As such, works devoting to examining the blurriness of the postcolonial Self and Other and to investigating the multidimensional exploitation of postcolonial neoliberal English and ELT by every stakeholder are emerging (O'Regan 2014; Phan 2016). Put differently, the spread of English is hardly natural or neutral. It can be beneficial but is always coupled with certain politics and controversies. Phan Le Ha argues in her works cited above that the politics associated with English and ELT does not necessarily have to be dictated by any high power authority, but is often generated from within any individual, any institution, and any entity. Therefore the question of agency, identity, and power in EIL cannot be reduced to any single grand ideology. To respond to this call, any work related to the global development of English and ELT ought to recognize the dynamic nature of postcolonialism as well as ought to engage with the cultural politics of postcolonialism in creative and liberating ways.

Gramsci and Culture

Raquel de Almeida Moraes

UnB - University of Brasilia, Brasilia, Brazil

Antonio Gramsci, Italian philosopher, journalist, and socialist politician, lived at the beginning of this century in Mussolini's Fascist Italy. His work, partly developed in the long imprisonment imposed on him by Mussolini, constitutes a political theory that is considered as one of the great contemporary philosophical contributions to the critic and the social fight for the transformation of the capitalist society.

The starting point for his theory has as genesis Marx's conception concerning the development and operation of the capitalist society, composed of the contradictory duality between dominant class and subordinate class, between possessors and the poor, and between the capitalists and the proletariat. The private ownership both of the earth and of the means of production of the material life (base or infrastructure of the society) has, in the superstructure, i.e., in the ideological and spiritual sphere of the society, a direct correspondence. Gramsci agrees with Marx in the conception that the class which seizes the material power also seizes the ideological power or the power of the ideas, and that's exactly the knot he took advantage of to deepen and to develop his political theory. His main thesis is that the superstructure maintains the class relationships, and that this dominance is executed by the mechanisms of hegemony of the State and of the civil society. To overcome this hegemony, it would be necessary to develop a counter-hegemony, what can be gotten if the working class, including the socialist intellectuals, promote the creation and the development of a new culture, in opposition to the bourgeois hegemony. Or better: the emphasis of the economical and social transformation happens in the superstructure, in the field of the values and norms as in man's and world's vision.

Holding these general ideas in mind, we will develop, in the following section, a brief synthesis

of the concepts involved in this thesis: (a) civil society, (b) hegemony, and (c) State. And, inside this conception, the strategy to overcome the bourgeois hegemony includes these other concepts: (a) hegemony crisis, (b) war of position, and (c) the intellectuals' role.

With this, we intended to contribute with theoretical subsidies to the debate on the problem of the hegemony in the bourgeois societies in this global phase of the capital.

Key Concepts

- (a) **Civil Society:** it is located in the superstructure, although its roots are in the material production. Its role is the perpetuation of class relationships and prevention of the development of the class consciousness. It is composed of private social organisms $\frac{3}{4}$ responsible for the production and reproduction of the hegemony $\frac{3}{4}$ and by the State, the public organisms. It has as function the direct dominance, both in the domain of the hegemony and in the use of coercion.
- (b) **Hegemony:** from the Marxist thesis that the class is the dominant material force in society and at the same time its dominant intellectual force, Gramsci added to the Marxist philosophy the concept of hegemony. Hegemony expresses the consent of the subordinate classes to the bourgeois dominance, which comes as the other face of the power: the face of the domain of consciousness and of the reproduction of ideology.

Hegemony embraces the following aspects:

- **Inter-bourgeoisie:** the dominant fraction inside the civil society exercise the control through its moral and intellectual leadership. This dominant fraction (which can alternate depending on the force relations in the inter-bourgeoisie) detains the power and the capacity to articulate the interests of the other fractions. It doesn't impose its own ideology, but combines common elements, extracted from visions of the world and interests of the allied groups.

- Bourgeoisie X proletariat: the bourgeoisie uses its political, moral, and intellectual leadership to impose its vision of the world as something comprehensible and universal, which in this way molds the interests and needs of the subordinate groups. Thus, although hegemony is political-ethical, it is also based on the decisive function of the economical activity. And this is made through a group of institutions, practices, and agents that embrace the productive and administrative sectors, as well as the political and the technological ones.

It should be pointed out that for Gramsci, there is no monolithic power among all those hegemony apparatus. The class struggle inserts itself in all of them, and this explains the changes and the resistances to the hegemony of the dominant class.

- (c) **State:** it represents hegemony as guaranteed by the armor of coercion. It can be schematized by the formula: political society and civil society.

Similarly to the production forces, the control of consciousness is also an arena for the political fight.

The State is an “educator” in the sense that its tendency is to create a new civilization type or level. It operates according to a plan; it impels, incites, requests, and punishes. These actions lead to a “passive” revolution, in other words, to a constant reorganization of the power of the State in the sense of preserving its hegemony through the exclusion of the masses over the economical and political institutions.

In Gramsci’s perspective, the historical-social changes, the movements that happen in the relationships between structure and superstructure, obey two principles:

1. “No society assumes responsibilities for whose solution the necessary and sufficient conditions don’t still exist, or that at least are not about to appear and to develop.”

2. “No society is dissolved or can be replaced before developing and completing all the implicit life forms in its relationships.”

Movement or change types:

- Organic: are those that generate relatively permanent character changes and are linked to the mode of social organization. Example: change from feudalism to capitalism.
- Conjuncture: are the movements that come as occasional and immediate. Of course the conjuncture movements and changes depend on the organic movements, but their meanings neither have a wide historical reach nor alter the structure or mode of economical-social organization of society.

Forces that impel the movement/changes:

- Economic: expressed in the conflicts between capital and work
- Politic: since the corporations to the highest expressions in the political parties
- Technical-military: considered by Gramsci, the decisive forces

Starting from these key concepts, how could the transformation happen if the arena of the consciousness is the immediate space for the principal struggles of the dominant classes against the subordinate ones?

Gramsci thought three strategies to overcome the bourgeoisie hegemony: hegemony crisis, position war, and the intellectuals’ role.

- (a) **Crisis of Hegemony:** has its origin when the classes separate from their political parties and the civil society enlarges its power and autonomy through unpopular acts by the leaders in the State. This loss of the consent makes the society no more a directing power, but only dominant, just exercising its coercive force. That crisis is not a direct function of the economical crises, although these can also generate them. This crisis are not a direct function of economical crises, although these can also

generate them. They can be caused by the loss of welfare, poverty, etc. Although the crisis of the State is an important factor for the socialist transformation, this is not enough. It is necessary that the crisis occurs in the whole power complex and not just in the most immediate instance of the hegemony, which is the State.

- (b) **War of Position:** it is the siege of the State by the working class, by developing and enlarging a counter-hegemony through the creation of a popular culture that gives foundation to a new world vision: norms and values of a new society that would replace the consent of the bourgeoisie. Like this, the arena of the consciousness would be reconstructed with a new man's and world's vision.

This new culture would be developed by the party of the masses, a party that would not implant a vertical understanding, from top to bottom, but something organic, which relates the party as a whole, because it would be created by all those involved in it.

This process of construction and education of a counter-hegemony would have as mission to build great powers of cohesion, centralization, and innovation, which would be mining the power of the hegemony.

- (c) **The Intellectuals' Role:** Premise: "All men are intellectual...but not all men play the intellectuals' role in the society."

Degrees of intellectual activity: Higher level: creators of the several sciences, philosophy, art, etc. Lower level: administrators and divulgers of the existent intellectual wealth.

Under the capitalism: the schools form intellectuals of several levels whose functions in the civil society (private organisms and State) are those that organize the hegemony, the spontaneous consent of the population. This consent is born from the prestige the bourgeoisie has in society and of the apparatus of State coercion that legally assures the discipline for those that admit the consent.

In the transformation or revolutionary process, the intellectuals' role would be given by their technical capacity to act as thinkers and organizing elements of the subordinate classes.

Their mission is not professional, but, as partners of the construction of a new culture through the party of the masses, he/she would have the function of driving the ideas and the aspirations of the class to which they organically belong, taking into account that all the men are intellectual and think, although not all fully develop that capacity, due to the bourgeois hegemony.

The party of the masses must therefore merge the traditional intellectuals (professional) and the organic intellectuals of the subordinate classes around a conception of the world that transcends their class interests, so that the workers awake their intellectual possibilities (through the educational functions of the party) and contribute to the war of position, creating the counter-hegemony of their class.

Intellectuals, School, and Culture

Perspective transformation of the school:

- Role of the school: to form intellectuals that will organize/form a new culture.
- Objective: to contribute to the creation process of a counter-hegemony against the dominant hegemony.
- Justification: it is in the arena of consciousness "that the elites use their organic intellectuals to maintain the dominance." However, given the inequalities and the injustices, it is necessary that the subordinate classes free their consciousness from the bourgeois hegemony and create a new culture. And in this process, school can have a role as transformer.

Necessary conditions:

- Public and free school: only in this way the school may involve all generations, without divisions of groups or castes. The efficiency of the school is better and much more intense when the relationship between teacher and student is small.

- Buildings: the school should be a college school, with bedrooms, refectories, specialized libraries, laboratories, classrooms for the work of seminars, etc.
- Duration: the unitary school should correspond to the period of elementary schools in average, reorganized not only in relation to the content and teaching method, but also with regard to the disposal for the students attending the several degrees in the school career.

The teacher's role:

- To quit the reactionary position and to become a “friendly” guide.
- To accelerate and discipline the child’s formation according to the superior type in struggle against the inferior type.

Curriculum: (10 years)

- First phase: 3–4 years. Besides teaching the first instrumental “notions” (reading, writing, duties, geography, and history), the fundamental notions of the State and society should be learned as primordial elements of a new conception of the world.
- Second phase: the rest of the course should not surpass more than 6 years, so that, when the student was 15–16 years old, he/she would have concluded all the degrees of the unitary school.

Presupposed curriculum effects:

- Unified manual and intellectual work
- Values: intellectual self-discipline and moral autonomy

Method:

- The study and learning of creative methods in science and life should permeate the whole course. Therefore, the school should be a creative school.

For Gramsci, creative school doesn’t mean inventors’ and discoverers’ school; it indicates a

phase and an investigation method of knowledge and not a “predetermined program” that forces the innovation and originality at any cost.

For him, to discover a truth by himself, without suggestions and external helps, is creation (same as the truth is old) and demonstrates the adequacy of the method. Therefore, the fundamental school activity will grow in seminars, in libraries, and in experimental laboratories. The aim of education is, at most, to develop the intellect, that is, a habit of order and system, a habit for relating the whole new knowledge with the ones that are already possessed and to integrate them together, and what is more important, the acceptance and use of certain principles, as center of the thought. In this critical university, history exists and it is not just a new book of novels; the speakers and publications of the day loose the infallibility; eloquence doesn’t replace thought, nor the courageous statements or the colored descriptions occupy the place of arguments, says Gramsci.

Final Consideration

In the Gramscian theory, it is relevant to think in what degree a plan that involves the participation of the collectivity cannot be conducted as one moment – among others – of discussion and development of a new culture of a counter-hegemony.

In this sense, it is of fundamental importance to discuss what type of vision of man and of the world is giving a foundation to the everyday life of the people involved in this process, which values are present (whether from hegemony or not), and how one could take advantage of such moment to carry ahead the construction of the new culture.

On the other hand, in these moments when the Left all over the world lives what Therborn (THERBORN, Göran. In SADER, Emir (org.), 1995) analyzes as the crisis of the socialist culture (in identity level, values, and world vision), the accomplishment of a task as this we suggested is of highest importance for the future of the Left itself, because there won’t be a democratic equality if a socialist culture does not exist. And the

socialist culture needs to be reconstructed on the basis of popular participation (consciousness), as stated by Gramsci, and not in the vertical direction of an “illuminated” vanguard, as the world history has been registering until now.

Green, Public Education, and the Idea of Positive Freedom

William Mace
University of Surrey, Surrey, UK

Introduction

The industrialization of nineteenth-century Britain was a key moment for political theory; it catalyzed a group of British scholars to radically rethink the conventional understanding of liberty and what it is to be “free.” The movement, often referred to as British Idealism, sought to address the social evils of its time, such as poor working conditions, increasing inequality, and a lack of adequate medical care and education. The

Idealist’s took the view that classical liberal assumptions such as laissez-faire and freedom of contract underpinned and reinforced these evils and aimed to revise liberalism in this context. The key thinkers included Bernard Bosanquet, Edward Caird, F. H. Bradley, L. T. Hobhouse, and T. H. Green. Here the focus is upon the latter, T. H. Green (1836–1882), due to his immense contributions to political philosophy and, importantly for this collection, his arguments for the extension of public education in Britain and his pivotal role as a precursor to the welfare State.

Contextualizing Green’s Theoretical Background

Green, a fellow of Balliol College Oxford, was primarily influenced by the German Idealism of G. W. F. Hegel, Kant’s liberal egalitarianism, and the Greek thought of Aristotle, which he then brought to bear on classical liberalism. The concept of positive liberty has now become commonplace, and although Green is often referred to as a theorist of this ilk, the term fails to fully encapsulate his complex liberal position and his normative theory of justice (Simhony 2003). His “New Liberal” stance added a positive dimension to classical formulations of liberty, defining freedom in the more expansive notion of self-realization, as opposed to mere absence of restraint and interference. In brief, he argued that for individuals to be considered free, they need the “capacity” or “ability” to be free. This aligned strongly with his conception of the common good, which played a lead role in his theory of freedom.

Green’s arguments for a positively enabled State – which provides the conditions for individual self-development and the common good – influenced substantial educational reforms in Victorian Britain. Until the late 1800s, elementary schooling was provided by voluntary associations, namely, the church. Therefore there was no national provision as such. For Green this system was wholly inadequate for the time, as educational opportunities were largely only open to the British upper classes. Key to understanding his defense of

public education are his notions of the common good, self-realization, and internal freedom, which constitute “freedom in the positive sense” (Green 1986a, p. 200). The concepts are interlinked but referenced sporadically throughout his work, no doubt due to his untimely death and the posthumous publication of his key lectures and texts. Here they are addressed in turn, in order to present the role education plays in society, which hopefully reflects Green’s intentions.

Green on Education as Common Good

Education was the great leveler for the British Idealists, whose key goal was to extend equality of opportunity. The education of the working class was a central focus of Green’s scholarship. It informed his vision of integrating education into the fabric of civic life, exercised through his conception of the common good. This has been cogently expressed as an ideal that emerges from the “good society: a community of mutually developing individuals, the moral requiredness of which justifies the construction of social order in terms of both justice and citizenship” (Simhony 2001, p. 71). It is an ethic of society that can be contrasted with the classical liberal view, of atomized individuals cooperating merely for mutual advantage. The good is common, as Green explains, because it is not a “good for [oneself] or for this man or that more than another, but for all members equally in virtue of their relation to each other and their common nature” (Green 1986b, p. 95f). In *Prolegomena to Ethics*, he states that the “true good must be good for all men, so that no one should seek to gain by another’s loss, gain and loss being estimated on the same principle for each” (Green 1906a, p. 281).

Therefore the common good is a moral ideal that individuals in society should act in accordance with and seek to promote. Individuals and institutions, as moral agents, can use the common good to test the moral validity of their acts. For example, Green asks whether a law or course of action contributes “to the better being of society,” which can be measured against whether the act

contributes to the establishment “of conditions favourable to the attainment of recognised excellences and virtues” (Green 1906d, p. 434). However he adds an important liberal caveat to this statement, that even if such acts meet the criteria above, they should not “detract from the opportunities of others” (Green 1906d, p. 434).

The common good can be interpreted further as a criterion, in respect to the objects that individuals choose to pursue. As Green’s central concern is the self-development of individuals, he subsequently argues that this can be achieved by pursuing, or willing, certain objects. The nature and moral value of these objects depend upon whether they allow an agent to achieve intrinsic self-satisfaction. Importantly though, this requires the realization of moral objects to be a social activity, as society acts as the conduit through which moral self-development can take place. It is a mechanism through which true common goods can be recognized. For Green, “human society presupposes persons in capacity – subjects capable each of conceiving himself and the bettering of his life as an end to himself – but it is only in the intercourse of men, each recognised by each as an end, and not merely a means, and thus as having reciprocal claims, that the capacity is actualised and that we really live as persons” (1906a, p. 209).

The good is thus common, as it is something which has to be shared in common with others. Green stipulates that the only object of intrinsic value is “the perfection of human character – a perfection of individuals which is also that of society, and of society which is also that of individuals . . .” (1906b, p. 291, also 1906a, p. 210). Therefore, what is good for an individual is also good for society. Resultantly social goods are not private but good for individuals as members of a community (Green 1906b, p. 271). Aristotle’s influence now surfaces, as Green essentially argues that human beings are social animals and can only fully realize themselves within a community. It is the necessary condition for self-realization to take place. A critical aspect of society is that “persons” recognize one another “and their interest in each other, *as persons*, i.e., as beings who are ends in themselves . . .” (Green

1906a, p. 217). Mutual recognition thus enables individuals to appreciate whether the interests they pursue are true moral goods, ones that are noncompetitive, are not private, but good for the community as a whole:

... the only good which is really common to all who may pursue it, is that which consists in the universal will to be good – in the settled disposition on each man's part to make the most and best of humanity in his own person and in the persons of others. (Green 1906b, p. 287)

Education can thus be viewed as a derivative of the common good, as Green's philosophy is derived from the moral character of individuals, rather than a prescribed set of principles. It forms part of the "supply," of "conditions favourable to good character" (Green 1906c, p. 400). Not only should education be enjoyed in common with others, as a noncompetitive and public good, but it importantly enables individuals to become self-questioning moral agents, allowing them, and their society through the common good, to progress further with their own self-perfection. To reveal how this is so, focus now turns to Green's notion of self-realization.

Green on Self-Realization

Securing educational resources is of particular importance for Green, as it allows individuals to develop their rational capacities and in essence gives them a greater ability to act in accordance with the common good. Consequently "without education one could not develop one's character and pursue morally good ends" (Plant 2006, p. 30). This can be seen as an extension of John Stuart Mill's work. He defended the notion of a private sphere of noninterference, so that individuals could be left alone to develop their higher faculties. Yet Green placed more emphasis on the role of community. For him, to be morally autonomous and to realize these higher faculties meant acting in accordance with the common good. Although individual autonomy remained central, it could not be separated from community and the common good and thus lead him in a different direction to Mill's liberalism.

Green's account of moral autonomy is perhaps best explained by using the concept of a "lifeplan," which illustrates his divergence from classical liberalism (Simhony 1993, p. 31). For individuals to be acting in accordance with their lifeplan, they must be organizing and pursuing their interests in light of the self-conscious exercising of their will and reason. Freedom is not only the absence of constraint and interference but the ability for one to "exercise the capacity of will and reason" (Simhony 1993, p. 31). This is what he meant by the term self-realization. It is the combination of the self-conscious effort individuals make to satisfy themselves and the capacity they have to conceive of themselves in a better state, one which can be reached by rational action.

The self-conscious effort Green has in mind is directed toward an individual becoming a full moral agent. Thus self-realization, or real freedom, is a moral ideal (Green 1986c, pp. 228f, 234, 242, 244, 246). It involves individuals striving to be the best they can be and thus able to freely exercise their human faculties (Green 1986a, p. 201). Freedom therefore relates to the internal nature and development of the individual, as a self-realizing moral agent. It concerns a person's character, their possession of "a habitual disposition to do what is good because it is good" (Nicholson 1990, p. 122). However there is also a strong communal dimension. It is the social institutions of society that can inculcate in its members, ideas of what it means to be free, and facilitate the necessary mutual recognition between citizens, as full moral agents (Nicholson 1990, p. 120). Consequently real freedom aligns with the common good through reciprocal recognition, and society must therefore progress as a whole toward the moral ideal of real freedom. It cannot be realized in a society where there is oppression (Nicholson 1990, p. 120), as in that case, some individuals would lack the power to make the best of themselves. This introduces Green's concept of "internal freedom," that is, the individual's capacity to overcome "internal" obstacles to the good life. In other words to be able to fully develop their human faculties and will the common good, education would be central here.

Green's Contribution to the Educational System

The value of education is its ability to enable individuals to develop their human faculties and moral conscious, to contribute to the common good, and to essentially achieve “true freedom” in the positive sense. Yet Green’s philosophical idealism was not devoid of practical experience: he contributed to the Taunton Commission, tasked with investigating Britain’s secondary school system; was on the School Board for Oxford elementary schools; a leading figure in the founding of the Oxford School for Boys; a member of the National Education League; and part of the university extension movement, which aimed at improving higher education opportunities for women.

The most controversial aspects of Green’s arguments for elementary education were that he thought it should be provided by the State and be compulsory. This was a novel idea at the time. However he saw problems both in the quantity and the quality of education offered by voluntary associations and feared that children may be indoctrinated if education was overseen by religious organizations. He argued that more public funds should be made available to provide for nationwide State elementary education. Attendance would be free, and parents would be compelled to send their children to school. The last point is contentious. However Green felt that during his “modern” times, parents lacked sufficient educational responsibility for their children, due to mass labor that often meant parents would be away for long periods of time (Green 1911a, p. 432). This was especially the case for the working class families.

Education was highly significant because without it, individuals would not be able to develop themselves to the best of their ability. Green claimed that “without a command of certain elementary arts and knowledge, the individual in modern society is effectually crippled as by the loss of a limb or a broken constitution,” as she “is not free to develop [her] faculties” (Green 1986a, p. 201). It therefore comes under “the province of

the state to prevent children growing up in that kind of ignorance which practically excludes them from a career in life” (Green 1986a, p. 201). This statement refers directly to his notion of capacity, in this case elementary education enables “the growth of the capacity for beneficially exercising rights” (Green 1986b, p. 161). As rights are reciprocal and thus form part of the common good, they act as a base for developing the “perfect character” in individuals and “in others” (Green 1986b, p. 23). Compulsory education should therefore be enforced by the State, as part of its duty is to remove obstacles to individual self-realization (Green 1986b, p. 161). A lack of education hinders the development of a child’s capacity for rights and constrains the “free exercise of [their] human faculties” (Green 1986a, p. 202). Education therefore forms a significant part of what Green calls freedom in the positive sense: “the liberation of the powers of all men equally for contributions to the common good” (Green 1986a, p. 200).

With regard to secondary schools, he adopted a different position, notably they should not be made compulsory. However they retained an essential role in his vision of educational reform. The reform he suggested essentially served to create equality of opportunity via a “ladder of learning” (Plant 2006, p. 34). The system he proposed consisted of having a three-tier system for schools. The first level would cover basic aspects of education beyond manual labor, such as literacy and writing, and move to the third, which would essentially be preparing students for university (Nicholson 1990, p. 171f). By having a careful grading of children and schools, overseen by school boards, and a provision made for scholarships, educational opportunities would be open to students from all social backgrounds. Essentially he advocated a meritocratic system which rewarded ability rather than wealth. Although he thought that parents who could afford to send the children into further education should pay (Green 1911b, p. 412), scholarships that would relieve poor students of fees would be key to generating equality of opportunity. Therefore children from the poorest backgrounds, who demonstrate good ability, should be able to take advantage of the

intellectual opportunities that higher levels of education offer.

Green also thought that this system would ease class antagonism:

“Common education is the true social leveller. Men and women who have been at school together, or who have been at schools of the same sort, will always understand each other, will always be at ease together, will be free from social jealousies and animosities however different their circumstances in life may be” (Green 1911c, p. 457f).

Therefore if the State actively removes social barriers, such as education, social unity should improve as well. It reflected his overarching idealist philosophy, that society is not constituted by atomized individuals but rather as a community of mutually indebted citizens: an integrated whole sharing a common good (Gordon and White 1979, p. 4). Only collective action could remove these obstacles that hindered individual self-development. Green argued that “[t]o educate one’s children is no doubt a moral duty,” but it importantly prevents “a hindrance to the capacity for rights on the part of the children” (Green 1986b, p. 161). In Britain this meant reforming the voluntarist school system, which Green believed had had its chance and failed. Instead a comprehensive State-managed educational system was necessary, one that allowed able students, regardless of their background, to reach the highest levels of education. He justified this approach morally, in respect to the common good and individual self-realization.

Green did not abandon liberalism but reformed it. Traditional liberal principles of self-help and self-reliance remained highly significant. However he thought that his proposals did not violate such principles. State-provided education would not damage self-reliance. If a parent was already sending their child to school, they would not notice the new law (Green 1986a, p. 203, 1986b, p. 161), and if parents were not, then they were already failing in their moral duty and the State’s noninterference would not improve the situation for those children (Nicholson 1990, p. 170). Similarly Green advocated elementary education for farm laborers, as ignorance was a contributing

factor to low wages for these workers. Education therefore reinforces self-reliance (Nicholson 1990, p. 176).

Conclusion

In sum Green had a keen awareness of circumstance. For example, he promoted women’s education, but thought that policy would be unsuccessful if it raced too far ahead of public opinion (Green 1986a, p. 210). In a similar vein, he recognized that industrialization had created new problems for British society and new sources of exploitation. Thus he argued that the State was justified in adopting a more interventionist position, in order to give all its citizens an equal opportunity of obtaining the good life. Education is clearly central to this goal, and especially pertinent today, where rapid technological advances, transnational economic markets, and international terrorism are again challenging traditional conceptions of freedom and opportunity. Green’s work has further contemporary relevance, in relation to a revised social democratic conception of public education as a universal right. Education for Green clearly fulfills a positive community function premised on the norms of cooperation and universal entitlement, rather than as a competition based on neoliberal “choice” policies, which have come to characterize the post-welfare state settlement since the 1970s. Essentially Green asks what skills and competences are necessary for the realization of the good life, postulating that these, and thus education, should not be competitive but fundamental rights for all.

Introduction

Jürgen Habermas (born 1929, in Düsseldorf, Germany), considered the greatest living German philosopher, of international renown, is also a critical intellectual, attentive to the new flows of argument and problematizations of society that may break down constellations of power and broaden inclusive relations. His main concern, ever since his work when young, has been loss

of respect and of the meaning of human life and emancipation. His project intends to deal with this problem and produce a systematic grounding of rationality using a reconstructive analysis of the cognitive and normative contents of our practices. He thus moves away from a substantial indication of what a just society would be to investigate the conditions which make it possible for the subjects to deliberate about their lives through processes of understanding. This is a fascinating object that depends on forms of communication able to promote rational formation of the will. The possibility of communicative rationality is accompanied by a skeptical evaluation of the world situation. In the scenario in which we move, there is a kind of haziness, a narrowing of prospects (*die neue Unübersichtlichkeit*). Even acknowledging a certain unintelligibility in our time, Habermas does not hurry to reach conclusions. On the contrary, despite the multiple transformations that have occurred in modern societies, he considers that no radical change has occurred in the way of debating our future possibilities, which will lead him to endorse the postmodern movement that occurred at the end of the 1970s. Nor can the project of modernity be taken up again using the same criteria and that is where his effort lies: reconstructing the normative Fundamentals and formulating a critical theory that will include the social pathologies, enabling a new type of rationality to emerge.

Habermas is influenced by the traditions of the enlightenment, idealism, and neo-humanism that

wagered on a process of cultural and spiritual formation at the beginning of the nineteenth century, in Germany, on philosophy of language and pragmatism. In his own words, he was influenced “by philosophical principles that highlight the intersubjective constitution of the human spirit, namely: the hermeneutic tradition that goes back to Wilhelm von Humboldt, to the American pragmatism of Charles Sanders Peirce and George Herbert Mead, to the theory of the symbolic forms, to Ernst Cassirer and Ludwig Wittgenstein’s philosophy of language” (Habermas 2005, pp. 17–18).

Communicative Action Theory: Concepts

In 1981, Habermas published his *magnum opus* “Communicative action theory” (*Theorie des kommunikativen Handelns*), prepared during over two decades, intending to redimension reason from a communicative perspective, reconstruct a social theory that will articulate the world of the system and the world of life, and restore the normative content of modernity. The central thesis refers to the existence of a *télos* of understanding in language, namely, as speakers we are already participants in a rational intersubjectivity.

The instrumental, economic, and bureaucratic rationality that pertains to the system world invades the lifeworld, with the consequent loss of meaning and freedom. Communicative action is differentiated from other actions, namely teleologic action, in which the actor chooses means with utilitarian ends; normative action, in which the action is turned to common values and respect for the norms agreed by the social group; and dramaturgic action, which involves the self-representation of the subject when dealing with a public. Different from the others, communicative action refers to the “interaction of at least two subjects, capable of speech and action, who establish an interpersonal relationship” (Habermas 1987a, 1, p. 128). Outstanding in this action is the interpretation and search for understanding with a view to consensus. When we act communicatively, we are prepared to hear what the others

have to say, that is, the possibility of challenging the validity of the announcements is accepted.

The validity claims can always be criticized and are the following: claim to truth, which refers to the objective world and is constituted by the theoretical discourses; the claim to rightfulness or justice in which the utterance of the participants must be right according to the prevailing norms; and the claim to truthfulness, which refers to the subjective world and the authenticity of the subject (the express intention of the speaker must coincide with what he thinks). It is necessary to accept these validity claims from a partner in discourse to begin a movement of communicative rationality. The communicative practice has, immanently, the possibility that the participants will enter an argumentative process, present good reasons, and critically examine the truth of the enouncements, the rightfulness of actions and norms, and the authenticity of expressive manifestations. If there is a challenge to them, it is possible to begin the argumentative process anew until consensus is achieved. Since everything that is presented can be criticized, this process allows identifying errors and learning from them. Consensus can only be established because it is supported on the intersubjective recognition of validity claims that can be criticized. According to Habermas:

It must be possible to defend what we consider to be true with convincing reasons, not only in another context, but also in all possible contexts, that is, at any time and against anyone. The discursive theory of truth is inspired by this; in this way an enouncement is true when under the demanding conditions of a rational discourse, it resists all attempts at refuting it. (1999, p. 259)

In this way, in modern societies, individuals can coordinate their interests communicatively. Communicative action has a kind of anchor that feeds the interpretations of the participants in the interaction, called the lifeworld (*Lebenswelt*), the horizon in which we move. This is a concept from the phenomenology of Edmund Husserl, introduced by Habermas to link social action to the rationalization processes. The actions are understood based on the lifeworld which refers to the pretheoretical, convictions, nonproblematized

self-evidence: “this collection of knowledge that provides the participants in communication with *non-problematic background convictions*, background convictions which they assume are guaranteed” (Habermas 1987b, 2, p. 191). The lifeworld contains an interpretative reserve that makes it possible to anchor our actions in the face of the risk of disagreement that could occur in any process of comprehension. These are cultural contents, values, interpretive patterns that are situated within the sphere of life experiences. The understanding that occurs in the lifeworld establishes the process of education and formation, since “when the child participates in interactions, with reference people that perform concrete actions, it internalizes the evaluative orientations of its social group and *acquires* generalizing capacities for action” (Habermas 1989, p. 497).

The lifeworld produces and reproduces itself symbolically by means of communicative action and becomes rationalized, producing the basic structures of modern consciousness. In communicative action, the participants say yes or no to the actions of speech, regarding their validity, both when we describe things of the objective world and when we refer to the justice of the norms or express our opinion about our feelings about something. This condition as participants in interactions allow all to question the validity claims. In this way, interaction can continue. Mostly we understand each other based on a set of familiar conviction that constitutes the aforementioned “collection of knowledge.” When these convictions are broken down or stabilized, they are submitted to discussion and are no longer part of the lifeworld. But when they become customary, they return to the lifeworld which is resized and rationalized, constituting the structures of modern consciousness. The rationalized lifeworld is differentiated into three structural components: culture, personality, and society. Thus,

communicative action serves tradition and the renewal of cultural knowledge; as to the aspect of action coordination, it serves social integration and the creation of solidarity; finally, as regards the aspect of socialization, it serves to form personal identities. The symbolic structures of the lifeworld are reproduced through continuing the valid knowledge of stabilization of group solidarity and the

formation of actors that can respond to their actions. The reproduction process includes the new situations with the already existing states of the world. [...] To these processes of cultural reproduction, social integration and socialization correspond the structural component of life that are culture, society and personality. (1987b, 2, pp. 208–209)

As an intellectual, Habermas maintained an open attitude to interlocution with his critics and was attentive to the problems of society. This led him to give new influxes to his philosophical project, with the investigation of the principles of communicative action in the field of ethics, in *Moral consciousness and communicative action* (*Moralbewusstsein und kommunikatives Handeln*, 1983, and revised edition in 1984) and *Comments on discourse ethics* (Habermas 1991) and in the field of law, in *Law and Democracy* (*Facticity and Validity*) (*Faktizität und Geltung*, 1996). There are also theoretical deployments of his theses in various works, among which the main ones are *The Inclusion of the other: Studies in Political Theory* (Habermas 1996), *Truth and Justification: philosophical essays* (Habermas 1999), *between naturalism and religion: philosophical essays* (Habermas 2005). He took active part in the debate on contemporary issues and recognizes the force of noninstitutional social networks that express the organization of groups that are not part of political power. In this sense, he participates in the public debates on biotechnology, multiculturalism, religion, inclusion of the other, besides a great number of political essays about globalization processes, the public sphere, democratization, issues of tolerance, terrorism, the role of the State in reducing social inequalities, the Nazi past, among other topics.

Educational Implications

Habermas did not write a treatise on education, but his work supplies significant element to review/recreate the concept of formation insofar as it not only points out the blemishes of an education process caught in the illusions of the theory of subjectivity and the pitfalls of instrumental rationality, it also offers instruments to

reinterpret the concept of education emphasizing intersubjectivity. In other words, the very concept of formation may undergo corrections of its idealistic assumptions if it is submitted to a discursive process which leads education to review them and improve the level of public controversies. Through language we could problematize and transform our heritage regarding what is education, in the light of the experiments we perform.

Although the educational processes are not the specific object of his investigation, he concerns himself with the broader social processes of learning, because any significant social action depends on the rational critique and communicative competencies which result from constructive learning processes, as was understood by Jean Piaget (1896–1980). According to Habermas' interpretation of Piaget's concept, constructive learning is based on the following supposition: first, the supposition that knowledge, in general, can be analyzed as a product of learning processes; then, that learning is a problem solving process in which the subject who learns is actively involved; and, finally, that the learning process is guided by the discernments of the very subjects directly involved in this process.

In a broad sense, Habermas' theory is a defense according to which communicative action is a learning of subjects in interaction. Education, on the one hand, must promote the discursive and argumentative capacity, so as to prepare the subjects to meet their demands and become inserted in democratic processes; on the other hand, it must promote public discussion about the rationality criteria underlying the educational actions, and promote the continuity of knowledges and wisdom of the cultural tradition that will ensure the interpretive schemes of the subject and the cultural identity (Hermann Prestes 1996; Hermann 1999).

Educational action is only feasible because we are with others in a common world, in a multiplicity of experiences. In this type of formation, there is an echo of Humboldt's neo-humanist tradition, according to which education is a work of oneself, in a dialectical opening between experience in the world and project of a world. In Habermas' words, it is the "intersubjective constitution of the human

spirit" (2005, pp. 17–18). Otherwise we would have the wealth of the formative process reduced to a mere preparation of technical competencies, a training, in an irresponsible lack of attention to the competencies that transform man "into a person" (Ibid. p. 17).

And the formation of subjects that are capable of interacting does not occur a posteriori, but from the experience of communicative processes, since "we men learn *from each other*" (Ibid.). Habermas is conscious of the importance of a formative process for the democratic principles to "take root in the minds and hearts of people" (Ibid. p. 25) and also to establish a space opened by the discursiveness of public opinion. Reason and discourse, formation, and constitution of a new mind set mix in intense reciprocity. It is especially in this aspect that Habermas reveals the influence of the democratic tradition in education. From Dewey's pragmatism, he inherits the antielitistic and egalitarian attitude, associated with the belief that education is vital to promote humanity.

He wagers on man's capacity to modify himself and the environment by developing communicative procedures that respect the different life forms and are able to generate the cultural and moral survival itself of the social world. Habermas' theory is challenging, because his virtualities to establish a foundation for a public sphere instigate the promotion of a rational reconstruction process of education. Therefore, no educational crisis permits abandoning the project; on the contrary, it requires constant argumentative tests, so as to promote a democratic culture. This sets us constant challenges. For this reason, it can be said that reading Habermas provokes a kind of therapeutic shock, namely, the destabilizing confrontation that reading his work brings from the limits of theoretical assumptions that, by tendency, lead education into the pitfalls of idealizations. These limits are not really a novelty but take on their own relevance in the ensemble of the work, since with the same skill as he points them out, Habermas indicates also how not to do away with claims born within this same idealism that, together with our historical consciousness, bring a validity to which we cannot turn our back. His

critique, thus, is not immobilizing. On the contrary, it is challenging because it requires very high hermeneutic efforts to reconstruct an educational process that has already diagnosed its pathologies and that now, conscious of the pitfalls of idealism, has to deal with self-responsibility.

