as you would they should do unto you, a notion referred to by Hare as universalizability.

Universalizability means that whenever one uses the term "ought," one must be ready to apply it to all similar situations, for all persons. On the rational consistency view, lying is always

wrong, whatever the circumstances. Whatever one person is morally obliged to do in a particular situation, all others in comparable situations must also be obligated to do. Generalizing from one experience to the other is the most usual way we make meaning, and we encourage students to do it in schools. It becomes dangerous if the conceptions and generalizations so formed become rigid and closed on the basis of past experiences, for instance in racial stereotyping. The strength of the rational consistency model is at the same time its weakness because its categories of ethical concepts are abstracted and therefore distant from the complexities of real and experienced situations.

There are problems with the efficacy of any system which becomes logically consistent without contradictions, because, as Gödel pointed out in his attack on formal logical systems, such systems become self-justifying and circular. If ethics were only a set of coherent conceptions or principles, we would not know what to do when those principles came into conflict. Neo-Kantians (like O'Neill 1996) cannot evade this problem by building a more complicated system of qualifiers into the system, or by ranking the rules in some hierarchical and abstracting structure to resolve conflicts between them, for that only pushes the resolution of issues back to a more abstract set of ideals.

The consequences approach therefore places its emphasis on what can be observed and agreed upon intersubjectively, and like utilitarianism, it focuses on the scientific or measurable aspects of morality. It is also a teleological view – that is, it focuses on goals rather than internalized rules. Actions are assessed by the extent to which they reach those goals. It looks at cause and effect rather than at principles and outcomes rather than intentions.

Many educators adopt a consequentialist or utilitarian position for most of their decisions. They attempt to provide a felicific calculus for each action, that is, draw up all the possible beneficial consequences, weigh them against the possible harmful consequences, and carry out that action which promotes the greatest happiness or well-being for the greatest number of people. The

position is called “objective” because it promotes the belief that such a calculus can be agreed upon, that different people can see the consequences of any action as if they were real in the world, and that the units that are being measured are really units.

A consequentialist theory of ethics is not inconsistent in its movement up a hierarchy with Kohlbergian ethics because from the subjective point of view, a young child starts with an immediate egocentric and concrete concern for pleasure and pain as immediate benefits and costs and builds up from that calculus to a wider awareness of short term and long-term consequences to a concern for abstract consequences. As a person internalizes the rules that they construct both through concrete operations and the acquisition of social practices through language, the physical consequences of their actions become less and less easy to distinguish from the linguistic and logical structures of knowledge and belief. What counts as a consequence becomes more and more abstract as it is forced to cover a wider and more complex set of actual and possible circumstances.

The consequential point of view by itself is inadequate as a foundation for ethical behavior, if it presumes that the greatest good for the greatest possible number could be discovered independently of any conceptual structure or idealistic structure. Such a structure is necessary to provide the criteria for good or bad consequences. As Kant said, percepts without concepts are empty; concepts without percepts are blind. Janus-like, they are not mutually exclusive, but different aspects of the same actions.

A hierarchical dualistic model which combines consequentialism and a move towards logical consistency is inadequate because it still basically assumes a modernist model of the moral subject. One can only arrive at the “truth” of maximizing benefits or of universalizability within a frame of transcendental arguments which presume categorical imperatives, moral laws which cannot be disobeyed, or facts which exist outside a web of beliefs. We are confronted with the paradox of polyglot universalism, treated consistently by O’Neill (1996) or consequentially by Nussbaum (1997).

Although universalizability principles transcend cultural values, we cannot deduce from these concepts which practices or conceptions are to count as most worthwhile. Simply thinking within a coherent system of abstract ideas will not help us settle intercultural disputes. The two great comprehensive ethical systems – Kant’s ethics of duty and utilitarianism – put enormous emphasis on human rationality. In a complex world, competing coherent systems will require ongoing negotiation for the competing merits of different conceptions of ethics which could each be consistent with their own abstracted concepts but are incompatible with one another (Lyotard 1988). Reason alone will not show the fly out of the flybottle.

Heidegger (1927) posited that *Sorge* or *Care* as an ontological attribute is a prerequisite to reasonableness. Ethical sensitivity seems closely related to care. Care, argued Gilligan (1982), is not a matter of logic or justice, but more a matter of caring within a circle or web of responsibility. The emphasis on contextuality and narrative moves the care frame outside an objectively measured one or a logically constructed one and is centered in the personal response. To care is to inhabit a Habermasian lifeworld, to be aware rather than reflective (Habermas 1990, p. 207).

Gilligan’s conception of morality as concerned with the activity of care centers moral development round the understanding of responsibility and relationships, just as the conception of morality as fairness ties moral development to the understanding of rights and rules (Hekman 1995).

Because an ethic of care focuses on response to the situation it is more grounded in the perceptions of situations than the abstracted reflection and measurement of them required by either the consistency or consequences model. The strengths of the consistency and consequences approaches, namely that they invoke important forms of cognitive accountability, are at the same time its weakness in placing too much emphasis on rationality and too little on the immediate response, a way of seeing which is personal. While caring uses distinction as an instrument it does not depend upon it for its meaning.

What do we mean when we advise someone to take care? How is it related to the more sentimental notion of caring? The thesaurus indicates that care is related to anxiety, responsibility, being anxious, and being careful. This is a common thread throughout many of those who write about the need for an ethical community to be a caring one (Noddings 1984; Nussbaum 1996).

The ethic of responsibility is needed for ethical practices to be meaningful, because it is a holistic response rather than a distanced or analytic one. This ethic of responsibility or care picks up the etymology of responsibility as responding (Buber 1961), that is, it is one in which one responds to the concerns of others, not out of a sense of duty but out of a feeling of responsive mutuality (Benhabib 1992). The apparent gender differences are more illusory than useful and the ethic of care or responding to the world situationally and holistically is as much an agent of conceptual development as it is a different manner of conceptualizing morally.

The ethic of care is not superior to the consistency or consequences aspects – they are all necessary components of a dialogical and relational process of moral growth.

Both care and consistency are marks of personal integrity and commitment, and in that respect opposed to consequences which focusses on what happens regardless of the way any individual perceives it. But in taking care as well as caring, one must pay attention to the Other while consistency remains a matter of one's internalized conceptual and logical schemata. From another perspective, thinking about consequences and internal consistency are both cerebral and analytic, the knowledge of cause and effect that can allow us to consider consequences often being at least proto-theoretical. In that respect care, holistic, and sensed rather than intellectual is oppositional to consistency and consequences.

To illustrate their interdependence, I (Haynes 1998) borrow a metaphor from Lacan (1975, p. 112), that of the Borromean knots, interlocking rings such that when any one of the rings is cut the entire interlocking system falls apart. What the

Borromean knot particularly emphasizes is the fall from privilege of any one of the rings that constitute the knot. Neither consistency, consequences, nor care provides adequate foundation for ethical decisions, but jointly they constitute the base for ethical decision-making.

To remove ethics from a logical or factual foundation does not make it anarchic or chaotic (Squires 1993). Ethics is founded on reasonableness and an educator will be ethical to the extent to which he or she gives serious consideration to these three aspects of any situation:

- What are the consequences, both short and long term for me and others, and do the benefits of any possible action outweigh the harmful effects?
- Are all the agents in this situation being consistent with their own past actions and beliefs? That is, are they acting according to an ethical principle/ethical principles which they would be willing to apply in any other similar situation? Are they doing to others as they would they should do unto them?
- Are they responding to the needs of others as human beings? Do they care about other people in this particular situation as persons with feelings like themselves? Are they attentive to others?

Introduction

This entry focuses on Victoria Lady Welby's (1837–1912) theory of meaning – which she denominated *significs* – and addresses her contribution to education as, specifically, the problematic of educating for values. To bring Welby's legacy into edusemiotics is timely, especially considering that her work does not yet enjoy the notoriety it deserves. Yet her conceptualizations demonstrate the connection of her unorthodox theory of meaning to the philosophy of education today – a key concern in both *edusemiotics* (Stables and Semetsky 2015) and *semioethics* (Petrilli and Ponzio 2010), whence ethics is informed by signs, their interpretation, and translation in the context of practical life and human actions. Such new direction explored on the basis of Welby's *significs* as a theory of meaning focuses on the relation between signs, sense, and values. A particularly important contribution from semioethics today is the special attention it devotes to the relationship between the study of language (philosophy of language) and ideologies as social planning. This interdisciplinary enterprise is especially important for education in the context of so-called *global semiotics* (Danesi et al. 2004). The study of semiotics, according to eminent semiotician Thomas Sebeok, went through the paradigm shift during the last century thus passing through the boundaries of its earlier, exclusively glottocentric, sphere to include the whole of life.

Lady Welby on Experience and Meaning

Stating in her essay “Sense, Meaning, and Interpretation,” originally published in two parts in the journal *Mind*, that everyone of us is in one sense a born explorer and our choices lie in what world we would explore, Lady Welby points to the value and meaning of human experiences in the world, which – as Charles Peirce made clear – is perfused with signs: it is a semiotic world. Her major *oeuvre* “What is Meaning?” was reviewed by Peirce, the event leading to an 8-year correspondence between

them (Hardwick 1977). Welby considered language to be just one, albeit preeminent, of the forms of broader expressions manifesting sense and significance that surpass solely linguistic representations. In an apparent affinity with Deweyan pragmatism and its focus on the reorganization and revaluation of lived experience, Welby addresses the most important components of experience as distinction and unification, comparison and combination, analysis and synthesis at once, and against the background of the confused manifold of the as yet hidden significance. Welby signals the need for studies on child development and criticizes the educational system for not sufficiently recognizing the child's inherent capacity for interrogating reasons, for the explicit "why" question. However, typical formal schooling systematically blunts the child's interest in language.

Reflecting on the progress of Welby's signifiacs, Charles Ogden asserted that the most urgent reference and promising field for signifiacs lies in the direction of education – to which we add now the importance of tracing the main lines of development as proceeding from signifiacs to semioethics in the context of current advances demonstrated by edusemiotics with which Welby's theory demonstrates a remarkable affinity. For Welby, the theoretical exploration of meaning that embraces the whole of life experiences and cannot be confined to verbal signs, the related principle of translation, and the questions of education are closely interconnected. She was writing lessons, emphasizing the duty of saying what we mean and meaning what we say, and understanding what we hear or read, thereby promoting education in language for an adequate development of the interpretive and signifying capacity, ultimately for reflection on the relation between language, logic, meaning, and understanding. A "significant education" is education for critical linguistic consciousness, meaning, and value. Welby describes her concept of signifiacs as

a method of mental training, which, though implied in all true views of education, is not yet practically recognised or systematically applied. In a special sense, it aims at the concentration of intellectual activities on that which we tacitly assume to be the main value of all study, and vaguely call "meaning".

Its instructive and disciplinary value must be secondary to this, as they are both ultimately dependent upon it. (Welby 1983[1903], p. 83)

Similarly to later semioticians like Roland Barthes denouncing the fascism of language or Michel Foucault's critique of the order of discourse, Welby denounces the tyranny of language and expression when they tend toward uniformity, homologation, and the adherence to values imposed from above by a given linguistic system and ruling social norms. She maintains that from early childhood everyone should be educated in the spirit of conscious awareness and the development of critical and creative thinking. Welby theorizes the concepts of difference and singularity, maintaining that each human being is unique, so that beyond commonality given by the relation with the other in social life, but from a "significant" perspective developed in the direction of semioethics, identity emerges in terms of difference and the logic of otherness – not unlike much later, poststructuralist and feminist, veins in educational philosophy that contributed to the development of edusemiotics as a novel theoretical foundation for education (e.g., Semetsky 2006; Noddings 2006, 2010) to date. Welby's approach implies education for listening to the other, for difference based on the logic of otherness, for being responsive to the other, and for engaging in dialogue with the other. The value of "otherness" is thus affirmed. Her long-term project was social change through the development of critical linguistic consciousness and training in responsible thinking based on values informing human actions (Petrilli 2009, pp. 371–379).

Welby's work prefigures both John Dewey's philosophy of democratic education and Charles Morris' contributions. Indeed, Morris referred to the school system as a form of social organization for the perpetuation of culture underlining the interconnection between education, communication, and political-ideological orientation of the community. He was adamant that the totalitarian society cannot give widespread attention to semiotics as regards its educational plans because such knowledge of sign phenomena would make it less easy to manipulate those who have this knowledge. He

asserted that it is precisely because of this fact that semiotics should have a prominent place in the educational system of a democratic society.

Welby worked on educational issues relative to all spheres of knowledge and experience throughout the entire course of her research. In her “Questions for Teachers,” she formulates 50 questions bearing on theological and eschatological issues aiming to teach educators per se to interrogate the text. Text is composed by signs that need to be interpreted rather than taken as “facts.” No text should be accepted passively. Interpreters must establish relations of active participation, relate dialogically to the text, interrogate it, and question value systems, behavioral patterns, and belief systems. The connection between language, logic, and meaning involves education understood as educating for meanings and values and laying down the pathway to critical thinking and ethical responsibility. Welby called for systematic training in critical and creative reflection and wanted “to persuade parents and schoolmasters that the first need is to centre all education upon the question of ‘Meaning and how to convey it’” (1983 [1903], pp. 140–141). Educating in the meaningful use of language is our moral responsibility, the capacity to interrogate sense and significance – our ethical commitment toward the general improvement of the human condition and interpersonal relationships.

A significant education develops the power of interpretation and expression from different points of view. Educating for meaning and values teaches students to make distinctions and detect fallacies and confusions, whether intentional or unconscious, to establish connections and associations among ideas and research fields, to link all parts of growing experience, and therefore to apply in practice the principle of *semiotic translation*. Beyond interlingual translation, to *translate* is to confront, contrast, compare, and associate multiple signs and sign systems (whether verbal or nonverbal), linguistic expressions and value systems, spheres of knowledge, and lived experience. This involves identifying a common denominator (metaphorically of course), common language, and shared meanings on the basis of which one

can interpret the unknown other, and thereby make sense for, and find significance in, our experience of relating to others. Reflecting on analogy and translation, also described as “inter-expression,” the processes of transferral, transvaluation, and the translation of meaning through human experience constitute a test to the validity of meaning beyond enhancing signifying value generally. The first analogy upon which all others are constructed is the one between one’s own mind and others: “we forget that we cannot say one word to our fellow without assuming the analogy between his ‘mind’ and our own” (Welby 1983[1903], p. 43).

Welby introduces the term “metalemma” for linguistic metaphors, underlining the importance of resorting to imagery as well as experimentation and verification for communicative effectiveness. Unconscious logico-linguistic mechanisms should be lifted to the surface of consciousness as a step toward dealing with inferential or interpretive inadequacies and communicative deficiencies at large. This, for Welby, implies developing a propensity for the critique of imagery and analogy from early childhood while acquiring adequate habits of analysis, verification, and classification. She signaled the need for training in the use of imagery (popular, poetical, philosophical, and scientific) as well as teaching strategies oriented to such awareness. She describes the “critique of imagery” as a method against confusing and fallacious inferential processes. Interestingly, Peirce’s mode of abductive inference is typically considered fallacious from the viewpoint of the strictly analytical philosophy of language that affords no place for semiotic mediation and interpretation and posits signs as exclusively verbal and reducible to their direct representations. However, abduction is invaluable in edusemiotics that recognizes the unconscious dimension of experience and the necessity to become aware of it by developing self-reflective, critical, and creative consciousness. Interpreting the nonverbal “language” of images, translating it into verbal expressions, and utilizing all forms of inference including abduction, deduction, and induction are part and parcel of fully-fledged edusemiotics (Semetsky 2011, 2013).

Welby's *Significs* as a Theory-Practice Nexus

Welby's theoretical research was inseparable from practice: she was not only attending school lessons but also constructing elaborate lesson plans to conduct lessons herself on an experimental basis. In this context, Welby remarks:

The following extracts are from a series of twelve familiar lessons on "Sign and Sense" given by a grandmother to a boy eight years old, and reported verbatim. They gave much delight, not because of any aptitude on the part of the teacher, but obviously from the natural affinity of the subject and the fascination of its problems to the young mind. The lessons, however, had to be discontinued from the time the boy went to school. It is to be hoped that the time is not far off when such lessons in worthier form will become the recognised introduction to the school course. (Welby 1983[1903], p. 306)

A signifiical education is education in training thought to identify problems and ask questions, rather than pave the path to final truths. Asking questions is a condition for the acquisition and transformation of our conceptual knowledge and practical skills: the dynamic reality of the question sweeps the mind forward in an endless movement to new and wider horizons. To develop an inquiring spirit in a child is much more significant than providing ready-made answers. Any answer in fact should be just a departure point for a string of new questions. Welby was keen to confront her ideas with the semiotic perspective and was convinced that we should not ignore the need to reassess the relation between languages and values in the direction of education founded on the study of signs embedded in life. Teaching methods should be revised and updated in light of research on language and meaning, while questioning the relation to values and applying in practice the principle of translation. Welby envisaged the children of tomorrow as being educated in a *sense of sense* so to understand what the meaning of "meaning" per se is. Children should be educated to understand what signs signify and to learn how to translate and interpret the dialectics pertaining to real practical life. Educating for meanings and values can provide guidance to better navigate through the "jungle" that we call

language. The children of tomorrow, whose education is indeed "signifiical," would be able to interpret and translate the signs of experience. Such new generation of students, if and when educated in significs and semioethics, will be able to understand the deeper meanings that are available today only to, using Welby's words, *the sheer force of genius*.

As all human beings are instinctively endowed with "mother sense" or "primal sense," such sensibility is a priori for the development of critical consciousness, creativity, and ethical responsibility. Welby comments that if mother or primal sense continues to be more vital in women than in men, this is because women are more capable of shaking off the effects of "high" civilization and typical or conventional education. She insisted on early childhood education and bringing up children in the spirit of crucial importance of preserving and utilizing all aspects of language, not only as regards the economy of knowledge but also using language for lucidity, grace, melody, dignity, beauty, and the power to express the inexpressible. The following passage deserves to be quoted in full to underline the importance of Welby's theory of meaning for edusemiotics as a new, and future-oriented, direction in the philosophy of education:

We must remember that while the appeal to the matter-of-fact character would have told on the side of economy, of simplicity, and of efficiency . . . the appeal to the imaginative character would have told on the side of truer conception, whether abstract or pictorial, whether ethical or artistic, whether making for truth, goodness or beauty. The prosaic type would have seen the point best on the economical, . . . as a question of success or failure, praise or reproof, reward or punishment. The imaginative or emotional type would have seen the iniquity and folly of crippling or mutilating the most precious of its gifts, of starving instead of fostering a really vital energy. All alike would by this time have contributed abundantly to our store. For the whole mental atmosphere and attitude of a generation thus trained from the very beginning of life would be altered. Its centre of gravity would be changed. Its world would also at once be expanded; the area of the common interest enlarged and concentrated, and value of life revealed and enhanced.

[. . .] We should at last touch [a child's] natural tendency to seek a "because" for everything – to link together all parts of his growing experience. As all fun and chaff, no less than all wit and humour,

depend on turns either of sense or meaning or significance; as the ludicrous depends on the incongruous, and our sense of the incongruous depends on the strength of our mastery of the congruous, this method of education would lend itself, as no other could attempt to do, to the child's craving to be interested, excited, even amused in learning. (Welby 1983[1903], pp. 212–218)

Conclusion

Welby's corpus includes a selection of extracts from different authors expressing their views on education, in support of her own position and touching on such themes as educational reform, teacher training, and student training strategies, the importance of motivation and interest in learning processes and of imagination, the objects of primary education, the place of classical studies in the educational system and of grammar, etc. Her focus on play and imagination in the acquisition of knowledge recalls Peirce's notion of the *play of musement*, later developed by Thomas Sebeok with regard to his concept of primary modeling. The present-day problems relative to educational theories and pedagogical practices show that an expansion of philosophy of education to the point of its convergence with semiotics is now necessary. It is such current expansion that constitutes the critical instance of philosophy as semiotics, that is, an open-ended field of inquiry and research demonstrating that the fully-fledged science of signs is always in the process of evolution, rather than being an achieved end result to boast about.

Welby's contribution to edusemiotics is thus indispensable, her historical place among such "edusemiotic precursors" as Peirce, Dewey, Deleuze, Kristeva, or Noddings notwithstanding. Nor is her theory of any small account as reflected in the fact that, with respect to other extant possible denominations circulating at the time, including "semiotics," she should have preferred to introduce the neologism *significs* to underline her inexhaustible interest in sense and significance, in *value* and not simply linguistic meaning. With her choice of the term "significs" for her research, the question she underlined is not that of whoever professes this or that discipline or subject matter nor in the established role of scholar, scientist, or intellectual.

Instead, it is the question posed by an ordinary person in everyday life, namely, what does it mean for me, for us, today, now, or later and what sense and what value does our practical experience have. This is a question that semioethics recovers and that also is central to edusemiotics.

Ethics and Values Education

Vojko Strahovnik

Ljubljana, Slovenia

Synonyms

Ethics education; Moral education; Values education

Introduction

Ethics and values education encompasses a wide variety of aspects, conceptual frameworks, topics, and approaches. Arising out of the field of ethics, it foremost has to be sensitive to a multi-dimensional and deep anthropological nature of human being and the recognition of this in educational processes. The relational and communitarian nature of ethics (arising out of the recognition of a human being as relational being, a being of community, and a being of dialogue) is extremely important and dictates reflections on justice, solidarity, compassion, and cooperation in the spirit of a genuine dialogue in the field of ethics and values education, which further call for openness, reciprocity, and mutual recognition. These aspects are of key importance for ethics and values education, since one of its main goals is to strengthen such dialogical and emphatic stance on all levels of educational process. These should not address and stress merely basic ethical norms and values (such as liberty, dignity and respect for life, equality, truthfulness, nonviolence, social justice, solidarity, moderation, humility, nondiscrimination, well-being, and security) but also turn to virtues that are at the heart of each individual development and development of a community as a whole. The dialogical nature of ethics and with this also of ethics and values education therefore stipulates openness toward the other and thus invites us to be open in the process of mutual growth and learning. In the formal educational process, an all-encompassing nature of ethical reflection and ethical awareness calls for an integrative approach, in which ethical topics are addressed in most if not all the subjects in school, trans-circularly, and in school life as a whole.

The global recognition of the importance of ethics and values education is well reflected in the 1996 UNESCO report of the International Commission on Education for the Twenty-first Century. "In confronting the many challenges that the future holds in store, mankind sees in education an indispensable asset in its attempts to attain the ideas of peace, freedom and social justice. The Commission does not see education as a miracle cure or a magic formula opening the

door to a world in which all ideals will be attained, but as one of the principal means available to foster a deeper and more harmonious form of human development and thereby to reduce poverty, exclusion, ignorance, oppression and war" (Delors et al. 1996). Since the field of ethics and values education is very broad and includes changing trends, this entry addresses just some of its key aspects, especially those related to more recent views and approaches, which stress the aforementioned integrative, holistic, and comprehensive nature of it.

Ethics and Values Education

In a narrower sense the term ethics and values education applies to all aspects of the process of education, which either explicitly or implicitly relate to ethical and axiological dimensions of life and are such that can be structured, guided, and monitored with appropriate educational methods and tools. Evaluative and ethical dimensions are an integral aspect of every educational process. "Education implies that something worthwhile has been intentionally transmitted in a morally acceptable manner. It would be a logical contradiction to say that a man had been educated but that he had in no way changed for the better or that in educating his son a man was attempting nothing that was worthwhile" (Peters 1970, p. 25). Ethics and values education specifically converts this implicit goal into an explicit one, following a recognition that vital presence of moral and value dimensions cannot be sensibly denied and the idea of a value-free education process proved to be a delusion. Among the main aims of ethics and values education are the following: to stimulate ethical reflection, awareness, autonomy, responsibility, and compassion in children, to provide children with insight into important ethical principles and values, to equip them with intellectual capacities (critical thinking, reflection, understanding, decision-making, compassion) for responsible moral judgment, to develop approaches to build a classroom or school environment as an ethical community, and to reflectively situate an individual into local and global

communities with a mission to contribute to them. All this enables children to overcome prejudice, discrimination, and other unethical practices and attitudes and at the same time shape proper attitudes toward themselves, relationships they form, society, and environment

Ethics and values education steers children toward the search and commitment to fundamental values, meaning, and purpose in their lives. Ethics and values education is also oriented into nurturing respectful attitude toward others (both individuals and communities alike) and putting one's beliefs, attitudes, and values into practice. As such it cannot be limited to one school subject or a set of subjects, since the initial all-encompassing nature of ethical reflection and awareness calls for a trans-curricular, integrative approach. If one regards values in a broad way as comprising of principles, fundamental convictions, ideals, standards, or life stances that guide individuals, their evaluations, and behavior (Halstead and Taylor 1996) both in their personal and social lives and include in this also a broader reflection upon them, then in a sense a field of ethics education overlaps with values education. In a narrower sense values education refers to a process of educational transmission of dominant social values to individuals to somehow incorporate them into the society.

Aims of Ethics and Values Education

Some of the main aims of ethics and values education have already been mentioned: to stimulate ethical reflection, awareness, responsibility, and compassion, to provide insight into important ethical principles and values, to equip an individual with key cognitive and noncognitive (moral) intellectual capacities (critical thinking, reflection, understanding, decision-making, compassion) for responsible moral judgment, to reflectively situate individual into local and global environment, and to enable individuals to overcome prejudice, discrimination, and cultural and other stereotypes. Next, the aims include that ethics and values education encourages children to explore diverse dimensions of values and various possible

justifications for moral status of action and to apply them in school, at home, or in professional life. It paves the way for reflective exploration of different ethical evaluative standpoints and analysis of their practical implications. It also enables them to gain confidence and self-esteem, foster cooperative behavior, stimulate and deepen moral motivation, shape their character, and enable overall growth in terms of purposeful, morally excellent, and satisfying life.

All these are connected into a more general, overall goal, among others defined by Dewey. "The formation of a cultivated and effectively operative good judgment or taste with respect to what is aesthetically admirable, intellectually acceptable and morally approvable is the supreme task set to human beings by the incidents of experience" (Dewey 1980, p. 262). One can add to this that "[o]ne purpose of moral education is to help make children virtuous – honest, responsible, and compassionate. Another is to make mature students informed and reflective about important and controversial moral issues. Both purposes are embedded in a yet larger project – making sense of life. On most accounts, morality isn't intellectually free-floating, a matter of personal choices and subjective values. Moralities are embedded in traditions, in conceptions of what it means to be human, in worldviews." (Nord and Haynes 1998) It thus stimulates individuals to make values relevant for their lives in a concrete social context in an experiential and expressive manner. The open questions remain: How can ethics and values education be genuinely effective, how can it gain a real hold on children as opposed to a simple recognition or authoritative assent, and what are the (pre)conditions for its efficacy (Silcock and Duncan 2001)?

Approaches and Methods

One aspect related to ethics and values education is how much of it and in what form should be based upon ethical theory. The answers here vary quite a bit, but a consensus seems to be emerging in the direction that a straight transposition of particular ethical theories as the main content of

ethics and values education is ineffective. "Another way of looking at ethics education, a favourite among traditional philosophers, is to see professional ethics education as an opportunity to learn about philosophical theories of ethics. Under this approach, the students are taught one or more ethical theories (usually utilitarianism, Kantian deontology, or care theory) and are then taught to apply these theories to resolve, or at least inform, ethical dilemmas. Among philosophers of education, who have dealt with ethics of teaching, however, it is generally agreed that this applied-theory approach to ethics education is particularly problematic" (Warnick and Silverman 2011, p. 274). When we move from the early education toward professional ethics education, the stress on ethical theory of course enhances but in a sense that ethical theory forms the basis of ethics education (not its main contents) since it can increase students' understanding of particular normative or evaluative stance, increase their capacities to formulate cogent justification and moral arguments, increase their ethical reflection and capacities of good decision-making, and lastly underpin a particular ethical code relevant for the field of professional study.

In early education this role can be played by incorporation of critical thinking and philosophy with children and inquiring community approaches. These can also secure the necessary balance between individual and societal aspects of values education. "As Socrates would have it, the philosophical examination of life is a collaborative inquiry. The social nature of the enterprise goes with its spirit of inquiry to form his bifocal vision of the examined life. These days, insofar as our society teaches us to think about values, it tends to inculcate a private rather than a public conception of them. This makes reflection a personal and inward journey rather than a social and collaborative one and a person's values a matter of parental guidance in childhood and individual decision in maturity" (Cam 2014, p. 1203). That is why reflective and collaborative approach is so essential, since it can secure a middle ground between individual relativism and a straight imposition of dominant social values, it fosters development of good moral judgment, and it enables us

to put ourselves in the position of another and finally to develop a dialogic and inclusive stance.

There are several specific methods developed for the field of values education. These range from inculcation of values by teaching, storytelling, or school practices and policies to approaches that are more open and reflective (philosophy with children), address specific aspects of morality (care ethics approach, empathy approach, cognitive developmental ethics education, character education, infusion approach, etc.), or are oriented toward ethical action (service learning approach). One of the more popular approaches in the past was the values clarification approach (Simon et al. 1972), which (following the lessons of moral pluralism) rejected the idea of inculcation and offered an individual an opportunity for free personal choice or preference regarding values and their understanding. Criticism of this approach stresses particularly the questions about its effectiveness and the lack of philosophical and educational foundations, while one of the reasons for the decline of its popularity was also its erratic implementation. One of its main proponents, Kirschenbaum (1992) has later accepted much of this criticism and proposed a more comprehensive values education approach. It is based upon four aspects of comprehensiveness. The first aspect concerns the content, since comprehensive values education includes personal and social, ethical, and moral issues. Secondly, the comprehensive approach includes a variety of difference methodologies. Thirdly, the approach gets extended throughout the school life, including both classes and all other school-related activities. And lastly, the comprehensive approach includes not merely children and their teachers, but the entire community and including other institutions as agents of values education (Kirschenbaum 1992, p. 775).

Joined to this trend was also character education as a specific form of ethics education, focusing primarily on character development, e.g., development of moral virtues, habits, and other aspects of character, which then translates into morally right action and meaningful life. Building upon an ancient tradition and educational ideas of Socrates, Plato, and Aristotle, this form often

obtained a more limited form of moral education through the use of role models and exemplars as key tools. With the rise of modernity, it slowly started to lose its appeal and relevance, primarily due to secularization and a focus on rules of conduct. Ryan (2015) states that in the 1980s, as a response to concern about poor academic achievements and bad behavior, educators have rediscovered character education (also as part of a wider trend of the return of virtue ethics championed, e.g., by G.E.M. Anscombe and Alasdair MacIntyre). Character education thus focuses on cultivating virtues and forming good character habits and at the same time eliminating poor habits. It is crucial that it begins early in childhood and rests on the assumption that parents and later on teachers begin the engraving process of habituation to consideration of others, self-control, and responsibility, and later on this individual takes over the formation of his or her own character (Ryan 2015).

In recent decades there is also a rise of other integrative and comprehensive approaches, which take into account both traditional educational goals and new findings from moral psychology and other sciences. In line with this development, Silcock and Duncan (2001) put forward the following preconditions for successful values acquisitions in schools.

- (1) Process condition: Optimal circumstances for the integration of values into students' lives must include in part their voluntary commitment at some stage of this process. This means recognizing their autonomy, competence, and personal choice in line with their moral development.
- (2) Conceptual condition: Values education must lead to personally transformed relationships between students and themes and contents considered worthwhile, which means that the move from belief toward motivation and action presupposes "co-construction", a consciously accomplished, cross-transformation where what is studied becomes a personal value through the act of commitment, while the commitment itself becomes a value-commitment via the potent nature of what is transformed (e.g., the potential a moral virtue has to change one's life)" (Silcock and Duncan 2001, p. 251).
- (3) Contextual condition: There has to be at least partial consistency or concurrence between the values, virtues, ideals, or standards learned and wider sociopolitical context, since this is necessary for ethics and values education to be as free as possible from internal inconsistencies regarding both contents and goals of it. Thus, in order for ethics and values education to obtain lifelong lasting relevance, one must include a wider understanding and grounds of the mentioned values, virtues, ideals, or standards they appeal to.

Some Challenges

Quite a number of challenges have been raised in regard to ethics and values education. In the context of school education, one challenge is how to situate it within the curriculum, especially regarding more explicit approaches that promote specially dedicated ethics and values education classes, given ever more pressing time demands of the curriculum and a possible lack of sensitivity to age-specific moral maturity. Another challenge is the global, plural, and multicultural world we live in that puts pressure upon the question of which values to choose in the beginning. Here ethics and values education can either appeal to some core common values (e.g., Hans Küng's *Weltethos* approach) or specifically include education for an inclusive cosmopolitan society (the abovementioned values clarification process was in part developed in response to this recognition).

From the perspective of teachers and other educators, one of the main challenges is the recognition that they often lack a more specific knowledge about ethics and values and related competencies to tackle them in the classroom in a coherent and integrative way. Education professionals are often additionally burdened with pressures toward more effective educational outputs, working schedule flexibility and mobility, new topics in curriculum, and increasing number of

students with adjustment disorders and often also with a lack of effective lifelong learning opportunities. Often they express skepticisms about their assigned role as some sort of moral authority or role model. All this may decrease the willingness and strengthen the reluctance to actively adopt a particular ethics and values education model.

Conclusion

Ethics and values education is a challenging field and task, which must harbor aspect of thinking, understanding, and community in order to be effective. “Values education therefore cannot be simply a matter of instructing students as to what they should value – just so much ‘teaching that’ – as if students did not need to inquire into values or learn to exercise their judgement. In any case, it is an intellectual mistake to think that values constitute a subject matter to be learned by heart. They are not that kind of thing. Values are embodied in commitments and actions and not merely in propositions that are verbally affirmed” (Cam 2014, p. 1208). The central aim remains striving to develop an autonomous, responsible, and caring individual to form a morally good society.

Examining the “Service” of Business Education for Women: A Service-Dominant Logic Perspective

Kellilynn M. Frias¹ and James R. Carver²

Introduction

Numerous studies identify failures in business school *output* (Thomas and Corneul 2012). Citing a gap between the skills and knowledge desired by prospective employers and the preparedness of new business graduates, the business school

faces increased pressures to improve education. A lack of relevance in topics, outdated teaching methods, and insufficient faculty diversity are among some of the most predominant arguments for improving the business school experience.

These failures, and corresponding need for improvement, are particularly important for women as existing research have been found to have a (greater) disproportionate impact on women than men Connell and Ryan (2011). Currently, business schools are said to evoke a male dominant bias due to the focus on “hard” management and the overly aggressive and competitive environment (Parsons and Priola 2010; White et al. 2011). A cumulative effect of sexist use of language, presentation of stereotypical views of women, and instructors favoring male students reportedly dissuade women from enrolling and achieving success in business classes (Crombie et al. 2003). In support of these claims, recent statistics suggest that business is the only area of graduate studies that has not seen a similar increase in women.

Stakeholder groups such as prospective employers, business practitioners, and incoming students benefit from an improved business school curriculum because students may be better prepared to face the reality of an increasingly complex and diverse business environment (McMurray et al. 2016). In particular, because the business school relative to other areas of education is the typical entry point for employers recruiting management-level trainees, many suggest the College of Business (COB) should improve business practice. Unfortunately, reports suggest the experience of a business school education may extend beyond graduation to perpetuate gender equality in the workforce (Warhurst 2011).

Our research into these COB failures suggests many are likely the result of traditional views of economic exchange (i.e., economic science) upon which a significant majority of business thought and, more importantly for this context, business education is based. Recent research in marketing has demonstrated the failures of many classic economic assumptions, or premises; yet these same assumptions and corresponding failures as

a result of classic economic theory have not been addressed or articulated in any educational context. As such, we begin with a brief, yet critical, discussion of the (economic science) foundation upon which America's COBs were, and continue to be, based. We use this historical foundation to frame (and explain) how current COB curricula and teaching methods have negatively impacted all COB students, and particularly women. We then discuss how new marketing theories relating to service (singular) provide not only an alternative lens for understanding education's role and practice but also practical, and immediately actionable, avenues for improving the current COB educational system for women, as well as all students in general.

The Foundations of Business Thought and Education

When the opportunity of a formal business education emerged at the end of the nineteenth century with the creation of America's first business colleges (e.g., the Wharton School in 1881 – University of Pennsylvania; the Booth School in 1898 – University of Chicago; the Tuck School in 1900 – Dartmouth College), the prevailing thinking was that a nation's wealth, and therefore value, was rooted in one's access to natural resources and the, subsequent, wealth (i.e., outputs) one's resources could produce not only for the enhancement of the nation's members but also for export in exchange for the desired resources and outputs one lacked domestically (Smith 1776/1904). The fundamental practices taught in early COBs were very functional by nature and focused on practical approaches to management. During this time, most faculty were either current or retired industrial managers (primarily men) teaching male students who lived and worked near the campus in which they were enrolled. As economic thought and the focus of business education began to shift toward research (to improve business practices), economic science became the fundamental curriculum of these business colleges. Specifically, these theories were rooted in the ever-

growing need to enhance production and distribution efforts as production increasingly moved away from the agricultural fields and individual homes and into the factory. Theories pertaining to specialization of labor suggested these newly formed business colleges, and sub-disciplines (e.g., marketing, accounting), would provide the necessary efficiencies to enhance one's (America's) overall wealth (Vargo and Lusch 2004).

However, emerging disciplines' early efforts to gain legitimacy are often grounded in justification, differentiation, and classification of what is being taught and/or studied. Like that of economics earlier on, each subdiscipline believed that if they were to ever be "accepted" as viable "sciences," they must be able to model, in a deterministic sense, mathematical rules, and "laws" similar to those of mathematics and other (natural) sciences (e.g., Mill 1848). Quantifiable measurement became a critical, *and enduring*, focus.

Similarly, as economics was rooted in the transformation and subsequent sale of resources for maximal (exchange) value (e.g., selling price), COBs, too, became obsessed with the development of *tangible outputs* (goods). They, unlike their *intangible* "siblings" (services), were easily measurable, quantifiable, and highly similar to those resources empirically studied within economics. Furthermore, due to *repeated* misinterpretation and (mis)citation of Adam Smith's, the "father of economic thought," *Wealth of Nations* (1776/1904 – Vol. 1, Book 2, Ch. 3, pp. 314–318), services were deemed "unproductive" and, therefore, unworthy of any significant, much less leadership, role in business research/curricula.

A Goods-Dominant Logic to Business and Business Education

This overt, almost singular, focus on production outputs ushered in what has now become commonly referred to as the goods-dominant logic (GDL), which has dominated business school curricula throughout the twentieth, and even early twenty-first, century (Bettencourt et al. 2014; Vargo and Lusch 2004). Value, wealth, and, therefore, success have all become inextricably linked

to the production of tangible, homogeneous, and nonperishable goods. Thus suggesting that homogeneity in curriculum and students provide relatively more value due to increased efficiency. Services, conversely, have been commonly referred to as having IHIP (intangible, heterogeneous, inseparable, and perishable) characteristics; all of which are seen as largely negative for maximizing one’s (e.g., a company or nation’s) exchange value potential (Dunne et al. 2014).

A term that is almost ubiquitous in COB classrooms, corporate boardrooms, and even shareholder reports is *value-added*; this “value-added” lens is foundational to the GDL paradigm of business yet is easily applied to the current, educational, context. When viewed through a “value-added” (GDL) lens, students are “goods” or “products;” producers (faculty, curricula, administrators, etc.) *add value* (mold, create, or enhance) to their products (students). To further underscore how truly pervasive the GDL – and symbiotically the value-added paradigm – is *throughout all* of education, consider how often one might hear the phrase, “to *shape* individuals’ (or even the country’s) future” via education (or by being an educator).

Products need shaping (value-added) so they can later be sold in a marketplace for the greatest amount of value (exchange value). Understandably, a business education is heavily influenced by the value-added concept. The value-added concept may (un)knowingly be operationally appealing to educators because it positions (educational) value in terms of what each sub-discipline, college, and even university *controls*. Administrators do research what companies’ likely responses are to different variations in the bundles of attributes taught to students, but these responses are only done to maximize the course materials embedded upon students (output). This focus suggests the value of the materials, labor, and services contributed to each output (student) is unidirectional, and it simultaneously underemphasizes the importance of the customer (recruiters in the marketplace), as well as the students who bring their own knowledge, skills, experiences to the classroom. Consequently, the integration of these resources

aids (future) employers in better identifying needs, solving problems, and providing solutions (i.e., to provide service) to their respective customers.

The Failure of a Goods-Dominant Logic for Business Education

As suggested earlier, a GDL perspective puts a heavy emphasis on analytical models and reductionism – what is measurable, quantifiable, controllable, and, therefore, easily standardized. It is a production-focused mentality centered upon generating outputs (e.g., students) that has led to a singular philosophy for educational exchange in the COB. Although this may have aided the efficiency of information exchange during that time, businesses, their resources, and therefore their current needs require business schools provide more than one (standardized) solution (e.g., vestiges of the assembly line). Students are not, and should not, represent production outputs. Similarly, not all students have, nor desire, similar capabilities either for jobs or, more importantly, *their educations*. What is needed is a *change in philosophy* – one that not only better addresses the needs of the marketplace (one’s future employers) but also, and more importantly, the *service* of education for all students.

A Service-Dominant Logic for Education

Over the last decade, a new, and significant, paradigm off/for business has emerged – a Service-Dominant Logic (SDL) (e.g., Vargo and Lusch 2004). At its most foundational level, it argues that individuals *do not* buy, exchange, or even produce goods; rather, *service* (through the performance of deeds, processes, and performances for others) *is the root of all exchange* – business, social, interpersonal, etc. While Vargo and Lusch’s (2004) initial conceptualization was framed for the marketing community, its application has grown significantly over the last decade to include many domains outside of business (see Bettencourt et al. 2014 and Vargo & Lusch 2016 for further discussion).

A Jobs-To-Be-Done Lens: Women and Business Education

If COBs are to best address the known impediments for women achieving a meaningful business education, they must view the problem(s) using a JTBD-lens. A JTBD-lens shifts the focus from what is being produced to enabling students to get their jobs done successfully. As such, this is achieved by asking the "right" types of questions, such as "How do women evaluate value when it comes to their educational experiences and desired results?", "What unique know-how does (our) COB possess that might help women make the most out of their educational experiences?", "How might our know-how be better integrated with the resources of partners (other colleges, company partners/recruiters, business thought-leaders, etc.) to help women cocreate the most meaningful educational experience(s) via the COB?", and "What are some of the current needs, and problems faced, by our resource partners so as to better understand the desired jobs-to-be-done by our (future) female graduates?"

By embracing a JTBD (service) lens, COBs can do a better job in their quest to provide a meaningful, and by extension, more valuable, educational experience to women. Understandably, such questioning challenges long-term, firmly-held assumptions about value and the role of not only the COB, but also, and more importantly, its female student population. Students are no longer "products" to be shaped, created, or managed; they are *active* participants in the value creation process. Similarly, employers are no longer customers of COB-created value; they too are active participants in the value-creation process. *Everyone* (students, faculty, companies, and colleges) *is a cocreator of value, and value is only realized through the exchange of service* (knowledge, skills, and abilities through the act of deeds, processes, and performances for the benefit of others).

Primary Jobs-To-Be-Done to Improve Business Education

The following discussion is by no means and attempt at an exhaustive, or comprehensive, solution to the current criticisms/trends associated

with COBs. Instead, it is intended to provide a baseline understanding, or framework, upon which further, more specialized, investigations can build. In so doing, the conclusion will describe the three primary criticisms voiced in the literature, while simultaneously identifying how a JTBD-lens might identify appropriate questions and corrective measures to be taken in the future.

Question 1: What Teaching, and/or Learning, Approaches are Most Desirable by Resource Partners (e.g., Recruiters) and (Female) Students to Better Address the Needs of the Workplace? Extant research has consistently demonstrated that students have a strong desire to feel challenged while simultaneously learning topics that are relevant to future employment. Yet the traditional paradigm of business schools is hard-pressed to provide students with relevant business educations to meet the needs of diverse employers. COB courses largely require students to learn information that is often too technical, too heavily rooted in "best practices" (standardized), overly rational, and routinely focused on delivering short-term, non-contextualized, materials that lack lasting value applicable to the current (or future) business environments (see Augier and March 2007).

Such mechanized, overtly measurement-driven education has led many to suggest that COB students exiting college with underdeveloped, yet extremely important, behavioral skills, particularly those relating to effective communication, multicultural awareness, and leadership (Hawawini 2005). All of these "softer skills," as many refer to them, are routinely pointed out by recruiters as *critical* for building relationships, establishing trust, and evoking a sense of commitment and "citizenship" amongst colleagues and businesses alike. Taken together, critics suggest COBs are failing to sufficiently prepare students for an increasingly complex business environment where relational skills, the ability to interact with, and operate within, diverse populations, and a keen ability to problem-solve are paramount.

For women, the lack of relevance in coursework has additional implications for their

success. As a result of the indicated preoccupation with measurement and control in business courses, education theorists suggest students are taught under a pretense of a male moral bias. For women, relational theory (often considered to be a part of feminist theory) provides an approach to understanding women’s experiences (this theory does not propose to apply to all women) that may be indicative of their sense of self and morality (Buttner 2002). Relational theory suggests that much of women’s psychological development is rooted in connection to others. Relational practice in organizations contributes to employee effectiveness and enhanced work performance. Further studies suggest cultivating relational practices, particularly for women, operating in large corporations may lead to a competitive advantage in the marketplace as a result of better relationships, empathy, collective empowerment, and enhancing team effectiveness (Rapoport and Bailyn 1996). For women entrepreneurs, relational practices also reportedly enhanced the decision-making efforts of the startup team and aid in the development of a unified vision of their venture (Buttner 2001).

Thus one approach to improve the relevance of topics and materials covered in the coursework is to use relational theory in practice. For women, particular emphasis must be placed on the value of the diversity of experiences brought forth by various resource partners. Facilitating such relational, softer, skills in a classroom environment is sure to be *both* challenging and rigorous for faculty and students. From a faculty-member’s perspective, one is no longer able to “control,” or pre-plan, one’s lectures and classroom-experiences. Such classroom experiences are *organic* and *dialog-driven*, which will surely put a premium on educator preparedness. However, the challenging-nature of such a service-driven, classroom environment does not fall solely at the feet of faculty members. If students are to enhance the collaborative and relational skills employers’ desire, students must come (significantly) prepared to each and every class meeting; failure to do so will surely limit, if not eliminate, the possibility for dialog-driven, cocreative, learning experiences. Furthermore, cocreative learning

environments are predicated on students’ willingness to put forward one’s own judgments/ideas for critical evaluation by other students and the faculty member(s) involved. Dialog-based, seminar-style classes should simply result in a more organic, more idiosyncratic learning experience emphasizing the knowledge, skills, and experiences of all participants (faculty and students). Absent relational theories in practice, all students, but particularly women, will not have an opportunity to learn, engage, and practice these skills during their business school experience and, thereby, lose some of their competitive advantage in the workforce.

Question 2: What Current Teaching Techniques Used in the COB are Likely to Stifle (Female) Students’ Maximal Learning Potential, and What Resources Exist That Might Later be Integrated to Enhance Students’ Future Classroom Experiences? Unidirectional, lecture-based teaching continues to be the norm throughout much of the COB. This may be carryover from the GDL paradigm, the result of faculty fears over losing control of the material to be covered or perhaps some combination thereof. Regardless of its origin, predetermined, lecture-based classroom experiences fail to accommodate the learning preferences/predispositions of many students. Lecture-based teaching is a passive method of embedding knowledge in students. Furthermore, it limits the opportunities students have to meaningfully engage in conversation with faculty and students alike when a topic(s) of interest presents itself to the student. As such, it’s not surprising that recent research finds students are 1.5 times more likely to fail a course(s) if taught in a unidirectional, lecture-based format (Freeman et al. 2014). Lecture-based classrooms simply result in many students perceiving the learning environment as “closed” for active questioning.

For employers, the lecture-based approach can be problematic because students are not prepared to communicate and consequently advocate for their ideas. One alternative implemented by many COBs is the case-based method of teaching. Popularized by the Harvard Business School, this approach to learning was designed to give

students the opportunity to learn by solving real-business problems. Unlike a lecture-based approach, the students lead classroom discussion while the professor is responsible for facilitating dialogue (i.e., coproducing knowledge and skills).

For women, the lecture-based and case-based approaches to learning provide different challenges. First, a lecture-based approach to learning is found to be less effective when students are not engaged in the classroom dialogue and to be particularly problematic for diverse student populations. For under-represented minorities' (e.g., women in the business school), alternative approaches to traditional lecture-based courses can improve perceived leadership skills, positively reinforce core concepts, and help students break down complex tasks. However, currently, self-reports suggest business cases are not valued similarly by women and men. A recent study suggests more than half of the women enrolled in business schools could not relate to the characters in the case studies because they are absent in many roles (Catalyst Survey 2000).

Thus potential options for improving case-based dialogue and learning may require altering characters in cases to include women in leadership roles with specific case-scenarios identifying business success from the perspective of women leaders. Furthermore, altering the structure of dialogue may bring increased benefits to women as previous research suggests much of the traditional classroom conversation is dominated by male students. Additional resources may include classroom response systems (i.e., clickers), flipped-classrooms, and connected learning. Arguably, the transition from viewing female students as similar to males (output) to cocreators of educational value may also bring a significant refocus to future approaches to classroom dialogue.

Question 3: What Resource Partners (e.g., Faculty, Industry Experts) are Available, or Should be Integrated in the Future, so as To Enhance (Female) Students' Ability to Cocreate New Knowledge, Skills, and Competences? Lack of diversity limits exposure to diverse experiences, skills, and knowledge from which to best examine a problem for possible service solutions.

Business, in particular, faces increasing globalization, rapid technology development, and changing workplace demographics. As such, the business school faculties, similar to business practitioners, are a critical catalyst of change to improve the diversity of students entering Corporate America. Industry experts suggest that gender-diverse companies are more likely to outperform their peers by 15% and ethnically-diverse companies are 35% more likely to do the same. Teams with diversity are much more likely to outperform their peers in team-based assessments, and for companies with women represented on the board of directors, they are also shown to outperform their peers.

From a JTBD lens, faculty are cocreators of service via their unique knowledge and skills. If students and business practitioners are to receive the reciprocal effects of improving gender and diversity profiles among COB faculty, then the COB must improve diversity of faculty teaching in the classroom. The value of these relationships is supported by recent reports suggesting that female COB students report not having adequate opportunities to work with female faculty while acquiring their business degree (Catalyst 2000). Furthermore, recent reports suggest a majority of the US flagship State universities lag far behind in their faculty diversity when compare with that of their student body (Myers 2016). Upon consideration of faculty as cocreators of knowledge, skills, and value, efforts to increase the diversity of faculty have critical implications to enhancing the diversity of students as well as that of future business executives. Thus industry practitioners must support the teaching of business faculty to enhance the diversity of gender (and ethnicity) facilitating learning in the classroom today.

Existential Individual Alone Within Freire's Sociopolitical Solidarity

R. Scott Webster

Deakin University, Melbourne, Australia

Synonyms

Angst; Authenticity; Conscientization; Dialogue; Existentialism; Freedom

Introduction

Freire's work has been recognized as lacking some careful and systematic attention to details on occasion (Dale and Hyslop-Margison 2011; Gerhardt 1993; Roberts 2010). This is not a serious criticism but is simply accepted as characteristic of his humanizing approach. One example of an event Freire identifies as important but does not provide systematic details about is the personally existential encounter an individual must face *alone* while being educated and liberated to participate in the sociopolitical solidarity of her context. Existential encounters are often marginalized due to the all-important focus upon dialogue between others. This contribution seeks to draw attention to the existential experiences of educational transformations to which Freire refers, explaining that these are not just juxtaposed

ideas (Hufford 2010) but must necessarily be experienced *alone* because of their existential nature and that these experiences are also considered to be a necessary element for his pedagogy for transformation.

Existential Influences

Themes such as dehumanization, alienation, domination, existential, fear of freedom, and authenticity are some examples of the terminologies that are present in Freire's writings which demonstrate the influence that existentialism had upon some of his thinking. Freire was well acquainted with the works of the existentialists such as Buber, de Beauvoir, Jaspers, Kierkegaard, Marcel, Sartre, and others and was personally acquainted with, and quite influenced by, Eric Fromm. Comparing the existential works of Fromm and Freire is quite illuminating and so several references to Fromm's works shall be made in this chapter.

While existentialist philosophies are readily recognized for centering their concern upon the *individual* who often feels alone, alienated, and anxious about the recognition of a certain sense of personal freedom, it is not systematically clear in Freire's work of a similar sort of individually felt dread and angst concerning one's existence. However, this chapter seeks to tease some of this out. Through his educational writings which are aimed towards liberating the oppressed social classes, particularly in South America, Freire often makes reference to the oppressed as "an exploited social class." This may be understood as an attempt to empower the entire membership of the group as a *social-political* phenomenon rather than as one which is centered upon each personally existing *individual*. This is often supported by Freire's (1985, p. 99) preference for such notions as "we think" rather than "I think."

It is clear from the descriptions of oppressive systems that Freire wanted us to understand them as *social-political* phenomena of cultural oppression affecting an under-class, which he described at times as the "masses of common people." Nevertheless, we can appreciate that he, along with other significant philosophers of education such

as John Dewey with his emphasis upon a "new individualism," recognized that an education for liberty involves a site of struggle in the lived existence of each *individual* – at least for one phase of the process. Freire (1998, p. 65) describes the felt impotence of the oppressed class as "existential weariness" because it is experienced by each individual who has a sense of being too insignificant to have any real potential for making a difference. He also describes this same "existential weariness" as a "spiritual weariness" because it is "emptied of courage, emptied of hope, and above all, seized with fear of adventure and risk" (Freire 1994, p. 114). This is particularly relevant for the notion of the "fear of freedom" which Freire appreciated is not easily overcome for those who are oppressed.

Freedom

For Freire, the overall aim is to attain liberty for all – including for the oppressors as well as for the oppressed. He often described such freedom as a culture for which a liberating education is an essential component. The sort of freedom which he espoused was not unlimited and irresponsible, "perverted into license" as if it were absolute. Rather it is a socially responsible freedom which respects the humanity in all persons irrespective of their social position in life.

Cultures of oppression which domesticate and silence the masses make people consider themselves as lacking the freedom and capacity to enact change and to assertively pursue greater liberty. Freire (1985, p. 115) importantly describes this system as a culture for controlling the aspirations of the oppressed as it is "crucial for dehumanizing ideology to avoid, at all costs, any opportunity for men and women to perceive themselves as reflective, active beings, as creators and transformers of the world." In addition to being dominant throughout the whole of society, this is a culture which is internalized at the *individual* level. Therefore, cultural action for liberating and bringing about changes in social structures, institutions, and practices *first* requires that *individuals* take action from a basis of self-conviction

rather than being caught up simply *following* and being led by what the rest of the crowd might be doing – even if the crowd is enacting a culture of liberty. This is because even in this social situation the individual herself is not authentically free if she is nevertheless being led passively by others. She must be led by her *own* personal convictions and intentions.

This is a crucial step that is often overlooked and is quite existential in nature. Freire's education for liberating, while a social affair involving dialogical relations, does not *give* freedom to people as if freedom was *something* to be "had" or obtained. Rather, freedom is more ontological in nature because it involves the very *being* of people. This transformation of individuals enables them to *be* free rather than just to *have* freedom, and as an ontological phenomenon this pertains to each individual who undergoes conscientization. This site of the individual struggling through reflective and critical thought is an important dimension for political action to begin, as Freire (2000, pp. 108 & 124) explains that others cannot "think for me" but liberated people must become "masters of their thinking."

The felt sense of freedom at the *individual* level is important for all political actions because it is "the freedom that moves us, that makes us take risks..." (Freire 1998, p. 102). He appears to reference Fromm's book *The Fear of Freedom* in the preface of his *Pedagogy of the Oppressed* in relation to education for critical conscious-raising because inevitably each individual must grapple with a new sense of personal freedom in order to enact living politically according to a new and emancipative culture which is often at odds with the dominant culture. Importantly, in Fromm's (1942, p. 91) book is his argument that we are unfortunately too often fascinated with "freedom from powers *outside* ourselves and are blinded to the fact of *inner* restraints, compulsions, and fears." In line with this, Freire (1994, p. 115) argues that this inner fear prevents individuals' struggling. Significant freedom for both Fromm and Freire is freedom of one's inner *will* – one's intentionality – which must be grappled with *alone* while in the midst of being in and with the world.

Conscientization and Existential Angst

Conscientization is a form of *intentionality* which provides personal *purposefulness* for being *with* the world. In order to pursue the process of enabling people to be liberated through education, Freire (2000, pp. 55 & 111) argues that "the first stage must deal with . . . oppressed consciousness" which he described as "alienating domestication [and] . . . the bureaucratisation of the mind." Interestingly, he explains this as a consciousness which transforms "everything surrounding it into an object of its domination . . . everything reduced to the status of objects at its disposal" (Freire 2000, pp. 58–59) where the people "no longer *are*; they merely *have*." This is a reflection of some similar ideas found in Fromm's *To Have or to Be?* and *The Art of Being*. Consequently, one of the first things he tries to encourage his students to appreciate is that culture is an anthropological concept which is distinctively different from the assumed static condition of the world of nature which is often accepted as being more "objective" (Freire 1975, p. 41).

His critique of the silence that is produced in the oppressed social classes identifies that these people believe too much in an objective reality for which they feel separated and powerless to influence. Drawing upon de Beauvoir, Freire (2000, p. 74) argued that "the interests of the oppressors lie in 'changing the consciousness of the oppressed, not the situation which oppresses them'". Hence is focus upon encouraging his students to consider the manner which they are actively relating to their own context.

Freire's (1985, pp. 51 & 68) process of conscientization centers the "existential situations of the learners" themselves including their sense of subjectivity and how they relate to a world of human culture. This is portrayed clearly in his book *Education for Critical Consciousness* in which he presents drawings of ten existential situations to his adult students which they could *relate* to as part of their present existence. Understanding human persons as relational beings who relate to their relations is a key existential concept. Developing this in some detail, Kierkegaard has famously argued that "truth is subjectivity." By

this he meant that in order to live a more meaningful life, *how* one relates to the entities around one has more significance than coming to “know” (in an objective sense) the nature of the “*what*” of the objects themselves. This existential notion of “subjective truth” appears significant for Freire. Not in the sense for establishing “truth” in an epistemological sense of gaining knowledge *about* the facts of reality but rather understanding is as “truly relating” to one’s situation in an authentic manner, in a reflexive sense for how one *relates* to one’s environment in which one plays an active and present role.

Freire’s philosophy appears to be more action-oriented than that of the existentialist philosophers but he does value the internal strife – or anxiety – that is required to reorient a human life towards greater conscientization. Similar to the existentialists, he argues against a “spectator approach” to life and appreciates the existential angst – involving “emotional power” and what he refers to as the “dramatic tension” (Freire 1975, p. 29, 1985, pp. 128–129) of our existence. This is experienced when one encounters a critical revelation through the demythologizing praxis of a liberating education which seeks to uncover how one is positioned and then relates to the world one finds oneself “thrown” in, as it importantly seeks the *raison d’être* of the facts behind one’s *facticity*. Freire (2000, p. 115) argues that critical consciousness raising must seek a holistic view of things, “a totality.” This is much like Heidegger’s notion of “total relevance” and Dewey’s notion of “significance” – it is the “big picture” understanding of the hegemonic culture in which we are embedded – and for Freire it is essential to give particular importance to the political dimensions of our world.

This “totality” view of Freire’s is also akin to Kierkegaard’s religious stage of giving meaning and purpose to all that we do. Indeed this totalizing “religious” view is able to provide a *why* for all entities in the environment, including a *why* for being moral. As Freire (1998, p. 53) explains that “what makes men and women ethical is their capacity to ‘spiritualise’ the world.” Hence through education, *doxa* (accepted understandings of the dominant ideology) is challenged and

replaced by *logos* (totality of meanings in which persons participate in *making* such meanings) enabling people “to perceive critically *the way they exist* in the world” in order to transform it and themselves (Freire 2000, pp. 81–83). Freire describes this process of “becoming fully human” as an “existential experience” (*ibid.*, p. 75) because it involves creating a culture within oneself often including fear and anxiety, but which is also shared in solidarity with others.

The inclination to develop existential purposes were previously absent in the minds and intentions of the oppressed because these are not compatible with the dominating culture. Therefore Freire (2000, p. 39) argues that conscientization “is a task for radicals” which is reflective of Fromm’s notion of *Disobedience* for which he argues for the importance of being a revolutionary in the sense of being with a shared vision of a better world rather than just being a disobedient “rebel without a cause.” It is understood that “the revolutionary process is eminently educational in character” (Freire 2000, p. 138) because it enables the students to better see the world as in need of change and is not a world with a “fixed entity,” which is a key feature of Freire’s problem-posing education. In a more tempered articulation of this same idea is that conscientization encourages *curiosity* to evolve as an important aspect of a strengthening personal intentionality. He explained in his *Pedagogy of Hope* that one of the reasons he gave his adult learners drawings of existential situations with which they had some familiarity was to render them sympathetic. In turn, this promotes curiosity, which in turn begins the process of conscientization (1994, p. 65).

Authenticity and Authentic Dialogue

There are frequent references to “authenticity” in Freire’s works and in particular in relation to his understanding of dialogue. Authenticity is a key concept in existentialism, pertaining to the individual who makes/chooses one’s *own* meanings, purposes, and intentions. Freire doesn’t always use authenticity in this manner that is specific to existentialist philosophy. However, he does

appear to use it when he describes the oppressed as “unauthentic beings” and for claiming that the people’s destiny was to overcome this in order to become “authentic human beings” (Freire 1975, p. 16). He also employed this term authenticity for better understanding the potentially liberating relationship between educators and their students as one involving “authentic dialogue.”

Educators are not to impose themselves or their teachings onto students in a paternalistic sense because this would perpetuate the myth that students ought to be dependent on their teachers. Rather students and teachers are to be *with* each other as equal human beings – not necessarily united by identical ideas, aspirations, and feelings – but having a unity through diversity, oneness with difference, and a dialectical solidarity which is a hallmark of democratic living (Freire 1994). This is partly represented through Freire’s notion of authentic dialogue and due to the inherent differences to emerge through dialogue he explains that this activity is able to provoke a critical attitude (Freire 1975). Sometimes this is represented in secondary sources as “egalitarian dialogue” or “dialogic inquiry.” However, they present themselves as “methods” or “techniques” of pedagogy but for which Freire would be opposed. Both egalitarian dialogue and dialogic inquiry tend to be focused upon the rationality and validity of propositions and arguments for which all participants are free to challenge and engage with in a rather cognitive sense. However, these concepts do not adequately capture the existential dimension of authentic dialogue that was important for Freire (1975, p. 45) who described it in Buber’s existentialist phrase as an “I-Thou relationship.”

Freire (2000, p. 88) argued that “human beings are not built in silence” and so dialogue serves as “an existential necessity” to humanize persons. Therefore *authentic* dialogue brings to light the important existential personal *courage* needed by each individual student to overcome personal fear in order to transcend the oppressing culture which silences them from sharing their *own* understandings and feelings. Asserting one’s own voice is not encouraged nor welcomed in an oppressive culture which manifests itself as an *inner* culture of

“manipulating” and silencing voices because the individual believes herself not to be worthy or capable of having a view of her own that may be contrary to the culture of the status quo.

In summary, while Freire’s works can be primarily understood as engaging with and transforming social-political practices, he greatly appreciated the important role of the existential site of struggle within individuals which they must encounter in order to participate in liberating education. This is evident through acknowledging that the dominating culture of oppression exists in the inner world of individuals in addition to being manifest in the external practices of society. Transforming oppressive political societies first requires the raising of critical consciousness or conscientization in the inner worlds of individuals. Freire argued that this might at first be encouraged through sympathetic recognition which leads towards curiosity. This might develop into a more determined interest to inquire into cultural practices more rigorously. The emergence of a new intentionality through this educative pedagogy might then enable individuals to face their fear of freedom and to choose new aspirations for themselves. Then as a collective of individuals, *action* in solidarity may follow. Of existential importance is the courage that is required to overcome the existential anxiety encountered at the individual level, at the interface between actual present conditions and the possible new conditions which are hoped for.

Expertise and Educational Practice

Michael Luntley
Department of Philosophy, University of
Warwick, Coventry, UK

Do experts have distinctive ways of knowing and distinctive modes of deploying knowledge in performance? The idea that they do has been commonplace, but these claims have been subjected to considerable scrutiny in recent years. Consider:

- H1: There are ways of knowing distinctive of expert knowledge.
- H2: There are distinctive forms of rationality (the rational deployment of knowledge) characteristic of expert practice.

H1 is the key hypothesis. It is independent of H2, but if H1 were true, that would add weight to the case for H2. Contrariwise, if H1 is false, that erodes the reasons for H2. With regard to both hypotheses, it is useful to think of a spectrum from conservative to profligate conceptions of knowledge and rationality, respectively. The conservative opposes the proliferation of ways of knowing and forms of rationality; the profligate endorses proliferation. The key methodological issue concerns the status of the claims made in favor of either hypothesis: Just what is at stake in claiming H1? I shall focus on H1.

This entry provides (section “[History](#)”) a brief overview of some of the historical sources for this debate, (section “[Key Theoretical Claims](#)”) a summary of some key theoretical claims and methodological assumptions, (section “[Assessment of Lines of Debate](#)”) an assessment of some of the main lines of debate, and (section “[Lines of Development](#)”) an indication of potential development.

History

Sources for the idea of distinctive non-propositional ways of knowing can be found in Polanyi's notions of tacit knowledge (1958, 1966), Ryle's knowing-how/known-that distinction (1949), and the Dreyfus and Dreyfus taxonomy of expertise (1986) and appeal to Aristotle on practical knowledge and wisdom (Dunne 1993, Wiggins 2012). Evidence for the appeal to forms of knowing embedded in our practical engagement with the environment is often sourced from Heidegger and Wittgenstein – Stickney (2008), Simpson (2014), and Smeyers and Burbules (2006, 2008) – and the analysis of practitioner behavior (Schon 1983, 1987, 1991) and in psychological theorizing about how experts decide, e.g., Gigerenzer (2000), Gigerenzer and Selton (2002a, b), and Klein and Zsombok (1997). See Searle (1995, 2001) for the Wittgensteinian influence on the role of the “background” in models of rational action.

Key Theoretical Claims

Is there reason to proliferate ways of knowing? In debates in education, the idea of different ways of knowing, some of which are only available to expert practitioners, has become almost commonplace. The Dreyfus model that differentiates ways of knowing from novice to expert has dominated nurse education (Benner 1984), and Schon's account of reflective practitioners that appeals to both Polanyi and Ryle in its appropriation of the idea of nonpropositional ways of knowing has been influential in many fields of professional education. The prevalence of these claims is due largely to the idea that profligacy captures the phenomenology of expert performance. It strikes many that there is something about "the what it is like" to know and act in the moment that is difficult to capture in ordinary propositional modes of knowing (Eraut 1994, 2000; Hager 2000; Beckett and Hager 2005). Acting on the basis of expert knowledge often seems not to be based on a model of deliberation and weighing of reasons in the scales of some preferred model of rational action (Gigerenzer 2000).

This emphasis on phenomenology raises a central methodological issue: What question is being answered with H1 and H2? Is it a phenomenology question of the form "what is it like for experts to think and act in the moment?", or is it a constitutive question of the form "what constitutes the knowledge deployed in expert performance?". That is to say, to what is a theory of expert knowledge and action answerable? Is it answerable to phenomenological adequacy (it describes the "what it is like" of expert knowledge and performance)? Or is it answerable to metaphysical adequacy (it characterizes accurately the nature of the knowledge and its modes of employment in expert performance)? Call the latter metaphysical constraint on theorizing the constitutive constraint, for it amounts to the idea that our account of expert knowledge should deliver what is constitutive of expert knowledge; howsoever, it may seem to the knowing subject. The phenomenological constraint simply takes the requirement on our theorizing to be that our account fits the first-

personal avowals of expert knowers in action (Dreyfus and Dreyfus 1986; Collins 2010).

The phenomenological approach faces an obvious challenge: howsoever, it may appear to practitioners that they are using knowledge that is difficult to articulate and often deployed without full conscious awareness of what is being deployed; is there any good reason to think that what is at stake here (what makes it knowledge) is anything other than what is at stake with ordinary propositional knowledge? It is unclear why an account of what someone knows that informs their performance has to be answerable to what they say they know, let alone why the subject's first-personal access to what they know should be the deciding factor in how what they know is to be fitted into categories of types of ways of knowing. For this response to Gigerenzer's phenomenological case in support of H2, see Chater and Oaksford (2000).

Philosophers working outside education debates have only recently taken detailed interest in this, and the key debates are now foundational – is there anything distinctive about expertise with regard to the types and deployment of knowledge?

There are two main lines of debate – the McDowell/Dreyfus debate and the debate about the viability of Ryle's knowing-how/knowing-that distinction. In the former debate, McDowell (*locus classicus* 1994; see also 2013) has a line of argument that pushes the conservative view that all knowledge is propositional, contra the profligacy advocated by Dreyfus. The latter debate draws on McDowell but is more concerned with assessing Ryle's argument that knowing-how is separate from and cannot be analyzed in terms of knowing-that.

Assessment of Lines of Debate

See Schear (2013) for a thorough collection essential for the McDowell/Dreyfus debate. Central to the debate is the question:

What's a Proposition? A key driver for proliferating ways of knowing is phenomenology. It is

oftentimes difficult for experts to articulate the knowledge they deploy in their moment by moment expert action. At the extreme, they might even say that their response is intuitive. Dreyfus uses “intuition” to pick out the highest level of expert knowledge. The case for proliferation is based on the difficulty and sometimes inability to articulate a propositional content. Suppose you cannot articulate fully what you know in a situation and words are inadequate to express what you know. McDowell’s key claim is that it does not follow from such inarticulacy that what is known is not a proposition. To understand how the inarticulate can nevertheless still be propositional, we need to clarify the concept of a proposition.

If you individuate propositions with sentences (you count propositions and distinguish between them by counting and distinguishing sentences – strings of symbols), then inarticulate knowings cannot be propositional. For example, a nurse might express the way she performs a complicated four-layer bandaging technique by saying:

1. I do it like this.

Sentence (1) does not individuate a proposition. The same sentence can be used by a pianist to express the way they play a particular phrase – the same words, different items of knowledge. If you count propositions by sentences, then what the nurse knows cannot be propositional. But the assumption that propositions are individuated by sentences has no good basis, and hardly anyone in contemporary philosophy would endorse that assumption. It is commonplace that we can make sense of propositions that are only expressible with context-sensitive words (like the demonstratives, “this” and “that”); see Luntley (1999) for overview and McDowell and Pettit (1986) for an early key collection. If so, the fact that experts often express themselves with such sentences tells us nothing about whether or not the knowledge expressed is propositional. It might seem to the expert that it is impossible to articulate what they know. But if that just means “impossible to express in full in context-independent language,”

that says nothing about what constitutes the knowledge in question, and it says nothing that is inconsistent with the idea that the knowledge is knowledge of a proposition.

A proposition is a complex structure, a combination of concepts that in virtue of its structure forms a whole thought that can be either true or false. A concept is a repeatable component of such structures. There is no more need to identify a concept with a word, as there is to identify a proposition with a sentence. There can be context-dependent concepts, and, when the words used in a context to express such concepts are then deployed in a sentence used in a context, you get a context-dependent proposition. Here’s a simple example. Consider a shade of blue for which you have no name. You call it simply “that shade” as you point to it. Suppose you can recognize that shade on different occasions. If so, you can use the words “that shade” as a repeatable component of thoughts when, for example, you look at the paint color chart and think:

2. I like that shade; it will look good on my wall.

and use it again when looking at swatches of material for the curtains and you think:

3. I’m not sure that shade will go well if I use this material for the curtain.

If you endorse the proposition expressed at (3), that bears on the rationality of continuing to endorse (2) – most likely you will decide that the earlier thought expressed in (2) was mistaken. But your thought expressed with (3) only bears on your assessment of what you thought with (2) if the phrase “that shade” picks out the same shade of blue. But that is exactly what we ordinarily think is happening in such examples. The fact that what we are thinking is not fully expressible in words (we rarely remember the names for subtle shade differences on paint manufacturers’ color charts) does not mean that we are not thinking propositional thoughts with (2) and (3). Indeed, the obvious explanation of why, on thinking (3), we retract the thought at (2) is precisely because there is an ongoing way of thinking about

the shade of blue expressed by “that shade.” That concept figured in a candidate for knowledge at (2), it figures again in the knowledge expressed at (3) which is why, if we endorse the proposition expressed with (3), we retract the earlier claim. There is a continuous way of thinking of a color shade that features in both propositional knowledge contents. The knowledge at stake in the example is propositional knowledge.

The point generalizes. Consider the nurse who finds it difficult to articulate why she thought the patient was relapsing – it was something about their look and the pallor of their skin, but quite what it was that they spotted slips through the net of their descriptive vocabulary. Experienced nurses typically respond to very fine shades of appearance and behavioral difference in forming judgments about the well-being of patients. It does not follow that their knowledge is non-propositional, for there is the option of saying that what they know is that the patient “looks like this” and then they point. Those who share their experience and training (including regular exposure and attention to fine differences of pallor, temperature, anxiety in patients’ demeanor, etc.) will see what they are pointing at and be able to use that appearance in other cases. They will have a concept. See Luntley (2007).

The McDowellian idea that all experience, even the most finest grained differentiations, can be captured conceptually is a powerful tool in the case against proliferating modes of knowing; see Gascoigne and Thornton (2014). It does not mean that there are no differences between expert knowing and novice knowing, but the difference lies not in different modes of knowing. The difference might be in the objects of propositional knowings. The novice performs on the basis of propositional knowings, the content of which is given in context-independent propositions – the sorts of propositions that can be expressed in context-free language and the sorts of propositions that figure in general rules for performance that are applicable across many if not all situations. In contrast, the expert, although still using propositional knowledge, is able to exploit propositions that represent the particular details, the fine grades of difference in the saliences of situations. So their

engagement with situations is more dependent on experience and what their perceptual skills make available to them (they notice more details than the novice). Their perceptual attention provides more bearing on what they do than the novice, but what their perception provides is not a different nonpropositional way of knowing. See Ainley and Luntley (2005, 2007) for details of a pilot empirical study of experienced classroom teachers that concentrates on the role of attention in differentiating expert knowledge.

A related debate concerns Ryle’s (1949) distinction between know-that and know-how. Ryle had argued that it is impossible to reduce know-how to know-that. The knowledge that makes action skilful cannot consist solely in propositional knowing-that. His idea was that skilful performance required knowing-how and not mere entertaining of a proposition. Whatever propositional knowledge might be relevant in considering action, the agent needs to know not just what the proposition is, but how to deploy it. Skilful action requires knowing how to apply knowledge. If knowing-how were not separate to and more basic than know-that, then one could never act on knowledge, and one would merely entertain propositions. In a number of seminal publications, this argument has been put under intense pressure Stanley and Williamson (2001), Stanley (2005, 2011). The point exploits the McDowell insight outlined above.

Suppose you thought that knowing how to open a door by turning the knob was an irreducible item of knowing-how. Propositions about the way in which locks work can be entertained, but mere grasp of the propositions does not explain the action of opening the door – you need to know how to use the knowledge contained in the propositions. Stanley’s key initiative is to note the existence of practical modes of presentations – practical ways in which things can figure in thought by virtue of practical concepts. One can know that doors open when the knob is *turned like this*. This practical mode of presentation is, like the McDowellian perceptually dependent concept – the shade *looks like this* – a context-dependent concept. It is a concept available to the thinker in virtue of their grasp of a

way of acting. As such, grasping the proposition that the door opens when you *turn the knob like this* would suffice to explain the action of opening the door despite the fact that it uses propositional knowing-that, not knowing-how. Once again, the case for proliferating modes of knowing is undermined by an analysis that shows that know-how can be captured with know-that.

Note that the intellectualist case shows that it is possible, once one grasps the point of context-sensitive modes of presentation, to analyze know-how in terms of know-that. The Stanley argument for intellectualism is a powerful tool in defense of conservatism about modes of knowledge. It does not, however, settle all the questions one might have about the knowledge that shapes expert performance.

If your question is, “Is it possible to analyze all the knowledge deployed by experts in performance in terms of propositional knowing-that?” then the McDowell and Stanley arguments provide a powerful case for epistemic conservatism. But suppose your question is slightly different. Consider the following:

- (a) How does knowledge of activity-dependent propositions depend on activity?
- (b) How do we acquire activity-dependent modes of presentation?

It is tempting to think that we acquire the knowledge involved in knowing that this is the way to open the door, by first knowing how to open the door. We first acquire the skill at door opening, and then we can label exercises of the skill by using the activity-dependent concept in thinking and talking about our opening it *like this*. In other words, one might think that although once acquired we can, as theorists, represent what the skilful actors know as propositional knowing that the door is opened *like this*; the skilful actor might never think or talk about their skill and simply know how to open the door. In that case, one might think that the know-how is, in terms of what underpins the skilful performance, the knowledge that matters. See Winch (2010, 2011, 2015). Wiggins (2012) has a defense of know-how against the intellectualism that repays careful consideration. Wiggins

acknowledges the Stanley and Williamson point but claims that knowing-that is the “step child” of knowing-how. It is not fully clear what the force of Wiggins’ claim is at this point. Is it just a return of the prioritizing of phenomenology of the knower’s point of view, or is it a move toward a deeper point that attempts to tackle questions (a) and (b) above. If the latter, it suggests a direction that warrants further development.

Lines of Development

Context-sensitive concepts (whether perceptually dependent or performance dependent) are concepts that are dependent on experience – our experience of things as we perceive them and our experience of our own actions. If question (b) makes sense, there ought to be an account of how we acquire such concepts. One of the problems with the McDowellian position is that it can give no such account, see Crane (2013), Schellenberg (2013). For McDowell, experience is conceptually structured through and through; there is no level of experience other than that delivered to us by concepts. There is, then, for McDowell, no account of the origin or acquisition of context-sensitive concepts. One line of potential enquiry in these debates is to explore the scope for such an account.

There are many problems with this line of development. At a minimum, any answer to (b) requires a theory of how experience can present us with things (including the form of our own actions) in patterns that are less than conceptual. The very idea of a nonconceptual content to experience is, however, fraught; see Carman (2013) and Noe (2013), and see Gunther (2003) for overview of that debate. But it is not necessary that the contribution of experience need be in terms of content, albeit a nonconceptual content. Experience might provide a *relation* to things and properties in conscious attention and that is what enables concept possession. This idea is exploited in Luntley (2009) developing insights due to Campbell (2002). See also Luntley (2015) for the idea that a relationist account of attention contributes to the way the aesthetics of experience

plays a foundational role required for answering (b). That suggests a quite different account of what differentiates experts and novices: it is not the type of knowledge they deploy; it is their capacity for learning and generating new concepts. Experts tend to use more context-sensitive concepts and propositions because the form (aesthetic) of their experiential sensitivity and scrutiny provides them the resources to notice and attend to new things, find new saliences, and develop new ways of thinking and talking about the phenomena at hand. See Luntley (2011) for this way of differentiating expert and knower.

Fairness in Educational Assessment

Robin D. Tierney
Research-for-Learning, San Jose, CA, USA

Synonyms

Bias; Care; Consistency; Differentiation; Equality; Equity; Justice; Opportunity to learn; Reliability; Respect; Transparency; Trust; Validity

Introduction

Fairness is a moral virtue and a fundamental quality in educational assessment. Understanding of fairness in educational assessment has evolved with developments in learning theory and measurement, and it has increasingly been recognized as a necessary quality for inclusivity in education. Fairness is closely related to, but distinct from, the societal concepts of equality, equity, and justice and the measurement concepts of bias, reliability, and validity. In practice, three conditions contribute to fairer educational assessment: opportunity to learn, a constructive environment, and evaluative thinking. Multiple strategies, revolving around the principle of transparency and the provision of opportunity to demonstrate learning, should be used to ensure fairer educational assessment for diverse learners.

The Concept of Fairness

Some English words are used fleetingly by one generation, snatched up like new toys and quickly abandoned, whereas others are used by generations for centuries. The roots of the word *fair* date back to the Germanic period in Northern Europe (400–800 AD). In Old English, fair meant beautiful, pleasant, or agreeable, and it was broadly applied from physique (e.g., fair hair) to sailing (e.g., fair wind). By Medieval Times, it was also used to describe good treatment of others (e.g., fair dealings), particularly in following the rules of competition (e.g., fair play). This etymological transition illuminates the link between two definitions of *fair* in English language dictionaries, which might otherwise seem disparate. Fair is a physical quality characterized by an absence. A fair day lacks inclement weather. Fair is also a behavioral quality, specifically interacting or treating others without self-interest, partiality, or prejudice. Both of these definitions underlie the meaning of fairness in educational assessment.

Common expressions relating to fairness help explain how educational stakeholders interpret the concept. A *fair shake*, for example, means to give someone or something a reasonable opportunity. The expression comes from games of chance and it holds two ideas stemming from the above etymology. The first is openness; game rules usually require dice to be visible as they roll. The opposite is reflected in expressions, such as under-the-table or shady deals, that

refer to dishonest or questionable proceedings. The second element is balance; the playing surface and the sides of the dice should be even so that the results are not impeded by irregularities. This idea is expressed as fair and square in business. The association with balance suggests that fairness is not extreme. Fair weather is pleasant, neither very hot nor very cold. To do something fairly well means it is good, neither a poor nor an excellent performance. In contrast, favoring one side, person, or perspective is considered unfair, or biased. Fairness in human interactions involves reasoning, or weighing the balance. It is for this reason that unbiased opinions, independent investigators, and evenhanded judges are sought, particularly when high-stakes decisions are involved.

A complication for discussion across educational contexts is that the word fairness is not directly translatable, with the exception of Scandinavian languages. In other languages, the related terms equality, equity, and justice are necessarily used. *Equality* refers to sameness, or the state of being equal. Treating people equally can be fair in some situations (e.g., cutting a cake), and it is an important step for social justice (e.g., universal human rights), but its application can also have the reverse effect. For example, one-strength-fits-all eyeglasses would clearly be unfair for some. *Equity* is the state of being just, impartial, or fair. Something equitable is proportionately equal, meaning that it is distributed according to need. The three bears in Goldilocks, for instance, had an equitable arrangement in beds and bowls. *Justice* is the quality of being fair, reasonable, or just. The word *just* also has multiple meanings, and it can be used to mean morally right (e.g., a cause), based on sound reason (e.g., a decision), or deserved (e.g., desserts). As their definitions indicate, equity, justice, and fairness are closely related, and they are often used in tandem. However, their use in context shows that they are not completely synonymous. For example, just is more apt as a descriptor for a cause than for access, whereas the opposite is true for equitable. Furthermore, neither equity nor justice encompass the same sense of openness that is associated with fairness.

The universality of the concept of fairness has been questioned because of the missing cognates across languages. Several points suggest that at very minimum, fairness is widely considered desirable as a social quality. All world religions preach the ethic of reciprocity (i.e., the Golden Rule), which essentially encourages fair treatment of others. Fairer social and economic practices are promoted by international initiatives (e.g., fair trade), and similar concerns about fairness in education are voiced across national boundaries (e.g., research on grading). Additionally, research in behavioral sciences has shown that most humans and some animals have a sense of fairness that goes beyond the level of cooperation needed for survival. In counterpoint, there are radical differences in political opinion regarding the notion that *life is unfair*. From a liberal perspective, this idea provides initiative for social reform, whereas in conservative economics it is used as justification for perpetuating the status quo. Although the latter may simply be political rhetoric, there is an underlying equation of fairness with sameness, which is also how some educational stakeholders understand fairness. Thus, while fairness is widely appreciated, different interpretations exist within and across educational contexts.

Imperatives for Fairness in Educational Assessment

Educational assessment encompasses two main types: classroom assessment and external assessment. Both involve the process of collecting and evaluating information about student learning, but they serve different purposes. In *classroom assessment*, teachers and students ideally use various assessment strategies, tools, and tasks for two purposes: to support ongoing teaching and learning (i.e., formative assessment, or assessment for learning) and to report on the achievement of learning expectations (i.e., criterion-referenced summative assessment). Classroom assessment usually relies on teachers' knowledge and professional judgment. *External assessment* includes standardized tests and large-scale assessments developed commercially or by organizations

outside the classroom. Standardized tests are used to determine individual levels of achievement in reference to a norm group, usually for the purpose of certification or selection (e.g., program admission). Large-scale assessments are administered at regional, national, and international levels, either within or across educational systems. They are usually used for accountability, meaning that their purpose is to evaluate system effectiveness. The purpose of an assessment affects what should be considered during its development and use for the fairest results. Guiding principles or standards have been produced by various test developers, educational committees, and professional organizations since the mid-twentieth century. Although these documents do not always clearly define fairness, they reflect a strong interest in fair assessment in the educational community.

Three imperatives underpin the quest for fairness in educational assessment. The first is democratic. Various forms of assessment have been used through history for candidate selection. Government appointments in China were based on written examinations for centuries, from the Han Dynasty (202 B.C. to A.D. 200) to the early twentieth century. Written examinations were also used, from the mid-nineteenth century on, to select candidates for university admissions in western nations. The prestige conferred through a rigorous selection process was initially of more interest to the administering institutions than any democratization of the process. Examinations came to be seen as fairer because they allowed merit to be considered in the selection process. They thus appeared to broaden access to opportunity, which had previously been restricted to a privileged minority. With the development of psychological and educational measurement in the twentieth century came a dramatic rise in the prevalence of high-stakes testing, and the significant consequences for students became apparent. By the beginning of the twenty-first century, the long-lasting effect of classroom assessment on students' identities and learning trajectories was also recognized. Democratic values now call for inclusive educational systems that recognize and support student diversity. From a technical perspective, this requires attention to multiple factors

in the design, administration, use and consequences of educational assessment to ensure that some students are not favored over others. Specifically, when student characteristics and abilities (e.g., gender, ethnicity, language) are not relevant to the construct (i.e., subject or concept) being assessed, they should not affect the results. In sum, while examinations have not historically always been fair or democratic in intent or consequence, a democratic imperative for fairness in assessment has evolved from the tradition of selection by examination.

The second imperative relates to measurement. The quality of information that assessments provide is affected by stakeholders' perceptions of fairness. Students' perceptions influence their motivation in the assessment process, their degree of engagement, and thus the degree to which they demonstrate learning. When principals and teachers administer externally developed assessments in schools, their perceptions of fairness influence how they present the materials to students and the degree to which they follow the developers' instructions. Perceptions of fairness should be taken into account in the development and revision of an assessment tool for the same reason that face validity and credibility are considered. When stakeholders view an assessment as fair and meaningful, genuine participation is more likely, as opposed to superficial compliance or disengagement. Additionally, information gathered from one group can be used for revision to improve subsequent perceptions of fairness, thus further increasing the quality of the results.

The third imperative is pedagogical. As theories and knowledge about learning have evolved, educational assessment has increasingly been seen as a social process that shapes identity and influences opportunity to learn. Interest in using assessment for learning has grown internationally. For assessment to serve this purpose effectively, students must be willing to reveal what they do and do not know, and teachers must be able to recognize and act on the information students provide. This necessitates a trusting, respectful, and engaging learning environment where students feel psychologically safe enough to make mistakes. Students are also more likely to engage

when learning expectations and assessment criteria are clear and relevant, and they are more likely to continue learning when assessment results (e.g., feedback) and interactions (e.g., peer comments) are meaningful. The beliefs and knowledge that teachers and students bring to teaching and learning interact with different elements of fairness (next section). The fairness of classroom assessment, regardless of purpose, is affected by classroom relationships and interactions, which in turn influences the learning environment. When this circular process is scaled up from classrooms to systems, based on the assumption that all educational assessments should ultimately inform teaching and learning, the pedagogical imperative for fair assessment is at the heart of the enterprise.

The Evolution of Fairness in Educational Assessment

The field of educational assessment emerged in the twentieth century as a result of two earlier developments. Interest in the mind had taken a decidedly scientific turn in the latter half of the nineteenth century as experimental psychologists attempted to measure human intelligence. At the same time, student numbers were rising dramatically in many nations with the growth of compulsory public education. Various systems were borrowed from universities for grading achievement, which resulted in mounting concern about the assignment of students' grades. Assessment methods at the time (i.e., essays and oral recitations) permitted a great deal of subjectivity in grading decisions, and there was wide variance in the criteria and evidence being used by teachers. New psychometric methods held promise for greater consistency, and the subsequent proliferation of educational tests were considered fairer because they could be objectively scored. In retrospect, the initial response to concerns about fairness in educational assessment focused primarily on the issue of reliability. Although progressive alternatives were proposed, they were not popular at the time, and objective tests won the day.

Scientific technique and standardization had considerable appeal for efficiency in expanding educational systems, and testing was increasingly common after WWI, particularly in American schools. However, earlier charges of racism following the development of intelligence tests continued to surface. By the end of the 1960s, attempts to build "culture-free" tests had failed, and measurement specialists were looking for algorithms for fair use of test results by employers and educational institutions. The 1974 edition of the *Standards for Educational and Psychological Tests* explicitly acknowledged the potential unfairness of testing, particularly for women and minority groups, and called on developers to examine test items for bias. The terms fair and unbiased were often used as synonyms up to this point, but the meaning of bias narrowed with advancements in statistics. Bias in measurement refers specifically to systematic error in test scores, which occurs when factors that are irrelevant to the intended construct of an assessment influence the results. Because evidence of bias can be found through statistical analysis of differences in how groups of test takers respond (e.g., differential item functioning), unfairness in external assessment still tends to be equated with bias.

Toward the end of the twentieth century, the technical focus that had dominated discourse and research in educational assessment began to shift. The value-laden nature of assessment and the need to consider its consequences were emphasized in validity theory. Debate ensued on several fronts, particularly about ownership of responsibility for assessment consequences (i.e., test developers or users) and about the feasibility of validation for all uses of an assessment, especially those beyond what the developers intended. Measurement and assessment specialists continue to disagree about the scope of validity, diverging on whether it is purely a measurement concept or a matter of ethics. This raises questions regarding the relationship between validity, reliability, and fairness. Overlapping areas on a Venn diagram with three circles representing these key qualities could change considerably according to differing perspectives or purposes in assessment. Nonetheless, clear definitions are needed for key qualities

to guide assessment practices. At present, general agreement exists on two points. First, fairness is similar to validity and reliability in that it is not dichotomous, which means that it is determined by degree. Second, unlike validity and reliability, fairness is not in itself a technical quality, but it is affected by technical quality. Fairness is a requirement for the ethical practice of educational assessment, which in turn contributes to the broader matter of social justice.

Achieving Fairer Educational Assessment

Fairness in educational assessment is complex, and it cannot be ensured through any one practice. Fairer assessment can be achieved in different ways, with some conditions or strategies being more important in some situations than others, depending on the purpose of the assessment and the individuals assessed. Conditions and strategies for fairness should be considered proactively in the design and development of assessment tools and tasks, continually through assessment interactions, and retrospectively in reviewing the assessment process.

Three conditions for fairer educational assessment are opportunity to learn, a constructive environment, and evaluative thinking. *Opportunity to learn* is a seemingly self-defining term that can vary considerably in breadth. It can simply mean exposure to test content or refer more broadly to the alignment between curriculum and assessment. It can also refer to a gamut of socioeconomic and educational factors that enable learning, including the availability and quality of resources (i.e., teachers, learning materials, technology, etc.) and students' ability to use them within an environment or system. While ensuring opportunity to learn for every student in the fullest sense is a social justice issue beyond the scope of any one assessment, it should be considered in planning and interpreting results in both classroom and external assessment. A *constructive environment* is one that respectfully encourages students to fully participate and disclose their knowledge and learning through assessment.

This requires an extent of buy-in, meaning that an assessment must be perceived as worthwhile, or at least necessary. Interactions between students, teachers, principals, and parents can affect the environment for external assessments and hence the quality of results. For classroom assessment to genuinely and openly serve learning, high levels of trust and respect must be nurtured, not only between teachers and students but also between classroom peers. Creating constructive environments for fairer assessment requires *evaluative thinking*. This involves asking questions, identifying assumptions, seeking evidence and considering different explanations, or in brief, critically evaluating assessment practices. In external assessment, evaluative thinking should be part of a formal process (i.e., validation) that draws on qualitative and quantitative evidence for fairness (e.g., panel reviews, DIF). In classroom assessment, teachers' self-evaluation about assessment tools, tasks, and interactions should be part of reflective practice. Reflection is particularly important for recognizing assumptions or beliefs that might lead to bias, and for receptivity to the knowledge and learning of diverse students, even when it diverges from the expected. Most importantly, all educational assessments benefit from the acceptance of responsibility for fairness and thoughtful planning, administration, and interpretation.

Multiple strategies can and should be used at each phase to ensure fairer educational assessment. Several strategies relate to the principle of *transparency*. It is widely accepted that students should know how their work (i.e., performance, product, responses) will be judged before an assessment begins. A basic strategy is to provide clear instructions. Assessment criteria that flow logically from learning expectations should also be made explicit. A challenge in this process is to specify criteria sufficiently for students to understand it without constraining what they demonstrate or what is evaluated. Additional criteria should not come into play in the marking process (or scoring, grading). This is especially problematic in performance assessments where differing responses are possible (e.g., problem solving) and personal preferences creep into the judgment

process. Transparency makes assessments fairer by reducing the potential influence of irrelevant factors. It also supports the primary purpose of classroom assessment, particularly when the formative process should in itself be an opportunity to learn.

A second set of strategies revolves around the provision of *opportunity to demonstrate learning*. Students should have multiple, varied, equitable, and meaningful opportunities to demonstrate their learning. Offering students multiple opportunities allows teachers to gather sufficient information to make fairer decisions (i.e., increasing reliability), especially in summative assessment that affects placement or certification. Offering students varied opportunities allows learning to be demonstrated in different ways and enables different types of learners to succeed. Because assessment formats (e.g., multiple choice, essay) affect students differently, using varied methods prevents any one type from overly benefiting or penalizing students. Providing students with equitable opportunities, where appropriate accommodations allow individuals or groups to demonstrate what they know, also makes assessment fairer. A tension here goes back over a century to when it was noted that fair comparison of scores was not possible with inconsistent grading. The need for consistency (i.e., equal treatment) versus the need for differentiation (i.e., equitable treatment) depends on whether the purpose of the assessment is to compare scores or support learning. Whenever assessment results are used to distribute a benefit or opportunity, there should be a consistent basis for comparison. This is why the comparability and appropriateness of procedures, including accommodations, are important in external testing and when summative grades are used for external decisions (e.g., admissions). In contrast, when the goal is to advance learning, assessment can be individually tailored, such as in adaptive computer assessment. A final strategy for fairness, offering students meaningful opportunities to demonstrate learning, requires a balance between two core qualities in the ethics of teaching: care and respect. Care must be tempered with respect for students' learning to ensure that opportunities are engaging without being superficial, and that

they are genuinely challenging without being impossible. Assessment that recognizes and responds to the knowledge and learning of diverse students is fairer in the long term because it enables subsequent opportunities to learn. In essence, educational assessment should give all students a fair shake at success in their learning careers.

Fanon and Decolonial Thought

Nelson Maldonado Torres
 Department of Latino and Caribbean Studies,
 Rutgers University, New Brunswick, NJ, USA
 University of South Africa, Pretoria, South Africa

Introduction

Frantz Fanon (1925–1961) is probably the best known theorist of the Third World and a major reference in various formal fields of study, including Africana philosophy, and postcolonial studies. He is also an important reference in cultural anthropology, cultural studies, and political theory, among other fields (see Gordon 2015). This is an outline of some of his major contributions to a broader and less formal area: decolonial thought or decolonial thinking. Decolonial thinking refers to varied forms of knowledges that explore the significance of modern colonialism and that assert the relevance of decolonization. It is expressed in multiple ways: from written and oral discourses, to social movement organizing, to scholarly studies, to political manifestos, to dance and performance, music, poetry, and visual art, etc.

Fanon's work is a major reference in twentieth- and twenty-first-century global decolonial thinking.

His four major published texts *Black Skin, White Masks* (2008, originally published in 1952), *Toward the African Revolution* (1988, originally published in 1964), *A Dying Colonialism* (1965, originally published in 1959), and *The Wretched of the Earth* (2004, originally published in 1961) provide acute analyses of the experience of being colonized, of the mechanisms of colonization, and of the process of decolonization. Many of his insights are highly relevant for education as formal education itself has often served as an instrument of colonization. Also, decolonization can be conceptualized as a form of unlearning, relearning, and innovating. Fanon's work has influenced major theoreticians of education, such as Paulo Freire, and is one of the main sources of decolonial pedagogy (Walsh 2013).

It is not possible to understand Fanon's work or his impact without considering that many of his insights into colonization and decolonization are based on his own experience in colonized settings and his participation in movements for decolonization. Fanon lived in a time of major global transformations, including the propagation of decolonization movements in Africa, Asia, and the Caribbean. He was born in what was then the French colony of Martinique and died as a member of the Algerian Liberation Front, which sought the decolonization of Algeria. His thought was deeply informed by the living conditions and the various movements that defied colonization in both places. He was also a veteran of the Second World War and was intimately familiar with how colonial and racial divides worked inside Europe. His writings have circulated and continue to circulate, not only among scholars interested in understanding modern colonialism and decolonization, but even more so among groups of activists, including intellectual-activists and artists, who pursue decolonization. A more detailed definition of decolonial thinking serves as a basis to identify several of Fanon's major contributions to this area of knowledge.

Decolonial Thinking

Decolonial thinking has perhaps two basic elements: the first one, clearly stated in the work of

one of Fanon's teachers, the renowned poet, statesperson, and thinker Aimé Césaire, is that colonialism is a fundamental problem (Césaire 2000) and the second one, greatly illustrated in Fanon's work himself, is that decolonization is a project. That decolonial thinking takes colonialism as a fundamental problem rather than as a secondary issue or a problem of pure historical significance means that colonialism has deeply shaped key practices, ideas, and structures in our modern world. It means that modern ideals, such as progress and development; modern institutions, such as the nation-State; and modern conceptions of knowledge and subjectivity, such as the liberal arts and sciences and the sovereign self, have come into being with colonialism as a background and an implication.

Considering colonialism as a fundamental problem may sound like a minor consideration, but it signals a profound turn in theory and philosophy as it goes directly against the norm of conceiving the colonial subject as a problem. This decolonial turn is the result of a change of attitude in the colonized whereby she emerges as someone who poses questions, who identifies problems and who considers her lived experience and knowledge as relevant in the process of elucidating and seeking to respond to such problems. The transition from a modern/colonial attitude of seeking recognition by the colonizer – as in desiring to become White or seeking to obtain value by being recognized as White preferably by Whites – to a decolonial attitude of challenging the presuppositions of the colonial system and worldview is central in Fanon's entire oeuvre and a basic element in decolonial pedagogy and decolonial thinking.

As Césaire so clearly indicated in his classic *Discourse on Colonialism* (Césaire 2000), the emergence of colonialism as a problem is inextricably interrelated with the critique of modern Western civilization. The reason for this is that not only colonialism became broader and arguably more devastating in Western civilization but also that Western modernity portrays colonialism as a vehicle of civilization and as an apparent solution to the problem that is the colonized. For Césaire, modernity creates a particular form of

colonialism that, instead of regarding it as a problem, it tends to pose it as a solution. Raising the question of colonialism as a problem therefore involves a critique of Western modernity.

Central in the decolonial critique of Western modernity is that what is usually called modern civilization is deeply tied with the creation of relations of power, conceptions of knowledge, and forms of being that lead to colonialism or reproduce a colonial logic in various ways. This is a logic that organizes society and that makes sense of the geopolitical space and of everything that appears in its horizon according to perceptions of degrees of humanity. The closer to an ideal of the human subjects and groups are, the more they can enjoy a certain condition considered normal for humans, and the farther away from that ideal subjects and groups are, the closer they will be to a condition of death or early death, misery, dispossession, and permanent slavery and war. This is a form of colonialism that involves racially motivated genocide and racial slavery and that can continue even after the formal end of slavery and colonialism. In that sense, in decolonial thinking, colonialism refers more to an overarching modern logic of dehumanization that can be characterized as coloniality, than to historical colonialism per se, as it is found since so-called "prehistory" and "Antiquity" (Mignolo 2000; Quijano 2000).

Likewise, for decolonial thinking decolonization is less the end of colonialism wherever it has occurred and more the project of undoing and unlearning the coloniality of power, knowledge, and being and of creating a new sense of humanity and forms of interrelationality. In that sense, decolonization or decoloniality is an unfinished project that seeks to bring the problem of coloniality to an end without assurances that this will ever happen. The goal is, as Fanon put it, "to be actional" (Fanon 2008, 197): to undo and create rather than simply to follow or react in face of discourses of modernization and coloniality.

More than only reflect about the impact of colonization on subjects and bodies of knowledge, decolonial thinking involves an assertion of the colonized subject as a critical perspective and an affirmation of colonized and/or

non-Western knowledges as sources of sustainable critical and transformative thinking, which themselves are submitted to critique and to innovation in light of the struggle for decolonization. Decolonial thinking often also takes into consideration and is shaped in part by Western thought, but it is not confined by the authority of Western canons or committed to Western modernity as a project. Instead, decolonial thinking typically reveals multiple experiences, desires, and ideas, particularly among subjects and communities that are often depicted as lacking an active internal life or proper reason, and explores their potential for critique and decolonization. Decolonial thinking is also found between two or more languages and cultural experiences divided by colonialism or different forms of dehumanization and often finds itself at the crossroads of various conceptions of the body, histories, and claims to space and land.

Fanon's Contributions to Decolonial Thinking

Fanon's contributions to decolonial thinking are too many to discuss in a few pages, but it is possible to identify various key ideas in his work about the problematic nature of colonialism and coloniality, and about the character of decolonization as an unfinished project. One such idea is the anthropological and the ontological character of coloniality, in the sense that coloniality is not only a question of social order but also of conceptions of being human. In short, coloniality locates the colonized out of the bounds of proper humanity. Fanon observed this in the constitution of the meaning of Blackness. The ontological separation – the location of different people in scales of being and its lack – between colonizer and colonized is made particularly apparent when it appears in the form of the divide White colonizer and Black colonized. Fanon uncovered the arena of non-humanity, put in question the European human sciences on that basis, and shed new light into thinking about, from, and with those considered nonhuman.

For Fanon, the modern conception of Blackness is tied to modern colonialism and racial

slavery, which together are part of coloniality. This makes the notion of ontological separation between subjects and groups part and parcel of coloniality. The notion that (modern) colonialism, racial slavery, and coloniality are built on ideas and practices of ontological separation is not necessarily Fanon's invention, but his work provides some of the clearest and most insightful descriptions and analyses of this condition. The link between colonial hierarchies of knowledge and power with notions of ontological lack would affect and redefine other forms of human classification and organization such as those based on gender, sex, and class.

A second key contribution from Fanon to the understanding of coloniality as a fundamental problem is the appreciation of the depth of coloniality and, particularly, the understanding of the complexities and contradictions of colonized subjectivities. The regime of colonial ontological separation does not leave the subjects that it categorizes intact. It does not simply order and classify already existing subjects but rather engenders the subjectivity of those subjects. In the same vein, modern colonization is not merely about the appropriation of land or the exploitation of work but also about the very definition of identity and subjectivity. In modernity, not only land, work, and society but subjectivity itself is colonized. This is what leads to the phenomenon of Black people who detest their Blackness and who want to escape from it that Fanon investigates in *Black Skin, White Masks*. Whites are also conditioned by this situation, but the overwhelming presumption about them is that they do not have to undermine much of what they are in order to claim full humanity. Also, claiming superiority over the Black and the colonized appears as part of a path to claim full humanity. White skin also automatically tends to grant protections and privileges to those perceived as Whites even when they fail to adhere to the expectations of the dominant heteronormative and masculinist definition of humanity.

A third contribution by Fanon to decolonial thinking is the analysis of the multiple forms of evasion that both colonized and colonizer take in order to avoid recognition of coloniality as a problem. Coloniality is a regime of ontological

separations that organizes society and creates subjectivities while preventing its own thematization as a problem. Since colonization has to do with the creation of people considered as lesser human beings, colonization itself is considered to be superfluous or not important. This is part of what Fanon identified as the “cat and mouse” game of reason in modernity/coloniality (Fanon 2008). Since a Black person is supposed to behave more as a passive object than as an agent or a subject with a point of view, whenever a Black person adopts reason as a mode of response to coloniality, the standards of reason become so unstable and shifting that it is impossible for the Black person to make any advance in the recognition of her or his equality or in the importance of problems that affect her or him. In a modern/colonial anti-Black world, the fundamental problems are identified from the perspective of the colonizer. Recognizing the relevance of colonialism, which is typically posed as a problem by the colonized, would be to give the colonized too much credit, which goes against the directives of the colonial world. And since colonialism is not taken seriously by the colonizer, this would mean that it would not be taken seriously by any of the colonized who themselves are striving to be accepted by the colonizers or at least to enter their world and obtain its benefits. This means that the assertion of colonialism as a fundamental problem itself can be considered an insurgent and revolutionary act.

The first three of Fanon’s contributions to decolonial thinking have to do with a better and deeper understanding of colonialism as a problem. The remaining three address the idea of decolonization as a project. The first such contribution is Fanon’s insistence about the uncertain and undefined character of decolonization and about the centrality of attitude. That is, for Fanon, there can be no specific manual for decolonization, no premade model of life after a revolution for decolonization, and no certainty that such revolution or its triumph will ever occur. Decolonization is to be pursued because there is no other way in which one can imagine living in a context marked by coloniality. This is so because, if coloniality undermines the basic coordinates of humanity,

then an affirmation of oneself as a human being needs to involve a critical engagement with coloniality. This is to a great extent a matter of attitude and of actions guided by such attitude. But attitude neither offers nor rests on the clarity of a manual and it does not rely on more than a very general notion of the world that it is trying to create. Attitude denotes an orientation toward oneself, others, one’s surroundings, what has been imposed, and what one considers less alienating. Attitude is also a way of orienting oneself in and of conceiving of time and space. It is the orientation of the self in time and space, a time and a space that have been, like the self itself, colonized and that call for decolonization.

While decolonization is fundamentally undefined and uncertain, it is also a generative process that can be assumed as an ongoing project. This is Fanon’s second main contribution to the understanding of decolonization. Fanon urged revolutionaries involved in the process of decolonization to pay attention to the changes to self and society that occurred in the context of the revolution because the best point of departure for the society of tomorrow appeared not in the canons of Western thought, in the past, or in any specific tradition but in the very changes introduced or facilitated by revolutionary struggle. Fanon saw decolonial activity not so much as action toward a fixed goal, but itself as a generator of ideas, relations, and actions that needed to be preserved and continued after any organized effort to increase decolonization. In *A Dying Colonialism*, for instance, Fanon highlights the changes in the relation between family members that were occurring in the Algerian revolution, such as an increasing sense of equality due to the participation of multiple members of the family in the revolution. He also observed and applauded the forms in which the Algerian people, particularly those involved in the struggle for decolonization, appropriated Western knowledge and technologies such as Western medicine and the radio. Fanon advocated for such changes to serve as key references for the society to be built after the revolution. For Fanon it was also clear that political independence was far from representing the accomplishment of decolonization. Decolonization remained as an

incomplete project even after independence. But it had to be assumed as such.

Unfortunately, Fanon found some of the same kind of contradictions that he had observed in the sector of colonized Black people that he studied in *Black Skin, White Masks* in an Algerian society in the process of decolonization. The process of decolonization, therefore, has nothing automatic about it and it is continually challenged from the outside and the inside. Realization of this reality leaves to a third contribution to the understanding of decolonization: decolonization has to involve the continued cultivation of oppositional and coalitional consciousness (Sandoval 2000). This is a way of looking at the world critically, on the one hand, but also constructively and in search for establishing relations with others, on the other. Oppositional and coalitional consciousness is, like the notion of decolonization as a project itself, the outcome of a decolonial attitude. The decolonial attitude is an ethico-political orientation that seeks to affirm what Fanon considers the basic coordinates of human activity: a “Yes to life. Yes to love. Yes to generosity,” and a “No to man’s contempt. No to the indignity of man.” (Fanon 2008, p. 197). The decolonial attitude seeks to “build the world of the *you*” (Fanon 2008, p. 206). This is a world where everyone can appear as a “*you*” in front of another rather than as an ontologically separated entity that provokes anxiety, sadism, desire, and fear. Decolonial thought is a form of thinking that seeks to help create this attitude and to build such a world.

Feedback as Dialogue

David Carless

University of Hong Kong, Hong Kong, China

Introduction

Feedback can be an important catalyst for improvement. Helpful comments which enable students to see issues from fresh perspectives are central in supporting the ongoing development of work in progress. In mass higher education, there is a variety of evidence from different contexts that students and teachers have misgivings about the ways in which feedback processes are currently handled (Boud and Molloy 2013). Students perceive that feedback often comes too late to be useful; it frequently fails to connect; and there are usually insufficient opportunities to act on the feedback received. Both teachers and students experience frustration with the limited positive impacts of how feedback processes are managed.

Given the centrality of feedback for learning, there is an urgent imperative for fresh ways of thinking about feedback processes and associated development of staff and student feedback literacy. The aim of this entry is to chart some prospects for feedback as dialogue: how students can take a more active role in seeking, generating, accessing, and using feedback. For feedback to be sustainable, students in higher education cannot rely predominantly on the teacher to provide insights in that they need additional ways of developing their own capacity to make informed judgments (Carless et al. 2011).

At the outset, it is worth considering meanings of feedback. Central to my position is to view feedback as a process not as a product which is delivered to students. Feedback processes involve information which usually comes from a peer, a teacher, or oneself. They also involve sense making when students engage with and interpret comments they have received. Building on these strands, feedback is defined as follows:

Feedback involves dialogic processes whereby learners make sense of information from various sources and use it to enhance their work or learning strategies.

The notion of students using feedback is crucial because only then are feedback loops successfully closed. A problem with much current feedback practice is that it involves hopefully useful information that is not acted upon (Boud and Molloy 2013). Transmission forms of feedback are limited in analogous ways to transmission forms of pedagogy (Sadler 2010).

In the next section, feedback is contextualized within a wider set of influences, such as curriculum, pedagogy, and assessment. Then in the main section of the entry, five ways in which feedback processes can operate dialogically are analyzed. Some challenges for dialogic feedback and how these might be tackled are then discussed. The conclusion sums up some key messages.

Contextualizing Feedback Processes

Feedback processes are more than about feedback per se; they are part of a wider network of factors

which include curriculum, pedagogy, and assessment. Successful feedback exchanges are also reliant on positive relationships between participants: often a challenge in mass, sometimes impersonalized, higher education.

Feedback processes need to be seen as an integral part of the curriculum and certainly not just something that comes at its end. Feedback should be embedded within curriculum design to facilitate opportunities for students to engage with feedback and carry out productive dialogues about academic work.

In line with this perspective, there are also pedagogic dimensions to feedback which evolve from how teachers interpret their roles in the instructional process. A conception of teaching focused mainly on information transfer may lead to teacher-controlled forms of feedback, for example, correcting misconceptions. A constructivist view of teaching suggests a more active student role in feedback processes.

The way sequences of assessment tasks are designed is an important facilitating or inhibiting factor for dialogic feedback. When there is a cumulative series of tasks in a course, there is greater potential for feedback from one task to inform the next. With these kinds of assessment designs, students engage more actively with feedback messages because they can use them when it counts toward their course performance. Conversely, a one-off examination or end-of-semester essay may have some pragmatic or academic advantages, but these forms of assessment are unlikely to promote productive feedback processes.

The pedagogy of feedback processes also involves relational issues, such as care, trust, class atmosphere, and relationships between participants. Relational aspects of feedback are salient in that feedback is an aspect of interpersonal communication. These often lead to tensions between critical feedback which risks harming the self-esteem of the recipient and more encouraging feedback which may fail to stimulate desired improvements. Honest, constructive comments are more useful than empty praise, but it is a hard line to draw. One person's constructive critique may be another's wounding

criticism. When providing searching commentary, it is useful to reiterate that the aim is to help the learner to grow. Trust develops when one perceives that an interlocutor has one's best interests at heart. Conversely, distrust can emerge from feedback providers who seem threatening, unapproachable, or dogmatic (Carless 2015).

Implementing Dialogic Feedback

Five ways in which feedback processes can operate dialogically are now discussed: integrated cycles of guidance and feedback, peer feedback, technologically facilitated feedback, internal feedback, and teacher-generated written feedback.

Guidance as Feedback

One of the main problems that students perceive with feedback is that it often comes too late for them to use, especially in relation to summative comments on end-of-semester assignments. This problem is exacerbated in that students find it difficult to use feedback from one course on another course taught by a different teacher.

A useful pedagogic strategy to tackle this problem is to provide integrated cycles of guidance and feedback within regular course scheduling (Hounsell et al. 2008). Students value guidelines about what is expected, support in understanding criteria, how they might tackle assignments, and preemptive hints based on teacher understanding of common problems students experience in the assignments being undertaken.

An important part of the guidance process is clarifying goals, expectations, and standards. A common strategy is to involve students in generating criteria or rubrics: such processes start to engage students with the characteristics of good performance. Probably even more useful from the student perspective are samples of student work: exemplars of performance from previous or parallel cohorts. Exemplars are concrete manifestations of quality (Sadler 2010). The dialogic analysis of such samples can play an important role in students developing an appreciation of the nature of quality work.

A complementary strategy involves the use of "on-display assignments" (Hounsell et al. 2008) in which student work is openly visible to classmates rather than remaining private. Oral presentations, posters, and group projects carry visibility, thereby facilitating opportunities for dialogue, peer feedback, and clarification of standards. These act as guidance by enabling students to self-evaluate their performance against that of others.

Peer Feedback

Peer feedback or peer review involves students commenting on each other's work. Students gain a lot from examining their peers' assignments, identifying strengths, weaknesses, and areas for improvement. Such processes begin to sensitize students to what good performance looks like and differences between their work and that of others. There is also potential for peer feedback to be available more quickly and in greater quantity, in comparison with more authoritative but slower teacher input.

Students often resist peer assessment using marks because they do not feel comfortable awarding grades to their friends and classmates. This is why peer feedback is usually more effective than peer assessment. There is also sometimes student resistance to receiving comments from peers because they worry they are not sufficiently insightful or that some classmates do not take peer feedback seriously. An important counter-argument is that the processes of peer review go beyond the usefulness of specific individual comments. Peer review opens our horizons to different ways of doing things and enables us to compare our approach to that of others. It can remind us what we are doing well and also sensitize us to key areas of improvement.

A key research finding is that the giving of peer feedback is often more beneficial than receiving comments because it is more cognitively engaging: involving higher-order processes, such as application of criteria, diagnosing problems, and suggesting solutions (Nicol et al. 2014). This is an important part of the rationale for peer feedback which needs to be communicated with students so that they are clear

about the potential benefits of involvement in peer review. Student involvement in peer review processes should be a core component of course designs (Sadler 2010).

Technology-Facilitated Feedback

Technology has considerable potential to promote feedback dialogues, especially when it is pedagogy rather than technology which drives developments. Learning management systems (LMSs), such as Moodle, can be used to store feedback, and students might be required to show how they are using feedback from previous assignments to inform current submissions. Discussion forums on LMSs can enable students to involve themselves in dialogues around course content or work in progress. These are often more motivating for students when some kind of incentive is included, for example, assessed participation or online quizzes. Social media, such as Facebook or Twitter, are also increasingly being used for academic interaction.

Peer review can also be enabled through technology. For example, within the Turnitin suite of applications, PeerMark can be set up to allow students to read, review, and evaluate submissions from one or more of their classmates. Clickers or electronic voting systems can be used to collect students' views, promote peer discussion, and enable teachers to understand learning progress. These strategies relate to the pedagogic principles of peer review and integrated guidance and feedback as discussed above.

Electronic marking and feedback through tools, such as "Track Changes" or annotated PDF documents, seem popular with students, although still attracting some resistance from staff (Glover et al. 2015). Another recent trend is audio or video feedback, whereby teachers record verbal commentary on student work and then send the file electronically. This kind of feedback enhances students' perceptions of teacher concern for their progress and seems to carry potential to enhance relationships between participants. An additional dimension involves student response to audio or video feedback comments, for example, through screencasts.

Internal Feedback

Internal feedback refers to the inner dialogue or self-monitoring in which students are engaged when they are tackling a task. All students are producing internal feedback as they work on tasks and assignments, but many students are not self-monitoring effectively. The development of students' capacities to monitor themselves is congruent with a key aim of feedback processes to enhance student abilities to self-evaluate their own work (Nicol and Macfarlane-Dick 2006).

Students refine their ability to self-evaluate their performance when they are involved in activities which involve them in making academic judgments, developing better understandings of what good work looks like and how it differs from their attempts, and strategizing to close the gap between the two. Peer feedback and the analysis of exemplars of student work are two processes discussed above which support these goals.

The student development of judgment needs to be embedded systematically across the duration of an undergraduate program. There is evidence that students can become more accurate in judging standards of their own performance when given extended opportunities to self-evaluate (Boud et al. 2015). Enhancing student capacity to make judgments and self-evaluate effectively is arguably one of the most useful things teachers can do.

Dialogic Written Feedback

Even within conventional marking of student written work, it is feasible to engineer some dialogue. On the cover page of their assignments, students can be asked to state those aspects on which they would most like to receive feedback (Nicol 2010). This prompts them to reflect on their work and starts to develop some partnership in assessment and marking. It may also save the marker time as they can focus their comments more on the issues identified by students. Feedback is sometimes based too much on what the teacher wants to say, rather than on students' needs and interests.

Another variation would be for the cover page to include a summary of how students have addressed previous comments that they have

received. In this way, students are being prompted to build a cumulative sense of the feedback they are engaging with and indicate how they are acting on feedback messages.

Written feedback which raises questions rather than setting up teacher comments as the final judgment also contains possibilities for developing dialogue. Such processes can be facilitated through iterative cycles of drafting, revising, and resubmitting when there is more potential for written feedback from teachers or peers to be acted upon. Students need to be encouraged and supported to close feedback loops. This is an important part of their feedback literacy.

Addressing Challenges for Dialogic Feedback

Various challenges for dialogic feedback and how these might be tackled at institutional, student, and teacher levels are now discussed.

An obvious institutional barrier relates to large class sizes which would impede teacher-intensive forms of feedback. An emphasis in this entry has been on peer review, student self-evaluation, and technology-enhanced feedback as practical tools which have potential to alleviate, if not fully overcome, the challenges of teaching large classes. Further institutional barriers include lack of time, resources, and incentives which are compounded by the need for many staff to prioritize research. An emerging trend in a number of British universities is an extension of teaching excellence awards to include other elements, such as “best feedback award.” This provides recognition for good practice, stimulates the surfacing and dissemination of worthwhile feedback strategies, and reinforces the image of feedback as being an important issue, worthy of attention.

There are also various student-related barriers for effective feedback processes. In relation to peer review and self-evaluation, not all students interact deeply with peers on academic matters and some may lack the motivation to do the hard work of reflecting on their performance. They may prefer to use social media and technology for leisure rather than academic work. These points relate to the thorny issue of student engagement. A potential way forward is to develop

course climates in which norms include giving and receiving peer feedback and reflecting on progress. Teachers need to have faith in students to want to maximize their learning and be willing to generate and use feedback for their own improvement.