Habermas' theory has an illuminating role for philosophy of education, because it offers very specific criteria to – when facing the “lack of transparency of time,” as Habermas himself called it – point at an education that is more adjusted to the present times, in which we are easily confounded by two problems: the devaluation of a common world that would prepare the existence of the public sphere; and the misleading promise of reducing formation exclusively in favor of developing capacities, especially for the work world, abandoning the tradition of education as a human and ethical formation. Habermas' theory manages to offer an articulate conceptual analysis that enables viewing these problems more adequately, exposing their tensions and challenges, allowing one to foresee that the projection of possible alternatives requires an interdisciplinary effort to cover the complexity of the issue. Besides, his defense of moral universalism and the possibility of an intercultural dialogue offer theoretical instruments for education to deal with a radically plural world, give new life to processes of opening to the other, and render effective an education sensitive to differences and to multiculturalism.

Habermas adds to the idea of spiritual formation inherited from the tradition of the enlightenment, especially from Hegel, the formation of the political will that is translated by the communicative competence to respond to the demands of the community. The interaction perceived by the communicative action involves everyone's responsibility in a network of relations – a response to the other. No matter how difficult, formation depends on the patient process of repairing the communicative competency, the effort to open the way for the subjects themselves to find answers to their problems, and this is a responsibility pertaining to everyone, which results from interaction in the lifeworld and not from specialist's knowledge.

Habermas and the Problem of Indoctrination

University of Joensuu, Joensuu, Finland

The Problem of the Criteria of Indoctrination

In the philosophy of education, the concept of indoctrination refers to unethical influencing in a teaching situation. Indoctrination means infiltrating (drilling, inculcating, etc.) concepts, attitudes, beliefs, and theories into a student's mind by-passing her free and critical deliberation. When – on a general level – we define indoctrination in this way, it is easy to say that indoctrinative teaching is morally wrong and that teachers or educational institutions should not practice it. The problem is how do we acknowledge indoctrinative teaching? By what criterion

do we consider teaching to be a form of indoctrination or to have elements of indoctrination?

The educational philosopher Ivan Snook has divided criteria that have been used in educational literature into four classes (Snook 1972, pp. 16–67):

1. The method of teaching as a criterion of indoctrination. In the US context, thanks to John Dewey, the tendency is to connect indoctrination to a certain teaching method. This illegitimate teaching method is said to include the following elements: (a) Teaching is authoritarian; (b) Teaching content is drilled in students' minds; (c) There are threading elements in teaching and free discussion is not allowed. Some writers label these as *irrational teaching methods*.
2. The content of teaching as criterion of indoctrination. According to the trivial content criterion, the content of teaching determines whether or not teaching is indoctrination. As Anthony Flew put it: "No doctrines, no indoctrination" (Flew 1972, p. 11).
3. The intention of teaching as criterion of indoctrination. The first person to use the term indoctrination in its pejorative sense was William Heard Kilpatrick (see Gatchel 1972, p. 13). Kilpatrick emphasized the intention of the teacher in his concept of indoctrination. He did not deny the possibility of unintentional indoctrination, but nevertheless considered the teacher's intention to be the most important criterion of indoctrination. John White defines a teacher's so-called indoctrinative intention in the following way: "The child should believe that 'p' is true, in a such way that nothing will shake this belief" (White 1972a, p. 119, 1973, p. 179).
4. The consequence of teaching as a criterion of indoctrination. When we consider indoctrination in the light of the consequence criterion, we focus our attention to the outcomes of teaching and education. According to this criterion, teaching is indoctrination if the outcome is an *indoctrinated person*. John Wilson claims that an indoctrinated person lives in self-deception. She is a kind of sleepwalker

(Wilson 1972, p. 18). The ground of the beliefs of such a person are believed to be untenable or beyond rational reasoning. An indoctrinated person holds her conviction despite of counterevidence.

These four criteria – stated in this traditional way – include serious problems that could potentially render the entire concept of indoctrination useless in the context of a postmodern teaching situation. I agree with Snook, who claims that indoctrination cannot be defined as "irrational teaching methods" (Snook 1972, pp. 22–23). It is clear that when a teacher teaches in an authoritarian style, she tends to produce nondiscursive and indoctrinative learning, although this is a very ineffective way to indoctrinate in a modern teaching situation. It is mainly used in the military, in some private educational institutes, in some workplaces, and in other so-called total institutions (see Peshkin 1986). However, the lack of this kind of teaching does not necessarily remove the danger of indoctrination, which is why I disagree with John Wilson, who insists "it is also logically necessary to the concept of indoctrination that the indoctrinated person arrives at the belief by non-rational methods" (Wilson 1972, p. 19). The point in the concept of indoctrination is not, nor should it be, the concrete teaching method. The same concrete teaching method (e.g., question-answer circle) can be used either for indoctrinative purposes or for legitimate educative purposes. But I do not want to reject the aspect of method in the theory of indoctrination.

One might think that problems of the method criterion can be overcome by the use of the content criterion. According to the content criterion, teaching is indoctrination when the content of teaching consists of *unscientific doctrines*, regardless of teaching methods. This sounds promising, but the problem is how to define the term doctrine. What is the difference between a doctrine and scientific knowledge, quasi-science, and true science? Philosophers of science have not reached agreement on this subject, but teachers are expected to be able to discern between a doctrine and an irrational belief. Members of the Vienna Circle claimed that science is a system of true or justified beliefs

(justificationism; in the context of indoctrination, see, e.g., White 1973). On this matter, I agree with Imre Lakatos, who has written that after the non-Euclidean geometry, non-Newtonian physics, and inductive logic, “it turned out that all theories are equally unprovable” (Lakatos 1974, pp. 94–95). There were good reasons to abandon scientific justificationism.

Also Karl Popper has clearly demonstrated the incompetence of justificationism. He created the so-called criterion of falsification to be used as a demarcation between science and quasi-science. In educational literature, Gregory and Woods, and Tasos Kazepides, have revised the content criterion in accordance with Popperian falsificationism. Gregory and Woods claim that unscientific doctrines are such the kinds of statements that we can never know are true or untrue (e.g., political or religious conviction). No new findings or conditions can make a doctrine false. Gregory and Woods call this the “not-known-to-be-true-or-false” property of doctrines. In the case of scientific knowledge, there must be some condition when the statement will be falsified. According to Gregory and Woods, Karl Marx’s political economy was not a doctrinal system in the beginning; afterward Marxism became a quasi-scientific and non-falsificative doctrinal system (Gregory and Woods 1972).

This Popperian revision of the content criterion also has serious problems. Every scientific theory has some elements that are non-falsificative. Let us take Euclidean geometry as an example. From the point of view of falsificationism, one can say that Euclidian geometry is a doctrinal system, because there is no condition in which it could be falsified. But it would be ridiculous to say that the teaching of Euclidian geometry represents a form of indoctrination, because it does not include any criterion of falsification.

I am in strong agreement with John White, who claims that indoctrinated beliefs need not form a doctrinal system. As White likes to say, “indoctrinated beliefs could be of any kind whatever” (White 1972b). If this is the case, for the purpose of the indoctrination theory, we do not need any demarcation criterion in order to separate doctrines from science.

Ivan Snook’s and John White’s strategy to avoid the problems of method and content criteria is to connect the concept of indoctrination solely to the intention of the teacher. Of course, the teacher is an indoctrinator when she wants to indoctrinate or manipulate students. This type of case is clear (the case of the total institution). But how many teachers really want to indoctrinate students? Teachers who have truly understood the ethical codes of teacherhood have no intention of indoctrinating students. So, it is more meaningful to assume that indoctrination happens unintentionally (by structural causes). In this case, the traditional formulation of the intention criterion (see White’s definition mentioned earlier) is useless. The intention criterion does not recognize indoctrination that is caused by institutional or social structures. I presume that in the (post)modern teaching situation, indoctrination occurs at the level of hidden curriculum (see Snyder 1973). No teacher or no educational institution openly and intentionally indoctrinates students, although many unreflected attitudes and beliefs (e.g., racist and ethnocentric beliefs that would be rejected in the open and critical discourse) are transferred to the next generation through education.

The traditional formulation of the consequence criterion is also very problematic. It presumes that an indoctrinated person does not change her mind regardless of the counterevidence. But who is to say that a person is indoctrinated? Should an unindoctrinated rational person always change her mind when the counterevidence is presented? What amount of the counterevidence is needed for a rational person to change her mind? Was Einstein an indoctrinated person because he did not accept the quantum physics regardless of the very reasonable counterevidence presented to him? We could also take an example from ethics. If I postulate (and I do not give any rational grounds for doing so) that the “categorical imperative is a pure fact of Reason,” and I believe it to be so regardless of any counterevidence, am I an indoctrinated person?

One way to reconstruct a more actual and useful concept of indoctrination for a modern teaching situation is to apply Jürgen Habermas’s theory

of communicative action as Robert Young has done. Young's Habermasian concept of indoctrination opens up some promising perspectives, but on the other hand Young's theory has problems of its own. Before focusing on Young's theory and its problems, we must take a short look at Habermas's concept of the ideal speech situation and his theory of communicative action.

Jürgen Habermas on Linguistic Interaction

The Concept of the Ideal Speech Situation

With the concept of the ideal speech situation, Habermas is referring to the idealized conditions of speech. The ideal speech situation refers to the situation where conditions for argumentative action are ideals. This means that in discourse there is no other force than the force of better argument. There are no inner or outer restrictions that determine the outcome of discourse. Only the force of better argument determines the speech situation. In the ideal speech situation, systematically distorted communication is excluded (Habermas 1984a, p. 177). In this imaginative yet factually ideal speech situation, it is possible to gain consensus about all those subjects that generally are discursive in nature.

Habermas outlines four conditions for his ideal speech situation:

1. All potential participants in discourse must have equal rights to use speech acts in such a way that discourse could be permanently open to claims and counterclaims, questions, and answers.
2. All participants in discourse must have equal opportunities to present interpretations, to present assertions, recommendations, explanations, and corrections, and also equal chances to problematize (problematisieren) or challenge the validity of these presentations, to present arguments for and against. In this way all possible critiques are visible and no unreflected prejudices remain.
3. These two conditions facilitate the free discourse and the pure communicative action in which participants, by means of presentative speech acts (repräsentative Sprechakte), equally express their attitudes, feelings, and wishes and also in which participants are honest to each other (sich selbst gegenüber wahrhaftig sind) and make their inner nature (intentions) transparent.
4. Participants have equal opportunities to order and resist orders, to promise and refuse, to be accountable for one's conduct, and to demand accountability from others. It is only in this way that the reciprocity of action anticipations (Reziprozität der Verhaltenserwartungen) is realized (Habermas 1984a, pp. 177–178; see also Benhabib 1986, p. 285).

Habermas claims that no empirical investigation or study could ever reveal the facticity of the ideal speech situation, yet it still operates within it. It is a simultaneously real element of the discourse and a counterfactual standard for actual discourse (Habermas 1984a, p. 180).

Later on Habermas simply stops using the notion of the ideal speech situation and begins referring to the universal presuppositions of argumentation. He starts to speak about "universal conditions of possible understanding" and "general presuppositions of communicative action" (Habermas 1979, p. 1). In his article *Discourse Ethics: Notes on a Program of Philosophical Justification*, Habermas relies on Robert Alex's formulation of universal presuppositions of argumentation (Habermas 1990, pp. 88–89):

- (2.1) Every speaker may assert only what he really believes. (2.2) A person who disputes a proposition or norm under discussion must provide a reason for wanting to do so. (3.1) Every subject with the competence to speak and act is allowed to take part in a discourse. (3.2) a. Everyone is allowed to question any assertion whatever. b. Everyone is allowed to introduce any assertion whatever into the discourse. c. Everyone is allowed to express his attitudes, desires and needs. (3.3) No speaker may be prevented, by internal or external coercion, from exercising his rights as laid down in (3.1) and (3.2).

In this article, Habermas says that he does not want to specify, renew, or change his former notion of the ideal speech situation (Habermas

1990, p. 88). In his book *Between Facts and Norms*, Habermas definitively leaves the concept of the ideal speech situation behind and claims that discussion of “the ideal communication community” (Karl-Otto Apel) and “the ideal speech situation” tempts the improper hypostatization of validity claims (Habermas 1996, p. 323).

Communicative Action and Speech Acts

At the heart of the theory of communicative action is the vision that the modern world view is differentiated into three parts. This is why nowadays there are better opportunities to come to a mutual understanding. Following Karl Popper, Habermas distinguishes the objective world, the social world, and the subjective world. A communicatively competent speaker can independently present differentiated statements concerning any of these three worlds. She can independently evaluate any statement about the world with proper validity claims. There are three validity claims for these three worlds:

1. Truth (Wahrheit). A claim that refers to the objective world is valid if it is true, i.e., if it corresponds to the reality.
2. Truthfulness (Wahrhaftigkeit). A claim that refers to the subjective world is valid if it is honest, i.e., if it has an authentic relationship with the subjective world.
3. Rightness (Richtigkeit). A claim that refers to the social world is valid if it does not contradict commonly agreed social norms (Habermas 1984b, p. 440).

Let us examine the example of the claim “Teachers have right to practice indoctrination in schools.” This claim refers to the social world, and its proper validity claims is rightness (justice). A communicatively competent opponent could challenge this claim by stating that it contradicts that which is commonly considered as morally correct behavior (or it would be commonly considered as such in a free and critical discourse). If an opponent merely says that “My inner self told me that indoctrination is wrong” (truthfulness or

authenticity) or “It is scientifically proven that indoctrination is wrong” (truth), she is using an incorrect validity claim and she is not a communicatively competent speaker. So, in this case, the proper validity claim is that of rightness or justice.

To understand why Habermas has placed so much emphasis on the demand of mutual understanding, we have to look at Habermas’s theory of social action. First, Habermas divides ideal (pure) types of action into the categories of social and nonsocial action. An object of nonsocial action is nature, and the objects of social action are other people. According to Habermas, nonsocial action is always purposive-rational instrumental action: The actor makes use of specific objects for his or her own benefit. Social action can be either success-oriented strategic action or understanding-oriented communicative action. Strategic action is purposive-rational action oriented toward other persons from a utilitarian point of view. The actor does not treat others as genuine persons but rather as natural objects. Strategic action means calculative exploitation, or manipulation, of others. An actor who acts strategically is primarily seeking her own ends and manipulates other people either openly or tacitly. Communicative action is the opposite of strategic action. Communicative action – or its pure type – means interpersonal communication, which is oriented toward mutual understanding and in which other participants are treated as genuine persons, not as objects of manipulation. Actors do not primarily aim at attaining their own success but want to harmonize their plans of action with the other participants (Habermas 1984b, p. 285; see also p. 333.) (Fig. 1).

Habermas’s most vulnerable claim is that the tendency toward understanding is the immanent telos of speech or the original mode of language use. The instrumental use of language (in other words, strategic action) is, according to Habermas, parasitic on the original usage. “(...) the use of language with an orientation to reaching understanding is the original mode of language use, upon which indirect understanding, giving something to understand or letting something be understood, and instrumental use of language in general, are parasitic” (Habermas 1984b, p. 288).

		Action orientation	
		Oriented to Success	Oriented to Reaching Understanding
Action situation	Nonsocial	Instrumental action	—
Action situation	Social	Strategic action	Communicative action

Habermas and the Problem of Indoctrination, Fig. 1 Pure types of action (Habermas 1984b, p. 285)

To state arguments in support of this vulnerable claim, Habermas presents his own interpretations of John Austin’s speech act theory. According to Austin, the basic form of a speech act is **Mp**.

I claim,	that it is raining
M	<i>p</i>

The performance of this basic form of a speech act means that:

1. The speaker expresses state of affair *p* (i.e., *p*), in other words executes illocutionary speech act.
2. The speaker makes a claim, promise, command, avowal, etc., in other words executes a locutionary speech act (which is seen in modus **M**).
3. By carrying out a speech act, the speaker produces an effect upon the hearer, in other words executes a perlocutionary speech act. As Austin himself put it: to say something (*p*), to act in saying something (**M**), to bring about something through acting in saying something (Austin according to Habermas 1984b, p. 289).

Thus, Habermas claims that locutionary and illocutionary speech acts are the original features of language usage. If the speaker wants to achieve any kind of perlocutionary effects, she must execute locutionary and illocutionary speech acts in a satisfactory manner. The speaker must achieve so-called locutionary and illocutionary aims before reaching at any perlocutionary ends. Habermas thinks that the perlocutionary aspects of speech do not belong to *the immanent telos* of the speech act. A perlocutionary aspect appears only after people begin to practice instrumental action in the linguistic interaction (i.e., strategic action). When this happens, locutionary and

illocutionary aspects of speech are recruited as a means to utilitarian ends (strategic use of language). Strategic action is the kind of linguistic interaction in which one or more speakers want to produce perlocutionary effects. As such, only a portion of all linguistic interactions belongs to the category (pure type) of communicative action. The difficult question is, as will become clear below, whether teaching is communicative or strategic action.

Robert Young’s Critical Concept of Indoctrination

In sketching the non-indoctrinative and critical concept of teaching and learning, Robert Young constructs the concept of an ideal pedagogical speech situation (IPSS). It is based on Habermas’s theory of the ideal speech situation (ISS) explained above. It also refers to Klaus Mollenhauer’s educational theory (Mollenhauer 1972, p. 42; see also Masschelein 1991, pp. 134–136). Young interprets Habermas in the following way:

The idea of the ISS is a critical reconstruction of the assumptions of everyday speech communication. It is argued that these assumptions underlie the possibility of speech communication and are universal (...) When we speak we normally act as if a certain situation existed, even though, in fact, it does not. These assumptions are contra-factual (...) for without these assumptions there would be chaos. The assumptions are:

1. that what we are saying or hearing is intelligible, i.e. is coded according to the usual rules, etc.;
2. that what we are saying or hearing is true so far as it implies the existence of states of affairs;
3. that the person speaking are being truthful or sincere;
4. and that the things said are normatively appropriate considering the relationship among the people and between them the situation they are in.

(Young 1989, pp. 75–76)

For the purpose of the ideal pedagogical speech situation, Young defines a perlocutionary speech act as follows: “Perlocutionary action involves a special class of strategic action – that in which illocutions are employed as a means to ends other than reaching understanding and freely co-ordinating action plans in the light of validity claims” (Young 1989, p. 106).

Young emphasizes that we should not equate perlocutionary utterances with imperative utterances. Imperative utterances form merely one class of perlocutions. This class of imperative utterances admits two subdivisions:

Imperatives which appeal to known positive or negative sanctions which the person in power can control (type 2) and imperatives which appeal to a known normative context of legitimate authority (type 1) (...). But there exists another general class of perlocutions which might be called ‘deceptions’ or ‘ulterior purposes’ (type 3). In these, as Strawson has shown, a speaker has to succeed in getting a hearer to accept an illocutionary claim in order to succeed in some further purpose, which must remain concealed. (Young 1989, p. 106)

For example, a dishonest car salesman performs speech act type 3 when she is trying to persuade the customer (the perlocutive act) to buy a faulty car by presenting (illocutionary speech act) false statements (locutionary speech act) about its condition. In this way, the car salesman is attempting to successfully achieve a concealed strategic end, the sale of a faulty car at a good price.

With the concept of the ideal pedagogical speech situation, and with types 2 and 3 perlocutions, Young develops his own theory of indoctrinative teaching: “If the ideal pedagogical speech situation (IPSS) is one in which the student is able rationally to assess views or, at least, come to hold them in ‘a manner open to rational assessment,’ then only those speech acts which are illocutionary but not perlocutionary (in senses 2 and 3) can characterise the form of action we would want to call ‘educational’ rather than ‘indoctrinatory’” (Young 1989, p. 107). Because the difference between “illocutionary and perlocutionary acts (in senses 2 and 3)” is in the teacher’s intention, we can regard Young’s criterion for indoctrination as a communicative version of the intention criterion.

According to Young, it is not possible on the level of empirical pragmatics to show which of a teacher’s singular speech acts are legitimate (represent true education) and which are illegitimate (represent indoctrination). Perlocutionary intentions become visible in the structure of interaction over time. This is the general weakness of any intention criterion. Intention criterion focuses attention on the teacher-student relationship and excludes the aspects of social systems or ideological processes. Young recognizes this weakness, although he does not provide any supplementary criterion concerning content or consequence of teaching.

Critique of Young’s Criterion of Indoctrination

Young’s concept of the ideal pedagogical speech situation is problematic. It is based on Habermas’s theory of the ideal speech situation, which Habermas has abandoned or revised to something else. Both the ideal speech situation and the ideal pedagogical speech situation are ambitious attempts to overcome historicity, the context dependence of all our concepts. The concept of the ideal speech situation relies on the assumption that there exists some transcendental language game (Karl-Otto Apel), which precedes every actual speech situation. I think that these concepts (ISS and IPSS) contain values and preferences of our time, values that I gladly acknowledge. Nevertheless, conditions of the ideal speech situation are not properties of the transcendental language game. Attempting to promote these conditions to transcendental standards is, however, problematic.

Both traditional intention criterion and Young’s revised version do not recognize indoctrination that is caused by social structures and indoctrination that occurs at the level of hidden curriculum. In these cases it may well be that the teacher never uses sense 2 and 3 acts, but still some unreflected attitudes and beliefs are infiltrated into students’ minds. The teacher’s intentions may fulfill any requirements of validity, but some structural mechanism could still cause systematically distorted communication in teaching, which eventually leads to indoctrination of students.

Another problem is that teaching is a very special form of human interaction, which is why the concept of the ideal speech situation – and the concept of communicative action as such – may be poorly suited to the act of teaching. Is teaching, in its essence, communicative or strategic action? One could present very convincing arguments in favor of the notion that teaching is not at all communicative action (e.g., Moilanen 1996). According to Habermas, interaction is always strategic if perlocutive aims are involved. Where teaching is concerned, one could define didactic aims as perlocutive aims. From this point of view, teaching always remains as a perlocutionary action (in senses 2 and 3), in which the teacher attempts to influence others (*Beeinflussung des Gegenspielers*), and the teacher's success can be evaluated by criterion of effectiveness (the validity claim of the instrumental and strategic action). In this respect, teaching is always strategic action and teachers undeniably use perlocutionary speech acts (in senses 2 and 3).

One could also claim that teaching cannot be placed along the axis of communicative-strategic action (see Oelkers 1983; Kivelä 1996). I would still rely on Habermas's basic concept of interaction (communicative versus strategic action), but in a productive way. I want to introduce the concepts of communicative and strategic teaching, which are not simple applications of Habermas's original concepts. I follow Jan Masschelein's strategy to conceive pedagogical action as simulated communicative action (Masschelein 1991, p. 145).

I claim that the issue in the problem of indoctrination is not the question of what kinds of perlocutionary speech acts are legitimate (see also Puolimatka 1995, p. 153). The problem is more complex, and other aspects of teaching (content and consequence) should also be taken into consideration.

The Modified Habermasian Concept of Indoctrination

I understand communicative teaching to include value orientations in which the teacher commits herself to universal presuppositions of

argumentation and acts in accordance with these maxims as to the best of her ability ("normative minimum"; Mollenhauer 1972, p. 42). Pedagogical communication is a kind of simulated communicative action, and it is more simulated in the early stage of education. When a teacher teaches seven-year-old pupils, the words "to the best of her ability" have different practical consequences than in the case of a teacher who teaches twenty-year-old students. The value orientation is the same, but the practice or application of presuppositions of argumentation is different. When we understand communicative teaching in this way, as an exceptional form of communicative action, the concept of communicative teaching is looser than the concept of communicative action itself. I would like to think that communicative teaching – as an exceptional application of communicative action – still remains within the realm of communicative action, although teachers sometimes make use of sense 2 and 3, illegitimate perlocutionary, speech acts. I could imagine that the amount of perlocutive aims – the degree of simulation of the proper discourse – is higher in elementary school than in institutes of higher education, but the value orientation of teaching is still the same in both cases.

In dealing with the dilemma of indoctrination, we should refrain from focusing specific attention on the singular speech acts of a teacher. When the telos of education is to produce mature and communicatively competent people and the content of teaching provides materials for independent and critical thinking, then the teacher may use methods that, when taken out of context, may resemble strategic action and the perlocutive use of language (or may de facto be some form of strategic action depending on how one defines strategic and communicative action).

In this respect, I have set two parallel criteria for indoctrinative teaching: (1) the communicative method and intention criterion and (2) the empowering content and consequence criterion.

The Communicative Method and Intention Criterion of Indoctrination

Like William Kilpatrick, I think that the most important element in non-indoctrinative teaching

is the respect for other persons. Habermas defines communicative action as a kind of linguistic interaction in which one's fellow man is considered as a genuine person and in which aims and ends of action are decided in an environment of free and equal discussion. Opposed to this communicative action, there is the strategic action in which one treats others as a natural object, solely as a means to an end. I define the strategic teaching as the kind of teaching in which the teacher treats her students solely as objects, as objects of a series of didactical maneuvers. This strategic teaching is a form of indoctrination (strategic teaching is not the same as indoctrination), when a teacher tries to transfer teaching content to the students' minds, treating them merely as passive objects, not as active co-subjects of the learning process. Then the teaching is in no sense the simulation of the communicative action but the pure strategic action.

I define the communicative teaching, which is based on "The Bildung as a human teaching situation" ("Bildung als menschlich gültig Situation," Schäfer and Schaller 1976, p. 57), as contradictory to the strategic teaching. The aim is a communicatively competent student who does not need to rely on the teacher or any other authority for that matter. In communicative teaching, students are not treated as passive objects but as active learners. In communicative teaching, a teacher and her students cooperatively participate in the formation of meanings and new perspectives. In communicative teaching, the teacher does not impose her ideas on the students, but rather they make a joint effort to find a meaningful insight regarding the issues at hand. What I refer to as communicative teaching very closely corresponds with Gert Biesta's "the practical intersubjectivity in teaching." Biesta does not understand education "as a one way process in which culture is transferred from one (already accultured) organism to another (not yet accultured), but as a co-constructive process, a process in which both participating organism play active role and in which meaning is not transferred but produced" (Biesta 1994, p. 312). Unlike Biesta, I do not consider teaching (no matter how good a teacher is) as a symmetrical communicative action.

Communicative teaching is nearest to the ideal of communicative action that can get in a real teaching situation. Communicative teaching is a simulation of communicative action, a simulation of a free and equal discourse. It is also a simulation of democracy and democratic mode of action. This means that there could be no communicative teaching in the school, if there exists no kind of practice of a school democracy. Nevertheless, pedagogical action essentially remains as an asymmetrical relationship, because the teacher and her students do not share a common level of communicative competence. Only after a person has completed her education (*Bildung*) is she prepared to engage in the proper communicative action.

However, even my revised version of the method and intention criterion does not recognize the unintentionally or structurally caused indoctrination. Let us take, for example, the Hitler Jugend assembly in Germany in the 1930s. No matter how communicatively orientated the teacher or the Gruppenlieder was, elements of indoctrination were strongly present. The Hitler Jugend was a very effective training institution, and we cannot gain a comprehensive picture of its operations if we restrict our examination to the teachers' intentions and methods. In some teaching situations, no matter what a teacher's intentions and methods were, the outcome was still an uneducated ("indoctrinated") person. Thus, it is clear that we need aspects of the content and the consequence of teaching.

The Content and Consequence Criterion of Empowerment

The starting point in the empowerment content criterion is the constructivist view of knowledge (see, e.g., Berger and Luckmann 1979; Young 1992). Nowadays, teaching cannot be based on the notion that there exists a group of objective facts, which are deposited into students' minds like money is deposited in a bank. According to the constructivist view, knowledge is constructed through social processes. Knowledge does not imitate outer reality, but rather the system of knowledge is a construction of the reality. When the constructivist nature of knowledge is

recognized, higher demands with regard to the teaching content are directed. The teaching content should provide students with opportunities to construct their own creative and multidimensional view of reality. The teaching content should also promote students to engage critical self-reflection. Thus, if we want the teaching content to be non-indoctrinative, the teaching content should contribute to students' reflectivity toward those meaning perspectives that they have already adopted and toward those that are taught (see Mezirow 1991). The teaching content should not provide any easy answers but rather should improve students' own power of judgment and capacity for mature deliberation. I consider content that limits students' meaning perspectives and minimizes as opposed to increases students' own power of judgment as indoctrinative. In the case of indoctrination, the teaching content tends to keep students at an immature stage. The non-indoctrinative teaching content gives students both the freedom and faculty to determine their own differentiated identity, world view, and conduct of life.

The consequence criterion of empowerment is related to the theories of modern identity and reflective modernity (Beck et al. 1994). The idea of this criterion is to promote such kind of education that contributes to the formation of reflective and relatively open identities. In modern societies, identities are open to a certain extent. In every society, some part of identity is solid as a result of primary socialization, but in modern societies, the individual tends to remain somewhat incomplete. The modern individual is conscious of her capacity to change her own identity, and she possesses the perspective of many possible identities. This relatively open form of identity produces the pluralization of life worlds and meaning perspectives. People tend to grow up differently in modern societies. This corresponds with the situation that Emile Durkheim called organic solidarity (Durkheim 1984). In the stage of organic solidarity, society needs autonomous, independent, critical, and professional individual personalities. My claim is that if educational institutions tend to systematically produce closed identities (which are necessary in a traditional society

during the stage of mechanical solidarity), we can presume that these institutions impose some form of indoctrination. In modern or postmodern society, educational institutions should encourage a reflective attitude toward one's own identity.

Epilogue

Habermas's theory of communicative action could be a very important – but not sufficient – contribution to the theory of indoctrination. Robert Young was the first to apply Habermas to the theory of indoctrination, but Young's concept of indoctrination has its own inherent problems. Young's theory concentrates solely on the speech acts of the teacher, which should not be the point in the theory of indoctrination. This is why I present here a revised version of the Habermasian concept of indoctrination and I also supplement it with the content and consequence criterion of empowerment. I have to say that my critique toward Young concerns only a small portion of his larger critical theory of education. With the exception of this concept of indoctrination, I am very much in agreement with Young.

My revised Habermasian version of the concept of indoctrination requires the application of a proper theory of a subject and its genesis. The question is: How does a human grow into a mature person with the capacity for critical self-reflection and self-knowledge? Neither Habermas's theory of communicative action (which includes the socialization theory) nor the traditional analytic philosophy of education (and English sociology of education) provide the theory of a social subject.

Another problem is the question of power in education. According to Michel Foucault:

The individual is no doubt the fictitious atom of an 'ideological' representation of society; but he is also a reality fabricated by this specific technology of power that I have called 'discipline'. (Foucault 1992, p. 194)

Foucault poses a great challenge to the theory of indoctrination. If the Foucaultian illustration is the whole truth about individuality, then the

critique of indoctrination is impossible. My aim is to create a critical theory of education that takes into consideration both the aspect of freedom and the aspect of power in the process of socialization.

Hayek and Education

Nesta Devine

Auckland University of Technology, Auckland,
New Zealand

Friedrich Augustus Hayek is one of the most respected – if seldom read – of the theorists who, whilst defending a particular concept of

liberalism, from the basis of the discipline of economics – created the new political philosophy of “neo-liberalism.” Hayek has been particularly significant in the development of “Public Choice Theory,” which attempts to apply neoclassical economics to political life. In this way Hayek is a very important character behind the reform of education in many countries of the world: many of his views are now regarded as orthodox in sociology and education.

Class and culture: Hayek was born in Vienna on May 8, 1899. He was the son, grandson, and greatgrandson of men who were both scholars and public servants. His family belonged to the lower ranks of the gentry – Hayek as a member of the minor aristocracy would have been entitled to the honorary “von” except that the Austrian empire which lent such titles their legitimacy ceased to exist after the First World War.

During the First World War Hayek served as an officer in the Imperial Army. Afterward he returned to his studies in Vienna, but spent a few months at the University of Zurich, where he furthered his interest in psychology, on which he published a book, *The Sensory Order*, many years later, in 1952.

Hayek had a successful and eclectic education at the University of Vienna, where he studied law, and economics. He gained his doctorate in jurisprudence in 1921 and in political science in 1923.

The Austrian School

During his university career Hayek belonged to or helped to form the “Geistkreis” which was a loose association of university students and teachers who were interested in a range of topics. Associations of this kind had been a vibrant characteristic of Viennese intellectual life for many years. Hayek’s group were in a sense heir to the Menger circle, although he points out that Menger’s coffee-circle – the first “Austrian School” – were senior civil servants as well as professors in economics. The influence of Menger upon Hayek and upon economics in the academy and its reading in the world of politics would be hard to overestimate. In a sense, Hayek is the vehicle by

which Menger’s most important ideas were diffused throughout the English speaking world.

The distinguishing marks of the series of groups which form what is known as the “Austrian school” in economics are adherence to

- A narrow interpretation of Adam Smith’s views on the character of markets; the “invisible hand” converts individual participation in the market to general wealth
- The desirability of a minimalist role for government in the economy
- “Methodological individualism” (Carl Menger’s original contribution to economic theory)
- The notion of the “subjective theory of value” – also a contribution of Carl Menger – which attributes value to unpredictable individual preference, rather than to any fixed and calculable notion of the components of value

The Austrian school of economics owed its success – perhaps even its existence – to its peculiar ability to convert the great political doctrines of liberalism to a form of economic thought which restricted liberalism so closely to financial and economic affairs – both of the individual and of the State – that it posed no threat to the autocratic rule of the Emperor of Austria, and hence was not simply allowed to exist, but members were given favored positions within government. Participation in the market, not in government, or political life, became the great paradigm of freedom.

The Vienna Circle

Another group which had its effect upon Hayek was the Vienna Circle, the distinguished group of philosophers of science, who, starting with Ernst Mach, provided the foundations and parameters of scientific positivism. Hayek records his indebtedness to Mach, and to the ideas of Moritz Schlick, also of the Vienna Circle. Another member of the Vienna Circle who influenced Hayek was Karl Popper, whose book, *The Logic of Scientific Discovery* (1935) was at one and the same time a challenge to the school of logical

positivism, and yet was constructed in that tradition. Popper's views confirmed Hayek's dissatisfaction with the teachings of Mach as applied to social science, and yet reinforced his views as to what constitutes "science."

Career

In 1921 Hayek took a position in the (government-sponsored) Abrechnungsamt, an office for clearing debts incurred before the war, under Ludwig von Mises, and became a member of Mises "Privatseminar." His association with Mises was in many ways intellectually congenial to him, but his differences with Mises over rationality and epistemology sharpened his thinking on these points, and directed him toward a view of "subjectivity" and its consequences which took him on a rather different exploratory path.

As a result of this work and his exposure in 1923 to American debates on economic changes over time, he became interested in "business cycles" on which he wrote a paper which drew the attention of Lionel Robbins and this eventually led to his being offered a position at the London School of Economics.

During the war Hayek, although now a British citizen, was not involved in the management of manpower or resources in the way that most other British economists and many other academics were, from Lord Keynes down. Instead he reflected on what he saw as the inverse relationship between "planning" and individual freedom, and became one of Keynes's most effective critics. In this period he wrote *The Road to Serfdom* (1944), a book whose popular style secured his influence on political affairs for the future, but caused misgivings as to his professionalism among economists.

In 1950 Hayek was offered a position at the University of Chicago, not in the economics department or the school of management of public policy but in the school of social science, the "Committee on Social Thought." Hayek's interests were by now turning from economics to wider questions of human life: the processes of mind and perception (Hayek 1952a), and the relation of

individual minds to social order and constitutional issues (*The Constitution of Liberty* 1960). Although substantially sympathetic to the Chicago school of economists, he disagreed with them on monetarism and regarded them as "logical positivists" – a position he no longer adopted. Hayek regarded Friedman as "on most things . . . sound" but saw Friedman's book *Essays in Positive Economics* as "dangerous" (Hayek 1994, pp. 1434–1445). Eventually Hayek was invited to the University of Freiburg, where except for a relatively short period at the University of Salzburg he remained for the rest of his academic career.

Economics as Social Science

Hayek, always a voracious reader, read a great deal in the wider liberal tradition, and explored the writings of Jeremy Bentham, John Stuart Mill, Saint-Simon, and Comte, and published works on several of these writers. He was in a sense looking for a firm basis for a "social science." Menger's methodological individualism gave him the unit on which a science, in Mach's logical positivist understanding, could be built. But it did not account for what could and could not be admitted to this science.

Karl Popper's book *The Logic of Scientific Discovery* (1935) gave him some of the methodological ground he was looking for, although Hayek hesitated to commit social science completely to Popper's definitions of what constituted research methodology for social science. In particular Hayek wanted to maintain that the very identity of researcher and subject in the human sciences gave the researcher access to information in the form of "understanding" of motivation which would not be possible in other sciences, where the subject was inanimate or animal.

This reservation is an important aspect of Hayek's views on "rationality," a core concern of economists, since theirs is a science which attempts to explain human behavior. Hayek believed that rationality was a quality which was intelligible to other rational people. If a person's actions could not be understood, he was irrational.

Irrational persons were in a sense outside the pale: their behavior could not form the kind of patterns of iterated behavior which constituted “laws.” However, Hayek did not put the faith in human rationality which was typical of Kantian philosophers: he believed that human rationality was limited, and that it could not by itself be responsible for the great human institutions which form the backbone of (Western) society – the market, the family, the church.

The Evolution of Spontaneous Order

These institutions, so vital for the continued existence of “society,” he believed to have formed over time, by a process of evolution. The evolutionary process had weeded out less advantageous forms of human relationships, and had left behind these outstanding examples of the “spontaneous” creation of order from the chaos of myriad individual human decisions. No one human he contended was sufficiently rational to be able to coordinate all the variables which came together in one of these institutions: they were therefore not of human design, although they were of human creation. In effect Hayek had devised a scheme of social Darwinism which valorized certain institutions – the market, the Church, and the family, as evolutionary survivors, and therefore the “fittest” form of human institutions. His term “spontaneous order” however also suggests that these institutions erupted from the evolutionary process without genealogy – without a history. “Collectivism” – which he sometimes calls “tribalism,” he regards as an early and inferior form of human organization, now outmoded by the evolutionary process.

Catallactics

In further examining one of these institutions, the market, Hayek emphasized “catallactics”: the “science of exchange.” The price mechanism supplied information to the buyer. Competition amounted to a research program: only in a competitive context could the buyer have the choice

which made possible evolution from those choices of higher forms. Hayek regarded competition as a discovery procedure which compensated for the limits of knowledge, not as an end in itself. Limitations to competition result in a lack of information available to buyers, and consequently the evolutionary process – the process of continual improvement – is interrupted or distorted. He has no qualms about the unequal distribution of wealth arising from competition or inheritance: he was not interested in “equality” as a desirable feature of political or economic life. In his view, the impartiality of the application of the rules of competition would make the consequences acceptable to those who might experience disadvantage through that mechanism. The market is equal, and democratic, because everyone can enter into it, and it is free because no one is obliged to buy or sell.

The Application of Economics to Politics

From this valorization of the market and competition Hayek makes one of those great moves of “displacement” which creates a new discipline. Hayek developed an acceptance of Adam Smith’s “invisible hand,” the notion that the market is the vehicle for converting many individual transactions into general wealth by marrying buyers and sellers, and conveying information about supply and demand through the price mechanism, into a notion that that mechanism could be applied to other areas of human endeavor. For the corollary of Hayek’s idea of the limitations of human rationality was that humans are not capable of encompassing all the variables they need in order to make the grand decisions which government makes, particularly when it decided to do without, or reduce the role, of the market. This is the point on which he had disagreed with Mises: Hayek believed that Mises overestimated the possibilities of rationality, and therefore laid himself open to those errors of planning, predicting the future, and government intervention which were characteristic of socialism, communism, and fascism. The market on the other hand is an institution which compensates for the limited rationality

of human beings, yet allows them freedom in the sense of being able to make “choices” and incorporates their myriad choices into an evolutionary process of perpetual improvement. Therefore the market is a superior form of governmental institution than government. The role of government should be limited to protecting the bases of the market: personal and property rights. Although he is prepared to accept a limited role for government as a “safety net” this must not be allowed to create monopoly or to undercut or otherwise distort the market.

This is the theme of Hayek’s most popular and influential book, *The Road to Serfdom* (1944). In this book Hayek argues that State intervention, the welfare State, socialism, fascism, bureaucracies, all share the same fallacy: that the human mind is capable of integrating the needs of the populace into a plan which can be executed by government. To accept the exigencies of wartime planning in peacetime is to start down the road which leads to fascist dictatorship, and ends the freedom of individuals. This book was directed squarely at the work of J.M. Keynes, whose economics was a direct response to the political and economic needs of the Great Depression, and whose adherents were working on the theoretic and practical application of his ideas in the welfare States which developed throughout much of the Western world during the 1930s and 1940s. *The Road To Serfdom* became very popular, and according to Cockett, formed the basis for Churchill’s unsuccessful election campaign in 1947.

Although the importance of this book and subsequent writing by Hayek should not be underestimated, his real impact but also ironically his effectual theoretic subversion – took place, not directly through his own writings but through the machinery he set up to spread neoliberal conceptions of economics, politics, and government.

The Mt Pelerin Society

In 1938 Hayek had been part of a “Colloquium Walter Lippmann” which was called to consider the problem of the encroachment of socialist and fascist forms of government and the lack of

effectiveness of liberal arguments. Any plans for coherent and practical action were interrupted by the war, which was in itself a gorging, a gluttony of State control and intervention. After the war, Hayek tried again. He called a select meeting at Mt Pelerin in the Swiss Alps, of people dedicated to similar, neoliberal, and conservative ideas. The Mt Pelerin society was formed. Among its founding members were Hayek, Milton Friedman, Karl Polanyi, Karl Popper, James Buchanan, and the English millionaire Ralph Fisher. Fisher’s money provided the basis for the establishment of the Institute of Economic Affairs – the IEA, which took as its business the task of creating a favorable climate of opinion for the implementation of neoliberal principles of economic and government management. The IEA published the “Hobart pamphlets,” a series of simple, easily read articles on matters of public interest, all written from a clearly identifiable neoliberal point of view, but all claiming the impartiality of “science” and rationality. These short, clear texts, some of which were written by Hayek, have influenced the thinking of politicians and economists all over the world.

The success of the IEA proved the inspiration for the creation of similar “think-tanks” all over the world. Cockett estimates that they now number about 500. Prominent groups of this kind include the Adam Smith Institute, the Centre for Independent Studies, the Heritage Foundation, the Hoover Institute, the New Zealand Business Round Table, etc.

Hayek is not the only economist to be publicized through the IEA, but the common themes are ones which are consonant with Hayek’s ideas – the importance of the market, the stress on “market messages,” the fostering of competition, the need to diminish the impact of government on the economy, the indifference to social and economic inequality. Other parts of the neoliberal package he would be less happy with: human capital theory, for instance, reflects precisely that objection Hayek had to Mises’ belief in the possibility of human rationality: manpower planning preempts the market, but only the market, according to Hayek’s ideas, could rationally coordinate the demand and supply of labor.

Planning, a necessary feature of the implementation of human capital theory, is the first step down the “road to serfdom.”

Hayek and Democracy: The “Rule of Law”

Hayek’s views on the limitations of individual rationality caused him to have a fairly pessimistic view of democratic institutions. His political views it must be remembered were formed in a youth spent under the most conservative government in western Europe, under whose auspices liberalism had been recast as the freedom to get rich, not to alter the government. To Hayek’s way of thinking democratic government offered a means by which taxpayers could be coerced by nontaxpaying majorities. There is no guarantee under democratic government that the principles of justice or fairness will be followed, but rather, given the Smithian concept of the self-interest of the individual, it is likely that lobbies will suborn politicians by means of an appeal to their self-interest. The very notion of “social justice” – which is in the interest of the poor majority – must, by impelling government to interfere in the interests of egalitarian distribution, bring about a totalitarian form of government (Hayek 1976, p. 68, vol. 2). A well-governed country must therefore have some form of limitation on the self-interest of politicians and lobby groups.

To this end, Hayek developed the idea of a kind of “super-law” which would enforce general rules of just conduct. Initially Hayek’s concept of the “rule of law” was vaguely assimilated to Plato’s notion of the Rule of Law under the philosopher kings. But where Plato saw the Rule of Law as being an outcome of the government of just men, Hayek saw the rule of law as a way of controlling venal men. In his later writing, the rule of law becomes a proposal for a particular form of second House, the very purpose of which is to impose limits to the power of government. Hayek acknowledges the conflict between the idea of a universal rule of law and the idea of egalitarian access to the fruits of good government:

A necessary, and only apparently paradoxical, result of this is that formal equality before the law is in conflict, and in fact incompatible, with any activity of the government deliberately aiming at material or substantive equality of different people, and that any policy aiming at a substantive ideal of distributive justice must lead to the destruction of the rule of Law. (Hayek 1986, p. 59).

The idea of a universal superlaw has been widely spread and influential in various countries who have instituted some laws which are beyond the immediate power of government to alter – rules affecting, for instance, the inflation rate, the control of central banks, and the like. Essentially, the political program of a small group of economists has become “laws” which have been inscribed into statutes so that they become structural. Even if people of a different political persuasion should manage to attain power, their economic and political options are thereby limited.

A New Form of Liberalism

It might be argued that Hayek sought to reinscribe in liberalism the elements of advantage and property which the liberal theoretic disposition to egalitarianism had put in jeopardy. The insistence on a form of liberalism which re-emphasizes property and in effect makes participation in political affairs reconceived as economic affairs dependent upon having a stake with which to enter the market is an idea not only redolent of nineteenth-century liberalism but a formulation with great appeal in a Western world in which the traditional ruling groups find themselves under threat by others requiring inclusion in terms derived from the principles of liberalism itself. Hayek’s unease with the extension of power to other groups can be seen in John Stuart Mill and Harriet Taylor, in whom, despite his evident sympathy with the emotional and social difficulties in their relationship, he has little sympathy with her extension of liberal ideas of freedom beyond the conventional – indeed he describes her as “rationalist”, (a serious criticism from Hayek!) and remarks that after her death Mill “withdrew a little from the advanced positions” she had caused him to take up (Hayek 1951, p. 266).

Education

Hayek's views on the superiority of markets have been widely applied, not least in the field of education, with results which he would have found deeply distasteful. On education Hayek was a classical liberal: he believed profoundly in the value of a liberal arts education, and would have resisted the notion of an education geared to the economy, both because of its inherent inadequacy as education but also because the limitations of our knowledge make it impossible to educate students for a future we cannot know. This is evident in his spirited attack on the Ecole Polytechnique, and its belief that it was possible to know – and consequently engineer – all things. The Ecole Polytechnique in Hayek's opinion is the real origin of socialism: its belief in the possibility of knowing enough to be able to alter human society he describes as “hubris,” the pride which challenges the gods. In a similar vein, throughout his life he attacked “scientism,” again on the grounds of the extent of knowledge, particularly in the human sciences. It is these very limitations of human knowledge which in Hayek's view make the market so important, because it creates, conveys, and reveals information in a way no other human institution can emulate. Hayek intensely disliked the restricted form of knowledge taught at the Ecole Polytechnique – he mentions in particular the absence of Greek and other languages, history and literature – and its result:

...the technical specialist who was regarded as educated because he had passed through difficult schools but who had little or no knowledge of society, its life, growth, problems and its values, which only the study of history, literature and languages can give. (Hayek 1952, p. 110).

Presumably he would not be in favor then of the limitation of education to the vocational and commercially vogue subjects which is too often the logical outcome of the application of market principles to education. Indeed, genealogically, the notion of human capital, which underlies much of the pressure on schools to become training grounds for the economy, derives from Hayek's associate Ludwig von Mises' views,

and conflicts directly with Hayek's suspicion of rationality, planning, and predictability.

Although the remodeling of education as a “market” might be seen to be in accord with Hayek's views on “catallaxy,” that is, that competition between schools should reveal information about the best model of school, the one which commands the highest price presumably being the evolutionary survivor, his prescription for curriculum was quite deeply affected by a notion of the requisites of the development of a subjectivity which could not in itself be reduced to a planned production of a certain kind of worker, or even manager.

Hayek's profound distrust of government involvement in the economy might lead one to imagine that he would support the privatization of education, but there is no evidence in his account of his education at the University of Vienna that he believed it would have been more effective as a private institution. The general acceptance of his views on the inherent dangers of government provision of services has been used to support programs of privatization, including steps toward the privatization of education. It seems likely however that Hayek would support at least a minimum involvement in government provision of education as a public good. The essential problem for education which arises from the application from Hayek's views is that the application of market principles may limit the formation of the individual whose judgment, exercised in a multiplicity of choices, creates the market's evolutionary drive toward perpetual improvement. Hayek's opposition to the narrow education of the Ecole Polytechnique indicates that, whatever the cost, quality education is essential to the continued liberal project, even in its neoliberal form.

Introduction

One of the most important contributions to the critical pedagogy of Paulo Freire comes from German philosopher G. W. F. Hegel. While there is an ongoing debate as to whether Freire's *Pedagogy of the Oppressed* (*PO* hereafter) has superseded its intellectual predecessor, this section will focus on unearthing the underlying influence of Hegel's philosophy through a comparative description of the *PO* and the *Phenomenology of Spirit* (*PS* hereafter).

Both Hegel and Freire sought to write a book that could serve as a ladder toward self-awareness, freedom, and liberation. In Hegel's case, the *PS* is a history of the *education* of consciousness, one that results in "absolute knowing," which is also referred to by Hegel as the "standpoint of science" (as in the *Science of Logic*) (Hegel 1991). In other words, the *PS* focuses on the tendency of world history (i.e., Spirit, or the totality of the history of all consciousnesses, of all human beings) toward freedom and defines "science" as the philosophy or vantage point from which the reader can comprehend this process and become aware of this journey, which is also the reader's own journey.

It should be noted at this point that by "all human beings," Hegel meant white, European, subjects. There is debate in the literature as to whether Hegel was influenced by the Haitian Revolution (Buck-Morss 2009), as well as to his feminist credentials (Mills 1995). Nonetheless, in the *PS* all the crucial historical, political, cultural, religious, and philosophical references are properly speaking European; the *PS* generally excludes consideration of other civilizational perspectives.

In Freire's case, the *PO* offers a pedagogy, a method that can spur the process of the education and ultimate liberation of the oppressed consciousness. Its underlying assumptions are similar to Hegel's: the oppressed and the oppressor are incomplete beings who can become conscious of their own incompleteness and attempt to become more fully human. A closer examination of the following themes will reveal the parallels and differences in more detail (Mills 1995).

Lordship and Bondage

One of the most visible resemblances between Freire and Hegel is in their treatment of the relation between the master and the slave. In the *PS*, the chapter on Lordship and Bondage belongs to the development of self-consciousness at the individual level; later chapters in the *PS* will deal with the same topic from the societal and spiritual level. Self-consciousness can be defined as a prototypical human that knows itself as a subject and is aware of its capacity to transform the world and its surroundings.

But where did this “subjectivity” come from? How did it develop? Lordship and Bondage is preceded by a section in which Hegel argues the following: nature or the objects of desire (food, water, all of natural existence) cannot properly be the medium through which a person comes to awareness of its own subjectivity; only through a relation to another human can a person come to know itself as a subject. In other words, only through the struggle against another human can the human animal awaken its self-consciousness. This is the education process that self-consciousness undergoes in Lordship and Bondage.

Thus, the struggle between the master and the slave is one of recognition; both want to be recognized as the master, as a subject. When they first encounter each other, each thinks of itself as subject and the other as a mere animal. Insofar as each self-consciousness is unwilling to accept the other’s authority – for to do so would entail the self-negation of selfhood – each tries to force the other to recognize a foreign authority, and the struggle necessitates the risk of life as proof of independence from nature.

Each self-consciousness is here engaged in a struggle for a misguided notion of freedom, namely, the notion that only as an independent individual can I be said to be a person, a subject. Kant’s moral laws, the Hobbesian sovereign, are all built upon this fantasy of pure detachment from society and nature. Self-consciousness is, hence, the ultimate egotistical being, wholly absorbed within itself and only preoccupied with and only aware of its private interests. Everything beyond is seen as a mere limitation, as a shackle, and as a radical otherness.

The struggle for recognition, however, fails if one or both parties die because a claim to authority is a claim insofar as there is someone to obey. The struggle can result in a positive result only if one self-consciousness learns that life is essential to be a self-consciousness; there is no such thing as a dead subject, and thus life and subjectivity constitute an unbreakable interdependence. In the midst of the struggle, then, if one of the parties pays heed to its instinct for self-preservation, it will be forced to submit to the will of the other, accepting a dependent existence and becoming a slave. The victor, who has thus proved itself to be a pure independent self-consciousness, is the master.

The lord is now in command of the slave by virtue of proving he has no fear of death and is therefore independent from nature. Moreover, he can enjoy that which provides sustenance through the labor of the bondsman. This mediation allows the lord to further annihilate the independence of life; for example, the pig becomes pork, a human food, not an animal that has an independent existence. In this pure comfort, the master achieves self-identity with life, turning everything in the natural world into an extension of his will.

A problem, however, arises. The lord lacks the one thing that drove him into the struggle in the first place: recognition by an equal, another self-consciousness. In degrading the bondsman to a thing, the one recognizing the lord’s authority is not a subject. The master certainly grants the slave a certain level of recognition. After all, masters do eat food prepared by slaves, give them commands in a shared language, etc. But this recognition is of a limited kind and at best equates the slave to animals with more advanced cognitive functions. For the master the one thing that makes a human truly human is missing in the slave: the capacity to live by normative values, to obey a law for its moral worth alone, and to be absolutely free and independent.

And because the master’s authority is only morally binding and human, if it is recognized as such by another human, the lord is condemned to be uncertain of his own subjectivity. In other words, to be a human among animals is to not be a human at all. This is the result of a recognition that is one-sided and unequal: a radical

dissatisfaction that will drive the lord into unconscious manifestations of insecurity and doubt. As the blame is pushed on the slave, the master will resort to ever more tyrannical expressions of rage and madness. Ultimately, in dehumanizing the bondsman, the lord dehumanizes himself, sinking to animal desire, to a subhuman existence precisely because he attains the independence and power over everything.

This movement is a dialectical reversal, wherein the master showed that its essential nature is the reverse of what it wants to be; in wanting to become a subject, it nonetheless sinks into the existence of an object because it lacks recognition. The slave, on the other hand, will also go through a dialectical reversal and become the truly independent self-consciousness.

The bondsman believes that the lord is an independent subject. What it does not yet realize is that in the experience of being subjugated and forced to labor, it has itself already become a potential subject. The lord merely declared its independence from life *in principle*, but *in practice* it is a glutton, a slave to its animal desire. The slave, on the contrary, by way of servitude, denies his own natural impulses; through work, the slave postpones the satisfaction of desire.

Not only does he achieve independence from life in the labor process but also an enduring recognition in the product of this work. While for the master everything that has an independent existence is alien and therefore needs to be subjugated to its will, for the slave the product of his work is an external thing that retains its independence vis-à-vis its creator, but is nevertheless not really alien. By transforming the world, the slave sees himself reflected in the thing. Thus, a new form of independence is revealed to the slave, and he comes to see in the independent existence of the object his own independence: If the object, something completely at the mercy of the slave's work, still retains an independence, a self-identity, then the slave himself, though enslaved, also possesses the same kind of independence.

Hegel ends this section by emphasizing that both the absolute terror of death and alienated work are essential for the slave's transformation. In other words, the master, who makes sure the

slave faces both of these oppressions, is essential to the slave's freedom. Without a fear that can make the slave tremble and despair, work becomes a mere expression of self-certainty. Conversely, without work, there is nothing that can reflect back to the slave his own essential independence. Fear without work is pure dependence on the master, and on nature, work without fear is pure independence, a form of fully self-absorbed vanity. The freedom earned by the slave in his torments is an embedded one. It is an independence that can only and necessarily come forth within the confines of absolute dependence and servitude.

However, this freedom is only an inner freedom of the mind, not yet the objective freedom that can only come through the abolition of the institutions that enforce enslavement. The slave's independence, its freedom, is therefore something that will not help him attain mutual recognition: this freedom is merely the freedom of stoicism, a retreat into the abstract kingdom of the mind.

Oppressor and Oppressed

Freire's account of his own master-slave dialectics borrows many aspects from Hegel's. But he also diverges significantly, not the least because for Freire, the stoic freedom of Hegel's slave is inadequate for the context of a postcolonial Brazil in the twentieth century. If Hegel's chapter ended in a subjective freedom (which Hegel goes on to supersede), Freire will set his aim at objective freedom, at the overthrow of the objective conditions of enslavement and oppression. This underlying difference is the source of the main divergences in their respective analyses.

From the outset, Freire shares the foundational assumptions of Hegelian thought: the meaning and essence of being human is to be recognized as a subject and to develop our capacities as social agents in this world. Dehumanization is the negation of this essence, and it is the vocation of those affected to strive for freedom and recognition. Freire also takes from Hegel the idea that oppressors are not fully human; in Hegel's terminology, they have not attained self-consciousness or rather regress into animal desire. Freire further adds that only the oppressed can achieve the liberation and

humanization of both parties. And the way to achieve this is, just like in Hegel's case, through work and through praxis.

A crucial difference surfaces here: the objects of work in Hegel's case were things of nature – stones, animals, plants, wood, etc. The kinds of work involved were along the lines of carpentry, farming, cooking, construction, and such. In Freire's case, the objects of revolutionary praxis are social relations, that is, the institutions of social oppression, exploitation, and dehumanization. And this kind of work involves a spiritual rebirth of the oppressed consciousness, one that is marked by the love of humanity.

In the beginning, Freire says, the oppressed will adhere to the oppressors; they think that to be free is to have power over nature and over other human beings. This was true of Hegel's slave as well. It sought the status of master, but lost in the ensuing struggle. Freire names this misidentification with the master as a manifestation of the slave's fear of freedom. To achieve freedom, the oppressed must embrace the risks of freedom that revolutionary struggle entails. Here is yet another difference with the *PS*: while for Hegel the fear of death was crucial for the slave's development as a spiritually, if not physically, free subject, for Freire the condition for the freedom of the oppressed is to be rid of the fear of death.

But the courage of the oppressed is not motivated by the desire to control and suppress the freedom of another being; this was the mistake that the master made in the *PS*. For Freire the struggle of the oppressed is not aimed at gaining power over the oppressors. Doing so would only result in a new situation of oppression. This is the reason why the oppressor can never be the liberators and humanizers; they know only of violence and lovelessness. The oppressed, on the other hand, have the capacity to shed their fear of freedom, which also involves the fear of death, and turn their fight into an "act of love."

The notion of love is central to Freire's thought. And even here, there are remarkable similarities with Hegel's emphasis on the collaborative nature of mutual recognition. In the *PS*, self-consciousness is described as essentially split, a duplication, something that is radically

independent, free, and self-determining only insofar as it exists in a relation of radical dependency. In other words, self-consciousness is radically dependent, first and foremost on nature, because life is the medium in which the self is embedded; secondly, on "others," because the self cannot exist as such without recognition, without another self acknowledging me as a subject.

Of course, the *PS* has shown how self-consciousness tries to suppress this dependence and claim its independence over nature and over its own social peers. And it has also shown that the master inevitably fails in its quest because it had a naive idea of what independence means; it is impossible to "supersede" another human being, i.e., to force recognition from the other, unless the other is willing to give it. A human is, after all, different from a fruit, and nothing done externally can forcefully extract recognition. No amount of violence can help the master become a humanized self-consciousness. Consequently, the action of seeking recognition can only be achieved together, in communion and in solidarity, as an act of love for the other that is nothing but an act of love toward oneself. Hegel tells us that self-consciousness needs to become aware that it at once is, and is not, another consciousness, if it ever wishes to move beyond the limiting narrowness of self-identity and into full humanness. This is also, in essence, what underlies Freire's notion of revolution as an act of love, rather than of violence. Its goal is not to suppress an enemy but to affirm the essence of being human for both the oppressors and the oppressed.

Moreover, the struggle to achieve this will not come without a fight; Freire was not a pacifist. In his view, freedom has to be conquered, for the transformation of the objective conditions of oppression necessarily involves all forms of power struggle. In this sense, Freire is also agreeing with Hegel insofar as the latter believed that in some instances, bloodshed and death are part of the life process of spirit by which renewal and birth become possible.

Lastly, it should be noted that both Freire and Hegel shared a similar ontological framework; if their belief in the perfectibility of humankind is still highly debatable, what is certain is that both

affirmed the very possibility of historical progress. For Freire, humanization was not merely a historical possibility but a human vocation that the oppressed are fated to pursue. And while dehumanization is for him a historical reality, it merely comprises an “inauthentic” expression of social reality. Hegel, on his part, similarly affirms the “self-certainty” of the master as a necessary element in the slave’s development into stoicism but labels it as a “one-sided” and misguided manifestation of spirit (this confidence in the march and progress of history would come under heavy critique and doubt in the course of the twentieth century).

It is against this ontological background that Freire’s pedagogy is designed to make an intervention: its goal is not to direct the oppressed or grant them freedom (this is impossible). Rather, the emphasis is on helping them open a path toward their own liberation. The means to achieve this is a dialogical pedagogy that is synonymous with the practice of freedom. In other words, it is a pedagogy that helps both teachers and students recognize each other as essential to their respective identities as free subjects. And above all, it is a pedagogy that fosters a concrete set of actions aimed at changing the objective conditions of existence beyond the confines of the classroom. Thus, when undertaken dialogically, education is potentially a historical intervention in objective existence of revolutionary proportions.

This means that while Freire borrows from Hegel the main outlines of his ontological framework, the pedagogy introduced in the *PO* constitutes the main point of departure between the two thinkers. On the one hand, Freire’s pedagogy spoke for a different constituency; the *PO* is the theoretical manifestation of a different social group, in a different historical time. On the other hand, this pedagogy represented a non-prescriptive blueprint for a form of political praxis, a point of view that is absent in the *PS*. While the *PS* inhabits the skins of the particular forms of consciousness in history, it does so only to the extent that it shows how the inner workings of its own assumptions bring about its own collapse. The book itself is written from the “standpoint of science,” a point of view that is universal and from where the reader can comprehend the

entirety of the process of the spirit’s development. Thus, in developing a pedagogy that focuses on praxis, Freire abandons the standpoint of absolute knowing and claims the particular social space inhabited by the revolutionary class of his time.

Hegel and Philosophy of Education (I)

Tarso Bonilha Mazzotti

Universidade Estácio de Sá, Rio de Janeiro, RJ, Brazil

In European eighteenth century the reform of pedagogy or the education of children and youth was one of the most important themes discussed in families, social gatherings and a variety of auditoriums. These debates reached the nineteenth century centered on an incompatibility between the necessity of disciplining children and youth and, at the same time, guaranteeing the development of moral or ethical autonomy. To Bernard Bourgeois (1978) the philosophy instituted by G. W. F. Hegel is both “a pedagogical philosophy and the pedagogical philosophy” (pp. 9–10). For Hegel the education process consists of becoming conscious of the need of limiting one’s impulses in order to realize oneself as an ethical being. The educational process takes the immediate subjectivity [without mediation, undetermined, in itself,

singularity or individuality] to, from the exterior, conduct it to the mediate subjectivity [educated man: “citizen”], determined by the rationality that manifests itself in the State (*Staat/Volksgeist*). That’s why Hegel says that the educated man is a moral, ethical, universal; that is, he is saying that the essence of the educational process is found in the universality of the spirit of the people (*Volksgeist/Staat*), in which the “good and bad, fair and unfair contents, are determined, for usual cases of private life, in the laws and costumes of the State” (Hegel 1946, p. 77). These contents express the proper morality [Moralität] of each social class and the harmonization of the interests of the classes in a rational state.

This “major history” is the *efetivation* of a movement that is beyond all historical people, being over and above each immediate moral community. It is the realization of the idea that, in its substance, is the universal spirit (*der Geist*; God). In this history, the universal spirit was initially joined to matter in an undetermined way – nature; *physis* – and, by an act of will, perceived thyself limited by materiality. This experience in the material world was made by Asiatic, Greek-Roman and German peoples, and in these peoples some individuals accomplished the task of self-consciousness of the spirit. These individuals give a positive answer to the problem of existing morality, exceeding the undetermined dissatisfaction of other men – who just complain, express their dissatisfaction, remaining in the negativity – these individuals overcome, those difficulties and make a new morality.

Do historical individuals know the state of the world? Are they able to predict the course of history?

Hegel supports that “the state of the world is not known. [...] The others follow this soul’s conductor, because they feel that in him is the irresistible power of his own internal spirit” (Hegel 1946, pp. 78–79). For Hegel, historical individuals are practical; they are not theoretic or philosophic. They act aiming to achieve their private interests, but these, even though they do not know, are of the absolute spirit. Since trap of the reason – producing the self-consciousness of people spirit.

Since the real educators of people are their heroes, educational processes are necessarily formal. The child and the young have an immediate subjectivity that needs to be adapted to the proper morality spirit of the people. Thus, the familial and scholarly education can only be initially formal discipline (*Zucht*), since it must adapt, in an external way, each singularity to the morality of people. This discipline, however, is not arbitrary and is not abstract, because it is the people spirit that requires it and it is, in itself and by itself, the manifestation of the universal spirit. The universal spirit requires that each individual overcomes himself as a being, as wish impelled by the matter that he also is, to become a complete spirit, that knows which are his needs and, because of that, knows how to restrain himself and limit himself. This discipline is not, in fact, something that is taught only in the schools, since it is the needed expression of the people spirit’s morality. The school must maintain and develop this morality and, in the case of schools that lead to higher education, expose its reasons. Moreover, the schools that lead to higher education must train the students in the disciplined intellectual work required by science and philosophy. The restless young spirit, that is, found in gymnasium, must be restrained and, by a pedagogic trap, conducted through classic literary studies to the comprehension of the morality which has its principles in the spirit of the Greek people (cf. *Bourgeois* in Hegel, 1978, pp. 43–57). The same is not required in technical schools adequate to the interests of the classes of manual workers. This division of schools according to the social classes does not imply any depreciation of those who take university courses, because the social division of work does not imply any essential difference among men, because the individuals have their function designated and, therefore, their duty designated; and their morality consists of behaving according to this duty (Hegel 1946, tome I, p. 75).

In fact, for Hegel, university does not distinguish men; any distinction comes from their acts. These acts are qualified by their knowledge of the people spirit. Schooling is only one of the possible paths to the formation of the individual, because ethical acts (of morality, civility, citizenship) depend on the conformation of the individual to

the people spirit, being in a common life [civil society], particularly through the reformed Christian religion. Notice that, for Hegel, philosophy and sciences are not efficient agents of transformation of the world. This transformation is only made by practical men, historical individuals, who are not philosophers and do not need philosophy. For Hegel, philosophy is, in fact, the “notary” of history, that is, takes note of what has already happened. It is like the owl of Athens, which only wakes up at nightfall.

The educated man reaches universality which objectivates itself completely in the State composed by free men – aware of their needs and, therefore, capable of self-limiting. Only in the State [*State/Volksgeist*] man has rational existence. All education tries to ensure that the individual does not continue being something subjective, leading him to make himself objective in the State.

[...] The truth is the unit of the general will and of the subjective will; and the universal is in the Laws of the State, in the universal and rational determinations. (ibid., pp. 88–89)

Moral life is the essence of the State. Through the unification of the subjective will as the general will, the will is both an activity and the principle by which social life is established. The life of the State “implies the need of the formal culture and, therefore, of the birth of sciences, as well as of a poetry and of with art in general” (ibid., p. 139). These formal human activities need to be cultivated in schools; the same happening with philosophy which is the thought of the thought. Since the universal thought is destroyer, keeping only the principle of the spirit – the liberty – we have that the educational task is the one which destroys the immediate subjectivity so that the universality of thinking goes on its course – alienation determined by the people spirit. But this is not an infinite path, because it has an end [terminus], which “is to turn to itself” (ibid., p. 145). That’s why Hegel states that: “all individual needs to go through in his distinct fields, which are the bases of his conceit of spirit ...” (ibid., p. 147). The schooling education is, then, the form of the culture (*Kultur*) and the educationally formed man is the one who lives the universality of the culture, lives the content-substance of the people spirit.

As we saw, although Hegel does not propose a philosophy of education, his philosophical system is a pedagogy that leads the singularity of his state of almost philosophical unconsciousness to his state of consciousness. Not by chance he wrote and rewrote the *Encyclopædia* (Hegel, 1970), a manual through which he taught philosophy starting from the immediate consciousness of his listeners and leading them to philosophical consciousness. Certainly that manual required and requires comments that clarify its movements, which is the way whose starting point is in the idea-logic from which goes through idea-nature to reach the idea-spirit, the three moments – or syllogism – of the thought that thinks itself.

Hegel and Philosophy of Education (II)

Nigel Tubbs

Faculty of Education, University of Winchester, Hampshire, UK

Hegel’s contribution to education has been largely overlooked by those in philosophy and in educational theory. This is astonishing because Hegel’s

philosophy, of all Western philosophical systematic and nonsystematic critiques, is arguably the one which is most clear about its educational foundations. Before Hegel became a university lecturer, he was for 8 years (1808–1816) the headteacher of the Nuremberg Gymnasium or grammar school. In that time not only did he write his *Science of Logic* (1812, 1816), he thought through issues of pedagogy and of learning and teaching in many of his letters which are still current nearly 200 years later. These letters written between 1808 and 1816 contained reflections on discipline, on the problems and advantages of student-centered learning, on the contradictions of independent learning, on the bad practice of “spoon-feeding,” on the part that the classics can play, and many other aspects of educational theory and practice. I cannot, in what follows, rehearse all of these, and the interested reader should consult Butler and Seiler (1984).

I will, however, give a brief overview of his educational theory and practice in the Gymnasium before looking at the ways in which education plays a wider and much more significant role in his philosophy overall.

As a teacher Hegel combined an interesting mixture of what we would call traditional and progressive ideas. He discouraged dueling, fighting, and smoking as well as political activity. In his school address of 1810, he stated that “for those attend our school we expect quiet behaviour, the habit of continuous attention, respect and obedience to the teachers and a proper and seemly conduct both towards these and their fellow pupils” (Mackenzie 1909, p. 163). He also introduced military drill into the school day, arguing that it helped students to learn quickly and “to have the presence of mind to carry out a command on the spot without previous reflection” (1909, p. 165). He was impressed by the discipline held in the classroom of Pythagoras who demanded that his pupils keep silent for the first four years of their studies. Surely says Hegel, “the philosopher at least has the right to ask of the reader to keep his own thoughts quiet until he has gone through the whole” (1984, p. 293). Such comments give us today the impression of an authoritarian and didactic teacher, one who did not encourage his pupils to think for themselves or

to express their own opinions. Progressive teachers today would see such an approach as at best fearful of losing control in the classroom and at worst as a dogmatic reproduction of the status quo and a suppression of voice and difference. Postmodern thinkers might add that it is no longer credible to believe that a teacher can claim to be offering “a whole.” Hegel’s response to such thinking even in 1816 was that “it has become the prejudice not only of philosophical study but also – and indeed even more extensively – of pedagogy that thinking for oneself is to be developed and practised in the first place as if the subject matter were of no importance” (1984, p. 340). Four years earlier Hegel also expressed the view that “the unfortunate urge to educate the individual in thinking for himself and being self-productive has cast a shadow over truth” (1984, p. 279).

Yet, on the other hand, a much more liberal side to his views on students can also be found. Mackenzie notes that he was much liked by his students and that his “genuine enthusiasm for knowledge” (1909, p. 32) was infectious. He could teach most subjects with ease; he encouraged wide reading and took a personal interest in the students’ reading material. He interviewed all the students before they left the Gymnasium, whether they were proceeding to university or not.

His distaste for traditional didactic forms of instruction is clear in his reproach of the district school councilor, whose “only concept of educating the young is the misery of endless inculcating, reprimanding, memorising – not even learning by heart but merely the misery of endless repetition, pressure and stupefaction, ceaseless spoon feeding and stuffing. He cannot comprehend that in learning a young mind must in fact behave independently” (1984, p. 199). In another school address Hegel made a speech that echoed the thoughts of many modern educators about respect for the learning and freedom of the student. Hegel says that teachers should not induce in children a feeling of subjection and bondage – to make them obey another will even in unimportant matters – to demand absolute obedience for obedience’s sake and by severity to obtain what really belongs alone to the feeling of love and reverence.

A society of students cannot be regarded as an assemblage of servants nor should they have the appearance or behavior of such. "Education to independence demands that young people should be accustomed early to consult their own sense of propriety and their own reason" (1909, p. 175).

Summing up this ambivalence at the heart of Hegel's educational theory and practice, he notes that "to regard study as mere receptivity and memory work is to have a most incomplete view of what instruction means. On the other hand, to concentrate attention on the pupils own original reflections and reasoning is equally one-sided and should be still more carefully guarded against" (1909, p. 167). The contradictory nature of Hegel's reasoning here and his seemingly holding two irreconcilable views are totally in keeping with the philosophical system for which he is so infamous. In moving now to look at the part education plays in the system, we can make a smooth transition by looking at one of the most educationally significant of Hegel's letters. Speaking not only of philosophy in the Gymnasium but of philosophy as a whole, Hegel wrote:

Philosophical content has in its method and soul three forms: it is 1. abstract, 2. dialectical, and 3. speculative. It is abstract insofar as it takes place generally in the element of thought. Yet as merely abstract it becomes - in contrast to the dialectical and speculative forms- the so-called understanding which holds determinations fast and comes to know them in their fixed distinction. The dialectical is the movement and confusion of such fixed determinateness; it is negative reason. The speculative is positive reason, the spiritual, and it alone is a really philosophical. (1984, p. 280)

It is this triune system which has made Hegel one of the most difficult and challenging yet profound and comprehensive thinkers of the modern era. His philosophy is unusually, but importantly, a theory of what education actually is. Fundamentally, Hegel views education and learning as "experiential" (see Hegel 1977, p. 55). But to have a philosophy of education or, better, a science or philosophy that is education, experience has somehow to experience itself, to recognize the educational development which is taking place. The logic of this "self-experience"

has the triune structure outlined above. An object is thought (known) and then mediated in its being known as a thought thought again or known as not known and finally known and not known as both of these. This final stage is therefore not final at all, and its instability is its being educational or our continued learning from and about experience.