At the teacher level, a barrier is modest assessment and feedback literacy. Only a minority of teachers seem to have thought carefully about assessment task sequences and effective feedback designs. For some, feedback may equate to marking which is generally regarded as an unpleasant academic chore. Feedback as dialogue is best implemented through thoughtful, skillful, student-focused teaching. This is often not easy in view of the multiple demands of academic life. The assessment literate teacher involves students in communication and negotiation around feedback processes and scaffolds student assessment and feedback literacy, so that students become clearer about their active role in seeking, engaging with, and using feedback.

The practices discussed in this entry are intended to be workload neutral. Teachers need to focus their efforts on where guidance and feedback have most potential, spending less time on forms of end-of-semester marking which the literature indicates are unproductive. Teachers could include more in-class dialogic activities which support student development of evaluative capacities and less time on one-way transmission of comments after a course is completed. Effort invested on the development of student feedback literacy might in the long run achieve workload economies for teachers.

Conclusion

To sum up, effective feedback processes go beyond comments and marking in that they are the products of wider sets of influences which include curriculum design, assessment policy and practice, how teaching and learning are approached, and relationships between participants.

Feedback is a contextualized form of social communication in which care must be taken with blanket recipes. This caveat notwithstanding,

promising practices in developing dialogic feedback processes mainly involve:

- Activating the student role in seeking, generating, and using feedback
- The integration of feedback, assessment task design, and the development of student capacities to make academic judgments
- Timely discussion of student work, including in-class guidance, peer feedback, and technology-enhanced dialogues
- Creating course climates which encourage and facilitate the above

Feminism and Philosophy of Education

Suzanne Rice
University of Kansas, Lawrence, KS, USA

Introduction

Feminism has now influenced nearly all the academic disciplines and traditions and has also informed newer areas of inquiry as they have come into existence. Feminist thought has been fairly contagious, with insights arising in one

corner of the academy being “caught” in others. Thus the scholarship of, say, a feminist biologist may come to be reflected in that of a psychologist, and vice versa. This pattern has characterized feminism in philosophy of education, where feminist ideas originating elsewhere are brought to bear on questions and problems in the field and where, occasionally, ideas developed within the field are exported to other traditions and disciplines.

Jane Roland Martin: Pioneer

In the USA, Jane Roland Martin was one of the first professional philosophers of education to bring a feminist perspective to her work. Reflecting back on the field prior to the 1980s, Martin noted the absence of discussions by or about women:

Whether one was thinking of women as the subjects or the objects of educational thought, for all intents and purposes we had no place at all: as subjects, women’s philosophical works on education were ignored; as objects, works by women and men about women’s education and their role as educators of the young were largely neglected. Moreover, the very definition of education and the educational realm adopted implicitly by the standard texts in philosophy of education excludes women. (Martin 1999, p. 150)

Martin herself has made significant efforts to remedy the situation she described, writing extensively on girls and women in relation to various topics of interest to philosophers of education – curricula, school organization, and educational aims, to name just a few. A pair of major articles published by Martin in 1981 and a third article appearing in 1982 generated much discussion and debate among philosophers of education and, seemingly, opened the door to feminist scholarship in the organization (Martin 1981a, b, 1982). Martin remains one of the most prolific feminist philosophers of education, and between 1985 and 2011 published ten books and countless articles, the vast majority of which are informed by a feminist sensibility and address some aspect of education in relation to girls and women.

The Reach of Feminism in Philosophy of Education

Since Martin first wrote about gender and education, feminism has influenced more and more philosophers of education. This may be due in part to the fact that during this time there has been a dramatic increase in the number of female philosophers of education. A measure of the growing number of female philosophers is their membership in the Philosophy of Education Society and a measure of their influence is their representation in leadership positions in that organization; among the most recent Philosophy of Education Society Presidents (between 2006 and 2016), there have been five women. All these female presidents have been sensitive to gender issues, and four – Susan Laird, Audrey Thompson, Barbara S. Stengel, and Barbara Applebaum – have made significant contributions to specifically feminist thought (e.g., Laird 2008; Thompson 1998; Mayo and Stengel 2010; Applebaum 2000).

While it is not surprising that women have produced most of the feminist scholarship in philosophy of education, certain feminist criticisms and insights are now fairly widely discussed – and often embraced – by philosophers of education, regardless of their sex. At the very least, many philosophers of education now make an effort to account for gender when it appears to be relevant; and over the years, the relevance of gender in numerous and diverse situations has become much more apparent. There is perhaps no clearer example of feminist thought informing scholarship in philosophy of education broadly than that provided by Nel Noddings’s *Caring: A Feminine Approach to Ethics and Moral Education* (1984). (Noddings herself was influenced by feminist thought in psychology, most notably by Carol Gilligan, who challenged male-centric understandings of moral development (Gilligan 1982).) Briefly, the ethic of care arises out of natural caring, such as when a parent cares for her child: “It is that condition toward which we long and strive, and it is our longing for caring—to be in that special relation—that provides the motivation for us to be moral. We want to be

moral in order to remain in the caring relation and to embrace the ideal of ourselves as one-caring” (p. 5). Noddings’s book inspired countless publications, as philosophers of education (among other academics) drew comparisons and connections between “caring” and various other moral and educational phenomena, for example, caring and justice (e.g., Held 1995); caring and political theory (e.g., Engster 2004); and caring and leadership (e.g., Beck 1994).

Noddings’s scholarship on moral thought and education has been phenomenally influential. But other feminist scholars have also produced important and eminent work within philosophy of education in regard to the particular topics they study. For example, Megan M. Boler has worked extensively on questions related to gender, technology, and democracy (e.g., 2008/2010), and Huey-li Li has expanded the concept of “ecofeminism” (2007). In both cases, these authors have examined phenomena occurring largely outside schools (and draw on literature that is largely outside of the education corpus) but then show why and how these phenomena and literatures matter in educational terms. Feminism and philosophy of education have also been drawn together in several works examining mothering in relation to education. *Maternal Thinking*, by Sara Ruddick, and *Women’s Ways of Knowing* by Mary Field Belenky, Blythe McVicker Clinchy, Nancy Rule Goldberger, and Jill Mattuck Tarule are perhaps the most famous examples of such work, but more recently Amy Shuffelton has also considered mothers’ implication in education. (Mothering also figures into Noddings’s care ethics.)

Other feminist scholars working in philosophy of education have helped to illuminate the educational significance of female philosophers (outside education) whose writings have been undervalued or ignored altogether by other philosophers of education. For example, Natasha Levinson has written extensively about the work of philosopher Hannah Arendt, while Susan Laird has focused her energies on the writings of Mary Wollstonecraft. Levinson and Laird make compelling cases that Arendt and Wollstonecraft

matter educationally – although in very different ways.

With important exceptions, much of the literature published by feminists from the 1960s until well into the 1980s tended to focus on the experiences and interests of white (generally middle class) women and girls and often failed to question whether all women and girls shared these experiences and interests or to seriously examine what differences might exist. However, especially over the past two-plus decades, an increasing number of feminists have developed a greater sensitivity to experiences of girls and women that are linked to race, class, culture, and sexual orientation, among other factors. In philosophy of education as well, there has been a growing appreciation of such differences and their implications for educational theory and practice. Audrey Thompson, for one, argues that standpoint epistemologies articulated by Black, Asian, Chicana, and other feminists of color challenge the assumed universality of certain ethical and educational theories (Thompson 1998).

There is no single feminist voice, and different feminist scholars are aligned with different theoretical orientations, ranging from the liberal to the poststructural. In an effort to capture this diversity of thought, some observers refer to “feminisms” rather than to the singular “feminism.” The scholarship of different feminist philosophers of education reflects these different strands in feminism more broadly (e.g., Diller et al. 1996; Thayer-Bacon et al. 2013). Despite this diversity, the work of philosophers of education who adopt a feminist stance reflects the key insight that a failure to attend to the ideas, problems, and experiences of females, as well as males, is bound to produce incomplete and distorted analyses of educational phenomena; this insight exists alongside efforts by some to problematize such concepts as “female” and “male,” “woman” and “girl.”

The foregoing account offers a mere sample of the kinds of topics and approaches adopted by philosophers of education who identify as feminist, whose work is explicitly influenced by feminist thought, and/or who have made contributions

to the scholarship on feminism and philosophy of education. There are many other scholars whose work is informed by and advances feminist thought in philosophy of education.

Feminist Pedagogy

Sara Regina Mitcho
Fairfax Station, VA, USA

Synonyms

Critical pedagogy; Feminism; Gender; Women's studies

Introduction

Feminist pedagogy is an approach to education that brings to bear feminist theory, feminist activism, and women's experiences on educational content, the learning environment, the relationship between teacher and student, and the connection between the learning environment and the outside world. The approach emerged as a clear educational strategy by the 1980s and was influenced by feminist activism, critical pedagogical theory, and the progressive education movement in the United States. Like critical pedagogy, feminist pedagogy rejects traditional pedagogical approaches that perpetuate hegemonic power structures. Feminist pedagogues are particularly critical of educational approaches that maintain gender oppression and other intersecting forms of oppression. Feminist pedagogy envisions

learners as active agents who work in community with teachers in an environment that values personal experience to critique and change the societal conditions that maintain and produce uneven power relationships.

History

Feminist pedagogy emerged as a cohesive educational approach by the 1980s after an increasing number of feminist scholars applied its principles in their classrooms and wrote about them in articles and other texts like the influential *Learning Our Way: Essays in Feminist Education* (Bunch and Pollack 1983). Many early feminist pedagogues were influenced by feminist movements in the 1960s and 1970s and adopted tactics from those movements, including consciousness-raising. This technique consisted of small groups of women meeting to discuss their personal experiences of gender oppression. The practice of consciousness-raising helped remove the barriers presented by women's isolation in individual homes throughout society and placed value on women's experiences by allowing each participant time and space to share her own story. This practice was also designed to help women see their experiences of sexism and misogyny not as isolated cases but as part of a pattern that reflected broader structures of systematic gender oppression. Consciousness-raising was seen as a model by some feminist pedagogues for a new educational structure that could work to eradicate traditional gender roles and gender oppression.

Many feminist pedagogues have also been influenced by Paulo Freire's theory of critical pedagogy and his critique of the "banking" model of education wherein students passively receive knowledge rather than playing a role in their educational experience, thereby missing a chance to view – and change – the power relations at work in their lives. Feminist pedagogues influenced by critical pedagogy have not been without their critiques of its theorists, particularly when critical pedagogues have conceptualized learners as coherent or essentialized individuals, uncomplicated by intersecting identities and their

corresponding intersecting forms of oppression (Crabtree et al. 2009). Feminist pedagogues share with advocates of critical pedagogy, however, a concern with structures of power and oppression and the aim to empower students to be active agents in both the learning process and in the effort to change the conditions of their lives and societies. For these reasons, feminist pedagogues are often seen – and see themselves – as members of a broader community of critical pedagogues. In addition to the feminist movements of the 1960s and 1970s and critical pedagogical theory, some feminist pedagogues have been influenced by John Dewey and other theorists associated with the progressive education movement in the United States, particularly its commitment to "experiential learning, social responsibility, [and] a reclamation of the civic mission of education in a democracy" (Crabtree et al. 2009, p. 3).

Definition

Feminist pedagogy concerns not just the content covered in a particular educational environment but also the environment itself and the relationships of power within that environment and in the broader world in which that learning environment is situated (including the education system and the larger society in which it is located). In other words, one is not a feminist pedagogue simply because one teaches feminist theory or women's studies or engages one's students in discussions about women, women's experiences, or even structural gender oppression. This is because engaging in feminist pedagogy also means adjusting one's approach to the classroom environment and the relationships of power within the learning environment and the outside world. Likewise, courses on topics not explicitly associated with feminist theory or women's studies might be feminist pedagogical environments when they are informed by feminism and approach the learning process in a manner that accounts for relations of power and oppression, particularly gender oppression. Certainly, however, because feminist pedagogy is informed by feminist thought, it remains important for feminist pedagogues in facilitating a

learning environment that rejects gender oppression as well as other intersecting forms of oppression, including homophobia, racism, and classism. Specifically, feminist pedagogues committed to feminism value women's experiences as well as activism designed to end gender oppression, see feminism as a philosophy through which one can learn about "the entire human condition (not just that of women)" (Crabtree et al. 2009, p. 1), and view gender oppression as intertwined with other forms of oppression.

Also important in a feminist pedagogical learning environment is a concern with the relationship between teacher and student, particularly with regard to power. Feminist pedagogues strive to foster "a participatory, democratic process in which at least some of the power is shared" (Shrewsbury 1987). They do not erase the role of the instructor as teacher, but seek to also empower students, viewing power in this context in a positive light rather than as a tool for domination (Shrewsbury 1987). These educators work to provide students with independence and agency, building a community of learners who facilitate the learning process rather than being docile recipients of knowledge. While this is an important approach for all critical pedagogues, it takes on a crucial role in the context of feminist pedagogy since women's experiences and arguments have historically been dismissed as unimportant or invalid. Feminist pedagogues, therefore, view the learning environment as a potentially liberatory one when students are empowered in the classroom, but also one in which both teacher and student constantly reflect on the learning experience and the educational content (Shrewsbury 1987). In this way, both teacher and students share responsibility for learning and determining what counts as important.

Given this collaborative environment, students are often involved in the process of evaluation rather than simply being subject to it. Feminist pedagogical environments often involve students in the process of evaluation with tools such as self-evaluations, student-generated evaluative tools, and peer reviews of student work. Evaluative measures seldom rely exclusively on rote memorization, but usually employ more substantive measures such as written work.

Among the knowledge and content often considered important in the feminist pedagogical learning environment is personal experience. Given the long history of dismissing or minimizing women's experiences or viewing them solely through the lens of those in power (i.e., through a dominant, patriarchal perspective), valuing personal experience in the feminist classroom serves three important purposes. First, it problematizes devotion to supposedly "objective" truths, offering instead a model wherein knowledge production is a process and objectivity is a myth since so-called "objective" truths are often simply reflections of dominant ideological positions. Second, valuing personal experience in the feminist pedagogical environment helps validate women's experiences as knowledge and personal experience generally "as one among several valid forms of evidence and authority" (Hoffmann and Stake 1998, p. 81). Finally, just as in the consciousness-raising groups of the 1960s and 1970s, sharing and listening to stories of others' experiences of oppression and domination help students identify larger structures of systematic oppression, make connections with others around shared experiences of oppression, and begin to build coalitions to combat it.

The learning process in a feminist pedagogical environment is a reflexive one, where students and teachers constantly exercise critical thinking and reflect on educational content, the learning environment, and the outside world in which it is situated. Because the teacher and students cannot escape, but are always embedded in, a society of gender oppression, this reflexivity allows for critical thinking about how these individuals, the class content, and the structures in which they are situated (the educational system, the university, etc.) may be replicating or complicit with gender oppression.

This concern with the outside world within which the learning environment is situated reflects feminist pedagogues' general concern with power relations as well as with helping students become aware of their place in these relationships of power (a goal related to the feminist tactic of consciousness-raising). In addition to being generally concerned with systematic societal gender oppression, feminist pedagogues also concern

themselves specifically with the way in which the educational system itself is often designed to replicate and encourage societal gender norms as well as structures of gender oppression. Feminist classrooms are therefore oriented toward feminist activism. This might take the form of critiquing the university or educational system, its policies, the traditional arrangements of power therein, its economic role and policy, and the laws, regulations, and norms of the greater society in which the educational system is situated, particularly as these structures maintain and perpetuate gender oppression.

An additional characteristic of feminist pedagogy that has developed out of reflexivity and a general concern about uneven relations and structures of power is its understanding of oppression as intersectional. In other words, feminist pedagogues see gender oppression as part of a larger web of oppressions that include racism, classism, homophobia, as well as oppression of the transgender community and others with non-conforming gender identities. Feminist pedagogues' understanding of these oppressions as intersecting means that one cannot simply address sexism, racism, and the like individually but instead must consider them as connected. Teachers and students in a feminist pedagogical learning environment are also reflexive about the ways in which they may inadvertently perpetuate one form of oppression (racism, for example) in the process of attempting to eradicate another: gender oppression. Importantly, distinct but compatible pedagogical approaches such as black feminist pedagogy and queer pedagogy have been developed by activists and theorists in these areas alongside feminist pedagogy precisely because of the need to fully account for the ways in which traditional hegemonic approaches to pedagogy perpetuate multiple forms of oppression.

Tactics and Strategies

Just as teaching feminist theory or women's studies or addressing women's experiences in the classroom does not, on its own, constitute feminist pedagogy, neither can this approach to education be boiled down to a list of classroom tactics or strategies. However, some tactics and strategies

have become closely associated with feminist pedagogy because of the ways in which they facilitate its practice. Many of these tactics are associated with critical pedagogy in general, including arranging the classroom in a circular or semicircular seating arrangement to encourage participation from students, echo a commitment to shared power, and place student contributions on the same level as teacher instruction. Some tactics, however, take on a particular meaning in the context of feminist pedagogy.

While many critical pedagogues use small groups to invite student contributions and allow for an intimacy that is not possible in a larger classroom setting, when used by feminist pedagogues, this strategy echoes the history of consciousness-raising groups. In other words, small groups are often employed in a feminist pedagogical environment to facilitate the sharing of personal encounters with gender oppression, privilege, and domination in an intimate environment where students are inclined to feel more comfortable disclosing their experiences. This format allows for the discussion of potentially sensitive topics that may be difficult to discuss in a larger group setting. Attentiveness to sensitive topics that relate to gender oppression is, in fact, another hallmark of feminist pedagogy that extends beyond the use of small groups.

Feminist pedagogues are concerned generally with conversational strategies that encourage participation from all students while exercising keen sensitivity to situations where students may feel their diminished societal power in the classroom. Because the learning environment does not exist outside of, but is in fact embedded in, a larger society that condones or permits sexual assault of women, overt gender oppression in the form of catcalls or jokes about women, homophobia, transphobia, racism, classism, and the like, feminist pedagogues strive to create an environment where students feel comfortable sharing their experiences as victims of these practices while acknowledging that many of the students in the learning environment may have internalized the structures of power that perpetuate these practices such that they view them as normal. Many feminist pedagogues characterize the effort of creating an environment where victims of oppression feel

comfortable sharing their experiences as creating a “safe space” in their classroom. While there is some debate as to whether a completely “safe” space is possible, all feminist pedagogues make efforts to help students feel comfortable discussing personal experiences of gender oppression to help place them in a larger context of oppression and to facilitate the process of mobilizing for social change. The effort to create “safe” spaces also includes attempts to integrate theory and personal stories from marginalized communities (like the LGBTQ community, for example) particularly when members of those oppressed communities are not represented in the classroom or are not inclined to identify themselves or their experiences. In other words, feminist pedagogues often highlight otherwise invisible or ignored oppressions in the classroom to make them visible and to avoid replicating intersecting forms of oppression in the pursuit of addressing gender oppression.

Finally, in addition to calling students’ attention to the ways in which the topics discussed in the learning environment relate to society at large, many feminist pedagogues require explicit engagement with the outside world in the form of service learning, social activist projects in the local community, and the like. These practices underscore the importance in feminist pedagogy of connecting the work done in the learning environment with the community at large while also echoing its roots in (and enduring connection to) feminist activism.

Conclusion

Influenced by feminist consciousness-raising, critical pedagogy, and the progressive education movement, feminist pedagogy endures as an approach to education rooted in feminism that influences teachers’ and students’ engagement with educational content, the learning environment, and the broader world in which the educational environment is situated. This approach is concerned with uneven relationships of power, with particular attention given to structural gender oppression as well as other intersecting forms of oppression. Practitioners of feminist pedagogy consider uneven power as it affects teachers and

students as well as the greater environment in which both are situated. These practitioners aim to empower those who are disempowered, seeing students as active agents, valuing women’s experiences, and facilitating critical reflections on the effects of hegemonic uneven structures of power. Tactics in the feminist pedagogical environment include small group work, discussions, and other activities designed to minimize uneven power relationships in the classroom, value personal experience as a form of knowledge, and facilitate critical inquiry. Because of feminist pedagogues’ commitment to connecting the educational environment with the outside world, students also engage in service learning and other forms of feminist activism in the community to promote social change. This and other similar feminist pedagogical strategies emphasize the importance not just of feminist theory but of feminist practice and highlight the usefulness of feminist pedagogy in a variety of educational environments.

Feminist Theories and Gender Inequalities: Headteachers, Staff, and Children

Kay Fuller
University of Nottingham, Nottingham, UK

Introduction

The connection feminists have made between the personal and the political is no less relevant in the twenty-first century than in the 1960–1970s when

it became the message of second-wave feminism. Education feminists have linked personal experiences with feminist research projects about girls and women's experiences to engage with epistemologies and methodologies that speak back to traditional ways of knowing about education and educational leadership. Such research might be about researchers, educators, leaders, or children, young people, and adult learners. Thus, feminist standpoint theory values women's "insider" perspectives; their standpoints uncover unequal power relations beyond the individual at organizational, social, and political levels. This entry provides first an overview of feminist theories. Next, there is an overview of literature concerned with leadership for equality, diversity, and social justice. In the following section, Fraser's (2007) framework of recognition, redistribution, and representation shapes two women headteacher/principals' constructions of gender inequalities among women and girls in their schools. Their varying degrees of critical consciousness are discussed in the light of feminist theories. The entry ends with conclusions about the education of school leaders, teachers, children, young people, and adult learners.

Feminist Theories

Feminist thought has been organized historically. Although women's writing and oral histories of sex inequalities date back further, the first wave of feminism is located in the nineteenth to twentieth century. Second-wave feminism began in the 1960s and third-wave feminism in the 1980s and 1990s when Rebecca Walker declared she *was* the Third Wave. The fourth wave of feminism, connected with in the twenty-first century, remains highly contested. Particular concerns include the nature of spirituality, community and oppression, male or (pro)feminists, transgenderism, sex work, and relationships in social media. Indeed, each wave is characterized by contemporary issues. The concepts of "woman," "experience," and "personal politics" pose problems for a single conceptualization of feminism. There are

undeniably multiple feminisms. The articulation of women's experiences, their identity politics, and engagement in wide-ranging debates negates the existence of a single feminist theory. There follows an overview of *liberal*, *radical*, *socialist*, *poststructural*, *Black*, and *postcolonial feminisms*.

Liberal feminism is associated with first- and second-wave feminisms. It focuses on establishing equality for women relating to suffrage, property ownership, divorce, employment rights, and access to education. This individualist, meritocratic approach focused on achieving justice and enabled some governments to enact sex discrimination legislation. Indeed, much was achieved through second-wave feminism for some women. However, it is critiqued widely for its exclusion of women of color (Davis 1981; Mirza 1997) and the perpetuation of the hierarchy of dualism. *Radical feminism*, as a reaction to liberal feminism, is a theory of difference that recognized women's experience as inextricably linked to embodiment. Systemic change, begun by liberal feminists, needed social and psychological change, to overthrow patriarchal oppression that privileged the "male/masculine" over the "female/feminine." However, the insistence on universality and the concept of patriarchy again excluded Black and Global Majority (BGM)/Black and Ethnic Minority (BEM) women. *Socialist feminism* challenges capitalism as well as patriarchy by recognizing unequal class relations alongside gendered oppressions. The exploitation of women's unpaid labor in the home shifted the focus onto private *and* public worlds. A Marxist analysis sees the gendered division of labor as constituent of production and the distribution of the family wage. These three feminisms form a foundation for understanding the evolution of feminist theories.

Poststructural feminism, *Black Feminist Thought*, and *Postcolonial feminism* address the assumption of universal womanhood. They are associated with third-wave feminism. Poststructural feminism problematizes binarized and essentialist categories of "woman" and "man." Education feminists have used poststructuralism to reconstruct their understanding of leadership to

offer an alternative to “masculinist” leadership (Blackmore 1989). Reconstructed theories are useful in work focused on social justice; the problematization of key concepts means a single vision of liberation for women is resisted. The feminist projects of African-American or Black British women are not the same as those of White Americans or White British women. Nor are they the same projects as for women in developing countries. For example, Black feminist thought portrays African-American women as “self-defined and self-determining within intersecting oppressions” (Collins 2000, p. 273) or a matrix of domination. Crenshaw’s (1991) theory of intersectionality ensures the intersections of race and gender are a focus for Black feminist research. Colonialism has done damage to indigenous peoples worldwide. Postcolonial feminists acknowledge diasporic histories impact on women’s lives regardless of whether or not there is direct personal experience of migration. Contemporary imperialism and the hegemony of Western scholarship that seeks to control “hearts and minds” and sees “Third World women” as a homogenous group have been powerfully critiqued (Mohanty 1988, p. 336). Critical theorists have also used queer theory to trouble essentialist conceptions of leadership. Thus, various and seemingly incompatible gender theories have led to a retheorization of gender as heteroglossic (Francis 2012). These theories have informed this research into headteachers’ understandings of diversity among school populations. There follows an overview of a selection of literature concerned with leadership for equality, diversity, and social justice.

School Leadership for Equality, Diversity, and Social Justice

A small but rich literature highlights Black women leaders’ connections with the school communities they serve in the United States (e.g., Dillard 1995), the United Kingdom, and South Africa. Familiarity with the community might be advantageous to the school principal. School

leaders appear to suit some communities and schools and not others. Fitzgerald (2006) problematizes the expectation that indigenous women leaders in New Zealand, Australia, and Canada should take responsibility for indigenous children’s welfare and learning. There is a need to simultaneously value school leaders’ connections with, and care for, potentially marginalized communities and not to confine them to working with particular school populations. School leaders from dominant “raced” and gendered (White (fe) male) groups have responsibility to lead for social justice. Feminist leadership theory is inherently linked with social justice. In order to establish justice (parity of participation), a three-dimensional theory of justice requires redistribution, recognition, and representation (Fraser 2007). Redistribution occurs by dismantling economic class structures that impede participatory parity; recognition confers cultural status; and representation ensures political voice and a share in decision-making (Fraser 2007).

A Position of (Under)Privilege

Educational leadership gender theorists have experienced, firsthand, the nature of gendered oppressions that variously intersect with “race” and ethnicity, social class, and critical incidents such as discriminatory and violent experiences (Lyman et al. 2012). This author has positioned herself as a single, White, middle-class woman of working-class origins (Fuller 2013). Her experiences of gender inequalities are likely to be different from those of women daily experiencing the intersecting oppressions of racism and sexism and other protected characteristics outlined in the United Kingdom Equality Act (2010): age, disability, gender reassignment, marriage and civil partnership, pregnancy and maternity, religion or belief, and sexual orientation. The focus, here, is on two White women headteacher/principals’ awareness of gender inequalities among the school population (see Fuller 2013). Each had experienced gender inequalities in their professional lives. The account is framed by Fraser’s

(2007) three-dimensional theory of justice: recognition, redistribution, and representation.

Headteachers' Recognition of Gender Inequalities: Self, Staff, and Pupils

Isabella was a headteacher of a mixed (coeducational) comprehensive school. More than half the pupil population was of minority ethnic heritage as 28% Asian, 15% Black African Caribbean, and 11% from other groups. Over a quarter of children were eligible for free school meals; 30% had a special educational need; and for 28% English was an additional language. Isabella was married with a daughter of school age. She recounted multilayered awareness of gender inequalities that drew on her classed, gendered, and minority White ethnic identity as the daughter of a European immigrant. Bullied at school for dressing differently and coming from a strict background, she aspired to a future different from her friend's, who was pregnant as a teenager. Education was an escape route, "I thought I have got to get out of here" (adapted from Fuller 2013, p. 91). Isabella experienced bullying in the workplace where her ideas were blocked. In response, she learnt to think creatively. Her support for women's advancement extended to leading professional development training at national level. The gendered division of labor meant women did not generally gain curriculum leadership experience. Isabella recognized women's multiple and changing needs in the workplace as nonteaching staff, teachers, and aspiring headteachers. She recounted an incident relating to Black girls, identified by their teacher as troublemakers.

Katherine was a headteacher of a selective girls' school where the majority were White British, with a substantial proportion of Asian-Indian girls. Girls were from affluent backgrounds. A high proportion had a range of physical and emotional difficulties; many spoke English fluently as an additional language. Katherine was divorced with no children. She had worked in a middle leadership role with an "awkward" male junior colleague. In response, she learnt to

approach people in different ways. Katherine recognized nonteaching staff (women) were important to the operational management of the school. Teachers supported girls academically in their own time. She recounted anecdotes about her impatience with colleagues and single-minded decisiveness in senior leadership team meetings. Katherine distinguished between girls by personal circumstances such as affluence, family illness and death, and low self-esteem that accompanied peer group comparisons in a high-performing, selective, single-sex school. Low self-esteem demonstrated itself as withdrawal or misbehavior. Girls' "neuroses" were caused by family pressure. They presented as anorexia, self-harm, and teenage pregnancy.

Redistribution of Resources: Staff and Pupils

Isabella attributed achievement of social mobility to the acquisition of cultural capital. She redistributed economic, cultural, and social capital to three groups of women. First, there were informal arrangements to support nonteaching staff taking degrees. She awarded time to complete assignments. Ten learning assistants aspired to a higher education. Second, the head of physical education did not want to become "a middle aged woman in a tracksuit on the field" (adapted from Fuller 2013, p. 96). The woman retrained as head of information and communications technology. Third, Isabella had promoted a woman to a senior leadership post; she went on to achieve a further senior post elsewhere within six months. Isabella shared her cultural capital (professional knowledge) by nurturing colleagues and the capital her reference provided. Isabella recounted an occasion when a teacher reprimanded three Black girls for singing in his music lessons. Where he saw misbehavior, Isabella saw raw talent. She used her position to invite them to sing at a public performance.

Katherine did not describe support for women teachers. Instead, she recounted a light-hearted conversation with a female deputy headteacher who had reflected on Katherine's impatience in

meetings and single-minded decision-making. Her support for staff in external facing conversations was more likely to be about protecting the school's reputation than professional trust of staff. Nonteaching staff (largely women) were valued highly as key to operational management. They were seen as "pupil partners" (adapted from Fuller 2013, p. 47), alongside teachers, in an attempt to break down barriers between highly qualified professional teachers and less educated and low-paid nonteaching staff. She redistributed resources to less affluent girls by passing on second-hand uniforms from lost property and subsidizing residential trips. However, her recognition of girls with a range of difficulties and personal circumstances translated into resignation that nothing could be done to support them, "A pregnancy, and the baby's produced in the middle of the GCSEs [public examinations] helps everybody doesn't it? Yes. There's nothing you can do about that, at all" (adapted from Fuller 2013, p. 47).

Representation: Staff and Pupils

Isabella's willingness to listen to staff and pupil voices can be seen above. Her "open door" policy and practice meant staff asked "can I have two minutes?". Isabella valued dialogue among staff. Training days were spent as teams of people talking; time was allocated for teachers to work together to "plan, prepare, argue, talk, think" (adapted from Fuller 2013, pp. 122–123) about pedagogy. Other spaces for dialogue existed; "they can talk in their unions, they can talk in the staff room informally, or they can come in here" (adapted from Fuller 2013, p. 123). The voices of the Black girls described above were heard, valued, and publically afforded high status. Isabella had found the key to unlock their self-esteem and potential; "I think everybody can succeed at something if you find the key."

Katherine's "open door" was a mechanism for surveillance; her consultation of colleagues was an opportunity for them to "feel" they had been heard; "I don't suffer fools. I'll let them talk, because it's important that people think that, feel that they've had their say and people feel that I've listened"

(adapted from Fuller 2013, p. 46). A school inspection report noted some girls thought their welfare and aspirations were of interest to staff only when they affected academic achievement. The report cited a survey that rated academic support more highly than personal support and noted girls thought there was no adult who knew them well and to whom they could turn for help. They were unable to represent their own interests.

Which Feminist Theory Aids Understanding?

Isabella and Katherine's achievement of headship can be seen through the lenses of liberal and radical feminisms associated with women's rights to higher education and equal access to employment opportunities with men. Headship of girls' schools (like Katherine's) was associated with educated, professional women from the nineteenth century. Isabella's success in achieving headship in a mixed school is indicative of breaking down barriers in a patriarchal society that expects coeducational school leaders to be men. Isabella's concern for the advancement of women at all levels of the organization, and in the profession more widely, suggests a feminist commitment to closing the gender gap. Her achievement of social mobility can be located in socialist feminism. Education enabled her to cross the economic class borders of her upbringing; it is not surprising she saw education as the means to dismantle class barriers for others.

Neither Isabella nor Katherine constructed woman-/girlhood as universal. Isabella recognized the intersections of gender with "race"/ethnicity and social class. Katherine recognized the intersections of gender with social class but did not recognize the high proportion of Asian-Indian girls at the school in her account of diversity. Using Blackmore's (1989) reconstruction of leadership, her leadership discourse is constructed as masculinist rather than feminist (Fuller 2013). Isabella was sensitive to existing stereotypes and prejudices surrounding Black girls; she turned a teacher's prejudices into a celebration of the girls' singing talent. These constructions might be seen

through the lenses of poststructuralist and/or Black and postcolonial feminisms. However, neither headteacher recognized the intersections of “race”/ethnicity with gender inequalities among staff.

Contemporary gender theorization recognizes a single feminist theory is insufficient to understanding the nuances and complexities of gender as it is socially constructed. Holvino (2010) draws on multiple feminist theoretical frameworks as socialist, poststructuralist, and transnational/postcolonial/“Third World” feminisms to advocate knowledge production through intersecting, overlapping, and interacting theories. Such an approach has been discussed as gender heteroglossia (Francis 2012) and polyglossic simultaneity (Fuller 2014). An intersectional approach is necessary to uncovering combinations of multiple sites of oppression and inequality, for example, among BGM/BEM staff members (Collins 2000; Crenshaw 1991).

Conclusion

This short entry focused on a feminist theorization of gender inequalities experienced by school leaders and of their understanding of gender inequalities among staff and children. While women, and Black and Global Majority women in particular, *should* be better represented in secondary school headship as a matter of social justice, the fact remains that being a woman headteacher does not lead to feminist leadership. It does not even lead to the recognition of multiple needs, desires, and interests of women and girls, or of men and boys in potentially marginalized groups, in a diverse and pluralist society. Rather, in their leadership for social justice, men headteachers might be (pro)feminist, and women headteachers might be masculinist. It cannot be assumed that headteachers recognize gender, “race,” and class or that their leadership is about eliminating marginalization and developing inclusive practices, particularly when some are committed to working in and perpetuating a selective school system. What remains is a need to educate and prepare school leaders for the exercise of

leadership for equality, diversity, and social justice. Such education and leadership preparation would enhance the critical consciousness of children and young people, teachers and nonteaching staff, aspiring leaders, and headteachers regarding gender, “race,” and other combinations of inequalities in schools, the education system, broader society, and in politics. An understanding of feminist theories as they have evolved over time would facilitate that.

Feminization Thesis: Gender and Higher Education

Sarah Jane Aiston

University of Birmingham, Birmingham, UK

Introduction

In contemporary society, women have made significant gains in terms of their participation rate as undergraduate students worldwide, to the extent to which a feminization of higher education thesis has been put forward. Claims have arisen that women are “taking over” higher education, not only in terms of student numbers, but also the culture of universities (Leathwood and Read 2009).

But to what extent has an increase in the number of women in higher education led to a reconceptualization of gender and the university as a “space” in which women are no longer “out of place” (Aiston 2006)? There are many indicators to suggest otherwise, for example, prevailing sexism, “laddism” and a culture of harassment that has been identified as an aspect of university life for women undergraduates in the UK and the USA (NUS 2013). In Mainland China, the dominant discourse of graduate women as a “third sex” (men, women, women with PhDs) represents highly educated women as troublesome transgressives who refuse, or who will be unable, to take their place in traditional family hierarchies (Aiston *in press*).

This entry aims to interrogate the feminization thesis in the context of contemporary research in the field of gender and higher education. As such the entry will draw on critical frameworks, such as feminism, to discuss the numerous social justice challenges that endure with respect to gender and higher education in the twenty-first century.

Counting Women In

Headlines around the world, including the UK, USA, Australia, and parts of Europe, proclaiming

“Gender gap widens as women graduates outpace the men” (The Australian 2015), present a somewhat misleading picture of the position of women in the academy. Research highlights the geographic variation with respect to women being “counted in” as undergraduates. Statistical data compiled by UNESCO and the United Nations emphasize that while globally women are at an advantage, in countries with very low levels of participation in higher education, such as parts of Asia and sub-Saharan Africa, women are effectively excluded. These data also show that the gender gap is reversed at postgraduate level – men outnumber women as PhD candidates and as researchers. Moreover, it is important to recognize differences between countries within regions, for example, while women are well represented as students in most countries in Central and Eastern Europe, there are exceptions, such as Turkey (Leathwood and Read 2009).

This leads us to our next issue, the underrepresentation of women at the highest levels of the academic profession. Extensive research internationally has documented the lack of women academics as full Professors and senior leaders (e.g., Dean, Vice-Chancellor/President). So while women might be considered as being “counted in” as students, particularly as undergraduates, they are distinctly *absent* from the higher echelons of the academic hierarchy (Morley 2014). The underrepresentation of women as academic leaders is often explained away/justified in terms of time. Since the number of women entering higher education as undergraduates has increased, then so it follows, according to pipeline theory, that women will enter and rise through the academic ranks – it is just a matter of time. But research indicates that this is clearly not the case (see, for example, Aiston 2014, with respect to Hong Kong). Intervention is required, a point to which we will return, if women are to be more equally represented in the most senior leadership roles of the profession. To assume that simply waiting will rectify this situation is what can be termed as a “dangerous discourse.”

While the focus of this entry is women in higher education, it is also important to note that there are groups of young men who are also at risk of not

being “counted in,” for example, Latino young men who are “vanishing” from the US higher education system (Saenz and Ponjuan 2009).

Disciplinary Tribes, Disciplinary Ghettos?

The total aggregate figures reported in the headlines fail to adequately interrogate the issue of disciplinary difference. While in some countries women comprise half of all undergraduate students, this equal distribution does not extend to all subjects studied. Here we might draw on the concept of “academic tribes” that refers to groups of scholars based on disciplinary boundaries, in which, the discipline, or “territory,” is fiercely guarded by the tribe (Becher 1989). Adopting a critical gender lens to the notion of academic tribes, we can see how some disciplines are constitutively male. Most obviously, science, technology, engineering, and maths – the STEM disciplines – remain overwhelmingly male in tertiary education. A theory of gender difference in ability, namely, female “deficit theory,” is offered as an explanation as to why women are underrepresented in STEM subjects. Feminist researchers, however, have challenged gender stereotypes – the notion that women are not “cut out” for science and put forward theories of gender as being socially constructed as alternative explanations. For those women who do enter these disciplines, gender remains a salient factor. Women are predominately to be found studying biology, or for those small number of women who enter engineering, certain fields are considered more appropriate, chemical as opposed to mechanical engineering, for example.

But it is not only the STEM disciplines in which women are underrepresented. The humanities are largely subjects in which women are overly represented; however, there is significant lack of gender parity, comparable with the STEM disciplines, for women students and academics in philosophy. Philosophy, particularly analytical philosophy with its emphasis on formal logic, is represented as an inherently male discipline.

In some respects, we might consider women students and academics as inhabiting disciplinary ghettos, in so far as they study subject areas regarded as gender appropriate. However, at the end of the twentieth century, women academics were at the forefront of creating a new academic tribe, an academic tribe based on interdisciplinarity, which sought to counterbalance white, male, western knowledge – namely, women’s studies, or, as it is more likely to be referred to now, gender studies.

A Masculine Culture

As noted above, some fear that *too* many women are being “counted in” to higher education, while researchers are concerned that not enough women are entering what are considered as the male disciplines, or entering the most senior academic ranks and leadership positions. But what of the culture of higher education? Has the academy, culturally, become feminized? As indicated in the introduction, it would seem not. Research shows that women in higher education do not typically have a gender-neutral experience of the environment. Women students, studying subjects in which they are in a minority, experience strongly masculine cultures – referred to in the literature as the “chilly climate thesis.” This might comprise of alcohol and pornography in science project rooms, to very aggressive argument styles in the philosophy seminar. Or, as indicated in the introduction, the proliferation of “laddism” on some of the most elite campuses in the world, in which women students are sexually objectified. This objectification ranges from unwanted comments about their bodies, to unwanted groping or touching, and even rape. Fraternity and sports societies – heavily focused around drinking large amounts of alcohol – have been exposed as chanting rape songs, distributing leaflets referring to women as “slags” and “mingers” and discussing raping women students who identify themselves as feminist (see extensive recent media coverage of these issues, for example, in The Huffington Post).

While women academics are not exposed to the forms of “laddism” in the guise as detailed above, they are nonetheless positioned “differently” to their male colleagues, as a result of gender stereotyping. Academic women are more likely to take on different, less prestigious roles in the *research* prestige economy of higher education. Their academic identities are constructed as “academic mommies,” “caretakers,” with greater responsibility for teaching, student welfare, committee work, rather than research, which is privileged in the academy. It is therefore not surprising to find that empirical data show a gendered research productivity gap, with women, for example, publishing less than their male colleagues and receiving less research funding. A common explanation for this phenomenon is that family responsibilities affect the research productivity of women academics. But there is evidence to suggest that this is not always the case. There are other significant structural and systemic discriminatory practices in the profession to which we can look, for example, the allocation of workload (Aiston and Jung 2015), exclusion from elite male groups and important networks – referred to as the “old boy’s club” – and a lack of access to mentors.

Policy and Practice

There are higher education sectors around the world that have recognized some of the above issues. Societies concerned to bring about social justice – the concept of parity that extends to all aspects of society – take “deliberate and specific intervention to secure equality and equity” (Chapman and West-Burnham 2010, p. 26). Let us take the example of the position and status of women academics in the UK. In 1990 British universities were described as “bastions of male power and prestige” (Hansard Society Commission) leading to the introduction of institutional equal opportunity policies. However, researchers have subsequently called into question the effectiveness of such policies suggesting that the culture of the academy has not substantially changed,

that such policies operate primarily as mechanisms to protect institutions legally, and that a gap exists between policy and actual practice. Moreover, the introduction of policies *imagined* to result in institutional fairness has been described as the “postdiscrimination” blues, as if the mere existence of the policy negates the inequality. At this point, we might consider the nature of discrimination that such policies set out to tackle, namely, cases of overt discrimination, which can be very difficult to pursue and “prove.” However, scholars suggest women academics experience the sector differently largely due to what is termed as “hidden discrimination”; discrimination that is subtle, deeply embedded, and almost intangible. Here the concepts of micro-inequalities and unconscious bias are hugely relevant.

“Microinequalities” are small, unjust inequalities that are part of the larger story. They are small events, which are covert, often unintentional and occur whenever people are perceived as “different.” The cumulative effect, however, can impair performance, damage self-esteem, and possibly lead to withdrawal. For those who experience such microinequalities, a common response is to give alternative interpretations of the event, or wonder why the person is so sensitive (Brennan 2013). Let us take an example. The scenario is as follows, a vibrant research seminar series at a leading research-intensive university attracts internationally renowned scholars to speak on issues related to a particular community of experts. There is a woman scholar in the department whose expertise lies in this field, but she is never asked to chair, or act as a respondent to the papers. Before each event, she is sent details in a round robin email alert, which advertises the upcoming seminar and her male colleagues’ participation.

Could this behavior by this group of male scholars be explained as an example of unconscious or implicit bias? Such bias stems from gender stereotyping, which has been discussed in relation to academic women earlier in the entry. An excellent example of the operation and consequence of unconscious or implicit bias can

be seen in what has become an infamous study of how academic scientists from research-intensive universities in the USA rated the application of a “student” for a laboratory position (Moss-Racusin et al. 2012). The “student” was randomly assigned as male or female, but the academics reviewing and rating the application were in fact looking at the same CV. The result? Academics rated the “male” applicant as significantly more competent and hireable than the “female” applicant. Also it is important to note that both men and women exhibited this bias. With the increasing recognition of the role played by unconscious bias in the academy, progressive institutions of higher education have instigated awareness-raising and training to tackle this difficult issue.

Conclusion

The aim of this entry is to interrogate the feminization thesis in light of contemporary research in the field of gender and higher education. So the question remains, have women taken over the academy? Research clearly indicates not. Women remain underrepresented in the “male” disciplines as students and consequently as academics. Women are missing at the highest levels of the profession, in terms of senior academic status and leadership roles. This is a significant issue for a number of reasons; women generally are not therefore party to decision-making at the most senior levels of our universities. In their absence, women as students are denied female role models, and their interests within the university are not being represented by their own sex. The culture of higher education remains one in which women are still positioned as “other,” that is, differently to their male peers. Equal opportunity policies and initiatives have not led to a shift in the culture of higher education, and the existence of microinequities and unconscious bias render tackling gender discrimination tricky. And of course, it is important to acknowledge the gendered outcomes of higher education; the persistence of a graduate gender pay gap, even for those women who have studied the same subject as their male peers. A report from the UK in 2013,

for example, found that while women as law undergraduates were well represented, they went on to be paid 28% less at the start of their careers in comparison to male law undergraduates.

In conclusion, it might appear that in the twenty-first century, particularly in developed, Western contexts, that gender is no longer an issue. However, caution must be exercised, as this entry has shown. Evaluating the position, status, and experience of women in the academy must remain firmly on the agenda.

Field of Educational Administration and Its Coevolving Epistemologies

Jae Park

The Hong Kong Institute of Education,
Hong Kong, China

Synonyms

Coevolution; Educational administration and management; Epistemological pluralism; Field of study

The theory and practice of educational administration and management have been arenas of competing intellectual traditions. Related literature elaborates on the strength and weaknesses of various research methods and practices, the corresponding epistemologies and, ultimately, the underlying philosophies of science. This entry opens with a historiography of administration and management studies and the question of whether educational administration and management constitutes a *field* of study in itself, and, if this is indeed the case, what could possibly be the field's *conditio sine qua non*. It is suggested that it has been the very coexistence and coevolution of contentious administrative practices and theories that give way to the *field*, which continues to be withstood by a tension between scholarly pluralism and an intuitive/instinctive (hence, categorically irrational) belief that there must be one single greatest research framework-methodology, epistemology, and best practice. To maintain a salutary tension between theory and practice, as well as among multiple epistemological traditions – which has historically been the main

concern and contention in the *field* – educational administration and management must continue aiming at the betterment of education as a whole by means of rational, honest, and liberal debates instead of intellectual exclusivism and isolation.

The management of education as practice existed long before its transformation into a scholarly discipline in and of itself. Ancient civilizations of the East and the West, from the Confucian *Great Learning* to the Greek *Paideia*, never dichotomized education from culture, humanities, polity (Greek πολιτεία), tradition, literature, and mind-heart (Chinese 心 *xin*). Rather, education and family/society were inextricably linked, to be looked after by households and State administrators, that is, “citizens,” as in the Aristotle's *Politics* and *The Athenian Constitution*.

When modern rationalism brought about the practice-theory dichotomy heralded by the Cartesian distinction of *res extensa* and *res cogitans*, the already widespread social practice of administering and managing education grew to be popularized and institutionalized, overlapping – not entirely by chance – with the introduction of humanitarian mass public education by Joseph Calasanz.

Social practice alone, however, did not constitute an academic field of study or *field*. It was only in late modernity that educational administration and management (EAM) emerged as an academic discipline with its own theory added to practice, although it is not clear exactly when. Etymology can assist in the task of identifying the emergence of the EAM as a *field*. The *Oxford English Dictionary* (OED) (OED 2012) is of particular interest because, unlike Spanish or French dictionaries that only recognize words officially sanctioned by their national language academies, the OED attempts to identify and date the earliest usages of terms recorded in the public domain.

The English verbs “to administer” and “to manage” derive from Latin to denote serving and handling things and issues. “Administration” as a noun initially indicated “providing something” as in administering justice or religious sacraments. The meaning of public function or office emerges around the late fifteenth century. In the Napoleonic era, there emerges the idea of people

responsible for an organization, who are considered collectively as the managing body or administrative department of an organization or business. The concept that an administrator should be a leader vested with authoritative power is really quite recent – the term “administration leader” was first coined in an academic paper from *The Quarterly Journal of Economics* in 1907.

In the seventeenth century, the English noun “management” already connoted the supervising or ministering of enterprises and people; it was, thus, only nominally distinguishable from the term “administration.” It was also used pejoratively, as an irony about or mischief played on a victim, what educationalists today might call bullying. It is only in the early nineteenth century that “management,” in the sense of a governing body of an organization or business, first emerges (OED 2012). In the March 1893 issue of *The Economic Journal*, “management” indicated for the first time the character of a scholarly discipline or science, as evidenced by the use of “management committee,” for example. The term *scientific management*, coined by Louis Brandeis, was first utilized in 1911 by F.W. Taylor who pioneered the moving of managerial practices from the domain of art/craft to the “science” of multiple observations and deductions, leading to the generalization and practice for higher productivity also known as *Taylorism*. However, alongside Barnard, Urwick, and Fayol, Taylor has been counted as a “practitioner-scholar,” as opposed to a pure theoretician such as Herbert Simon and his theory of scientific decision-making (Greenfield 1986). Related technical concepts multiply around the same period. The term “management consultant” appears in the 1935 *Manhattan Classified Telephone Directory* and July 1938 issue of *The Journal of Business of the University of Chicago*.

“Management” as a subject matter worthy of being taught – hence the compound “management education” – was first published in *The Journal of Education* in 1920. Finally, the terms “management science” and “institute of management sciences” (different from Taylor’s *scientific management*) were first published in 1954.

The fact is that, at the turn of the twentieth century, “management science” was a subject to be taught; “administration leader” surreptitiously entailed what Michel Foucault would classify as a “system of differentiation of power”; and, such terms were used mostly in academic circles. This suggests that general administration and management was already an academic and public discourse, with the majority usage seemingly coming from American academia. In other words, at the turn of the twentieth century, general administration and management had been discursively constructed as a field of study.

Although a typical historiography of EAM almost always starts with narrative of scientific management or administrative science (Greenfield 1986), it is uncertain that EAM was regarded as a distinct *field* from general administration and management. The dawn of the EAM *field* is often traced to the 1950s and 1960s, with applied/behavioral psychologist A.W. Halpin’s comparison of the leadership of aircraft commanders with educational administrators and D. E. Griffiths’ theorizations of educational leadership, hence the appellatives *New Movement* and *Theory Movement*.

An alternative account of EAM as a *field of study* dates it back to the writings on school hierarchy and leadership of William Payne in 1875, followed by the creation of training courses for school practitioners at the University of Michigan and Columbia University’s Teachers College. This view relies on the fact that there were public schools and discussions surrounding autonomous local educational leadership in the United States from the 1830s. This could perhaps indicate that related managerial conjectures and polity constituted a *discipline* (Blount 2013), although it is not clear that such archaic educational administrative debates and practices became a *field*. Soon after this, John Dewey was prolifically writing in clear managerial terms about the “organization and management of the school or system of schools” (1895), the “mechanics of school management” (1904), and the “modes of school administration” (1933).

It is uncertain whether these “practitioner-scholars” (Greenfield 1986) with their pragmatic

arguments and intents meet other two important conditions of an academic discipline: a social space where the interplay between structure and human agency takes place and an inner coherence of a substantive subject matter with identifiable boundaries.

Despite the fact that theories such as motivation, leadership, managerial skills, organizational culture, and transformative action still form the main bulk of its scholarship, the EAM *field* appears to resist being associated with the mainstream business administration field. Instead, it relies more on the paradigm of Western social science. This has guided the field's development since the 1950s as experts of the field such as J. Darech, P. Hallinger, and A. Walker have suggested.

EAM has long been associated with developments in general social science. The latter per se, however, does not provide EAM with a distinct social space where the interaction between structure and human agency occurs. A common opinion among scholars in the field is not that social science and EAM are undistinguishable but, rather, that EAM heavily depends on social science research frameworks and methods. If sociology as a science is to be traced back to Auguste Comte, it is only natural that the EAM *field* has relied on scientific methods of an empirical-positivist kind.

Bourdieu's concept of an academic *champ* (1969) is not a physical location but a social structure and arena in which participating agents pursue desired resources, power, and ideas. It is mainly over the latter that scholars in the EAM *field* struggle (conflict theory perspective) and toil (functionalist perspective) to discover new frontiers of the *field* by expanding it further, by building upon existing knowledge, or by demolishing it critically with a promise of reconstruction. Such dynamics between structure, agency, and discourse occurs in EAM, with a global network of experts and societies devoted to it who consider themselves knowing, justifying, exploring, and doing EAM (Evers and Lakomski 2012). Furthermore, this ripples out to greater academic circles and the general public through a score of reputed academic journals such as the *Journal of*

Education Administration. Nevertheless, the *field* itself emerged (literally, as in complexity science) founder-less, unforeseen, and unexpected "while" and "with" scholarly publications and debates were taking place in the referred arena. To reiterate, EAM became a *field* as scholars were discussing, examining, criticizing, and arguing about their common concerns, while they feel, believe, and enact identities as members of a community of inquiry. This has important implications for one of the main claims of the present encyclopedic entry: coexistence and coevolution of multiple epistemological traditions gave rise to the EAM *field*.

Such efforts of the EAM *field* balance over two fulcra. The first is the tension between theory-oriented scholarship and practice-oriented research (Park 2015). This distinction can be traced back to the Aristotelian distinction between theoretic knowledge that aims at truth and practical knowledge that aims at action (*Metaphysics* 993b19-23). Yet this does not imply a total separation between administrative theory and practice, denounced as one of the key dichotomies causing harm to the field (Evers and Lakomski 2012). The to and fro between the two edges, theory and practice, constitutes an epistemological dualism in its own right, reported to have historically been more persistent than the dialectics between positivist and non-positivist scholarship, as elucidated by D. E. Griffiths and D. Willower.

A second fulcrum has been the debate over one of the most critical issues in the field, namely, a lack of dialogue between the humanities and the logical empiricist version of science, in other words, the dichotomy between the theoretical elaborations and the hypothetico-deductive pursuits of the so-called science of educational administration. This tendency to make a clear-cut distinction between science and humanity-arts within EAM academic circles was analyzed early on by T. B. Greenfield in favor of the humanities, even subjectivist humanity, over positivist science and, by Christopher Hodgkinson, in favor of genealogical moral philosophy. These were in turn counter-refuted, in a Popperian fashion, by the *naturalistic coherentism* that advocated a continuum between the natural sciences and the

humanities in EAM (see works by Evers and Lakowski). Similarly, it is undeniable that changes in the *field* of sociology greatly influenced both the theory and practice of schooling. The transition from Weberian and Durkheimian bureaucratic and functionalist society to the post-industrial era gave way to more critical – if not deconstructivist – political, and epistemological theories by neo-Marxian as well as neo-Kantian liberal theories proposed by J. Rawls and, after him, K. Strike (Bates 1983).

The greatest challenge for EAM to be considered a *field* is the inner logical coherence of a substantive subject matter with identifiable boundaries that makes it distinguishable. At first sight, the boundaries between EAM and general social science and general administration and management can hardly be regarded as strong as clear. It is common for faculties/schools of education around the world to be classed as social sciences. Furthermore, key issues addressed by the EAM *field* are often indistinguishable from general administration and management in which educational institutions are but a type of organization. If these considerations and practices are further entertained, it is not unthinkable that EAM be subjected to a *reduction* or *inter-theoretic reduction* by which science itself tends to merge disciplines and fields into by the principle of Ockham's razor. From medicine to law, there is a burgeoning number of specialisms that get further atomized into subspecialisms, each with its own pretention to be an independent field. In this view, EAM is a likely candidate to be merged into the *field* of education as an area of enquiry in, say, education policy or general administration where education would be a type of organization or enterprise. A relatively recent – but largely unsuccessful – managerial response of global higher education institutions to this problem is the advocacy and establishment of interdisciplinary and multidisciplinary divisions, departments, and research centers.

What has been crucial for even talking about EAM as a potential *field* or *subfield* is an enlightened social space à la Habermas, namely, openness to equality, common concern, and rational argument. Perhaps unwittingly for the

protagonists themselves, the aforementioned experts, and many others, their very academic arguments (theory/practice and multiple epistemologies and their underlying philosophies) gave origin to and have nurtured the EAM *field*. Rather than a community of like-minded individuals and one homogeneous epistemology, it was the pluralism, coexistence, and coevolution of contentious practices/theories as well as variation in epistemological and methodological commitments that constructed the *field*. In this interpretation, scholars in it are adaptive agents who form a structure/system (a community of practice or inquiry, if terms other than complexity are used) where they act and interact influencing each other's changes over time. This systemic environment or complex adaptive system where divergent epistemologies coexist and coevolve is precisely a *field*.

The most formidable enemy for the EAM *field*'s sustainability is perhaps therefore exclusivism a not-quite-scientific conviction that there ought to be one single rationality, an exclusive research framework-methodology, epistemology, and a single set of "best practices." This clashes with the coexistence and coevolution of different intellectual traditions. In order to contribute to the betterment of education as a whole, the EAM *field* should remain open as an adaptive system. Furthermore, rather than grand treatise-like and exclusive theoretical claims, it has been suggested a thematic approach to theoretical elaborations seems better suited and healthier to the field (Park 2015).

In conclusion, educational administration and management is a rather complex *field* with weak boundaries forged by a community of diverse practices and theories. Without pretension to be a postmodern critique, a dichotomy between these two seems untenable because theory informs practice, and observed/experimented practices tend to be theorized. The interplay of structure and agency leading to developments of theory and practice in the *field* does not hinge on uniformity but contrast among various epistemological commitments and the corresponding philosophy of science that allow equally diverse approaches and engagements with it. Precisely, this tension among every so often contentious positions and their debates over theory and practice have given

birth, energized, and sustained the *field*. Field contributors' conjectures meet refutations triggering further claims and rejoinders. After all, this is how sciences advance, not by dogma but falsification. As the saying goes, problems worthy of attack prove their worth by hitting back. Theorization of educational administration and ethics converges here as scholars attempt to fathom human actions and practices in the *field*. It is this tacitly agreed environment of critical dialogue and diversity of practice that is likely to be conducive to further expansion of the *field*. The real challenge lying ahead of the *field* of educational administration and management is scientific and moral coherence of its protagonists and critical respect for their coevolving epistemological pluralism.

Introduction

Fonua has been researched and introduced to academia by Tongan scholars (Mahina 1992; Taufe'ulungaki 2004, as cited in Tu'itahi 2005).

This entry starts by defining the word/concept and then discusses the Samoan equivalent, which is fanua. Then there is the unpacking of the multiple meanings of fanua and its cultural relevance to Samoan people. What follows is a brief overview into the significance associated with i'e toga (fine mats) and the importance of sacred relationships.

Definition

Fonua is a Tongan concept that best describes land, people, and ongoing relationships (Tu'itahi 2005). The same concept is acknowledged by the various Pacific Island cultures. Fonua is the word for Tonga and Niue. For Maori it is whenua; Samoa, fanua; Fiji, vanua; Cook Islands, 'enua; Tokelau, fenua; and Tuvalu, manafa.

Fonua also connects the various stages of the cycle of human life. For example, a baby is born into the fonua (land); she experiences life and builds relationships with the fonua (land). The baby's fonua (placenta) that nourished and supported her is buried back to the fonua (physical land). The pito (umbilical cord that connects the baby to the fonua, placenta) is also buried in the fonua (physical land). When she dies, she is buried in her fonualoto (land within the land or grave) (Tu'itahi 2005).

Fanua

For the Samoans the burial of the fanua (placenta) and pute (belly button stump) involves a special blessing by the faifeau (minister), which is later followed by a celebratory feast by the aiga (family). As the fanua is buried, a tree or plant is placed on top to symbolize that this belongs and connects to a particular child, and therefore as the tree grows, so too the baby develops and is nurtured and cared throughout his/her life. Sometimes the pute is brought back from overseas for burial on the family fanua (land), in the belief that as these Samoan children grow up in foreign places, they will one day travel back to Samoa, to their other home and place of belonging (back to their fanua) (Utumapu-McBride 2014).

There are cultural protocols that expectant mothers adhere to protect themselves and their babies. For example, the mother is never left alone; there is always someone with her and walking behind her, especially at night time as the spirits are drawn to her baby. The mother's hair is always tied up and not loose. Some chores are forbidden, like hanging the laundry. Mothers are taught not to wear helter neck tops or dresses with ties around the neck, nor do they wear bathing towels or lavalava around their neck either. This is to prevent the umbilical cord from being wrapped around the baby's neck. When mothers consume food like a roast meal, they are not allowed to cut the meat and eat it directly from the serving dish. The food must be eaten only from their own personal plate. A pregnant woman should not consume food that has been contaminated or stolen. When the baby is born, there are several traditional massages, like for mumu (inflammations and swellings) and to help with ila (birthmark and rash) with Samoan oil, plants, and herbs (like fuefue sina, also known as *Vigna marina*) (University of Hawaii at Manoa n.d.).

According to Tui Atua (2009), many Samoan words used today bond man and his environment in spiritual ways. For example, the Samoan terms for eleele (earth) and palapala (mud) are also the words for blood. Fatu (rock) is also the word for heart. Fanua (placenta) is also the word for land. For Samoans this shows how Papa and Eleele are the descendants of man. Even more so the burying of the pute (belly button stump) and fanua (placenta) into the land or earth shows symbolism in these rituals, which connects spirituality with the harmony and respect for the environment. The naming of a baby has special significance and draws connections from tua'a (ancestors), aiga potopoto (extended family), and fanua (land) (Tagoilelagi-Leota et al. 2013).

Samoa's Tusi Fa'alupega (village salutations) contains all the hierarchies for all families in both Samoa and American Samoa. The chief/orator title/s shows where each family is placed throughout the land. It shows the stratified layers of high-ranking chief and orator families. The Tusi Fa'alupega also identifies the names of the fanua (land) and the malae (open area of land where

ceremonies are conducted) for each family, including the name for the taupou (high chief's daughter) or manaia (high chief's son). A position of a family within a nu'u (village) can be easily traced by using the Tusi Fa'alupega. This wealth of cultural knowledge is learned by a matai (chief/orator) over time and recalled and spoken in speeches at ceremonies and significant events. For Tagoilelagi-Leota (2010), she states:

A Samoan child comes to the centre not alone but armed with his/her family gafa (genealogy), language and culture as a protective cloak that also contributes to learning. Within this gafa lies the fa'alupega of the children's families and villages in which people take pride when they are publicly acknowledged. (p. 43)

A strong sense of patriotism is also expressed when reflecting in one's fa'asinomaga (cultural identity) in regard to fanua. Samoan people take pride in their connection to fanua and culture, as seen in the uptake and display of cultural tattoos, whether full-body pea for men, malu for women, and taulima (ankle, hand, elbow, or shoulder tattoos). In addition to the other aspects of fa'asamoa aganu'u (Samoan culture) that show loyalty and allegiance are tautua (service), alofa (love), and fa'aaloalo (respect).

Even though some of the fanua in Samoa is government owned and freehold, most of the land is customary (under the control and guardianship) of matai (chiefs) of a nu'u (village) that represent the collective interests of the aiga potopoto (extended family). In Samoa the fanua tanu (burial place) can be either on family fanua (land) or at a communal or village tu'ugamau (cemetery). Before a tree is cut down, a fa'alanu (or prayer chant) is performed. This seeks permission from the god of the forest for taking the tree or using any of its parts (Tui Atua 2009).

There are also the indigenous cultural beliefs, which are still adhered to nowadays. For example, the crying of the ve'a (banded rail bird) serves as a warning that something bad is going to happen. This is also the same as hearing the eerie crying of a cat at night, an omen predicting death. Even having dreams, about a wedding or teeth, is also a signal of pending bad luck or having an eye that continues to twitch (means that something is

wrong). The superstitious beliefs that have been passed down by our elders, such as covering the mirror at night, to avoid seeing the reflection of an aitu (spirit/ghost). In particular villages in Samoa, the aitu take offense easily; therefore people have to behave accordingly and respectfully (especially outsiders).

I'e Toga

I'e toga (fine mat) is a product from the fanua (land), made from the leaves of the pandanus plant. It is also known as measina a Samoa (a precious, cultural treasure). The i'e toga is presented at ceremonial occasions or events that mark the life span development of a Samoan person. At birth the i'e fa'atupu (mat for the king) when presented represents the child, his/her position in the aiga, ancestry links, and her link to the fanua. The same i'e toga will reappear again when the child is older at his/her wedding day. The various i'e toga are presented at particular significant stages of a Samoan person's life, such as between birth and death. Ulumoega o le fa'afailelegatama (mats and i'e toga given by the mother's family to the father's family) also includes fala pepe (baby mats) and i'e fa'atupu and i'e fa'amatua (marks the milestone of first-time parents). Ulumoega o le fa'aipoipoga (i'e toga) these are presented by the bride's family to the groom's family before or after the wedding. The i'e fa'atupu is then presented to the husband's family. This important gathering of the two families is where the bride meets her new in-laws chaperoned by her aiga potopoto (extended family) and her ancestors (Tagoilelagi-Leota et al. 2013).

I'e o le mavaega (special fine mats at a funeral) is often presented by either the husband or wife's family when he/she dies; this i'e toga is to say goodbye to the deceased person, marking the end of his/her life span (Tagoilelagi-Leota et al. 2013). Other important events when i'e toga are given are saofa'i (bestowal of titles to chiefs or orators); opening of churches, schools, halls, and other buildings; liutofaga (reburial); induction of a new minister; unveiling of a headstone; birthdays;

graduations; and ifoga (ritual where the offending person/s pleads for pardon from the offended person/party).

Sacred Relationships

There is a sacred relationship between parents and their children. This began when mothers started nurturing their babies from their fanua (womb). Parents provide love and support for their children as they grow. Hence it is the beginning of sowing the seeds of obligation and loyalty, whereby children are always expected to listen and obey their parents, with the apron strings being cut at death. Unlike the Western universal notion of independence or complete freedom from parents/elders upon reaching a particular milestone, like turning 21, joining the workforce, being eligible to vote, or moving out of the family home, these are not recognized by Pacific Island cultures.

There is also a sacred relationship between brother and sister, known as feagaiga. According to Tui Atua (2009), “the feagaiga was founded on the principle that women have the gift of producing and nurturing life. As child bearers women were seen as sharing divinity with the gods” (p. 111). The sisters were seen as the peacemakers of a family, as well as being capable of granting blessings or curses. Feagaiga has also been extended to all families and to the faifeau (minister) (Tui Atua 2009). In old Samoa, “women had the highest authority, such as the sisters of the ali’i (high chief) and in every aiga (family) the sisters of the matai (chief) had authority over family matters” (Meleisea et al. 1987, p. 28). For the faifeau, the relationship with his/her congregation is also sacred. The literal translation of the word faifeau means someone who does chores or the servant of God.

Conclusion

The concept of fonua/fanua represents the cultural ecology or cyclic bond with the interlocking connection of land, people, and ongoing relationships. For the Samoans there is always a link

with the fanua; it is about the place of birth, sense of belonging, cultural identity, and the love and tautua for the family.

Formation of School Subjects

Ivor Goodson

University of Tallinn, Tallinn, Estonia

Introduction

This entry examines the history of subject knowledge from the early 1960s to date, through the work of critical theorists and sociologists. It looks at the reexamination of the role of sociological and historical methods in the study of curriculum and the importance of understanding the social history of the school curriculum and in particular school subjects.

Studying Subject Knowledge

In Britain in the early 1970s, there was a wave of change in secondary schooling from a previously selective “tripartite” system toward a fully comprehensive system where all types and abilities of children were grouped under the roof of one school. This transformation in the organization of secondary schooling led to an interesting series of curriculum debates both within schools and outside schools about the form that the comprehensive school curriculum should take. In addition to comprehensive reorganization, the regime of school examinations was fairly liberal at the time and a good deal of work was done to define “mode 3” examinations. These examinations were set up and partially conducted by the teachers themselves in association with examination boards (the Associated Examining Board was a pioneer in developing this mode).

Basil Bernstein, Michael Young, and Brian Davis at the Institute of Education in 1969/1970 were examining issues of knowledge and control, and a series of new mode 3 examinations were being developed in new subject areas such as environmental studies, urban studies, and community studies. These new subject areas seemed to offer the chance of better patterns of motivation and involvement for the children of working

people than had been on offer from the more “traditional subjects.” Certainly the levels of interest and engagement that these syllabuses facilitated seemed to imply that here were new approaches to learning which may well improve on or at the very least complement the traditional subjects of the secondary school curriculum.

Toward a History of School Knowledge

So far studies of the history of contemporary knowledge, let alone school knowledge, have tended to resemble the pre-paradigmatic stages of disciplines and a new wave of work began to emerge in the 1970s. The studies have argued that in school curricula “by extending our sense of history we can develop a different way of viewing the species” (Macdonald and Walker 1976, p. 86). Mary Waring’s work on Nuffield science was developed from a similar perspective:

If we are to understand events, whether of thought or of action, knowledge of the background is essential. Knowledge of events is merely the raw material of history: to be an intelligible reconstruction of the past, events must be related to other events, and to the assumptions and practices of the milieu. Hence they must be made the subject of inquiry, their origins as products of particular social and historical circumstance, the manner in which individuals and groups have acted must be identified, and explanations for their actions sought. (Waring 1975, p. 12)

The justifications for historical studies of the evolution of school knowledge can be found at the level of thought and action.

Firstly, such work will improve social scientific of school knowledge. Historical studies can elucidate the changing human process behind the definition and promotion of school subjects. Employing this strategy shifts the emphasis from questions of the intrinsic and philosophic value of subjects, from their existence as objective realities, to the motives and activities immanent and inherent in their construction and maintenance. Further, historical scrutiny offers insights into the existence of patterns and recurring constraints: why, for instance, certain “traditions” in school knowledge survive and others disappear. While historical studies do not as their major intention

seek to prove particular theories, nonetheless they may use and contribute to theory.

Secondly, at the level of school practice historical studies can aid analysis. Such studies might even aid in explaining the emergence and maintenance of anti-research traditions among teachers. Partly, teachers' antipathy derives from the point Shipman et al. (1974) makes about the curriculum project he was involved with:

The end-product of the project was determined in the field, in contact with the school, not on the drawing board. . . in the end it was what worked that survived. Shipman et al. (1974, p. 2)

But the autonomy of the teacher, his capacity for active reinterpretation, should not be overestimated for major constraints do exist. Hence, Shipman's judgment in a sense missed the point: only what is prepared on the drawing board goes into the school and therefore *has a chance* to be interpreted and to survive. Exploring the editing process which takes place on the drawing board of history with respect to school knowledge is more than static historicism. By understanding this process, it is possible to argue a range of constraints that are immanent in the teachers' work. Historical studies should be a prerequisite to attempts to change classroom practice. Linking the teacher to the history of her/his working milieu could further the potential for actively creating new history.

Studying Subject Knowledge

As can be seen in the above, a good deal of this research program for developing a social history of school knowledge owed a debt to the work of critical theorists and sociologists of knowledge from the 1960s to 1970s onward.

At that time, a new impetus to scholarship on school subjects had come from sociologists and specifically from sociologists of knowledge. Writing in 1968, Frank Musgrove exhorted educational researchers to "examine subjects both within the school and the nation at large as social systems sustained by communication networks, material endowments, and ideologies" (Musgrove 1968, p. 101). In the communication networks, Esland

(1971) later argued that research should focus, in part, on the subject perspective of the teacher:

The knowledge which a teacher thinks 'fills up' his subject is held in common with members of a supporting community who collectively approach its paradigms and utility criteria, as they are legitimated in training courses and 'official' statements. It would seem that teachers, because of the dispersed nature of their epistemic communities, experience the conceptual precariousness which comes from the lack of significant others who can confirm plausibility. They are, therefore, heavily dependent on journals, and, to a lesser extent, conferences, for their reality confirmation. (Esland 1971, p. 79)

Michael F. D. Young (1971) sought to follow up the relationship between school knowledge and social control and to do so in a manner which focused on content and form. He argued, following Bernstein, that:

Those in positions of power will attempt to define what is to be taken as knowledge, how accessible to different groups any knowledge is, and what are the accepted relationships between different knowledge areas, and between those who have access to them and make them available. (Young, 1971, p. 31–32)

His concern with the form of high-status school subjects focused on the "organizing principles" which he discerned as underlying the academic curriculum:

These are literacy, or an emphasis on written as opposed to oral presentation, individualism (or avoidance of group work or cooperativeness) which focused on how academic work is assessed and is a characteristic of both the 'process' of learning and the way the 'product' is presented; abstractness of the knowledge and its structuring and compartmentalizing independently of the knowledge of the learner; finally and linked to the former is . . . called the unrelatedness of academic curricula, which refers to the extent to which they are 'at odds' with daily life and experience. (ibid, p. 38)

This emphasis on the form of school knowledge should not exclude concerns like that of Williams with the social construction of particular contents. The crucial point to grasp is that it is the interrelated force of form and content which should be at the center of the study of school subjects. The study of subject, form, and content should moreover be placed in an historical perspective.

In fact, Young later came to acknowledge the somewhat static determinism of his earlier writing in knowledge and control and to argue that historical work should be an essential ingredient of the study of school knowledge. He wrote of the need to understand the “historical emergence and persistence of particular conventions (e.g., school subjects).” By failing to situate the problems of contemporary education historically, one is again limited from understanding issues of politics and control. He concluded that “one crucial way of reformulating and transcending the limits within which we work is to see. . . how such limits are not given or fixed but produced through the conflicting actions and interests of men in history” (Young 1977, pp. 248–249). Young’s recent work moves back to a more concise concern with subject knowledge (Young 2008).

New Directions for Studying School Subjects

The important work by sociologists of knowledge in defining research programs for studies of school knowledge led on to an acknowledgment by some of them that historical study might complement and extend their project. In studying school subjects, the enquiry has arrived at a new stage. Sociologists of knowledge like Bernstein and Young, subsequently, have played a vital role in rescuing and reasserting the validity of this intellectual project; in the process, however, some of the necessary focus on historical and empirical circumstances has been lost. The task undertaken was to reexamine the role of sociological and historical methods in the study of curriculum and to rearticulate a mode of study for extending an understanding of the social history of the school curriculum and, in this work, particularly school subjects.

Beginning in 1985, *Studies in Curriculum History*, a series of 20 books, was launched with this view in mind. In the first volume, *Social Histories of the Secondary Curriculum* (Goodson 1985), work was collected together on a wide range of subjects: classics, science, domestic subjects,

religious education, social studies, and modern languages. These studies reflected a growing interest in the history of curriculum and, besides elucidating the symbolic drift of school knowledge toward the academic tradition, raised central questions about explanations of school subjects whether they are sociological or philosophical.

Emergent work in the United States began to focus on the evolution of the school curriculum studied in historical manner. Kliebard’s (1986) writing on the curriculum in the United States from 1893 to 1958 discerned a number of the dominant traditions within the school curriculum and, as noted, came to the intriguing conclusion that by the end of the period covered the traditional school subject remained “an impregnable fortress.” His later set of essays usefully complements this theme (Kliebard 1992). However, Kliebard’s work does not go into the details of school life. In this respect Franklin (1986) provided some valuable insights in a case study of Minneapolis. Here the vital negotiation from curriculum ideas, the terrain of Kliebard’s work, toward implementation as school practice is seen. In addition, a collection of papers put together by Popkewitz (1987) examined the historical aspects of a range of subjects: early education, art, reading and writing, biology, mathematics, social studies, special education, socialist curriculum, and a study of Rugg’s work. Likewise, Apple’s work provided helpful studies of school texts (Apple 1993).

The study of the written curriculum of school subjects should afford a range of insights into schooling. But it is very important to stress that such inquiry must be allied to other kinds of study: in particular studies of school process, of school texts, and of the history of pedagogy. Hamilton (1989; reissued 2013) elegantly sought to capture some of these complexities as they intersect and interact. Schooling is composed of the interlinked matrix of these, and indeed, other vital ingredients. With regard to schooling and to curriculum in particular, the final question is “Who gets what and what do they do with it?”

The preactive definition of school subjects is part of this story. That is not the same as asserting a direct or easily discernible relationship between

the preactive definition of subjects and their interactive realization in classrooms. It is, however, to assert that the written curriculum most often sets important parameters for classroom practice (not always, not at all times, not in all classrooms, but most often). The study of written curriculum of school subjects will firstly increase understanding of the influences and interests active at the preactive level. Secondly, this understanding will further the knowledge of the values and purposes represented in schooling and the manner in which preactive definition, notwithstanding individual, local, and national variations, may set parameters for interactive realization and negotiation in the classroom and school.

The Need for Curriculum History

The danger of breaking the links between interaction and historical circumstances can be well illustrated by studies of curriculum definitions and classroom practice. Through interactionist overreaction, practice in classrooms can be elevated to a pedestal where the curriculum is seen as presented and negotiated by the teacher as agent. Even where the curriculum, as in the National Curriculum, has been clearly politically designated elsewhere, interactionist and micropolitical studies hold on to the agency of the teacher.

This view conspires with the view of government regimes that say when learning fails to take place, the teacher as front-line agent must be, by definition culpable (or incompetent). The preactive definition of the curriculum and of general historical circumstances is lost in the spectacle of classroom myopia (see Goodson 2014).

In much of their work on curriculum, philosophers have taken the curriculum as a given. Hence the historical environment in which knowledge is socially produced has been ignored. This ahistorical aspect of philosophy has defused its capacity to act as an antidote to the transcendence and immersed immediacy noted above.

Hirst (1967), for example, talked about school subjects “which are indisputably logically cohesive disciplines” (Hirst 1967, p. 44). In fact such a philosophical perspective is rooted in particular

and rather contestable educational convictions. Most notable is the assertion that “no matter what the ability of the child may be, the heart of all his development as a rational being, I am saying, intellectual” (Hirst 1976). In accordance with these convictions, Hirst (and also Peters) argued that “the central objectives of education are developments of mind” (Hirst and Peters 1970, pp. 63–64). These objectives are best pursued by “the definition of forms of knowledge” (later broadened to include “fields of knowledge”). These forms and fields of knowledge then provide “the logically cohesive disciplines” on which school subjects are based.

The philosophy of Hirst and Peters, therefore, provides an explanatory basis for the school curriculum as trying to promote the intellectual development of its pupils. In their model of school subject definition, it is often implied that the intellectual discipline is created by a community of scholars, normally working in a university, and is then translated for use as a school subject. Phenix (1964) defines the intellectual discipline base in this way:

The general test for discipline is that it should be the characteristic activity of an identifiable organised tradition of men of knowledge, that is of persons who are skilled in certain specified functions that they are able to justify by a set of intelligible standards. (Phenix 1964, p. 317)

When such a discipline has been defined and promoted and a university base has been established, it creates a cycle of virtuous self-fulfillment to argue that this is a bona fide academic form of knowledge. This academic discipline can then define and direct the “academic” school subject. The model, by ignoring historical process entirely, celebrates this fait accompli in the painstaking creation of disciplines and associated school subjects. This model is devoid of explanatory potential because the stages in the promotion and emergence of disciplines and subjects are left unexplored, as are the reasons for the “symbolic drift” toward academic forms. In fact, academic subjects tend to follow similar evolutionary profiles which tell us a great deal about the structuring of material interests and resources (Goodson 2014). By examining school subjects

as “professional communities” with clear “missions” and underpinning material interests, it is possible to understand the symbolic drift of academic disciplines and school subjects toward common culminating patterns.

Foucault and Educational Administration

Richard Niesche

Introduction

The aim of this chapter is to demonstrate the usefulness of Michel Foucault’s work for the study of and research in educational

administration. While Foucault's work has been used extensively across many domains within education and to some extent in educational administration, his ideas can bring significant utility in identifying the operation of power, the formation of subjects, and problematizing ongoing claims to totality and best practice that routinely appear in the fields of educational administration and leadership. In meeting these aims, this entry is divided into two main sections: first, an examination of some Foucauldian ideas and concepts in the form of a "toolbox" that can be "put to work" in educational administration and, second, the implications for the problematization of knowledge construction in the area of educational administration. Specific concepts examined include discursive practices, disciplinary power, subjectivity, and ethics. The application of these concepts will be linked to some examples of research that have been undertaken in the field drawing on Foucault's ideas. This line of inquiry will be of significant interest to those seeking to work with more "critical" perspectives in educational administration, management, and leadership studies.

Building a Foucauldian Toolbox

The influence of Michel Foucault's work has been far reaching throughout much of the humanities and social sciences. Education, and even in recent years, educational administration, has also seen an increasing array of applications of Foucault's ideas. This has not been an easy undertaking for scholars of educational administration as the field has very much been a core part of the modernist project of education and contains a variety of discourses that Foucault's work certainly challenges and problematizes. More critical approaches, such as those drawing on the work of Foucault, are still very much marginalized in the field of educational leadership, management, and administration. As a field, educational administration (including the much more faddish term "leadership") has drawn on a variety of competing approaches such as (but not limited to) scientific, problem solving, humanist, moral, and symbolic

interactionist with which to understand educational administration. Critical theorists, phenomenologists, feminists, and poststructuralist approaches have also been drawn upon to constitute fields of knowledge and also shape the knowledge production of educational administration. The importance of Foucault's work is that its criticality not only leads to a troubling of mainstream educational administration discourse but also allows for more generative approach to think differently about educational administration. Foucault actually said little about education and educational administration. However, he was very much concerned with the administering and governing of lives and individuals within particular regimes of practices.

Discursive Practices

Foucault is well known for his historical investigations into the links between rationalization and power in specific areas such as prisons, hospitals, asylums, and sexuality. Central to much of this work is the notion of discourse as well as, more specifically, discursive practices. Broadly speaking, Foucault uses discourse to refer to the historical traces of things that are said, or a complex set of practices that privilege some statements and exclude others. It is not simply about language, although individual statements are important. Discourse is importantly linked to both relations of power and the formation of knowledge. In order to understand discourse and analyze discursive practices, Foucault argues that they must be examined where and when they occur (see Foucault 1972).

Furthermore, Foucault famously stated that discourses "are practices that systematically form the objects of which they speak" (Foucault 1972, p. 54). He goes on to say that discourses are more than just language and it is the more that one needs to reveal and describe. It is in the *practices* that certain truths are inscribed and knowledge is produced. The focus is less on the explicit language or linguistic structures but more so the ensemble of discursive practices that constitute what counts as truth. To study things as they are said, Foucault describes four rules of discursive formation according to the formation of *objects* (i.e., the objects of discourse), *subjects* (who is

speaking), *concepts*, and *strategies* (Foucault 1972). It is through these rules of formation that Foucault is able to identify specific practices as “places as where what is said and what is done, rules imposed and reasons given, the planned and the taken for granted meet and interconnect” (Foucault 1991, p. 75).

Disciplinary Power

Foucault’s work on power very much centered on the ways that power operates through social relations and in social institutions. In *Discipline and Punish* (Foucault 1977), Foucault was concerned with exploring how individuals are disciplined, managed, and controlled through various practices. These disciplinary practices included normalization, hierarchical observation, and examination. Further to these practices, Foucault argued that Bentham’s panopticon was a central feature of disciplinary society. The panopticon is an architectural mechanism that divided prisoners into separate cells whereby they are under constant surveillance with the central observer unseen so that the prisoners believe they are always on view. Foucault developed these ideas to show how power is exercised or functions as a set of actions upon actions rather than something that is held by an individual. Power is therefore a relation between individuals or groups of individuals rather than existing as a form of domination or repression. It is also important to note that Foucault was not developing a theory of power but, rather, tools for analysis of how subjects are formed through various practices and discourses. These ideas are important for understanding how individuals in schools are constituted as subjects through various educational, societal, economic, and political discourses.

Links to schools and education have been extensively made through Foucault’s work on disciplinary power. The dividing up of school subject areas (or disciplines), for example, is one way that disciplinary practices are brought to bear on individuals for the purposes of normalization, examination, and observation. In relation to educational administration, disciplinary practices are central to the operation of administration of education both on the bodies of educational leaders as

well as through them for the purposes of disciplining others such as teachers and students (see Nietzsche 2011). An understanding of how school leaders and administrators are constituted by and through discourse is a key element of the study of educational administration (also see Anderson and Grinberg 1998; Gillies 2013; Mennicken and Miller 2015).

Subjectivity

In Foucault’s later works, he was interested in clarifying that he was not developing a theory of power but more so developing tools for an analysis of the subject or how individuals are made subjects in various domains. Foucault uses the term subject to refer to two things: first, subject to someone else’s control and dependence and, second, tied to one’s own identity by a conscience or self-knowledge (Foucault 2001a). For Foucault, the subject is constituted and shaped by various discourses that are closely linked to social structures and practices. It is these sets of power relations that need to be described and analyzed. Individuals are constructed through multiple discursive practices and as a result Foucault argues against the notion of the existence of a universal human subject. One of the core aspects of educational administration and leadership has been the attempt to define the leader or leadership in the form of a fixed and therefore usable identity to articulate good leadership or best practice in the functioning of an educational organization. Foucault’s work can be used to disrupt these claims for a universal human subject and seek to develop a more nuanced understanding as to how subjects exist at the intersection of multiple and often conflicting discourses.

Governmentality

The notion of governmentality has been increasingly drawn upon over recent years, particularly in education policy research to argue how neoliberal conceptions of education reform have become pervasive. However, what still remain less common are detailed examinations of specific practices that work to construct particular neoliberal discourse in education as well as the sorts of practices that both make room for and develop

forms of counter-conduct. For Foucault, governmentality is concerned with the rationalities of government or the conduct of conduct. The word conduct specifically refers to behaviors and actions and also to conduct of the self. In order to analyze government, it is the practices that try to “shape, sculpt, mobilise and work through the choices, desires, aspirations, needs, wants and lifestyles of individuals and groups” (Foucault 1991, p. 12). The study of educational organizations, administration, and leadership is an excellent target for these kinds of analyses as education is a vehicle for government to develop specific behaviors and practices of individuals and the population for the purposes it sets out.

Ethics

Towards the end of his life, Foucault spent a lot of time investigating ethics and technologies of the self. Foucault distinguishes between the notions of ethics and morals. For Foucault, morals are the sets of values that are usually prescribed by certain institutions such as the church, families, and schools. Ethics refers to the formation of oneself as a subject according to rules or codes of action. That is, Foucault considers ethics to be concerned with the relationship one has with oneself with respect to codes of action (Foucault 1992). Foucault developed a fourfold ethical framework to understand the aspects of ethical work on the self and in relation to others. These consist of the *ethical substance*, or part of oneself that is to be considered for ethical judgment; *modes of subjectification*, or ways in which individuals are made to recognize or think about their moral obligations; *forms of elaboration*, or self-forming practices or activities; and, finally, *telos*, or mode of being that is characteristic of an ethical subject (Foucault 1992). These ideas have significant utility to understand the work of educators and how they work to become particular ethical subjects, in both the governing of themselves and in the governing of others. Education is a deeply ethical activity and Foucault’s work can allow us to understand such technologies of the self as individuals work towards particular ethical goals and subject positions (see Niesche and Keddie 2015).

Problematizing Educational Administration

Foucault’s work is challenging for educational discourses and particularly discourses of educational administration, management, and leadership. Drawing on Foucault’s concepts requires the exploration of practices that exercise certain relations of power, form particular knowledges and subjects, and as a result construct educational leadership and administration as multiple forms of discourse (Niesche 2011; Gillies 2013) and not a phenomenon that is immediately knowable, instrumentalist, and provides the “truth” of best practice. By problematizing educational administration and examining how particular statements are constitutive of certain discursive formations in relation to educational administration, management, and leadership, it becomes possible to identify how some statements and practices work to privilege particular constructions of educational administration. Foucault uses the term *problematization* to call into question those taken for granted discourses and ways of thinking in the field. Foucault argues that his role is not to prescribe solutions as this would then be instituting new regimes of truth that would also then need to be unmasked (Anderson and Grinberg 1998). Foucault’s aim was to underscore problems, to raise questions that consider issues in their complexity, and to allow those at the grassroots or local level to voice their concerns and be allowed the space to speak. For example, as Foucault explains:

I have absolutely no desire to play the role of a prescriber of solutions. I think that the role of the intellectual today is not to ordain, to recommend solutions, to prophesy, because in that function he [sic] can only contribute to the functioning of a particular power situation that, in my opinion, must be criticised. (Foucault 2001b, p. 288)

In other words, solutions and best practice models to educational administration and leadership need to be interrogated in favor of local practices, studying the exercise of power and counter-conducts. It is for this reason that Foucault has been described as a nuisance for organization studies (Mennicken and Miller 2015).

Foucault's predilection for asking "how" questions rather than "what" or "why" questions means facing disruptive and uncomfortable explanations for organizational phenomena.

Of course, there are a multitude of challenges for anyone wanting to draw on Foucault's ideas in educational administration. First is the complex and challenging writing and language that Foucault used in his works. Second is understanding the context of his writings as they took place during a particular temporal moment in continental philosophy and challenges in postwar France. Third is his numerous influences and engagements with the work of philosophers such as Nietzsche, Kant, Heidegger, Merleau-Ponty and a variety of in-depth historical analyses in fields other than education (although *Discipline and Punish* has been linked to schools as disciplinary institutions). Fourth is Foucault's penchant for changing his views on issues and what might be the overall focus of his overall research project. He would never say that he was wrong but rather that he has changed his emphasis or clarified what his project has been about all along. Therefore tracing a linear progression of ideas is problematic and certainly against the tradition of his writing. Fifth is the difficulty of placing or categorizing his work, as it does not easily fit into any particular categorization. For instance, Foucault has been labeled both a structuralist and a poststructuralist amongst many other descriptions. Sixth are the challenges of choosing which of his concepts to put to work. This is due to the large number of concepts but also their interrelatedness so that distinction between concepts becomes problematic. For example, the interrelationships and slippery language between the notions of power, the subject, regimes of truth, governmentality, pastoral power, discourse, ethics, and biopower (to name a few) illustrate the difficulty of putting these ideas to use in other domains.

Therefore the task for scholars and researchers in educational administration is to draw on the work of thinkers such as Foucault to pose problems and to challenge dominant modes of thinking around efficiency, effectiveness, educational leadership, and best practice. These are the

discourses that marginalize alternative, more critical viewpoints that are still very much needed in the field. Particularly since education reforms premised on moves to school-based management and other neoliberal regimes of practices in education, there is a need to hold to account discourses that continue to maintain the status quo of inequality; the underperformance of minority groups; the privatization of schooling to the interests of big business; the shifting away of education from educational leadership, management, and administration; and other such processes that have worked against more democratic forms of administration and leadership in schools and education more broadly. Sadly, discourses of leadership have been coopted by governments, think tanks, and other vested interests to pursue such policies in education that work against the development of alternative and more transgressive approaches to enduring educational problems.

There needs to be a focus on specific practices, the constraints and possibilities for action, how leaders are constituted as particular subjects, and an understanding of how power relations work to produce certain effects. Foucault's ideas can continue to contribute strongly to these challenges and in fact, in the current educational moment, are essential to criticize the workings of education policy and discourse. However, this is not the only aim of Foucault's work, for there can also be a more generative aspect by creating the conditions for a variety of stakeholders to speak out and have their voices heard. This is possible through interrupting dominant discourses and putting forward ways of thinking differently about educational administration discourse.

Traditional approaches to educational administration have few tools to be able to explain and understand the shifting subjectivities of educational leaders. Rather, they tend to try to identify ideal models of working that can then be transferred to other sites for the purposes of effectiveness and efficiency. Foucault's work offers a different role in examining the variety of power relations that construct multiple subjectivities and, in fact, subjectivities that can often be in tension with one another. For example, maintaining an

educative purpose to administration and leadership as the core purpose of schooling can be in tension with neoliberal discourses and normative models of best practice. Foucault's work seeks different forms of knowledge, to make sense of the contradictions, crack, and fissures in educational administration discourse and to identify practices that are understood in their local circumstances of the school, community, and also broader social, economic, political discourses, and education policies. This can be a fruitful line of inquiry that may provide alternative accounts of administrative and leadership practice in education at a time when such avenues are being closed down through neoliberal education reforms with a particularly narrow and conservative view of educational administration and leadership at its core.

Introduction

When one is speaking about Michel Foucault, it seems that he would be a strange rebellious intellectual with obstreperous dazzling ideas. The question “who is Foucault?” has various responses and some of these can be contradictory. This diversity has masked Foucault's ideas rather than elucidating them. Moreover, Foucault's various works, different contexts of his analyses and discussions, and his intellectual turns during his thinking life have redoubled this ambiguity. While in some papers like “who is author?,” one encounters with a radical structuralist; in later works the footprints of poststructuralism can be traced. Regarding these contradictory descriptions, Foucault attempted to deny some of them on the one hand and acknowledge others or some aspects of them on the other hand (Marshall 1990). In addition, he argued that none of these labels can be fitted to his thought, despite the fact that everyone reflected some aspects of it.

However, when Dreyfus and Rabinow published *Michel Foucault: Beyond Structuralism and Hermeneutics*, Foucault with a comprehensive view redefined his different works as a project concerning the subjugation of human beings. He claimed that he wanted to show different modes of this objectification during the history. Since these various modes have been distributed in different arenas of human social life, Foucault's critical project deals one way or another with these various areas. Education is one of these areas in which human beings are thought to be subjugated. It is a value-laden site that

divides students by labeling and discriminating them in various value systems. All of these reasons persuade us that educational theory can be investigated in Foucault's project seriously.

But can one say that Foucault concentrates on education for its own sake? Many scholars would respond in the negative. For example, Gutting (1994, p. 16) emphasizes that "his theorizing is typically not for its own sake but in response to the demands of a specific historical or critical project." One cannot take Foucault, therefore, as an educational theorist. His studies about human knowledge and educational practices, however, have significant implications. Then, it seems that although his purpose has been breaking various truth idols in human knowledge rather than establishing a new kind of knowledge or theory, his reflections on educational theories and practices have affected the educational arena. Regarding this, Foucault's inspirations for educational studies which signify educational theory and practice in a unique manner will be delineated.

When Foucault speaks of subject and objectification, he recognizes three kinds of relations in which human subjects are placed: relations of production, of signification, and of power (Dreyfus and Rabinow 1982). While relations between different members of a school can be problematized from power relations point of view, curriculum content which is derived from knowledge discourses may reflect signification relations. Therefore, it seems that educational area can be considered in Foucault's project at least from two points of view. While the first perspective concentrates on subject and power networks, the second one puts emphasis on knowledge and power interrelations.

Education, Subject, and Power

In Foucault's view "Man," the central concept of contemporary human science, does not "exist" (Foucault 1973, p. 368). Investigating the various ways in which discourses have transformed human beings to objects, Foucault claimed that human is the "recent invention" of Western culture, or rather, "appears in ambiguous position as

an object of knowledge and as a subject that knows" (Foucault 1973, p. 323). Accordingly, human sciences are based on this active knowing subject and, at the same time, have objectified human being as an object to be known (Marshall 1990). Educational theory, therefore, from this point of view will be a discourse in which human beings are taken as objects. Concentrating on modern notion of human as an object, educational discourse attempts to redefine educational aims, teachers' duties and students' tasks, content of curriculum, methods of learning and teaching, and educational standards.

Consequently, educational theory should be considered as what Foucault refers to in a number of occasions as "culture of the self" (Besley and Peters 2007); a discourse that its major concern is to construct "self" and "subject." Foucault's critical attack on the unique universal nonhistorical reason and the truths generated by it can be understood as decentering the "self." Regarding the two kinds of ethics in Foucault's thought, one based on external codes and the other on independent aesthetic existence, Besley and Peters (2007) distinguish self-denial from self-mastery and attempt to investigate educational theory by this theoretical framework. As a result, some educational approaches, like neoliberalism, that concentrate on external codes can be criticized and assumed as denying the self.

On the other hand, educational area is based on different interactions between many agents like students, teachers, parents, and principals. As these interactions are interwoven with power, investigating them one can find some power relations that objectify human beings. For, in Foucault's view, power is redefined as a texture of human life and relationships. At the same time, educational theories support these hierarchical relations in terms of various justifications. For example, forms of students' seats compared to teachers' positions in classes, place of principal's office in the school and forms of seats located in it for parents, and many other points in the architecture of school buildings establish these hierarchical relations and provide conditions for bringing power to play. Regarding this role of power in educational institutions, Foucault (1979)

emphasizes that *panopticon* is spread throughout all the schools. This panopticon makes everything visible for the power and thereby makes the power more economic and more effective. In addition, pedagogical status of teachers in educational process and procedures of teaching, learning, punishment, and rewarding provide conditions for the exercising of power on students as objects. Teachers are subjugated in this system as well. Rigid objectives, behavioral educational aims, the criteria which identify professional teachers, formal procedures of promotion in teaching, and systems of rewarding and rebuking all surround teachers and bring power to play in educational area. Foucault's critical analysis of systems of differentiations established by traditions, law, and theories can be understood as an attack on these hierarchical relations in which the power exercises on subjects and limiting their freedom shapes them gently as it wants.

Furthermore, educational theories legitimize these exercises of power on subjects. This task can be assumed as a rationalization which occurs in the theoretical atmosphere of education. An educational theory develops knowledge about people, their beliefs, behaviors, and lifestyles to shape them in a special manner. Concepts like "good," "humane," "legal," and "norm" require special kinds of rationalization which attempt to dominate on the whole intellectual arena and justify power role in educational practices.

Thereupon, some concepts like teacher's authority in class and hierarchical relations implied in it should be considered as a kind of instrument at the hands of shaping power for objectification. As a result, concentrating on such problematic relations, Foucault attempted to challenge with educational theories that justify them. Some of the indications of this challenge have been elaborated and expanded in further analysis on, for instance, teaching professionalization (See Labaree, 1992) and punishment (See Marshall, 1990).

Education, Knowledge, and Power

Another way of human objectification is located in relations of significance. One may consider

Foucault's work as tracing these significance relations in epistemic and language areas. According to Foucault, not only every piece of our knowledge has been influenced by power but also it can be a product of power. Thus, power can do many things: "It 'excludes', it 'represses', it 'censors', it 'abstracts', it 'makes', it 'conceals'. In fact, power produces; it produces reality; it produces domains of objects and ritual of truth" (Foucault 1977, p. 194).

When Foucault denies the neutral knowledge and argues that knowledge and power are interrelated, one can conclude that all truths join powers. He takes knowledge and power in one integrated system in which each of them supports the other. In this relational model, power and knowledge transform from two external elements to two inter-related elements that influence each other. There is not, therefore, any liberating truth that can be opposed to power.

Consequently, given human sciences as various discourses in which different truths are constructed, there may be something to be said about sciences and their supposed rigid truths. As Foucault himself claimed, he wants to emancipate people from these strict scientific truths that play the role of rigid prisons:

My role – and that is too emphatic a word – is to show people that they are much freer than they feel, that people accept as truth, as evidence, some themes which have been built up at a certain moment during history, and that this so-called evidence can be criticized and destroyed. To change something in the minds of people – that's the role of an intellectual. (Foucault, in Martin et al. 1988, p. 10)

To emancipate people from such quasi-prisons – that people accept as truth and evidence – Foucault attacks on epistemic areas and truths produced in them. Moreover, in an interview, Foucault points out that his problem is tracing and finding those discursive or non-discursive practices that render something as a matter that can be true or false (Kritzman and Sheriden 1990, p. 257). He argues that what is counted as truth is produced and determined by the discursive practices or conceptual systems. Different conceptual systems and discursive practices then make different games of truth. When

Foucault speaks about truth games, he does not refer to really “true” systems but merely to some sets of conventional rules according to which truth and falsity of a statement is determined. “Truth games” then include the conditions of the emergence of truth and falsehood (Gutting 1994).

These regimes of truths are relevant to social-historical conditions and model truth in a different meaning. In this model, truth is a matter of human world which is made during power struggles. It is constructed because of several complicated types of restrictions. It can justify restrictive effects of power and enable some technologies with the aim of regulating human life. Then, every society and every social condition imply their particular regimes of truth (Foucault 1980, p. 131). Truth regimes, therefore, are combined from contingent matters not pure and necessary truths.

Investigating these “truth games” and their historical features, Foucault tries to break their sacred idols down and touch them by his critical hands. Then, he holds that a genealogist should attempt “to unmask determined ‘truth games’” and observe them in their historical contexts. This renders them as something related to their backgrounds, involving specific technologies and ways by which human beings perceive themselves, and denies their universal necessities (Foucault, cited in Martin et al. 1988, p. 18). As a result of this, people have some relative nonuniversal truths which are open to critique and reexamination.

Truths in educational institutions can play important roles. First of all, schools as formal institutions should shape students’ lives. It seems that knowledge contents actualize this aim more than other components of curriculum. Educational contents, textbooks, and various scientific truths can be seen as instruments of objectification and subjugating students. As a result, the Foucauldian view provides a theoretical perspective to investigate and analyze the knowledge contents regarding their relations to power and their roles in limiting and shaping students. These critiques provide conditions for challenging truths and questioning knowledge contents offered in classes.

Foucault, regarding the complex of power-knowledge-subject, analyzes school examinations and marks and interprets them as normalization

procedures which bring power to play. In the examinations, power exercises on subjects through knowledge networks, “disciplines,” and scientific “discourses” that produce truths. For examinations interweave knowledge and values and thereby locate students upon their marks in hierarchical categories which impact on their positions in social relations and their sociopolitical actions.

Educational Theory and Historical Studies

All of Foucault’s studies can be accounted as historical but in a new meaning of history. Foucault rejects the triple matrix of origin-continuity-subject that identifies the traditional concept of history and thus in his historical studies of education goes beyond this matrix. As Foucault (1977) himself says, a genealogist challenges the pursuit of the origin because it implies on the exact essence of things and presupposes the existence of immobile forms. He holds that listening to the history, a genealogist “finds that there is ‘something altogether different’ behind things: not a timeless and essential secret, but the secret that they have no essence or that their essence was fabricated in a piecemeal fashion from alien forms” (Foucault 1977, p. 78). Notions like “origin” and “continuity” can impose on history some ultimate goals associated with a superhistorical perspective that guides history in a special way.

Relying on Foucault’s insights in several genealogies of prison, sex, and human sciences, one can argue that his genealogy is a kind of “present history,” which tries to tell us many stories about several struggles occurring between diverse powers constructing our present conditions. The present history has been characterized as “the union of erudite knowledge and local memories which allows us to establish a historical knowledge of struggles and to make use of this knowledge tactically today” (Foucault 1980, p. 83). Consequently, the constructive elements of our present conditions can be found.

However, these conditions are contingent and people can change their present by manipulating

them. This kind of historiography locates truths in their social-cultural contexts and defines discourses in relation to these contexts. Truths, then, are not universal, necessary, and absolute. They are products of discursive and nondiscursive practices as sociocultural conditions occur in special historical moments. People can have other products if they change those conditions. Accordingly, not only should educational theory be regarded as a historical phenomenon but also it should be taken as a contingent phenomenon in terms of power relations in social conditions.

Conclusion

Foucault's concern about human being objectification on the one hand and the critical role of education in this process on the other hand leads to Foucault's concentration on educational theory and practice. As a result, one can investigate educational practices and sites as those surveillant procedures that are controlling and regulating students' lives. Educational theory in its turn supports this objectification and subjugation of students. As Foucault attempted to challenge these subjugating procedures and technologies, he could not avoid from challenging popular educational theories. So, according to him, we should be suspicious about educational theories and take a critical stance against them. This critique can be promoted by applying new Foucauldian framework consisting of some critical concepts like power, knowledge, subject, and transient constructive truths. This stance can demonstrate some implicit aspects of educational phenomena.

Foucault, Confession, and Education

Andreas Fejes
Department of Behavioural Sciences and
Learning, Linköping University, Linköping,
Sweden

Introduction

[T]he confession became one of the West's most highly valued techniques for producing truth. We have since become a singularly confessing society. . . Western man has become a confessing animal. (Foucault 1998, p. 59)

If something useful about the present is said by Foucault's (1998) argument that Western man has become a confessing animal and that confession has become the most valuable technique for producing truth in society, we will argue that we live in a confessing society. One of the primary arguments made by Foucault (1998) is that verbalization has become a central method through which people make themselves visible to themselves and to others and that people come to know who they are through verbalization. In his writing, psychoanalysis is used as an example of how previous Christian practices of confession have become appropriated by a secular *scientia sexualis* (Foucault 1998), which has spread to most aspects of private life. In this context, confession does not specifically limit itself to the confession taking place in church, but it also signifies the most private and intimate relationships that we have with our lovers, family, friends, and with ourselves. Confession has become scientized.

Keeping the concepts of confession and verbalization in mind, we can see how there are numerous contemporary practices in which we are invited to speak about ourselves, making our dreams, wishes, aspirations, fears, and faults, for example, visible to ourselves and others, not the least in the media; reality TV shows, such as *Big Brother* and *Nanny TV*; or online social communities, such as Facebook and Twitter. But also within education, through the mobilization of examination practices or reflective practices where students are asked to scrutinize themselves and make this visible to themselves and to their peers and teachers. Verbalization (disclosure) could thus, in line with Foucault's work, be seen as one of the most prominent features of the confessing society. One could argue that "there is a transhistorical human need or psychological compulsion to confess" (Taylor 2010, p. 6). In the following, I will, based on one book I have cowritten (Fejes and Dahlstedt 2014), and one book I have coedited (Fejes and Nicoll 2015) on confession, firstly outline a short genealogy of confession based on Foucault's work, and provide examples of how confession operates within education.

A Genealogy of Confession

Today's confessional practices are not a unity or a homogeneity, nor are they immutable. The purpose here is to provide a short genealogy, a historical account of lines of descent and emergence of confessional practices, in order provide one possible starting point for analyzing contemporary confessional practices as they operate in education so that they can then be looked on anew and assessed critically. Foucault's wider historical analysis of technologies of the self at different periods in the "West" aimed to demonstrate this. His analysis was not intended to construct a history of these forms, for this would be an attempt to contribute to the analysis of history as progression. Foucault suggested that techniques of confession, which focus specifically on "verbalization" of the self, emerged as practices of the human sciences. He argued that knowledge acquisition in the human sciences required this technique, so these practices and this knowledge supported the establishment of a new way of governing (Foucault 2003a). In contemporary times, therefore, confession has become "scientized" "through clinical codifications, personal examinations, histological techniques, the general documentation and data collection of personal data, the proliferation of interpretative schemas and the development of a whole host of therapeutic techniques for 'normalization'" (Besley and Peters 2007, p. 16). Verbalization has become linked to science and reinvented in practices which promise to help us live a better life. This "scientization" places confession in the interface between public and private domains, where it always requires an "other," either real or virtual, to whom one confesses (cf. Fejes and Dahlstedt 2014; Foucault 1998).

Care of the Self as a Path Toward Knowledge of the Self

In his genealogy, Foucault traced the confession back to the Ancient Greeks and the relationship between the Greek practices of "care of the self" and the Delphic statement "know yourself." During the Greco-Roman period, the latter (knowing yourself) appeared as a consequence of the former

(care of the self), where much later, the Christian concept of knowing yourself obscured “care of the self.” Self-renunciation in Christianity came to be a condition for salvation. In order to renounce the self, you had to know yourself. Foucault elaborated on how the relationship between care of the self and knowledge of the self emerged and changed during the Greco-Roman period, in contrast to practices influenced by the emergence of Christianity and the present era, which have produced different forms with distinguishable effects in terms of power relations.

During the Greco-Roman period, care of the self was a general philosophical principle. To care for the self was to make life an art object – a “*tekhnē*.” To care for the self was about existence. Care of the soul was an art, but only in so far as it involved caring for the activity of the soul and not the soul as a substance. The aim was to develop good values *in* life (as opposed to values aimed at a life after death, as occurred later in Christianity). Writing became an important technique in this endeavor. Taking notes about oneself and the activities of the day, reviewing them and keeping notebooks, was a way “to reactivate for oneself the truths one needed” (Foucault 2003a, p. 153). Through this writing, the subject became the object of the writing activity. Writing was not about knowing oneself and searching for the truth about oneself as would later be the case in Christianity. Instead, writing was about finding the truths an individual needed in order to develop good values and turn life into the art of existence.

Examination of conscience emerged within this writing activity as a technique of the Greco-Roman period. For the Stoics, this involved a self-examination of the deeds of the day. However, the writer was not looking for bad intentions. Faults were simply good intentions left undone. The focus was on remembering the truth or recovering a truth that had been forgotten, in order to be successful in one’s intentions and to develop good values in life. The subject had not forgotten himself, but had forgotten the rules of conduct and what ought to have been done. By recalling errors committed, the subject emerged in the gap between what had been done and the rules for what should have been done: “The subject

constitutes the intersection between acts that have to be regulated and rules for what ought to be done” (Foucault 2003a, p. 157). Thus, self-regulation became important in the art of living, where the focus was on the activities and deeds of the person rather than on the thoughts. Care of the self as a writing activity and an art of the self also constituted knowledge of the self in relation to these rules of conduct. As I will illustrate later, this focus is different from Christian concepts where the focus was on thoughts, verbalizing, and making sins visible.

Another stoical technique for the care of the self was known as *askesis*. *Askesis* involved drawing truth out from memory, “not a disclosure of the secret self but a remembering” (Foucault 2003a, p. 158). The truth was once more not to be found within the self, but in the teachings of the master. The master’s words were memorized and turned into rules of conduct. The aim was to make life subjective through truth and to prepare for the reality of the world (Foucault 2003a, p. 158). *Askesis* involved remembering the truth of the master as a set of rules for shaping self-care on a daily basis.

The Stoics construed care of the self as an activity that required listening and remembering rules. These activities were methods of preparing for life as an art, and ways of mastering the self. The techniques of writing, self-examination, and *askesis* were integral methods of caring for the self, through which individuals trained themselves for life.

Knowledge of the Self as a Path Toward Purity

With the emergence of Christianity in the third and fourth centuries, the relationship between care of the self and knowledge of the self was reconfigured. Aesthetics were no longer concerned with existence, but became linked to purity. The aim of caring for the self was to maintain purity. Physical integrity rather than self-regulation became important. The self was no longer something to be created (an art of living), but rather something to be renounced and deciphered. Care of the self was replaced by a requirement to know the self in terms of personal sins. In Christianity, writing became a test that

“brings into light the movements of thought, it dissipates the inner shadow where the enemy’s plots are woven” (Foucault 2003b, p. 121). In Christianity, writing was used to help individuals find the truth about themselves as a way of accessing the light, by making their inner thoughts visible to themselves (disclosing themselves). To renounce oneself one had to know oneself, and this truth was deciphered through writing. Knowing oneself, renouncing the self and one’s sins through writing as a form of purification, became the way to truth.

During early Christian times, the self was disclosed through the ritual of exomologesis: “a ritual of recognising oneself as a sinner and penitent” (Foucault 2003a, p. 162). This did not require verbalization, as the bishop imposed the status of penitent on the individual. Through this ritual, the status of the sinner was made public and confirmed. Thus, exomologesis was a status rather than an act. During the fourth century, Foucault identified a practice of “exagoreusis,” which had emerged in monastic orders as a distinctive verbal practice for disclosing the self, requiring purity of thought. Exagoreusis was a form of self-examination related to two principles of Christian spirituality: obedience and contemplation. Obedience for the monk involved total obedience to the rules and to the master, while contemplation concerned an obligation of the monk to turn thoughts continuously to God and to ensure the heart was sufficiently pure to see God. There was only one way to discriminate between good and bad thoughts: “to tell all thought to our director, to be obedient to our master in all things, to engage in the permanent verbalisation of all our thoughts” (Foucault 2003a, p. 166). Confession was a mark of truth and allowed the master to discriminate between good and evil. Even if the master did not respond, “the fact that the thought has been expressed will have an effect of discrimination” (Foucault 2003a, p. 167). This was therefore a confession involving sacrifice of the self through a permanent contemplation of God.

There is a big difference between exomologesis and exagoreusis. Their common element involves the fact that a person cannot make a disclosure without renunciation. In

exomologesis, “the sinner must ‘kill’ himself through ascetic macerations . . . disclosure of the self is the renunciation of one’s own self” (Foucault 2003a, p. 167). In exagoreusis, the self constantly verbalizes itself and obeys the master; renouncing oneself and one’s own will to the extent that it has no expression. Foucault described exomologesis as the “ontological temptations of Christianity” and exagoreusis as the “epistemological temptation of Christianity.” While the former positioned the ontological being as a sinner, the latter considered the self in constant search of self-knowledge (cf. Taylor 2010). Exomologesic and exagoreusic practices continued until the seventeenth century. However, Foucault (2003a) considered the relationship between the disclosing self and the drama of verbalizing renunciation of the self to have been important throughout Christianity.

With the emergence of the human sciences in the seventeenth and eighteenth century, confession was once again reshaped. The focus shifted to knowledge of the self and verbalizing this knowledge without renouncing the self. The aim was now to build a new and improved self. With this, a different type of rationality of governing emerged, aiming to shape and foster subjects, simultaneously governing themselves and others through the conduct of conduct (Foucault 2007).

Confession, Education and an Alternative Form of Critique

Confessional practices emerge today as a new alignment in the exercise of productive force said to be necessary to the maintenance and productivity of education, learning, and societies. These practices operate as technology in the conduit or channeling of power in a particular way that makes the innermost thoughts of the learner available for correction and the possibility of their internalization as specific forms of practice of self-scrutiny. The discursive regime as apparatus of education and learning may be fragmented but alliances of power operate strategically. They operate through actions relating one person to an “other”; one confessing and one receiving that

confession in attempts at shaping the self and others. These techniques support new modes of governing people, in part through scientific knowledge of education and learning that has emerged to inform and support them.

Such operations can, e.g., be seen in practices of the examination. Through an examination students are objectified, compared, ranked, and finally graded. But students are also, through examinations in the shape of logbooks and self-evaluations etc., required to scrutinize who they are and how they behave and to disclose this to others, may it be teachers, students, or an virtual other in the form of the “norm.” In doing so, students are both shaping themselves, as being shaped by others. Similar operation can be seen within the frames of cognitive behavioral programs in school. Here, techniques such as providing students with a “heart” when they have done something good are used. Students are asked to evaluate and scrutinize themselves and their behavior during the lesson and make this public to the class by saying if they deserve a heart or not, and thus the confession is at play. So, if confession is widespread in education, why do we need this kind of analysis?

The confession can be connected up with Foucault’s notions of an alternative form of critique as a way of life and mode of existence through practices of the self (Fejes and Nicoll 2015), allows the possibility for alternatives to a modern art of critique which allows us to think that we know what we do through it. It allows the raising of questions of the productive and limiting effects of processes of governmentalization and the exercise of power through practices and knowledge that education and learning entails. Once we start with the assumption we are caught up in such processes, questions arise about the politics of this and what this does.

By analyzing how confession operates, the focus is not to offer a scientific truth or knowledge. Rather it is about putting aside questions of the truth or otherwise of confession as technology in education by examining what goes on in specific sites where it is taken up as practice, so as to consider the power and politics of this. The focus is directed on the power relations involved and

thus the politics of this knowledge and these practices. This is to acknowledge that there are limits to the methods of the production of scientific knowledge, in that they preclude exploration of the effects of power in constituting or shaping practices and knowledge of “selves.” The efforts are tactical in focus – they are partial, incomplete, fragmentary analyses of what is going on *in terms* of power. In this they are political and discursive acts. They construct knowledge of a sort to act as “monsters on the prowl” (Fejes and Dahlstedt 2014), at the margins of pedagogical discourses. These are not “antiscience” or against science, but are analyses that sit in contrast to scientific investigations. They sit on the margins of the field of study of education contributing a different kind of analysis and critical starting point for questions. They are monsters in their potential to open a field of possibility for practices. For, they implicate the field by questioning whether teachers, researchers and politicians, and parents know what they do, and is done, through a science of learning-to-learn and its associated discourses for the constitution of the self through confession in teaching and learning.

Conclusion

A focus on confession extends research resources for exploring detail in practices of education and learning. This is an experimentation, in ways to extend and challenge thinking. To simply ask: what does a technology of confession in education and learning do to ourselves and societies (cf. Fejes and Dahlstedt 2014)? By putting aside questions of the veracity or otherwise of a teaching and learning technique (whether or not it works), it is possible to examine the detail of what goes on in sites where the “confessional” is taken up as practice.

Foucault's Work in Philosophy and History of Education, Reception and Influence of

Lynn Fendler

Department of Teacher Education, Michigan State University, East Lansing, MI, USA

In its relentlessly critical mode, Foucault's philosophy challenged most of the boundaries that circumscribe traditional disciplinary fields and their methodological approaches. Either in spite of those challenges or because of them, Foucault's work has been taken up in a startling array of intellectual fields ranging from philosophy and history to social work, religion, and education.

Foucault refused to advocate specific political agendas or methodological directives for intellectual inquiry. He also discouraged readers from following his lead: "What the intellectual can do is to provide instruments of analysis. ...But as for saying, 'Here is what you must do!,' certainly not" (Foucault 1980, p. 62).

Although Foucault seldom referred to Nietzsche explicitly in his writings, Foucault did declare that the impact of Nietzsche's writings

on his philosophy was profound. For example, Nietzsche's philosophy is like Foucault's in that it does not follow in the tradition of a modern quest for truth. Like Nietzsche's, Foucault's philosophy is meant to galvanize readers, not just inform them. Following Nietzsche, Foucault called his own later historical work genealogy. We can also see Nietzsche's influence in Foucault's poetic use of language and in his historical approach to political problematization.

Foucault's Reception in Educational Research

Foucault's philosophy, his concepts, theories, and histories have been appropriated to serve in multiple and contradictory projects in educational studies. The magnitude of disagreement is so great that it would be appalling if it were not also appropriate to Foucault's philosophy.

In the field of educational studies, British educational sociologist Stephen J. Ball edited the first collection of essays explicitly engaging the work of Foucault in education. Published in 1990, *Foucault and Education* contains chapters written by nine educationists from Australia, Canada, Great Britain, and New Zealand. In their analyses of educational issues, these chapters draw primarily from Foucault's book *Discipline and Punish*. In 1996, James Marshall, educational philosopher originally from New Zealand and contributor to the earlier Ball anthology, published *Michel Foucault: Personal Autonomy and Education*. This book focuses on the philosophical issues of humanism and offers an elegant analysis of Foucault's relationship to enlightenment commitments. In 1998, *Foucault's Challenge* was published, extending Ball's previous work on Foucault in educational studies. This volume, edited by Thomas Popkewitz and Marie Brennan, brings together authors from Australia, India, New Zealand, and the United States. Contributors to this book draw from many of Foucault's works. The chapters range from interpretations of Foucault's work to applications in such fields as political science and literary criticism. In 2004 another anthology appeared entitled *Dangerous*

Coagulations?. Editors Bernadette Baker and Katy Heyning selected for this volume papers from the inauguration of the Foucault and Education Special Interest Group of the American Educational Research Association. Also in the field of education, Michael Peters and Tina Besley published two books on Foucault: *Why Foucault? New Directions in Educational Research* and *Subjectivity & Truth: Foucault, Education, and the Culture of the Self*. Since the 1990s, Foucault's work has been taken up across a broad spectrum of projects in educational philosophy and theory (Fendler 2010).

The authoritative compilation of Foucault's shorter works is *Dit et Écrits*, edited by Daniel Defert and François Ewald, published by Gallimard originally in four volumes (1994) and later in two volumes (2001). The authoritative anthology of commentary is *Michel Foucault: Beyond Structuralism and Hermeneutics* (1982), edited by Hubert Dreyfus and Paul Rabinow. Foucault's lectures from the Collège de France have been translated by Graham Burchell and are being published in book form by St. Martin's Press.