Hegel's system has been and continues to be characterized variously as dogmatic, totalitarian, closing, oppressive, and domesticating and as the archetypal model of a system which believes it has grasped the structure and content of knowledge as a whole. But these interpretations, be they from within Marxism, critical theory, postmodern theory, feminism, literary theory, philosophy, sociology, or cultural studies, have not read and continually refuse to read Hegel's system educationally. The only thing that grows in "certainty" in the system is our own comprehension of the necessity of uncertainty in all that we do, all that we think, and all that we learn. When the philosophical and spiritual education which lies at the heart of Hegel's system is interpreted only as an ordinary abstract education offering abstract knowledge, then it is interpreted as if it were an "empirical whole." But such thinking is precisely what our philosophical education undermines and continually protests against.

More sophisticated readings of Hegel, particularly those which place him in relation to Kant, argue that he is not offering a naive theory of truth nor a philosophy of absolute closure (see, e.g., Rose 1981). However, unlike Rose, most other commentators who find that they can identify with the circle of misrecognition in Hegel and sympathize with the power of its return cannot go the "whole" way in comprehending this misrecognition to be science. The charge against Hegel is that his phenomenology of experience and learning overcomes its own uncertainties by claiming (or desiring) to have its meaning, structure, and truth present to it before those experiences (see, e.g., Beardsworth (1996), p. 59). The circle, in other words, completes only what it presupposes or what it wants to complete, leaving no room for the different, the incommensurable, and the impossible.

This is a difficult charge to consider in such a brief space, but three defenses can be made here (see also Tubbs, 1997). First, to assume that uncertainty and difference have a significance somewhere other than within the circle of experience is to reify them and to separate them from the conditions which are their predetermination, even if this predetermination renders them “impossible.” Second, such reification is only another repetition of modern (bourgeois) social and political relations, separating again the laboring consciousness from its objects and refusing the philosophical and spiritual import of the logic of their return to each other in and as experience (again). Third, it is therefore Hegel (and Nietzsche!) who offers a critique of modern unfreedom without importing concepts of impossibility, trace, or “difference,” concepts which themselves presuppose negative experience not to be its own education and development. The Hegelian system stands guard against all such presuppositions of education, positive and negative, abstract and dialectical, empirical and postmodern.

What, then, do we learn within the circle of experience? Do we overcome our misrecognitions? Do we learn from our experiences to see the world “correctly”? Do we arrive at the truth? The answer for Hegel is both yes and no. We do arrive at a recognition of that which we have misrecognized, but this recognition does not overcome misrecognition, and it does not save or “mend the world” (Fackenheim 1994). It does give us a philosophical and spiritual understanding of the world and it is positive in this sense. But it retains its negativity for it is based on our experience in which our knowledge of the world is always lost. How, then, would we live within this negation of negation? The answer is we would live educationally, learning and continually struggling to comprehend the contradictory and difficult nature of those experiences, to know them as both true and untrue, and to resist all one-sided repetitions of modern unfreedom. This philosophical and spiritual education is far more dramatic than any abstract determination about truth or identity which resolves the difficulty. In any case, as Hegel made clear in the Introduction to his *Phenomenology of Spirit*, such resolutions cannot hold against the

negative power and inevitability of further experiences in which the philosophical and the spiritual return again (and again).

To end, two further things can be said of Hegel and education. First, the structure of his philosophical system, being as it is a science of rational experience, is also a model of personal, social, spiritual, and political development. His *Philosophy of Right* (1967) reveals this educational structure showing the movement from “natural” family education to the civil education of bourgeois social relations in which the family is replaced as educator. Second, within civil society we experience many different ways in which our civil relations have truths beyond their immediate bourgeois appearance. These are our experiences of culture which, for Hegel, represent the relation between persons and the universal. *Bildung* is the term used by Hegel to describe this sort of education, but it does not “end” in culture or in cultural studies. Culture for Hegel is not the “end of reason” (1967, p. 125) for our experience of culture (it could, e.g., be religious or aesthetic) is itself another education for us, one which Hegel describes as “the absolute transition from an ethical substantiality which is immediate and natural to the one which is intellectual and so both infinitely subjective and lofty enough to have attained universality of form” (1967, p. 125). Freedom becomes for Hegel an educational issue characterized by the difficult struggle to make these experiences our own education, our own spiritual self-development. Rejecting reason and freedom on the grounds of their difficulty and their tendency to disappoint us, and even to oppose themselves, as recent postmodernism has done, would be despised by Hegel. The difficulty is precisely what freedom consists in and demands.

Lastly and perhaps most controversially, Hegel has a philosophy of history. This means that he sees the same educational development outlined above in the unfolding of human history. It would seem from his *Philosophy of History* (1956) that the rationality of the West marks the highest expression of human development that the world has seen and, according to Fukuyama (1989), can expect. “Late twentieth-century Western” philosophizing has largely rejected such a view,

rejecting in particular its racist and imperialist overtones that “west is best” and that all other world views are underdeveloped, naive, simple, whatever. (At times Hegel seems equally derogatory to women.) In response, at the very least one is obliged to read the *Philosophy of History* in the light of the system and therefore educationally. What the *Philosophy of History* reveals is the history of human misrecognition of itself and of its knowledge of truth and the forms in which that misrecognition has been represented. Nor does the philosophy of history for Hegel necessarily culminate in the end of history. True, at times, it appears that there is little left to do, but equally and predominantly our “philosophical” stage of Western development is that in which our own negativity is still also our own subjectivity. This is the basis of the modern State but is still characterized by misrecognition and struggle and not by final resolutions. Those “final solutions” which have been part of the Western twentieth century are not Hegelian in nature; indeed, they are expressions of what happens when the struggle of freedom and of education is refused or is itself reified. The use of international law to try and combat the triumph of unfreedom may well be Hegelian, but international law itself is also another form of misrecognition and necessarily both master and slave of world spirit. It is by no means the case that Hegel’s philosophy of history precludes other world views, e.g., Judaism and Islam, from developing their relationship between State and religion or human freedom and divine law or again between reason and God, in their own ways. There is evidence that this has always happened, continues to happen, and will happen in the future. Hegel’s critics are perhaps more imperialist than their adversary and certainly less open to education and learning in assuming that other world views are either inside or outside the philosophy of history rather than, as the West is, in constant negotiation with it and repetition of it.

Hegel on Moral Development, Education, and Ethical Life

Kari Väyrynen

Introduction

Georg Wilhelm Friedrich Hegel (1770–1831) was an important educational thinker. He was, besides Kant, the most eminent philosopher of German idealism. His first great work, *Phenomenology of Spirit* (1807) was of revolutionary significance. He developed in his *Science of Logic* (1816) a dialectical system of categories, which was, for example, important for Marxist philosophy. His later philosophical system was summarized in *Encyclopedia* (1818), which he began to write in Heidelberg. Later in Berlin, his philosophy became internationally famous. He died of cholera in 1831 (on Hegel’s biography see Pinkard 2000; general introduction to his thinking Beiser 1993; Hösle 1987).

Hegel was especially influential for continental philosophy – Marxism, hermeneutics, post-modernism – and also affected American pragmatism, for example, John Dewey. Hegel as a pedagogical thinker is not so influential, but for the philosophy of education even today remains very interesting. New interpretations of his philosophy, for example, the discussion of his social ontology and recognition (*Anerkennung*), are potentially fruitful for educational theory and worth further development (on recognition see, for example, Honneth 1995, 2010; Ikäheimo and Laitinen 2011).

Besides his academic career, Hegel had very extensive experience as a house and school teacher. He was 45 years old when he acquired his first full-time academic post, a professorship at the University of Heidelberg in 1816. Two years later he moved to Berlin. Before the Heidelberg post, he had spent 14 years as a house and school teacher instructing children and young adults. From 1808 to 1816 he held the post of Rector and Professor of Philosophy at the Gymnasium at Nuremberg and wrote there not only one of his theoretical main works *Science of Logic* (1816) but also the pedagogically important *Philosophical Propaedeutic* (published 1840 as a separate volume (XVIII) of the *Collected Works*). At this time, he reflected pedagogical questions also in his letters and school addresses.

Towards the “Concrete Ethics”: From Morality (*Moralität*) to Ethical Life (*Sittlichkeit*)

Following Aristotle, Hegel sees ethics in connection to politics. Ethical action is always situated in a society: virtues, for example, are connected to different social roles to which a citizen has socialized in a society. Hegel’s starting point is on the other hand the ethics of Kant. He stresses like Kant the importance of obligations and universal human rights. However, he does not accept the formalistic traces of Kantian ethics. Kant’s categorical imperative is a universal, law-like formal rule, underlining the free, autonomic choices of a

moral agent. The historical and social context is irrelevant for ethical action.

According to Hegel, Kant does not connect moral universalism to the practical motivation and interests of an agent in a concrete historical situation. The Kantian ideal of moral agency leads to an empty conception of both the agent and the moral rules. Kant does not take seriously the specific goods that make up ethical life in a certain society and culture. His rational agent has no moral feelings, no interests, or *summa summarum*, no real ethical motivation which would constitute a concrete, socially situated morality in the Hegelian sense. This concrete morality can be found only in a connection between morality (*Moralität*) and ethical life (*Sittlichkeit*), in understanding the specific goods, roles, and ethically significant institutions within a particular society.

Hegel does not reject Kantian morality totally – this would lead to a cultural relativism, which Hegel does not represent. Hegel accepts the cornerstone of the Kantian ethics: the free will. Only free agents can be considered as morally responsible. Morality makes sense only if we can critically reflect on traditional *mores*, traditional moral practices and habits. In this sense, Hegel is not a conservative, who would restore traditional morality as such – his famous *dictum* concerning the reasonability of reality does not mean that the existing order as such would be rational. One should rather critically reflect on how the existing order could be changed towards rational, moral, and political standards. Historically the most important principle is the increasing freedom, which constitutes the cornerstone of Hegel’s philosophy of history (*The Philosophy of History*, compiled after his death, is probably the most widely read of Hegel’s works). History is progressive; a progress towards a society in which all are free through a progress in a consciousness of freedom. It is therefore clear that Hegel does not accept cultural relativism, which cannot criticize different forms of suppression of individual freedom.

In the German historical context, where the development of capitalism at the beginning of nineteenth century was still very weak, Hegel’s liberal and bourgeois political thinking (especially

in his doctrine of “civil society,” *bürgerliche Gesellschaft*) is quite radical. His doctrine of State (*Staat*) is not a totalitarian, as many earlier interpretations have misunderstood. The Hegelian State is not only a result of a social contract based on mutual protection of private property, like the Lockean State. Hegel calls this kind of liberal State *Notstaat*, a State based on need. This State is exclusive; it leaves the powerless and poor people without protection.

On the contrary, real State is, for Hegel, more: it is a political unity which promotes common good equally for all of its citizen (it is in this respect a family-like unit). Hegel demands, for example, equal education for all citizen. The State recognizes also individual liberty and preserves a sense of shared identity. It is a moral unit in the Kantian sense: It respects all its members as goals and does not accept using others only as a means. The Hegelian State is in this respect altruistic, a family-like unit, which does not accept economical instrumentalization and exploitation of each other's productive and consumptive capabilities. State is based in a general commitment to a way of life based on rational and coherent principles. The idea of constitution represents this possibility of a State to be a moral agent of its own. At the same time, constitution must express the deepest interests of the individual citizen (Pinkard 1988, pp. 146–148). The Hegelian State is therefore not a totalitarian whole, because it expresses the rational will and freedom of the individual citizen.

Education in its different forms is closely connected to this institutional structure of ethical life (or society as a whole). Family education is mainly moral education, in which children are educated in the sphere of mutual love, which is the institutional principle of family as a moral unit. This earliest education is mainly instinctive, children are gradually assimilated through loving and caring interactions with parents into altruistic human action, in which others are respected as goals. Mutual recognition of individual interests and capabilities is here, already, important. Through school education, children become gradually become members of a larger community, leading to legal membership of civil society and State, capable to begin ground their own families.

The school is as an institution a kind of corporation. Hegel calls all organizations, which unite people with common interests into groups that represent their interests, corporations. He does not mention schools and universities in this context. Guilds and unions are typical examples of corporations. But considering that schools take the reasonable interests of children and young adults as their guiding lines, one should also call schools corporations. Universities are a special kind of corporation because they produce new knowledge and mediate it to young adults. They are therefore also corporations for scientists and intellectuals.

On the other hand, schools and universities are more than corporations because they are organized by the State as a political unit (not only as a part of *Nootstaat*). They are therefore more general and reason-based institutions than guilds and unions, which represent only the interests of small groups. Schools prepare children to act for a better future as becoming State citizens. In this respect, schools and universities are not only mediating to the next generation traditional knowledge as such but are also critical moral and political institutions, which help to formulate the general will (cp. Rousseau's reason-based *volonté générale*, which is not the common “will of all,” *volonté de tous*, the will of potentially irrational majority, Rousseau 1762) of future generations. Schools and universities anticipate a probable future in discussing important local and global problems like current environmental questions. In Hegel's time, such a problem – especially in Germany – was the building of a national State. Therefore the question of patriotism was, in the Hegelian pedagogy of nineteenth century, an especially important problem. This question also arose in other European countries. For example, the most important Finnish Hegelian, J.V. Snellman (1806–1881), who extensively researched the problems of school education ca. 1840, became a national leader in Finland. Finland was at that time an autonomous part of Russia and became independent in 1917 in the turmoils of the Russian Revolution (on the pedagogy of the Finnish Hegelians see Väyrynen 1992).

The Hegelian pedagogy is for this reason morally and politically grounded: The social context and the questions concerning the possible

development of the society are important. On the other hand, the structure of knowledge and its adaptability to the psychical development of children must also be taken into account. Hegel stresses in general the activity of the children in learning processes. In this respect, the development of children's subjectivity, self-consciousness, and personality are crucial goals in all education, be it purely theoretical or practically political. Hegel develops these practical questions of pedagogy extensively and connects them firmly to his more general philosophical views.

Dialectics of *Bildung* and the Fundaments of Moral Education

Hegel's pedagogical views are based in his concept of *Bildung* (one could translate it as a general becoming or formation of man). The concept was developed in German neohumanistic and romantic thinking, for example, in Goethe and Schiller. However, Hegel's conception is original. *Bildung* is not a harmonic development like natural growth, it is rather a dialectical process, in which antagonistic elements play a crucial role. The development of a child begins from a natural and instinctive state, which is irrational, capricious, and amoral – not at all idealized, as in Rousseau inspired pedagogies. *Bildung* begins as an alienation from this natural domain: A child must first be morally educated in the family. There are elements of coercion (and therefore alienation), but the main thing is that the institutional principle of family, love between parents and child, immediately assimilates the child into the normative rules of family life. This first stage of *Bildung* is therefore taking place quite harmoniously, in the immediate substantiality of the ethical life in the loving and caring family.

At school, the antagonistic aspects of *Bildung* became more explicit. Norms are more systematically inculcated and the pupil is forced to sacrifice his immediate idiosyncrasies and interests to the experience of the systematic demands of thought, guided by curriculum. Hegel summarizes this process of *Bildung* as follows: "The final purpose of education ... is liberation and the struggle for

higher liberation still; education is the absolute transition from an ethical substantiality which is immediate and natural to one which is intellectual and so both infinitely subjective and lofty enough to have attained universality of form" (Hegel 1971, p. 125). In this respect, school teaching mirrors the whole society: it supports the development of the subjective self-consciousness of the pupils and prepares in this way their future lives in the civil society (*bürgerliche Gesellschaft*). For example, the competitive elements at school prepare children to the life in capitalistic society.

On the other hand, school teaching must prepare the pupils to work for the more general, communitarian interests of the State (*Staat*) as ethically responsible citizens. The demands of capitalism may not totally dictate the goals of the education system which has, as a part of the political State, a critical autonomy from the economic system. Especially in higher education (gymnasium, university), general humanistic and scientific goals have a priority. Hegel's concept of school education clearly mirrors in this way his general views of society. From the viewpoint of moral education, the task of the school is antagonistic, it must support both egoistic and altruistic goals. This mirrors the antagonism of the whole society.

The process of the child's education, in a way, mirrors the bigger historical process of the *Bildung* of mankind. The formative stages of Spirit (*Geist*) provide the material element for the curriculum. This must be communicated to the child. Hegel describes this process in his *Phenomenology of Spirit* as follows: "Thus as far as factual information is concerned, we find that what in former ages engaged the attention of men of mature minds, has been reduced to the level of facts, exercises and even games for children; and, in the child's progress through the school, we shall recognize the history of the cultural development of the world traced, as it were, in a silhouette" (Hegel 1979, p. 16). Hegel stresses therefore the importance of the classics of Greece and Rome: they allow the child to distance himself from his own immediate interests and narrow practical demands of a particular historical situation. This is something that philosophy does more abstractly. Hegel therefore even speculates that

the classics ought to be accorded a more prominent place than philosophy in the Gymnasium's curriculum (Hegel 1986, Introduction p. xvi).

Historical knowledge and classics help the children to develop their skills of critical thinking – classics are not, as some conservative philosophers like Hans Georg Gadamer have seen, something in which the universal nature of Spirit could be most easily found. They are rather intellectually a kind of *significant other*, through which the mind of the child can return to itself as mentally enriched but at the same time as free to criticize even the classical views. Hegel is of course a modernist, for whom classics are not an unsurpassable authority but rather equal partners in the common search for truth, sustainable values, and ethical life.

Classics are especially important for moral education. They help to develop the moral sensitivities of the child and create preconditions for the development of the child's capacity for participation in the life of his society as a full citizen in emphasizing the different duties of the citizen. Morality will be inculcated gradually through the study of classics. On the other hand, also practical philosophy is important in this respect. Its central systematic role in the Hegelian curriculum will be analyzed later.

Classics are for Hegel not authorities, but rather models for encouraging the pupil's own ethical and social activity. They are an important tool in awakening this activity. For Hegel, all real learning is an active process. Hegel emphasizes this strongly in his second Nuremberg *School Address* in writing that "if learning limited itself to mere receiving, the effect would not be much better than if we wrote sentences on water: for it is not the receiving but the self-activity of comprehension and the power to use it again, that first makes knowledge our possession" (Hegel 1909, p. 167). The goal of moral education is active political citizenship. This is possible only if pupils learn practical morality instead of mere abstract morality or moral theorizing. The pupil must learn how to apply moral rules and obligations in different social contexts, leaning on an authentic, concretely situated ethics as opposed to mere formalistic approach. Kantian ethics is for Hegel only a starting point and the ultimate goal is to teach ethical judgment, an ability

to evaluate different social contexts and their special ethical problems in order to find solutions. This is possible especially through the study of classics, because through them a positive alienation from the current interests and their limitations becomes possible.

How to Build Pedagogically Relevant Curriculum?

One could speak of the primacy of practical philosophy in the Hegelian view of curriculum (modifying Kant's "Primacy of the practical reason," *Primat der praktischen Vernunft* – see Kant 1978, pp. 191–194). According to Hegel, the subjects of Law and Ethics are pedagogically best suited for children, while they contain material which is more directly practical, connected to the immediate life problems of the children (for example, what rights and obligations do I have in a certain social context? and why?). These are also easier to grasp for the children than purely theoretical questions. Concepts of practical philosophy are more immediate and definite for the child, suitable for their psychical development. Theoretical subjects, for example, the concepts of Logic are only "shadows of the real" and therefore harder to grasp. Also the subjects of the Philosophy of Nature are not very well suited for children, because many of the children regard them as boring and irrelevant (Hegel 1986, Introduction pp. xviii–xix). The concepts of practical philosophy combine the possibility of immediate experience in a life context with rational form: They are therefore best suited to produce valid knowledge from the theoretical viewpoint of the German idealism, which tried to combine empiristic and rationalistic traditions of philosophy.

As already mentioned, Hegel's general view concerning the formation of knowledge was activistic. Following Kant and Fichte, he stressed the constitutive role of subjectivity in the formation of knowledge. This subjective aspect and the objective validity of knowledge can be easily connected with each other in the human context, than in the case of nature. Hegel actually leans here on the conception of *actors knowledge*,

developed earlier especially by Aristotle, Hobbes, and Vico, according to which people can have a more certain knowledge of the things that they have – or could have – made. People can, for example, *reenact* – to use the expression of Collingwood – historical actions in their mind and understand, on which values, goals, and believes historical actions were based. As Giambattista Vico (1668–1744) stressed, this kind of understanding can reach a more certain knowledge than the empirical research of nature, because people have no possibility to grasp such an inner view of the principles behind the creation of nature (creationistic position excluded).

The priority of Law and Ethics in the Hegelian curriculum stresses the objective validity of their concepts. They are therefore ideally suited to combine the subjective starting point of all knowledge with objective certainty. Hegel's metaphysical position is objective idealism and this is pedagogically easiest to understand in the realm of objective spirit, in which the doctrine of ethical life (*Sittlichkeit*) plays a key role. Basic institutions of the society, family, civil society, and State are for him primarily historical products of human mind, and people can understand them correctly only if they can reenact, what kind of values, goals, and believes they objectify. Even the children can easily understand, how, for example, the concept of private property rights was born (possessing first my own body and power to work, as Locke explains). On the other hand, private property has objective validity expressed at the institutional level. Obligations and norms express this objective aspect and the reasons for these rules are not even for children any harder to understand as the ideas of basic rights.

Understanding the concepts of Morality and Law, therefore, gives the children an intuition regarding objective knowledge is possible combining constructive subjective aspects and objective validity in a society. The children may therefore already learn to avoid simplified theoretical positions like naïve realism or subjective relativism. Michael George and Andrew Miller have summarized this central idea of Hegel well in their *Introduction to Hegel's Philosophical Propaedeutic* in writing, that “Education generally, by

retracing the path of Spirit's self-realization, raises the individual's subjectivity to a recognition of the rationality underpinning the social institutions of *his* society. . . . The *Propaedeutic* therefore . . . (brings) the child of the modern world into that state of intellectual appreciation which alone would enable him to participate as an active, rational, informed and concerned citizen of his society and age” (Hegel 1986, *Introduction*, p. xxi).

Hegel underlines in his didactics the primacy of the content instead of form. He criticizes Kant's *dictum* of the priority of philosophizing instead of the content, basic concepts of philosophy. Hegel believes that the two cannot be separated so easily. It is in reviewing the content that one learns to philosophize. Children especially need the careful, systematic study of the content of law and morality, in order to learn philosophy. Philosophy devoid of content and systematic structure is haphazard, empty, and fragmentary. This does not exclude the activity of the children's subjectivity: as George and Miller put it, “to think through detailed material in class and in homework is to re-enact the principle of thought itself . . . the pupil must then take on the hard ‘labour of the Notion’, i.e. think though (should be through? – KV) the problem himself and ‘possess’ it” (Hegel 1986, *Introduction*, p. xix). Although Hegel criticizes such pedagogies, which stress the role of a play, he does not underestimate the positive role of the imagination in child's subjectivity. Especially the study of classics of Greek and Rome – and also Defoe's *Robinson Crusoe* – take children to a different world and encourage their imagination. It is important to reflect freely different possibilities: this promotes children's capability to critical thinking.

Heidegger and Curriculum

Steven Hodge
Griffith University, Brisbane, QLD, Australia

Introduction

Martin Heidegger (1889–1976), one of the most influential philosophers of the twentieth century, did not develop a philosophy of education per se. However, the remarks he did make about it, his brief efforts at higher education reform, and

his philosophy, more broadly, have rich implications for education. Yet when it comes to the question of *curriculum* – of what should be taught and learned – the tenor of Heidegger's thought militates against a definitive position (Hodge 2015). His philosophy is characterized as revolving around a single question, the question of "being." This is the question of the ground of intelligibility, the disclosure of entities as entities to us. For Heidegger, the question of being is *the* question of philosophy. It also concerns the meaning of our own existence and the meaning we make of others and the world. It is a question that concerns our cultural milieu which is today pervaded by an instrumental mentality and an associated fascination with technology and sense of faith in technical solutions. It is a world wherein the being of things and people is taking on the character of "resource." Heidegger's analyses of the existential and historical modes of being that shape the sense we make of the world suggest two basic interpretations of education. There is education that inducts us into the forms of disclosure characteristic of the age, and education that seeks to comprehend these forms of disclosure and move beyond them to ask the question of being directly and for ourselves. In terms of curriculum, at least one type is clearly implied: a curriculum that guides induction into established ways of understanding being. But Heidegger's philosophy casts such a curriculum in a problematic light. Foisting authoritative interpretations of being on young and developing people is to suppress the question of being. To impress upon human being ready-made ontologies and life projects is to consign another generation to what Heidegger called the "forgetfulness of being." The question concerning curriculum then becomes acute. How can there be curriculum that promotes the question of being if any decision about what is important to teach and learn is to settle, prematurely, the question of being?

Curriculum Orientations

To get at this question, it is helpful to consider ways curriculum itself has been understood. For

this purpose, Schubert's (1986) framework for analyzing curriculum is employed. According to Schubert there are three major curriculum traditions or "orientations" that contend for a place in or dominance of the curriculum. The "intellectual-traditionalist" perspective embraces what is often called the "liberal" or "disciplinary" curriculum which seeks to pass on the greatest cultural and scientific achievements of humankind. The "social-behaviorist" approach has a focus on present needs and promotes knowledge and skills for coping and flourishing in contemporary society. The third tradition is what Schubert terms the "experientialist," and it is concerned with the actualization or growth of learners, developing the essence of the human through more or less guided experiences.

Many of Heidegger's remarks about education and philosophical arguments can be considered in the light of one or another of Schubert's curriculum orientations. In general, Heidegger (2010) takes a critical line on what he calls the "tradition." For Heidegger, the tradition is our cultural heritage contained in works and systems of knowledge. The problem with it is that it transmits presuppositions about the meaning of being and human being. These are powerful metaphysical assumptions that guide our stance toward being. Heidegger is critical of what he sees as the "forgetfulness of being" that characterizes our culture and which derives from the weight of received interpretations of being. Since the intellectual-traditionalist curriculum is devoted to preserving the very tradition Heidegger thinks contributes to our forgetfulness, this orientation would appear to be suspect. A Heideggerian critique of the liberal arts curriculum tradition was elaborated by Spanos (1993), who argued that a conservative reaction against Heidegger-inspired "post-human" curriculum in American higher education was underway. Spanos describes a resurgence of the intellectual-traditionalist curriculum in contemporary society.

However, it is not possible to simply turn away from the tradition promoted by the intellectual-traditionalist curriculum. Heidegger makes a great deal of what he calls a "destructive" reading of the great works of human culture. He thinks the

tradition springs from genuine insights into being or can be made to reveal insights, but that such opportunities are lost in the official processes of transmission and acquisition. Hence a seminal contributor such as Plato can be on the curriculum today without any of his ontologically germane insights coming to light. But these same works can be dismantled through a "destructive" reading and their original insights recovered. For instance, a destructive reading of Plato's allegory of the cave reveals experience of the essence of truth and missteps of interpretation that have had a decisive influence on the way truth is understood within the tradition (Heidegger 1998). Intellectual-traditionalist curriculum – the liberal curriculum of the great works of humanity – therefore has the potential to merely transmit a deadening set of assumptions or can be read in a particular way so as to unlock ontological insights. In a Heideggerian sense, everything depends on the attitude to the tradition when it features in the curriculum.

As Heidegger's critical views evolved, he focused more and more on the dangers of what he called the "essence of technology." His concerns were not directed to technology as such but at the instrumental mind-set that envisages and values technical solutions to all problems and questions. Heidegger (1977) believed that this mind-set he calls "enframing" tends to reduce everything to resources. The idea is that in the contemporary world, entities become a stock of resources or raw material awaiting extraction and refinement. Resources are more or less sophisticated and either in or awaiting deployment. Even human being has been encompassed by this mind-set. We have become "human resources," subject to development, correction, and deployment in processes that involve the construction, stockpiling, and deployment of other resources. For Heidegger, the mind-set of enframing is a totalizing system that progressively embraces every entity. Schubert's "social-behaviorist" orientation can be understood as an approach to curriculum attuned to the demands of enframing. This orientation aims to fit learners to life and work in a contemporary world ruled by enframing. Technologies and sciences are

especially valued in the social-behaviorist curriculum, while the great achievements of the past are not neglected so much as updated so that their contemporary uses are highlighted. Curriculum serves as a blueprint for the refinement and adjustment of human resources as well as a source of guidance for living among and working with resources.

Heidegger's (1977) analysis of enframing seems to offer no escape from the totalizing ambitions of instrumentalism, but he does stress that human being retains an inalienable possibility of extrication from the great system of enframing. Humans respond to something when they partake in the project of enframing, and their response and creative endeavors are necessary to further the project. Heidegger explains that this response is to a "call" from being. So, while humans can play at submitting to the dictates of enframing and see and treat themselves as resources, they cannot be completely reduced. They remain the one called by being and retain the creative scope to conceive of being in different ways. There is always a remainder from the process of enframing humans, and thus the possibility is always there for disruption of the project. Indeed, in Heidegger's estimate, the danger of enframing harbors the key to lifting its spell. Enframing is potentially a great teacher and the stage for envisioning genuine alternatives. In a way, this promise at the heart of the danger of enframing echoes the potential of a destructive reading of the liberal tradition to reverse the deadening effects of the tradition. The social-behaviorist curriculum orientation can be approached in a way that offers a way out of the grip of enframing, but it requires an approach dedicated to discovering the underlying emptiness of the era of enframing.

Schubert's third curriculum orientation is the "experientialist." He has in mind the ideas of Dewey here, but it also encompasses the broader humanistic doctrine of the value of the human essence and the propriety of educational endeavors that seek its unfolding. The experientialist curriculum orientation problematizes a focus on content that characterizes the intellectual-traditionalist and social-behaviorist orientations. Pinar's (1975) notion of *currere* presents a way to understand

the critique of curriculum as content. In Pinar's view, curriculum as content can be likened to a guide for tourists, while the curriculum as *currere* is the actual tour, the course experienced. The experientialist curriculum is therefore concerned with experiences, and the purpose is to develop what is within the learner. This curriculum orientation has parallels in the work of Heidegger, especially in his earlier "existential" phase. The early Heidegger (2010) was committed to the methodological principle of analyzing human being to get at the meaning of being. The deep connection between being and human being (which underpins the saving potential of the danger of enframing too) can be realized in "authentic" moments and decisions. These junctures represent those times when the being of the human being is experienced to be at stake, when the path before us is deliberately taken as my own. Moments that also bring our own being before us are experiences of anxiety and contemplating our own death. These are experiences that expose our finitude and our separate existence from the crowd. In the early Heidegger, then, experience can be the way to an authentic mode of being, a form of existence that sloughs off the forgetfulness of being and confronts us with the big question.

However, Heidegger's doctrine of authenticity does not fully coincide with the curriculum visions of the experientialist. The problem here can be appreciated in the light of Heidegger's (1998) critique of humanism. He argued that since Roman times, the educational project or *paideia* has involved taking some idea of the human essence and actively shaping the conduct and thought of the young in conformity with it. In Heidegger's view, this is a problematic undertaking because it means prescribing what is to be educated from the learner. The outcome of the Roman *paideia* is known in advance. For the Romans, it was a picture of the human as civilized, the image of *homo humanus*. But for Heidegger, to promote a prior understanding of the human and then developing learners according to this understanding is to close off an attitude of openness to being, especially of the human being. Forming humans according to a preformed specification of the human serves to repeat traditional

ways of being. Humanism blunts sensitivity to the question of being and discourages the open stance necessary to face the question. Heidegger believes that later programs of human formation such as Christianity, communism, and even Sartre's existentialism repeat the fundamental mistake of humanism, leading him to apply the label of humanism to all these later systems that are tied to programs of forming human conduct and knowledge. This criticism applies, too, to the modern humanisms of Rogers, Maslow, and Knowles. They each propose programs of formation that make assumptions about the true essence of the human and the need to realize it through appropriately guided experience.

An Ontological Curriculum

It may be appreciated, then, that the very project of curriculum is problematized by Heidegger's philosophy. A content focus, exemplified by the intellectual-traditionalist orientation, implies that curriculum is given over to the service of the tradition, but the tradition in Heidegger's (2010) early work is fundamentally problematic because it transmits influential yet faulty assumptions about the meaning of being. An intellectual-traditionalist curriculum will promote forgetfulness of being because by it we are supplied with ready answers to our deepest questions, absolving us of the need to question for ourselves. The social-behaviorist orientation is also focused on content, but it is up-to-date content that is designed to equip learners to play a part in the technologically driven society we now inhabit. In his later work, Heidegger (1977) identifies a significant problem with this society, and it is the pervasiveness of the instrumental mind-set of enframing. A social-behaviorist curriculum is by definition one that will instill the values and knowledge required to enframe. The experientialist orientation does not have a focus on content, but because it emphasizes the value of experience for developing the human essence, it makes assumptions about what it is that is being developed. In Heidegger's (1998) philosophy, promoting an idea of the human, even if it does not

take the material form of curriculum content, is still to suppress the open emergence of the being of humans. Although an emphasis on the experience side of curriculum in the spirit of Pinar's (1975) notion of *currere* resonates with Heidegger's (2010) early existential philosophy, while ever an experiential curriculum is based on realizing some idea of the human, only limited, conforming results will be aimed for and recognized.

These critical perspectives on the three curriculum orientations identified by Schubert (1986) do, however, contain the seeds of a Heideggerian approach to curriculum. "Content" certainly was important to Heidegger. His analysis of human being (Heidegger 2010) foregrounded the aspect of "thrown-ness", the ontologically significant fact that we are always already engaged in the culture and projects of our society. Asking the question of being does not occur in a vacuum. In our time, it is by deeply understanding the tradition, especially as it affects us in the form of "enframing," that we can reawaken a sense of the wonder and uncanniness of being. But such a recollection requires us to approach curriculum content as something that must be seen through. Such a curriculum must possess scope to seek beyond the boundaries of disciplines, competencies, and subject areas. Heidegger's (1993) proposals for higher education curriculum reform reflect this critical approach to curriculum content. He argued that students and faculty need to interrogate the ontological ground of the entities that are usually the exclusive concern of disciplinary content (Thomson 2005). Heidegger called for what could be considered an "ontological" curriculum orientation, one that has in view the ultimate need to inquire after the meaning of being, using content as a stepping-off point.

A second dimension of a Heideggerian approach to curriculum can be understood in terms of experience. Such an approach contrasts with Schubert's (1986) experientialist orientation in that it is explicitly decoupled from any prior understanding of the human to be unfolded through experience. Instead, the experiential dimension of a Heideggerian approach to curriculum concerns what Heidegger (1988) called the "ontological difference" – the difference between

being as such and beings. Experience is usually, “factically,” experience with beings – the things of our world. To feel and ask the question of being is, however, to take a radical turn in the midst of beings. It is in one sense a “course,” *currere*. But it is *currere* that takes an ontological rather than ontical direction. It is an orientation to the ontological difference in the context of things. It is a mode of curriculum that uses experience as a stepping-off point, discarding any ideas of a goal taken from the measure of the human.

An ontological curriculum is suggested by Thomson’s (2005) analysis of Heidegger’s destructive reading of Plato’s cave allegory. Plato used the allegory to illustrate his metaphysics, narrating stages of soul’s ascent from a world of shadows in the cave below to the experience of truth in the bright light of day above. For Heidegger, Plato’s allegory can be read for its insights into truth but also for its educational vision connected with the soul’s journey from darkness (opinion) to light (knowledge). Thomson argues that the world of the cave can be regarded as the contemporary enframed world. The soul’s adjustment to the conditions of the cave represents modern education that is both enframed (by neoliberal policy frameworks) and enframing (by shaping learners as resources to work in a world of resources). The intellectual-traditionalist and social-behaviorist types of curriculum correspond to the curriculum of the cave. In Plato’s allegory, the soul’s path to freedom begins when it is unshackled and can look around to see how things really are in the shadowy world of the cave. Thomson explains that a “negative freedom” is attained at this stage, an experience of discontent with the world rendered as resources and understood in instrumental terms. The next stage in soul’s journey in Plato’s story is to the surface and an experience of the source of light and truth – the sun. For Thomson, this is the stage where the learner orients to the question of being and reaches the goal of an “ontological education.” The path traversed by the learner can only be understood in an experientialist way up to a point. The ontological *currere* is the path that leads all the way to the surface and to the possibility of asking the question of being for oneself.