Foucault's Contributions to Philosophy of Education

At the most general level, Foucault's work challenged all the prevailing traditions of modern critical theories of education including Marxism, phenomenology, existentialism, psychoanalysis, and structuralism. Foucault's philosophical position with respect to prevailing critical theories changed in his various writings. However, eventually, and in an unrelenting sense, Foucault's philosophy can be read as a critique of critical theories in education.

Foucault's Philosophy of Power

Foucault's theory of power contrasts with modern and Marxian theories in which power inequities are categorical and structural. For example, from the perspective of modern structuralism, we would be inclined to see the teacher as more powerful and the students as less powerful because of their respective institutional roles. However, Foucault's theory of power is discursive

and not structural. That means we can analyze exercises of power not in terms of institutional roles, but rather in terms of what people say and how people act. For Foucault, power is not something that people have; power is something that people exercise in practice.

Foucault proposed a theory that distinguishes power from domination. Domination is a relationship in which one party has no options (e.g., an infant or a shackled prisoner). In contrast, power is a relationship in which both parties have at least some options. Foucault outlined several modalities of power that are exercised in democracies including disciplinary, bio-power, and pastoral power.

Foucault's pastoral power is relevant to educational philosophy because the concept helps us see ways people who are taking care of us are also exercising power. The care may be benevolent, rational, and healthy, and it is also an exercise of power. Pastoral power helps us to see that a democratic citizen is a particular kind of person. If we participate in a democracy, we are expected to govern ourselves in ways that are recognizable to others. There are many ways of behaving that are not acceptable in a democracy. Our definitions for being good people are aligned with democratic definitions of what it means to be normal. There is a limit to the diversity that is tolerated in our democratic systems, and there is a tacit model for the kind of behavior that is valued in the society. That model is a product of power relations, however benevolent or well intentioned.

Critical Theory, Post-structuralism, and Postmodernism

Much critical theory in educational research is derived from Marxian philosophies of social justice. In contrast, Foucault's philosophy was framed in terms of discourse, a critique of the Marxian concept of ideology. In that way, Foucault's work can be understood as a critique of critical theory. There is no agreement about classifying Foucault's philosophy in terms of either structuralism or post-structuralism. Both intellectual movements are components in the philosophical context of Foucault's work.

Some scholars think that Foucault's early books (*Madness and Civilisation*, *The Birth of the Clinic*, and *The Order of Things*) are structuralist. Foucault's theories share with structuralism the conviction that thought cannot be separated from language (see White 1973, pp. 23–54). At the same time, there are other factors that argue against classifying Foucault's work – even his early books – as structuralist. For one thing, Foucault explicitly denied that his work was structuralist.

The term post-structuralism is derived from linguistics and anthropology; the term postmodernism is derived from architecture and the arts. Postmodernism departs from Modernism. Modernist architecture is exemplified by the work of the Bauhaus school, which began in Germany in 1919. Famous modernist architects are Le Corbusier, Ludwig Mies van der Rohe, and Walter Gropius. The characteristics of modernist art and architecture are functional design, the lack of ornamentation and decoration, and simplicity in form. One way to think about the concept behind modernist architecture is “the bare necessities.” A modernist style of design includes the bare functional necessities of a building and eliminates anything that might be added for aesthetic purposes only. Modernism, like modern philosophy, is associated with industrialism, efficiency, rationality, and functionality.

Just as post-structuralism follows from structuralism, postmodernism follows from modernism. And just as post-structuralism takes many diverse paths away from structuralism, postmodernism also takes many diverse paths away from modernism. Postmodernism is not just one thing; it is many different things. Postmodern movements are generally those that reject modernist qualities of coherence, rationality, objectivity, linear hierarchy, and organization.

Foucault himself rejected the label of “post-modernist”; in fact, he claimed (provocatively and playfully) that he did not know what “post-modern” meant. However, since Foucault's philosophy departs so radically from modern philosophy in its aim and method, it is easy to see why Foucault is considered by many people to be a postmodern thinker.

Governmentality in Educational Philosophy and Theory

One of the most generative Foucaultian contributions for educational philosophy and theory is his concept of power-knowledge. By studying the historical power dynamics that shape what we call knowledge, Foucault's theories have been used to shed light on the production of knowledge and the histories and processes by which various curricula have been created, aligned, revised, legitimated, and rejected.

In educational theory, Foucault's concept of governmentality has been influential in discussions of power relations in schooling and around issues such as critical pedagogy and possibilities for freedom in schools. In their wonderful introduction, Barry et al. (1996) summarize Foucault's thinking about freedom this way:

The possibilities for liberal forms of freedom may historically depend upon the exercise of discipline. Freedom, in a liberal sense, should thus not be equated with anarchy, but with a kind of well-regulated and ‘responsibilized’ liberty. (p. 8)

As this quotation illustrates, rather than opposing government and freedom, the notion of governmentality emphasizes that practices of freedom are themselves a form of governance. Governmentality is a term that allows us to talk about the norms by which we govern ourselves as free people. Governmentality is neither a bad thing nor a good thing.

Rather than regarding governmentality as a kind of power to be resisted in education, we can understand governmentality as a lens through which we recognize ourselves and the ways we behave. Thus it is more difficult to disclaim ethical responsibility for our own actions, that is, we cannot so easily say, “It is because of the system that I act this way. It's not my fault. There are dominant social and political forces at work.” The lens of governmentality leads us to question – not to deny – the degree to which our actions have been dictated by social norms. At the same time, through the lens of governmentality, it is also more difficult to claim individual autonomy for our actions, that is, we cannot so easily say, “I have agency that allows me to resist the forces of domination. I am capable of acting independently,

and I can take responsibility for my own actions.” Governmentality supports neither State control nor individual autonomy. For Foucault, governmentality, like genealogy, serves a critical – provocative – function. It does not tell us which perspective is “true,” but serves to undermine the individual-versus-State dichotomy and replace it with a perspective in which we understand freedom to be regulated by power relations and power relations to be defined in the context of freedom and discipline. This perspective, then, serves as a basis for us to be skeptical and critical every time we hear allegations of blame and responsibility that attempt to explain problems with the educational system, students, or teachers.

Foucault's critical philosophy can help us to reconsider what we know about the various purposes of schooling. Comparative education researchers and educational historians have shown a wide variety of purposes of schooling in different places and times, including social reproduction, vocational preparation, social assimilation, upward mobility, credentialism, and preparation for democratic participation. Those are debatable purposes and contentious issues in education, and they are all thinkable.

Foucault's philosophy invites us to consider what is not thinkable. For example, we might imagine that the purpose of schooling is to intensify our experience of pleasure as we eat, dance, make love, and listen to music. The idea that schools – including curriculum, pedagogy, and assessments – would be designed to cultivate our capacities for pleasure does not really make sense, and the strangeness of the idea is a product of governmentality – or how we govern ourselves in the name of normalcy. Foucault's work incites us to ask instead: What would a primary grade curriculum look like if the purpose of schooling were to cultivate enjoyment of life? How would we design a lesson plan to teach children to be more fun loving?

Foucault's Approach to Educational Historiography

Just as some philosophers do not consider Foucault to be a philosopher, some historians do not

consider Foucault to be a historian. The reasons for both are similar: Foucault's work challenged the rules of research in both philosophy and history.

Archaeology is the study of a cross section of artifacts in a particular time. It is unlike mainstream history because it analyzes a variety of artifacts in one time period rather than tracing the development of one thing over a period of years. The term *episteme* was used to refer to the knowledge system in a particular time. The episteme is the pattern that can be seen across various disciplines like economics, linguistics, and science. An episteme forms the basis for distinguishing scientific from non-scientific:

I would define the episteme retrospectively as the strategic apparatus which permits of separating out from among all the statements which are possible those that will be acceptable within, I won't say a scientific theory, but a field of scientificity, and which it is possible to say are true or false. The episteme is the 'apparatus' which makes possible the separation, not of the true from the false, but of what may from what may not be characterised as scientific. (1980, p. 197)

Foucault's use of the term genealogy is usually distinguished from archaeology. However, by most reckonings, genealogies are based on archaeologies. While archaeology works to understand how artifacts fit together in a historical moment, genealogy works to figure out what kind of people would fit into that set of artifacts. Foucault's genealogies are generally based on archaeological-type studies. That is, he examined a cross section of artifacts (archaeology) and then asked questions such as: what kind of people would live in such a way?

Foucault's approach to history does not try to be objective, but rather it aims to be a critical history of the present. This does not mean that Foucault wrote history in flagrant disregard of facts. Rather, the focus and emphasis of his historical analysis were shaped by concerns about the present, including the role of chance in human lives. As he wrote, the job of genealogy is to restore chance to its rightful place in history. Recognizing that reason has been one of the disciplinary technologies of modern societies, Foucault repeatedly reminded us that much of history

cannot be explained by anything other than “the iron hand of necessity shaking the dice-box of chance” (Nietzsche’s *Dawn* cited in Foucault 1998, p. 381). Foucault celebrated the role of chance in history because chance defies determinism; chance makes change easier to imagine. If we do not think of history as proceeding in some inevitable or predictable manner, then history is not so deterministic, and it is easier for us to imagine that things might be different in the future.

Implications for Teaching: Exemplary Critique

One path of insight into Foucault’s philosophical project is to look at it in terms of pedagogical theory. In pedagogical theory we can analyze teaching as being comprised of three roles: provider, facilitator, and model. Most teaching includes all three roles, and different teachers may favor one role over the others at different times for different purposes. We can classify Foucault’s philosophy as being most closely related to modeling or “teaching by example.”

People who are not educators may not recognize facilitating or modeling as important aspects of teaching. Noneducators often perceive lecturing as “real” teaching; teaching equals telling. Along the same lines, some readers tend to assume that the role of philosophy is to provide solutions for problems and guidelines for action. Modern and analytic philosophies are regularly written in the form of lectures, and they can be classified as expository in genre. We expect philosophy to provide us with information, principles, and evaluations, just as we expect teachers to provide us with information, principles, and evaluations.

But Foucault’s philosophy does more than provide us with information; it also provokes questions and models the exercise of freedom. By means of provocative devices, Foucault’s philosophy facilitates our ability to think critically. By means of its poetic devices, Foucault’s work excites our imaginations and disconcerts our expectations. When Foucault problematized the

foundations of modern philosophy – including reason and the search for truth – Foucault was practicing an ethical life. His philosophy does not explain to us how we can be free, and it does not try to persuade us to resist dominant forces. Foucault does not enjoin us to “do as I say.” In fact, he does quite the opposite; he entreats us not to follow him. Foucault’s philosophy offers us a model – an example – of one person’s striving to live an ethical life of critical proportions. We can take it or leave it.

Genealogy cannot legislate autonomy for us, it recognizes no grounds on which such an act of legislation could be secured, but it can (and does) exemplify its commitment to the value of freedom in the form of its reflection on our present (Owen 1995, p. 492). As a form of exemplary critique, genealogy is itself an act of transgression. In sum, legislative critique is like direct instruction; it teaches by telling and bestows agency. Exemplary critique is like modeling; it teaches by example, and it embodies agency.

Conclusion

Analytic philosophers understand Foucault’s logical arguments and ethical formulations, but they often disregard his focus on clinical practices or the poetry of his language. Writers in rhetorical studies and literature may focus on the poetry and his exemplary mode of persuasion, but tend to ignore the details about obscure practices in psychiatric hospitals. Historians can relate to the meticulous empirical archival work in Foucault’s studies, but they may be put off by his refusal to look at history objectively or to draw causal inferences connecting historical events.

With all these different characterizations and criticisms of Foucault’s work, how are we to decide what Foucault really meant? This is a clear question, but unfortunately, for any discussion of Foucault’s work, it does not have a clear answer. When we read about all the different ways Foucault’s work has been received in educational philosophy and theory, it is helpful to remember the characteristics of Foucault’s philosophy as provocative, problematizing, and poetic. The

objective is not to arrive at certainty about the truth, but rather to seize the opportunity to think our lives afresh.

Introduction

William Frankena (1966) has suggested a model for analyzing philosophies of education based on practical syllogism which goes back to Aristotle. Even though the deductive method in philosophy of education was the subject of attacks, Frankena's model has been influential as it has been appealed to in religious education studies (e.g., Cohen 2010), applied branches of education (e.g., Martin 2011), as well as philosophical reflection on education (e.g., Covalleski 2007). Frankena's model helps students to analyze philosophies of education and acquire a proper understanding of values education (Litke 1976), teacher education (Ainsworth and Johnson 2005), and workplace education (Hager 1999).

Frankena's Model

According to Frankena (1956/1969), there have been three types of philosophizing called speculative, normative, and analytical. In the speculative activity, one attempts to combine scientific findings with the results of moral, aesthetic, and religious experiences to present a picture of the world and humans' position in it in a way that it provides a meaning for human life. In the normative activity, the aim is to determine goals, norms, and standards for human personal and social behavior to orient human beings' actions. Finally, in analytical or critical activity, the aim is to analyze and explore the concepts, assumptions, and methods used by philosophers, scientists, and ordinary people.

Therefore, Frankena talks of three research methods in philosophy of education. By considering education as a discipline, he takes the philosophy of education to be a philosophy of the discipline of education. Then, he divides this discipline into three parts:

1. The experimental science of education that deals with real things.
2. The normative part of education that is concerned with educational and management goals and advices.

3. The analytical part that analyzes the concepts related to experimental science of education (such as intelligence) and the concepts discussed in the normative part (e.g., justice), and explores the methods for justifying the advices given in these parts.

Philosophy's relation to these parts becomes somehow clear because the three activities mentioned by Frankena respond to these three parts. The studies in philosophy of education are, in fact, connecting or utilizing philosophy in the respected parts of education as it is explained below.

In the light of the first part of philosophical activities and education, it can be said that theoretical philosophical activities can affect the experimental science of education; for instance, the image by which humans are presented can be used as an assumption in education. Frankena holds that as far as the empirical science of education is dependent on philosophical assumptions, it is in fact philosophical in nature (Frankena 1969, p. 289).

In the second part, on the normative activity in philosophy and the science of education, the relation of philosophy and education is apparent as well, because the normative view in philosophy can be used in the normative issues of education, in a way that Frankena believes that the normative part of education is nothing but a branch of normative philosophy. He considers this part as "the heart of philosophy of education" (p. 289). In his opinion, the method used in this part of the philosophy of education is practical syllogism. In this method, two premises are combined to achieve a conclusion in the form of a normative advice related to aims or methods of education: one normative premise obtained from, for instance, the philosophy of ethics and a factual or realistic one obtained from the common sense, science, or philosophy. Frankena presents the following example. Any kind of advice on religious education in schools is dependent, on the one hand, on the goals of education related to the moral or social philosophy (the normative premise), and on the other hand, it is dependent on the credibility of the religious beliefs and the significance of religious teachings (the realistic premise).

Finally, in the third part, concerned with the analytical activity in philosophy as well as education, the relation between philosophy and education can be seen in using the methods of philosophical analysis in educational concepts.

Therefore, in Frankena's opinion, three kinds of research can be carried out in the philosophy of education:

1. A theoretical research that attempts to provide assumptions concerning the human beings and the world in relation to the process of education.
2. A normative research on goals, principles, and methods that can be used in the education.
3. An analytical research that aims at explaining the concepts used in education.

Frankena holds that from among these three, only the second one, the normative research, is the heart of education. In this type of research, a practical syllogism is used.

However, it is worth mentioning in passing that Frankena takes the theoretical syllogism as the proper method in relation to the first type of research. A theoretical syllogism contains two declarative premises and one declarative conclusion. When philosophers of education reach a declarative conclusion, they provide scientists of education with negative heuristics that prevent them from following hypotheses that are incompatible with that conclusion as well as with positive heuristics that encourage them to pursue the hypotheses compatible with it.

Although Frankena (1956) had previously suggested three kinds of philosophies of education, in his later article (Frankena 1966), without mentioning the theoretical research, divides the philosophies of education into two major kinds: normative and analytical. Frankena's main attempt is to show how one can analyze the normative philosophies of education. Hence, he holds that his work is itself an analytical one: "Since I am here seeking to show how to analyze a philosophy of education, this essay is itself an example of analytical philosophy of education" (Frankena 1966, p. 8).

Frankena suggests a model for this purpose. The first notion discussed in this model is that

there are two types of propositions required in the normative philosophies of education: normative and factual. Normative propositions, which are prescriptive, are themselves of three types:

1. Propositions related to the fundamental goals and principles of education.
2. Propositions related to the knowledge, skills, or viewpoints that should be formed during education.
3. Propositions related to the methods and practical procedures that should be used in education.

On the other hand, the factual propositions concerning the relations between things are of two types:

1. Propositions that indicate what kinds of knowledge, skills, or viewpoints are required to achieve the fundamental goals or for following the basic principles.
2. Propositions that indicate the required methods for acquiring the abovementioned kinds of knowledge, skills, or viewpoints.

Factual propositions can consist of explanatory hypotheses, psychological theories, experimental findings, predictions, etc. They can also consist of epistemological, metaphysical, or theological propositions. In addition, there might be some analytical points beside each one of the five types of propositions. Based on these five types of propositions, three types of normative philosophies of education are possible.

The first type is more philosophical and general in which the details are left to the educationists. In this type, the structure of philosophy of education is a combination of normative propositions of the abovementioned first or the second type, on the one hand, and a factual proposition of the first type on the other hand. In this combination, the premises include a normative proposition of the first type and a factual proposition of the first type and the conclusion is a normative proposition of the second type. For instance, in Aristotelian philosophy of education, the two premises and the conclusion are as follows:

- (a) The main goal of education is to have a good life including inherently valuable activities such as thinking and reflection (A normative proposition of the first type).
- (b) A good life is achieved through dispositions such as moderation, practical wisdom, and knowledge of mathematics, physics, and philosophy (A factual proposition).
- (c) To achieve the good life, dispositions such as moderation, practical wisdom, and knowledge of mathematics, physics, and philosophy should be cultivated (A normative proposition of the second type).

The second type of normative philosophies of education is less philosophical, since the starting point of this type is the list of knowledge, skills, and attitudes that should be cultivated in individuals, while this list is not obtained from a deduction like before, rather it might be borrowed from a philosophical work, it might come from eclectic sources, or merely what the society or the government requires. This kind of philosophies of education has a structure that is a combination of two normative propositions of the second or the third type and a factual proposition of the second type. In this combination, the premises include the normative proposition of the second type and the factual proposition. The following is an example for the second type of philosophy of education:

- (a) Mathematics is a branch of knowledge that its disposition should be cultivated in individuals.
- (b) The method X is effective or helpful in teaching mathematics.
- (c) To cultivate mathematical disposition in individuals, the method X should be used.

The third type of normative philosophies of education has a perfect or complete form that combines the two former types. In Frankena's opinion, to understand a philosophy of education fully, one should follow these steps:

1. One must first look to see what dispositions it says education should foster (Box C).

2. Next, one must try to determine the rationale given to show that education should foster those dispositions. To do this one must:
 - (a) See what its basic normative premises are – its basic values, principles, or ends (Box A).
 - (b) See what factual premises are brought in (implicitly or explicitly), empirical, theological, or philosophical (Box B).
 - (c) See how these go together to make a line of argument of the ABC pattern to show that the dispositions listed I should be cultivated.
- (3) Then one should look for recommendations about ways and means of teaching, administering, etc. (Box E)
- (4) Fourthly, one must seek to discover the rationales for these recommendations. To do this one must:
 - (a) See what factual statements based on observation and experience are brought in (possibly borrowed from psychology, etc.) (Box D).
 - (b) See if any premises from Boxes A or B are used here.
 - (c) See how these go together to make a line of argument (or a battery of separate arguments) to show that the ways and means recommended should be used in the cultivation of the dispositions listed (Pattern CDE).
5. All along, of course, one should notice any definitions or bits of analysis that occur and see how they fit into the discussion (Frankena 1966: 13). (Boxes A–E)

Using The Model for Analysis

Frankena's model is very useful in analyzing philosophies of education. In this model, the fundamental goals or values are the basis of the chain of syllogisms that follow them but they are not the subject of justification themselves. Frankena, of course, alludes that in providing reasons for why the fundamental goals should be followed, different views bring about some philosophical premises into the structure of argument but he does not see these premises logically necessary:

It is in this part of a philosophy of education that epistemological, ontological, and theological premises most often appear, but they are not logically necessary. What *is* logically required is, first, some normative premises stating basic goals or principles...and second, factual claims stating that certain dispositions are conducive to the achievement of those goals or to the following of those principles...(Frankena 1966, p. 10)

Thus, what is important for Frankena as the first step is to give some basic premises about the fundamental values. However, it is a serious question to ask while methods of education or dispositions to be cultivated need to be justified, why should the fundamental goals be taken beyond justification? In answering this question, one might state that in Aristotelian practical syllogism, which is presupposed by Frankena, it is envisaged that the practical reason is concerned with the means to goals not goals themselves. This notion is based on the interpretation of some of Aristotle's writings in which he has said that the practical reason is for thinking about means not goals (Aristotle 1925, 1145a5-6) or reflection is for means not goals (Aristotle 1925, 1112b13, 1112b34-35).

However, this interpretation is controversial. Some (e.g., Dahl 1984, p. 39) believe that Aristotle has taken some roles for practical reason in relation to goals as he states: "If therefore to have deliberated well is a characteristic of prudent men, deliberative excellence must be correctness of deliberation with regard to what is expedient as a means to the end, a true conception of which constitutes prudence" (Aristotle, 1142b31-34). Therefore, the practical reason would play a role in determining the goals as well as using the suitable means to reach these goals. According to Dahl (p. 42), in Aristotle's view, the role of the practical reason in determining the goals is played by inductive reasoning, through which the reason uses its experiences of good deeds as especial cases to reach a generalization and an understanding of virtues, as it is mentioned in some cases (Aristotle, 1143a35-b5).

Thus, it seems that a further and more preliminary practical syllogism should be added to Frankena's model in order to justify the

fundamental goals. This preliminary syllogism would be like this:

- I ought to live and be alive.
- Being alive requires having a good life (as a bad life destroys the life altogether).
- Therefore, I ought to have a good life.

Again, a further syllogism might be needed to show what a good life requires.

- I ought to have a good life.
- A good life requires having permanent goals.
- Therefore, I ought to have permanent goals.

For making clear what is a permanent goal, as Frankena stated, philosophical premises arrive at; however, contrary to what he holds, these are necessary for arriving at a conclusion which plays a vital role in choosing a philosophy of education.

As it is clear, the conclusion of the last syllogism was the final stage in Frankena's chain of syllogisms back from methods of education through the required dispositions. By the added syllogisms, we take some further steps to reach the fundamental goals. The premises of these practical syllogisms again include a normative and a factual proposition. The first normative proposition includes an "ought" in relation to answering the humans beings' essential needs. This might be called the fundamental "ought." This proposition is the most fundamental "ought" of the living human beings, the response to which gives rise to human endeavors. In other words, there is no more fundamental purpose for humans than what is stated in this proposition, therefore, it can be said that this value is the most fundamental one for humans. It should be especially noted that in practical syllogisms, there might be a question concerning the conclusion of the syllogism to be taken whether as a "hypothetical imperative" or as a "categorical imperative." If the conclusion is hypothetical, it is not required to be carried out and one only carries it out when one decides to do it. However, when the fundamental "ought" comes into consideration, the conclusion would be decisive and unavoidable.

However, some believe that a practical syllogism as a practical inference should not contain

premises consisting of psychological states such as demands and needs, because inference should be valid and validity lies within the purely logical relations. For instance, Gem Anscombe (2005) in criticizing G. H. Von Wright has stated that there is no difference between practical and theoretical syllogism and both should contain descriptive propositions in order to be valid based on the logical necessity of truth relationship ($p, p \rightarrow q: q$). Therefore, she holds that practical syllogism should not contain premises consisting of individual demands and needs, except the ones that express something peripheral that does not affect the functionality of the logical inference. As Anscombe states, setting a goal is required in practical syllogisms, however, propositions related to the goal cannot be considered as the essential premises for the syllogism. She mentions the following example:

- Everyone who intends to kill their parents should get rid of this intention by meeting a psychiatrist.
- I intend to kill my parents.
- If I meet up with a psychiatrist, I would get rid of this intention.
- A is a psychiatrist.
- Then, I will meet up with A.

Anscombe means that the expressed intention in the second proposition plays no role in the logical validity of the inference and it is in fact, a historical notion. The only thing that is logically significant is the truth relationship. Von Wright (Schipf and Hahn 1989) points out two notions in his response. First, practical syllogisms express the necessary means for goals, not any means that accidentally might result in achieving the goals. Therefore, the necessity of the goal is transferred to the means as well, making them necessary too. He believes that Kant also agrees with this notion, since Kant holds that anyone who wants to reach a goal will want the means that are inevitably related to that goal and are at their access. Second, one should not restrict the acceptable logical relationships to relations of truth among propositions because in that case there would be no doxastic logic, of the sort we have got today, in which the logical relations among propositions of beliefs are at stake.

Frankena's Model for Analyzing Philosophies of Education, Fig. 1

One might say that the first “ought” proposition is about a fact containing “is” and amounts to saying that: “It is the case that every human tells oneself: ‘I should have a good life.’” If so, then the normative proposition turns to be a factual one and combining this proposition with another factual proposition will prevent from achieving a normative goal. However, it should be noted that to change an “ought” proposition to an “is” proposition in this way would be like substituting a completely different proposition. Naturally, substituting another proposition will change the conclusion as well. Based on the “substitutivity principle,” only if a proposition is substituted with its equivalent, can one expect that the conclusion will remain the same. Therefore, to substitute the mentioned descriptive proposition with the prescriptive one is tantamount to assembling another syllogism; it does not mean that the previous syllogism (containing the prescriptive and descriptive propositions) does not result in a prescriptive or normative proposition (Fig. 1).

Introduction

“When we are no longer able to change a situation, we are challenged to change ourselves.”

Viktor E. Frankl, Man’s Search for Meaning

The aim of logotherapy is, first of all, the moral and the spiritual growth toward meaningful life. Logotherapy was founded by Dr. Viktor Emil Frankl (1905–1997). According to Frankl, the most important issue for a human being is him/her search for the meaning of life. “Logos” is the Greek word for “spirit” and “meaning.” Thus, Frankl’s logotherapy is a meaning-centered therapy. The highest dimension of human is spiritual, but this should not to be taken as religious statement. Spirituality means human’s ability to do and express highest things in human life, like beauty, art, truth, and goodness. Spirituality can also include religion but not necessary.

Frankl called logotherapy as “education toward responsibility.” That means the responsibility for living one’s life authentically, in other words, meaningfully (Frankl 1986, p. 14). Logotherapy can be understood as method to heal somebody who has mental illness. However, this definition is correct but too narrow, because it loses the most essential idea of the logotherapy. Logotherapy is a lifelong process to grow, to learn, and to find meaning of life to be a human being. The meaning of life and being a human being are about “to serve a cause or love a person” (Frankl 2006, p. 14). Serving a cause, however, stays unclear through his writings, while the other part – love a person – is quite clear. Loving a person is connected to human being’s ability to self-transcendence: “What I see as self-transcendence is that being human always means related to or pointing to something or someone other than oneself” (Frankl 2006, p. 31). Logotherapy is different from psychoanalysis, because the methods of logotherapy are less retrospective and less introspective. It focuses on the future of a human’s life instead of past – it searches for the meaning of life.

Viktor E. Frankl as Founder of Logotherapy

Frankl was a psychiatrist and a neurologist, and also he finished his doctoral thesis on philosophy. He presents his ideas of logotherapy on his writing

Man’s Search for Meaning, which has sold over 11 million copies in over 20 different languages. The original title of Frankl’s book in German is *Ein Psychologe erlebt das Konzentrationslager*. The first part of the book describes his horrific experiences in the concentration camps, and the second part provides a basic introduction to his ideas of logotherapy. During the Second World War II, Frankl was subjected to four different concentration camps and was dehumanized to a mere number: 119,104 (Benvenista 1998). In August 1945, Frankl returns to Vienna, where he was told about the death of his wife, his mother, and his brother (Boeree 2006).

Man’s Search for Meaning is unquestionably the most important and well-known opus of Frankl. He presented logotherapy more scientifically and more widely in his book *Ärztliche Seelsorge: Grundlagen der Logotherapie und Existenzanalyse (The Doctor and the Soul)* in the year 1945. This book is also his habilitation work for the University of Vienna. Frankl published in 1966 *The Will to Meaning – Foundation and Application of Logotherapy*, which he regarded as his most systematic book in English.

Logotherapy and Human Being

Logotherapy is also known in our days as Logotherapy and Existential Analysis (LTEA). Logotherapy is called the third Viennese school of psychotherapy after the “first school” of Sigmund Freud and the “second school” of Alfred Adler. Logotherapy is an internationally acknowledged and empirically based meaning-centered approach to psychotherapy. Especially the legacy of Frankl’s logotherapy is taken care by two institutes: the Viktor Frankl Institute founded in Vienna in 1992 and Viktor Frankl Institute of Logotherapy founded in Abilene, Texas, in 1978. Some of the most notable followers and commentators of Viktor Frankl logotherapy are Elisabeth Lukas, Maria and Edward Marshall, Joseph B. Fabry, and Alexander Batthyany.

Logotherapy is called humanistic therapy, because its core question is to define what

human being is. Frankl saw reductionist understanding of human as pseudoscientist idea by which human phenomena are reduced to subhuman phenomena (Frankl 1979, p. 25; 1988, p. 85). He believed that there is no psychotherapy apart from the theory of human being. This is why logotherapy has very powerful idea of human being, and it can shortly be presented through six points:

1. The human being is an entity consisting of the body, mind, and spirit.

The first point deals with a body (soma), mind (psyche), and spirit (noos). According to Frankl, the body and mind are what we have and spirit is what we are. Frankl also developed a theory, which he called dimensional ontology. The lowest dimension is the body, the next dimension is the mind, and the highest dimension is the spirit. He saw that dimensional ontology could give some answers to the most essential problems of philosophical, the problems of freedom of the will and problems between the body and mind. However, he did not get further in this area of ontology he only repeated this possibility several times.

2. Human being's life has meaning under all circumstances, even the most miserable.

Frankl thought that this is a lesson he learned in concentration camps. Even in your last minutes before death, your life does not lose its meanings, quite the opposite.

3. All human beings have a will to meaning.

This is the major motivation for living and acting. When we see meaning, we are ready to act. This is considered to be different than our will to achieve power and pleasure.

4. Human beings have freedom under all circumstances to activate the will to find meaning.

We are free to activate our will to find meaning, and this can be done under any circumstances. This deals with the change of attitudes about unavoidable fate. Our circumstances in the world put limitations on what we can do or wish, but we always have freedom to choose our own attitude, how we relate to the circumstances.

5. Life has a demand quality to which human being must respond if decisions are to be meaningful.

The meaning of the moment is more practical in daily living than ultimate meaning. Unlike ultimate meaning, this meaning can be found and fulfilled. This can be done by following the values of society or by following the voice of our conscience.

6. The human individual is unique.

The sixth assumption deals with one's sense of meaning. This is enhanced by the realization that we are irreplaceable.

In essence, all human beings are unique with an entity of a body, mind, and spirit. We all go through unique situations and are constantly looking for finding meaning. We are free to do this at all times in response to certain demands. More widely, Frankl presents his idea of philosophical anthropology in his paper called as *Zehn Thesen über die Person*. This paper have been modified and added to the end of his opus *Ärztliche Seelsorge* edited by Alexander Batthyany (Frankl 2013; Batthyany 2013).

Three Basic Concepts of Logotherapy

Frankl is speaking through his texts three fundamental assumptions of logotherapy, which form a chain of links interconnected with one another (Frankl 1978, p. 14, 1988, p. vii, 2010, p. 72):

1. Freedom of will
2. Will to meaning
3. Meaning of life

These three basic concepts are alpha and omega of the logotherapy. We have freedom to find meaning in what we do and what we experience. This freedom makes us human beings. Frankl addresses that the most valued idea what Sartrean/Heideggerian existentialism has thought us is that human being is not a thing among other things but something quite else: "But a human being is no thing. This no-thingness, rather than nothingness, is the lesson to learn from

existentialism” (Frankl 1988, p. 6). Even when we faced with a situation of suffering, we have freedom to choose how we deal with that suffering. According to the logotherapy, humans are not fully subject to conditions but are basically free to decide and capable of taking their stance toward internal (psychological) and external (biological and social) conditions (Batthyany 2015). Freedom is here defined as the space of shaping one’s own life within the limits of the given possibilities.

The will to meaning must be understood distinctively from the will to power by Nietzsche and the will to pleasure by Freud. The will to meaning can be seen as the primary motivation of humans but not as a negative force. When humans cannot realize their “will to meaning,” they will experience an abysmal sensation of meaninglessness and emptiness. This abysmal sensation, which logotherapy calls existential frustration, can also result in neuroses. For this type of neuroses, logotherapy calls “noogenic neuroses” in contrast to neuroses in the usual sense of the word, i.e., psychogenic neuroses (Frankl 2010, p. 62). Logotherapy assists humans in perceiving and removing those factors that hinder them in pursuing meaningful goals in their lives. Humans are sensitized for the perception of meaning potentialities; however, they are not offered specific meanings. They are guided and assisted in the realization of those meaning possibilities they have detected themselves. In other words, there are no ready answers on what you should do.

Life has meaning under all circumstances, even the most miserable ones. Thus, all human lives are precious and unique. Frankl speaks a lot about the spiritual dimension of human being. He sees that it is the highest dimension of human. Although, he thinks that religion is everybody’s private thing and that the logotherapy does not make any difference between different religious. You can be Muslim, Christian, Jew (as Frankl was), or atheist and still you have this highest spiritual dimension. Frankl: “Logotherapy, as a secular theory and medical practise, must restrict itself to factual statements, leaving to the patient the decision as to understand his own being-responsible: Whether along the lines of religious

beliefs or agnostic convictions. Logotherapy must remain available for everybody. . . . in cases of atheistic patients and usable in the hands of atheistic doctors.” (Frankl 1978, pp. 23–24.)

Our main motivation for living is our will to find meaning in life. According to Frankl (2006, p. 133): “We can discover this meaning in life in three different ways: (1) by creating a work or doing a deed; (2) by experiencing something or encountering someone; and (3) by the attitude we take toward unavoidable suffering” and that “everything can be taken from a man but one thing: the last of the human freedoms – to choose one’s attitude in any given set of circumstances.” The meaning of life has nothing to do about your age, conditions, health, or abilities. It is important to realize that logotherapy does not declare or offer some general meanings of life. Rather, the question is to help people to achieve the openness and flexibility that will enable them to shape their day-to-day lives in a meaningful manner.

Paradoxical Intention, Dereflexion, and Socratic Dialogue

The main tools of logotherapy are paradoxical intention, dereflexion, and Socratic dialogue. First two methods are used also pathological cases, but it is stressed that when doing so, the environment must be safe, enclosure, and controlled. The third method Socratic dialogue can express a case of logotherapeutic session and also the main idea of the logotherapy. The idea of logotherapy is Socratic because there is no ready-made answers, but everybody must find your own questions and the answers to your own question. And at the same time, logotherapy has the answer: the meaning of life is self-transcendence to other living being, care, and love.

In paradoxical intention guided by the therapist, clients learn to overcome their obsessions or anxieties by self-distancing and humorous exaggeration, thus breaking the vicious circle of symptom.

Dereflexion is the application of human being’s will to meaning and his capacity of self-transcendence. A logotherapist sees a human

being, not basically concerned with maintaining him/her inner equilibrium by gratifying one's drives but as directed toward something other than oneself, reaching out toward other persons to meet. The patient is dereflected from his disturbance.

Dereflection is intended to counteract compulsive inclination to self-observation. Trough paradoxical intention the patient tries to ridicule his symptoms, while he learns to 'ignore' them through dereflection. (Frankl DS 255–254)

When a patient is afraid that something bad will happen to him/her, the logotherapist encourages the patient to intend or wish for precisely what she/he fears (Frankl 1978, p. 138). If you have a severe stage fright, the logotherapist might ask, what is the most horrific thing that can happen to you when you go to stage? After this, the logotherapist asks him/her to imagine this situation.

Socratic dialogue is a conversational method frequently used by logotherapists. In Socratic dialogue, the specific questions are aimed to raise the consciousness of the patient in order to provide the patient possibilities to find the meaning of one's life and give the patient freedom to fulfill his life.

In the philosophical setting, this technique of guiding by questioning was introduced by Socrates, who characterized it as a sort of "spiritual midwife." Meaning cannot be given, it must be discovered. This is why the Socratic dialogue tends to be a struggle. First, it is a struggle between a therapist and a patient, but finally it is a struggle in the search for meaning. In the final phase, the therapist steps back and makes himself/herself useless.

Freire and a Pedagogy of Suffering: A Moral Ontology

Rosa Hong Chen

Simon Fraser University, Vancouver, Canada

It is important to emphasize that, in speaking of “being more,” or of humanization as ontological vocation of the human being, I am not falling into any fundamentalistic position. . .

—Paulo Freire (*Pedagogy of Hope*, 2007, p. 84)

Introduction

Paulo Freire has been widely and richly studied within the fields of pedagogy, freedom, hope, oppression in terms of liberation education, and methodology (Roberts 2000, 2016, and many others). For Freire, literacy, “through which the self learns and changes” (1985, p. 6), is an effort for an individual to take control of his world (cf. Freire 1985, 2006, 2007). This is, metaphysically, a process of humanization. Freire’s educational philosophy focuses particularly on the ontological and moral nature of human beings in the struggle for liberation from economic, social, and political domination. He says in *Pedagogy of the Oppressed* (2006) that the aim of humanization is authentic liberation, which is a praxis, “reflection and action upon the world in order to transform it” (p. 51). Human beings in their ontological agency can look critically at the world and become capable of accepting the limits, transcending the contradictions, and educating each other “through the mediation of the world” (cf. p. 32).

Humanization is thus Freire’s ethical ideal (cf. Roberts 2000). Human beings, for Freire, are ontologically incomplete, always in the process of “becoming.” Likewise, the world, in which they are situated, is neither a static nor closed order, but a *given reality* which humans must accept and to which they must adjust. This given reality is resource of humans to overcome dehumanization, to create history, and to become more fully

human. The very thought of oppressed people has been conditioned by being oppressed, “by the contradictions of the concrete, existential situation by which they were shaped” (Freire 2006, p. 45). The ideal of the oppressed, Freire believes, is to be men, through recognizing the common humanity of their opponents and including them in one’s moral scope. “This is their model of humanity” (p. 45).

Confronted by such existential conditions, humans pursue their supreme value of freedom with critical agency and responsibility. According to Freire, freedom, an ideal located inside of man, is “the indispensable condition for the quest for human completion” (Freire 2006, p. 47). This ontological condition entails a motivating force for liberating action. Freire says:

In order for the oppressed to be able to wage the struggle for their liberation, they must perceive the reality of oppression not as a closed world from which there is no exit, but as a limiting situation which they can transform. (p. 49)

Such motivation thus “becomes a need, a necessity” (2007, p. 85). Freire goes on to say in his *Pedagogy of Hope* (2007), we even “invent the opportunity of setting ourselves free to the extent that we become able to perceive as unconcluded, limited, conditioned, historical beings” (p. 85). Furthermore, he emphasizes that the sheer perception is not enough and yet must be joined with “the political struggle for the transformation of the world” (p. 85).

Liberation of human beings, thus pursued constantly and responsibly, must be acquired, Freire insists, “by conquest, not by gift” (Freire 2006, p. 47). The oppressed *must* fight for their liberation in order to become more fully human, which, driven as their ontological vocation, is a form of spiritual and societal transformation. The liberation of individuals, as Freire puts it, “acquires profound meaning only when the transformation of society is achieved” (2007, p. 85). These strands of concepts, inherently interrelated in the process of the self-action, are the philosophical premises of Freire’s pedagogy of humanization.

The choice of title for this entry is to highlight the philosophical ground of Freire’s ethical ideal, humanization, vis-à-vis human suffering. Freire is

surely known best for his landmark text, *Pedagogy of the Oppressed*, wherein he addresses the “sharpness and intensity” of our moral and epistemological struggle in the “limited situations,” inasmuch as that we must meet our ontological need, namely, to hope, and to be more fully human. Yet, human suffering experience, such as hunger, poverty, limitation, and oppression, is an integral part of what it is to be human, and its significance for education may not have been widely noted. In a deepest understanding of the texts, this entry points out that while most studies concentrate on his methods and techniques, Freire’s deeply rooted philosophical aspiration in metaphysics has been less examined. Taking a comparative approach to Eastern and Western perspectives, this entry examines the strong yet less explicitly studied aspect of Freire’s metaphysical and moral commitment, particularly the place of human suffering in educational transformation. It indicates that Freire’s critical pedagogies both embody and entail a human primal ontological force, invariably, for self-action, freedom, and emancipation. The entry concludes that a pedagogy of suffering, with its roots in Freire’s lived experiences, is not at all a “teaching method,” but rather an ontological challenge and possibility, calling for our moral aspirations of becoming more fully human.

The Onto-epistemological Ground for Suffering and Morality

Concern for humanization leads at once to the recognition of dehumanization, not only as an ontological possibility but as an historical reality.

—Paulo Freire (*Pedagogy of the Oppressed*, 2006, p. 43)

Freire’s philosophical position is that “both humanization and dehumanization are possibilities for a person as an uncompleted being conscious of their incompleteness” and dehumanization “is a distortion of the vocation of becoming more fully human” (Freire 2006, pp. 43, 44). Human beings have an ability to react existentially and transcendently to their circumstances and therefore are bound to hope for freedom and

transformation. The oppressed discover that “without freedom they cannot exist authentically” (p. 48). For Freire, oppressed people are affected by being submerged in the situation of oppression, so they have “fear of freedom.” Therefore, it is necessary to develop a critical consciousness in the oppressed, so that they can see outside themselves, understand their situation, and begin to think about their world. This happens, Freire believes, through dialogue in education. The basic message of *Pedagogy of the Oppressed* is to affirm that it is humans’ responsibility to react thoughtfully and positively to their circumstances.

This is, Freire says, “not just a question of grit or courage. It’s an ontological dimension of our human condition” (Freire 1998, p. 47). Here, Freire’s philosophical ground is necessarily humans’ ontological possibility, their potential for accepting and transcending their existential conditions, particularly their suffering situations, such as oppression, affliction, despair, and sadness. One of humans’ obvious advantages is their capacity to go beyond the factors of conditioning. Suffering and hope are the two intrinsic notions in understanding Freirean critical consciousness. Hope is generated, as Freire asserts, in the process of reflecting on pains and suffering (Roberts 2016, pp. 53, 55–56, 58, 63). This process, seeking for critical understanding of the existential condition, is, in Freire’s own expression, “the unmasking of the ‘why’ of my experience of suffering” (2007, p. 23). With this new understanding, one can “engage in a political struggle for the transformation of the concrete conditions in which the oppression prevails” (p. 23). As such, critical consciousness and dialectical recognition of thought and action are ways to reclaim humanity and to become humanized (cf. Chen 2012, pp. 53–78). Humanity can be attained, or “regained,” in Freire’s assertion, through transforming action, such as self-action, self-overcoming, and liberating, so that a new situation can be created. Humans’ onto-epistemological possibilities can thus be enhanced from and through suffering (cf. Roberts 2016, pp. 75, 77, 81; Chen 2012, pp. 138–159).

An ontological reading of Daoist and Confucian traditions can accommodate Freire’s

ontological and epistemological possibilities. In a hope of wakening humanity, Laozi wanted people to awaken themselves first. “Truly,” Laozi said, “the greatest gift you have to give is that of your own self-transformation” (cf. *Dao De Jing*, 2006). Similar to Freire’s humanizing vocation of becoming more fully human, the ethical ideal for Laozi rests on human inner power, the ontological force inherent in Nature (or cosmos), which leads humanity to moral attainments. For Laozi, individuals are capable of realizing their authentic *de* (virtue) to the full, in that the idea of an authentic ontological core assures the possibility of attaining wisdom – Aristotelian *phronesis* (practical knowledge). In its very nature, humanization, living though lived experiences, is restored.

Freire’s onto-epistemological consciousness of human conditions suggests possible ethical meanings of human suffering. This sort of ethical understanding manifests the acts of consciousness, representing the response of a creative mind and sensitive conscience to the extraordinary misery and suffering of the oppressed around him. Mengzi, one of the key thinkers of Confucianism, insisted that the recognition of suffering for all sentient beings is a reason for action (cf. Mengzi 2006). Similar to Freire’s calling for developing critical consciousness in the oppressed, Mengzi’s need for such recognition calls for a high level of consciousness. That is, one develops one’s moral sense through recognizing suffering. The only difference is that Freire addresses the recognition of suffering of the oppressed, while Mengzi that of the oppressor. When conversing with the King, Mengzi offered ways of how to act morally, suggesting that people could develop their moral sensibilities by having their attention drawn to appropriate analogies similar to moral significant cases such as the recognition of other’s suffering. Mengzi emphasized, “All people have a mind that cannot bear to see the suffering of others” (2.6), because all people have a mind of commiseration – the mind of humanity (cf. Chen 2012, p. 35). And Laozi’s rhetorical question may stress Freire’s ontological and epistemological position of humans’ moral capacity,

when he asked, “Who can enjoy enlightenment and remain indifferent to suffering in the world? This is not in keeping with the Way” (cf. *Dao De Jing*, 2006).

Freirean Pedagogy and Moral Possibility

I like to be human because in my unfinishedness I know that I am conditioned. Yet conscious of such conditioning, I know that I can go beyond it, which is the essential difference between conditioned and determined existence.

—Paulo Freire (*Pedagogy of Freedom*, 1998, p. 54)

Freire’s pedagogies are sprung from his ontological conviction that humans are aware of being conditioned in their “incompletion” or “unfinishedness,” the state of which does not determine but only effects them. Therefore, in dealing with their existential conditions, they have free will to “recognize themselves,” to “overcome the contradictions,” and to “transform the world” (cf. Freire 2006, pp. 43–70). Consequently, humans are morally responsible for their action. They act and decide as individuals and are accountable as such: “I know that I can go beyond it,” proclaims Freire. Clearly, for him, human interactions with the world are only existentially conditioned, and such conditioning entails moral possibility. Freire affirms:

[Oppressed] people must first critically recognize its causes, so that through transforming action they can create a new situation, one which makes possible the pursuit of a fuller humanity. (Freire 2006, p. 47)

In light of the motivating force for liberating action, Freire’s ontological characterization of human beings emphasizes a viable possibility for humanization (cf. Freire 2006, p. 43).

Freire’s metaphysical unfinishedness of humanity as existential conditioning is reified in Laozi’s metaphysics of *Dao*, the level of pure consciousness that manifests the ontological source of cosmos and humanity. Similar to Freire’s critical thought, the level of consciousness is unbounded, hence capable of being awakened, enlivened, and expanded. Laozi’s *Dao of Nature* and *Dao of Man* represent the dynamic

of the Nature and humanity, and the interrelation thereof, as he assured:

The *Dao* produces the One.
The One turns into the Two.
The Two gives rise to the Three.
The Three brings forth the myriad of things.
... (*Dao De Jing*, 2006, Chapter 42)

Like Nature that is not static, but evolving and changing, Man's ontological characterization, for Laozi, is of ability to meditate, to experience, and to transcend. This is the possibility of *de* (human virtue), corresponding to Aristotle's moral virtue or excellence in *Nicomachean Ethics*. Thus, is entailed a universal teaching of universal reality – a great attainment of Man, for Laozi, and raising consciousness with “objective transformation of reality” – a “liberating pedagogy,” for Freire (2006, p. 48, p. 50).

Freirean pedagogies are grounded from the development of critical consciousness. In forming the pedagogy of the oppressed, Freire says, it is “a pedagogy which must be forged with, not for, the oppressed (whether individuals or peoples) in the incessant struggle to regain their humanity. ... And in the struggle this pedagogy will be made and remade” (Freire 2006, p. 48). Freire's pedagogies, therefore, cannot be narrowly conceived as merely teaching “methods” or “techniques.” The term “pedagogy” employed by Freire, as Peter Roberts (2000) describes, denotes “a complex philosophy, politics and practice of education” (p. 13). These contextual complexities not only shape Freire's pedagogical activities but also reflect his philosophical principles. For Freire, every educational decision, policy, or practice implies a particular thought of human beings and the world as well as a specific ethical position (cf. Roberts 2000, p. 57).

These are the very possible dimensions that Freire holds as most significant in any pedagogy. The significance of Freirean pedagogy relates a process of transformation in the whole of life and represents sociopolitical and cultural intervention and complexity. As Roberts (2000) lucidly accounts, they include “a conception of human beings and the nature of reality, an epistemological theory, an ethical position, and a political stance – from which broad (not fixed) underlying principles are derived” (p. 70).

Conclusion and a Pedagogy of Suffering

To live is to decide, to opt, to choose, to struggle. This confirms our existence as ethical and political beings, and signifies the crucial importance of education in social and individual formation.

—Paulo Freire (*Pedagogy of Freedom*, 1998, p. 53)

Freire encourages people to open their minds, as to experience hope and possibility through collective experience. He says, we must fight for hope and possibility, because “hope of liberation does not mean liberation already. ... and we must hopefully labour to create them” (Freire 1997, p. 44). To achieve liberating transformation, Freire calls for “problematizing the future” (p. 42). For Freire, the past links to the future through the present. He relates his own exile, as an example, to argue that while in exile he did not live only in the past, but existed in the present to prepare himself for possible change (cf. Freire 1997, p. 67). Freire accounts, “My homeland is also pain, hunger, misery. It is also hope of millions who remain hungry for social justice” (p. 40). In Freire's own words, “I cannot be indifferent to the pain of those who go hungry, [and] I cannot suggest to them. ... that their situation is the result of God's will. That is a lie” (Freire 1998, p. 45). The past must be regarded as possibility for the future, as Freire puts it, “if the future is to break out of a fatalistic determinism” (Freire 1997, pp. 36–37).

Freire's own suffering experience gives rise to his critical consciousness. His ideological stand elucidates his pedagogical framework – a pedagogy of suffering. This implies humans' agentic power to transcend suffering and the possibility for the emergence of consciousness and critical intervention in reality. As Freire confirms, only power that springs from the weakness of the oppressed will be sufficiently strong to free both the oppressed and the oppressor (Freire 2006, p. 44). Similar to a pedagogy of suffering, Freire offers “problem-posing education,” a pedagogy that is not merely the intellectual excise, but also the ethical practice of freedom. For Freire, in order to transform a concrete situation of oppression by establishing the process of liberation, people need to confront the dire situations – suffering, pain, or oppression (cf. Freire 2006, p. 46). Freire explains

that problem-posing education “affirms men and women as beings in the process of *becoming* – as finished, uncompleted beings in and with a likewise unfinished reality” (p. 84). This is, as Freire calls, “[A]uthentic liberation – the process of humanization” (p. 79). A pedagogy of suffering – imperative to transform suffering situation – signifies Freire’s philosophical, ethical, and educational position (cf. Freire 1998, pp. 72–74).

By and large, Freirean humanizing pedagogy is humanist and libertarian pedagogy. It consists of two different stages, says Freire:

In the first, the oppressed unveil the world of oppression and through the praxis commit themselves to its transformation. In the second stage, in which the reality of oppression has already been transformed, this pedagogy ceases to belong to the oppressed and becomes a pedagogy of all people in the process of permanent liberation. (Freire 2006, p. 54)

Freire and the Body

Antonia Darder

Loyola Marymount University, Los Angeles, CA, USA

It is the human body, young or old, fat or thin, of whatever color, the conscious body that looks at the stars. It is the body that writes. It is the body that speaks. It is the body that fights. It is the body that loves and hates. It is the body that suffers. It is the body that dies. It is the body that lives!

—Paulo Freire (Freire & Faundez 1989)

Introduction

Freire left behind a legacy that speaks passionately to the relationship of the body to emancipatory forms of education. This encompasses a pedagogical perspective that remains fully cognizant of the primacy of the body in the construction of knowledge. Freire’s philosophical renderings are anchored to an understanding of teachers and students as material beings and thus call for a pedagogical process informed by a humanizing ethos of the body to support reflection, dialogue, and solidarity, as we labor for the common good. As teachers and students participate more fully in the dialogical process of communal learning, the materiality of their bodies also must be understood as rightful allies in the formation and expression of collective consciousness. Of this Freire (1983) said, “true education incarnates the permanent search of people together with others for their becoming fully human in the world in which they exist” (p. 96). With these ideas in mind, this essay considers some of the salient ways in which the body is made central to Freirean thought.

Banking Education and Disembodiment

In *Teachers and Cultural Workers: Letters to Those who Dare to Teach*, it is apparent that for Freire (1998b) providing a rightful place for the

engagement of the body in the classroom encompasses an integral view of students as multi-dimensional human beings. It is this integral view that is often negated within banking education, where a more complex understanding of the body and its significance to intellectual and political formation is generally absent – unless it is being directed toward corporal control of students. Since the epistemological focus of traditional education privileges cognition, other important ways of knowing are easily ignored or dismissed. As a result, student voices and physical expressions of the body that fall outside the mainstream cultural register are systematically silenced. It is also worth noting that this phenomenon is predicated upon the prevailing notion of the individual as psychological self, whose intelligence and “ego strength” is supposedly gauged by the ability to function effectively, irrespective of external conditions.

In contrast, Freire (2002, 1993, 1989a) counters the limits of this Western pedagogical tradition that disembodies knowledge, supporting the banking approach to education, which negates the role of the body in teaching and learning. Freire understood this to be tied to the intellectual history of the West, where the mind and the body, as the mind and the heart, are deemed antagonists in the process of intellectual formation. This tradition of disembodiment shapes antidialogical classroom practices and expectations that students compartmentalize themselves, without contending with the manner in which this approach to learning reproduces asymmetrical relations of power that oppress organic constructions of knowledge. Freire (1998a) recognized that such disembodiment serves to disable the formation of student voice, social agency, and democratic participation – a process that can be even more disabling to oppressed who seldom enjoy the resources and opportunities of their more affluent counterparts.

Accordingly, Freire (1993) noted that students are expected to engage their studies as objective, distanced, and impartial observers, even when the object of their study may be intimately linked to brutal conditions of human suffering that are a part of their lived histories. He rightly argued

that traditional academic expectations affirm that feelings and intuition corrupt the process of teaching and learning and, thus, should be feared. Of this he argued, “the categorical negation of emotion and passion, the belief in technicism, ends in convincing many that, the more neutral [or disembodied] we are in our actions, the more objective and efficient we will be” (p. 106). Hence, university students, for example, are slowly but surely socialized to labor as uncritical, descriptive, “neutral” scholars, dispassionate, disembodied, and alienated from the subject of study. This results from a pedagogy conceived epistemologically in deeply *estranged* ways, devoid of the very qualities that humanize our existence.

Freire posited that, unfortunately, educators prepared in a banking pedagogy seldom possess the necessary political acumen about the body to deflect deficit notions embodied commonsensically within the classroom. This further incapacitates the human sensibility necessary for critical engagement of the larger conditions of inequalities that shape the lives of historically oppressed populations. Common authoritarian responses to student physicality also ignore or misinterpret meaning and intent behind student behaviors outside the mainstream, converting the body into an object that must acquiesce to the teacher’s will or be expelled (Darder 2015). In the process, little attention is given to the dialectical relationship that students have with their material world – a relationship that for working class youth of color, for example, requires constant navigation of the minefields of structural oppression perpetuated by racism, poverty, and other forms of social exclusions. The unfortunate consequence is that disembodied knowledge seldom leads teachers and students to grapple critically with deeper moral questions of education, which would undoubtedly challenge social and material relations that sustain human suffering and structural inequalities.

The Estrangement of the Body

Freire (2002) made a variety of references in *Pedagogy of Hope* that reflect his recognition

that the material conditions of estrangement that shape the lived histories of oppressed students, workers, and their communities are made visible and are profoundly expressed through their bodies. This can be witnessed in their skin, their teeth, their hair, their gestures, their speech, and the movement of their arms and legs. As such, student bodies provide meaningful maps of identity and powerful insights into the tensions, struggles, and needs that students from oppressed communities express in the classroom and out in the world. In concert with Marx, Freire (1998a) understood that hegemonic schooling is founded on a politics of estrangement, which like that of estranged labor functions to alienate youth from their bodies and the natural world. He considered the estrangement of the body akin to “that invisible power of alienating domestication... a state of refined estrangement... of a loss of consciousness of the body” (p. 102).

Hence, banking education exists as an arena of domestication, where abstract knowledge and its constructions are decontextualized, disembodied, and objectified. In response, students are forced to acquiesce to its alienating function, limiting rationality, and technocratic instrumentalism. With this in mind, Freire (1998a) asserted in *Pedagogy of Freedom* that it is insufficient to rely on abstract approaches to learning, where disembodied words and texts are privileged in the construction of knowledge: “words not given body (made flesh) have little or no value” (p. 39). His concern here was with the manner in which educational processes of estrangement cause false dichotomies that alienate students from their material world – the only true realm from which liberatory education can be forged.

Given the significant role of the body in the pedagogical process, Freire noted how the ontological and epistemological estrangement of the body in banking approaches interfere dramatically with the capacities of students to know themselves, one another, and their world. Ignored is the obvious fact; our lives unfold within the vital experiences of the flesh and its sentient capacity. Instead, the body is seen as an object to be controlled, contained, or

transcended, given its potential to disrupt the hegemonic order. This negation sidelines the affective and relational needs of student bodies that must endure, resist, and struggle to become free from the social and material entanglements of a society that imprisons them, both ideologically and corporally.

Repressive views of the body and sensuality within education also serve to negate, overtly or covertly, the cultural knowledge and wisdom of oppressed cultural populations, whose epistemological view and expression of the body in their cultural process of knowing may differ substantially from the mainstream’s dichotomy of body and consciousness. In the process, this often alienates and estranges students from ways of life, including human suffering, which exist outside of the limited scope of the hegemonic lens, whether linked to class, gender, ethnicity, sexuality, skin color, physical constitution, or spiritual beliefs.

Unfortunately, it precisely the power of sensuality, with its revolutionary potential to summon dissent and nurture empowerment, that is systematically stripped away from student experiences within the classroom. In response, Freire’s view of the body challenges conservative ideologies of social control historically linked to Western pedagogical traditions, which negate the body’s relevance. Disembodied views of teaching and learning have also led to pedagogical practices that perpetrate violence upon the oppressed through an erasure of the body and the annihilation of the flesh in the act of knowing. Accordingly, inequalities are reproduced through class, racialized, gendered, ableist, and heterosexist perceptions and distortions, which are embedded, wittingly or unwittingly, in prevailing attitudes of hegemonic schooling.

Teachers, whose bodies too are similarly restricted, alienated, and domesticated by their workplace are under enormous pressure to follow strict policies and procedures for classroom conduct, instead of employing more creative and humanizing approaches, grounded in the actual needs of students. We can return here to Freire’s (2013) notion of “the human being as a conscious

body” (p. 128) and his assertion that domestication is responsible for “a loss of consciousness of the body” (Freire 1998a, p. 102). As a consequence of this disembodiment (a symptom of estrangement), Freire recognized that teachers generally experience an uphill battle in meeting standardized mandates, which systematically functioned to also extricate student bodies from the equation of their learning.

Meanwhile, educators who struggle to implement liberating strategies in this context of estrangement are also often forced to become masters of deception – saying what the principal or district office wishes to hear, while doing behind closed doors what they believe is in the best interest of youth. Unfortunately, having to shoulder the physical stress of this duplicity can drive some of the most effective teachers away from their chosen vocation, given the intolerable alienation this engenders. While others, who simply feel defeated or frustrated by the pressure, adopt more authoritarian approaches manipulate or coerce cooperation, justifying their decision with contradictory rhetoric about the pragmatic necessity. What cannot be overlooked is that authoritarian practices of the classroom not only “blindfold students and lead them to a domesticated future” (Freire 1970, p. 79) but also alienate teacher labor as well.

Implicit here again are deficit assumptions and debilitating preconceptions projected upon teachers or students whose bodily appearance or expression is perceived to be outside the classed, racialized, patriarchal, heteronormative, abled, or spiritual mainstream of acceptable classroom behavior. Consequently, students from working class and racialized communities, where the body’s spontaneity is given greater primacy and freedom in the act of knowing, are often expected to sacrifice the creative and sensual knowledge of their bodies to an atomized, abstracted, and dispassionate logic of being. As such, Freire (2005) pointed to “the need for an interdisciplinary reading of bodies with students, for breaking away from dichotomies, ruptures that are enviable and deforming” (p. 52) in the forging of a critical praxis of the body.

Critical Praxis of the Body

Freire’s ideas on the body point then to the need for teachers and students to labor in the flesh. This is to say that liberatory forms of teaching and learning must be rooted in the materiality of human existence, as a starting place for critical praxis. Freire (1993) argued, “It is [through] this process of change, of transforming the material world from which we emerged, that creation of the cultural and historical world takes place (p. 108).” However, there is nothing automatic or “natural” about this process of social change nor is it a process that can solely rely on calculating logic or cold rationality. Moreover, given that the body’s sentient quality overwhelmingly shapes student experiences, their bodies constantly resist or desist, adjust or rebel, rejoice or despair in their desire to experience the freedom to be.

As a political and organic entity, the body plays then a significant role in making sense of the material conditions and social relations of power that shape our lives. Similarly, a praxis of the body can support teachers in building a democratic educational practice, where students are not asked to confront themselves and each other as strangers, but rather in the spirit of human kinship and community. This link between the body and communal life is also central to Freire’s understanding of *conscientização*, which can only unfold and evolve within the context of solidarity and political participation – *in the flesh* (Darder 2015).

So much so, that in *Pedagogy of the City*, Freire (1993) spoke to the undeniable centrality of the body in the act of knowing the world: “The importance of the body is indisputable. . . its importance has to do with a certain sensualism. . . even in connection with cognitive ability. . . it’s absurd to separate the rigorous acts of knowing the world from the [body’s] passionate ability to know” (p. 87). Freire’s own passionate way of being in the world and his many references to the “beauty of the body” and “the restlessness of bodies,” bore witness to the ways in which the body’s sensuality and sexuality had a

determining impact on consciousness and reason. In *Pedagogy of the Heart*, Freire (1998c) commented on the “gradual improvement in performance on the part of the student, as the pedagogy of questioning started to gain ground against the pedagogy of answers, and as issues around the body were addressed” (p. 62).

Yet, despite major institutional efforts to repress and control the desires, pleasures, and mobility of the body within the classroom, Freire’s writings support the view that students seldom fully surrender their bodies or readily acquiesce to authoritarian practices – practices which in themselves provide the impetus for resistance, especially in those students whose dynamic histories are excluded within mainstream education. Instead, Freire (1970) recognized that in their struggle for freedom, students who are repressed will “try out forms of rebellious action” (p. 64), engaging in the construction of their own cultural forms of resistance that may or may not always function in their best interest.

Yet, often, expressions of student resistance are enacted in the classroom through alterations of the body – be they clothing, hairstyle, posturing, manner of walking, way of speaking, the piercing and tattooing of the body. These actions represent then not only acts of resistance but also alternative ways of experiencing, affirming, and knowing the world, generally perceived by officials as transgressive and disruptive to the social order. In a footnote in *Pedagogy of the Oppressed*, Freire (1970) made reference to the pedagogical significance of this phenomenon by saying that teachers cannot “see youth rebellion as a mere example of the traditional differences between generations. Something deeper is involved here. Young people in their rebellion are denouncing and condemning the unjust model of a society of domination. This rebellion with its special dimension, however, is very recent; [in that] society continues to be authoritarian in character” (p. 154).

Freire contended that often this authoritarianism led to historical absences of the body in the classroom, due to institutional fears associated with the body’s real potential for disruption and subversion. Thus, he called upon an emancipatory

ethical commitment to counter the disembodiment of our humanity – a commitment that lies at the heart of Freire’s liberatory pedagogical project. To endure daily confrontations with oppressive forces, for example, Freire (1998a) urged us to “struggle for the material conditions without which our body will suffer from neglect” (p. 95). Nevertheless, often missing from educational discourses is precisely this ethical connection of the body to critical praxis.

The Body as Ethical Terrain of Struggle

Freire (1993) embraced the totality of the body in the act of knowing, insisting “It is my entire body that socially knows. I cannot, in the name of exactness and rigor, negate my body, my emotions and my feelings” (p. 105). With this in mind, Freire (2002, 1989) posited that the human body constitutes an ethical terrain of struggle from which all emancipatory knowledge must emerge. Without the materiality of the body, our teaching and learning is reduced to processes of abstraction and fragmentation that attempt to falsely render knowledge a neutral and objective phenomenon, absent of history and ideology. Accordingly, Freire (2002, 1998a, 1993) understood the body as the medium for our existence as subjects of history and as politically empowered agents of change. We are molded and shaped by the structures, policies and practices of economic domination, and social exclusion, which violently insert our bodies into the alienating morass of an intensified global division of labor.

Therefore, it is not surprising that in *Pedagogy of the Heart*, Freire (1998c) merges the question of the body to ethics, when he asserts, “I refuse, for all these reasons, to think that we are eternally destined to live the negation of our own selves. In order to be in the world, my conscious body, my unfinished and historical being, needs food as it needs ethics. The fight would make no sense to me without this” (p. 89). Hence, for Freire, the integration of the body served as an indisputable ethical dimension of revolutionary praxis and this, emancipatory education, in that, ultimately: *It is the body that lives!*

Freire, Paulo (1921–1997)

Walter Omar Kohan

State University of Rio de Janeiro, Rio de Janeiro, Brazil

Introduction

Paulo Freire is one of those public intellectuals who makes any attempt to study his ideas apart from his life problematic. Although many contemporary scholars – on the assumption that philosophy of education is simply a history of philosophical doctrines about educational problems – have made that attempt, it is virtually impossible to restrict any interpretation of his life's work to his writings. Moreover, his texts are full of anecdotes and personal stories, and his *oeuvre* is composed not only of theoretical texts but also of interviews, letters, class records, lectures, and other forms of writing (cf. Gadotti 2001), and his understanding of philosophical

thought approaches Foucault's (2011, p. 210) characterization of the latter as "a history of forms, modes, and styles of life, a history of the philosophical life as a philosophical problem, but also as a mode of being and as a form both of ethics and heroism." This manner of living a philosophical life originates with Socrates, who occupies a singular and paradoxical educational position, as shown in Plato's *Apology* (Plato, *Apology* 33a ff.), that is, he takes care of himself by not taking care *ipso facto* of himself but by taking care that others take care of themselves (Foucault 2011, p. 158). What makes Socrates a paradoxical educator also makes him a philosophical hero. As a heroic form of ethics, his philosophical life embodies philosophy not as content or knowledge but as a form of examined living, as he himself demonstrates in the *Apology*. There is no Socratic education outside his philosophical life and no philosophy of Socrates outside his educational life. As also shown in the *Apology* (21e ff.), Socrates presents this task as a divine mission given by the god Apollo to awaken the Athenians: philosophy is, then, born as a form of educational life as much as a religious enterprise. There is a long tradition built upon this conception of philosophy as education, which originated with Socrates and is rarely remarked upon (cf. Masschelein and Kohan 2015), like the ancient Cynics and a few prominent Latin-American philosophers as educators, like the "Socrates of Caracas," Simón Rodríguez (Kohan 2015). It is precisely in this tradition that Paulo Freire could, as a vivid example of a philosophical and educational life, be perfectly inserted, much more than in the history of philosophical doctrines.

Freire as Founder of a Tradition: Philosophy as Education

For the reasons offered above, this entry will include references to Paulo Freire's writings as well as to his life, with no pretension to deliver a complete or full account, but rather aiming to provoke a problematization of the legacy of this powerful figure in educational philosophy.

One way to understand Freire's life project is to try to identify his life and work with the discourses

of philosophy as education that originated with Socrates. Let us consider at least two alternatives: (a) the Cynic tradition, illustrated by Diogenes' life, in which one's own philosophical life is in itself educative and implicitly contains a political value – philosophy and education are here political in their way of inhabiting the public space – and (b) the Platonic, illustrated by the Allegory of the Cave, in which the philosopher, knowing the Good, liberates others' lives by taking them out of their devalued world of shadows and copies of the real they are immersed in. In this second discourse, philosophy is educational and political if and only if it changes the way others live in order to approximate their lives to what it is considered the true one.

Freire's own testimony confirms this last perspective as a task given by himself to himself: as a young man, he wandered the fens, streams, and mountains of his native Recife and moved to the rural areas of Pernambuco to work with slums people and countrywomen, inspired by a loyalty to the figure of Christ servant and liberator. But the hard reality of the lives of the people he served led him directly to Marx, in whom he found an "objective basis" to continue Christ's mission. In his own words, Freire "stayed with Marx in worldliness looking for Christ in transcendence" (Freire 1997). As such, his life project had to do with taking care, as a Christian shepherd, of the poor, excluded and dispossessed, based on a Marxist understanding of social history. Marxism functioned as the theoretical background to his task of political liberation through educational praxis, which he understood as infusing Christian values into the oppressed in the specific context of a southern, developing country such as Brazil. The analogy with a Platonic reading of Socrates suggests itself here: like the Socrates of the cave, Freire understood his philosophical and educational project as a mission, guided by a religious inspiration, with the political aim of liberating others from the shadows they inhabit at the dark underground.

There are at least two specific senses in which Freire seems to have understood this task, which give specific and prominent meaning to his thought, character, and vocation: (a) the task of

education is to give the oppressed (and, eventually, the oppressors) not only the consciousness of their condition but also the desire to transform it (he seeks not only intellectual liberation but an existential as well) and (b) the final political end of philosophy as education is to transform not only the condition of human beings (taking them from the cave) but also turning social reality into a non-oppressive one (a world with no caves). In order to accomplish this project, Freire involved himself from the very beginning of his adult life with educational theory and practice through his studies in law at his native Recife. But political conditions influenced his project decisively. Three main periods of that project can be distinguished, marked by the urgent need to abandon Brazil in 1964 following the eruption of the military coup d'état and by his return to the country in 1980.

Certain characteristic features accompany this educational militant for the poor from his youth to the end of his lifetime. For one, he always combined an academic life with activism in the realm of educational policy. As a very young man, he taught at the same school in which he had studied and directed programs in adult literacy. At the same moment that he finished his Ph.D., he became a professor at the University of Recife and very soon was made a member of the State Council of Education of Pernambuco. With the coup d'état in 1964, the National Program in Adult Literacy he coordinated was suspended, and he was driven into exile. He stayed a few months in Bolivia, and following a coup d'état there, he moved to Chile. Over a period of 15 years, he traveled the world and ran educational programs in several African countries sponsored by UNESCO and the World Council of Churches. Upon returning from exile, he taught at several universities in the State of São Paulo, where he also cofounded the Brazilian Labor Party – which actually governs the country since 2002 – and occupied the position of Secretary of Education of the city of São Paulo.

The Errant Philosopher as Educator

Given all this political commitment, the analogy with the Socrates of Athens loses some force. Socrates states at the *Apology* that fortunately he

has not participated in politics; otherwise, he would have died much earlier (Apology 31d). However, the life and vocation of another Socrates, closer to Freire's historical place and time – the nineteenth-century Venezuelan Simón Rodríguez – offers a striking similarity. Rodríguez, known as the “Socrates of Caracas,” devoted his life to popular education, to the extent of founding an experimental school for the poor and socially excluded – in Chuquisaca – which represented the vanguard of liberatory education in the first decades of the nineteenth century. He also maintained, like Socrates and Freire, a strong connection between philosophy and education, or understanding of philosophy as a way of living an educational life (Kohan 2015).

What probably most strongly and specifically connects Freire and Simón Rodríguez in their way of enacting philosophy as education is the idea of errantry: they both live a life of philosophical essaying and wandering, inventing new forms of schooling, holding to the education of the excluded as an ethical and political anchor for a traveling form of existence. The circumstances of Freire's major book *Pedagogy of the Oppressed* illustrates his condition of errantry: written in Chile, it was first published in New York in 1970, forbidden publication in Brazil, and only finally issued there in 1974. His other major work, *Pedagogy of Freedom (Pedagogy of Autonomy)* in the original Portuguese), dates to the end of his life. Not only is there more than 20 years between these two works but also a number of other differences. For one, the tone has changed. If they both read more like political manifestos than theoretical treatments, the former points to a revolutionary society, while the latter defends a “democratic” one. The main dialectical pairs of the *Pedagogy of the Oppressed* are oppressor vs. oppressed and banking vs. liberating pedagogy. Humanization vs. dehumanization, positivism vs. dialectic, and hierarchy vs. dialogue still underlie his thinking, but operate less strongly as elements of a narrative strategy; the class struggle is still identified as a motor of history and as one among others; and the subject of history has changed from the monolithic oppressed to a gendered and ethnic situated subject.

A Life Lived Opposing Oppression

The humanizing project of the *Pedagogy of the oppressed* is not without tensions regarding its real possibility and opportunity. On the one hand, it is assumed to be possible when its pedagogical method is presented or its main strategy is portrayed. The latter has two moments: first, the oppressed unfold their condition and become conscious of it through the perception of the “untested feasibility” which they previously did not even consider and, in a second, moment they search for a way to put it into practice (Freire 2004, p. 110). On the other hand, Freire affirms that education itself is not a path for revolution, which requires, as a condition, a social change that does not come from education. Once the oppressive reality is transformed, the contradiction educator-educated is overcome in a dialogical relationship, and the pedagogy of the oppressed turns into a liberating pedagogy for every human being (Freire 2004, p. 44). This tension may be an expression of Freire's doubts concerning the real possibilities of education in a class-based society. Taken as a whole, his work does not seem to aim to demonstrate education's possibility, but rather to show its importance and meaning as a conscientizing, humanizing, liberating, and dialogical practice. The idea of dialogue might be considered to be Freire's most specific theoretical contribution to a Marxist pedagogy. It transforms the relations of all its discursive characters – the oppressed, the oppressors, and even between oppressors and oppressed. Dialogue is, for Freire, “radical exigency of every authentic revolution” (Freire 2004, p. 149).

Pedagogy of the Oppressed also presents Freire's pedagogical method, which was developed in order to teach rural workers in the poorest Angicos, northeast of Brazil, to read. According to him, forty hours is enough to create the conditions to start the process of liberation of the oppressed and to learn to read through reading the world and one's situation in it. In order to apply the method, some guidelines need to be followed: leave the stultifying techniques which depotentialize what can only be a thoughtful and creative activity; produce the so-called culture cards to make contact with the knowledge of the

oppressed; create conditions for learners to problematize the meanings given to the words that regularly appear in their vocabulary and thus give them consciousness of their class; help them to repudiate the attributions of inferiority ascribed to their class, so that through generative words and themes they can empower their own reading of the world; convince that they can unfold all the power of which they are capable to read, to think, and to act creatively; invite them to reject apathy and conformism; and engage actively as cultured beings and producers. It is, then, as much a methodology devoted to cultural and political literacy as it is to language literacy. Regularly revisited by Freire himself, the method has progressively become less a specific way to teach or a methodology and more a political principle for education – the unconditional affirmation of the principle that “any human being can learn to read and write (a language, but also a social reality) if provided with the appropriate conditions to do so.”

The Errantry of a Philosophy of Education

Pedagogy of Freedom (2001), published more than 20 years later and just a few months before Freire died yet written with hope, passion, and enthusiasm, has another tone, vocabulary and spirit, beginning from the title: a pedagogy that originally addressed a class now addresses a concept. Some words (such as “revolution”) disappear, others (such as “awareness” or “oppressed”) lose centrality, some others (such as “dialogue” or “autonomy”) are resignified, and new words appear (like “ethics” or “aesthetic”). Even though Marxism loses its centrality in Freire’s final approach, a very similar anthropological, epistemological, and ontological background remains, based on the “unfinished human condition” and the consequent human curiosity to “be more,” both individually and culturally. However, the main difference is in the book’s political tone: if *Pedagogy of the Oppressed* – in spite of the ambivalent relationship between education and revolution reflected there – was “revolutionary” in spirit, *Pedagogy of Freedom* looks more “reformist,” and the idea of revolution is replaced by a less ambitious but still unconditioned

commitment to transformative education, expressed in his nostrum “change is difficult, but not impossible” (Freire 1997, p. 30 ff.). Its subtitle (“Needed Knowledge for Educational Practice”) still shows a high commitment to practice, and all three sections of the book focus on teaching and teachers. Each of the nine sections of the three chapters offers a kind of requirement to “thinking well” that ought to form the basis of all educational practice (Freire 1997, p. 11 ff.). The list of requirements is long: rigor, epistemological curiosity, criticality, risk, humility, beauty, non-discrimination, generosity, consistency, experience, communicability, hope, participation, dialogue, and demanding. The book, then, could be understood as offering a normative set of principles for good teaching practice. It is Freire’s last testimony – less simple, political, and appealing than the *Pedagogy of the Oppressed*, but also more open, flexible, and, interestingly dialogic.

Paulo Freire: A Tropical Socrates?

In philosophy as education, it all started with Socrates. Foucault points out, in his *The Courage of the Truth*, two opposing paths, illustrated by Platonism and Cynicism along which a true life may be found: in another world or in another form of life (Foucault 2011, p. 246 ff.). One path is drawn starting from the *Alcibiades*, where the care of the self is understood as the contemplation of one’s own soul as a path that leads to the contemplation of another World. The other path is drawn from the *Laches*, where the care of the self does not lead to so much to self-contemplation, but to the issue of how the self should live a caring life in this actual world. There has been constant interaction between these two paths, and Foucault explores the Gnostic currents in Christianity in an attempt to think a coherent relationship between both (Foucault 2011, p. 247).

Paulo Freire might well be inscribed in this tradition as a contemporary attempt to harmonically combine the other world and another life – a Christian world and a more just and inclusive social life. And just as Socrates’ educationally and philosophically revolutionary life encountered a deadly political reaction in Classical

Athens, so did Paulo Freire's life of errantry in our time. Even more, regarded from all political sides, contemporary Brazilian education might be regarded as a proof of the failure of his project: from the left, the reality of more than 13 million Brazilian adult illiterates and from the right, accusing him, as the public demonstrations of March 2015 did in Brasília, of being the source of "Marxist indoctrination." Between these two forms of critique, hundreds of thousands of educators seem to be enacting a confirmation of his accomplishments daily, in a variety of forms, often in very adverse conditions, inspired by the promise of a more dialogical educational practice.

Paulo Freire is a distinctly Latin-American and popular Socrates. Loved and hated like the Athenian, he devotes himself to an educational and philosophical mission in which a political commitment to the liberation of the excluded is inseparable from a way of living. To that extent, it is singularly inspiring not only for those who work in philosophy and education in this part of the world but for anyone sensitive to the needs of justice anywhere and any time.

Introduction

Paulo Freire was one of the most well-known educators in the world. Elements of his work have been incorporated into fields as diverse as nursing, social work, and business management. Much of the attention given to Freire's work has focused on the Marxist elements within his analysis of education and society. What receives far less attention, however, is the fact that Paulo Freire was a Christian. Freire's religious beliefs seem to have influenced much of his theory and practice. Indeed, one writer claimed that "those of us who espouse critical pedagogy and embrace Paulo Freire's visions of praxis and conscientization work out of a tradition, often unknowingly, with deep ties to religious faith" (Stenberg 2006, p. 271). Freire's faith is easy to miss, even though numerous articles have been written about it. He seldom used words such as faith, religion, and spirituality and used the words Jesus, God, and Creator even less often. In most of his books, Freire did not make explicit connections among his faith, his theory, and his activism. His was not a proselytizing faith; he was not trying to win converts to Christianity. Nor was

he comfortable speaking about his faith (Freire 1997). Instead, his faith seemed to provide him with a personal motivation for his work:

This is how I have always understood God – a presence in history that does not preclude me from making history, but rather pushes me toward world transformation which makes it possible to restore the *humanity* of those who exploit and of the weak. (Freire 1997, pp. 103–104; original emphasis).

Freire further clarified the crucial link between his faith and his fight against injustice when he wrote about “the fundamental importance of [his] faith in [his] struggle for overcoming an oppressive reality and for building a less ugly society, one that is less evil and more humane” (Freire 1997, p. 104).

For readers of Freire, understanding the role Freire's faith played within his work adds context to his Marxism. Freire drew from Marx in creating a language of critique and a framework of analysis, but his faith seemed to help provide Freire with the motivation to critique society in the first place. This understanding also sheds light on a number of “why?” questions that arise in analyzing Freire's work, such as why did Freire emphasize dialogue and relationships, and why is humanization people's historical vocation? Finally, this understanding helps to illuminate the connection many of the most significant concepts within Freire's writings had with his Christian beliefs.

A Lifelong Religious Motivation

Freire seems to have felt a faith-driven call for justice throughout his life. Even as a young child, growing up as a Catholic in Recife, Brazil, Freire felt a call to advocate for justice:

I remember that when I was 6 years old, one day I was talking with my father and my mother, and I protested strongly against the way my grandmother had treated a black woman at home – not with physical violence, but with undoubtedly racial prejudice. I said to my mother and to my father that I couldn't understand that, not maybe with the formal speech I am using now, but I was underlining for me the impossibility of being a Christian and at the same time discriminating against another person for any reason. (Horton and Freire 1990, p. 243).

This faith influenced Freire in deciding to begin meeting and working with peasants and workers in Recife's slums. About this decision he claimed, “I have to confess that I did that pushed by my Christian faith” (p. 245). Later in his life, even into the years just before his death, Freire maintained clear religious convictions. In his talking book with Myles Horton (Horton and Freire 1990), Freire stated that “I would say that I am a man of faith” (p. 246). Elsewhere, Freire gave a more robust articulation of his faith:

Being a Christian, a revolutionary; these are very close. It assumes the totality of humility of telling me that I am a man trying to become a Christian; I am a Christian trying to become a revolutionary. *I am a Christian revolutionary or a revolutionary Christian because I know what I want to become.* (Costigan 1983, p. 37; original emphasis).

Freire described his work as responding to a call: “The Word of God is inviting me to re-create the world, not for my brothers' domination but for their liberation” (Freire 1972, p. 7). Freire explained this call when describing his work in the Recife slums. He wrote, “I know that I had been sent, but Christ did not do that personally. I don't want to say that I have such prestige. I went because I believed in what I heard and in what I studied” (Horton and Freire 1990, p. 245). Freire further explained the call from Christ and how that call resonates within the Gospels. He wrote that he

was fascinated and continue[d] to be fascinated by the indivisibility of the content of the Gospels and the manner in which Christ communicated them. Christ's teaching was not, and could never be, the teaching of one, who like so many of us, sees himself to be the possessor of truth which he seeks to impose or simply transfer. He was himself Truth, the Word that became flesh. This word could never be learned if, at the same time, its meaning were not also grasped, and its meaning could not be grasped if it were not, also, incarnate in us. This is the basis of the invitation that Christ made, and continues to make to us. . . . (Freire 1984, pp. 547–548)

For Freire, the best way to teach the Gospels was to try to live them as a call to social action: “To know the Gospels through seeking to practice them. . . is, thus, the best way I have of teaching them” (p. 548). Towards this end, Freire explained, “Christ will always be, as he is for me, an example of the Teacher” (p. 547).

Freire's relationship with the Catholic Church was also revealing about his faith. In his native Brazil and also in Chile, the Church had a powerful influence over society, especially in its educational role. Thus, when the Church taught, for example, that God caused suffering as a punishment for people or that to challenge the Church was to challenge God, those teachings impeded Freire's goal of humanization. If people held on to those kinds of false teachings, as Freire considered them to be, then they were less able to engage in conscientization. Freire, in his support of a prophetic church, challenged such myths that served oppression. He argued that "the prophetic position demands a critical analysis of the social structures in which conflict takes place" (Freire 1985, p. 138).

Freire's connection to Liberation Theology was part of this reaction against the oppressive tendencies of the Church. Freire was aware of the response such actions would provoke from the Church. He stated that if we invite people to "tear away the veils that hide the facts and reveal the true causes of their misery and oppression...we will be damned as enemies of the Christian Western civilization" (Freire 1972, pp. 6–7). Yet, Freire challenged the Church anyway, just as Jesus challenged the Pharisees. As Freire put it, "Christ was no conservative. The prophetic church, like him, must move forward constantly, forever dying and forever being reborn. In order to be, it must always be in a state of *becoming*. There is no prophecy without risk" (Freire 1985, p. 139; original emphasis).

God was not an abstraction for Freire. God was not absent from the workings of the world. Nor was God, to borrow from Marx, merely an opiate. Instead, Freire wrote that God's relationship with people was central to the process of liberation:

God's relationship over us is based on the fact of our finitude and our knowledge of this finitude. For we are incomplete beings, and the completion of our incompleteness is encountered in our relationships with our Creator, a relationship which, by its very nature, can never be a relationship of domination or domestication, but is always a relationship of liberation (Freire 1969, p. 29).

In other words, Freire's purpose for liberation seemed to be both material *and* spiritual. He stated

that "the true humanization of man cannot be brought about in the interiority of our minds; it has to take place in external history" (Freire 1972, p. 7). His purpose was material in that external reality can impede people from becoming fully humanized: "If objective reality keeps man from being humanized, then he should change that reality" (p. 7). But liberation was also spiritual in that the process of becoming and people's awareness of their unfinished nature (Freire 1970) is only made whole in relationship with God.

Religious Language and Symbolism in Freire's Work

Religious language and symbolism fill Freire's work. While *Pedagogy of the Oppressed*, his best known book, for example, brims with religious symbolism, one can find such language and symbolism across a number of Freire's writings. The following takes a brief look at some of the religious connections found within a few well-known aspects of his work.

Relationship

Relationship is central to Freirean praxis. Freire lamented the breakdown of the relationship between educators and learners. Problem-posing cannot effectively happen unless relationships between teacher and student are developed first. Distinctions between teacher and student can begin to be erased only within supportive and respectful relationships. Freire's focus on relationship can be traced, in part, back to people's relationship to God. Freire held that people's relationship with God is central to liberation. It is through relationship to God that people experience wholeness, "completion of our incompleteness." Freire placed relationships at the center of human experience when he wrote that "to be human is to engage in relationships with others and with the world" (Freire 2013, p. 3).

Dialogue

Dialogue is the means by which Freire's educational practice happens. True dialogue reveals reality as a process and admits no dichotomy

between people and the world (Freire 1970). But this dialogue takes an a priori faith in humankind. Faith and hope connect, for, as Paul defined faith in his letter to the Hebrew Christian congregation, "Faith is the assured expectation of what is hoped for, the evident demonstration of realities that are not seen" (Heb 11:1). Freire made an explicit connection between dialogue and his religious faith when he wrote "Existence is a dynamic concept, implying eternal dialogue between man and man, between man and the world, between man and his Creator. It is this dialogue which makes of man an historical being" (Freire 2013, p. 14). Freire imbues dialogue with spiritual purpose by linking dialogue between people with dialogue with God.

Naming

The act of naming is perhaps the core component of creating and analyzing generative themes. Freire stated that "to exist, humanly, is to *name* the world, to change it. Once named, the world in its turn reappears to the namers as a problem and requires of them a new *naming*" (Freire 1970, p. 69; original emphasis). People, then, transform the world through naming it. For Freire, naming "is an act of creation; it must not serve as a crafty instrument for the domination of one person by another" (p. 70). Freire articulated a connection between naming and God's direction to Adam to name the animals of the Earth:

It was when God said to the human beings that they would *give a name* to the things. I read this when I was very young and never forgot it. Giving a name is something which generally comes after transformation. I transform. I create. I then give a name. (Costigan 1983, p. 35; original emphasis)

Language, through naming, becomes a world-builder. In reading the word-world, people are presented with the problem of renaming the world with new words, thus building new worlds.

Freire's use of the phrase "the word" also carries another religious overtone. In the Bible, in the Gospel of John, Jesus is referred to as "the Word" (John 1:1). Jesus, "the Word," was sent by God to transform the World and preach the good news of God's Kingdom (Luke 4:43). Freire

recognized Jesus as the Word, borrowing from John 1:14 in stating that "just as the Word became flesh, so the Word can be approached only through man" (Freire 1972, p. 7). John wrote that "All things came into existence through him, and apart from him not even one thing came into existence" (John 1:3). Here the Bible states that God created all things through Jesus, "the Word." Freire's symbolism is subtle, but powerful. "The word" refers, on one level, to actual words, to language, which are powerful tools for building and analyzing the world. But on a deeper level, Freire seems to link Jesus, "the Word," as cocreator of the world, with language, "the word," also as a cocreator of the world. Both worked towards a utopia: one, God's Kingdom; the other, a more immediate material utopia. But, for Freire, the material utopia is linked to the spiritual utopia. As Freire put it, "That is why I insist that a Utopian and prophetic theology leads naturally to a cultural action for liberation, and hence to conscientization" (Freire 1972, pp. 7–8).

Problem-Posing

Freire believed that faith alone was not enough to address problems; action was also required. He argued that "being in faith means moving, engaging in different forms of action coherent with that faith" (Freire, 1997, p. 104). Problem-posing can be seen as action grounded within faith. Problem-posing is based on dialogue, and "dialogue...requires an intense faith in humankind, faith in their power to make and remake, to create and re-create, faith in their vocation to be more fully human" (Freire 1970, p. 71). Indeed, Freire seemed to imbue problem-posing with spiritual qualities: it affirms people as beings in the process of becoming and as beings who can transcend themselves. Additionally, problem-posing helps people to unveil reality, what Freire called "demythologizing reality." Freire's view of faith and works is similar to that of the Apostle James who wrote, "Of what benefit is it, my brothers, if someone says he has faith but he does not have works?" (James 2:17). Freire's identification of Christ as "the Teacher" is instructive here (Freire

1984). Throughout the Gospels, Jesus's disciples called him "Teacher." As he preached the news of the Kingdom, he criticized the religious leaders of the day for distorting God's word, for example, in telling the Pharisees that "you skillfully disregard the commandment of God in order to keep your tradition" (Mark 7:9). Plus, he was engaged in his own form of demythologizing as he tried to help people understand God's Kingdom. In doing these things, Jesus spoke to everyday practices and injustices that affected the people.

Easter and Rebirth

Perhaps the most religiously symbolic language Freire used was that of Easter and rebirth. For Freire, the move towards conscientization required a profound shift within a person, especially a person from the First World. Freire claimed that "for the First World to hear that Word [the Word of God inviting people to re-create the world], it must previously undergo an Easter. It must die as First World and be reborn as Third World" (Freire 1972, p. 7). Elsewhere, Freire asserted that "conversion to the people requires a profound rebirth. Those who undergo it must take on a new form of existence; they can no longer remain as they were" (Freire 1970, p. 43). This rebirth demands

a renunciation of myths that are dear to them: the myth of superiority, of purity of soul, of their virtues, their wisdom, the myth that they save the poor, the myth of the neutrality of the church, of theology, education, science, technology, the myth of their own impartiality. (Freire 1985, p. 123).

But this death and rebirth is not reserved for elites from the West. Students must also experience their own death and rebirth. Just as teachers must die to their previously held beliefs about teaching and about students, students must also die to their previously held beliefs about being students and about learning. Freire speaks here not just to sacrifice but also to profound love, for love is "an act of courage" and is required as commitment to the cause of liberation (Freire 1970, p. 70). Freire argued that it is a "loving action" to invite people to "tear away the veils that hide the facts" (Freire 1972, p. 6). He claimed that love of the world, of people, and of life is the

foundation of dialogue (Freire 1970). And he held that his work with peasants in the slums of Recife was reinforced by love (Horton and Freire 1990, p. 247). Freire's language of death and rebirth implies not a physical death, of course, but a death of previously held ideology, a rebirth into a new way of thinking, and the love for people to undergo that difficult process.

Synonyms

Conscientization; Dialogue; Liberation; Neoliberalism; Praxis

Introduction

At the heart of Paulo Freire's philosophy and pedagogy is the notion of humanization. While Freire's understanding and application of this central concept underwent some subtle shifts as his thought progressed, much remained consistent from his earliest books to his final writings. This entry explores some of the links between humanization and other key terms in Freirean theory – praxis, dialogue, and conscientization – and comments on Freire's depiction of neoliberalism as an example of dehumanization.

Humanization, Transformation, and Education

Freire's most comprehensive treatment of humanization can be found in chapter 1 of his classic early work, *Pedagogy of the Oppressed* (Freire 1972). There, he develops the idea that humanization is both an ontological and an historical vocation. Humanization is understood as a process of becoming more fully human. This is an ontological vocation in the sense that it involves becoming more completely what we already are or are meant to be as human beings. From a Freirean perspective, all human beings have this vocation, though each person is unique in the way he or she pursues this. But the process of humanizing ourselves does not take place in isolation from other human beings, or merely “inside our heads”; it unfolds in social contexts shaped by past and present structures, policies, beliefs, values, and practices. Humanization involves a form of work, a process of struggle, that never ends. From a Freirean perspective, we remain necessarily incomplete, unfinished, ever-evolving beings. We become *more* fully human, not *fully* human.

Underlying Freire's philosophy, then, is an ontology of restlessness that suggests a need for continuous searching, striving, and learning. Education is thus seen as a fundamental part of what it means to be human. Freire's emphasis on education as a process of ongoing transformation should not be taken to mean that nothing remains

constant or that everything is changing all the time. As human beings, we each have aspects of character – dispositions, beliefs, modes of thinking, and acting – that, in their unique combinations and permutations, distinguish us from others. Without something persisting, further change would not be possible. Freire is insistent, moreover, that the tendency to embrace the new simply because it is new should be avoided; instead, we should seek to discover what is worthwhile in both the old and the new (Freire 1976). But there is never a point at which we can say educational transformation is no longer necessary, possible, or likely. We cannot know precisely what will be demanded of us by future circumstances or events. We are always conditioned – not *determined* (Freire 1998a) – by the ever-changing world in which we exist. Continuity and change, for Freire, are dialectically related, and it is the interaction between the two that makes transformation possible. The influence of both Hegel and Marx, among others, can be detected in Freire's interpretation of the dialectic. Arguably, however, it is Marx who played the more important role. Freire's concern is not just with changes within the individual but also with contradictions, resistance, and transformation at wider economic, social, and political levels.

We realize our capacity for humanization through praxis (Mayo 1999; Schugurensky 2011). Freire refashioned this ancient philosophical notion in the light of the politics of his time. Praxis, as he defines it in *Pedagogy of the Oppressed*, is reflection and action upon the world in order to transform it. “World” in this context includes both the material domain of nature and socially constructed reality – our institutions, legal systems, forms of cultural expression, workplaces, leisure activities, and so on. Freire does not see praxis as a linear, step-by-step process or phenomenon. It is not a case of having to reflect first, then act, then reflect again. Often the two elements of praxis will be intertwined: we can act while reflecting, and careful, deep, purposeful reflection – with others – can itself be seen as a form of action. Freire's point is that we must not neglect either element in

conceiving of our task as human beings. He warns that reflection without action can become mere verbalism (e.g., endless talk by politicians about the need to address climate change, with no significant measures being put in place to do so). Equally dangerous is the tendency to act without thought, as in, for instance, blindly following a charismatic leader in an act of violence. Freire calls situations of the latter kind “activism” (Freire 1972). The linked elements of reflection, action, and transformation continue to produce new tasks across the human lifespan. As we engage in reflective action, the transformed reality that results from this demands fresh reflection and action, and so the process goes on.

Freire qualifies his account of praxis further: praxis, if it is to be humanizing, must be dialogical and critical. The “critical” aspect of praxis is encapsulated in the much misunderstood Freirean notion of *conscientization*. Freire was not the first person to employ this term in its original Portuguese form (as *conscientização*), but he was the best known proponent of the idea. Conscientization is sometimes seen as a process of moving through fixed stages of consciousness in an ordered, sequential manner. This runs counter to Freire’s explicit suggestions about how the term should be understood. It is true that in his earliest work Freire (1976) speaks of three different levels of consciousness – magical, naïve, and critical – but he does so as a means of describing dominant patterns of thought among particular groups in Brazil at given moments in its history. He did not intend those descriptions to be seen as immutable categories for distinguishing between individuals at different stages of educational development. He argued repeatedly that his ideas must be contextualized and that the methods adopted in one situation need not be the same as those applied in another. Others saw conscientization as a kind of “silver bullet,” attributing to it powers far beyond those Freire himself had intended. Freire was always clear that education on its own can only do so much; it can contribute to the process of social change, but it must be seen as just one part of a wider political process. For a period, Freire stopped referring directly to conscientization, but the essence of

the concept – an educational process of deepening our critical understanding of the society in which we live – remained across his corpus of published writings. Conscientization is not a stand-alone process; rather it can be seen as the reflective element of praxis. Conscientization occurs not in fixed, finite stages but continuously as a part of the unending process of human formation and transformation.

The dialogical element of praxis is equally important and is also much contested. For Freire, we are beings of communication, and dialogue is a distinctively human possibility. We are never truly alone in our thinking, feeling, and acting. We remain connected to others even while physically separated from them by time or distance. Dialogue presupposes a relationship between two or more human beings, but this need not be a direct, “real time,” face-to-face encounter. We can speak of engaging in a dialogue with a text, for example, building a connection between ourselves and the author, creating an intellectual conversation that can keep growing and changing over time. Freirean dialogue is not merely aimless or casual conversation. This is not to deny the potential value of talk of this kind; conversing in a relaxed way with friends or family can be vital in enhancing relationships and allowing us to “unwind” from the pressures of the day. But for dialogue to fulfill the educational purpose Freire has in mind, it must have a strong sense of structure, rigor, and direction (Freire and Shor 1987).

Dialogue from a Freirean perspective is not at odds with the principle of respecting and responding to difference; to the contrary, it depends upon it. There must be something we have in common in order to communicate with each other at all. Equally, however, if we imagine a situation (this would not be possible in practice) where everything between two or more participants in a conversation was the same, there would be nothing that provides the impetus or “motor” for dialogue. Dialogue relies upon difference to prompt reflection, to disrupt the flow of events, to unsettle, and sometimes disturb. Of course, differences can sometimes provide a barrier to communication. Dialogue can be impeded by cultural misunderstanding, by class

differences, and by the attitudes, expectations, and behaviors of those present in a conversation. Freire was not naïve about the challenges posed by attempts to cross barriers of these kinds. He took seriously the claims made by those working in identity politics about the difficulties of bringing the principle of dialogue to life in educational situations characterized by class, ethnic, and gender differences. He argued, however, that teachers and students in such situations are never characterized *just* by their differences. He advocated a stance of “unity through diversity,” aware of the criticisms this would bring but also cognizant of the destructive impact of theoretical infighting on the political Left (Freire 1997).

Neoliberalism, Dehumanization, and Liberation

Humanization needs to be understood alongside its opposite: dehumanization. According to Freire (1972), dehumanization is a reality, but it is not inevitable. Dehumanization is the process of constraining, through ideas, attitudes, structures, and practices, the pursuit of humanizing praxis by others. In dehumanizing others, we also dehumanize ourselves. A prime example of dehumanization in the late twentieth century, as Freire saw it, was neoliberalism. Neoliberalism emerged near the end of Freire's life as a complex, multilayered doctrine, applied in different ways in different parts of the world. In its Brazilian form, neoliberalism served as a prompt for Freire to reclaim the need for humanization. In *Pedagogy of Freedom*, he uses the phrase “universal human ethic” to capture what he means by humanization, contrasting this with the ethics of the market under neoliberalism (Freire 1998a). The neoliberal focus on self-interested, self-contained, utility maximizing individuals contrasts markedly with Freire's emphasis on humanization as a social process, driven by a sense of care for others. Neoliberals see knowledge as a commodity to be traded in a similar manner to other goods and services in a competitive market. For Freire, knowledge emerges through our dialogical, critical interaction with others and an ever-changing

world. Neoliberals, Freire argued, are too certain of their certainties; too reluctant to consider alternatives. They have a fatalistic view of human history, convinced their way of understanding human beings and of structuring our social and economic world is the only realistic possibility. Under the influence of neoliberal ideas, educational policy has been driven by an obsession with measurement and performance. From a Freirean perspective, the reduction of human beings to numbers not only diminishes and denies the complexity and unpredictability of human knowing but also dehumanizes the educational process. Neoliberalism, as Freire observed it, created a giant schism between the “haves” and the “have-nots,” exacerbating existing social inequalities. It stood as key “limit situation” at the end of the twentieth century, requiring “limit acts” from those committed to resisting it (Freire 1972, 1998a; Roberts 2010).

This leads to another key concept associated with Freire's work: liberation. In Freirean theory, liberation can be seen as the concrete manifestation of humanization. It will be recalled that Freire saw humanization as both an ontological and a historical process. Liberation is the realization of the historical dimension of becoming more fully human. Liberation for Freire is, in part, a process of struggling against oppression. Freire's primary focus was class oppression, but he acknowledged that oppressive attitudes and actions could be evident across multiple lines of difference. Liberation, Freire makes plain, is never simply given. Working against oppressive structures, policies, practices, and ideas is difficult, sometimes frighteningly so. It is, in many contexts, a matter of life and death, with brutal suppression of political criticism and dissent. Liberation requires commitment and courage. It is not a finite state to be achieved, after which no further work will be necessary; rather, it must constantly be remade. Liberation struggles often throw up contradictions and tensions, demanding careful reflection and dialogue across resistance groups. This is where the need for “unity through diversity” becomes apparent. Groups on the political Right typically have not only far more substantial financial resources at their disposal than those on the Left

but also often display greater pragmatic unity in the face of resistance from oppositional groups. Allowing differences among those on the Left to become a source of strength and hope rather than divisiveness is crucial in advancing the wider struggle against the destructive impact of neoliberalism (Freire 1997, 1998a).

The struggle against oppression, in its myriad forms, can only be understood as a liberating process if certain virtues are in evidence (Freire 1972, 1998b; Roberts 2010, 2016). Foremost among those virtues, for Freire, is *love*. For those who are teachers, love involves the cultivation of a deep sense of care for the students with whom one works, together with a love of knowledge, learning and the process of investigation. Freire (1972) adopts from Che Guevara the notion that love is a revolutionary virtue. It is an expression of our humanity, our connectedness with other human beings. This is not, however, a matter of loving humankind "in general" or as an abstract idea. Love as Freire understands it deals with particulars, with the messiness and complexity of real human lives. Freire also stresses the importance of *hope*. This too is not a false hope based on a refusal to confront the political realities of the present. Hope implies engagement, and this can be harrowing. Indeed, hope often becomes most meaningful and significant precisely in situations where all appears lost. Hope thus conceived becomes not so much the opposite of despair as its dialectical complement. Despair need not cancel out hope; it can give it its very reason for being (Roberts 2016). *Trust* is also crucial from a Freirean point of view (Freire 1972). Neoliberalism, as enacted in institutions such as schools and universities, often relies on a model of accountability where there is a fundamental lack of trust in those being held to account. From a Freirean perspective, the demand for accountability should be replaced with the principle of responsibility, the ethical partner of trust.

Other pedagogical virtues to which Freire paid attention include humility, openness, respect, and a willingness to listen (Freire 1972, 1976, 1998b; Freire and Shor 1987). These human qualities are closely related to each other. Humility arises from our recognition, as both teachers and learners, that

there is always much that we do not know. Freire (1976) notes that no one is ignorant of everything, just as no one can know everything. If we have humility, Freire showed, we will not only accept doubt and uncertainty but come to value them as essential to the learning process. If we are to gain a greater awareness of what is yet to be known, openness is essential. Openness for Freire does not mean one is completely porous; there should always be a process of "filtering," where the contents of consciousness are subjected to critical scrutiny. Similarly, while Freire favored the idea of openness as a principle for social organization, he did not want openness without limits. The open exchange of ideas and the maximizing of opportunities for human creativity must be balanced against concerns for human dignity and social justice. Respect for others is a key criterion in considering the possibilities for, and limits to, openness, and this is also a key educational virtue for Freire. A posture of respect acknowledges the seriousness of education and the importance of each participant in a teaching and learning situation. It recognizes that each person has a distinctive body of experience and knowledge to draw upon in an educational encounter. Building on existing understanding, without merely affirming it, is one of the essential elements of Freirean liberating education. Finally, learning from others, and learning more about ourselves, requires the ability to pay attention and to listen, patiently and reflectively, while also retaining our own right to form and express ideas.

Conclusion

Humanization is the pivot on which everything else in Freirean education turns; it binds the ontological, epistemological, ethical, and political elements of Freire's theory and practice together. Freire's philosophical analysis of this complex concept has been highly influential, but there are always possibilities for further work as scholars and practitioners take up Freirean ideas, consider their strengths and weaknesses, and apply them in novel ways in different educational contexts. At the time of his death, Freire was deepening and

extending his understanding of humanization and dehumanization in the light of the emerging ecological crisis. This was just one of the projects he had in mind. As a thinker, he could never sit still for long. He was aware of his own unfinishedness and was eager to continue writing and reflecting. Paulo Freire was the embodiment of the principle of ongoing educational change, and there is much that remains to be done in building on his legacy in the twenty-first century.

Introduction

“It is not so much our judgements as it is our prejudices that constitute our being,” writes Hans-Georg Gadamer in the opening paper of a collection of his essays titled *Philosophical Hermeneutics* (Gadamer 1976). This claim is a provocative one and announces one of the more memorable motifs in Gadamer’s writings. It also pursues in fresh directions a new note in

twentieth-century Western philosophy originally introduced by Heidegger. But more importantly for educational purposes, as we shall see, it opens up some promising paths for how teaching and learning are to be thought about, researched, and carried out.

Gadamer’s Radical Preoccupations

Gadamer is a philosopher who has concentrated on investigating the inescapable features of human understanding and the kinds of encounters with inheritances of learning through which understanding itself is advanced, or sometimes beclouded. It is surprising then that he has written little specifically on education. An active philosophical career spanning more than seven decades – till his death in 2002 at the age of 102 – has seen the publication of 42 books and monographs and over 350 articles, increasing portions of which are translated into English, Italian, French, and other languages. Five short essays of his on higher education – chiefly in Germany – have been assembled in English as Part I of a 1992 collection titled *Hans-Georg Gadamer on Education, Poetry, and History – Applied Hermeneutics* (Misgeld and Nicholson 1992). In addition, Gadamer has made some references to his own education in his autobiographical collection of short essays *Philosophical Apprenticeships* (1985). Apart from these occasional writings, education does

not feature as a topic in Gadamer's work. It is worth adding here however that in his hundredth year, Gadamer presented an address in Eppenheim titled "Erziehung ist Sich Erziehen" ("Education is Self-education," Gadamer 2001). The fact remains that on themes like the defensible purposes of teaching, the emergence of one's identity in experiences of schooling, or on issues of authority and justice in education, his writings make few explicit references. Yet they are replete with quite radical implications for issues just such as these where the practical conduct of education is concerned.

This radicalness has been overlooked by some critics who see in Gadamer's recurring encounters with "tradition" the preoccupations of a conservative (e.g., Eagleton 1983; Caputo 1987). The radical dimension of Gadamer's work lies not in anything like an overt political or social vision, as for instance might be said of Paulo Freire's works, or in a different way, of John Dewey's. It lies rather in Gadamer's emphasis on investigating what most Western philosophy since Plato has either overlooked or misconceived, namely: "what happens to us over and above our wanting and doing" when understanding of any kind takes place (Gadamer 1989, p. xxviii.). The consequences of Gadamer's investigations into what unavoidably happens behind our epistemological backs as it were are gloomy for both epistemology and metaphysics, at least as conceived and practiced for centuries. The pretensions of metaphysics to all-inclusive knowledge and of epistemology to establishing secure foundations for certainty are thoroughly critiqued in the course of Gadamer's enquiries. They are made to yield pride of place to something more primordial in the experience of human understanding. It is a bit disconcerting at first sight to learn what this something more primordial turns out to be: interpretation, preconceptions, even prejudices. On Gadamer's argument, philosophical reflection can properly help us to become aware in greater degree of these predisposing constituents of human understanding. Such reflection may discipline or reorient these predispositions. But, he insists, interpretative preconceptions always remain in play and reflection cannot get rid of

them in the name of autonomous reason, or certainty, or any all-encompassing overview. In undermining the traditional claims of metaphysics and epistemology then, Gadamer's account of human understanding – which account he calls philosophical hermeneutics – suggests that human understanding, far from being ultimately capable of rational autonomy, remains somehow irrevocably biased.

A conclusion like this seems at first sight to mark a victory for subjectivism, or even relativism. This would be dismal news for education's claim to be an enlightening and rationally defensible undertaking. But this news remains bad only as long as one's views on rationality itself are in thrall to an outlook – still quite common in Western intellectual circles – which considers the securing of foundations for certainty to be goal of rational enquiry itself. Such a rationalist stance, including positivistic and phenomenological variants of it, is subjected to painstaking critique in Gadamer's arguments. Engaging with a very wide range of philosophical works, these arguments seek to illuminate some inherent limitations in human understanding. Gadamer is keen to illustrate how such limitations have occasioned not only individual instances of human learning to take a wrong path, but whole traditions of human learning to do so. If these researches of Gadamer's can indicate more promising pathways for teaching and learning and their defensible pursuit – if also more modest pathways than those which seek certainty – then the charge of relativism is revealed as misplaced. So also is faith in the rationalism of any philosophy which might wish to uphold such a charge.

New Pathways: Six Educational Themes

This brief sketch should help to highlight, in the paragraphs that follow here, the main points at issue between the new directions marked by Gadamer's arguments and the more traditional currents of Western philosophy. In focusing on those parts of Gadamer's philosophy that are most pertinent to educational concerns, I will identify here six key themes. These are to be

found firstly in his major work, *Truth and Method* (Gadamer 1975 for German text, Gadamer 1989 for English translation) but they are refined and expanded upon in his subsequent writings. The six themes – which are a selective rather than a comprehensive survey – are the primacy of play (*Spiel*) in the experience of understanding, the principle of “effective history” (*Wirkungsgeschichte*), the predisposing of thought by language, the plurality of tradition, the “fusion of horizons” (*Horizontverschmelzung*), and the “dialogue that we are” (*das Gespräch das wir sind*).

In his efforts to illustrate the primacy of play in human experience, Gadamer contrasts this primacy with that given by epistemology to the critical consciousness of the individual. The player – or participant if the word “player” sounds too trivial – in a game, a debate, a dance, or a conversation is always involved in something more than that of which he or she is conscious. While consciously contributing to the play, even with decisive personal initiatives, the player is also *being played* along by the ceaseless flow of actions of others: by the countless moves, reversals, anticipations, constraints, surprises, nuances of meaning, etc. which animate the play and give it its ever-emergent character as an *interplay*. This interplay presupposes a prior context – or contexts – of assumptions, attributions, capabilities, and so on, which gives the participants’ actions intelligibility and significance in their own eyes, if not coherence in the eyes of all. This remains true whether the play takes place in a courtroom, a classroom, a boardroom, or through a conversation, a correspondence, a journal article, a feud, or whatever. The heart of Gadamer’s point is that in our understanding of all purposeful human engagements, what we can properly attempt to achieve is the stance of a critically alert participant as distinct from that of a critically detached observer or objective analyst. (By “our” and “we,” he means humankind.) The stance of detached observer, despite its methodological or theoretical appeal, can give inflated, even illusory pretensions to the activity of critique. All critique, Gadamer argues, belongs within the larger social interplay and historical flow of that which is being critiqued.

This is one of the more important insights associated with the second of the six themes, the principle of *Wirkungsgeschichtliches Bewusstsein* (consciousness of the effects of human historicity). The twofold import of this principle can be put roughly as follows: firstly, there is the consciousness of the effects of history on the contexts where human understanding takes place; secondly, there is the consciousness of being affected in our own understanding by these effects (Gadamer 1989, p. 300 ff.). This has some sobering consequences for philosophy as rational critique. It does not rob critique of its insights or its purpose, but it deprives critique of any claims to an authoritative final word. Critical philosophy, especially as epistemology, has traditionally assumed that it can somehow get behind the contexts which predispose human efforts at understanding; that it can expose the shortcomings of such contexts and succeed in overcoming them. The intellectual attraction of success in this endeavor still presents itself frequently in philosophical discourse as something worthy of philosophy’s own best attempts. But Gadamer’s entire work argues that this attraction is a mirage that all too often fails to be recognized as such.

The third of Gadamer’s themes chosen for this summary, the predisposing of thought itself by language, addresses this issue. It is primarily in language that human experience of a world gets understood and communicated. But to learn a language as one’s own, Gadamer points out, is to become a participant in an informal apprenticeship. In this apprenticeship a growing fluency in expressions and turns of phrase is inseparably linked to the internalization of certain opinions and convictions rather than others. Some parallels with Wittgenstein’s later philosophy become evident here, where language is understood not as a set of tools to be mastered and then employed at will, but as something which remains ever active in shaping our thinking and doing, as well as our speaking. The effects of history, it turns out, pervade language and its usage just as thoroughly as they influence the consciousness, or rationality, of individuals. From this one may conclude that, despite the aura of commanding insight and conceptual mastery associated with philosophical

analysis and critique, the part language plays in conditioning human experience remains crucial. Its pervasive influence in shaping whole inheritances of learning is perhaps the most significant thing about language itself. A champion of the autonomy of reason who overlooks this point might thus fail to detect some decisive presuppositions which quietly condition thought and articulation, even to the extent of stifling the best possibilities of reason itself.

Such dangers may sometimes lie elsewhere than where a rationalist philosophical orientation is disposed to look for them. From a liberal Enlightenment perspective for instance, curtailments of reason and its exercise are often seen to arise where learning and upbringing are marked by a uniformity, or conformity, of outlook invested with the authority of long tradition. There is of course an abundance of historical evidence to support this. Yet these dangers are scarcely less real where diversity has become so prevalent that it can be characterized as a disparate plurality of traditions. In this latter instance, different traditions can act as so many conformities for their own followers, each having its definite truth for its own adherents. It is worth adding that while many such traditions may be primarily religious or ethnic in character, not all are. Some may have a predominantly intellectual temper, for instance.

This introduces the fourth of the six themes: the plurality of tradition. Against both older and more recent uniformities Gadamer argues that tradition is wrongly understood as that which already possesses its own truth for its adherents. More importantly, he continues, the real significance of any tradition, or more precisely, any particular embodiment of a tradition, lies in the *claim* to truth of an unfamiliar kind which it *addresses* to the learner, or the newcomer. So this is not primarily an event of transmission on the one side and of acquiescence on the other. Rather it is an interplay that is ever pregnant with possibilities of new understandings, confrontations, misunderstandings, transformations, and so on. To be properly fruitful the interplay must try to remain open, resisting in particular the thrall of anything partisan. This identifies one of the

main ethical responsibilities of teachers and educational leaders. Before leaving this point it should be noted that the English word “tradition” is used in *Truth and Method* to translate both of the German words *Tradition* and *Überlieferung* (e.g., Gadamer 1989, p. 306, pp. 336–338). *Überlieferung* signifies much more than can be captured in a single English word, namely: everything that influentially “lies over” us from the past. Its educational suggestiveness is more evident than that of the term “tradition.”

Turning now to the fifth theme, a genuine encounter with tradition involves what Gadamer calls a “fusion of horizons” (*Horizontverschmelzung*); on the one hand the horizon of understanding the learner brings with him or her to the encounter and, on the other, the horizon of something specific within tradition which addresses the learner in this encounter. This “something specific” could be a theorem in geometry, a skill in turning wood, a piece of music or verse, a theory in science, a religious teaching, a foreign language, and so on. “Fusion” (*Verschmelzung*) is perhaps not the best word to convey what is meant here. What Gadamer has in mind is not a melting together in which all differences are laid to rest, but an attentive to-and-fro between the learner and the otherness of that which addresses the learner. It is something in which tensions are uncovered and brought to the fore rather than glossed or passed over (Gadamer 1989, p. 306). A particular embodiment of a tradition – scientific, literary, religious, etc. – is brought to active articulation, but that articulation and its own presuppositions can also be questioned and re-questioned by the learner. The learner becomes in this event a more fluent and more discerning participant, as distinct from an “expert” or an “authority” on anything. The learner’s understanding may become transformed in such encounters. But such transformation does not make them events of mastery of something that has now been brought under the learner’s manipulative control. Rather, to allow tradition in any of its manifestations its full voice is also to acknowledge that this voice, like one’s own understanding, is subject to limitations and disfigurements. As a description of

the happening of human understanding, the “fusion of horizons” seeks to illuminate this happening as something which is ever vulnerable to fallible turns, including indeed the institutionalization of such mistakes. The “fusion” is itself an active seeking for a more inclusive and self-critical understanding, as distinct from any completed understanding.

The last of the six themes, “the dialogue that we are” (*Das Gespräch das wir sind*), can be viewed as a natural conclusion of the other five. To illustrate this it is worth assembling these five here as a list of propositions: (a) Human rationality is properly to be understood not as something secured in place by an autonomous reason, but as a continuing play of influences which seeks a more inclusive coherence. Joining in this play means that one is being played – consciously or not – as well as playing. (b) These influences themselves bear the marks of an effective history – i.e., of a history that shapes what actually becomes more influential and what becomes less so. (c) This effective history predisposes thought and language but can also render both of them fluid, and open to new directions. (d) Tradition is properly to be understood not as the burdening force of what has already been institutionalized and which then seeks compliance from learners. Rather, tradition is to be understood as the abundant plurality of all that lies over us as humans in our cultural inheritances, old and new. (e) Encounters with inheritances of learning are properly conceived as active interplays between cultural horizons which are differently predisposed, which are becoming more fluent and critical, and which are also oriented toward a more adequate understanding.

Taken together, these five propositions suggest something crucial about humankind’s capacity for understanding, or to speak in an educational idiom, about the potentialities for understanding that learning environments need to cultivate. This “something crucial” is captured by Gadamer’s phrase “the dialogue that we are” – something that is at once both empirical and educationally beckoning. The educationally suggestive dimensions of “the dialogue that we are” are already

present in Gadamer’s perceptive historical review of the concept of *Bildung* in the opening chapter of *Truth and Method* (Gadamer 1989, pp. 10–19).

Conclusion

To make these educational dimensions explicit is to underline the point that for Gadamer *Bildung* is no longer a metaphysical concept, as it was for Hegel for instance. Availing of Gadamer’s fertile insights, *Bildung*, as the education of one’s human capabilities and dispositions for understanding, can now be properly seen to involve a number of emphases that have commonly been passed over. These fresh points of emphasis are as important for the philosophy of education as they are for educational practice. Let us conclude with a brief reference to just four of them. The first is an emphasis on teaching and learning more as an investigative *event of participation*, with both overt and unseen consequences, than as a matter of transmission of cognitive content and “values.” The second is an emphasis on attentiveness to the otherness, sometimes the challenging and unsettling otherness, of that which addresses human experience when an interplay with any of the voices of tradition is deliberately undertaken. The third is an emphasis on gaining in each instance the fluency which enables an informed and critical questioning of the claim to truth embodied in such addresses. The fourth is an emphasis on incremental, or sometimes decisive shifts in self-understanding, informed as much by an attitude of self-criticism as by a capability for critique. Taken together, these points disclose something of the educational tenor of “the dialogue that we are.” That is to say they disclose something of an educationally fruitful and ethically defensible pathway for what is at once aspirational and practical in the empirical matter-of-factness of teaching and learning.

Gender Equality in Sport

Michael Burke

ISEAL and College of Sport and Exercise Science, Victoria University, Melbourne, Australia

Introduction

Aside from some notable exceptions (Young 1980, 1988; MacKinnon 1987; Bryson 1987), mainstream feminism has rarely devoted sustained attention to an analysis of sport. This ignorance of sport by feminists is detrimental to developing a broader understanding of female subordination because the practice of sport is one of the most overt sites of contemporary male dominance. The differences in sporting performance both display and help to underpin the dominant conceptualization of human bodies as members of one or the other of two natural, dichotomous, and hierarchically organized categories of gender in modern society.