Hofstra University, Hempstead, NY, USA

“What is lacking, then, is action, not thought. . . . We must be ready and willing to listen.” Martin Heidegger, *What is Called Thinking?* (Heidegger 1968. Henceforth cited parenthetically as *WCT*).

“The hardest apprenticeship is that by which [people] learn how to hear and heed no imperative other than that relation. . . ‘setting the human *logos* in its proper relation to the *Logos*’.” Reiner Schürmann, *Heidegger On Being and Acting: From Principles to Anarchy* (Schürmann 1987).

Introduction

Martin Heidegger returned to the University of Freiburg in the winter semester of 1951, and in the following summer of 1952 he delivered his final lectures before his formal retirement from the

university. Those lecture courses were organized under the title *Was heisst Denken?* or the question *what is called thinking?* or what *calls* thinking? (In his editor's note, Krell writes, "What is called thinking? What calls for thinking? Both questions try to translate the title of Heidegger's 1951–1952 lecture course *Was heisst Denken?*" Krell (1993)). As J. Glenn Gray reminds us in his introduction to the first English edition of Heidegger's lectures, these courses in 1951–1952 "were also the first lectures he was permitted to give [in Freiburg] since 1944, when he was drafted by the Nazis into the people's militia (*Volkssturm*) and was afterwards forbidden to teach by the French occupying powers." Gray adds that the interruption in his teaching must have been costly for Heidegger because "Heidegger is above all else a teacher." (Gray, p. xvii) It is productive to listen to Gray's pronouncement and allow it to guide us towards an understanding of what Heidegger tells us about learning in that last year of teaching at Freiburg.

"Heidegger is above all else a teacher" – this is verified by one of his most renowned and devoted students, Hannah Arendt, who, when asked by the *New York Review of Books* to write an essay to commemorate Heidegger's eightieth birthday, audaciously dated his nativity as "neither the date of his birth (September 26, 1889, at Messkirch) nor the publication of his first book, but the first lecture courses and seminars which he held as a mere *Privatdozent* (instructor) and assistant to Husserl at the University of Freiburg in 1919" (Arendt 1971). Arendt continued:

For Heidegger's "fame" predates by about eight years the publication of *Sein und Zeit* (*Being and Time*) in 1927; indeed it is open to question whether the unusual success of this book – not just the immediate impact it had inside and outside the academic world but also its extraordinarily lasting influence, with which few of the century's publications can compare – would have been possible if it had not been preceded by the teacher's reputation among the students, in whose opinion, at any rate, the book's success merely confirmed what they had known for many years.

There was something strange about this early fame, stranger perhaps than the fame of Kafka in the early Twenties or of Braque and Picasso in the preceding decade, who were also unknown to what is commonly understood as the public and nevertheless exerted an extraordinary influence.

For in Heidegger's case there was nothing tangible on which his fame could have been based, nothing written, save for notes taken at his lectures which circulated among students everywhere. These lectures dealt with texts that were generally familiar; they contained no doctrine that could have been learned, reproduced, and handed on. There was hardly more than a name, but the name traveled all over Germany like the rumor of the hidden king.

It is indeed quite tempting in the space of an encyclopedia entry to take up the philosophical history of Heidegger qua teacher, and thereby engage his thinking in relation to Arendt and his other famous students whom Sheldon Wolin called "Heidegger's children" (Wolin 2001). If Heidegger is above all else a teacher then it is quite reasonable to trace the educational force of his thinking in the output of his prolific and influential students who, like Arendt, Herbert Marcuse, and Hans Jonas, were among those who attended his lectures and seminars, especially the earliest ones that produced the notes that circulated like bootlegged live performances.

Today, however, it is impossible to imagine the notes from the early lecture courses retain the aura they once emanated when they were circulated in Germany 39 years before the hidden King was dethroned from his professor's chair in Freiburg. Indeed, impossible, because *l'affaire Heidegger* continues to generate increasing infamy, most recently with the 2015 publications of Heidegger's *Schwarze Hefte*, or "black notebooks," where, from 1931 to 1970s, Heidegger kept his own private notes. Not the early traded notes, but, rather, the black notebooks is where it is claimed, today, that one encounters the lingering rumor of the hidden King, a rumor that has now morphed into the rumor of what the King has hidden behind the closed doors of his study.

Krell insists that Heidegger's black notebooks can only be read as exemplars of *unthinking* because there is almost nothing that is genuinely thought-provoking in the thousands of pages (Krell 2015). What one encounters in *Schwarze Hefte* is generated from the mood of the egomaniacal, written by a fugitive from thinking. Yet it remains a question how far removed these "private" words stand in contrast to Heidegger's "public" teaching. And this question is relevant

to those who remain students of Heidegger's published writing that now includes the notorious black notebooks alongside the revered monographs, lectures, dialogues, essays, and poems. Indeed, engaging in a conversation with him, which is to say learning with him, demands that we acknowledge the coexistence of both the famous and infamous figures, the two "Heideggers": the one figure appearing in the seminar room, who moves with his students into the clearing of thinking, and the other, remaining behind closed doors, working *sub rosa*. With the one we encounter the "Privatdozent" or "teacher" and with the other hand we encounter "Herr Rektor" or "administrator."

Today students of Heidegger who are moved by his thought-provoking writing are also familiar with the *sub rosa* Heidegger, and with the details that Gray did not include in his 1968 introduction to *What is Called Thinking?* Heidegger was elected rector of Freiburg University on April 21, 1933 (3 months after Hitler became chancellor). He became a member of the Nazi party on May 1st and remained one until 1945. And during that 12-year span Heidegger gave at least one well-known lecture course titled "Introduction to Metaphysics," where he notoriously professed "the inner truth and greatness of National Socialism." This line remained in the text when it was published in 1953, exactly 1 year after he offered his final courses in philosophy at Freiburg.

"Heidegger is above all else a teacher." From the historical distance of time and place what we learn from *l'affaire Heidegger* can be summoned up in the title of a book by Nietzsche, who was the subject of a lecture course Heidegger offered at Freiburg between 1936 and 1940 (Heidegger 1991. See Krell's introduction, "Heidegger Nietzsche Nazism."). The title of Nietzsche's book is *Human, All too Human*. Placed within existential force generated by this title, the two Heideggers are, together, absolved by the higher truth revealed in the tragedy that constitutes a human life: to be human, all too human, is to coexist as sinner and saint.

The complete title of Nietzsche's book bears a coincidental relation to the name of the city (Freiburg aka Free-city) where Heidegger lived

and taught: *Human, All too Human: A Book for Free Spirits*. The extended title suggests first and foremost the form of Nietzsche's writing: the aphorism. And with that in mind the title, along with the form it evokes, we find an important fragment in Heidegger: "the essence of truth is freedom." The fragment, from the essay, "On the Essence of Truth," ("On the Essence of Truth," *Basic Writings*, p. 123.) yields a word question that students of Heidegger are repeatedly confronted with: "*freedom?*"

In 1987, the same year that Victor Farias published *Heidegger et le Nazisme*, the English edition of Reiner Schürmann's *Heidegger: On Being and Acting* was published. Schürmann's thesis is that Heidegger must be read from the end to the beginning (i.e., studied from his last deeply musical and poetic writings and from there back to *Being and Time*). ("The Point here is that the correct understanding of his early writings is obtained only if he is read backward, from end to beginning. . . . When read backward, from the last writings to the first, Heidegger appears in a different light. Once again, his texts alone are at issue. From the viewpoint of the typology, *praxis*. . . is the only response that the actors in history give, and cannot but give, to the constellations of presencing that enclose them. . . . Heidegger then attempts to think presencing explicitly as plural. The action that responds to presencing so understood, will be diametrically opposed to the *Führerprinzip*; it would be a type of action irrationally alien to all reduction to the uniform, an action hostile to the standard. . . . Presencing then appears more Nietzschean, deprived of metaphysical principles, 'chaotico-practical' . . . anarchy." Schürmann, *Heidegger*, pp. 13–14.) A fragment from Schürmann's book directs us to expand the title of Heidegger the "teacher" as "teacher/learner". This expanded title enables us to grasp the priority of learning to Heidegger's later project, which, in effect, will enable us to trace this priority *back* to the beginning of his earliest work as a *Privatdozent*. Schürmann writes: "The hardest apprenticeship is that by which [people] learn how to hear and heed no other imperative than the relation. . . of human *logos* in its proper relation to the *Logos*."

An apprentice is a novice, a beginner, but also a beginning. As Arendt citing St. Augustine once insisted, we can begin because we are a beginning: “[the human person] is free because [they are] a beginning. . . . Because [they *are*] a beginning, [the human person] can begin; to be human and to be free are one and the same. God created [humanity] in order to introduce into the world the faculty of beginning: freedom” (Arendt 1977). In this sense, an apprentice in the Heideggerian sense is not only a beginner in being a novice but also beginning in being the appearance of freedom in the world. Learning how to hear and heed *Logos* entails *becoming* a beginning. The learner is the realization of freedom in the world.

Learning undertaken by the apprentice of *Logos* involves a *techne* (τεχνη) that is no mere technical technique (“how to”) but a *poiein* (ποιεῖν) that responds to the fundamental question “*freedom?*” *Poein* (ποιεῖν) hears the question of freedom as the question of Being and responds by making meaning. In turn, the hardest apprenticeship is learning how to listen to human *logos* in relation to *Logos*, and thereby receiving the call (inspiration) to make or compose a meaningful contribution to the world, which is to say, a work of art that gathers others into the clearing, or region of peace. Learning to listen is thus the process of learning the *techne* that most properly attains to human being: dwelling. “The word for peace, *Friede*, means the free, *das Freie*. . . . To dwell, to be set at peace, means to remain at peace within the free.” (“Building Dwelling Thinking,” *Basic Writings*, p. 351 Heidegger). In sum, responding to the call of *Logos*, to the question of freedom, entails undertaking the work that brings about peace.

“Heidegger *is* above all else a teacher” – and as one who pursued the evasive dynamic of thinking, he remains *before* and *beyond* all others a learner. With regard to Heidegger in the context of learning, what should interest us is what remains *before* and *beyond* the *personas* (the masks placed upon him by himself and by others, including his students past, present, and those who will come later). To hear Heidegger the teacher is to listen-with Heidegger the learner, which is to listen *not* to Heidegger *per se* but to *Logos*. When we do

this, the student recognizes what remains *before* the figures of “Heidegger,” behind these masks, is the shared breath, the human spirit, the Soul, which is ultimately exhaled through and moves *beyond* those masks. Thus what remains always *before* and *beyond* is the inspiration (the breath inspired, spirit) from *Logos*, received through the fundamental question “*freedom?*” and carried out in response to the instruction to “make something meaningful,” “make a world of meaning,” “make a meaningful world”: make, build, something lasting; something beautiful; something that will sublimate mortality; and something worthy of remembering, of repairing, and renewing.

In order to receive *Logos*, and thus to be inspired by the Word, the mask of “Heidegger” must give way to the call that precedes from the Spirit that is heard as the *antepersona* of Herr Recktor. Learning proceeds via listening, because human *logos* (saying) is preceded by *Logos* (universal calling) (Stauffer 2015). For the later Heidegger, the one a student must begin with, removing the mask of power proved to be the most difficult challenge within “the hardest apprenticeship.” As Krell puts it, the fundamental questions pursued by Heidegger “What calls on us to think? . . . give *us* pause. Here we must assert less, listen more.” (“Editor’s Introduction to *What is Calls for Thinking?*,” *Basic Writings*, p. 366 Krell). For his part, Heidegger recognized the struggle with the mask of power in his final lectures, announcing from the onset that the fundamental task of the teacher is to be a learner, and within the context of a learning community, the *first* learner:

The teacher is ahead of his apprentices in this alone, that he has still far more to learn than they – he has to learn to let them learn. The teacher must be capable of being more teachable than the apprentices. The teacher is far less assured of his ground than those who learn are of theirs. If the relation between teacher and taught is genuine, therefore, there is never a place in it for the authority of the know-it-all or the authoritative sway of the official. It is still an exalted matter, then, to become a teacher – which is something else entirely than becoming a famous professor (*WCT*, 15).

The move from assertion to listening involves a resolution to relinquish willing, or to will

non-willing, what Heidegger following the medieval mystic theologian Meister Eckhart calls *Gelassenheit* (releasement). Releasement of the will is a suspension of the will-to-power, that desire to impose or place upon oneself, others, and the world a *singulare tantum*, a single world-view or system of belief (dogma). *Gelassenheit*, the releasement of the will, places one into learning via unlearning, into the uncertainty that is confronted beyond dogma and the will-to-power: "when we learn to think. . . we must allow ourselves to become involved in questions that seek what no inventiveness can find.... [We] can learn only if we always unlearn at the same time.... we can learn thinking only if we radically unlearn what thinking has been traditionally" (*WCT*, 8).

"Heidegger is above all else a teacher" – *before* and *beyond* teaching is learning, which entails heeding call to think that is put underway by *Logos* with the thought-provoking question: "*freedom?*"

On the first day of his last course at Freiburg, Heidegger begins by telling his students that "we must be ready to learn thinking." And then he adds, "As soon as we allow ourselves to become involved in such learning, we have admitted that we are not yet capable of thinking." First and foremost, then, the task at hand is to learn how to *hear* the fundamental question placed before us: "*freedom?*" The hardest apprenticeship is the one that places us in the tutorial of listening.

In that same first lecture Heidegger informs his students that there is one exemplar in the history of philosophy: Socrates. He was "the purest thinker of the West," because he was a learner and not a professor, i.e., not one who professed to have knowledge. Socrates stood in the draft, which is to say, he remained unmasked, an oral thinker (as opposed to an orator) who remained steadfast in the dynamic flux of dialogue:

All through his life and right into his death, Socrates did nothing else than place himself into this draft, this current, and maintain himself in it. This is why he is the purest thinker of the West. This is why he wrote nothing. . . (*WCT*, 17)

Socrates asked questions, and he listened, and then asked more questions, and listened again.

The dialogic repetition pointed toward thinking, and away from knowing. In leading this process, Socrates demonstrated the strength required of the one who is an apprentice of *Logos*. Heidegger's "most thought-provoking is that we are not yet thinking," which he repeats mantra-like throughout the session of his last course, is a version of Socrates' "all that I know is that I know nothing at all." Both are the aphorisms of the teacher who is first and foremost a learner.

Philosophy offers its own form of education, and with Heidegger we can identify a pedagogy of philosophy that offers us a tutorial in "the essence of truth. . . freedom." In this sense to be a student of philosophy is to undertake the hardest apprenticeship, which demands remaining in the draft, in the dynamic flow of *Logos*, and thereby moved by the Word, and thereby constantly renewed by the existential study of the question, "*freedom?*" The student of philosophy (*Logos*) is put "underway to learn thinking" (*WCT*, 25), but this by no means suggest that they are being instructed in "good" or "correct" "reasoning." The aspiration of ethics, as a practical science, is in contrast to the radical uncertainty of existential freedom a "refuge" for people "from any draft too strong for them." On the contrary, the hardest apprenticeship for "those who practice the craft of thinking" (*WCT*, 25) offers only the guarantee of possibility that history has not foreclosed upon the future. The future remains open so long as the student remains unmasked, *sans persona*, and that requires a relation to the present that transcends the familiar, the repetitive, and thereby disrupts behavior and motivates action. Learning is thus a relation of attentiveness to the possibility that remains in the presence of the actual.

When Heidegger speaks of the "present," he is naming what is *presencing* before and beyond what is perceived to be actual or real (as understood by a fugitive from thinking). Perception of presencing happens by way of acute attentiveness: listening. Listening is thus a unique kind of relation to the present that places the student in the position to receive the presencing of existence (Being) in the specific moment or existential situation. This is what William Blake is describing when he writes of receiving "a World in a grain

of sand, and a Heaven in a wildflower, Infinity in the palm of your hand, and Eternity in an hour.” (William Blake, “Auguries of Innocence,” (public domain)). Learning prepares the student for the reception of Being via listening. “In order to be capable of thinking, we need to learn it first. What is learning? [A person] learns when [they] disposes everything [they do] so that it answers to whatever essentials are addressed to [them] *at any given moment*. We learn to think by giving our mind to what there is to think about” (*WCT*, 4).

To perceive what remains and exceeds “the real,” and comes before what “is” and remains not-yet, the student must *learn listening*: “what we can do in our present case, or anyway can learn, is to listen closely,” which “is the common concern of student and teacher” (*WCT*, 25). We might describe the learning of listening as the *community* of learning shared by student and teacher. And here Heidegger, as teacher/learner, is borrowing from Heraclitus who said, “Listen not to me, but to *Logos*, and know that thinking is common to all.”

With the hardest apprenticeship, the student learns to listen closely, and through close listening responds to offering made in the clearing that persists in-between the chronological order (*chronos*). *Logos* heard through the opening or break in time is named *kairos*. And those who practice the craft of thinking through the art of listening experience a transcendence from the chronological into the kairological, which is described by Heidegger, following Kierkegaard, as the leap. “There is no bridge here – only the leap. . . .” The leap named here is the final emancipatory releasement (*gelassenheit*) into the place where thinking resides: the clearing or the place where dynamic flow or draft of *Logos* is moving: “By way of this series of lectures, we are attempting to learn thinking. The way is long... to reach the point where only the leap will help further. The leap alone takes us into the neighborhood where thinking resides” (*WCT*, 12).

“Heidegger *is* above all else a teacher” – we must insist on using the present tense for the obvious reason that those who read Heidegger, which is to say study and thereby continue to learn from Heidegger, are drawn into the draft of his thinking, into the existential and ontological

dimension where Heidegger’s teaching exists in a *dynamic present* that defies the boundaries of the chronological, and the historical. For Heidegger, learning is occurring when we attend to what calls on us to think, and when we attend to what is compelling us to take up the essence of truth, which, for Heidegger, is freedom. Most forcefully, this call arrives from art, which is both the result of and the inspiration for the actualization of freedom. And this is why Socrates, whom Heidegger called “the purest thinker” and who remains the exemplary teacher, was inspired to undertake philosophy by the call he received from a dream-figure who repeatedly instructed him “to make music, and work at it” (*Phaedo*, 61b).

With the figure of Socrates as the exemplar, it may be the case that what is demanded for learning, for taking up the hardest apprenticeship, is first and foremost a listening that opens the student to the philosophical imaginary where dream-figures and muses appear. Perhaps this kind of listening will enable the student to not only hear the call of *Logos* but to hear also in this call the address of *Mythos*? This may be what Heidegger is indicating when he speaks of the transcendence into the kairological that happens by way of a leap. For it is by way of the imagination and dreaming that thinking perceives possibility, the sudden burst of the future, in the present. Heidegger tells his last group of Freiburg students: “The *mythos* is that appeal of foremost and radical concern to all human being which makes [humanity] think of what appears, what is in being. *Logos* says the same. . . .” (*WCT*, 10). The leap is thus a releasement or letting go of the fear and anxiety of the unknown and unknowable that drives thinking into exile. The leap into the realm of imagination and dreams, and thus the transcendence beyond what is falsely designated as “actual” or “real,” is, of course, part of the allegorical tradition of philosophical learning that was initiated by Parmenides: “the early Greek thinking (Parmenides, fragment 8) are precisely the ones to use *mythos* and *logos* in the same sense” (*WCT*, 10). If, at the end of his teaching career, Heidegger was describing that learning as the transcendent leap via listening takes the student into the region where *Mythos* and *Logos* remain together, then he

was at the moment returning to one of his earliest pronouncements, which, before the publication of his famous *Being and Time*, he declared that the encounter with and of thinking will always require run ahead to the past: “*It is Dasein’s running ahead to its past, to an extreme possibility of itself that stands before it in certain and utter indeterminacy. Dasein as human life is primarily being possible, the Being of the possibility of its certain yet indeterminate past*” (Heidegger 1992). to the past and through such running build up the momentum to take the necessary transcendent leap into the realm where things are different because they are disclosed via dreams, and different things are possible and made real through art:

“...the leap takes us abruptly to where everything is different, so different that it strikes us a strange... Though we may not founder in such a leap, what the leap takes us to will confound us....we must be ready and willing to listen. Such readiness allows us to surmount the boundaries in which all customary views are confined, and to reach a more open territory” (WCT, 12–13).

Heidegger and Mood

Tyson E. Lewis

University of North Texas, Denton, TX, USA

Mood as an Educational Issue

It is not uncommon to hear teachers talk about the moods of their classrooms. A morning art class might have an “exciting” or “adventurous” mood, while the very same class in the afternoon might seem “dead” or “flat.” Teachers use a variety of synonyms for such moods. When they walk into a classroom, they immediately and intuitively gage the “temperature of a room” or they pick up on the “vibe” of a class. These highly complex and poetic words indicate something is in the air, something that one cannot quite figure out yet nevertheless has a real presence. In fact, such moods are a constant topic of discussion. Are they caused by particular students, by the time of day, by the weather? The more one analyzes possible points of origin, the more mysterious and nebulous such moods become. And the implications are indeed serious. Adventurous or dead moods shape what is taught and how it is taught. The teacher, perhaps more than anyone else, understands that mood plays a role in how we relate not only to others but also to knowledge.

In this brief entry, I will assert that noted phenomenologist Martin Heidegger offers an important starting point for thinking through a philosophy of mood. By outlining Heidegger’s basic understanding of mood, I will hope to clarify three issues raised in my introduction: that moods seem to lack specific and identifiable causes, that they appear beyond our immediate and willful control, and that they disclose certain forms of knowing, relating, and being.

A Phenomenology of Mood

One of the most fascinating and controversial aspects of Heidegger’s analysis of *Dasein* in *Being and Time* is his description of mood

(*Stimmung*). Rather than an internal state, Heidegger argues that mood is a constitutive aspect of *Dasein's* being in the world. Heidegger uses the concept of *Dasein* (a compound composed of “*da*” there and “*sein*” being) to describe human beings in order to escape certain traps in the history of philosophy that attempt to define the human as a self-sufficient substance such as a soul. Instead of reifying the being of human beings into such a substance, Heidegger grounds our *special* kind of being in a “there.” Stated differently, *Dasein* is its situation. Because *Dasein* is the “there” of its situation, there is no fundamental gap separating the self from the world. Indeed, dichotomies between internal and external cease to make *sense* from a Heideggerian point of view. As such, *Dasein* is fully immersed in a world of relations, roles, practices, and equipment; it is its being in the world. Famously, Heidegger writes, “*Dasein* is its world existingly” (II.4, 364). Chapter 5 of the first division of Heidegger’s masterpiece *Being and Time* is an attempt to understand the structure of the “there” in *Dasein's* being there. This peculiar sense of thereness is comprised of three interrelated and equi-primordial dimensions: understanding, discourse, and mood. These dimensions or structural facets are equi-primordial in the sense that they are all equally primary and none of them can be explained without reference to the others. Due to limitations of space, I will not be able to discuss understanding and discourse; thus, my presentation below is somewhat artificial, cleaving mood off from a greater whole of which it is merely one facet.

Mood is part of an interdependent totality of characteristics that constitute *Dasein's* being in the world (its being there). The German word for mood, *Stimmung*, also means the tuning of a musical instrument. In English, we can play a bit with the word “tuning” in the sense that mood *attunes* us to what is meaningful in our lives. Stated differently, a mood *tunes us into* what is relevant. The there of *Dasein* is only a there (as a particular place wherein something meaningful can arise) because of mood. There are three important points to make about the nature and function of mood in relation to *Dasein's* being there.

To begin, because mood is ontologically primary to *Dasein*, we are always already in a mood. There is no stepping outside of a mood. *Dasein* is moody as such. Mood has a kind of atmospheric quality that is neither inside us as a private emotional state nor is it outside us as an objective substance which we can objectively observe. Whereas individuals might be able to move from one mood to another, there is no being outside of any mood. In short, there is no transcendental perspective that is divorced from a mood. *Dasein* finds itself in a mood. In this sense, there is some phenomenological truth in the common, everyday phrase “so-and-so is in a mood.” The “in” here is not spatial so much as existential, indicating that *Dasein* is always already worldly, wrapped up with and attuned to its situation.

Second, if we did not have an ontological capacity for being in a mood, then *Dasein* would not find anything familiar, relevant, or important to care about. For Heidegger, mood is a “disclosive submission to the world, out of which we can encounter something that matters to us” (1.5, 138, p. 177). A mood makes possible the ability to orient one’s self toward something, therefore producing the precondition for meaning. To be in a mood is to find one’s self in a clearing where the mood lights up certain things, people, roles, and features of the situation that can become relevant. For instance, if I am in a depressed mood, then certain possibilities will not light up for me, the world will appear dim and lifeless, and nothing will solicit my attention. That which might have seemed important one day, now appears irrelevant. The equipment that once called out to be used goes silent, and the relationships with others that once motivated me now appear insignificant, strange, or uncanny. If I am in a mood of love, then new relationships and forms of intimacy open up as real possibilities, and all my efforts become directed toward a focal practice of courtship. When in love, the there of *Dasein* is charged with electric tensions, gestures become infused with heightened meaning, and life as such blooms with a new sense of beauty. In both cases, to be in a mood means that the world is suddenly unlocked as a place of significance (or lack thereof). Even seemingly detached

and “objective” points of view (as in the empirical sciences) have, at their base, some kind of mood that situates them in a world (the scientific world or any other world for that matter). Without a mood, nothing of relevance could disclose itself to us, even in a science laboratory.

Third, and this follows from the second point, mood is not under our subjective control. Moods “assail us.” They seem to come from the outside and wash over us. Thus one cannot voluntarily enter into a specific mood, nor can one necessarily use one’s will to escape from a mood that one has entered into. As such, mood poses interesting questions to behavioral psychology, not to mention political theories of agency. On this reading, Heidegger emphasizes *Dasein*’s fundamental passivity. We receive moods, we find ourselves in them, and as such, there is something in our fundamental experience of the world that is *beyond our control*. Take, for instance, both depression and love. One cannot simply talk one’s self out of being depressed, nor can one talk one’s self into being in love. Depression and love *happen*; we find ourselves in these moods. And we should put full weight on the notion that we “find ourselves” in and through a mood. The self does not exist outside of the mood; *it is its moody situation*. Thus, the mood of depression or love is inseparable from who we are at the time and how the world is (how it appears). What is so infuriating about both of these moods is that they seem to arrive at the most inopportune of times and do not respond to our willful attempts to direct or control them.

In division one of *Being and Time*, Heidegger singles out anxiety (*Angst*) as an important mood. Anxiety is important because of the unique way it discloses *Dasein*’s being there (being in the world as a whole). Unlike fear having a definite cause (let’s say a bear in the woods), anxiety is rather diffuse and seems to lack a clear cause, which one can point out. Because there is no apparent cause, there is also very little that someone can do to ameliorate the overwhelming sensation of anxiety. In this sense, anxiety does not present *Dasein* with any action. Although *Dasein* is normally found coping and dealing with the world that it is in, anxiety presents an uneasy experience of being *in* the world but not *of* it. The focal practices

that orient us are suspended, the equipment that affords us action is inoperative, and the relationships which give our lives meaning seem inconsequential.

Usually, the world is taken for granted and is thus part of our background practices, roles, and experiences. It is so close to us that we pay it no mind. But when the rich significance of the world that invisibly props up our daily activities collapses, we feel paralyzed. The brilliance of Heidegger’s phenomenological method does not see this paralysis as mere nihilism. Indeed, it is only when the call of the world falls silent that something significant about the world is disclosed to *Dasein*. When the world loses its significance, all we are left with is the bare *structure* of that world (the worldhood of the world). Heidegger summarizes: “the *world as world* is disclosed first and foremost by anxiety” (232/187). When the world breaks down, then *Dasein* realizes the fundamental structure that makes a world possible. Lack of a world reorients *Dasein* to the basic fact that it is worldly.

Implications for Educational Research

Having summarized Heidegger’s basic phenomenology of mood, I would now like to turn to why this feature of *Dasein* is so important to educational philosophy and research. First, as Lauren Freeman (2014) argues, Heidegger’s phenomenology of mood is an important resource for addressing certain oversights, contradictions, and misunderstandings found in the psychology of emotions. Central to Freeman’s analysis is the fact that moods are not mere mental states but are rather the worldly preconditions for mental states (including emotions, feelings, beliefs, and so forth). Stated differently, moods are more basic than cognitive and/or emotional states. Indeed, private states of mind are derivative of a more general (public) mood. Yet in psychology, the worldly dimension of mood is often ignored or confused with private, subjective, and internal emotions. And because the starting point of psychology presupposes an internal and an external, it misses *Dasein*’s fundamental connectedness

with and responsiveness to the world. Further, psychology assumes that moods can be atomized and decontextualized. In this way, empirical studies of “mood” fail to recognize how moods are directly connected to being there in a place and are holistically connected with the other facets of one’s sense of self. Freeman concludes with suggestions for how psychology can clarify and complexify its understanding of mood as different from emotion.

Given the dominance of psychology in educational research, I would argue that Freeman’s critique is particularly pressing. Drawing on Freeman’s work, I would suggest that educational psychology (and certain branches of educational philosophy that draw heavily on psychological research) pays attention to the following questions: How are mood, emotion, feelings, and desires related to yet distinct from each other? What are the starting assumptions behind mood research, and how do these assumptions reveal and conceal certain features of mood? Do psychological experiments accurately ground mood in context and personal meaning? Does the experiment pay close enough attention to what it feels like from the first person perspective to be in a mood? Such questions interrupt the hegemonic dominance of psychology in educational research by returning us to the importance of phenomenological and ontological concerns.

Second, as I have explored with my coauthor Justin Garcia (2014), there are certain dangers in grounding teacher education in skill development and belief clarification. Both of these approaches miss how teaching is first and foremost contextual, embodied, and richly meaningful as a focal practice. Instead of beginning with clarifying what preservice teachers believe to be good teaching and with rudimentary skill building/knowledge acquisition (such as how to write a lesson plan or the proper way to handle disciplinary problems in a classroom), we suggest helping orient students toward teaching as a meaningful practice – as a worldly practice. To do so, we suggest students should observe classrooms not for learning about how to be a good teacher but rather to experience classrooms as worlds composed of interrelated subjects, pieces of

equipment, practices, and moods. Garcia and I call for a phenomenological form of preservice teacher education that helps students *get into the mood* of classroom life through poetic writing and journaling that captures what it feels like to be in a classroom. Such writing does not merely describe the mood of a classroom as if mood were an objective thing. Rather it would be moody writing, and through such moodiness, open up the fundamental questions of teaching. It is only against a background of meaningful attunement to teaching as a way of being in the world that skill development and belief clarification can have any meaning or relevance beyond pure instrumentalism.

A third aspect of mood that is worthy of note for educational philosophers concerns the ways in which different moods might offer up different educational opportunities for students. As stated above, moods are world disclosing. New facets of the world can be revealed through changes in mood. On this view, knowledge of the world is never neutral, detached, and omniscient but rather refracted through various moods. This means that moods such as wonder, melancholy, anxiety, boredom, and love (just to name a few) might grant students multiple ways of experiencing and apprehending the world. Certain moods might be more conducive to certain kinds of activities, thinking, and teaching than others. Recognizing the moodiness of a classroom becomes a unique opportunity for teachers to reflect on what kinds of learning, studying, dialoguing, and practicing become real possibilities that *Dasein* can plunge into. Drawing on Heidegger’s evocative phenomenology of boredom, Jan-Erik Mansikka (2009) describes the educational relevance of this mood. Boredom can lead students from learning that is not meaningful to learning that leaves them empty to a profound experience of undetermined existential potentialities that manifest themselves when students stop learning and wait.

But remember, moods do not have clear causes; they assail us and therefore might very well be beyond an individual will or intentional act of control. As such, the moodiness of a classroom is a particularly pressing issue for teachers. Let us assume that a particular classroom has a

“lousy” mood or a “disengaged” mood. It would be incorrect to attribute such a mood to any given student, activity, or piece of equipment as moods do not have direct, assignable causes. Attributing a “bad” mood to a particular student (or group of students), for instance, would miss how moods operate as worldly, atmospheric conditions that defy clear and easy subject/object, inside/outside dichotomies.

Yet is a teacher thus powerless over the mood of a classroom? Interestingly, Heidegger observes that great orators are great because of their understanding of mood. Audiences have a particular type of public mood that washes over them (think of public sporting events today). “It is into such as a mood,” writes Heidegger, “and out of such a mood that the orator speaks. He must understand the possibilities of moods in order to rouse them and guide them aright” (Heidegger 2008, p. 178). To understand the possibilities of moods means that the orator is himself/herself within the mood, effected by the mood, and thus moved by the mood. We can never be outside of the mood and as such have limited control and autonomy. And this goes for teachers as well as orators. By understanding mood, teachers dwell in the mood of the classroom in order to sense the mood’s educational possibilities. In this way, they might be able to rouse and guide students in and through moody variations. But first and foremost, the teacher must be open and receptive to the mood (whatever it is) in order to modify it from within through certain gestures, practices, and so forth. This is a line of philosophical inquiry and research that has not yet been adequately addressed within radical, progressive, or conservative forms of pedagogy, all of which often see the teacher as a heroic figure who can transform a classroom through his or her will.

In sum, I hope to have provided a tentative outline of mood as it is presented in Heidegger’s early masterwork *Being and Time*. I have also charted three ways in which mood is helpful for educational research and educational philosophy. First, a phenomenology of mood helps correct certain misconceptions of mood in the dominant psychology of emotions. Second, mood should become a main concern for teacher educators

who are concerned with how students enter into the world of teaching. And third, mood is a pedagogical issue in that different moods can unlock different educational experiences and insights into the world. What all three of these lines of inquiry share in common is a concerted effort to return not simply to Heidegger to answer pressing educational questions but rather to return to phenomenology as a method for addressing questions that other dominant discourses such as analytic philosophy or psychology miss.

[K–12 public education system](#)

Introduction

Any attempt to associate Heidegger’s work with schooling, that is, a K–12 public education system, or an attempt to draw on Heidegger’s work for gaining insights or ideas about schooling faces serious challenges. Admittedly, educational

matters and the concept of “education” itself are not missing from his philosophy; for example, in several places he discusses “teaching” and in different cases he presents his view on higher education. However, Heidegger does not link his philosophy directly or explicitly to children in schools nor does he offer any program for K–12 public education or any structured theory of development that might be applied for K–12 students. While he sees the university as “the pinnacle of our educational system” (2002a/1945, p. 30) and designates to it a role in his philosophical project, he virtually ignores schooling as a system that might have relevance for his philosophical ideas. But Heidegger’s own disregard of the pre-higher education system does not mean that his philosophy is not useful for schooling; insights from Heidegger’s work are inspiring both in characterizing the current situation of education and in suggesting specific courses of action. In reflecting upon the relevance of Heidegger’s work in relation to schooling, this entry avoids the temptation to suggest an Heideggerian education in which “Dasein” is simply replaced by “student.”

Between the University and Schooling

Heidegger’s critique of the dominance of metaphysics as the foundation for Western thought and for the way we see the world and ourselves leads him to challenge the traditional place of the human being as a subject, from a status of active ownership to a role of subordinate listener: “the authentic attitude of thinking is not a putting of questions – rather, it is a listening to the grant, the promise of what is to be put in question” (1982b/1959, p. 71). Heidegger conveys this reduced or lower status of the human being by animating concepts such as Being, world (“world worlds”), language (“language speaks”), time (“time times”), and space (“space spaces”). For Heidegger, one crucial implication of this shift in human’s status for education is a change in meaning of truth from correspondence to unconcealing:

This same interpretation of being as *ιδέα* [*idea*], which owes its primacy to a change in the essence of *ἀλήθεια* [*aletheia*], requires that viewing the

ideas be accorded high distinction. Corresponding to this distinction is *παιδεία* [*paideia*], the “education” of human beings. Concern with human being and with the position of humans amidst beings entirely dominates metaphysics. (Plato’s Doctrine of Truth, in *Pathmarks*, 1998/1967, p. 181)

The prevailing subject-object dichotomy results in education that is based on objectifying content and transferring it from those who hold it to those who are perceived as needing or seeking it. The metaphysical perception of truth equates between “idea” and “state of affairs” and leads to a “reduction of education by the logic of contract to the status of commodity to be exchanged for consideration according to the law of equivalence” (2002a, p. 40). Heidegger uses Husserl’s notion of “intentionality” in order to explain truth as world disclosure. He argues that “[w]ithout radically rethinking intentionality, the university’s attempts to lay claim to its much vaunted neutrality, to evade being the organ of the nation-state and of the market, is quite futile” (ibid., pp. 42–43). Heidegger understood that as a result, being under social, economic, and political stresses, the university is deprived of an independent intellectual freedom and becomes a tool in the service of powerful self-interested forces:

the university finds itself under a categorical imperative to advance the understanding of intentionality before all other service to society, whether in the interest of church, state, or civil society. . . . eschews the rational imperative of relevance in all the forms that fitness for purpose may take, such as utility and expediency, on the one hand, or conformity to convention and custom, on the other. . . . [the university] cannot be an instrument of social engineering or, more generally, simply a *means* to an end, without ceasing to *educate*. (ibid., p. 30–1)

Heidegger is concerned about a situation in which the university loses its identity and explicitly warns against “subversion of identities, of crossing the line between education and politics, university and state; of exceeding the limit beyond which philosophy becomes ideology [*Weltanschauung*] and teaching turns into propaganda” (ibid., p. 28). Since the time of Heidegger’s warning against instrumental usage of the university, the literature tends to attribute crisis and other catastrophic terms mostly to higher education, as

the university attracts a lot of attention among scholars who are worried about the institution's loss of identity as a result of over-vocationalization and a decrease in the prestige of undergraduate studies stemming from market forces. However, as a result of instrumentalism, public K–12 schooling is just as much in a state of emergency and requires appropriate measures in order to protect it. Moreover, as higher education is fed by the K–12 system, it might be that in some sense the higher education crisis originates from the perception of parents and students at the pre-university level and that at least some of the problems of higher education – especially those in the humanities – can be addressed by changing attitudes toward public K–12 schools. We should remember that unlike higher education, schooling is an obligatory system and as such it reaches all parts of the society, including those that choose not to attend or are excluded from the university – populations that at least in some sense are more vulnerable to being influenced by the social forces that Heidegger warns against. With regard to higher education, Heidegger sought to promote agency for the university in order to shield it from external powers:

the defining trait of the university lies in its *self-assertion* [*Selbstbehauptung*] from the social powers that are bent upon bringing it to heel, insofar as they are ultimately threatened by the institutionalizing of the practice of interpreting intentionality and transcendence in a free and unfettered way. (ibid., p. 31)

The same social forces that are concerned about “a free and unfettered” university are also – if not more – worried about independent or autonomous schooling that will define for itself its goals and strategies. Thus, when Heidegger's vision of self-assertion is coupled with K–12 public education, the result is schooling that has its own agency in such a manner that it could identify and protect itself from attempts to serve the needs of powerful social forces.