It is now over 30 years since the pioneering feminist sport philosopher, Jane English (1988), suggested three reforms to the contemporary organization of sport that would advance the position of females within the sporting world and help to break down the dominance of men. Her first strategy was to integrate males and females in sports where there are negligible differences between the sexes or where the differences between males and

females cancel each other out. English's second reform was to have separate sex teams, based on physiological criteria, in sports where the differences between men and women in these criteria are relevant to performance in these sports. Further, females should be allowed to "move up" to the male teams if they are skillful enough to counteract these physiological differences. The final suggestion offered by English was to create new sports that favor the physiological and anatomical advantages which females possess over males. Historically, sports have been developed which favor characteristics, such as height, weight, speed, and strength. In statistical terms, most men will have an advantage over most women in these criteria, and this is then reflected in the level of achievement of men and women in sports such as football, basketball, or athletics. The development of new women's sports would allow women the opportunity to succeed as the best athlete, rather than being marked as the best female athlete in a "male biased" sport.

Some of these aims of the women's movement in sport have been achieved. The integration of many junior-sporting competitions allows boys and girls to participate together. Legislation, such as Title IX in the United States and Equal Opportunities Acts in other countries, has endeavored to equalize the resources, if not the rewards, available for participation in sports for females. Professional tours and competitions in women's sport have gained greater public exposure and created greater financial rewards for the athletes, in sports such as golf, tennis, and basketball. Other sports where differences are negligible, such as marathon swimming, have been integrated on some occasions. Some male sport competitions have allowed females to break through the velvet curtain and appear as players.

This short summary will suggest that current research in the sport and gender equity area has moved on from a "counting numbers" version of gender equality to an idea of the equity of female authority in sport. Male authority in sporting discourse and organizations has always been granted on the basis of the apparently neutral criteria of performance. Excellence in sports has been narrowly defined in terms that generally suit

male athletes and, hence, the perpetuation of male authority. Gender equity arguments in sport philosophy are utilizing feminist foundations to produce greater authority for the females who are part of the sport community (Burke 2010, pp. 11–28).

Early Pioneers: First-Wave Sport Feminism

In order to challenge the current differences in access to authority between the genders, it is important to create awareness of the way that this difference has been produced and protected in history (Hall 1996, pp. 37–40). The current differences in both participation and authority between men and women in sport can be linked historically to historical discourses about women's passivity, dependence, and health which were partly produced and sustained through their limited sporting participation. Anne Balsamo describes these public beliefs in the following way:

... women were discouraged from participating in sport through what we now understand to be culturally defined "facts" of the female body. These facts asserted that women were "eternally wounded" because they bled during part of their reproductive (menstrual) cycle. ... Limiting women's participation in sport and exercise functioned both to control women's unruly physiology and to protect them for the important job of species reproduction. (1996)

Jennifer Hargreaves (1994) suggests that the late nineteenth century was a period of massive expansion in the opportunities for females in the industrialized society. Advances in the fields of women's sports and physical education represented new forms of challenge to the traditional positions for women. The impetus for the provision of sport for females had little to do with liberal notions of freedom and equality. It had more to do with the provision of training to be a good mother and the use of physical work to oppose the natural sexual urges of females, which were suggested as potentially draining for both sexes. Sports, when offered to women, were depicted as mechanisms of social control and

maternal advancement, with men and women playing in qualitatively different ways according to beliefs about their different individual natures. However, from this gendered beginning, women's participation in sport grew.

Feminism and Gender Equality in Sport: Second Wave

According to Catharine MacKinnon (1987, p. 35), the foundational impulse of liberal feminism "has moved to change the dead ends that were all we were seen as good for and has altered what passed for women's lack of physical training, which was really serious training in passivity and enforced weakness." The response in many Western societies, pressured by liberal feminists, has been the implementation of laws, programs, and economic interventions by the State, to try to redress any past inequality in terms of opportunities between females and males. In Britain, the UK Sex Discrimination Act was passed in 1975. It made discrimination on the basis of gender illegal in the context of employment and education. However, the practical implementation of the Act is made difficult in sport by its construction which allows the practice of sport some opportunities to escape from the legislation, often under the guise of dubious biological justifications. As with similar legislation in most countries, there is an exemption clause, Section 44 of the UK Act, that allows for unequal treatment where "strength, speed, and physique" would make mixed competition disadvantageous for either sex. This clause designed to limit adult male participation, when their bodies are considered too big or strong to fairly compete with females, has been used to limit even prepubertal participation by girls in sports such as soccer and softball. In all, the Act reinforces the historically produced discourse of the physical superiority of men and the inferiority of women. McArdle (1999, p. 44) explains, "sports bodies were arguing... that the law allowed them to adopt discriminatory practices that would be unacceptable in virtually every other area of employment."

In the United States, the equal opportunity legislation pertaining to education includes

sections that deal with sport and PE. Title IX of the Education Amendments (to the Civil Rights Act of 1964) was passed in 1972 to remove any system of preferential treatment on the basis of sex in education. There was an immediate increase in funding and facilities for female athletes after the implementation of Title IX. Yet, while the number of active female athletes has increased, there has been a substantial reduction in the number of female coaches and administrators. Since its implementation, Title IX has seen the substantial reduction of women's programs headed by women. This reduction in coaching and managerial roles has even occurred within the pool of sports that women have traditionally played. Increased participation in sports with a history of female participation has resulted in reduced opportunities for females to speak about their participation in these sports, as a coach or administrator.

Calls for human equality remain an important part of the mechanisms available to females to obtain authority, both in sport and in society. The idea is explained well by Catharine MacKinnon when she states that although she thinks "the real feminist issue is not whether biological males or biological females hold positions of power," she also contends that it is utterly essential that women are in these positions of power in order to promote the "real feminist issue" (1987). Some feminists have tended to ignore equal opportunities legislation as merely the incorporation of females into sporting practices that are controlled and defined by males. In contrast, it is essential for females to have access to power in order to resist the maleness of control and definition of social practices, and access to power in some practices may begin with access to participation. This may especially be relevant in many contemporary sports, where women have not yet won the battle for access to participation in all sports, so equal access to some sports remains an important ideal to be achieved (Burke 2010, p. 20).

The substantive use of equal opportunities legislation has mostly been limited to expanding the resources and protection given to females participating in those sports that confirm the so-called athletic "limitations" of their gender. The impulse

behind equal opportunities legislation is to protect the sporting opportunities for most women in most sports. But the legislation has been (ab) used to protect the exclusivity of male sports from “eccentric” females who could reveal the overlap between the sexes in sporting performance. Sporting segregation serves to protect men from the recognition that there is an overlap between male and female performance. Segregation is most ferociously defended when women wish to enter male sports or when women in male sports begin to outperform men. Equal opportunities legislation has not effectively been used to challenge the symbolism associated with gender-segregated sports.

The inclusion of women in gender-segregated sports may have a diminishing effect on the centrality of sport to the discourse of gender. Sport participation has placed females in the public view as physically capable people and people capable of resisting and using violence. It may be that liberal legislative interventions, such as the Title IX Act in the United States, give female athletes the security and position necessary so that they may produce discursive changes about both sport and gender.

Equity and Female Authority in Sport: Third-Wave Resistance

Radical feminists claimed that the mere positioning of females into institutions and practices, which have been traditionally occupied and controlled by males, would not, by itself, produce an authoritative female voice. The interests, values, virtues, and descriptions which men use are set up as human categories. At the same time, females are excluded from these categories and the production of discourse about these categories. As a result, the interests and values of women are ignored or trivialized, and the status of women exists in relation to their subservient role toward men.

The entrance of females into some sports, so that they were no longer exclusively male activities, created problems for the preservation of male authority in sport.

Several methods of resisting female intrusion into male sports arose. There were medical, legal, and scientific pronouncements against female participation in sport, still evident in discussing women’s participation in traditionally male sports such as boxing and football. Active socialization and positive reinforcement of female passivity are apparent in both popular culture and in sport. Trivialization and sexualization of female performance by the sports (male) media undermine the athleticism of many female athletes. All of these silencing acts maintain the male athlete and male sport as the standard, with the female athlete treated as an “add-on” to the supposedly gender neutral structure of sport.

Far more powerful acts of silencing were those that the female sport’s community took up as beneficial, profitable, and pleasurable for female athletes. Organizations which governed female sports in ice dancing, synchronized swimming or women’s bodybuilding, opposed the “masculinization” of their athletes by legislating against certain practices such as excessive muscle bulk and requiring other practices such as makeup, which maintained the trivialization of females as second-class athletes. Other sports, such as netball, basketball, cricket, athletics, and hockey, promoted the use of body-tight clothing to highlight the sexuality and eroticism of their athletes. Other female athletes participated in the production of soft-porn calendars which reinforced the idea that athleticism and emphasized femininity are compatible.

If these mechanisms did not catch all female athletes, then to further support the idea of “natural”, dichotomous and hierarchical categories of the sexed body, the “rational” principles of fairness and equality of opportunity were embraced and used by males to display female inferiority. Let females participate in all sports, as this will show their inferiority to males. The formal organization of sport, which favors male’s physiological advantages over females, allows for the “ideology of equality” to display female’s inferiority. Where female performances display overlap, a secondary set of undermining epitaphs are ascribed to performers, “drug-taker,” “lesbian,” “masculine,” or “ugly,” that are equally as

powerful in denying females access to authoritative positions in sport.

It is common in sports to tie athleticism to notions of physical power and force, which in turn are related to notions of the male body and masculinity. This exclusion of women from the narrow notion of athleticism has accomplished a contrast between men and women in two ways. Firstly, women athletes who engage in physical/masculine sports have their femininity and heterosexuality brought into question through the mechanisms of sex testing, drug testing, stereotyping, and disrespectful media portrayal. Conversely, women who participate in female sports are viewed as appropriate female role models. This has limited the choices that females can make to participate, even in the world of equal opportunities. Hence, Iris Young's (1988) suggestion that "sport and females are mutually exclusive categories" is validated by some women at the level of their bodywork. It involves women accepting practices in order to be included in the community of appropriately sexed humans, even when such practices make them marginal and non-authoritative members of the smaller community of athletes.

However, paraphrasing Foucault's ideas, while oppression occurs from a variety of points, including the sexing of the female athletic body, using a variety of discourses, it also encourages a variety of resistances to challenge normal knowledges. Sites of resistance to femininity in sport commence at the same time as training in femininity begins. Sport offers females a practice in which they can challenge the ways that their bodies are normally inscribed as female. There are females who develop new images of women through resistive participation in sport. Female body builders are one group of athletes who show such resistance to the dominant image of female athletes in society. This power goes beyond participation and incorporation into the dominant discourse. It involves the development of an alternative discourse. Potentially, sport performance offers a space where females learn to actively transform and resist the social constraints on physicality that are imposed on them. From a feminist perspective, this transformative physicality allows women to embody empowerment or feminist consciousness.

Liberal feminism, by itself, does not produce this change in authority. But equal opportunities legislation, taken to its limit of ignoring prescriptive gender roles and characteristics, may open up a space for the socialization of females as authoritative figures through sporting participation (Burke 2010, p. 21). More public challenges to the relations between the genders in sport are likely to occur when women enter sports that are exclusively or predominantly male. In order to develop this radical edge to liberalism, it is necessary to shift the foundation of equal opportunities away from questions of the numbers of female participants and toward the idea of equitable respect for the authority of female participants in different sports.

Sport is viewed as one of a number of practices where this relationship between the two genders is made explicit and is maintained. Feminist research tries to create a discourse where this unequal relationship of power may be broken down. There are diverse and divergent strands of thought and political action within the movement of loosely collected traditions that are called feminist. What all these groups share is a concern with improving the position of women in society. This difference in explanations, campaigns, and solutions displays the plurality of possible feminist positions. As Iris Young asserts (1997), we would be better served as feminists if we recognized that, at certain times, it will be necessary to argue as a liberal feminist, concerned with public issues such as the inequality of funding for female sport bodies or the lack of access to certain sports for females. At other times, it will be more useful to argue in terms of the radical feminists and challenge the male bias in the descriptions of sporting excellence or sporting entertainment.

Gender Practices in Early Childhood Education

Margaret Lyall
The University of Waikato, Hamilton,
New Zealand

Introduction

The early childhood education and care (ECEC) sector has been identified as being fraught with misinformation and conflicts around issues relating to gender (McNaughton 2000). While there

are multiple often complex and conflicting beliefs about gender within the ECEC sector, three main views have been identified as most influential. Such influential ideas shape both how gender is understood and therefore enacted by those involved in the ECEC sector and how gender policies develop at center, local, and national levels. Firstly the essentialist view of gender, prevalent in lay society, is keenly felt in the sector although not as prevalent in academic current literature. Secondly, more common in the current profusion of literature is the perception of gender as developed through gender-role socialization. Finally, over the past two decades, a post-structural perspective has risen in popularity in order to support identification and analyzes the complex power relationships that develop through gender roles and identities.

Gender Development in the Early Years

The importance of gender development in the early years is clear as children's early notions begin evolving during this time (Yelland 1998). The development includes children's gender identity, one's inner sense of one's own gender, and their understanding of gender role, the expectation, activities, and behaviors assigned to males and females within society along with gender norms, the stereotypical homogenized idea of a gender (Robinson and Diaz 2006). Gender norms are pervasive in all aspects of children lives including their educational settings. The forming of these concepts begins around 18 months with most children identifying as a boy or girl by the age of three although gender consistency, the understanding that gender remains the same over time even if superficial physical characteristics change, does not generally occur until around 6–7 years (Browne 2004).

During the early years, the young are likely to strictly adhere to gender roles and presentation. Adherence to a rigid understanding of what it means to be a girl or boy by young children, based on gender norms and external symbols such as hair length and clothing style, can lead to children clinging to a stereotypical view of gender

roles (Browne 2004). Children's gender rigidity is also likely to lead to homophily, the tendency for children to form same-gender or same-sex groups and eschew cross-gender play. Under the influence of same-sex peers, themselves holding rigid views of gender, the educational setting provides a strong context for stereotypical gender-role socialization to occur.

Gender Essentialism

The essentialist perspective of gender positions the norms and roles assigned to gender as inextricably tied to a fixed set of traits and characteristics. Gender essentialism is sometimes conflated with biological determinist theory but the latter provides a much broader perspective of essentialism. Similar to historical gender essentialist discourses, which reached the peak of influence during the eugenics movement of the early twentieth century, current theory supports the notion that gender difference is biologically hard wired, inevitable, and inflexible.

Within this paradigm, gender difference identifies females as more empathic and emotional and while males are positioned as more logical and rational (Guerin 2001; Robinson et al. 2006). While there is a small but growing volume of academic literature espousing gender essentialism, it is not currently prevalent in the ECEC sector. Despite this, the gender essentialist perspective is increasingly found underpinning much of the current popular literature on the children in the early years (Browne 2004; Eliot 2010). Underpinned by classical humanism and the fixed and unchangeable notion of the Platonic human ideal, gender essentialism homogenizes gender roles and gender norms to a single idealized character set within a male/female binary. This notion of gender as appearing within a hierarchical binary, with male positioned as superior to female, has become a central organizing phenomenon for gender (Robinson et al. 2006).

Influential in the current surge of gender essentialist, literature has been the development of new sciences and technologies in the fields of genetics and neuroscience (Browne 2004; Guerin 2001).

Based on these scientific advances, much of the popular literature supporting gender essentialism claims connections has been found between personality, aptitude, and gender in recent neurobiological scientific research (Browne 2004). In contrast, to the claims of gender essentialists found in popular literature much academic research acknowledges that science has yet to find conclusive proof for personality or aptitude difference based on gender (Browne 2004).

Gender Socialization

The mid-twentieth century brought new ways of understanding of gender and gender development based on socialization as a group of theories arose as a critique of essentialist development perspectives. These theories strove to explain how human development occurred within societies rather than as a natural phenomenon.

Early Gender-Role Socialization Theories

Gender-role socialization differs from gender essentialism assuming that gender role; identity and norms develop through social influences and engagement. The development would occur as children observe the behaviors, traits, and attitudes considered appropriate for the biological sex they are assigned at birth. Over time there have been multiple theories of gender-role socialization that strive to explain how the behaviors and expectations related to social roles and norms are integrated into a personal identity and social expression (Maccoby 2000).

The earliest of the gender-role socialization theories was based on social learning theory. Formulated by Albert Bandura, social learning theory proposes that identity develops through negative and positive reinforcement, meaning that acceptable gender roles would be predominately imposed on the subject. Later behaviorist theories, including cognitive developmental theory and gender schema theory, also considered gender identity to be imposed upon a subject. Sometimes called sociobehaviorism, these theories are largely rooted in empiricism. Criticism of the notion that individuals are passive in the imposition of

identity leads to further development of socialization theory as researchers began to investigate the ways that subjects themselves are active in identity construction as they interact with their own cultural contexts (Maccoby 2000). Underpinned by notions of relativism, this belief that the creation of knowledge and identity is formed through engagement within a cultural context places on emphasis on language and interpersonal relationships.

Sociocultural and Ecological Theory

The most currently influential socialization theory, in early childhood pedagogy and practice, is sociocultural theory and ecological theory. When using these theoretical lenses to view gender development, the individual is identified as being immersed within a complex mesh of cultural gender roles, norms, and rules that that would be incorporated into the individuals own gender identity and presentation. Sociocultural theory, which emerged in western academic writings through the writings of Russian social-constructionist Lev Vygotsky, emphasizes the role that children and adults play in the active construction of their own identity and roles within their specific social contexts. Similarly, influential is the ecological theory of Urie Bronfenbrenner that also positions identity as constructed by the subject within their social context. Both ecological and sociocultural theory continue to have a strong influence on the international ECEC sector, especially through the pedagogical approach developmentally appropriate practice (DAP). Through DAP there is potential for teachers aligning to gender socialization theory to still emphasize the link between gender and biological sex characteristics. DAP, as a pedagogical practice espousing a child-led curriculum, leads to some teachers having limited agency around challenging children's gender stereotypical play. DAP can also support the notion that the ECEC environment is and should remain neutral to allowing students to develop their individual gender identities which along with the focus on individualization can discourage teachers from engaging with children as actors within a wider social context (Kane 2012).

Post-Structural Theories of Gender

In recent decades, there has been an increase of educationalists who, while still considering gender development as occurring through socialization, critique both sociocultural developmental theories and essentialist theories. Instead, post-structural theory has been identified as a new way to consider gender and to explore the existing relations of power that are embedded in society (McNaughton 2000). Post-structural gender theories do not consider gender identity to be created through fixed biological characteristics or as a learned state. Rather post-structuralism considers gender to be a socialized role continually acted out or performed throughout life, an act described as performativity by feminist scholar Judith Butler (Blaise 2005). Therefore, when using a post-structural lens, gender roles and identity are neither biologically fixed or integrated from cultural transmitters but instead are purposefully acted out in relation to other identities such as culture, race, and class (Maccoby 2000).

This post-structural lens challenges the notion of gender as a boy/girl binary rather it positions gender presentation as performance on a moveable contextual continuum as individuals make sense of often complex gender roles and norms within social contexts and gendered relationships (Robinson et al. 2006). McNaughton (2000) identifies the post-structural notion of gender as performance as especially relevant in the early years of education sector as children often “play” with notions of gender identity during the preschool years.

Gender and Pedagogy

Each of the main three beliefs about gender identified in ECEC, essentialism, socioculturalism, and post-structuralism, influences pedagogy either through teachers individual practice or in the broader range of educational policies.

Essentialism, Gender and Pedagogy

Essentialist notions of gender have been historically influential in early childhood pedagogy. The philosophic underpinnings of both Froebel's play-

based learning and Piaget's stage-based learning, central to early practice and pedagogy, were influenced by essentialist thinking both considering there to be a "natural" development of childhood (Robinson et al. 2006). "The notion of the naturally developing child" Browne (2004, p. 14) claims "is still a very powerful concept for early years practitioners." Teachers and curriculum builders drawing from gender essentialist theory are likely to consider children playing in gender stereotypical ways as an expression of their natural gender roles and maybe unlikely to challenge this potentially stereotypes behavior (Blaise 2005). Teachers might consider themselves to have little agency to change or challenge "naturally" developing behaviors and traits if they considered it appropriate to do so at all. Robinson et al. (2006) point out that gender essentialist theory has long justified gender inequalities in education.

Michael Gurian, a central figure in the resurgence of gender essentialist theory, has written extensively on the intersection of gender and education and the resultant impact on learning and curriculum. Drawing on recent neurobiological research Gurian (2001) claims that gender differences in brain development lead to gendered learning needs proposing that even in early childhood boys and girls have different learning capacities, motivational skills, and personality traits. Such views homogenize learning abilities and styles. For example, the current debate around boy's educational success, prevalent internationally across the wider education system, reaffirms gender essentialism by homogenizing learning styles and educational successes and failures based on gender role. Browne (2004) though asserts that Gurian's (2001) claims although well established in popular literature lacks academic (Browne 2004). According to neuroscientist Lise Eliot (2010, p. 36), such literature has in fact "*no genuine neuroscientific justification.*"

Socialization, Gender and Pedagogy

Teachers adhering to gender socialization theory are likely to consider children playing in gender stereotypical ways as children responding to and imitating gender roles and traits observed in their

wider community (Blaise 2005). Pedagogy developed in response to development in gender socialization theory identifies the challenging or elimination of gender stereotypes from the educational environment as crucial. Described as the nonsexist approach to gender equity this pedagogy developed from the 1970s.

This method includes pedagogical practices such as the use of nongendered pronouns, teachers, and literature promoting nontraditional gender roles and providing equitable access to opportunities for play. This pedagogical response identifies gender as adaptable allowing teacher's agency to explore and challenge such behaviors. This acknowledgment of teacher's ability to have agency in children's gender stereotyped does not though always mean teachers take up this opportunity in daily pedagogy recognizing the need to challenge gender stereotypical play (Robinson et al. 2006). While this method may endeavor to limit the socialization of gender stereotypes, it does not challenge gendered unequal relations (Robinson et al. 2006).

Post-Structuralism, Gender and Pedagogy

Numerous post-structural theorists (Blaise 2005; Browne 2004; McNaughton 2000; Robinson et al. 2006) highlight the role that post-structural theory can play in teachers' pedagogical practices. Teachers aligning to post-structural theory of gender development identify explorations of gender and gender roles as needing to be actively incorporated into the curriculum, both as a response to children gendered play and proactively to explore and critique gendered norms and gendered power relationships. The anti-bias approach, developed by Derman-Sparks (1989) and based upon Paulo Freire's notions of critical pedagogy, proposes the development of pedagogy that directly supports teachers and children to tackle discrimination and create inclusive environments. While still developing in practice and pedagogical application the anti-bias approach can be found in use in several nations. Another approach, also underpinned by post-structural thought, which provides an alternative method for exploring and challenging issues of gender equity is queer theory (Blaise

2005). By exploring the impact of heteronormalization intersecting with gender role teachers can interrogate how gender binaries and the normalization of heterosexuality can uphold gender roles and norms and how this impacts practice (Robinson et al. 2006).

Gender and Policy

It is internationally recognized that issues of gender, race, and class are central to the quality practice of ECEC (Robinson et al. 2006). While in international practices and policy approaches to gender vary widely, there is an acknowledgment of the need for gender equity. Although approaches vary greatly, two broad categories are identifiable across the policies of developed and developing nations.

Developing Nations, Gender and Policy

In developing nations, the policy approach identifies the necessity for equitable pedagogy and practice while also recognizing that a need concerning both access and quality of girls' education still exists. Both international organizations such as the United Nations and national governments have developed policies designed to encourage gender equity education. This policy direction is seen as crucial to providing an overall equitable approach especially in areas where social and cultural constructs such as poverty and gender traditions may limit gender equity (Kane 2012).

Developed Nations, Gender and Policy

In developed nations, approaches to gender equity vary in degrees of explicitness in the curriculum, legislation, and policy from the explicit to the invisible. With multiple practices and pedagogical approaches to gender there is little consistency in approaches across the international sector. Further, to this McNaughton (2000) identified that gender issues have become increasingly removed from the ECEC sector and teachers' daily routines, despite the considerable amount of development in children's understanding of gender that occurs during the early years.

In a number of developed nations, the lack of a specific focus on issues relating to gender and gender equity has been identified (Blaise 2005; Browne 2004; McNaughton 2000). While the intent for gender equity is likely to be entrenched in government policy and law, the focus is often subsumed within a group of diversities, including gender identities, culture, ability, and sexuality. Without a specific policy direction teachers may acknowledge the need for embracing difference in gender norms and roles but not recognize a need to challenge play and stereotypes that fit into traditional gender norms.

The more explicit approach towards gender equity can be identified with the provision of specific legislation and policy. An example of the explicit emphasis placed on gender in early childhood policy and curriculum can be seen in the focus placed on gender equity in the Swedish ECEC. Within Swedish ECEC policy and curriculum gender equity is given a privileged position, mandatory in practice and legislated for in the policy, along with providing a focus on research on gender equity programs and professional development (Pramling Samuelsson and Sheridan 2004).

Summary

With gender as a central phenomenon for organizing society, young children's gender boundaries are closely monitored and shaped across all aspects of a child's life. As this monitoring and shaping also occur including through interaction with other children and teachers making the ECEC sector important to gender development (Yelland 1998). Further, the multiple pedagogical approaches to supporting gender equity in ECEC mean that there are inconsistencies in the importance placed on gender and the role that gender plays in early childhood development. As such there are a number of implications for teacher educators and early education policy makers that may not be addressed in a sector that is beset with conflicts and confusion relating to gender (McNaughton 2000).

Colonialism; Difference; Feminism; Gender; Identity; Marginality; ‘Other’; Postcolonialism; Power; Social change

Introduction

Postcolonial and gender theories emerge from political struggles and intellectual traditions which connect in important ways for education. Most significantly, these theoretical constellations converge in their critique of dominant power and, with this, in their challenge to the production of normative knowledge and authority relations. For example, critical explorations of the colonial and gendered operations of power interrogate how culture and identity are imbricated in the past and present taken-for-granted primacy of “Western,” masculinist knowledge. Such inquiries trouble the ways in which educational practices can silence, obscure, and sideline the knowledge, experiences, and understandings of women and the majority of the South. In doing so, postcolonial gender theories in education are driven by a desire to engage in social change. They explore the pedagogic possibilities for resisting and dismantling the co-constitutive logics of colonial and gendered oppression.

Postcolonial and gender theories sit in the nexus of activism, politics, and academia. Political struggles have shown the coloniality of gender and the gendered order of colonial violence. It is important, therefore, to understand the development of, and relationships between, postcolonial and gender theories in social and historical context. The first-, second-, and now so-called “third”-wave and “post”-feminist movements, de-colonial and independence struggles, the struggles for rights and recognition in the diaspora and indigenous rights campaigns have all influenced the intellectual developments of postcolonialism and gender theory. For instance, the influential work of the Subaltern Studies Group/Collective in the 1980s cannot be considered outside of historical struggles over representation and recognition in colonial and postcolonial India. Additionally, much black and postcolonial feminist scholarship has emerged as critical responses to the deficiencies and blinkers of “Western” feminist politics and its frequent assumption of a universal category of “woman.” Indeed, de-colonial and political struggles by women in the global South, as Connell (2015) reviews, have

produced powerful theorizing about the colonality of gender. But because the global economy of knowledge is at odds with the political history of gender relations, often these forms of knowledge – these theories and philosophies – are not recognized as being as such within the academy.

The different sociohistorical contexts in which theories about gendered colonial relations are produced and mobilized point to the significant diversity contained under the collectivizing umbrella terms of “postcolonial” and “gender” theory. This chapter reviews major contributions to this field, outlining three converging concerns of postcolonial and gender theory that have salience for educational theory and philosophy and research and practice. The first is a concern to understand, theorize from, and challenge the power dynamics of “marginality” and “difference.” The second relates to the subjectification of the Other and how the subjects of “woman” and “postcolonial” become “known,” contained, and controlled. The third regards the development of educational theories of change: the challenging of epistemological and ontological assumptions surrounding colonial and gendered relations across the global North and South.

Margins: “The Silent, Silenced Center”

Postcolonial gender theories critique the operations of power that create normative claims about the value of masculine Eurocentric knowledge and practices. This engagement sees the constitutive forces of colonialism as gendered; “If, in the context of colonial production, the subaltern has no history and cannot speak,” Gayatri Chakravorty Spivak reflects, “the subaltern as female is even more deeply in shadow” (1988, pp. 82–83). Spivak, a significant member of the Subaltern Studies Group, suggests that the “margins” constituted through the gendered postcolonial political economy are “the silent, silenced center” (1988, p. 78). The projects of postcolonial gender theorists to decenter the Self and privilege the voices of the heterogeneous Other seek, therefore, to challenge the hierarchical

binaries of center/margin, Self/Other, North/South, and male/female.

The consideration of what constitutes the “margins” and “marginality” is fundamentally about questioning how the majority world has come to be positioned as marginal to the Euro-male-center. This is an educational concern that cannot be unhooked from past and present political and economic organizing logics. How and why, for example, have gendered colonial forms of knowledge been circulated, legitimized, and normalized through social and educational institutions? In her recent work on feminist theory, author of *Southern Theory* Raewyn Connell examines how the cultures and practices of higher education and the academy support the taken-for-granted salience of (gendered) theories, knowledge, and practices from the global North. Connell argues, “In the era of neoliberal globalisation, the metropole continues to be the main site of theoretical processing, now including corporate research institutes and databanks” (2015, p. 51). This is a process of what Spivak terms “epistemic violence,” in which the knowledge and understandings of the Southern majority are dismissed through cultural and knowledge practices that fail to challenge the construction of the “South” as the colonial “Other” (1988, p. 76).

For postcolonial feminist theory, a focus on the margins is also a means to examine the politics of difference and diversity. Chandra Talpade Mohanty, a seminal figure in the field, for instance, laments that her contributions to postcolonial feminist theory were misinterpreted as a concern for relativist difference in the context of the “triumphal rise of postmodernism in the U.S. academia in the past three decades” (2003, p. 504). This is exacerbated, Mohanty contends, by a “world that appropriates and assimilates multiculturalism and “difference” through commodification and consumption” (ibid, p. 505). In response, Mohanty asserts the need for a conceptualization of marginality that seeks to unveil and challenge the political, social, and economic processes of power that creates the social, economic, and epistemological conditions for “marginality.” To support this project, Mohanty suggests the value in Gustavo Esteva and Madhu Suri

Prakash's terminology of "One-third world" and "Two-thirds world." This language, she argues, more accurately reflects global differences, in contrast to "misleading ideological or geographical binarisms" contained within the couplets "Western/Third World" and "North/South" (2003, p. 506).

The intellectual and political work of postcolonial gender theorists can be seen as a commitment taking the position of the margins in order to critique and challenge the structural bases of "epistemic violence" (Mirza 2009, p. 236). "If we pay attention to and think from the space of some of the most disenfranchized communities of women in the world," Mohanty claims, "we are most likely to envisage a just and democratic society capable of treating all its citizens fairly" (2003, p. 510). This is to eschew an exoticized, commodified reading of "difference," as well as a cultural relativism that risks suspending the possibility of political action.

For example, drawing on black feminist bell hooks, Heidi Mirza suggests that marginality can be a "radical location in which black women can situate themselves in relation to the dominant group through 'other ways of knowing'" (2009, p. 242). As hooks argues:

Marginality is a central location for the production of counterhegemonic discourse – it is found in the words, habits and the way one lives.... It is a site one clings to even when moving to the center. . . . it nourishes our capacity to resist....it is an inclusive space where we recover ourselves, where we move in solidarity to erase the category colonizer/colonized. (as cited in Mirza 2009, p. 243).

Mirza's research on black women's representation and experiences in UK higher education advances a black feminist epistemology. She suggests discriminatory institutional practices are challenged by women of color through their continual resistance and renaming of the "regulatory effects of the discourses of educational inequality in higher education" (Mirza 2009, p. 244). This is to view the struggle at the margins as a struggle for social change.

Importantly, however, for many postcolonial gender theorists, the task is not simply to invert the authority contained within North/South, male/

female, or to naively celebrate "marginalized voices." Sara Suleri, in her influential paper "Woman skin deep," warns against "the simplicities that underlie unthinking celebrations of oppression, elevating the "racially female voice" into a metaphor for "the good"" (1992, pp. 758–759). Critical of the binarisms that she sees postcolonial gender theory at risk of reproducing, Suleri engages complex debates about subjectivity and identity, asking "which comes first, gender or race?" (p. 759). Critically reflecting upon Minh-ha Trinh's 1989 *Women, Native, Other* and bell hooks's 1989 *Talking Back*, Suleri (1992) warns of the dangers of testimonial assertions of postcolonial womanhood. She argues for nuanced historical engagement that moves postcolonial feminist critique out of its discursive and cultural realms and into addressing past and present socio-political and legal practices.

In this way, Suleri offers a provocation to consider the role and purpose of postcolonial and gender intellectuals in the continuing violence of colonization. The question she poses is an ongoing debate for the field, with many arguing against seeing raced and gendered identity through an "additive model of double or triple jeopardy" (Mirza 2009, p. 234). Mirza, for example, argues: "a black feminist epistemology is contextual and contingent and examines the differentiated and variable organizing logics and beliefs that structure women's lives in various historical times and geographic places" (234). Gurminder Bhabra (2014) also calls attention to historical contingency. She argues that a radical deconstruction of the margins remains illusory if the knowledge of the Self and Other is continually constructed as separate: to move beyond binary hierarchies, the *connected* constitutions of knowledge need to be reconstructed. The educational challenge for the field of postcolonial and gender theory is how such relational understandings of marginality can be achieved.

The "Postcolonial Woman" Subject

Postcolonial conceptualizations of the "margins" challenge gendered colonial subjectifications of

the “Other.” In his 1952 seminal *Black Skin White Masks* Frantz Fanon draws on psychoanalysis to examine how gender is constituted within the colonial subject. Fanon (2008) suggests the white “Colonial Self” and the black “Colonized Other” are mutually created through the assertion and presumption of European cultural ascendancy and through complex relationalities of desire operating in and through sexualized and gendered colonial discourses that capture both men and women. In doing so, Fanon calls attention to the gendered, embodied, emotional, and affective dimensions of colonial power. In postcolonial theory, the subject positions of “woman” and “man” are understood as embedded within the colonial project. As scholar Amina Mama writes, “to understand violence against women in postcolonial Africa we must understand the violence of colonialism; and to understand that, we must start with ‘gender relations and gender violence at the imperial source’” (Mama 1997, as cited in Connell 2015, p. 53). These contributions understand gender relations, gendered subject positions, and gendered embodiments, as central to the continuing relations and consequences of colonialism.

In education, Heidi Mirza examines how when navigating educational spaces black women’s identities and bodies become sites of political, postcolonial struggle. She writes, “For postcolonial women of color, it is impossible to escape the body and its reconstructions as we negotiate our embodied social situations” (2009, p. 235). Mirza’s work on higher education in the UK investigates the ways in which the embodied experience of being and becoming a “postcolonial subject” shapes experiences of exclusion, inclusion, success, failure, and participation in education (2009). She examines how the dominant white gaze of higher education institutional practices works to surveil and contain the subject of the black woman, who is now “included” within the institution, but does not necessarily “belong.” This renders the black woman a “mute visible object” (Casey 1993 in Mirza 2009, p. 239). In turn, the feature of benign multiculturalism in education – a contingent inclusion that requires the subject to assimilate – displaces political and

institutional challenges to “the technologies and power of monolithic whiteness” (Mirza 2009, p. 244).

Postcolonial queer feminist scholar Sara Ahmed also takes up the affective and embodied dimensions of “difference” and “inclusion.” In *On Being Included* (2012), Ahmed examines the limits of institutional attempts to address racism and diversity in higher education. She explores how purported institutional commitments to diversity and inclusion can exacerbate the embodied and discursive effects of “difference.” Ahmed claims those who are “different” are often relegated the task of performing and creating institutional practices of “diversity.” She concludes her research by suggesting that those who raise issues about institutional racism often end up being understood as obtrusive. “Diversity practitioners,” Ahmed states, “not only come up against the wall, as that which does not move, they are often themselves encountered as the wall, as obstructing the movement of others” (2012, p. 186). Her point is that institutional and educational practices of “diversity” – as with Mohanty’s critique of difference – can be a smokescreen for a failure to genuinely enact equitable practices. “Diversity” can be adopted as a part of a global marketing campaign, rather than in the interests of institutional transformations required to tackle embedded cultures of racism. Ahmed, therefore, aims her critique at institutional declarations of antiracism that paper over the need for interventions in the political economy of inequality.

The Educational Challenges of/in Postcolonial Gender Theories

Ahmed’s critical examination of the diversity practices of higher education institutions follows a long line of interventions into education by scholars working with postcolonial and gender theories. Indeed, education is at the center of these theoretical considerations: as an instrument of dominant power and a possible tool with which to challenge, subvert, and critique taken-for-granted colonial and gender power and assumptions.

Hazel Carby, author of the highly influential “White woman listen! Black feminism and the boundaries of sisterhood,” for instance, levels incisive critique of education in her 1982 “Schooling in Babylon.” Carby argues schools in Britain work in association with the police and social services to discipline and govern black youth, rather than address the wider social and institutional relations of colonial racism. She likens the practices of so-called progressive teachers to the pacifying role of missionaries “in the wake of the armies of colonisation.” Carby asserts, “Like missionaries these teachers have not examined their own racism in their preoccupation with their own spiritual regeneration through ‘doing good’ to black youth” (1982, p. 199). In particular, Carby (1982) views education as a political, social, and cultural act and as a site of struggle. Writing nearly three decades later, Mirza (2009, p. 244) similarly states, “educational institutions must be seen, not just as mechanisms through which individuals are unconsciously subjected to dominant ideological systems of race, class, and gender, but rather as sites of struggle.”

A key dynamic of this struggle is that of knowledge and epistemology. This has significance not only for the institutions of education but also the institutions and practices of research. For instance, in *Decolonizing Methodologies*, Linda Tuhiwai Smith examines how knowledge, and the claim to “know,” is inextricably connected to the history of colonization. She asserts (1999, p. 63), “The globalisation of knowledge and Western culture constantly reaffirms the West’s view of itself as the center of legitimate knowledge, the arbiter of what counts as knowledge and the source of ‘civilized’ knowledge.” Schooling, she writes, is “directly implicated in this process” (ibid, p. 33). Curricula, maps, colonial histories, and language all reinforce, Smith suggests, a view of indigenous peoples as periphery and Other. To understand the role of education and schooling, therefore, is to understand the past and present knowledge practices, which were – and are – inextricably bound to colonization. Underpinning this is Christian and Enlightenment thinking, which judged “some of us as higher-order

savages who deserved salvation in order that we could become children of God” (ibid).

For postcolonial gender theorists, the intellectual and political task of challenging colonial and gender power is often seen as pedagogic. For example, bell hook’s *Teaching to Transgress* (1994) explicates her approach to “engaged pedagogy,” developing upon the ideas of Brazilian educator and activist Paulo Freire and Vietnamese Buddhist monk Thich Nhat Hanh. Engaged pedagogy, hooks suggests, is a political act that goes beyond critical and feminist pedagogies in its concern with the process of self-actualization for both teachers and students. For hooks (1994), such a pedagogy embraces difference, openness, and the opportunity for intellectual comradeship and discovery through the decentring of “Western” authority.

From different perspectives, a number of postcolonial gender theorists have attempted to explore the possibility for pedagogic practices of resistance. As Mohanty reflects, the “recurring question is how pedagogies can supplement, consolidate, or resist the dominant logic of globalisation” (2003, p. 523). Mohanty suggests that a “feminist solidarity” pedagogic approach best addresses relational constitutional difference (2003). The focus here is not only on the intersections of race, class, gender, nation, and sexuality but also on the interweaving histories, narratives, and experiences of these communities (2003, p. 522). This, argues Mohanty, avoids continuing to treat the “Third World Other” as a pit stop on a tour of difference and starts to examine and critique historical and sociological interrelations. Similarly, Connell advocates an approach based on understanding “gender *fundamentally* in the perspective of colonality” (2015, p. 59). She suggests a “solidarity-based epistemology,” based on “mutual learning on a world scale, in which different formations of knowledge are respected but enter into educational relations with each other” (ibid).

In these ways, the political and intellectual projects of postcolonial and gender theories are centrally educational projects of social change. Brought together, theories and philosophies of gender, postcolonialism, and education offer a

relational, intersectional, and historically nuanced view of social change that is attentive to the political economy of gendered colonial inequality and alive to the possibilities of its transformation.

Introduction

In the areas of sexuality and education, sexual dogma serves the purpose of dividing the working class (Agostinone-Wilson 2010). This is done by invoking the expectation of celibacy on certain sexual minorities while heteronormative beliefs leave unquestioned the ability of heterosexual married teachers to display their sexual identity through trivial yet identifying markers such as casual talk about spouses and children or photographs of husband or wife exhibited on one's desk. These everyday actions (and heterosexuality itself) are presented as neutral while any kind of LGBTQ or feminist advocacy is seen as “political.” Such efforts prevent the unity of the workforce required to overcome the worst abuses of capitalism (D’Emilio 1992). So far from being a “fringe issue,” sexuality is a cornerstone of how oppression operates through capitalism.

Adding to the hysteria already promoted by abstinence-only education are heightened fears about pedophilia and its link to homosexuality – a long-standing belief system with roots in the acceleration of capitalism under late 1800s industrialization (D’Emilio 1992). It is important to note that accusations of “sexual deviance” have been evoked several times throughout history in order to target groups by questioning their patriotism or as part of anticommunist witch hunting and red-baiting. This was also seen in early 1970s State efforts to fire any teacher or supporter of a teacher suspected of being gay or lesbian.

Homophobic policies impact not only the LGBTQ community but straight educators as well, because rigid gender norms target everyone (Valenti 2010). To quell majority fears and to distance themselves from these social constructs teachers have often presented themselves as asexual, particularly if they come from minority groups regularly targeted with hyper-sexualized stereotyping such as African-Americans and gay males. Majority fears about sex also shape sexuality education curriculum and laws about marriage. These have deep historical roots within K-12 schooling.

Thus the ideology of celibacy and its relationship to education needs to be understood within a

dialectical historical analysis of how teachers (gay and straight) were and are expected to conduct themselves (Agostinone-Wilson 2010). Related to this is the one common historical thread running through Jim Crow terrorism and contemporary racism, lynching, torture, gender bias, and homophobia: fears rooted in sex (Reich 1971). For example, during the Jim Crow era, black males were portrayed as sexually deviant and prone to rape white women, even though most sexual assaults were and are same-race. In a similar vein, gay males in particular were and are seen by majority culture as sexually aggressive pedophiles. Myths about these groups spreading sexually transmitted disease are another common belief promulgated within mainstream culture, as with media coverage of AIDS in Africa. In all of these cases, these stereotypes serve to justify targeting minorities with violence and discrimination.

This entry consists of three sections: The Role of Homophobia in Schools, The Ideology of Celibacy within the Historical Framework of Teaching, and Sexuality Education Curricula.

Role of Homophobia in Schools

While certainly issues of race are controversial enough, addressing LGBTQ concerns within K-12 schools involve constantly competing interests of religious, economic, and cultural groups regarding beliefs about sexuality and morality. A large portion of teachers in the USA and Canada hold homophobic beliefs toward LGBTQ youth. Kennedy and Covell (2009) report that 85% of teachers and 80% of guidance counselors working in K-12 schools are opposed to including LGBTQ issues into curriculum. Kennedy and Covell also found that gender-based harassment is aimed at gay male students in particular by heterosexual male students making up the majority of harassers. Even students who are not gay or lesbian but who are simply *perceived* to violate norms of gender are targeted, making all students, gay or straight, potential victims.

Homophobia is clearly linked to antifeminist thought and sexism. Certainly gender-based harassment and bullying is the primary means of

enforcing heteronormativity, reflecting the embeddedness of violence within K-12 schools. In the USA, an estimated 1.6 million K-12 students experience gender-based harassment and bullying with LGBTQ kids being three times as likely as straight peers to have been physically assaulted or involved in a fight (Swearer et al. 2008). These acts of violence are not a matter of individual intolerances but are a systemic part of a society that is set on preserving heteronormativity through policing how one dresses, acts, talks, and interacts with others (Swearer et al. 2008).

Heteronormativity is also enforced through specific beliefs disseminated within the school about what is or is not masculine. Even though the media features stories about body image and its impact on girls, boys are by far subject to more scrutiny about their gender appropriateness. This forms a masculine hegemony where those who follow appropriate gender norms and those who are viewed as violating them experience the high cost of loss of peer attachments and solidarity (Agostinone-Wilson 2010; Valenti 2010). Heterosexual males who do not fit the masculine norms are “gay baited” where they are pressured to demonstrate that they are manly enough (Swearer et al. 2008). Usually, this results in even more instances of harassment as those pressured often engage in antigay bullying to show that they are macho.

Remaining closeted is often a strategic decision used to preserve one’s job, especially if one works with younger children. Passing strategies are used, including pretending to have a boy/girlfriend, not challenging homophobic harassment, bringing opposite sex dates to school functions, avoiding LGBTQ topics in class, or even withdrawing from general school culture and keeping to one’s self, often in rejection of the climate of “willingness to disclose” information that permeates many school settings where everyone knows everyone else’s business (Agostinone-Wilson 2010). These strategies often further isolate LGBTQ educators. For many teachers, this is a continuation of their experiences in high school where they never saw themselves reflected in school curriculum, or when

LGBTQ issues were brought up, it was always in the context of harassment or scare tactics related to HIV/AIDS.

Ideology of Celibacy Within the Historical Framework of Teaching

The ideology of celibacy is that sexuality is limited to heterosexual marriage (and within some religious conservatives even then it is only reserved for procreation). Anyone not included in that category is expected to abstain from sexual activity. Expectations of self-control are also bound up with celibacy, which spill over into self-denial for the state and control writ large. Teaching remains one of the few professions where asexuality is held to a higher standard.

Celibacy and asexuality function to make LGBTQ teachers and students invisible. Issues of sexuality are dismissed as having no relevance for most K-12 students, and a default norm of heterosexuality is maintained. Preservice and full time teachers view LGBTQ issues as not being worth learning or that these topics are politically correct. This invisibility is sustained by homophobia where many LGBTQ teachers and students remain closeted and safely out of the way. The default norm of heterosexuality is further enforced via celibacy by sexuality curriculum that advocates abstinence, traditional gender roles, and the like (Agostinone-Wilson 2010; D'Emilio 1992).

The feminization of the teaching force was central to Horace Mann's vision of school reform in the mid-1800s. In order to meet the growing demand for school teachers at the same time factory work was attracting men away from becoming teachers, women were recruited due to their labor being readily available with no competition from other employment sectors, enabling wages to be kept low (Spring 2004). However, resistance to middle class women working outside of the home had to be overcome and part of the way to do this was to ensure the public that teachers' conduct would be heavily monitored and shaped toward Christian virtues of purity.

Today, women provide essential labor for the majority of K-12 schools and child care centers,

yet this has not translated into elevated wages or the promotion of teaching to a true profession. The shadowy borderlands between profession and babysitting hovers over teaching as a form of labor, yet not fully recognized as "labor" in the 1800s, despite low wages and poor working conditions facing female teachers, including marriage bans and a lack of maternity leave which were not addressed until the mid-twentieth century (Spring 2004).

The discourse of the "good" teacher with its focus on celibacy, personal conduct, control of the classroom, and subject matter mastery often supersedes addressing inequality. Personal conduct of teachers reflects an overarching expectation of conduct in society at large, where following rules is emphasized over confronting injustice, including overt and hidden taboos, rules, and regulation of behavior, which are linked to expectations of the ruling elite. Part of the onus of conduct is that anything of a sexual nature should be contained within the family. These expectations of conduct took place against a backdrop of increased State regulation and credentialing of teachers, reflecting an interest in social efficiency (Agostinone-Wilson 2010).

Sexuality, and especially demands for asceticism, therefore becomes a critical arena for accepting the State. However, rifts occur as people attempt to grapple with social expectations and their own desires. This resulting conflict between morality and biology produces neuroses which manifest themselves into antisocial, sadistic acts. Reich (1971) took Freud's thesis of fear of death much further when he located the source of sexual oppression in the oppressed themselves.

It is not much of a leap from sexual repression to the acceptance of corporal punishment, then the emergence of sadism, and finally applying these neuroses to those of a different race or sexuality. It is notable that the kinds of sexual stereotypes aimed at black males are similar to the stereotyping of gay males: sexual rapaciousness, loose morals, and accusations of "recruiting." With recruiting, black males were and are viewed as "going after" innocent white women, whereas gay males are viewed as pursuing underage boys. Here, we see the logic of the purity movement

folded into racism (Valenti 2010). These stereotypes serve as a de facto justification for public punishments in the form of beatings or “gay bashings,” just as lynching was often justified on the grounds of a black man simply looking at a white woman. By contrast, African-American women were not protected in such a manner.

However, there are key differences in the ways that sexual stereotyping emerges through homophobia and racism. African-Americans, often more readily identifiable through skin color, have encountered stereotypes of genetic intellectual inferiority, whereas gay males are identified by their display of “feminine” characteristics and behaviors, with many remaining closeted and beyond detection. At the same time, anyone (straight or LGBTQ) can be labeled “fag” or “dyke” as a form of social condemnation, whereas it is difficult to assign someone the label of a minority group (“nigger lover” is about as close as one can get to such assigned labeling). Because conservatives cannot bring themselves to consider the possibility of homosexuality being a genetic characteristic, LGBTQ people have escaped such biological stereotypes that often face minority groups.

Ultimately, Reich (1971) concluded that to end sexual oppression would require a fundamental overthrow of the organizing principles of capitalism – mere transgressing of sexual boundaries was not enough. This means that patriarchy, sadism, and oppression are not natural features of human beings. Things are constantly changing and evolving, including within the sexual sphere, as borne out by anthropological research indicating the fluidity of human experience.

Sexuality Education Curricula and Homophobia

Sexuality takes particular normative forms within official school curricula in K-12 settings, sending messages about what is or is not appropriate. Even when people might agree that sex is an important health topic for schools to cover, they usually bring up the “proper” developmental age of the student as an excuse to not provide too much information.

Even as religious groups such as Focus on the Family release statistics arguing that having premarital sex increases one’s likelihood of being poor and divorced later on, the median age of first sexual experience in the USA is 17 years, indicating that potential future poverty and being alone are not sufficient deterrents (Valenti 2010)! This means that by 12th grade, most students have had either oral or vaginal intercourse with nearly 15% experiencing anal intercourse. Just because one is not married or even living with someone does not mean one is not having sex – by age 44, 99% of Americans have had sex with the majority having had sex outside of marriage (Valenti 2010). Teen pregnancy rates are declining in first world nations, which are partially attributed to young people engaging in oral sex. However, teenagers have the highest rates of sexually transmitted infections (STIs).

In looking at sexuality curriculum, it is no surprise that the abstinence-only movement emerged during the backlash against the sexual revolution of the 1960s and 1970s. In 1981, the *Adolescent Family Life Act* was passed, providing funding only for pregnancy prevention programs that advocated strict abstinence with no contraception, in many cases couched in religious terms. After a lawsuit in 1993, the Act was not allowed to fund programs with overtly religious messages (Valenti 2010). As a result, the abstinence-only literature took on a secular tone, with an emphasis on the health benefits of chastity. The abstinence movement was further bolstered by the 1996 *Welfare Reform Act* under the Clinton administration which provided 50 million dollars in funding for abstinence-only programs.

Abstinence-only education is inherently homophobic in a variety of ways. First, this type of sexuality education completely ignores health concerns of LGBTQ people (Agostinone-Wilson 2010; Valenti 2010). Second, guidelines for abstinence-only programs prohibit mentioning anything sexual outside of the context of marriage. As Valenti (2010) points out, LGBTQ students are “essentially taught that sexual intimacy is something they can never experience” (p.110). Of course, an exception is when HIV/AIDS is mentioned, it is then tied to the gay community.

Third, some schools cite existing sodomy statutes as justification for not addressing gay issues in sex education.

In addition to being homophobic, abstinence-only curriculum is sexist with its focus on virginity as a primarily female attribute and evidence of a girl's/woman's worth. Virginity is therefore linked to being a "good" person with the implication that girls and women will be at risk of being "used goods" if they engage in premarital sex. The virginity and abstinence movements are not about empowerment but about a return to normative (read: sexist) gender relations (Valenti 2010). Linked to the nuclear family and compulsory marriage, chastity emerges as a demand to institutionalize these family forms (Reich 1971). Finally, virginity pledges that are part of the abstinence-only movement provide a convenient way to intimidate lesbians to remain closeted, as Valenti (2010) discovered in interviews with high school students who had taken the pledge partly as a way to provide cover for their homosexuality.

Among the many fallacies in abstinence-only curriculum are promotions of double standard views of gender, with exhortations for male students to control themselves and be manly men while female sexual desire is not even a point of discussion at all (Valenti 2010). What results is a policing of female desire in particular, since the only appropriate context for it (and the double standard means that women have the most to lose in terms of overall worth) is within straight marriage, and even then the primary purpose is for procreation, not pleasure. Reich (1971) explains that this promotion of patriarchy feeds right into fascist and authoritarian governments where males are privileged financially/legally and extorted to suppress women whereas non-class-based patriarchal/matriarchal societies were more fluid and open to societal change. Compulsory monogamy, then, is part of what gives heteronormativity its power and justifies the status quo.

Abstinence-only education is religious in its message, reflecting the most conservative of Christian denominations/sects in its views on sexuality. Comprehensive sexuality education is targeted by conservatives as one of the primary avenues for "secular humanism" in K-12 schools

and is seen as a major threat to parental authority. Major funding for abstinence-only education plays off of this base of reactionary support in the form of major donations from the Heritage Foundation, the National Advisory Council for Abstinence, crisis pregnancy centers, and, of course, the US government (Valenti 2010). This curriculum is couched in secular language expressing concern about "getting the truth out" about the supposed fallacies of safe sex, but its curriculum is religious on many levels.

Class-based societies have a vested interest in establishing paternity; therefore, virginity serves an important economic function in capitalist society by guaranteeing lineage. This positions women's sexuality as a commodity used to reinforce the nuclear family as the preserver of private property (Reich 1971; Valenti 2010). Abstinence-only education is part of a larger religious movement with economic interests in controlling women's rights so as to control working class wages. In reacting to the downward mobility of their wages and the collapse of the social safety net, conservatives have turned to sex as a target for the source of social ills, rather than a capitalist economy which is Godly and cannot be critiqued.

Put plainly, what the abstinence-only movement requires is that young people suppress their sexual selves in service to the State. Religion is the primary – though not the only – vehicle for steering people into the nuclear family arrangement, which is critical for reproduction of the workforce that capitalism demands. Since our society levels the most social benefits on married couples (inheritance, medical coverage, tax breaks, housing loans), the ruling elite are interested in limiting this to heterosexuals, though gay and lesbian marriage could certainly be assimilated into a capitalist system without a hitch as we are currently witnessing.

What this demonstrates is that economic concerns can lead to desires to address social issues in the form of attempts to police morality. Though the temperance movement was eventually connected to the abolition of slavery and the growth of feminism, it focused the bulk of its efforts on prohibiting a behavior. In a similar vein, abstinence-only advocates are chasing a

shadow of what cannot be while leaving the root cause of oppression intact.

Gendered Violences and Queer of Color Critiques in Educational Spaces: Remembering Sakia, Carl, and Jaheem

Durell M. Callier
Cultural Studies and Curriculum, Department of
Educational Leadership, Miami University,
Oxford, OH, USA

Introduction

Queer of color (QOC) critique arises from a field outside of education. However as recent educational studies and some scholars (see

Brockenbrough 2015; Coloma 2013; Cruz 2013; McCready 2013; Pritchard 2013) in the field have noted, queer of color critique offers useful theoretical insights and tools to enhance educational research practices. The aim of this text is twofold: to offer an overview of queer of color critique and provide relevant connections between QOC critique and education broadly defined. To do so this text uses the figures of Sakia Gunn, Carl Joseph Walker Hoover and Jaheem Herrera, youth of color as fulcrums to illustrate the stakes and therefore necessity of intersectional approaches like QOC critique. Queer of color critique provides educators and educational researchers useful ways to address issues of anti-Black racism and anti-queer antagonisms as they cut across those bodies marginalized because they are demarcated by difference, otherness, and nonnormativity.

Before continuing, it is important to note how queer is deployed throughout this text. Informed by queer theory and in particular queer of color critique and Black queer theory, lesbian, gay, bisexual, transgender, and queer (LGBTQ) are used interchangeably. In doing so, this text specifically attends to how LGBTQ identities signal an understanding of queerness as a unifying identifier of sexual desires and sexualities that are not heterosexual. While this definition rings true for many of the subjects discussed within this essay, who can be understood as queer because of same sex desire, this text advances an argument for a more intentional understanding of how youth of color and Black youth in particular as racialized subjects are queered and thus experience differential treatment and harm.

To be a racialized other, within an American context, has always been imagined queerly, despite efforts to understand social justice issues related to race and sexuality through monocausal lenses. Examples of this can be seen in how Black familial structures, sexual lives, and citizenship have been policed and read as aberrant within the United States (Cohen 1997; Ferguson 2004; Somerville 2000). For example, Cathy Cohen (1997), in discussing the regulation of enslaved Black bodies “to endure a history of rape, lynching, and other forms of physical and mental terrorism,” demonstrates how Black people as a

“marginal group [...] lacking power and privilege although engaged in heterosexual behavior, have often found themselves defined as outside the norms and values of dominant society” (p. 454). Of importance is Cohen’s (1997) critique in the failure of queer politics to actualize anti-assimilationist, disruptions to dominant norms, which might produce, “a politics where the *non-normative* and *marginal* position of punks, bulldaggers, and welfare queens, for example, is the basis for progressive transformative coalition work” (p. 438). Cohen’s (1997) article, *Punks, Bulldaggers, and Welfare Queens: The Radical Potential of Queer Politics*, highlights the possibility of thinking through queerness not only in relationship to same-sex desire and attraction but to consider how nonnormative, deviant lifestyles, and racialized subjectivities are positioned queerly.

As a project queer theory seeks to unsettle various forms of normativity, thus, its utility is to consider how to unsettle logics, which normalizes the degradation of racialized subjects, gender non-confirming youth, and those outside of heteronormativity. In this way this text in reviewing current queer scholarship which focuses on the intersections of race, nonnormativity, and power builds upon extant scholarship in education which asks us to consider how racialization processes in a racist society perpetuate systemic forms of oppression and how those most affected react in kind (Dumas 2013; Dumas et al. 2016; McCready 2010).

Remembering Sakia Gunn, Carl Joseph Walker-Hoover and Jaheem Herrera

The victimization of queer youth in recent years has arguably garnered growing public concern in regard to the homophobic bullying and violence received by gender nonconfirming students, self-identified same gender loving youth, as well as their presumed heterosexual counterparts (Brockenbrough 2015). This is evidenced in the national news coverage of LGBTQ youth suicides in 2009 and the subsequent reverberations of this coverage (James 2009). For example, in

September 2010, Dan Savage, syndicated columnist and author created a YouTube video along with his partner Terry Miller to inspire “hope” for LGBT youth experiencing bullying and harassment ([It Gets Better Project](#)). Savage and Miller’s initial video was a “response to a number of students taking their own lives after being bullied in school, they wanted to create a personal way for supporters everywhere to tell LGBT youth that, yes, it does indeed get better (It Gets Better Project).” Their video served as the catalysts for the It Gets Better Project (IGBP), which launched its initial website in October 2010 ([It Gets Better Project](#)). The reception of the IGB project led to an overwhelming response of YouTube videos created by internationally acclaimed celebrities, politicians, businesses, as well as a myriad of concerned individuals. However, as Puar (2010) notes despite the virality of these videos and their aspirational, claim it doesn’t just get better.