Building on Nietzsche's notion of will-to-power, Heidegger argues that our contemporary late-modern way of being – that is, the way we perceive beings and our world – is a *technological* one, not in the sense of technological devices

(although this is one consequence) but in the sense of calculative thinking, that is, considering everything, including ourselves, as “standing-reserve” [*Bestand*] (*The Question Concerning Technology*, 1977/1955), resources to be mastered and optimized. This technological tendency, which Heidegger called enframing (*Gestell*), is the dominant way of thinking, and it is demonstrated everywhere, in scientific and nonscientific domains, from medicine through transportation to education. The same technological tendency to control and to optimize also guides the social forces that seek to influence education. Since this way of thinking is aggressive as it precludes other ways of thinking, Heidegger argues that “we must, of course, first rid ourselves of the calculative frame of mind” (1982b, p. 104).

There are already increasing voices within the critical schooling literature that acknowledge and criticize the operation of public education as a machinelike system that operates upon students as inputs in order to convert them to required outputs and voices that challenge approaches of “what works” in schooling as well as in educational research. As education is entangled in enframing, and as this way of being serves the human being's tendency to control its environment as well as its fellow human beings, education becomes a key agent in glorifying, praising, celebrating, and promoting humankind's ego – secondary perhaps only to science. Instead of playing this endorsing role, Heidegger's alternative and radical philosophy is inspiring as it enables us to think about schooling that is not dictated by political or economic desires, counterintuitive as such a situation might seem.

As an alternative for a transactional conception of education, and based on his ontological inquiry, Heidegger calls us to found education on guiding students toward awareness, attention, and response to the existential call; instead of the temptation and the urge to relay content, education should be a buffer or a barrier between the student and instrumental demands:

If the pose of teacherly omniscience and the authority that this pose articulates are disincentives to learn, then the question of education is the question not of how to transmit knowledge but of how to suspend it. The concrete teacher is one who

temporarily stages the scene of resourcelessness. Education is not a passing on of knowledge and skills either in the medieval paradigm of master/apprentice or in the modern of seller/consumer. Rather call it a withholding, a delaying of articulation, in order that the student may attain an answer. . . . The teacher's silence is finally what has to be heard. (2002a, p. 41)

Here, too, the critical schooling literature is not left behind and makes a case for a governing principle of suspension rather than the efficient transmission of knowledge in schools.

Language and Educational Experiences

For Heidegger, language is a central "instance" of Being and of Dasein: "The being of anything that is resides in the word. Therefore this statement holds true: Language is the house of Being" (1982b, p. 63). There is direct linkage between the call to which the human being listens and language: "man by virtue of his language dwells within the claim and call of Being" (1982a/1959, p. 5). In language – and reflecting on language – we find a linkage to Being and as such to ourselves, a linkage formulated by the "guide-word": "The being of language: The language of being" (1982b, p. 72). Similarly to other notions, in Heidegger's philosophy language gains life, or personality, a status or power over the human being, and as such the relationships between the human being and language are changed, if not inverted: "What we speak of, language, is always ahead of us. Our speaking merely follows language constantly" (ibid., p. 75). Instead of an objectified perception of language as a communication instrument – one which also serves us in schools to transfer content – Heidegger inquires about "undergoing an experience with language" through which:

something befalls us, strikes us, comes over us, overwhelms and transforms us. When we talk of "undergoing" an experience, we mean specifically that the experience is not of our own making; to undergo here means that we endure it, suffer it, receive it as it strikes us and submit to it. It is this something itself that comes about, comes to pass, happens. (ibid., p. 57)

Thus, when experiencing language, we face a call: "the reflective use of language. . . must be guided by the hidden riches that language holds in store for us, so that these riches may summon us for the saying of language" (ibid., p. 91).

Heidegger reaches these ideas regarding language through reading and analysis of poetry. His close reading of poems (e.g., in *On the Way to Language* (1982a, b) and in *The Origin of the Work of Art* (2002b/1950)) reveals experiences with language that for him tells us something about ourselves. But reading and writing are key elements in schooling, as they – initially as basic skills and later as means for learning – are crucial for the student's studies. Therefore, perceiving language not as a communication tool but as a hint for Being that reveals, calls us, causes us something, changes us, means for schooling a shift in treating or encountering texts: from "using" to "confronting" or "facing." Writing or reading texts is not a peaceful activity but a painful one that involves a struggle: not just a struggle in creating or understanding the text itself, but moreover a struggle with what the text does to us, what the text makes us realize about ourselves, and whether we are the authors or the recipients. As writing and reading, in the broad sense of being-in-the-world, involve truth as world-disclosure, and as "[t]he unhidden must be torn away from a hiddenness; it must in a sense be stolen from hiddenness . . . Truth originally means what has been wrested from hiddenness" (1998, p. 171), so writing and reading become violent acts that are accompanied by heavy responsibility and possible far-reaching consequences.

Heidegger's inquiry into the possibility of experience with language opens the door for educational inquiry into broadening the notion of "experience" in general beyond designed or calculated circumstances that are meant to create experiences for students. When students attend schools, as well as when they refer to school assignments at home, they are placed in environments and situations that are planned to stimulate them to react in a cause-and-effect manner. As such, educational experiences are seen through a pragmatic lens by which the student is called to respond to the educator's voice, mostly as it is

drawn from the curriculum. However, a broader notion of experience that exceeds the ready-made curriculum will include any experience that students and teachers undergo – in schools and especially outside school – as a source for educational reflection. Heidegger alludes to the need to integrate students' lives within his critique of the predominance of *theoria* over *praxis*:

Instruction is thus modeled on exchange: to teach, the teacher disregards the differences and distinctions within the concrete student manifold and addresses himself to the faceless, abstract student that is his counterpart. Likewise, to learn, the student abandons the idiosyncratic expressions of his life for a generic way of thinking that raises him to the level of the teacher. (2002a, p. 40–1)

In addition, Heidegger's goal of initiation of a "living philosophizing" (1995/1983, p. 57) within his students, and his (2002b) descriptions of the Greek temple as well as van Gogh's paintings, supports an educational view that allows a central role for unsolicited experiences that are not based on a body of knowledge and are not tested in advance. An implication for schooling is an establishment of a parallel mechanism for creating educational opportunities, derived from students' – and teachers' – own lives, alongside the curriculum. This means that schooling becomes less predictable and more surprising. Such an approach probably necessitates reducing the volume of curriculum in schooling in order to make room for students' and teachers' experiences as they bring them into the classroom. It is the educators' task to decide which and how aspects of students' lives are relevant for schooling, but it seems that students' own interests, their relationships with family and friends, and their encounters with culture – "high" culture as well as popular – are a fertile ground for alternative educational experiences.

Preparing for a Failure

One way in which Heidegger conducts his phenomenological inquiry is bringing forth situations when the flow of being-in-the-world is interrupted and our unreflected immersion within our

environment becomes apparent. In *Being and Time* (2010/1927), this phenomenon is illustrated by showing how our awareness of the hammer's "handiness" (p. 69) emerges as a result of an absence of malfunction of the hammer. This technique of discovery out of deficiency is also demonstrated in Heidegger's investigation into the nature of language. Heidegger identifies situations of missing words, and for him these cases reveal something about language's treatment of us:

But when does language speak itself as language? Curiously enough, when we cannot find the right word for something that concerns us, carries us away, oppresses or encourages us... undergo moments in which language itself has distantly and fleetingly touched us with its essential being (1982b, p. 59)

In its extreme form, Heidegger's attention to deficiency is manifested, of course, in his analysis of Dasein's mortality. His critique of the metaphysical subject-object divide leads him to connecting following "the way of education" and our finitude:

the way of education ineluctably returns us from the soaring heights of theory to the lowly gutter of our finitude. The way of education constitutes the passage into thought, but not a lifeless conduit connecting us as subject to an object by way of representation. No, where it leads only discloses itself as we venture onto it with the weight of our entire being. (2002a, p. 32)

Heidegger's positive attitude toward what does not work in our lives and his ontological inquiry into deficiency is in striking contradiction to the dominant tendencies in educational planning and in educational policy to base education according to cause-and-effect logic and "what works." Thus, Heidegger's attention to breakdowns together with his association between our finitude and education points to the possibility of schooling that instead of focusing mostly on preparing students toward achievements and the purchasing of future identities also significantly addresses the possibility of failures and disappointments in students' lives. "Failure" here does not mean our demise, that is, our biological finitude, but rather a collapse of one's world, whether in a personal context when one's project fails or in a broader context with regard to one's social belonging.

Current education rarely ever refers to failure outside the educational context, that is, beyond referring to students' achievements in school in relation to expected results. The fact that life outside school (physically) and life after school (postgraduation) are full of failures, and as such failure is part of the human "story" and a repeated experience, is almost totally overlooked.

Conclusion

Heidegger can be regarded as a forerunner of the contemporary situation of institutionalized education in general and of today's schooling in particular. As problematic phenomena identified in research can be explained through Heidegger's analysis and terminology, it seems that the greatest potential of his work for schooling is in identifying and characterizing ills, weaknesses, and threats. Therefore, should educators and policy makers (who, unfortunately, are not necessarily the same people) consider Heidegger's insights or ideas drawn from them, they still face the task of designing alternatives as responses to the dangers Heidegger identified and highlighted.

Heidegger and Wonder

Nassim Noroozi

McGill University, Montreal, Canada

Introduction

Heidegger's analysis on wonder is comprised of detaching wonder from its commonly assumed connotations and associating it with seemingly unconventional ones. As such, Heidegger parts ways with the customary interpretations of wonder as being synonymous with curiosity. He reflects on and "de-structures" the history of wonder as the origin of philosophy in the West by affiliating it with ideas like need, necessity, distress, lack, creative suffering, an engagement with the known and the usual, and, finally, with his theories on truth and being. Such connections and abstractions provide the conceptual vista for Heidegger to establish what he calls a "retrospective sketch" of wonder (1994, p. 148).

Heidegger substantially deliberates on wonder in one of his works in particular, a lecture in a series of lectures given in Freiburg from 1937 to 1938 entitled "The Need and the Necessity of the First Beginning and the Need and the Necessity of an Other Way to Question and to Begin" (1994, pp. 131–164). One of the central ideas he builds his study on is Plato's *Theaetetus* (2004). This is an oft-quoted classical reference for wonder in the West, in which Socrates glorifies *thaumazein* – wonder – as being the origin and beginning of philosophy. Readers of this entry will find the dialogue a helpful resource in

illustrating some dimensions of wonder that Heidegger preoccupies himself with in his work.

Wonder and the Need for Other Ways of Questioning and Beginning

Even though Heidegger devotes an entire lecture mainly to wonder, he does not immediately engage with it in his piece. He first elucidates how certain, supposedly negative, concepts that usually connote a lack or absence of thinking are in fact imperative elements for thought. Indeed, for Heidegger these concepts “arise out of surpluses or abundances” of thought provided that we are willing to tune out of the field of view of our calculating reason (1994, pp. 6, 22 & 132). The first such concept on which Heidegger builds the foundation of his sketch on wonder is the “need” of the first beginning for thinking. Heidegger’s take on need as “the ground of necessity for primordial questioning” is not related to vacuity nor perplexity; it is not a beginning for thinking waiting to be assimilated into a mode of knowledge (e.g., into a theory or a school of thought).

This need, whose essence according to Heidegger we need to have “the most profound understanding of,” arises from the distress of not knowing the way in or out (1994, p. 132). Distress for Heidegger is that between-space for thought where thinking has not yet become categorical, determined, or finalized. The distress does not guide us into another mode of knowledge, nor does it propel us to assimilate into a theory. In Heidegger’s own words, “it does not simply compel us into already determined relations to beings, ones already opened up and interpreted in their beingness” (1994, p. 134). Instead, it is an implicit self-opening – as well as a between, a mode of being, and a space that is not yet determined and controlled by any concrete theory or idea – that humans are thrown into or disposed in (1994, p. 132). This is surely not an ordinary space that existed before the experience of distress. Because the in-between is not appropriated by pre-established ideas, it is a place where beings emerge for the first time in their beingness. It causes humans to see things without being limited

to, for example, concepts immediately associated with them. That is why this not-yet-determined-by-ideas space has great potential for thought. It disposes us “into the beginning of genuine thinking and thoroughly determines it” (1994, p. 136). In doing so, it affects who we are, and it is therefore a space for the highest possibilities for human standpoints to come to light and to be created.

This between-space does not designate a space between two modes of knowledge. In essence, wonder caused by distress and need does not make you grow out of a kind of knowing, nor will it make your thoughts grow into another form of knowing. “What here permits neither an out nor an in oscillates back to itself in an extraordinary sense as this between” (1994, p. 139). It is this dwelling and turning inside one’s own knowledge, and not turning outside toward an unknown object, that Heidegger delights in when it comes to discussing his ideas of wonder. Rather, this oscillation helps a whole to surface that contains all the directions that thinking can go in, all the “whence”s and “whither”s of thought (Heidegger 1994, p. 137). The usual, existing, predefined concepts and beings that created our knowledge will look weakened with *thaumazein*, and the possibility of looking at our thoughts is brought forth and brought to light (Noroozi 2015, pp. 12–13) (See, e.g., when Socrates makes *Theaetetus* dizzy with wonder as he questions him on his knowledge of mathematics and makes him reflect of the limitations of knowledge in general, yet Socrates does not provide an escape out of this wonder and instead celebrates it as the origin of philosophy). Heidegger calls this the surfacing of an “undifferentiated” whole; “the measurelessness of the undifferentiatedness between what beings as beings are as a whole and that which presses forth as inconstant, formless and carrying away, which means here at the same time what immediately withdraws” (1994, p. 139). He regards the undifferentiatedness as a sign of abundance of thinking and not a lack thereof, acknowledging that this mode of undifferentiated “between” is very difficult to create; nonetheless, it is a gift for thought, one whose importance society has unremembered and one whose loss is to be grieved (1994, p. 133).

Wonder as enmeshed in distress and the need of an undifferentiated *between* is in sharp contrast with theories that deem wonder as a prelude to more certain knowledge. Correspondingly, it is antithetical to what can be called an analytic look at wonder: one that legitimizes the presence of wonder as a *beginning* epistemic activity provided that it eventually becomes “wedded to a concern for truth” or absorbed to knowledge and one that is necessary so far as it “gets the ‘real’ inquiry going” (Kingwell 2000, p. 88). Wonder in this light can be regarded as what Francis Bacon calls a broken knowledge (1895, p. 270), with its sustenance being ultimately preclusive to real knowing.

Wonder and Its Conceptual Affiliates

Once we are familiarized with Heidegger’s preference for associating concepts like distress and need to structure a discussion on wonder, it becomes easier to imagine that for him, common representations of wonder – associating it with concepts like curiosity and awe – are insufficient and objectionable.

Indeed, that wonder, as having been described as the beginning of philosophy by Socrates, which is interpreted as something close to curiosity is for Heidegger a “weak and pitiful determination of origin” (1994, p. 135). For Heidegger, curiosity is a thief of wonder or, at best, a degenerated form of it (Stone 2006, p. 207). In his work *Being and Time*, Heidegger completely refuses to see curiosity as identical with wonder. Curiosity is in search for novelty and unknown and has at least three constitutive elements that make it different from wonder: “a specific *not-staying* with what is nearest,” “distraction by new possibilities,” and “*never dwelling anywhere*” (2010, p. 161 emphasis in original). For Heidegger, Western philosophy did not originate in curiosity but in a need for another way of questioning. The primordial beginning of thinking was created out of a distress of not knowing the way in or the way out: a distress determined at oscillating back to itself as opposed to assimilating into another structure of thought or instead of being amused by an unknown object of awe.

Indeed, regarding philosophy in general as an activity that was initiated in curiosity and as being infatuated with unknown and unusual objects is a form of trivialization of philosophy. Heidegger critiques the “readily cited” approach to wonder as the origin of philosophy, arguing that this robs philosophy of wonder and the wondrous. Philosophy rose because we faced questions about knowing and truth that we found inexplicable. In order to recapture philosophy, Heidegger exhorts us to acknowledge that philosophy is not only wondrous in essence but it becomes “more wondrous the more it becomes what it really is” (1994, p. 141).

By the same token, Heidegger also engages in a certain “dispelling” of concepts – other than curiosity – that are normally regarded as synonymous to and associated with wonder. Concepts like admiration, astonishment, and awe share affinities with wonder because they encounter elements of surprise and unexpectedness juxtaposed to or set against the exceptional and the unexpected. Similar to the experience of wonder, they all start with “the wondrous” (1994, p. 140). Admiration, to take a case in point, sees the unusual foregrounding from its usual surrounding as wondrous, together with astonishment and awe, which have positions of suspense taking when dealing with the wondrous. They are all however mainly enamored with the unknown and the unusual, whereas wonder is more like a hinge (Miller 1992) that oscillates back to the known and the usual.

Heidegger’s Sketch on Wonder

Heidegger ultimately develops thirteen theses in order to construct his theories on wonder. A few of the theses are: (a) In wonder, what is most usual itself becomes the most unusual; (b) In wonder, what is most usual of all and in all, in whatever manner this might be, becomes the most unusual; (c) The most extreme wonder knows no way out of the unusualness of what is most usual; (d) Wonder as between the usual and the unusual, wonder as dwelling in a between, between the most usual, beings, and their unusualness, their

“is”; (e) The eruption of the usualness of the most usual in the transition of the most usual into the most unusual. What alone is wondrous: beings *as* beings; (f) Wonder displaces man into the perception of beings as beings, into the sustaining of unconcealedness; (g) Wonder as a basic disposition belongs to the most unusual (1994, pp. 143–153).

A reciprocal interplay of need and distress of another way to question and begin, wonder through these thirteen theses is portrayed as having a very critical relationship with the known and the ordinary. Through wonder, we are taken out of our ordinary involvement with things. Wonder thus “makes what is ordinarily unquestioned, questionable, makes what ordinarily seems familiar, strange” (Malpas 2006, p. 259). The unusualness of the usual creates a reflective stance toward one’s knowledge. Thinking can be seen as having become an interrogatory position toward the known (Noroozi 2015, pp. 12–13) or a formative peculiar return to beginnings (Sallis 1995, p. 244). Wonder does not seek to escape from this unusualness of the usual by attempts to dominate it. It does not seek control over the unknown, nor does it seek mastery over the known *per se*. It dwells on beings and their “is” by turning to the usual (1994). “It cast back wholly on itself, knowing that it is incapable of penetrating the unusualness by way of explanation, since that would be precisely to destroy it” (1994, p. 145). It thereby creates the necessity to feel a need for another way to begin thinking about the usual, the known, and the truth.

Another concept Heidegger links to wonder in his statements is the idea of creative suffering and tolerating. Not every activity requires this creative suffering according to Heidegger. Ski jumping or acting, for example, might need admiration and can live on without the wondrous, but philosophy or any other “essentially creative power” needs to preserve the suffering (1994, p. 141). Heidegger’s notion of suffering does not refer to the orthodox meanings of the word, resembling a “Christian-moralistic-psychological way of a submissive acceptance” or “a renunciation of all the pride” but more a sense of what he calls an “acceptance of what overgrows man and in that way transforms him and makes him ever more tolerant for

what he is supposed to grasp when he has to grasp beings as such and as a whole” (1994, p. 151). This borders on aesthetic suffering: being patient with thinking and not hurrying to incorporate it into an already established thought. He turns to Holderlin’s poem “The reflective god hates all untimely growth” to illustrate the aesthetic essence that this suffering bears for the sake of the growth of thoughtful questioning (p. 153).

Heidegger ultimately brings in what he calls *aletheia* as an imperative element inherently related to *thaumazein*. *Aletheia* is the Greek word for truth, but this is not truth as projecting its common meaning of actuality, facticity, or correctness. In fact, Heidegger pleads to win back for language “the hidden power of naming the essential” (1994, p. 132). He questions the practice of relying on common meanings as a norm for interpretation – truth being one of them – and returns to the Greeks and the pre-Socratics to determine and reevaluate what truth means. He thus hopes to determine and celebrate the correlation between wonder and truth, to thereupon call our attention to their pivotal relationship and thus reverse the course of modern history in dealing with contemporary philosophical problems (Korab-Karpowicz; Stone 2006 p. 207).

Truth, from the Greek word *aletheia*, embodies what Heidegger calls unconcealedness. *Aletheia* for Heidegger is “a progressive ‘disclosure’ of an entity” (McCumber 2005 p. 590). Heideggerian truth does not imply dissection or an “explanatory dissolution” of something unusual in order to make it similar, familiar, controlled, or something to eventually be turned into a fact (1994, p. 148). Through this unconcealedness the entities and beings approach us not as preformulated definitions or to-be-formulated ideas but as “beings as beings.” This disclosure of beings displaces us into “the essence of one who perceives and gathers in the open and thereby first experiences the hidden and closed as such” (ibid). Socrates’ dialogue with *Theaetetus* and him feeling dizzy with wonder when Socrates questions his knowledge of mathematics and calculation can be one example of experiencing unconcealedness through the distress of wonder that takes you “to the point of not understanding” (Heidegger 2010, p. 161).

For Heidegger, this truth as unconcealedness has two Greek concepts as its leitmotifs: *phusis* and *techne*. *Phusis* (from which the word “nature” is also derived) can refer to a number of things: growth, becoming, generation, decline, degeneration and death (Vallier 2005, p. 414), “the manner in which something appears or manifests itself and the conditions of one’s birth” (Keltner 2005, p. 318), or what Heidegger himself describes as “beings as a whole, beings *qua* beings” (1994, p. 146), as well as what “emerges into the light,” “to shine forth and therefore to appear” out of itself and to “remain standing” (2000, p. 75).

Techne is the other word related to truth and wonder. *Techne* here does not denote technology nor a sense of a skillful mastery but more a sense of knowledge, a know-how, “to grasp beings as emerging out of themselves in the way they show themselves. . . to care for beings themselves and let them grow” (1994, p. 155). *Techne* embraces a special relationship with being and with *phusis*. The pure acknowledgment of beings (*phusis*) in truth is to happen through *techne*; *techne* helps prevent the incorporation of *phusis* into the realm of reason and as such creates the need for a primordial other beginning for thinking about *phusis*. *Techne* thus helps with grasping of beings and getting transformed by them. In the meantime, *techne* releases that very grasping and does not allow calculations to be brought in to dominate it. *Phusis* can thus be protected from being turned into principles. In essence, *techne* can “maintain the holding sway of *phusis* and the wondrous in unconcealedness.” (1994, p. 153). As such, *techne* is critically related to wonder as it unfolds and establishes the preservation of the wondrous as opposed to assimilating it into previous or future forms of thinking.

However, if *techne* metamorphoses into a “know-how” in the sense of “getting an idea,” grasping will no longer be a creative suffering but a constant assimilation that can have grim consequences: *phusis* (as what comes forth and comes to light) becomes something to grasp, to calculate, and to make ordinary for one’s knowledge. This way, *techne* serves as the method for the transformation of truth as unconcealedness into sameness (*homoiosis*). This is a subtle yet profound process

of “the loss of the basic disposition, the absence of the original need and necessity” which, Heidegger warns, ultimately degenerates the original essence of truth (1994, p. 156).

If this type of *techne* prevails, carrying out wonder can in fact destroy wonder. If truth as unconcealedness is substituted with truth as sameness and correctness, we will then also have the possibility of “positing of goals.” The danger is that once goals are posited, “the avidity for learning and calculation” (1994, p. 155) gets in place of basic disposition of wonder, and thinking can consequently escape out of the necessity of the primordial need in order to reach a goal. We are therefore to resist bringing *aletheia* into the realm of calculative reason, to preserve its wondrousness and “to let it stay as the wholly other” (Heidegger 1994, p. 155). The end product of wonder – as the most simple and greatest “all-decisive beginning” – is for Heidegger not a formation of a theory or an end in a comfortable or comforting resolving law. It is to transform the current modes of knowing and to create needs for other ways to question and think (1994, p. 150).

Furthermore, if postulating aims to become predominant, philosophy will become institutionalized and will turn into a practice of reaching goals and thus end up not needing the distress and in-between. As such, wonder as “a need for an otherwise beginning for thinking” has to surrender its originality and is thus violated by attempts to be assimilated, formed, and educated on the grounds of proposed goals. In fact, the more philosophy aims to educate according to posited goals, the more insidious it gets. That is why Heidegger critiques aspirations for philosophy becoming an institution and even for philosophers to be rulers. Genuine philosophical knowledge for Heidegger is not to engage in calculative speculation and representation or to “limp behind a being” that is already known and institutionalized. Rather, it is a knowledge that starts in a distress and need for another way to question beings and knowings, one that “leaps ahead, opening up new domains of questioning and aspects of questioning about the essence of things, an essence that constantly conceals itself anew” (1994, p. 5).

Incidentally, the danger of positing goals for wonder (thaumazein) had historical repercussions. Heidegger points out that the Greeks were primordial the custodians of *aletheia*, which originated in wonder, before the calculating reason took over philosophy. The West then moved away from *aletheia*, and man became *animale rationale* (Heidegger 1994, pp. 20 & 163). Philosophy then got “entangled and hostaged” by theology, and in the modern period, it became a factor of culture belonging to the realm of calculative notions of being. Philosophy was then deemed as having started in curiosity. Accordingly, in contemporary times, truth as unconcealedness and wonder as rising from the need and distress of another way to think became the “most unquestioned” (1994, p. 158). Those who romanticize philosophy by calling for its return are, according to Heidegger, referring to the time when philosophy was a cultural asset. This leads to a misconstrued notion as it actually overlooks the origin of philosophy having been in a need for a sustained unconcealedness, the need for other ways to begin thinking, and the need to establish, engage with, and sustain the wondrous. We humans forgot that our task was to “become prepared for the necessity of the question and the necessity for the inexplicability of the truth” (Heidegger 1994, p. 141).

Essentially, for Heidegger, discussions of wonder as a hinge between connecting the need of a primordial way of thinking with truth are to result in transforming perspectives on knowing and grasping, relinquishing the search for a new doctrine, refraining from assimilating truth as unconcealedness caused by wonder into facts and general knowledge, and leaping into what he calls “a more original and more simple course of essential occurrences in the history of Western thinking” (1994, p. 162).

Heidegger as Teacher

John Quay
Melbourne Graduate School of Education,
The University of Melbourne, Melbourne, VIC,
Australia

Synonyms

Arendt; Gadamer; Phenomenology; Teaching

Heidegger began his university teaching career in 1915, a century ago as I am writing, following achievement of his habilitation – the qualification

for becoming a *privatdozent*: a university instructor or teacher (one who can teach and supervise doctoral candidates independently and who may be considered eligible for a tenure-track position). This achievement required two main steps, the first of which was successful completion of his “qualifying dissertation” or “*Habilitationsschrift*” (Sheehan 1988, p. 77). The *Habilitationsschrift* (still used in many European countries) is undertaken after the doctorate (which Heidegger completed in 1913), requiring a further dissertation to be written and argued. A major difference between the two is that the doctoral dissertation is conducted under direct supervision, with the *Habilitationsschrift* reflecting work of a more independent nature.

After successful completion of his *Habilitationsschrift*, Heidegger was required to undergo the second main step in acquiring one’s habilitation – the “licensing examination” (Sheehan 1988, p. 81) – which involves delivery of a trial lecture. This he duly undertook, and, being deemed successful, Heidegger was awarded the *venia legendi* in philosophy on August 5, 1915 – his actual license to teach philosophy. During the second week of November of that year, “he officially initiated his teaching career with the lecture course *Grundlinien der antiken und scholastischen Philosophie* [*The basic trends of ancient and scholastic philosophy*]” (p. 82) at the University of Freiburg. In this lecture course Heidegger encountered “among the twenty-one students enrolled in the lecture . . . one Fraulein Elfriede Petri from Wiesbaden. A year later she and Heidegger would be engaged to be married” (p. 82). I mention this for two reasons: (1) I shall use some excerpts from Heidegger’s many letters to Elfriede, his wife, to help illuminate his experience of teaching, and (2) understanding Heidegger as a teacher requires insight into how he related to his students, of whom Elfriede was one.

The renown associated with Heidegger’s philosophical work did not initially spread through his publications but through his teaching. In fact most volumes of his *Gesamtausgabe* (collected works) have been constructed using notes from lectures and seminars. Different to many academics, Heidegger focused on his teaching more than his publishing. Hans-Georg Gadamer, a student of

Heidegger’s who followed him in his move from Freiburg to Marburg in 1923, drew a sharp contrast between Heidegger and the professor “who devoted the full force of his interest to his publications and saw teaching as a secondary form of activity” (1992, p. 5). “With Heidegger, it was the exact opposite,” Gadamer (p. 5) recounted. “In fact, we can see today that after *Being and Time* he didn’t even write any more books actually. Those were all more or less university lectures or seminars” (pp. 5–6). And yet it was the focus on his teaching which lent success to the writing he did publish. “Heidegger’s ‘fame’ predates by about 8 years the publication of *Sein und Zeit* (*Being and Time*) in 1927,” observed Hannah Arendt (1971, p. 50), another of Heidegger’s students of that time. “Indeed it is open to question whether the unusual success of this book . . . would have been possible if it had not been preceded by the teacher’s reputation among the students” (p. 50).

One aspect of this reputation was due to the way in which Heidegger connected with his students through his teaching. “It was remarkable,” Gadamer (1992, p. 6) asserted, referring to “the personal attention to and awareness of the student which we saw particularly in Heidegger.” “It was amazing how he took hold of every question that was asked and saw something in it that was positive” (p. 6). And “because of him the lecture format became something totally new. It was no longer the ‘lesson presentation’ of a professor who put his essential energy into research and publication” (1985, p. 48). Elisabeth Hirsch was another student of Heidegger’s at Marburg. She “took several seminars with Heidegger” which she identified as “equally exciting although by no means easy. We would read a text and discuss it sentence by sentence. Heidegger’s most valued quality was that he would listen to the student with patience and interest” (1979, p. 340).

Another aspect of this reputation was how Heidegger, instead of merely communicating time-worn interpretations of classical philosophical texts, employed a means of philosophizing that brought these texts to life in an existential way. “It was technically decisive,” argued Arendt (1971, p. 51), “that, for instance, Plato was not

talked about and his theory of Ideas expounded” – in the traditional manner – “rather for an entire semester a single dialogue was pursued and subjected to question step by step, until the time-honored doctrine had disappeared to make room for a set of problems of immediate and urgent relevance.” Hence “the rumor [amongst students] about Heidegger put it quite simply: Thinking has come to life again; the cultural treasures of the past, believed to be dead, are being made to speak” (p. 51). “There exists a teacher,” Arendt proclaimed, attempting to capture the mood of the time, and so “one can perhaps learn to think” (p. 51). “Today this sounds quite familiar,” she acknowledged, “because nowadays so many proceed in this way; but no one did so before Heidegger” (p. 51).

It is important to comprehend these two reputational aspects of Heidegger’s teaching not as separate but united – as features of the task of teaching through phenomenological philosophizing. As one they illuminate the new philosophical and pedagogical pathway along which Heidegger was trying to lead his students. Through careful consideration of Heidegger’s philosophic pedagogy, Ehrmantraut (2010) astutely discerned that “in Heidegger’s lectures on philosophy . . . it could be said that the subject matter of the philosophic lecture *is* the existence of the auditors themselves” (p. 41). In other words, “the aim, content, structure and procedure of the lecture are determined not only by the subject matter . . . but also by the existence of those who attend the lectures” (p. 41). Gadamer (1985) alluded to this when he recalled how “Heidegger’s mode [of teaching] consisted in him making the interpretation of a text as convincing as possible, to a point where we risked losing ourselves in it. That is how things went in Heidegger’s lectures” (pp. 38–39). And the same pedagogical event was evident in the teacher. “The unique thing about his person and his teaching lay in the fact that he identified himself fully with his work and radiated from that work” (p. 48).

Heidegger’s teaching was an attempt to work phenomenologically in the manner in which he had further developed Husserl’s work and to have his students engage phenomenologically. As

Arendt recalled, “the rumor . . . had it that there was someone who was actually attaining ‘the things’ that Husserl had proclaimed, someone who knew that these things were not academic matters but the concerns of thinking men [*sic*]” (1971, p. 51). However the difference between phenomenological thinking and that evident in more traditional lectures presented a formidable pedagogical challenge for Heidegger (as for any teacher) because of the “distinction between the expectations that a student usually brings to academic lectures and the fundamental ‘comportment’ that is demanded by genuine philosophizing” (Ehrmantraut 2010, p. 52). Such genuine philosophizing is phenomenological, and this was how Heidegger interpreted the classic philosophical work of Aristotle, Plato, and other early Greek thinkers. This phenomenological thinking was not the usual academic thinking characterized within debates between empiricism and rationalism. In phenomenological thinking the concepts remained living, existential, thus necessitating a “turning around of philosophical comportment” (Heidegger 2004, p. 11). For “it is only where empirical and rational moments work together that experience rings true” (2002, p. 46). This “philosophizing” thus “demands something more of the student than does ordinary scientific study, it requires a ‘different kind of attentiveness’” (Ehrmantraut, p. 52). But “just what comportment is demanded is, Heidegger admits, ‘confused’ and ‘uncertain’” (p. 52).

The challenge Heidegger had taken on was to reinvent philosophy phenomenologically, and he found that the best way to do this was through teaching his students, many of whom were more open to challenging the philosophical status quo than university colleagues. “Who among those who then followed him can forget the breathtaking swirl of questions that he developed in the introductory hours of the semester,” Gadamer (1985) recounted, all “for the sake of entangling himself in the second or third of these questions and then, in the final hours of the semester, rolling up the deep-dark clouds of sentences from which the lightning flashed to leave us half stunned” (p. 48). This was a memorable situation for students like Gadamer and Arendt, but for others the

philosophical “leap” (Gray, 1968, p. 21) that was required by phenomenology presented too much of a challenge. In a letter to Elfriede dated 1932, Heidegger confided that “even though I have the large lecture hall firmly in my power, I cannot rid myself of the feeling that it passes them by and if it does hit the mark it is hardly worthwhile” (2008, p. 136). This concern was patently visible during a lecture series that Heidegger taught in the winter semester of 1920–21 in Freiburg titled *Einleitung in die Phänomenologie der Religion* [Introduction to the Phenomenology of Religion]. Part way through the semester Heidegger was forced to make an “abrupt change in course content” as a “direct result of student complaints to the Dean of the Philosophical Faculty over the lack of religious content in a course on the philosophy of religion” (Kisiel 1993, p. 172). Many students held expectations that they were to learn more about the traditional philosophy of religion, whereas for Heidegger (2004) the course entailed engaging phenomenologically with “factual life” (p. 45) as expressed through “religious experience” (p. 47).

While some students struggled unsuccessfully with Heidegger’s phenomenological teaching, those who managed to make the leap set off with enthusiasm along the pathway that now opened before them. “We were an arrogant little in-group and easily let our pride in our teacher and his manner of working go to our heads” Gadamer (1985, p. 49) reminisced. But this was not “a ‘circle’ centered around and directed by a ‘master’” Arendt (1971, p. 50) argued. “Here there was neither a secret nor membership; those who heard the rumor were acquainted with one another, to be sure, since they were all students” (p. 50). “But there never was a circle and there was nothing esoteric about his following” (p. 50). “Still,” Gadamer (1985) acknowledged, “it was remarkable how Heidegger, who had invented the term ‘liberating care,’ could not prevent a large number of people from losing their freedom to him. Moths fly into the light” (p. 50).

This close connection between Heidegger and many of his students, encouraged by the challenges of working phenomenologically, seemed to be at the center of the justification to ban him from teaching at the end of the Second World War. Insight into this event is made accessible via a letter penned by

Karl Jaspers, a close colleague of Heidegger’s since the early 1920s, when asked to contribute his opinion to the denazification committee which was hearing Heidegger’s case in 1945. Jaspers had no major concerns with Heidegger being allowed to continue his philosophical work postwar, if this was to be primarily through his writing – but he did not condone Heidegger continuing his teaching. He recommended that the committee suspend Heidegger “from teaching duties for at least several years” (Jaspers, cited in Wolin, 1993, p. 150). Following a fairly drawn-out process, a suspension did result, which had a deleterious effect on Heidegger’s health. Shortly after, in 1946, Heidegger spent 3 weeks at a sanatorium having succumbed to a depressive episode. It was not until 1951, Gertrud Heidegger (2008, p. 218) notes, that Heidegger was “made an emeritus professor” at the University of Freiburg and “able to take up his lecturing at the University once again.” He continued lecturing until 1957, after which his teaching consisted mainly of seminars.

Jaspers justified his recommendation regarding Heidegger by way of a concern with “the education of youth” which “must be handled with the greatest responsibility” for “the youth must first reach a point where they can think for themselves” (cited in Wolin, 1993, p. 149) – before being exposed to Heidegger’s thinking. “Heidegger’s manner of thinking, which,” argued Jaspers, “seems in its essence unfree, dictatorial, and incapable of communication, would today in its pedagogical effects be disastrous” (p. 149). Jaspers’ reference to Heidegger’s teaching as unfree accords somewhat with Gadamer’s observation that students lost their freedom to him. And while there was a definite political concern in such statements, also highlighted is the strength of the teacher-student relation which Heidegger achieved through his pedagogy.

As soon as Heidegger was able to return to teaching, he delivered a lecture series titled *Was Heisst Denken?* [What is called thinking?] in which he expounded perhaps his most well-known commentary on teaching. And yet even while pronouncing on teaching, it was Heidegger’s pedagogy which stood out, as revealed in comments from J. Glenn Gray, the translator of these lectures, who through his

close affiliation with the text perceived how “Heidegger is first and foremost preoccupied with the students before him, only secondarily with the wider circle of readers who will necessarily miss the vital character and nuances of the spoken word” (Gray, 1968, p. vii). It is this vital character and nuance of phenomenological engagement which is better served through teaching via the spoken word than the written word. Heidegger’s teaching, as Gadamer has relayed, engaged students in question and response, in dialogue that enabled access to phenomenological philosophizing. “We learned from him what a lecture could be,” Gadamer (1985, p. 37) attested, “and I hope that none of us has forgotten.”

Heidegger on Teaching

John Quay

Synonyms

[Phenomenology; Teaching](#)

Central to the contributions Heidegger makes to education are his pronouncements on teaching. These statements are not numerous, but where they appear they are significant because they situate teaching within Heidegger’s broader philosophy. In addition they offer a concrete way to comprehend how this philosophy may be applied – as Heidegger applied it – in terms of the encounters between teacher and student(s), by way of Da-sein.

Perhaps the most famous of Heidegger’s statements on teaching occurs in his 1951–1952 lecture series *Was Heisst Denken?* [*What is called thinking?*], the first lecture course he delivered on his return to teaching following his postwar suspension. I include the major section of this proclamation on teaching here, while acknowledging that more of relevance was said in the flow of this first lecture in the course:

Teaching is even more difficult than learning. We know that; but we rarely think about it. And why is teaching more difficult than learning? Not because the teacher must have a larger store of information, and have it always ready. Teaching is more difficult than learning because what teaching calls for is this: to let learn. The real teacher, in fact, lets nothing else be learned than – learning. His conduct, therefore, often produces the impression that we properly learn nothing from him [or her], if by “learning” we now suddenly understand merely the procurement of useful information. The teacher is ahead of his apprentices in this alone, that [s]he still has far more to learn than they – [s]he has to learn to let them learn. The teacher must be capable of being more teachable than the apprentices. The teacher is far less assured of his [or her] ground than those who learn are of theirs. If the relation between the teacher and the taught is genuine, therefore, there is

never a place in it for the authority of the know-it-all or the authoritative sway of the official. It is still an exalted matter, then, to become a teacher – which is something else entirely than becoming a famous professor. (Heidegger 1968, p. 15)

On reading this statement many teachers will find themselves in agreement with Heidegger on the point that “teaching is more difficult than learning.” However Heidegger seems to contradict this position in a less well-known statement on teaching made in an earlier lecture course of 1935–1936 titled *Basic Questions of Metaphysics* and translated as *What is a thing?* In this pronouncement the same themes are prominent around teaching and learning, and yet he here proclaims learning to be more difficult than teaching:

True learning only occurs where the taking of what one already has is a self-giving and is experienced as such. Teaching, therefore, does not mean anything else than to let the others learn, i.e., to bring one another to learning. Learning is more difficult than teaching; for only he who can truly learn – and only as long as he can do it – can truly teach. The genuine teacher differs from the pupil only in that he can learn better and that he more genuinely wants to learn. In all teaching, the teacher learns the most. (Heidegger 1967, p. 73)

There is much of Heidegger’s broader philosophy embedded within both of these statements – and it is to his broader philosophy that we must turn in order to belie this seeming contradiction. Heidegger signposts the way to their complementarity through the notion of “to let learn” or “to let the others learn,” as mentioned in both statements. To let learn evokes a sense similar to that of “letting be,” which is an important phenomenological concept for Heidegger. As phenomenological it holds a different meaning than the same phrase expressed in the vernacular. For Heidegger letting be speaks to our existential engagement, as Da-sein, where “*Da* is namely the word for the open expanse,” thus Da-sein is “being-in-an-open-expanse” (2003, p. 69), an open characterized by meaning rather than as a mere collection of things. Heidegger employed the hyphen in Da-sein to highlight the Da (for a detailed unpacking of Heidegger’s use of Dasein and Da-sein see von Herrmann 2011).

Ordinarily we speak of letting be whenever, for example, we forgo some enterprise that has been planned. “We let something be” means we do not touch it again, we have nothing more to do with it. To let something be has here the negative sense of letting it alone, of renouncing it, of indifference and even neglect. However the phrase required now – to let beings be – does not refer to neglect and indifference but rather the opposite. To let be is to engage oneself with beings. On the other hand, to be sure, this is not to be understood only as mere management, preservation, tending, and planning of the beings in each case encountered or sought out. To let be – that is, to let beings be the beings they are – means to engage oneself with the open region and its openness into which every being comes to stand, bringing that openness, as it were, along with itself. (Heidegger 1998, p. 144)

Letting be, while generally considered to refer to our engagement with this open region (as Da-sein) and through this with beings which appear meaningful in some way via this open region, also embraces our engagement with other human beings as other Da-sein, other versions of being-in-an-open-expanse. This comes to light in statements made by Heidegger in conversation with Medard Boss (Heidegger 2001). Boss was a psychiatrist and concerned with application of Heidegger’s philosophy in understanding another human interaction – between doctor and patient. In these statements we see Heidegger emphasizing how important it is for “the investigator,” the person concerned with the other human being, to first be able to “experience him[or her]self as Da-sein.” Without this it is difficult if not impossible to accomplish an “appropriate letting be” of the other Da-sein – as contrasted with “inappropriate representations”:

The letting-be of this being (the human being) in light of Da-sein is extremely difficult, unfamiliar, and must always be examined anew by contemporary scientists, but also by the one who has gained familiarity with the projection of Da-sein. The “letting-be,” that is, accepting a being as it shows itself, becomes an appropriate letting-be only when this being, the Da-sein, stands constantly in view beforehand. [This can only happen] when the investigator has experienced and continues to experience himself as Da-sein, as ek-sisting, and when all human reality is determined *from there*. The elimination and avoidance of inappropriate representations about this being, the human being, is only possible when the practice of experiencing being

human as Da-sein has been successful and when it is illuminating any investigation of the healthy or sick human being in advance. (Heidegger 2001, p. 223)

The difficulty of letting be in relation to another Da-sein lies in the ability to engage Da-sein – which is perhaps the most difficult challenge of phenomenology: gaining the starting point of phenomenology (see Quay 2015). In this sense learning is more difficult than teaching, for one must learn to engage Da-sein, to experience being-in-an-open-expanse of meaning–ascribed things and other Da-sein (being-in-the-world), before one can teach. “Only [s]he who can truly learn – and only as long as [s]he can do it – can truly teach.” This “truly” (synonymous with “genuine”) is a Heideggerian pointer toward the importance of learning how to achieve the starting point of phenomenology (Da-sein) in order to engage with another human being via and as Da-sein – and thus to be able to teach this person. “How difficult this is has been demonstrated by decades of misinterpreting being-in-the-world as an [ontic] occurrence of the human being in the midst of other beings as a whole, of the ‘world’” (Heidegger 2001, p. 223). This misinterpretation is based on misunderstanding the Da as ontic, as a collection of separate things of which meaning has to be constructed (which is why Heidegger places ‘world’ in quotation marks), rather than as an open expanse through which these things are first meaningfully encountered. This misunderstanding also positions Da-sein as Dasein, as a separate thing amongst other separate things, but “Da-sein is not a being,” Heidegger (2013, p. 120) implores; being-in-an-open-expanse is not a thing, but can be understood as one amongst other possible “ways of *being*” (Heidegger 1985, p. 295). However, he did acknowledge that his use of Dasein/Da-sein in *Being and Time* – “very awkwardly and in an unhelpful way” (2003, p. 69) – contributes to this misinterpretation.

Additionally, Heidegger points out that engaging Da-sein and applying this awareness to investigating another Dasein need not, of itself, develop into a full-blown phenomenological investigation. “The method of investigation ‘appropriate to Da-sein’ is not phenomenological in itself but is

dependent upon and guided by phenomenology in the sense of the hermeneutics [interpretation] of Dasein” (2001, p. 223). In other words, while this experiencing of other Da-sein is not a full blown phenomenological investigation, it still requires achieving the phenomenological starting point, which is Da-sein. It can then be guided by application of phenomenological concepts attained through other more detailed phenomenological investigations. Heidegger’s phenomenological concepts – such as care, attunement, understanding, and letting be – can make such a contribution.

So learning can be understood as more difficult than teaching, because we must be able to learn in this way (by gaining the phenomenological starting point, Da-sein) before we can truly teach. But what of Heidegger’s other claim that teaching is more difficult than learning? This seeming contradiction can be unwound if we pay heed to Heidegger’s emphasis on the teacher’s learning. In both circumstances it is teaching which is more difficult because of the challenge of the teacher’s learning in relation to other Da-sein. When learning is more difficult than teaching, it is the teacher’s learning in relation to other Da-sein we are referring to. When teaching is more difficult than learning, this is understood on the basis that teaching (underpinned by teacher learning in relation to other Da-sein) is more difficult than student learning. The heart of the matter is that “the teacher is ahead of his [her] apprentices in this alone, that [s]he still has far more to learn than they – [s]he has to learn to let them learn.”

Having identified the difficulty inherent to learning in this way, the focus of Heidegger’s statements on teaching shifts from the teacher’s learning to the teacher’s teaching, the application of this learning in relation to other Da-sein, when teaching; in other words, “to let learn.” But how does one, as teacher, accomplish this in concrete terms? One pointer toward this may be Heidegger’s identification of possible concrete “modes of concern” for another, such as “being for-, against-, and without-one-another, passing-one-another-by, not-mattering-to-one-another” (2010, p. 118). It is obvious that most of these examples reveal an “indifference” (p. 118) to another. However there are also “positive

modes,” of which Heidegger identifies “two extreme possibilities” (p. 118): to “*leap in for*” (p. 118) and to “*leap ahead of*” (p. 119). Here, to *leap in for* another is “to take the other’s ‘care’ away from him [or her] and put itself in his [or her] place as taking care” (Heidegger 2010, p. 118). This is care understood phenomenologically, acknowledging how Da-sein “is concerned in its being about that being” (p. 185). Leaping (in this example) is always understood in connection with this existential care. Problematically, by leaping in for another Da-sein and taking away existential care, a major problem is created for the other Da-sein in its concern for being, even though this leaping in for may have been undertaken with positive intentions.

[In leaping in for] the other is thus displaced, [s]he steps back so that afterward, when the matter has been attended to, [s]he can take it over as something finished and available or disburden him[or her]self of it completely. In this concern, the other can become someone who is dependent and dominated even if this domination is a tacit one and remains hidden from him [or her]. (Heidegger 2010, pp. 118–119)

Expressed in terms of teaching, here the teacher, not acknowledging the other as Da-sein, comprehends the meaning of the situation from his or her own Da-sein exclusively, and is not even aware that the other’s existential care is taken away. The other, positioned in this way, adapts (or not) their Da-sein to be able to function in this situation.

However, “in contrast to this, there is the possibility of a concern which does not so much leap in for the other as *leap ahead of* him [or her] in his [or her] existentiell potentiality-of-being” (Heidegger 2010, p. 119). To “*leap ahead of*” is “not in order to take ‘care’ away from him [or her], but rather to authentically give it back as such” (p. 119). Hence leaping ahead of is concerned with the other as Da-sein, as their own being-in-an-open-expanse as a “potentiality of being.” “This concern which essentially pertains to authentic care – that is, it pertains to the existing of the other and not to a *what* which it takes care of – helps the other to become transparent to himself in his care and *free for it*” (p. 119). This authentic care is the authenticity of acknowledging the other as Da-sein, and thus as their own

“care,” which can also be expressed as freedom: the freedom of letting be, as Da-sein; which in a teaching-learning situation is the freedom of letting learn. Heidegger’s point is that teaching must let-learn by letting-be by leaping ahead of, through embrace of the other as Da-sein, with all of the challenges that this may introduce.

For Heidegger a teacher is not someone who has “a larger store of information . . . always ready” like a “know it all” or “official,” and thus a teacher is different to a “famous professor.” This emphasis on content expertise alone overlooks how the teacher must also learn to embrace the other as Da-sein, which can never be fully perfected. Teaching is “an exalted matter” because teaching works by way of Da-sein. Herein lies the candor of Heidegger’s statement that “in all teaching, the teacher learns the most.”

Heidegger's Enframing and the Indigenous Self in Education

Carl Mika

University of Waikato, Hamilton, New Zealand

Introduction

Aspects of Heidegger's personal life scream out to be confronted, especially when it is the indigenous writer referring to him and even if his sinister idiosyncrasies in that instance are not the key theme of that writer's text. The controversy of Heidegger – that he “wrote some really frightful rubbish, some of which explicitly links his philosophy to the most abominable political movement of the modern period” (Bowie 1997, p. 139) – must surely be at stake in any indigenous comparative that seeks to draw on his works. He was, after all, supportive of the extermination of a group of people: such a nasty complicity will not be lost on the indigenous scholar. The recent release of his notorious Black Notebooks only further confirms his involvement. Yet his philosophy on the dark recesses of colonization that force an object to appear in advance *as* constrained thing is, for indigenous counter-colonial purposes, compelling and amounts to “anything but rubbish” (Bowie 1997, p. 139). Since Plato but gaining momentum in Descartes, Heidegger argues, Western humanity has been predisposed toward an object or even people as if they are this or that in advance, and this primordial engagement has become the hallmark of the Western relationship with the world. Because Heidegger writes so unremittingly and profoundly on that very problem, yet due to his simultaneous personal convictions, he challenges his indigenous reader with a dilemma: he or she must tread carefully with Heidegger and his philosophy.

That seemingly natural and innocuous act of deciding what to do with Heidegger actually reveals a comportment to the world that has its roots in the very problem he discusses. Managing Heidegger – acknowledging the validity of his works and reorganizing parts of his private life

so that they do not impede on the indigenous scholar's work – demonstrates the innateness of enframing: it is simply *there*, as a template through which Western humanity, and thereby the colonized indigenous self, peers out at the world. Although enframing cannot (and most certainly should not) be confined to a discussion about education, it can nevertheless be thought about in the context of indigenous educational philosophies. This entry incorporates indigenous holistic thought around education with the problem of enframing.

Introducing Enframing

There is no single best place from which to launch a discussion on enframing, for it strangely claims the writer even before his or her attention is brought to it. Enframing, then, is complicit with being because it is a revelation or call to the self to respond. Of course, the writer is not alone in that disclosure, because for Heidegger enframing is an *a priori* that has immediately incorporated with the modern self. It lies beyond experience, but it dictates how one will act in response to that most primordial orientation. Enframing, or *Gestell* as Heidegger calls it in *The Question Concerning Technology*, is characterized by a particular predisposition toward things, where the self is oriented toward an object so that the latter may be captured and used instrumentally thereafter. Heidegger's abstract use of the term *Gestell* (which normally refers to a concrete entity) opens the issue up for discussion, away from one revolving around the social use of a thing to one turning on the profound philosophical enactment of the object by the human self and by Western modernity as a whole. In its universality, enframing is therefore something quite different from its symptoms, and Heidegger is clear that to confuse the two is dangerous. Its ubiquity heralds a related warning: that a delusion of modern thought lies in an authoritative, final discussion about enframing that would declare a logical, demarcable beginning and end. Enframing in that incorrect reading becomes something else much closer to its current manifestations which,

although needing discussion, should not take priority. Any reversion to the issue as a scientific or even sociological one is a result of Western humanity's tendency, as Heidegger (1967) notes, to not think about the difference between being and beings. Enframing is a particular disclosure through *technē* that defies limits, and for Heidegger its fusion with, and subsequent hiddenness within, its instrumental manifestations – such as computers, televisions, and the nuclear bomb – is a natural outcome of the conflation of being and beings.

Enframing constitutes entities and practices, including seemingly straightforward phenomena such as language. Language as Heidegger envisages it is not a phenomenon independent from the world, but when related to enframing, it is seen as sourced in the human self – a thorough outcome of the rational mind. Language is hence one thing in the world among others that is constrained: it can be wielded to assign the world its place and to staticize things themselves. According to Heidegger, humans do assign labels to these objects only because the world has been represented in a *Gestell* fashion in advance, meaning that humans do have some degree of agency in their reference to objects. This statement on its own may be applicable to a number of language philosophies that link with the metaphysics that enframing typifies; however, the degree to which objects are allowed to manifest their own subjectivism marks a great divergence between empiricism and phenomenology. In enframing, there is a prior determination of how objects are to be viewed in the first instance, and this preconception will show itself up in the label assigned to those things. That is, while humans deceive themselves that language is self-created, Heidegger argues that we give names to objects in the world only because we have already represented the world in a particular way (in this case, as *enframed*) to begin with. Enframing hence constrains the self in advance and the language the self transfers to those things.

There is one additional, crucial concept of Heidegger's that deserves brief mention here – that of *Bestand*, or “standing reserve.” While related to enframing, *Bestand* refers more

to an outcome of that metaphysical orientation, and is characterized by a more obvious activity against the world, involving the stockpiling of the latter's objects. Here we encounter a pragmatic gesture of enframing, one that is not equivalent with that deepest imprint of the self on the world but instead conjoins with it. In this instance, the indigenous self has consigned things to their rightful place or given them a label that categorizes them in accordance with their usefulness. This is a definitive development for Western humanity, even in the most unlikely areas. Richardson (2003), for example, notes that even the spiritual dimension is inevitably made into an entity relational with the self when he states that “coming to the nineteenth century . . . [one] find[s] the emphasis placed upon a philosophy of “Life-force,” but the basic pattern is still the same. A being attains status as a being only to the extent that it is absorbed in some way or other into man's life, sc. becomes a living-experience” (p. 327).

Introducing Indigenous Holism

The ubiquity of metaphysics – the fact that it is an *always-already* – is iterated in “Building Dwelling Thinking” in Heidegger's discussion about the fourfold or quadrate, where he explains that one thing is consistently claimed by others. Indigenous peoples may find Heidegger's works here especially fascinating, as the latter appears to represent a gathering together of four entities (and the given presence of all the others in any one of those) within one. Indigenous thought – as far as it is explained in literature, and in terms of much of its practice – is premised on a strong holism, where things in the world are thoroughly interconnected (Deloria 2001; Mika 2014). In much traditional indigenous educational practice, what was considered to be most important was the transmission of thought about those things such that they were sustainedly kept together. Moreover, the self was one thing among many, and how he or she represented the thing would have repercussions for the self's well-being (and education for many indigenous groups was seen as an issue of well-being at the same time, for people were

educated in accordance with a holistic depiction of the world). Things were also perceived to be vitally active, and, in synchronicity with what Heidegger notes about the fourfold, they were consistently mirrored between each other, so that they were thought of as inseparable.

This persistent activity between them creates constant tension for any one thing in the world (Mika 2014; Plebuch 2010) that is held up for contemplation by the self. Heidegger deliberately obscures the four entities and their ongoing drive against and with each other because their true form and interaction simply cannot be clarified. Although it would be tempting to conceive of that invisible facet as a “backdrop,” such a description sets up obscurity against clarity, to which Heidegger and indigenous groups would undoubtedly be opposed. On the contrary, it may better be thought of as a recessive tendency that nevertheless depicts how a thing is to appear and that has always called for the thinker’s attention. The complex intermesh of all entities necessarily means that a certain amount of humility has to be sustained in the face of them, including in their representation in educational processes.

For indigenous groups, the terms for entities hold special significance. Language – its means of clarifying the backdrop of an object as much as the object itself – displays a culmination of all things. Individuals would be encouraged to think about the proper terminology to use in reference to an object, so that it retained its innate relationship with the world. In that meeting place of the All, to which the concern of the self is drawn, a distinctive humility toward the world could also be found in language. Terms sourced from indigenous languages would be suffused with a depth that could not be approached by their denotative meaning; they resonated with the things they represent and are as much imbued with their own life as more concrete objects. Language from an indigenous perspective still attempts to ensure the oneness of things; in selecting a way of discussing one particular object of many, the indigenous self is not meaning to fragment it from its context but highlight both its obscure context and the entity. Human beings therefore

do not so much create language as work alongside it to highlight things’ resonance with each other (Mika 2015). Indeed, language is a phenomenon that originates from without for many indigenous groups, and it can often work in tandem with that exteriority to reveal, if nothing else, the limits of human knowledge. In that process, it merely provides curvature for a thing – it hints at its opacity rather than its solid truth – and hence forecloses against trying to grasp any entity as controllable.

The Influence of Enframing on Indigenous Perception and Education

Heidegger was concerned for the corrosion of Western culture through its metaphysical dedication to enframing, and so it remains for the indigenous thinker to draw from his works to suggest their relevance for his or her communities. For indigenous thought, Heidegger signals that there is at play an entrenched colonization that cannot be simply calculated or resolved by conventional studies and research. After all, enframing is the most primordial definer of the world, including when indigenous peoples retain some practical and philosophical vestiges that resist enframing. Instead of trying to set out to use empirical methods to research enframing, the indigenous thinker is posed with the challenge of burrowing deeply into terms and ideas but to withhold from declaring the “eureka” moment of having discovered the true parameters of enframing. This universality is not necessarily a cause for pessimism, and the fact that the writer is drawn to speculate on enframing is perversely due to enframing itself: here, Heidegger refers to a phrase from Hölderlin’s “Patmos” and reveals the potential of enframing through its “saving power.” What an indigenous reading of Heidegger does identify for the writer, however, is that there is an imperceptible gauze that interposes itself between the self and the world. This membrane is irremovable and orients the self toward the world in advance, and for the self, it is connected to issues of colonization and, perhaps disturbingly, indigenous metaphysics as well.

The unnerving possibility that indigenous metaphysics interrelates somehow with enframing, or that the latter may in its own right have brought our attention to the former through their co-diffusion, deserves some attention. Heidegger (1977) holds that there is in enframing a “destining that gathers together” (p. 31). Although there are important subsequent words in that quote that specifically describe the character of enframing, this initial signal about its activity is interesting on its own account. Its interplay with the self, as with indigenous metaphysics generally, emphasizes a sort of calm “coming to bear” or engulfment that has already taken place. That an entity has always endured, that it has always given itself to the world or arisen from something prior to it (such as, for instance, the Earth Mother – a common discourse among many indigenous peoples), is undoubtedly nothing new to indigenous people. This persistent “beckoning” in its most fundamental sense dictates that all things in the world are completely interrelated, and moreover that each thing reveals itself in its own way, and yet in tandem with its relationship with all other things as well as the prior phenomenon that gives rise to it.

Enframing may hence seem to read from the same page as indigenous metaphysics to the extent that it “endures most primally out of the earliest beginning” (Heidegger 1977, p. 31). Here again, though, some key words have been omitted from the quote, and any similarity between indigenous metaphysics and enframing draws to a close when we include Heidegger’s fuller intent. Enframing, to be sure, “grants permanently” as the rest of that quote highlights, but while we may be tempted to believe that enframing is precisely the same as indigenous metaphysics, we should remember that enframing only reveals its possibilities for humanity *despite itself*. Instead, what lies within enframing is a *challenging forth* that is forever attempting to put the world in its pre-ordained place. Heidegger’s reference to its controlled components as *Bestand*, or “standing reserve,” is notable for its emphasis on orderability and has particular significance for indigenous thought because it indicates a

distancing of the self from an object. Where in much indigenous thought the self and object are perceived to be one, or the object of contemplation was always already imbued with all other things in the world, now the object, true to its etymology, is thrown in front of the self. For the self, the object is thoroughly unrelated, even though it formerly shared a genealogy with the self.

It is the *notion* of totality that is threatened by enframing, but importantly for indigenous peoples, it may be the world as a whole – in a much more material sense – that is put in its place through the proscriptive activity of language or through any metaphysical orientation toward the world that seeks to allocate it its proper realm. In education, the world is made productive (Fitzpatrick 2002), through how the object is already posited in advance as a constrained entity. For Heidegger, as we have seen, enframing limits the full possibility of the world, and for indigenous peoples, the classroom may be a primary site where the All is constantly transmitted as an enframed entity. Indigenous peoples are therefore barred from access to a culturally appropriate, speculative educational practice that attempts to retain things in their totality. Even language – the “house of Being” (Heidegger 1999, p. 239) – is already elided into an enframing attitude so that the self’s openness to an object’s full potential is thoroughly limited well in advance. Enframing, most primordially for education in indigenous contexts, in all its aspects, turns the indigenous self toward the whole so that it can be dealt with in its isolated components, and this colonized notion of the All is then transmitted in nonindigenous educational settings.

Summary

Enframing has set the scene for things to be referenced in ways that are most convenient for humanity, but according to Heidegger this highly controlling approach is not to be confused with any sort of equipment. Instead, enframing exists intangibly within the very lens of perception,

directing the perceiver to move toward an object such that it is knowable and certain. For the indigenous thinker – him- or herself trained in a mainstream education system – a culturally appropriate access to the world may be predicated on the notion that the world is holistic, but enframing is inherently diffused throughout education so that it conditions things, draws on language that reflects the object as a single phenomenon rather than an interrelated one, and represents the object in an unmysterious fashion. In education, how free one is to perceive the interrelated object may indeed become an issue that is revealed, somewhat paradoxically, through the nature of enframing itself, and it is perhaps here that the indigenous self is called to both consider what their own metaphysics is, its relationship with enframing, and its possible resistance to the latter.

Herbart, Johann Friedrich (1776–1841)

Wilna A. J. Meijer

University of Groningen, Groningen,
The Netherlands

Introduction

This systematic thinker developed an educational theory, and its foundational ethical and psychological theories. At the same time, full recognition is given to the relation between educational theory and practice.

Herbart was born in 1776, in Oldenburg in Germany in the household of a jurist. His private education at home and, from the age of 12, a gymnasium, had already brought a first introduction to the philosophy of Kant, Wolff, and Leibniz. His education also exemplified the idea and ideal of a broad, humanistic education as to the role of art and the aesthetical: he learned to play the piano, cello, flute, and harp. At 18 he started a study in law at the University of Jena, where he was soon to change this *Brodstudium* (“bread study,” “just for money”) for the study of philosophy which attracted him so much more. In Jena, he was confronted with Fichte, whose philosophy he soon started to criticize. As early as 1798, he wrote an epistemological sketch to defeat idealism and defend realism in philosophy – a strand in his thought that will remain and can be discerned in all his philosophical, educational, and psychological work. At the same time, he gained experience in educational practice as a private teacher of three boys in the Steiger household in Bern, 1797–1799. Then he resumed his academic studies. He received a doctorate at the University of Göttingen in 1802, where he stayed to work as lecturer, later professor, until 1809. In that period the first educational works and the practical philosophy appeared.

From 1809 to 1833, Herbart was professor of philosophy at the University of Königsberg, formerly Kant’s chair. Königsberg is in Prussia, where educational matters were at the center of

political attention at that time. Wilhelm von Humboldt, Minister of Education, supported Herbart in realizing a plan already conceived of by Kant, viz., the establishment of an educational seminary at the university. Approximately ten boys were tutored by approximately ten teacher training students. A few experienced teachers were the guarantee that the pupils received a good, broad, and balanced education. Herbart himself taught mathematics. In his Königsberg days, Herbart's academic work concentrated on the development of a psychology after the new scientific paradigm that combines the empirical and the mathematical (note that 1776, Herbart's year of birth, was David Hume's year of death). In 1833, Herbart returned as full professor to the University of Göttingen. Here he wrote his late, as much lucid as concise and systematical, educational work *Umriss pädagogischer Vorlesungen* (*Umriss*, 1835, the second edition appeared in the year of his death, 1841; "Outline of Educational Lectures").

Herbart counts as one of the most systematical thinkers in the modern educational, academic discipline known as *Pädagogik* on the continent. He has left a rounded and close-knit oeuvre that is worthwhile reading and studying. From his first publications in the beginning of the nineteenth century, he developed an educational philosophy intertwined with practical philosophy (ethics) and psychology as its foundational disciplines. The fundamental educational ideas systematically presented once more in his late work, the *Umriss*, can already be traced in his early *Die ästhetische Darstellung der Welt als Hauptgeschäft der Erziehung* (AD, 1804; *The Aesthetic Representation of the World as Education's Main Concern*) and, more extensively, in his *Allgemeine Pädagogik aus dem Zweck der Erziehung abgeleitet* (AP, 1806; *General Educational Theory, Developed from the Aim of Education*). In between, he presented his ideas on ethics in the *Allgemeine Practische Philosophie* (APP, 1808; *General Practical Philosophy*) and, in a chain of works, his empirical, scientific psychology the *Lehrbuch zur Psychologie* (*Textbook on Psychology*) that appeared in 1816, a rewritten edition in 1834, in which he repeatedly emphasizes that it is

a popularization and a shorthand of the main scientific work, i.e., the two-volume *Psychologie als Wissenschaft, neugegründet auf Erfahrung, Metaphysik und Mathematik* (*Psychology as Science, Refounded on Experience, Metaphysics and Mathematics*), which he published at his own cost in 1824 and 1825.

The psychological works of his Königsberg years are, as much as the practical philosophy developed in his first Göttingen period, permeated by Herbart's educational interest. The objective to understand the possibility and the process of education and to develop a theoretical and practical sound concept of education is the gist of his entire work.

In his practical philosophy, Herbart explicitly relates to Kant. He thinks that Kant's conception of practical reason is not educationally fruitful. As an alternative, Herbart develops his idea of *aesthetic judgment* and its development and its relation to ethical judgment. It is evident from the early work that ethical and educational theory converge, and it is in the discussion of Kant's theory of practical, ethical judgment that this unity is accounted for by Herbart. In the AD of 1804 – Kant's year of death – there is a 15-page explanation of what is a few years later, in the AP and the APP, spelled out in greater detail. It is Herbart's concern to form an idea of morality and freedom as *real possibilities*, in other words, as possibilities realizable in historical time, in contrast to the transcendental and universal character of the Kantian conception of morality and freedom. Herbart's concern is inherently educational: the concept of the ethical is presented in unity with the concept of its development over time in childhood and youth.

Herbart's difference with Kant should not blind us to a crucial similarity. Herbart agrees with Kant that morality should not be identified with prevailing, historically given moralities. Rather, the ethical judgment of the free, autonomous human subject is crucial (*Der Sittliche gebietet sich selbst*; AD, Herbart 1986, p. 62). However, when it comes to the matter of such judgment, Kant dismisses this question by turning immediately to its *form*, i.e., the formal generality of the categorical imperative that distinguishes practical

judgment from random arbitrariness. Herbart explicitly chooses a different route here. Kant distinguishes, in his Critiques, practical, ethical reason (*der praktischen Vernunft*) from aesthetical reason (*Urteilstkraft*, “power of judgment”), while first having distinguished pure, theoretical reason (*der reine Vernunft*). Herbart connects aesthetical and ethical judgment and emphasizes their shared comparative-deliberative character in which form and content are indissolubly connected.

The overall aim of education is *Tugend*, virtue, which is elucidated in practical philosophical terms: “Virtue is the development in a person of the idea of inner freedom into a persistent reality” (*Tugend ist (...) die in einer Person zur beharrlichen Wirklichkeit gediehene Idee der inneren Freiheit*, *Umriss*, section 8). Like the other practical philosophical ideas (such as benevolence and equity), this practical philosophical idea of “inner freedom” is about the relation between insight and will, *Einsicht und Wille*. The relation which pleases (*gefällt*, the outcome of a nondiscursive, rather contemplative deliberation; to behold is to see) in this case is that the will follows the insight. Insight and judgment are as such the outcome of deliberation and reflective distanciation. This is also the case when they are concerned with human will and action and, more in particular, with one’s own will and action in relation to those of other people – the matter of ethical judgment.

Deliberating and judging one’s own will and action implies a certain duplicity, an essential self-referentiality and reflexivity. This duplicity is an important theme in Herbart’s AP, where it is discussed as the distinction between “objective character” and “subjective character.” It can also already be discerned in the AD, for example, in this passage:

See to it that the pupil finds itself as choosing the good and rejecting the bad: this, and nothing else, is character education! This elevation to a self-conscious personality should without a doubt happen in the mind of the pupil itself and it should be executed by the pupil’s own activity; it would be nonsense for the educator to produce this essential power and pour it into the soul of the other being. (AD, Herbart 1986, p. 61)

This is an important educational thought: the activity of the child itself as crucial to its own development and education, in contrast with a formative activity on the part of the educator. Further, there is, in the opening phrase (“the pupil finds itself as choosing...”), the mentioned duplicity that Herbart shall later elaborate upon in his scientific psychology. This psychology, underestimated or even dismissed for a long time, is re-appreciated presently because of its remarkably topical concept of the unconscious. Herbart’s educational and psychological thought is as much intertwined as his educational and practical philosophical thought.

Already in the AP, there are instances of Herbart’s notably realistic sense of psychological phenomena. The intriguing distinction of objective and subjective character, in which an idea of the importance of the unconscious is assumed, is a good case in point:

It is an old complaint, that the human being often has as it were two souls. He observes himself, wants to grasp himself, like himself, guide himself. But already before this observation, when he is immersed in things and the outside world, he *has* a will and occasionally very specific character traits. These are the objective, which the observing subject either agrees or conflicts with, by a *newly* created will, produced in a completely different mood. (AP, Herbart 1986, p. 141)

The subjective character agrees with or disproves of what it finds in the objective character. Objective character shows in what one consistently wants, chooses, and avoids. There are many inclinations and they are not equally strong – there is an element of choice here. Persons can understand themselves from the direction of their own motives and preferences and arrive at a judgment about it – in this way, explicit maxims or principles arise. Rules and principles are a late product in the individual’s development and education; they evolve from reflection on previously formed preferences and inclinations.

The educational side of the idea of a self-conscious and reflective person that “finds itself as a judging and choosing being” is relevant: aesthetical (and ethical) judgment originates from a broad and balanced “circle of thoughts” (*Gedankenkreis*). Education mainly contributes to the aim of virtue along this line: rather than

forming the will, it is geared toward building up knowledge of the world and insight. It is not educationally wise to try to influence or build the pupil's character and morality directly by moralizing or preaching. This is “a sort of false economy” (*eine Art von falscher Ökonomie*, AP, Herbart 1986, p. 179) that wants to attain immediately something which can only be the outcome of a gradual development over time. It is educationally unwise to demand of children an instantaneous acceptance of and obedience to specific moral rules and values, instead of waiting for the development and the coming into existence of aesthetical and ethical judgment in educated persons themselves. Certainly, as children participate in the everyday life of the community, they can be expected to adjust here and now to the custom and rule of that community; this is part of what Herbart calls *Regierung* (“reign”). And there is a place for the direct, dyadic interaction between educator and pupil which Herbart labels *Zucht* (“discipline”). But in the main part of education, *erziehender Unterricht* (“intellectual education” or, better, “general education”), it is crucial to give time – to wait and see – and to educate the mind and thoughts to wait. The gradual establishment of a rich and balanced circle of thoughts is education's first and main issue. Aesthetical (and ethical) judgment will arise in due time from full, “completed” perception and representation of its object (*vollendeten Vorstellen ihren Gegenstandes*; AD, Herbart 1986, p. 63).