Puar’s (2010), pointed critique illuminates the ways that race and other forms of difference in their absence thwart advancing nuanced discussions on the multiple forms of oppression which conspire to queerly mark students both inside and outside of schooling contexts. Take, for instance, Carl Joseph Walker-Hoover and Jaheem Herrera, youth of color who committed suicide in 2009. On April 6, Hoover’s mother discovered him, with an extension cord wrapped around his neck, hanging from the third floor rafter of their home in Springfield, Massachusetts (James 2009). Herrera, a resident of Atlanta, Georgia, took his life 10 days after Hoover (Simon 2009). Discovered by his mother and younger sister, Herrera was found hanging by his belt in his bedroom closet (Simon 2009). Hoover and Herrera were both only 11, when they decided to silence the daily taunts they experienced, of being called, “girlie,” “gay,” or “fag” (James 2009; Simon 2009).

Markedly different than suicide, Sakia Gunn, a self-identified Black lesbian, experienced anti-queer violence in part due to her gender nonconformity. May 2003, in Newark, New Jersey, Gunn, a 15-year-old Black lesbian, was stabbed and bled to death after refusing the sexual advances of her killer Richard McCullough

(Freeman 2008; Goodman and González 2003). Sakia, Jaheem, and Carl all in their gender non-conformity became queered subjects. Their lives and the tragedies of their deaths highlight how affronts to heteronormativity are connected to the ways that those deemed as ostensibly straight can be queered by hierarchical systems of power. Sakia in her refusal of McCullough and heteropatriarchy, her daring to exist in her truth made her a vulnerable target (Brown 2015). This same vulnerability can be seen in the treatment of Herrera and Hoover because of their nonnormative performances of masculinity. Noticing these connections not only becomes important in combating racism, homophobia, and other threats to “equity and justice in American education” but also in improving the afforded safety, quality, and right to life these youth experience (Brockenbrough 2015, p. 29).

The monocausal framing of the issues as illustrated by popular responses to Sakia, Jaheem, and Carl miss the systemic ways that race, sexuality, class, youthfulness, and gender (expression) simultaneously structure the lives of youth. Such frames ignore how issues of race, ethnicity, and class interact with issues of homophobia and anti-queer antagonisms. The deaths of non-LGBTQ people of color are deeply connected to the deaths, suicides, violence, and victimization experienced by LGBTQ-identified individuals because “young folks of color operate in the world as queer subjects, the targets of racial normalizing projects intent on pathologizing across the dimensions of race, class, gender, and sexuality. By normalizing their degradation, marginalization, and invisibility, it becomes something to which we no longer pay attention” (Cohen 2010, p. 128). To talk about race, sexuality, and difference, we need tool kits that do not eviscerate bodies rhetorically or discursively as they are disappeared and destroyed literally by State apparatuses and individual agents upholding systemic forms of oppression. Queer of color critique provides an avenue for researchers, educators, and those concerned with supporting efforts to address homophobia, racism, and other issues of social justice in educational contexts broadly defined.

Queer of Color Critique

Defined initially by Ferguson (2004), queer of color critique “interrogates social formations as the intersections of race, gender, sexuality, and class with particular interest in how those formations correspond with and diverge from nationalist ideals and practices” (p. 149). An interdisciplinary field of analysis, QOC critique centers the lives of queer people of color, their relationship, and resistance to power.

In its analysis, QOC critique assumes that approaches to the cultural studies of race, class, gender, and sexuality are segregated, resulting in the “monocausal protocols” which can only consider a particular subjectivity at the expense of another (Crenshaw 1991; Ferguson 2004). These “monocausal protocols,” in their exclusive approach, also reproduce accounts of marginalized subjects, which give precedence to those within the group who are more privileged, in which Blackness may be only thought of to equal maleness, or femininity to only equal White women, etc. (Crenshaw 1991; Muñoz 1999; Ferguson 2004).

QOC critique is informed by two theoretical legacies, women of color feminisms and queer theory/studies. Engaging queer theory broadly, QOC critique aligns itself with queer studies focus on challenging heteronormativity, destabilizing and denaturalizing identity categories based on sexuality, and understanding the formation and possibilities of transgressive sexual and gender formations in relationship to patriarchy and heteronormativity (Brockenbrough 2015; Eng et al. 2005; Jagose 1996; Sedgwick 1993; Somerville 2007; Warner 1993). As a genealogical offshoot of queer theory, Black queer theory is also influential in understanding the landscape in which queer of color critique emerges. An interdisciplinary project which blends theories, methodologies, and analyses of Black studies and queer studies, Black queer theory, in its fusing the social sciences and humanities, strives toward a liberatory project which usurps monolithic identity formation and strategies based on these formations to imbricate, race, class, gender, and sexuality (Johnson and Henderson 2005). Concordantly, other racialized engagements with queerness (e.g., queer Asian/

Asian American studies, Puerto Rican queer studies, Black queer Diaspora studies, queer Latina/Latino studies, etc.) characterize the entanglements and distinguishing characteristics of queer of color critique (see Allen 2011, 2012; La Fountain-Stokes 2009; Lim 2013; Manalansan 2003; Muñoz 2000; Rodriguez 2003, 2010; Tinsley 2008).

As a field, QOC critique narrates itself as emerging from women of color feminism instead of white Euro- and American-centered gay/lesbian/queer theory (Hong and Ferguson 2011). Women of color feminist have been instrumental in forging a bevy of scholarship, theoretical paradigms, and interventions, which seek to understand how race, sexuality, gender, and other forms of difference are co-created (Collins 1995, 2004; Crenshaw 1991; Gaunt 2006; Hooks 2004). Developing the analytic of intersectionality, women of color feminist have helped to illustrate the ways that systems of oppression are created in relationship to one another and are experienced simultaneously by an individual. Equally important is how women of color feminist scholarship challenges regimes of knowledge formation and production which would seek to discredit the knowledge of women and people of color and in doing so further instantiate hegemony (Alexander 2005; Brown 2013; Minh-ha 1989; Moraga and Anzaldúa 1983).

Exploring the Possibilities of Queer of Color Critique in Education

In his review of queer of color critique in educational research, Brockenbrough (2015) makes key connections between this particular body of scholarship and educational literature. Specifically, he draws out three key themes, which he proposes as recurrent in the scholarship and proposes for the development of each into a fuller research agenda for educational research. These themes include “the politics of knowledge production; the lived experiences of intersectionality; and the politics of queer visibility” (p. 32). Brockenbrough in illuminating these three themes pays close attention to the agentive practice of queer youth in order to offer a critical counterbalance to youth victimization narratives (see Blackburn 2005;

Brockenbrough 2015; McCready 2013). Moreover, his review of extant QOC critique literature in relationship to education illustrates how QOC critique when applied as an analytic lens has multiple applications for educational scholars not just for those interested in queers of color but who broadly “share a concern for social justice in education (Brockenbrough 2015, p. 38).”

Aligning with Brockenbrough’s call to seriously take up QOC critique in educational research, this text underscores the importance to consider what the lives of youth such as Jaheem Herrera, Carl Joseph Walker-Hoover, Sakia Gunn, and other youth queered through their non-normative performances have to offer the field of education. Take, for instance, Carl’s mother, Sirdeaner Walker, who on more than one occasion wished to express the fact that her son was not gay but that he was relentlessly bullied and that the schools did nothing (Essence 2009; Walker and Byard 2011). In an interview, Sirdeaner states, “I have been homeless, but Carl and I made it through [. . .] I was a victim of domestic violence, and we made it through. The one thing we couldn’t get through was public school” (James 2009, p. 3). What would it mean to think of QOC youth experiences in relation to a failing public school system, which abuses and punishes racialized, feminine, gender nonconfirming, and low-income/working class bodies? Further, what would it mean to analyze the structures, which perpetuate this type of violence, and how queer youth of color navigate these structures?

As educational researchers attend to the multiple ways of improving queer students of color, it is important to remember the lives and stories of Sakia Gunn, Jaheem Herrera, and Carl Joseph Walker-Hoover. Each illuminates the need for complex tool kits which would allow educational researchers to attend to the development of curricular and pedagogical interventions and the exploration and appreciation of the knowledge created by queers of color in and outside of schooling contexts which might better foster life-enhancing opportunities for these youth. Neither Carl nor Jaheem identified as gay or same gender loving, accordingly the bullying that they

experienced can neither be understood nor addressed through monocausal frames. Anti-bullying efforts, which focus simply on sexuality, fail to adequately address the intersectional nature of this issue (Pritchard 2013).

Queer of color critique like other discourses of difference (e.g., critical race theories, disability studies, crip theory, etc.) provides important and necessary ways to attune to the lives of queer youth of color, expanding the ability of educational researchers to create theories and methodologies which live, practice, and imagine ways of being that liberate and challenge domination. The usefulness of a QOC critique lens in educational policy and practice is that if taken seriously, the intersectional approach it provides would address issues of dominance across the multiple vectors in which students actually experience these. Schools in their operation are representations of discourses and ideologies of the culture in which they are embedded. Furthermore schools serve as primary centers to foster these ideas. As microcosms, which reflect dominant and marginalized communities/identities and also perpetuate ideologies of value, it is presumable that safer schools might lead to safer streets. The type of danger Jaheem and Carl experienced in school mirrored the danger Sakia faced beyond the schoolyard. The school taunts Carl and Jaheem's experience; their rhetorical violence lays the bedrock for the discursive and physical violence Sakia endured that ultimately cost her, her life. This relationship is critical as educators continue to take seriously the implications of educational policy and practice to shape the bend of our society toward social justice.

Paying attention to the lives and agentic practices of queer youth of color while expanding our practices as educational researchers is of the utmost importance given our historical moment. A moment in which we see the continued expansion of modes of power which brutalize racialized bodies, the poor, women/girls, non-gender confirming and a host of other deviant devalued bodies and communities (Brown 2013; Cacho 2011; Hong and Ferguson 2011). Sakia, Jaheem, Carl and others like them deserve not only our best efforts but the ability to live and to do so on their own terms.

Kohlberg started his research on moral development in the mid-1950s when he began to prepare his doctoral thesis. The thesis was presented in 1958 under the title *The Development of Modes of Moral Thinking and Choice in the years 10–16* (Kohlberg 1988). Kohlberg takes as a starting point Jean Piaget's four-staged model of the application of rules and the two types of morality. In his book *The Moral Judgement of the Child*, Piaget

(1983) uses a game of marbles as an example of an extremely complex system of rules, “a kind of jurisprudence of its own.” When adopting the rules, a child goes through four successive stages. The first stage concerns just a purely motor and individual character and thus does not have any significance for Kohlberg, but the next three stages form the foundation of Kohlberg's theory. Those three Piaget's stages are the stage of egocentrism (II), the stage of cooperations (III), and the stage of codification of rules (IV). From this study of rules of a game, Piaget concludes that there are two types of respect which are at the same time two types of morality: the morality of heteronomy and the morality of autonomy. Kohlberg used Piaget's model as the form of preunderstanding in his empirical research on boys' moral thinking (Kohlberg 1973, p. 632):

Our psychological theory of morality derives largely from Piaget, who claims that both logic and morality develop through stages and that each stage is a structure which, formally considered, is in better equilibrium than its predecessor. It assumes, that is, that each new (logical or moral) stage is a new structure which includes elements of earlier structures but transforms them in such a way as to present a more stable and extensive equilibrium.

Here, Kohlberg adapts Piaget's application of Hegel's theory of phenomenology of the spirit – the development of consciousness and civilization – and especially the concept of *Aufhebung*. Explicitly, Kohlberg wants to tie his theory to the ethics of Kant and Rawls (Kohlberg 1973, p. 632):

These ‘equilibration’ assumptions of our psychological theory are naturally allied to the formalistic tradition in philosophic ethics from Kant to Rawls. This isomorphism of psychological and normative theory generates the claim that a psychologically more advanced stage of moral judgment is more morally adequate, by moral philosophic criteria.

As Habermas (1995) points out, Kohlberg's empirical data is theory-laden, and we want to add that it is so within the Hegelian and Kantian paradigms. Its validity is connected to the validity of Kant's moral universalism and Hegelian-Piagetian evolutionism. These philosophical paradigms can never be empirically verified.

In his doctoral thesis, Kohlberg (1988) writes not about stages but modes of moral thinking. Kohlberg interviewed seventy-two 10–16-year-old boys living in the suburban areas of Chicago. Half of them were upper-middle class, the other half lower to lower-middle class. He presented them a moral dilemma and started posing questions related to dilemma. He used three different dilemmas (later on there were ten dilemmas), to which there are no right answers. Kohlberg was not interested in the solutions of the informants as such but rather in the reasons or bases that the informants presented for their solutions. The Heinz dilemma was one of the moral problems that Kohlberg used in his very first studies. Kohlberg (1988) used the following formulation:

A woman was near death from a special kind of cancer. There was one drug that the doctors thought might save her. It was a form of radium that a druggist in the same town had recently discovered. The drug was expensive to make, but the druggist was charging ten times what the drug cost him to produce. He paid \$200 for the radium and charged \$2,000 for a small dose of the drug. The sick woman's husband, Heinz, went to everyone he knew to borrow the money, but he could only get together about \$1,000 which is half of what it cost. He told the druggist that his wife was dying and asked him to sell it cheaper or let him pay later. But the druggist said: "No, I discovered the drug and I'm going to make money from it." So Heinz got desperate and broke into the man's store to steal the drug for his wife. Should Heinz have broken into the laboratory to steal the drug for his wife? Why or why not?

In the 1960s, Kohlberg did intensive empirical and theoretical research to create a proper developmental theory of human morality. Kohlberg (1969) presented the result of that work in a long article called "Stages and Sequence: The Cognitive-Developmental Approach to Socialization". In this article, Kohlberg presented three bases of moral judgments and six stages of development in the following way (Kohlberg 1969, p. 376):

Basis of moral judgment:

- I. Moral value resides in external, quasi-physical happenings, in bad acts, or in quasi-physical needs rather than in persons and standards.

Stages of Development:

1. Obedience and punishment
2. Naively egoistic orientation

Basis of moral judgment:

- II. Moral value resides in performing good or right roles, in maintaining the conventional order and the expectancies of others.

Stages of Development:

3. Good-boy orientation
4. Authority and social-order maintaining orientation

Basis of moral judgment:

- III. Moral value resides in conformity by the self to shared standards, rights, or duties.

Stages of Development:

5. Contractual legalistic orientations
6. Conscience or principle orientation

Later, Kohlberg named these three bases of moral judgments as the preconventional, conventional, and postconventional level (e.g., Kohlberg 1981, pp. 17–19; 408–412). The descriptions of the six stages remain essentially the same. In the first stage, action is motivated by avoidance of punishment, in the second stage by desire for reward or benefit, in the third stage by anticipation of disapproval of others, and in the fourth stage by anticipation of dishonor and by guilt over concrete harm done to others. In the fifth stage, action is concerned about maintaining the respect of equals, of the community, and own self-respect, and in the sixth stage, about self-condemnation for violating one's own principle (Kohlberg 1969, pp. 381–382). Kohlberg presents a basic "pro and contra" motive-related argumentation to the question "Should Heinz steal or not" as shown in Table 1.

Kohlberg has also asked actual political moral problems. In his article "Capital Punishment, Moral Development, and Constitution," Kohlberg applies his Kantian theory of moral development to empirical study on moral judgments on capital punishment (Kohlberg and Elfenbein 1981). In this study, Kohlberg and Elfenbein come to the following conclusion (Kohlberg and Elfenbein 1981, pp. 242–242):

We show that the moral principles applied by individuals to the problem of capital punishment derive from their stage of moral development. . . On the

Gilligan-Kohlberg Controversy, Table 1 Typical expressed motives for action in the case of Heinz' dilemma (modified from Kohlberg 1969, pp. 380–381)

	Should steal	Should not steal
Stage 1	If you let your wife die, you will get trouble	You shouldn't steal the drug because you'll be caught and sent to jail if you do
Stage 2	If you do happen to get caught you could give the drug back and you wouldn't get much of a sentence	If his wife dies, he shouldn't blame himself, it wasn't his fault she has cancer
Stage 3	If you let your wife die, you'll never be able to look anybody in the face again	After you steal it, you'll feel bad thinking how you've brought dishonour on your family and yourself; you won't be able to face anyone again
Stage 4	You'll always feel guilty that you caused her death if you don't do your duty to her	You're desperate and you may not know you're doing wrong when you steal the drug
Stage 5	If you let your wife die, it would be out of fear, not out of reasoning it	You'd lose self-respect and respect in the community, if you are carried away by emotion and forget the long-range point of view
Stage 6	If you let your wife die, you'd always condemn yourself for it afterwards	If you stole, you wouldn't be blamed by others but you'd condemn yourself because you wouldn't have lived up to your own conscience and standards of honesty

basis of our longitudinal data and our theory of moral development, we claim that attainment of the most mature stages generates moral condemnation of the death penalty.

We very much want to support Kohlberg's and Elfenbein's conclusion because capital punishment represents a very biblical concept of justice and its supporters must have some deficiency in their moral reasoning: supporters of capital punishment are not fully matured adults with fully developed moral consciousness. Unfortunately, this conclusion leads to a very strange situation, because Kant himself thinks that capital punishment is the just punishment for murder (see Ataner 2006). Did Kant seriously misunderstand his own moral theory, and did he never attain the most mature stage of moral development? Are there also other people or groups who have not attained the most mature stage of moral development because they do not agree with Kohlberg's interpretation of Kant's political liberalism: people who do not support constitutional parliamentarism (e.g., Aristotle or Marcus Aurelius); people who do not recognize the private ownership of land, water, and air (e.g., Thomas More, Karl Marx or Sitting Bull alias Thathánka Íyotake); people who do not believe in universal moral principles (e.g., William James or Martin Heidegger), etc.? If one does not accept

Kantian humanism, has she or he attained the moral maturity (see Kakkori and Huttunen 2012)?

Kohlberg believes that political liberalism "will not be replaced by a new ideology of the West but will continue to be its dominant ideology for the next century" (Kohlberg 1981, p. 233). Furthermore, Kohlberg believes that the liberalistic concept of justice represents a higher conceptualization of justice in the same sense in which a higher developmental stage in morality represents a higher understanding of justice. In society, too, there is a trend in the progression toward higher stages, and that is why the trend toward liberalism is the "natural" one (Kohlberg 1981, p. 237). One could claim that moral education based on Kohlberg's theory is indoctrinative (e.g., Broughton 1986) because it aims at Kantian universalistic moral thinking and political liberalism and rejects alternative modes of moral and political thinking. Kohlberg denies that his approach to moral education is indoctrinative. Kohlberg (1981, p. 28) says that his approach "differs from indoctrinative approaches because it tries to move the student's thinking in a direction that is natural for the student rather than moving the student in the direction of accepting the teacher's moral assumptions. It avoids preaching or didacticism linked to the teacher's authority." Maybe it avoids the teacher's didacticism, but it might not

avoid Kohlberg's own preaching and didacticism on universal moral principles and political liberalism as the natural telos of society. And how do we know that the direction of Kohlbergian moral education is "natural"? Even Kohlberg's distinguished friend and supporter, the philosopher Jürgen Habermas claims that stages 5 and 6 in Kohlberg's theory are not natural stages (Habermas 1990, p. 224).

Kohlberg does not take seriously the possibility that human morality and its development could consist of more than mere cognitive moral reasoning. Even Piaget writes about the important role of a child's first moral feelings (see Piaget 1981, pp. 44–55). Maybe moral sentimentalists have some say on this matter. Maybe empirical research on moral sentiments is also needed (see e.g., Juujärvi 2003). Maybe there is some knowledge on love, i.e., "love knowledge," which is not blind. We do not want to say that Kohlberg's moral theory is a total failure and that all his empirical findings are good for nothing. Kohlberg will have a permanent place in the history of ethics, psychology, and education. His theory on moral development deserves a serious consideration. Nevertheless, we claim that his theory on human morality and its development is one-sided and tendentious.

Carol Gilligan, a friend and a colleague of Kohlberg, familiarized herself very deeply with Kohlberg's research method and moral thinking. Gilligan started her academic career as a researcher in Kohlberg's research project. Gilligan describes a case of two 11-year-old children, Jake and Amy, participating in a study with Kohlberg's formulation of the Heinz dilemma. Jake's answer was clear: Heinz should steal the drug (Gilligan 1993, pp. 25–38). Jake used logical argumentation like comparing the value of human life and the drug. He also used the argument that mathematics is the only totally logical thing. Thus, the moral dilemma can be solved by logic and reason, and everybody would come to the same conclusion, because his solution is rational. Jake also considered the fact that stealing is against the law. Here he claimed that laws can be wrong, because you cannot write up a law for everything you can imagine. Jake did not change

his answer when more questions about the dilemma were asked. Jake's judgments are scored as conventional on Kohlberg's scale, a mixture of stages three and four. He has the ability to use logic, to differentiate morality from law, and he was sure about his judgment based on justice.

According to Kohlberg's theory, Amy's judgment of the dilemma appears to be a full stage lower than that of the boy. Gilligan found this problematic. Why was Amy rated at a lower level? Amy's answer was unsure (Gilligan 1993, p. 28): "Well, I don't think so." She thought that there could be other ways to solve the problem, like to borrow the money or negotiate on the matter. But Heinz's wife should not die, either. Amy's main concern was the effect that theft could have on the relationship between Heinz and his wife. What happens if Heinz has to go to jail? Who would then take care of the wife? For Amy, the dilemma was not mathematical but human. It is more like a narrative of relationships that extends over time. In the course of the interview, Amy's answer becomes unsure. She could not see the problem apart from the surrounding world. Gilligan argues that this is why her mode of moral thinking completely evades Kohlberg's theory. Gilligan does not rate the children, but she sees that Amy's judgments contain the insights central to an ethic of care, just as Jake's judgments reflect the logic of justice.

The Heinz dilemma is problematic, and it is possible to ask whether it really measures the state of moral development. In the Heinz dilemma, motivations of the druggist and his situation are excluded, just like the sick wife's view and her voice are excluded from the moral problem at hand. In Kohlberg's research, it was already decided what the highest moral level contains: the autonomic subject, who believes in universal moral principles, who is sure of his argumentation, and who does not change his opinion even if new information comes up.

Based on her research, Gilligan published in 1982 a book called *In a Different Voice* in which she presents her critique on Kohlberg. The book became to be one of the most influential books in the field of the ethic of care. The ethic of care has two different lines: the feminist ethic of care (e.g.,

Noddings 1984; Benhabid 1987; Tronto 1993), and the phenomenological ethic of care (e.g., Benner 2000; Paley 2000). Both of the labels are a little bit misleading. The feminist ethic presents care as a starting point for ethics. These theories try to clarify the female–male dichotomy in morals, and they are closely related to practice. The phenomenological ethic of care is based on a very heavy philosophical background, and it is not phenomenological in the way phenomenology is usually understood.

Gilligan's book is not an ordinary research report. It is polemic and written in a narrative style. She refers in the book to three studies, and one of them is "A Naturalistic Study of Abortion Decision" (Gilligan and Belenky 1980). Gilligan describes later on that her thinking changed during this study. She was "struck by the realization that women were constructing the dilemma in a way that was completely at odds with the public conversation" (Gilligan 1998). The public discussion of abortion was framed as a conflict between the right to life and the right to choice, raising the question of whose right took precedence in a formulation that pitted the fetus against the mother or women against men – this has not changed in today's public discussion. The women were not pondering the question of justice. The dilemma for them was that they could not see any way of acting that would not hurt someone. And still, they had to make a decision. In Gilligan's book, the different voice is the woman's voice against the man's voice that also represents the public voice (Gilligan 1995, p. 123):

Listening to women's voices clarified the ethic of care, not because care is essentially associated with women or part of women's nature, but because women for a combination of psychological and political reasons voiced relational realities that were otherwise unspoken or dismissed as inconsequential.

The different voice of women must be listened to attentively, because it has been suffocated for so long. Gilligan asserted that women have different moral and psychological tendencies from men. According to Gilligan, men think in terms of rules and justice and women are more inclined to think in terms of caring and relationships. This is,

of course, a simplistic picture of Gilligan's ideas. She wants Western society to equally value the discourse of justice and the discourse of care. Gilligan stresses that the question is not whether women and men are really different or who is better than the other. Her questions are about perception of reality and truth, how we know, how we hear, how we see, and how we speak. From this point, Gilligan developed her idea of the ethic of care (Gilligan 1993, p. xii).

After Gilligan's book, the ethic of care received a feministic label. This label facilitated many interesting and important researches, but it also orientated Gilligan's care ethic as a women's ethic that is an alternative for men's ethic of justice. This was partly Gilligan's intention but not the main goal. In her books, Gilligan writes about the necessity of recognizing the dual context of justice and care.

Joan C. Tronto sees that "the ethic of care" has become part of the vocabulary of contemporary feminism, but the term "the ethic of care" remains unclear (Tronto 1993, p. 125). Gilligan sees the same problem, and she wants to clarify the two different types of the ethic of care. There is difference between a feminine ethic of care and a feminist ethic of care (Gilligan 1995, p. 122): "A feminine ethic of care is an ethic of the relational world as that world appears within a patriarchal social order." Caring as a feminine ethic includes special obligations and interpersonal relations, and this means selflessness or self-sacrifice. That world is apart and separated politically and psychologically from a realm of individual autonomy and freedom which is the realm of justice and contractual obligations. "A feminist ethic of care begins with connection, theorized as primary and seen as fundamental in human life" (Gilligan 1995, p. 122). The human being is understood as having myriads of connections and relationships to other people. This is fundamental to the essence of the human being. She is not considered an autonomic subject with separate being and sense of justice. The feministic ethic of care sees a problem in the feminine ethic of care, and that problem is the disconnection of relationships.

In her book, Gilligan describes three moral perspectives and two transition phases of the

Gilligan-Kohlberg Controversy, Table 2 Interpretation of Gilligan's stages in the development of the ethic of care (see Gilligan 1993, p. 74)

Stages in the development of the ethic of care	
Perspective I	Caring for self
<i>Transition I</i> From caring for self to responsibility to others	
Perspective II	Caring for others
<i>Transition II</i> From inequality to caring for self and others	
Perspective III	Understanding interconnection between other and self. Care becomes the self-chosen principle. No one should be hurt

ethic of care (Table 2). These are also sequences in the development of the ethic of care. Gilligan does not give any age references, nor physical or social. We can even ask can we ever really reach the third perspective.

The first one is the initial perspective, through which one is caring for oneself in order to survive. This stage is followed by a transitional phase in which this is seen and criticized as selfish. "The criticism signals a new understanding of the connection between self and others which is articulated by the concept of responsibility" (Gilligan 1993, p. 74). In the second phase, good is equated with caring for others. This also causes the second transition. When only others are recipients of one's care, problems with relationships arise. The inequality between the self and the others as receivers of care leads to a reconsideration of relationships in an effort to sort out the confusion between self-sacrifice and care as goodness. The third perspective focuses on the dynamics of relationships. Care has no more anything to do with self-sacrifice but is the chosen principle of judgment. This judgment "remains psychological in its concern with relationships and response but becomes universal in its condemnation of exploitation and hurt" (Gilligan 1993, p. 74.). In this stage, knowledge is an important aspect, but it is not cognitive knowledge but instead knowledge of relations between people and understanding of social interactions. In this stage, the ethic of care reveals one of its principles: the self and the others are interdependent. It becomes clear that just as the incidence of violence is in the end destructive

to all, so the activity of care enhances both the others and the self.

One of Gilligan's most striking criticisms of Kohlberg's theory is that it has adopted the male form of life as a norm. She asks: "How to listen to women in women's terms, rather than assimilating women's voices to the existing theoretical framework" (Gilligan 1995, p. 120). The neutral and impartial point of view to equality and justice, which Kohlberg considers the highest stage of moral development, is constructed through men's eyes, and thus it is not neutral and impartial at all. The norm of the human being is man, and men's experience stands for human experience. Can we trust a theory that has this kind of inequality in its core? Gilligan claims that Sigmund Freud, Jean Piaget, and Erik H. Erikson also have a man's point of view. Gilligan states that Kohlberg's construction of the highest stage of morality as reflective understanding of what is right is one-sided because it does not leave room for care and human relationships, which are essential parts of the morals of maturity. For Gilligan, maturity is the stage in which an adult human being recognizes the dual context of justice and care.

Gilligan's theory has been criticized from several points of view. According to Nunner-Winkler, Gilligan postulates that "'in the classic dichotomies between, reason and compassion, fairness and forgiveness, justice and mercy ... thought and feeling' (Gilligan 1984, p. 4), females always opt for the latter pole" (Nunner-Winkler 1990, p. 115). Nunner-Winkler presents empirical evidence against Gilligan's assumption. The data is taken from a research project conducted by Nunner-Winkler and Dröber (1986). In the research, they compared the reactions of males and females (aged 14–22) to two moral dilemmas: the legitimacy of abortion and the justifiability of draft resistance (Nunner-Winkler 1990, p. 116). They found out that even females are more concerned about concrete costs and situational details. It is a question of more an instrumental sort of cost-benefit calculation than of taking care and compassion. The quotation from Gilligan is cited correctly, but the addition after it is questionable. Gilligan would not argue like that because

according to her research women do not always “opt for mercy and feelings.” The terms for the dilemmas, “legitimacy of abortion” and “justifiability of draft resistance,” represent Kohlbergian and Kantian universalistic moral theory. Thus, the moral dilemma is posed in a theory-laden way in Nunner-Winkler’s and Dröber’s (1986) study, just like it was in Kohlberg’s own empirical studies. In this respect, Eva Skoe’s (1998), Soile Juujärvi’s (2003), and John Snarey’s (1998) empirical research projects are very interesting. They have used two sets of moral dilemmas: those which evoke care-based reasoning and those which evoke justice-based reasoning. Possibly, there are also other bases for common-sense moral reasoning.

Sheyla Benhabib (1987) sees that Gilligan challenged the old paradigm and that it is common for adherents of an old research paradigm, like Nunner-Winkler, to respond by arguing in three ways: (1) the data base, (2) accommodation within the old theory, and (3) object domain of the two theories. The data-based argument means that the data base does not support the conclusion drawn by the revisionist. The accommodation within the old theory means that some of the new conclusions can be accommodated by the old theory. The argument of the object domain of the two theories claims that the new and old paradigms have different object domains and are concerned with explaining the same phenomena after all. Benhabib sees that Kohlberg resorts to all three arguments in his answer to Gilligan (Benhabib 1987, pp. 78–80).

Gilligan is on the right track when she writes about the dual context of morality and moral maturity. Most of us would consider such a person very odd who bases his or her morality solely on the Kantian notion of duty and justice, like Abraham who would sacrifice his son in the name of duty. Likewise, most of us would consider immature a person who always listens to his or her moral sentiments and never considers duty, impartiality, and validly agreed rules and laws. Nevertheless, Gilligan is wrong in the respect that she thinks – like Kohlberg – that these matters can be proven by empirical research. We need empirical research on moral growth, but no empirical

Gilligan-Kohlberg Controversy, Table 3 The dual context of justice and care in moral development

Phases of moral development	Lawrence Kohlberg	Carol Gilligan’s supplement
First phase	Preconventional moral consciousness (stages 1–2)	Caring for self (Transition I: From caring for self to responsibility to others)
Second phase	Conventional moral consciousness (stages 3–4)	Caring for others (Transition II: From inequality to caring for self and others)
Third phase	Postconventional moral consciousness (stages 5–6)	Understanding interconnection between other and self. Care becomes the self-chosen principle. No one should be hurt

research and data can provide an answer to the question what moral maturity is.

Like we said earlier, Gilligan’s critique of Kohlberg partly reminds Hegel’s critique of Kant’s ethics. Like Hegel, Gilligan wants also to take moral feelings seriously and put much emphasis on the social nature of morality. Nevertheless, Kohlberg’s moral theory and empirical finding are not to be forgotten. They need to be revised and improved but not to be forgotten. This actually is Gilligan’s intention. She did not want to reject Kohlberg’s theory but supplement it with the aspect of ethics of care. Gilligan is calling for the dual context of moral development which is illustrated in Table 3.

Possibly moral development and moral maturity contains more elements than aspects of justice (Kohlberg) and care (Gilligan), but there is good reason to believe that these aspects are worthwhile. More empirical and philosophical studies on this subject are needed.

Global Citizenship Education Reconsidered: Taking the “Migrant” Other Seriously

Yusef Waghid

University of Stellenbosch, Stellenbosch, South Africa

Contemporary Views on Global Citizenship Education

Global citizenship education has gained much currency in the last decade through rigorous volumes of which the following three texts have been identified: *Education for Citizenship and Democracy* (Arthur et al. 2008); *Global Citizenship*

Education: Philosophy, Theory and Pedagogy (Peters 2008); and *The Cosmopolitan Reader* (Wallace Brown and Held 2010). Firstly, global citizenship education is built on understandings of individuals and society in relation to the exercise of rights, identity, participation, and their attachment to "internationalism" – that is, relations between and not across nations (Arthur et al. 2008: 4–5). In European societies in particular, citizenship education is conceived in terms of a basic language of rights, a worldview of humanity as a marketplace of autonomous and competitive individuals, and ideas of community engagement, solidarity, and belonging in a discourse of freedom and equality (Banks 2008: 310). Yet, as recognized aptly by Banks (2008: 310) – one of the contributor's to the volume – such a view of citizenship education is not substantive in the sense that "[it] fails to persuade people that they ought to trust and love each other." The lack of public responsibility shown by several European nations in even preventing migrants to cross their borders on route to destinations of their choice – mostly Germany – is a testimony of the lack of trust and public-spirited cooperativeness and compromise required to enact their sense of universal moral responsibility. Of course, one recognizes that a similar lack of public responsibility might be ascribed to the home countries of migrants, whose failure to enact civic security is evident in the thousands of women, men, and children, who continue to seek refuge under the most treacherous of circumstances. But that discussion is not the purpose of this contribution.

Secondly, in relation to culture, democratic public life and multiculturalism, it is argued that global citizenship education "offers the prospect of extending both the ideologies of human rights and multiculturalism, perhaps, post-colonialism, in a critical and informed way" (Peters 2008: 11). Advancing a human rights discourse goes along with being responsive to "war crimes," "crimes against humanity," and "crimes against peace," whereas enhancing critical multiculturalism involves deepening openness to culture and democratic public life concomitantly with an aspiration for "peace, justice and solidarity" (Peters

2008: 6, 8). Despite the aforementioned laudable aspirations of global citizenship education, the inhospitality shown to human beings is evident not only in the refusal to access but equally evident even once entry is granted. Typically, therefore, a migrant is met by barbed-wire fences, meant to physically control migrants' access to other nations, followed by confinement of large masses of migrants to camps reminiscent of World War II Nazi prison and concentration camps. Vivid scenes, such as the latter, bring into moral questioning, on the one hand, the universal treatment of "strangers" in host countries and, on the other hand, the physical fencing in of human beings that undermine the very idea that all humans belong to a single moral community. Put differently, the cultivation of global citizens and talk of cosmopolitanism are currently being given scant attention that militates against the European Union's role in securing justice and refuge for asylum seekers. Perhaps, more alarming is the reality that even when those seeking safety or safe passage are allowed beyond borders, their physical displacement is further dehumanized through political languages (as in quotas of people allowed access) and spaces (as in barbed-wire camps), which are articulated and erected for the sole purpose of deterring others, or for pushing people back from whence they had come.

Thirdly, at the heart of global citizenship education is the cosmopolitan idea that all humans should be respected equally and that all humans are equal in their moral standing (Wallace Brown and Held 2010: 2). Five interrelated themes in relation to global citizenship or cosmopolitan education are identified: global justice through education that fosters sympathies for the plight of those beyond one's border; cultural cosmopolitanism that recognizes that all individuals are made up of multifarious cultures and that humans identify with such cultural obligations; legal cosmopolitanism concerned with the application of international law in the pursuit of global justice; political cosmopolitanism with its distinctive focus on global governance and the reform of international political institutions in line with cosmopolitan ideals; civic cosmopolitanism aimed at constructing a sense of cosmopolitan citizenship

(Wallace Brown and Held 2010: 9–13). Global justice, respect, and moral equality are tersely under threat considering that some European nations are now using profiling methods to distinguish between migrants from Syria and migrants from other Arab nations. While it might be easier to consider this type of extrapolation of human beings, as some derivative of Orwell’s dictum that some “animals are more equal than others” or, more appropriately, that some Muslims might be more inclined toward extremism than others, the sheer indignity of such an assessment of people becomes increasingly hard to swallow. Behind this disrespect and unequal treatment of migrants is the misunderstanding that among some migrants extremist “Islamic” terrorists might be present who will jeopardize the security of some European nations. As incredible and misplaced as this (mis)understanding might be, it begins to lay bare, on the one hand, the type of demonization necessary for the cultivation of fear, which, in turn, is necessary, for the justification and motivation of Islamophobia. On the other hand, the writing on the wall is clear that extremists, and those that liberal democracies ought to fear, are not “one of us” – they are “other to us,” and the well-being of liberal democracies rests on keeping those others out.

In sum, global citizenship education can broadly be stroked along ideas of community engagement, solidarity, and belonging; extension of universal human rights and critical multiculturalism; and equal moral respect and justice to all human beings. As has been intimated thus far, such understandings of global citizenship education are being put at risk especially in light of the most recent migration crisis that faces European nations. Why?

Global Citizenship Education at Risk: Paying Lip Service to the Vulnerability of the “Migrant” Other

The following account as reported in *The World Post*, dated 16 September 2015, on the plight of most of the Syrian refugees confirms the disrespect, injustice, and inequality with which they

are confronted. More than 50% of the migrants fleeing conflict and repression in their countries are from Syria, with some of the refugees emanating from Afghanistan and Iraq, thus debunking the view that refugees are illegal “economic” migrants searching for economic opportunities according to many hard-line politicians like Britain’s Nigel Farage, Slovakia’s Robert Fico, and Hungarian Prime Minister Viktor Orban. Despite Turkey haven taken in more than 1.9 million Syrian refugees this year, the country does not grant them (refugees) permanent asylum. The temporary protection Syrian refugees are granted is coupled to the idea that refugees will one day return to their countries. Small wonder humanitarian conditions in the overcrowded refugee camps in Turkey have deteriorated steadily. Half of the 1.1 million Syrian refugees in Lebanon live in insecure dwellings, and in Jordan two-thirds of the 600,000 Syrian refugees live in poverty according to the United Nations Refugee Agency causing many refugees to resort to begging, survival sex, and child labor. Moreover, there is also a growing fear among many anti-immigrant Europeans that Islamic State militants are hiding among migrants and want to sneak into Europe to commit terror attacks.

After Germany initially welcomed the refugees generously, the country has imposed border controls on “the frontier with Austria, which has restricted movement across the frontier with Hungary, which has in turn started imprisoning migrants who cross illegally from Serbia” (*The Economist* 2015). The imposition of border controls has also led to eastern European interior ministers blocking plans for 120,000 refugees to be resettled across the EU under a system of quotas (*The Economist* 2015). Restrictions, such as these, have not only undermined and brought into disrepute the idea of global citizenship but has placed under a spotlight the harsh humiliation and human rights violations inflicted upon refugees. Whether young or old, physically strong or vulnerable, refugees are currently held in check in camps, controlled by military posts, and subjected to tear gas and water cannons, as a means of maintaining order. The idea of such inhumane treatment is instigated by the attitudes of military

police who do not hesitate to let refugees know that they do not belong in the countries through which they travel – such as blocking trains filled with thousands of refugees on route to different nation States – and that the unwelcoming encounters are provoked by anti-immigrant protesters who claim that refugees take away the indigenous people's economic opportunities (CNN 2015).

Now if equal moral respect for all human beings, the contravention of migrants' human rights, and their denial of belonging (in this instance to the European community) are some of the aspects of global citizenship education that are being brought into question, then one can only infer that such an understanding of education is too difficult to internalize on the part of many Europeans. Global citizenship education is dealt a ferocious blow when people's rights to have rights – that is, "to be recognised by others . . . as persons entitled to moral respect and legally protected rights in a human community" (Benhabib 2011: 60) – is punctured. Migrants have a right to be recognized as moral beings worthy of "equal concern and equally entitled to be protected as legal personality by his or her own polity, as well as the world community" (Benhabib 2011: 62). The point is, the world community seems to undermine – as the migrant crisis further unfolds – the rights of other (migrants) to have similar rights and duties it (the world community) ascribes to itself. Similarly, the incidences of violence migrants encounter at the border crossings elicit similar distrust they faced in the home countries by violent rulers – in the case of Syria, the dictatorship of Basar al-Assad. When migrants suffer such disrespect, they are said to experience global moral injustice as their suffering merely escalates on account of a lack of global responsibility. Responsibility, Young avers (2007: 174), is a "moral right that respects agents [people] as individuals and expects them to behave in respectful ways toward others." Consequently, due to a lack of responsibility, and compassion, global citizenship is palpably undermined.

What is even more disconcerting about understandings of global citizenship education is that migrants are viewed as belonging to their own

nation States and communities. Syrian refugees are perceived as not belonging to the European nations to which they migrate on the grounds that their sense of belonging is considered only in relation to their own country of origin. In this regard, the existence of human-made borders, in a very real sense, determines not only an individual's citizenship but also an individual's humanity. There is nothing humane in trapping human beings in barbed-wire camps, inasmuch as there is nothing humane in witnessing a journalist tripping a father, as he desperately runs toward any hope of safety while holding his son in his arms. And yet, while the actions of the journalist were duly condemned, the silences around the inhumane treatment of people, just like Aylan Kurdi, or the latest, yet to be identified 5-year-old Egyptian girl, remain unbroken. The visible hatred shown toward migrants by some European members of nation States, particularly migrants with Muslim identities, is a dystopic threat against global solidarity and citizenship. Quite pertinently Benhabib (2011: 194) posits the following in relation to the threat of dystopia:

The damage done to the European sense of solidarity is intense and will not be so easily and quickly healed. European dystopia also manifests itself in hatred towards foreigners, and particularly Islam; in the increasing marginalization of those who cannot enter the jo-market . . . in the withering away of political culture through the weakness of an increasingly boring social democracy which is too squeamish to embrace internationalism, or implement the tough and innovative solutions that could curb global capitalism.

Such a dystopic view of belonging is a definitive onslaught against global citizenship education that can be remedied only through a reconceptualized understanding of belonging. For such a discussion, the author turns to the seminal thoughts of Giorgio Agamben.

Toward a Theory of Co-belonging

Many Europeans view migrants, like themselves, as citizens of particular nation States with their commonalities, differences, and identities. Syrian

refugees are viewed as people that collectively share a faith (Islam), place of origin, and repression at the hands of both ISIS and the Assad regime. Consequently, although they belong together, they are viewed as not belonging to European nations. This nonrecognition of belonging subjects refugees to humiliation, pain, and perpetual embarrassment. Agamben (1993) offers an account of community that is constituted by at least three dimensions: Firstly, a community in becoming, Agamben avers (1993), is one that is not bounded by identity, difference, and commonality but rather constituted by “whatever singularity”: “Whatever singularities cannot form a *societas* because they do not possess any identity to vindicate nor any bond of belonging for which they seek recognition” (Agamben 1993: 86). “Whatever” is constituted by a potentiality to become this or that rather than an actualization of this or that. Here, Agamben (1993: 18) posits that “[w]hatever is the thing with all its properties, none of which, however, constitutes difference. In-difference with respect to properties is what individuates and disseminates singularities” If migrants were to be considered as within “whatever singularities,” they would be seen indifferently which means that they would not be considered as “migrants” or “refugees” but rather as humans without difference – that is, without appropriating identities such as being Syrian, Muslim, and Arab.

Secondly, a coming community resembles a “new humanity” that finds improper and insignificant emotion such as shame, arrogance, conformity, and marginality; rather, such a community “represents an opportunity unheard of in the history of humanity . . . [because such a community is one] without presuppositions and without subjects, [that enter] into a communication without the incommunicable” (Agamben 1993: 64). My interest in a community as a “new humanity” is that host nations would not consider “migrants” and “refugees” as shameful subjects that have abandoned their places of origin and should now conform as gracious beings due to their marginalization and exclusion in their own countries. Instead, following Agamben, a community of

humanity does not bear any shame nor does it have to suffer at the arrogance of other people that demand their assimilation into the cultural dominance of the host nations. A coming community is one “without classes . . . where differences of language, of dialect, of ways of life, of character, of custom, and even the physical particularities of each person – has lost any meaning for them and any expression and communication” (Agamben 1993: 63–64). If Europeans and migrants would be so daring to engender such a coming community, then the possibility that one will look at the other as “other” would dissipate – and, communication among them would be enhanced and where “shame can finally rest in peace” (Agamben 1993: 64).

Thirdly, a coming community that does not presuppose commonality and identity as preconditions for belonging and appropriates “whatever singularity” “is a community to which all belong without claiming to belong, a community of ‘whatever beings’ that share nothing except their own being thus in pure communicability and ontological immediacy” (Mills 2008: 130). More lucidly, a coming community is one in which “the singularities form a community without affirming an identity, that humans co-belong without any representable conditions of belonging” (Agamben 1993: 86). Of interest to this point is the idea of co-belonging. The struggle between migrants and some European nation States does not happen because of determinate contents such as democracy and liberty but rather a struggle for a recognition of humanity. In this way, the potentiality that people co-belong devoid of any representable identity would be highly possible. When Europeans and migrants co-belong, they do so because they are jointly committed to cultivate one another’s humanity – that is, that all people are dignified human beings to be treated with the utmost respect as their singularities “appropriate belonging itself” (Agamben 1993: 87).

In sum, global citizenship education is dependent on the exercise of moral equality toward all human beings, exercising a universal human rights culture that recognizes the just treatment of all humans and that communities ought to

pursue a path of co-belonging in whatever singularity. When global citizenship education is geared toward engendering communities of co-belonging, the current migrant crisis would not only gain the much needed attention it thoroughly deserves but would actually dissipate as the fate and fortunes of the migrants and their host communities become enmeshed in a form of human interconnectedness that is still to come.

Introduction

This entry will consider the postcolonial cultural politics involved in the development of English as a global, international, a lingua franca, and world language within the sphere of education, with a particular focus on the field of English language teaching (ELT).

English language teaching (ELT) has, perhaps, been one of the fields at the forefront of engaging with the postcolonial cultural politics of education and the English language. Scholars have acknowledged and engaged with positive aspects of the globalizing of English. However, it is the way in which ELT scholarship has sought to interrogate and analyze the ideologies, discourses, conceptual frameworks, and practices which constitute the phenomenon of Global English that elucidates the postcolonial cultural politics at play. The multifaceted identity of English as an international language, a global language, and a lingua franca has made such engagement with postcolonial theories even more significant, especially when this identity has consistently been subject to criticism. These controversies are deeply rooted in questions of power struggle, racial discrimination, professional racialization, Western dominance, and hegemony, all of which are associated with the history of colonialism, its legacies, and – what is sometimes alleged to be its close family – globalization. This entry is concerned with the interrelationships of English, ELT, and the cultural politics of postcoloniality.

English, ELT, and the Constructs of Colonialism

The dominant status of English and ELT in almost all parts of the world is inextricably tied to colonialism as Pennycook (1998) argues in this signature work based on his research into the development of English and ELT in a number of former British colonies including India, Malaysia, Singapore, and Hong Kong. ELT as a field, a sphere, and an industry in the Centre (English-speaking Western countries) as seen today has its root in the colonial Periphery. In fact, during the colonial period, the development of ELT had started in the Periphery first, largely because of the colonial governments' needs to train a selective English-speaking mass who could work for them and help them rule over the local. ELT was later brought back to the Empire and is now "exported" to the world largely from and by the Centre. Based on the above, it could still be argued that ELT is the "product" of the Centre, although it was geographically located in the Periphery during the colonial period.

If in the colonial times ELT increased British colonial power intensively and extensively and thereby supported colonial governance, then ELT today similarly functions to strengthen the current global expansion of English and, consequently, spread and maintain its underlying cultural values. In this way, ELT can be seen as a vehicle to serve the interests of the colonialists in the past and what are described in the contemporary milieu as "linguistic imperialism" and hegemonic globalization (Pennycook 1998; Phillipson 1992; Tupas 2015).

Phillipson (1992) sees the increasing dominance of English and ELT as "linguistic imperialism," in which the Centre continues to impose its own cultural values, military and economic power, desires, and needs upon the Periphery through ELT as it is tied to various "aid" schemes as well as through the means of development and globalization. He sees English and ELT being carefully exploited to maintain the power of the English-speaking Western world, mainly the USA and the UK. According to Phillipson (1992, p. 271), English – "a superior language" – and

ELT – "a superior teaching practice" – became simultaneously promoted globally with support of three arguments, "relating to capacities, English-intrinsic arguments, what English is; resources, English-extrinsic arguments, what English has; and uses, English-functional arguments, what English does."

English and ELT have helped most in gaining the success of the Centre by acting as a tool, an instrument, and a neutral means to build a bridge between Centre and Periphery, as Phillipson (1992) argues. He refers to earlier works that show how the internalization of Centre values and ways of thought in Periphery countries has been mostly done via the "educated" in the Periphery, who have now ensured that there is no need for the Centre to be physically present. To add to that, computers these days help spread the values of the Centre to the Periphery much faster than any form of physical invasion could do. What's more, when scholars from Periphery countries are offered scholarships to do their research in the Centre, as Phillipson (1992) continues to argue, they are guided and influenced by the Centre and their research aims are often to benefit the Centre. He also argues that these scholars are the ones who will bring Western values, ways of thought, and the results of their research back to their countries. By doing so, these scholars contribute to the spread of English linguistic imperialism. They, whether unconsciously or not, are those who share common interests with the Centre's representatives; and if they are not aware of what they are doing, they then become active forces who transmit Western values and English linguistic imperialism to their home countries. Specifically, via English language and Western education, the elites in the Periphery have helped the Centre accomplish what colonialism failed to achieve. They are the ones who promote English and ELT the strongest. These propositions have been central to Phillipson's seminar work (1992).

The explosive growth of the use of English has been accompanied by the similarly rapid expansion of ELT. Moreover, according to Pennycook (1998), a colonial legacy that is still driving the spread of English and ELT is "the West is better,"

a view often held by both Westerners and non-Western people. This common and persistent view is getting even stronger, as increasing numbers of governments endorse English-medium education at all levels and as the demand for English is increasing throughout the non-English-speaking world (Chowdhury and Phan 2014; Jenkins 2014; Phan 2016).

Colonial Manifestations in Global Postcolonial English and ELT

An important reason why English has been generating multiple positioning and identifications, and has been evoking multiple emotions and sentiments, has been its root in colonialism and in the postcolonial cultural politics. These competing images of English as an enabler and English as a force of (neo)colonialism have been a consistent tension within the sphere of ELT.

Given that ELT had a long history of direct connections with colonialism and that ELT was both the product and weapon of colonialism, it carries in itself many of the ways of thinking and behaving that are still part of Periphery and Western cultures. In both Centre and Periphery countries, subconsciously led by the colonial spirit, English is purposefully used to exclude certain groups from power and social mobility and to create discrimination among people in societies on the basis of race, ethnicity, social class, and linguistic and cultural backgrounds (Kubota and Lin 2009; Phan 2008; Tupas 2015).

Pennycook (1998) argues that many current ELT theories and practices embody in themselves colonial thinking and views, particularly the colonial and postcolonial Self and Other dichotomy that places the superior Self over the inferior Other. These have implications for teaching methodologies, pedagogies, and questions of identity, whereby anything tagged with “Western” and/or “native English-speaking” or simply “native” is considered superior.

The most dominant dichotomy in the domain of English and ELT is perhaps the native and nonnative divide. Despite the increasing effort in deconstructing this native-speakerism syndrome

in ELT worldwide, native speakers of English are often seen and even projected as being better teachers of English because of their nativeness and Western origin, as discussed in Holliday (2005).

The dichotomy between native and nonnative teachers of English has been deeply rooted in the ELT pedagogy and practice. Phillipson (1992) calls the tenet “the ideal teacher of English is a native speaker” (p. 185) a fallacy. According to this tenet, the native-speaker teacher is regarded as “the best embodiment of the target and norm for learners” (p. 194). Argued by Phillipson (1992) and Holliday (2005), this tenet or this native-speakerism syndrome is not only insisted by the Self but is also validated by the Other. When the native-speaker norms are in contact with the norms of other speakers of English, it is often the case that the former are used to make judgments against the latter. Despite its international status, English in different forms of uses is still employed to exclude many of its users and to assert and strengthen the legitimacy of Standard English from the English-speaking Western countries.

Holliday problematizes past and current theories and practices of ELT while paying specific attention to those in Teaching English to Speakers of Other Languages (TESOL) with a particular “attack” on the native-speaker norms. He discusses how World TESOL people “behave with each other and with . . . students within a multicultural TESOL world” (p. 1) and shows how a number of colonial and postcolonial relationships preexisting and emerging in World TESOL have been nurturing and supporting “native speakerism” (p. 6). He also addresses a number of “conditions within which native-speakerism has developed and become such a powerful force in World TESOL” (p. 39). Holliday argues that the close connection between native-speakerism and a modernistic discourse in TESOL appears to empower and support native-speakerness and simultaneously places the Other in a much less favorable position, and worse than that, the real person of the student is in effect excluded from the whole picture. This becomes more serious when this connection involves

“correcting” the “culture” of the foreign Other, the very aspect that Pennycook (1994, 1998) also identifies and challenges.

Holliday looks at “learner-centeredness” and “autonomy,” “two of the key concepts of English-speaking Western TESOL professionalism” (p. 63), to further demonstrate how they have been used to justify the superior position of native speakers of English. Regarding learner-centeredness, Holliday argues that this very concept demands that the foreign Other of the “non-native speaker” be trained both linguistically and culturally, and this is what consolidates, legitimizes, and reproduces native-speakerism. Holliday further points out that “learner-centeredness” appears to be a mask which hides the intention to correct “the behaviour and culture of the Othered ‘non-native speaker’ students” (p. 78).

Holliday offers his own interpretation of the second key concept “learner autonomy,” seeing it as being driven by the “us”-“them” discourse embedded in native-speakerism and culturism, which involve “corrective training” (p. 79). He criticizes the tendency to contrast unquestionably and automatically “passivity” (assumed to be attached to the Othered “nonnative-speaker” students) with “autonomous learners” and “true learning” (assumed to be aligned with Western English-speaking TESOL). This tendency assumes that the Other student do not have “autonomy” and their “autonomy” can only be obtained by being trained through “learning strategies” developed and advocated by the Self teacher. “Passivity,” in the mindset of the Self, seems to be a property just owned by the Other. Holliday also acknowledges that it seems very difficult not to fall into the trap of dichotomizing Self and Other in TESOL regardless of how aware and critical one can be.

Regarding the Other teacher, Holliday demonstrates that native-speakerism pictures the nonnative-speaker Other teacher as being deficient who need to be trained and corrected by the native-speaker Self. Sadly, this deficit approach in viewing the nonnative-speaker Other TESOL teacher is very often, if not more often, taken by those teachers themselves, as Holliday clearly points out.

In short, as the scholars surveyed above show, while postcolonialism is a political project to critically interrogate colonialism, what is embedded in the global development of English and ELT shows that many postcolonial practices still function as colonizing forces. Specifically, English and ELT carry and enact presumptions of the inferior Other. These stereotypes normally suggest that the Other, including teachers, students, trainers, and trainees, is inferior than the Self in terms of “authentic” knowledge of the English language, teaching methodologies and approaches, teaching and learning styles, and values and cultures. This portrayal accordingly urges and self-urges the Other to change to adjust and to learn from the native Western Self. And the superior Self and inferior Other cycle continues.

Counterarguments

However, in acknowledging the agency of “the Other” in the global spread of English and ELT, many scholars have challenged the way in which the dominant discourse is rooted in native-nonnative dichotomy and impoverished postcolonial perspectives in explaining the field of ELT and TESOL. These scholars argue that the Other sees many benefits in learning English and that English must be understood beyond the usual colonial and postcolonial remnants (Kachru 1986; Jenkins 2014; Widdowson 1997). They show how speakers of English as an international language (EIL), English as a lingua franca (ELF), and World Englishes (WE) have been able to resist and appropriate English and ELT. These speakers of English own and can own English. These speakers, in fact, have been leading the growth of English and ELT with their own spirit, purposes, and innovation.

Kachru’s (1986) identification of three Circles of English marked a significant moment in the study of postcolonial English, which has led to the development of World Englishes. English, in this sense, encompasses a variety of Englishes that are evolving out of different communities, territories, States, countries, and regions, each of which enjoys its distinctive characteristics

reflecting its history, culture, linguistic repertoire, and educational landscape. The promotion for a sense of equality among all these Englishes has been at the heart of World Englishes studies; and implications for the teaching of World Englishes are offered by those leading the area. However, to date, the teaching of Standard English varieties from English-speaking Western countries still dominates ELT and TESOL globally.

Perhaps one of the most eminent advocates for politics-free English and ELT is Henry Widdowson, who since 1997 has been arguing for English as “a kind of composite lingua franca which is free of any specific allegiance to any primary variety of the language” (1997, pp. 399–400) including the English from the very Centre (English-speaking Western countries). Widdowson asserts that it is because he is aware of the politics of English and its consequences that he attempts to urge English users to look at it as the language “used internationally across communities as a means of global communication” (p. 399), but not as the language owned by the Inner Circle (the Centre). He forcefully maintains that it is impossible to control language once it is used and that this is precisely the case with English.

Widdowson’s work, though criticized by many scholars, has inspired the initial development of EIL, a branch of which later took a separate path and evolved itself exclusively into ELF. This branch has been led by scholars such as Jennifer Jenkins (2014) and her associates. ELF offers space for imaginations about English that could truly liberate and empower its speakers, regardless of how and in what forms English is used and expressed. It argues for the recognition of full agency of ELF users. The concept of “standard” in ELF is almost totally dismissed and irrelevant which has sparked ongoing debate and critique in the field, particularly since the late 2000s.

Specifically, criticisms of ELF (O’Regan 2014) have been raised over ELF promoting a “free” English whereby users of English regardless of their knowledge and understanding of the language, and regardless of their social status and aspirations, what they do, and where they are located, can own English and create their own

norms that would be valued and accepted by the international and global community. In other words, certain ELF works tend to imply that a power differentiation between Self and Other has little impact on the appropriation of English and on the development of an evolving and self-evolving ELF. This is precisely a major misconception embedded in the ELF scholarship, according to O’Regan (2014) who argues that the global elite are still the ones shaping the future of English and dictating the ownership of it and deciding what and whose English is standard. In the same vein, this reality is consolidated by Tupas’s (2015) edited volume on the study of postcolonial English and ELT. All the contributing authors demonstrate with empirical evidence that Englishes are unequal in diverse contexts and settings around the world.

Other scholars have continued to advance EIL through their commitment to examining the close relationship between the cultural politics of English and ELT and questions of agency, identity, empowerment, pedagogies, and knowledge production. Angel Lin, Ryuko Kubota, and Phan Le Ha, for instance, have hardly ever lost sight of this relationship in their works while still having been able to show the complex picture behind the worldwide spread of English and ELT (Chowdhury and Phan 2014; Kubota and Lin 2009; Phan 2016).

Current and Future Development

In short, the worldwide spread of English and ELT has been indebted to colonialism, postcolonial development of the field, and the current global desire for English-medium education. Adding to this, neocolonialism and neoliberalism are now dominant within cultural production; and again English and ELT have been the most effective and powerful means to transmit these ideals globally. They are not different from colonial and postcolonial practices and have appeared to be disguised behind the internal desire to learn and own English of the Other. As this desire is growing stronger, the dependence on the Western Self is also getting more intense and multifaceted,

because the view that “the West is better” has never died but has often been mixed in the agendas of empowerment and internationalization and commercialization of education (Chowdhury and Phan 2014; Phan 2016).