Herbart illustrates this by the example of hearing harmonic proportions in music. Suppose, he says, that the teacher is asked to furnish further evidence: he could only laugh and regret the obtuse ear that did not already perceive. In other words, one can sound the musical chord and let it be heard, but then the chord has to speak for itself. It is impossible to produce further arguments to back up the aesthetical judgment. This type of judgment springs from a completed perception; it is not the outcome of an argument or a line of reasoning. Aesthetical judgments are about perceptible proportions, be it in music (not about an isolated tone, but about various tones sounding simultaneously, chords, concords, discords) or in human affairs. Here, it is about relations between

human beings, comparative relations between what the one person does, or desires to do, and what the other does or desires to do, and also between the thinking and doing, insight and will, of each person individually. Here too, as in music, judgment arises from the completed, balanced perception of comparative relations in their full concreteness and detail.

The prime task of education is the “aesthetical representation of the world” (*aesthetische Darstellung der Welt*), the indirect contribution to the origination of aesthetical and ethical judgment, nourishing it by increasing the pupil's knowledge and understanding of the world, in which aesthetical proportions occur in ever-changing concrete configurations. Education's first concern is, therefore, what the perceived world will be like:

This world should be a rich, wide-open sphere full of varieties of life! (. . .) Such a revelation of the world – the *entire* world and *all* known ages – can rightly be called the main concern of education. (AD, Herbart 1986, p. 67)

Erziehender Unterricht is characterized by breadth and many-sidedness; in other words, it is a general, liberal education. It aims at the broadly interested and versatile mind that is eventually of ethical relevance. The person who is broad in mind, in knowledge and in thought, is also broad in desires and in interests (*wer viel kennt und denkt, der verlangt viel*; AD, Herbart 1986, p. 65). Whereas a restricted outlook, by its very one-sidedness, comes close to egoism: “The one-sided person approximates the egoist, even when he does not notice it himself, because he relates everything to the small circle of his own life and thought” (*Umriss*, section 63). The richer and fuller the world opened by education, the less one-sided and narrow-minded, and the more well-balanced, the judgments originating from the *Gedankenkreis* will be. This is why *erziehender Unterricht* should intentionally and methodically correct and complement one-sidedness that pupils have already acquired, more or less arbitrarily, in “experience and human association” (*Erfahrung und Umgang*) in the outside world and at home. Broadening horizons, or with Herbart's metaphor, opening all doors: “In order to intervene educationally in the existing thoughts and views

of the pupil, all doors should be opened to him” (*Damit der Unterricht in die vorhandenen Gedanken und Gesinnungen des Zöglings eingreife, müssen ihm allen Pforten geöffnet werden; Umriss*, section 36).

Again, time and reflection are relevant, as is clear from an idea in Herbart’s psychologically based, remarkably realistic didactics, viz., the idea of the “respiration of learning” (*geistige Respiration*; AP, Herbart 1986, p. 172). Neo-Herbartians interpreted the stages of learning (“clarity, association, system, method”) as a didactical method in the hands of teachers, but they are rather a characterization of the learner’s activity. It is one of the ways that Herbart drew attention to the importance of time in education. In the *Umriss*, he speaks about the “alternation of deepening and reflection” (*Wechsel der Vertiefung und Besinnung*; section 66): breadth and many-sidedness imply that this “many” is acquired successively and, subsequently, that it is connected, united in a balanced “circle of thoughts,” and thus truly appropriated. In his 1834 *Lehrbuch zur Psychologie*, this educational thought is also expressed: “the general requirement that deepening and reflection, as an intellectual respiration, should always alternate” (*die allgemeine Forderung, dass Vertiefung und Besinnung, gleich einer geistigen Respiration, stets mit einander abwechseln sollen*; 1965, p. 169).

As critical as he was of Kant’s idea of transcendental freedom is Herbart of the metaphysical idea of totalization, as developed by Hegel in Herbart’s days. It amounts to a “foolish forgetfulness of earthly boundedness” (*höriches Vergessen der irdischen Beschränktheit*), as Herbart formulates it in the concluding pages of the 1834 *Lehrbuch zur Psychologie* (1965, p. 196). Philosophy of history should “beware of the projection of a systematic totality onto the variety of historically known events and societies, as if the one were the necessary complement of the other and everything would connect into a single unity of the human spirit. All previous history is a beginning, of which the continuation cannot be predicted” (ib.). This is a good example of Herbart’s realistic sense of the historical and of the contingency of human existence. Both educational and political

practice work with moving and manageable forces (*bewegliche und lenksame Kräfte* (1965, p. 197)). They share the assumption that under certain circumstances and in due course, a permanent character can be gained – however, there are no necessities to build upon. “Iron necessity” is as much a detrimental illusion as absolute freedom is (1965, pp. 196–197). In education, one’s personal destination is eventually a matter of one’s own choice – but that choice itself is contextualized, therefore contingent. The occupation that the young person chooses for himself in his context can, therefore, be only an approximation of his true destination, one that the real society he lives in allows for (*sein Beruf, oder die Stellung und Wirksamkeit welche in der wirklichen Gesellschaft der Bestimmung möglichst ähnlich ist*, 1965, p. 198).

The relation between educational theory and practice that follows from this is given in Herbart’s idea of *tact*. Educational theory, however much scientifically informed, does not rob educators of their own judgment of their situation, but offers them insights with which they can improve their own practical deliberation and judgment. Tact consists in the power to judge situations of action. As every action situation is necessarily historical and therefore unique, it is not possible to deduce from theory how to act in actual practice. The situation itself always has to be judged on its own merit and in the light of its specific problems. Educational tact is the practitioner’s theoretically formed power of judgment. Theory does not produce ready-to-use recipes which educators might apply blindly, but sharpens, schools and directs the perception and interpretation of one’s own situation. The educator is never exempt from judging the practical situation, because no theory has ready-made answers for future historical situations on offer.

Hermeneutics and Educational Experience

Pádraig Hogan
National University of Ireland Maynooth,
Maynooth, Ireland

Synonyms

Educational experience; Ethical orientation; Gadamer; Hermeneutics; Pre-disposed understanding; Rationality

Introduction

During its long history – in biblical research, in literary criticism, in legal studies – hermeneutics was an interpretative art which sought to avoid the kinds of misunderstandings that arise from rigid,

or hasty, or overly literal interpretations. Thus, an old rule of hermeneutics states that any part of a text must be understood in the context of the whole, but also that the whole must be understood in the context of its parts. This rule, which has helped to inspire various kinds of modern philosophical research, implies that there is unavoidably some circular interplay involved in coming to understand texts. Historically the term “texts” in hermeneutics referred mainly to important or influential documents such as scriptures, legal documents, or literary texts. Two main features distinguish contemporary hermeneutics from more traditional forms. Firstly, the circular movement of interpretation comes to be disclosed as an inescapable feature, not just of understanding texts, but of human understanding itself. Secondly, the scope of hermeneutics as a field of research undergoes a significant shift. It moves from an enquiry concerned with an understanding of texts to one concerned with investigating what happens when understanding itself takes place in human experience more widely, including the experience of carrying out research. These developments have made hermeneutics itself a major theoretical resource for research in the humanities and social sciences. The consequences of such developments for research on educational experience will be explored below.

Questioning the Standing of Theory

To make the exploration more illuminating it is worth adding a few comments at the start on the significance of the two features just described for the issue of research procedure, or for what is frequently called the “theoretical standing” of research activity. In relation to the issue of circularity, the kind of understanding that merits the status of “research understanding” undergoes an important change. Without losing its critical focus on the question or data being investigated, it now pays more systematic attention to the context the researcher herself/himself brings to the enquiry. In particular it puts the spotlight on the nature of the assumptions that invariably reside in that context – e.g., biases of a gendered, ethnic,

religious, social class or other kind. Here the notion of research as certainty tends to lose anything like an unquestionable authority or absolute finality. A research outlook, or theoretical stance, that is disciplined by hermeneutic awareness grants a procedural priority not to certainty, but to the more provisional notion of justified warrant; a warrant that remains open to further criticism and revision. On this account, what may reasonably lay claim to such warrant can be summarized as follows: the argument or theory which offers openly the best fruits of its own disciplined efforts but which can also withstand the kind of critique that seeks to be as non-parochial and as well-informed as it can be. In relation to the second issue – the broadening scope of hermeneutics itself – it is not surprising that the expansion of hermeneutics into the main currents of ontology, epistemology and ethics has given rise to new questions within these domains themselves, indeed to new questioning *of* the domains themselves. In particular, any claims by ontology or metaphysics to have achieved a magisterial vantage point are called into question. Similarly called into question is any kind of epistemology which insists on absolute, as distinct from provisional notions of objectivity or certainty.

Hermeneutics as Philosophy

Broadly speaking then, two key ideas mark the transition from traditional hermeneutics to philosophical hermeneutics: that of a *circular interplay* rather than a linear logic in human understanding itself and that of *inescapable limitations* in human understanding itself. This transition is associated chiefly with the researches of Martin Heidegger and Hans-Georg Gadamer. Heidegger's critique in *Being and Time* (Heidegger 2008, first published in 1926) of the "essence" of human being (*Dasein*) unsettled the presuppositions on which centuries of traditional understandings of being were based. He shifted the emphasis of enquiry from "being" as a *what* with certain "properties" to the verbal sense of the word: i.e., to a kind of being *who* is from the start a being-in-the-world. What was definitive moreover in Heidegger's

ontology was that this is a being for *whom* his or her own being-in-the-world is the issue (Heidegger 2008, Section 9). "Being" is no longer associated with changeless essence, and essence itself (*Wesen*) is understood as "to be": a self-understanding that is *to be* thought about, decided upon, neglected, renewed, etc. in one's encounters with an unfolding historical world.

In carrying through this major shift, Heidegger focused with a new incisiveness on what he described as the "circle" at play within the historicity of human understanding in all of its modes, not just in that involved in understanding texts. Here he brought hermeneutics out from the domain of textual criticism and into what he called "fundamental ontology" (p. 32). In illustrating the play of prior influences in all understanding he broke radically with epistemology. He rejected epistemology's mistaken insistence on separating understanding from interpretation. Heidegger argued that this "circle," or interplay, is anything but a vicious circle. He emphasized that interpretations, always influenced by the interpreter's "fore-conceptions," remain integral to all acts of understanding and that in the circle itself lies an overlooked possibility of "the most primordial kind of knowing" (*B&T*, §32). In order however to realize this possibility, critical attention would have to be paid not only to what the interpreter was attempting to understand but also to the interpreter's own "fancies" and "popular conceptions," to the preconceptions that remain ever active in steering such attempts. "Primordial knowing" of this kind would be very different from what philosophy traditionally regarded as absolute knowledge. As Paul Ricoeur succinctly put it in one of his many essays on hermeneutics:

"It is because absolute knowledge is impossible that the conflict of interpretations is insurmountable and inescapable" (Ricoeur 1981, p. 193).

The new paths opened by Heidegger were developed in a major way by Gadamer's researches. In these researches hermeneutics becomes something much more significant than a method for systematically interpreting texts. Rather, as *philosophical* hermeneutics, it proceeds from a recognition of the point that interpretation

cannot finally be overcome and replaced by objective knowledge. Against the claims of classical epistemology that anything less than a certainty cleansed of all bias is a deficiency, philosophical hermeneutics stresses the point that interpretative understanding is humankind's inescapable way of experiencing a world. There may be better and worse efforts at understanding, but all such efforts involve some element of interpretation from the start. Human understanding is thus constituted less by the rational autonomy of critical consciousness than by a rationality that is itself unavoidably interpretative, whether vigilantly so or not. (See also the entry on ► [Gadamer and the Philosophy of Education](#)).

Philosophical hermeneutics has thus provided an understanding of human rationality which is quite different from how rationality has been understood in traditional Western philosophy – including both metaphysics and epistemology. It has given up the pretensions to absolute knowledge that characterized many centuries of metaphysics. It has given up the quest for unshakeable foundations for certain knowledge associated with classical epistemology. It has focused in a special way on the relationship between the predisposed self-understanding of the interpreter and the active character of everything that addresses that understanding. This “everything” could include the reading of a text, the experience of a debate, the conduct of an experiment, and, not least, the presentations of a teacher. Pursuing the educational implications of this, it must be remembered that teachers are interpreters and learners just as much as pupils or students are, albeit at a different level of experience.

Educational Experience

A hermeneutically disciplined understanding, on this account, would be particularly important for how educational experience is to be understood, and in particular for educational research. Firstly, it would disclose in each instance the advent of the unexpected in what the learner, or interpreter, is attempting to understand. This is often called the

“object of learning.” But such a reified term beclouds the point that this “object,” whether in science, history, languages, or whatever, is itself an active field of enquiry, continually in need of newcomers, as distinct from being a store of inert knowledge or ready-made skills. Secondly, a hermeneutic view of educational experience would shed light on the more subtle, or overlooked dimensions of the joint situation where a teacher has a leadership responsibility in seeking with students to understand something new. Previously undetected biases, as well as new insights, might thus be progressively disclosed about both learner and teacher and about what addresses the efforts of each. These disclosures might be surprising, or disquieting, or satisfying, or inspiring, or otherwise challenging. There is a strong parallel here with Dewey's remarks on “collateral learning” in his late work *Experience and Education* (1938/1991). “Perhaps the greatest of all pedagogical fallacies,” Dewey writes, “is the notion that a person learns only the particular thing he is studying at the time.” The attitudes that the student learns collaterally, but in an often unobserved way, may be much more significant in the longer term. “The most important attitude to cultivate” Dewey observes, “is the desire to go on learning.” (Dewey 1991, p. 48). The parallel between a hermeneutic and a Deweyan perspective here gives a particular ethical orientation to experience that is properly educational in character. The remainder of this article will seek to elucidate this ethical orientation a little more. A good way to start is by considering possible difficulties or objections.

If preconceptions play an inescapable part in all instances of human understanding, isn't every act of understanding likely to be something of a misunderstanding? How would one distinguish a form of understanding that brings a change for the better rather than a change for the worse in this connection? The short answer to the first of these questions is “yes,” but a yes that discloses unforeseen insights rather than bringing enquiry to an abrupt end. Gadamer's approach to such questions is to emphasize what he calls “the dialogue that we are / *das Gespräch das wir sind*” (Gadamer 1989, p. 378). To explain, the world experienced by humans is constituted by a totality

of influences, a totality that is ever changing and that is itself made possible through the articulations of multiple literatures, sciences, religions, musics, politics, and so on. In no two individuals is the range of such influences, including salient and minor influences, likely to be identical. Each individual moreover experiences only a tiny slice, a very partial slice, of such influences. “Partial” here should be understood in both senses of the word: firstly, incomplete; secondly, affected by bias. This double limitation is a feature of the human condition itself (again, some resonances with Dewey, also with Popper, later Wittgenstein and others), and the ethical orientation it signals for educational endeavor is likewise twofold. Firstly there is an acknowledgement of the provisional character of the fruits of even the most advanced accomplishments of human intellect. Secondly, and arising from this acknowledgement, there is a certain *conversational imperative*. What I mean by this is an openness to critique, a desire to further one’s best understanding of the matter to date by seeking informed perspectives from others. This provides fresh impetus for advances to be made in an educational journey; one of seeking, listening, experimenting, reconsidering, and so on. But crucially, this conversational imperative of educational experience includes a recognition that the journey itself is unfinished, and probably unfinishable, as far as humans are concerned.

Such an ethical orientation steers clear of any and all conceptions of a final truth that human reason might authoritatively seek to claim as knowledge. It conceives *educational* experience instead as being ever “on the way” to truth. Where the quality of that educational experience is concerned, this orientation gives a pedagogical priority to questions over answers, to attentive listening over assured assertion, to the openness of enquiry over the finality of pronouncement. This is not to say that one would have to abandon here one’s previous convictions. Hermeneutics itself would argue that such an abandonment would be far from self-transparent and could only be partial, even at best. Rather it means a willingness to place at risk in one’s engagements with others the claim to truth in these underlying

convictions. Such engagements include, not least, the engagements of teaching and learning. Reference should be made here to the early Socratic dialogues of Plato, for instance *Euthyphro*, *Gorgias*, *Protagoras*, *Apology*. The combination of critique and self-critique embodied in the standpoint of the Socrates depicted in these works anticipates much of the ethical perceptiveness and ontological cast of Gadamer’s “dialogue that we are.” A hermeneutic reading of these early works of Plato also reveals the Socratic origins of what I have called above the conversational imperative of educational experience.

In his major work *Truth and Method* (1960/1989) Gadamer was frequently less than explicit in drawing the more far-reaching consequences of his arguments; consequences that are radical for how educational experience is to be understood. This inexplicitness has led to a range of criticisms. The early criticisms came from opposite perspectives. On the one hand, by Habermas and others he was charged with conservatism. The heart of this charge is that philosophical hermeneutics privileges the claims of “tradition,” with all its institutionalized exclusions and unacknowledged inequities, to the neglect of the claims of critique. On the other hand, the relativist charge of “radical historicism” was made against Gadamer’s hermeneutics by critics such as E.D. Hirsch (1962) and E. Betti (1967). Some authors writing from post-modern perspectives have mistakenly sought to dismiss what they have termed the “hermeneutics of meaning” (Lyotard 1984), or “deep hermeneutics” (Dreyfus and Rabinow 2014), as some kind of teleological “grand narrative,” or some kind of metaphysical grasp for comfort.

Gadamer’s debate with Habermas has borne many fruits. A critical focus and an emphasis on practice are more in evidence in Gadamer’s later writings. Habermas’s later writings, for their part, engage in forms of critique that are much more hermeneutically alert than his earlier writings. Against his other critics Gadamer has never failed to point to the “scientific” (*wissenschaftlich*) nature of his researches. These others include those who are conservatively disposed like Hirsch and Betti, or those postmodern writers who erroneously regard hermeneutics as some kind of

latter-day metaphysics. His researches, Gadamer insists, are not concerned with the defense or advocacy of one or other unscientific commitments, but with something that is properly empirical: the “integrity of acknowledging the commitment involved in all understanding.” His concern, he explains, is “not what we do or ought to do, but what happens to us above our wanting and doing” (Gadamer 1989, p. xxviii). In one of his later writings (“Reflections on my Philosophical Journey,” 1996), Gadamer again stresses the point that what he means by “tradition” is nothing conservative, or indeed pristine. Rather, tradition signifies the open-endedness of the totality of inheritances that constitutes a humanly experienced world:

For we live in what has been handed down to us, and this is not just a specific region of our experience of the world, specifically what we call the ‘cultural tradition’ . . . No, it is the world itself which is communicatively experienced and continually entrusted (*traditur*) to us as an infinitely open task. It is never the world as it was on its first day, but as it has come down to us (p. 29).

Evident in these quotations from Gadamer is an investigative or “empirical” emphasis that disavows the kind of metaphysics that claimed superiority for centuries over other forms of learning. But it also disavows the empiricism of the skeptical philosophy that came to challenge such metaphysics in the eighteenth century. For instance, the hermeneutic notion of a conversational imperative reveals (contra David Hume) how an “ought,” or ethical orientation, can quite naturally arise from an “is” – i.e., from an uncovering of the predisposed nature of human understanding itself. With hindsight one can readily see that Hume’s empiricist philosophy needed to be empirical in a more radical sense in its own efforts to disclose the nature of human understanding.

These remarks highlight the importance of what Gadamer and others have called the *universality* of the hermeneutical in human understanding, including theoretical forms of understanding promoted by research. Far from imposing a uniformity of interpretation on educational experience, this universality is captured in Gadamer’s

own phrase: “we understand in a different way if we understand at all” (Gadamer 1989, p. 297). Attentiveness to these differences – of sensibility, of conviction, of cultural orientation, and so on – reveals the ethical tenor of philosophical hermeneutics as one that is both critical and ecumenical, conservationist and radical, inclusionary and pluralist, progressive and unfinished. It embodies a sense of universality which is not an a priori one but one which is constituted in the to-and-fro of dialogue itself and which remains open to further criticism and revision. Authors who have taken a critically hermeneutic stance to Gadamer’s own work have variously described this as an “interactive universalism” (Benhabib 1992) or as a “constitutive universal” (Ricoeur 1981). This kind of universality differs then from the “totalitarian” universality that postmodern authors criticize and shun. Like the conversational imperative considered earlier, such a universality now emerges as a practical necessity for educational experience. This is all the more pertinent if teaching and learning are to be conducted not only in a genuinely fruitful way but also with a defensible warrant amid the plurality of humankind, locally or globally.

History of Philosophy of Sport

Sharon Kay Stoll
Center for ETHICS, University of Idaho,
Moscow, ID, USA

Introduction

Numerous longer and more in-depth histories of the philosophy of sport have been written in the last five years. Seven articles in the 2010(2) *The Journal of Philosophy of Sport* were dedicated to the history of sport philosophy around the world: all of which built on Kretchmar's earlier work on the philosophy of sport history in North America (1997). Two specific and very good short histories of philosophy of sport can be found in Torres' *The Bloomsbury Companion to the Philosophy of Sport* (2014) and McNamee and Morgan's *Routledge Handbook of the Philosophy of Sport* (2014).

The present discussion of the history of the philosophy of sport will not revisit what has already been written; rather, the focus will be an overview of the political history and concomitant culture of physical education and athletics and give perspective of how these programs and activities influenced the development of the scholarly study of philosophy of sport.

What Is Philosophy of Sport?

To do philosophy of sport is to ponder about human interaction with play, game, and sport.

Typical philosophical questions pertaining to sport may lie in the nature of things (i.e., metaphysics) such as: What are the necessary and sufficient conditions of sport? What relations and distinctions are apparent among play, game, and sport? Or who are we as we play a sport? A different question may have to do with the value of sport, play, and games, i.e., “Does play develop character and virtue? Does play lead one to the meaning of life? What is good about sport? What values exist through play?” Yet a different question has to do with how and what we learn as we play a game or sport (epistemology), “What do we know when we play a game?” And yet another sort of question might be what is beautiful, ugly, artistic, sensual, and good (aesthetics)? “Why and how is sport aesthetic? What is the historical basis of the philosophy of sport?” (Kretchmar 1997; Morgan and Meier 1995). Though the questions above are notably a modern interpretation of the philosophic purpose of sport, these sorts of questions or variations of them have existed as long as humans have participated in play and sport.

Philosophical discussion surrounding sport historically is linked to virtue and athleticism and is older than a Western concept of sport. Reid (2011) wrote well about the historical philosophical statements that can be found in the athletic feats of kings and pharaohs in early Egypt and Mesopotamia. Later the notion of training virtue through athletic practice can be found in the writings of Socrates, Plato, and Aristotle and then through the Roman writings of Lucretius, Seneca, and Marcus Aurelius (Reid 2011).

Sport philosophy cannot be understood in the modern age outside of the parameters of the history of physical education. Gerber (1971) wrote a seminal text and chronicled the history of physical education as well as its relationship to athletics from the Greek period, through the Renaissance, to European Influence, to the USA. She also covered important writers who discussed the meaning and importance of activity and even what and how activity should be accomplished. Throughout her writings she discusses philosophy of the body as a means of exercise, health, fitness, and preparation for war. Often these writings are dismissed as not being true

philosophy in the modern sense, however, such a point of view limits our understanding of history. Gerber’s work focuses on the philosophical importance of these writers in relationship to physical education.

With this being said, there is a rich history of writers from the ancient period to the modern age. In North America, the historical beginning of modern academic sport philosophy, as we know it today, is tied to the late 1800s discussion of the purpose, principles, and philosophy of physical education and athletics, as well as a debate in the mid-1950s about the relevancy of physical education as an academic discipline in colleges and universities.

North American Physical Education

The story begins in 1861 when a physician physical educator began a professional journey to bring systematic physical education instruction to universities and colleges. Edward Hitchcock, appointed Professor of Hygiene and Physical Education at Amherst College in Massachusetts, was the first and only such professor until 1879. Hitchcock was the first doctor-physical educator in the world and the first to unite medicine and school physical education (Gerber 1971). He would not be the last – it became a trend to hire physician physical educators – and if any university or college was incorporated around the same period, its own history will note the hiring of these same credentialed individuals.

Harvard’s Dudley Allen Sargent’s pioneering work from 1879 using anthropometric measurement bluntly informed the world that young college educated men were woefully unfit; his work in curriculum development supported by measurement research became a standard for the physical development of college students. Sargent did not stop with his own students or his program at Harvard, he instituted a Harvard Summer School of Physical Education, as well as a physical education preparation program called the Sargent School for Physical Education. His work was probably the most influential and philosophical since it focused on what programs should

be. Again, if one were to pursue the archives of US universities, Sargent-trained educators would be in evidence.

Other important educators of the period included individuals who championed physical education across the USA and around the world, for example, Nils Posse (introduced Swedish gymnastics), Edmund Mussey Hartwell (defined the profession), Delphine Hanna (learned from Sargent and Posse and taught Thomas Wood, Luther Halsey Gulick, Jesse Feiring William, Jay Nash, and many more), William Gilbert Anderson (invited all of the notables to start an Association for the Advancement of Physical Education), Robert Tait McKenzie (sculptor, artist, and physical educator, offered great art about the ideal man), Luther Halsey Gulick (organized the Academy of Physical Education, the prestigious invited group of physical educators, researchers, and writers of the field, still in existence today), Thomas Denison Wood (organized an academic program at Stanford that gave physical education the same standing as other subject matter), Clark Hetherington (acted as a modern philosopher of physical education), Jay Nash (took the concept of play to its broadest connotations to the life experience of children and adults), Charles McCloy (led movement for increased research, focused his work on “physical rather than educational”), and Jesse Feiring Williams (wrote more philosophically and completely about physical education since “Plato”) (Gerber 1971).

None of these curriculums existed in a vacuum and focused only on “activity.” These influential physical educators asked what should be the purpose of physical education? Is the physical separate from the mind? What is the role of physical education in the greater education experience? What principles and philosophy should guide these programs? These questions mirrored the times in which progressive reformers took aim at an educational system that was sedentary and exclusive of any physical activity (Kretchmar 1997).

Soon college educators would gather to form an organization to discuss the merits of physical education, the curriculum, and the principles to guide such a program. In 1885, the Association

for the Advancement of Physical Education was formed and with it early physical educators debated the philosophy and principles that should guide and mentor curriculum within physical education and athletics and that debate continued for more than 50 years. Noted individuals mentioned above wrote passionately and extensively about what they thought physical activity should be in all educational settings.

Kretchmar (1997) has argued that these writers, though well intentioned, did not “do philosophy,” rather they “were more interested in sport, dance, exercise, play, and games as vehicles for education than as phenomena in their own right” (p. 188). Not to disagree with Kretchmar, but they did philosophy as they knew it – they addressed the pressing issues of the times and how and why physical activity should be. They also discussed and argued the link of education to physical education, i.e., education of the physical or education through the physical.

An ancillary philosophic issue throughout this period was the role of college athletics. Many did not believe athletics should be associated with physical education programs; others however believed the opposite, athletics should be a laboratory of what is learned in physical education.

Athletics in the USA began as early as 1852 as student-run activities, but it wasn’t long until colleges and universities realized the problems and potentials of such programs. It was argued that students did not have the capacity to manage such programs and universities needed to manage competition to control corruption. Perhaps it was for such ideal purposes, but Smith (2010) argued it was more to control and capture the amount of cash that ticket sales were bringing in. As is typical of universities, when athletics was subsumed into the academy it was placed into an academic unit to be managed, and that unit was the fledgling department of physical education. To give credence to athletics, early philosophers of physical education noted that athletics was a laboratory for physical activity, see Jesse Feiring Williams (Organization and Administration of Physical Education, 1922) and Thomas Wood and Rosaline Cassidy (The New Physical Education, 1927). Athletics and physical education were married

into a pseudo curriculum unit supported by a philosophy that argued for the benefits of competition and physical activity, i.e., sports, for students.

In these early years, large numbers of male students participated in athletics coached by men who were physical educators and coaches. Women were not necessarily in athletics, but were offered physical activity through dance programs and even play and recreational sport competitive experiences usually managed and lead by women physical educators through student organizations such as the Women's Recreation Association. Administrators of these programs were typically educated and influenced by the major philosophic writers of the period of time including Wood and Cassidy, Hetherington (*School Programs in Physical education*, 1922), McCoy (*Philosophical Bases for Physical Education*, 1940), and Feiring Williams. For over much of 80 years, they debated whether physical education was through the body or of the body. Athletics was supported through the belief that competition builds character. The women debated whether girls and women should compete, and they generally decided it was not good form either physically or socially. These disagreements between the men and women, plus social concern about men and women studying together, resulted in separate departments of physical education with separate buildings, separate administrations, and even separate and unique philosophies that guided their curriculum and preparation. Women physical educator writers focused on principles applied to women's issues of the times and spoke eloquently for a different model of sport competition and physical activity for women and established their own organization the Division of Girls and Women's Sports and eventually the AIAW (Association of Intercollegiate Athletics for Women) (Stoll and VanMullen 2014).

Sometime in the late 1890s and early 1900s, academic majors in physical education appeared in colleges and universities across the USA, and those majors were directed toward developing teachers of physical education and male coaches in schools throughout the USA. The philosophy of physical education was thus also projected

toward why physical education was important as well as offering principles as to how physical education and athletics should be managed and what curriculum should be offered.

1950 Conant's Challenge

All was well until debate swelled about the place of professional programs in universities and colleges. James Conant, president of Harvard University in 1963, criticized the preparation of American teachers in his *The Education of American Teachers* and even though his text only had a few paragraphs about physical education, those few paragraphs had a major effect on those individuals who were teaching and writing in the field.

Some writers argue that Conant's affect may not have been so noteworthy, but those who were in the educational system of the time know otherwise. Twietmeyer (2012) argues the "tenuous and contested nature of the discipline's philosophy foundations" were insecure and there was no direct confrontation by Conant. Perhaps, but the profession felt in great jeopardy – perhaps because Conant's book was generally read by administrators who also questioned the academic worth of physical education.

Whatever the case, there was a direct response from Franklin Henry, a respected professor of physical education at Southern California who argued for a discipline. The profession responded so powerfully and swiftly to Conant and Henry's short academic piece that a major change occurred to curriculum and preparation in physical education as well as professorial expectations (Sage 2013).

Unfortunately the major change that occurred also moved athletics out of the laboratory of physical education into its own department or commercial program – without academic ties to any department in the university. In the USA, this decision has had far-reaching negative ramifications for athletes, coaches, and the institution. Women athletics left the AIAW for the NCAA (National Collegiate Athletic Association), and the women physical education fears became reality – women's programs mirror the men's

competitive programs, and fewer and fewer women are involved in coaching and administration. Discussions about ethics, principles, and the philosophy of the organization and administration of athletics ceased. Philosophy of sport is NOT done within athletic departments, because coaches are seldom if ever professors of physical education. The discussions about philosophic issues moved elsewhere to academic disciplines such as sociology or history of sport. These discussions have affected little in the practice of athletics.

By the late 1960s, physical education professors needed an academic discipline, a body of knowledge that had theoretical roots and a research agenda. They had *no choice*; administrators actually forced them to either research and publish or leave to athletics or just leave. Those professionals who were focused toward writing about principles of physical education and athletics had to make a directional change in their writings as well as how they wrote and how they thought about activity. A very few did, the rest chose a different subdiscipline, sociology, literature, history of sport, or just retired from the profession.

It is important to note that the upsurge that occurred caught the physical education professionals in a catch 22 situation – they really hadn't been trained or educated in the greater discipline. This was true for all physical educators whether they saw themselves as sport sociologists, sport historians, or in this case philosophy. Now they were calling themselves sport philosophers instead of physical educators. As a subdiscipline – what was the body of knowledge to be studied? Some writing did exist that was philosophical and directed toward sport in general, i.e., Metheny, *Connotations of Movement in Sport and Dance*, 1965; Harold Slusher, *Man, Sport and Existence*, 1967, plus a very important work by Paul Weiss, *Sport: A Philosophic Inquiry*, 1969.

It is at this juncture where fate and individual choice made a difference in future direction.

The year was 1970 and no organization existed for “philosophers” of sport and no specialized journal existed. Three programs did exist at universities to train sport philosophers, i.e., Illinois

with Earle Zeigler, USC with Metheny and Slusher, and Seymour Kleinman at the Ohio State University. Also there was a unique program at the State University of New York, College at Brockport, where under the deanship of Warren Fraleigh, six sport philosophy-trained individuals taught six different courses exclusively devoted “to philosophic content and inquiry” (Kretchmar 1997, p. 192).

Philosophy of Sport

Kretchmar (1997) gives a play-by-play analysis of how the professionals of the period, Weiss, Fraleigh, Gerber, moved to establish a professional organization that had its first meeting in 1972 and its first conference in 1973. The society, titled Philosophic Society for the Study of Sport, immediately founded a professional scholarly publication, *The Journal of the Philosophy of Sport* (see iaps.net). The purpose of the society was to foster interchange and scholarship among those interested in the scholarly study of sport. The Society changed its name to the International Association of the Philosophy of Sport in 2001. This organization has been the root from which scholarly organizations have bloomed throughout the world, including Europe, Asia, and South America. Though the membership of IAPS is not large, there is a determined, energetic, and scholarly group that continues writing and writing well – many of these individuals are consultants for major global sport organizations (See IAPS.net). Unfortunately, even though it is a respected disciplinary study in graduate programs around the world, philosophy of sport courses have disappeared from undergraduate physical education, sport science curriculum in the USA; and this trend is not unique to the USA. The reason is tangled, but the answer rests with convincing the greater disciplines of sport science, exercise science, and physical education of philosophy of sport's importance to their disciplines. With that being said, the scholars continue their writing and offer important, thought-provoking scholarship concerning sport and competition.

Hobbes and Philosophy of Education

James D. Marshall

The University of Auckland, Auckland, New Zealand

Thomas Hobbes (1588–1679) is generally regarded as the founder of English moral and political philosophy. His most important work was *Leviathan* (1651), in which he offers a version of contract theory. One way in which obedience to the Sovereign can be attained, according to Hobbes, is by education (Marshall 1980). However, Hobbes

may be interpreted here as offering a form of governmentality* as his form of education can be seen as a method for ensuring that people come to accept the authority of the Sovereign.

Hobbes’ political theory is based upon a kind of contract theory in which, to avoid a life in the state of nature, a stable society or Commonwealth must be established. This society, outlined in *Leviathan*, requires people to relinquish to the Sovereign (a person or persons) their right to decide what is in their best interests. The Sovereign, imbued with reason, makes the laws which must be obeyed, except in the case of self-defense. But why should people obey the Sovereign? First, according to Hobbes, because it would be unjust – i.e., doing something which one had forgone the right to do. But, second, if people were correctly educated, then reason would dictate to them why they should obey the Sovereign.

The Sovereign is judge of what is necessary for the peace and defense of the State, including being the judge of what hinders or disturbs these ends, of the ways of obtaining these ends, and of the opinions men hold. Actions proceed from opinions according to Hobbes, and, if peace is to be obtained and maintained, then men’s opinions must be well governed. Thus, the Sovereign has the duty and the power not only to decide what “doctrines and opinions are averse, and what conducing to peace,” but also to ensure “what men are to be trusted . . . in speaking to the multitudes of people; and who shall examine the doctrines of all books before they be published. For doctrine repugnant to peace can no more be true, than peace and concord can be against the law of nature” (*Leviathan*, EW, III, p. 169).

On obedience to the Sovereign and education, Hobbes appears to generate a paradox. On the one hand, he argues for absolute power, absolute obedience, censorship, and the suppression of opposed beliefs and teachers thereof, and on the other hand, he states explicitly that it is the duty of the Sovereign to educate the people on political matters. Education, it might be thought, might be incompatible with absolute obedience, censorship, and the suppression of opposed beliefs and persons holding or teaching such beliefs. If education could lead to such beliefs, then instead of

obeying, the Sovereign subjects might revolt. Hence, education could lead to a state of war. Yet peace is the overriding concern of Hobbes' political theory. There is something of a paradox then as what is said about the duty of the citizen, namely, obligation, which seems to be inconsistent with the duty of the Sovereign, namely, education; if the Sovereign desires peace, then one cannot educate, whereas if one desires education, then one cannot ensure peace.

Hobbes states explicitly that the Sovereign does have duties of an educational nature in these areas. Thus, while the Sovereign is responsible primarily for the safety of people, "safety" is not to be interpreted as "bare preservation" but rather as "general providence," "...contained in public instruction both of doctrine and example." As it was contrary to the Sovereign's duty to relinquish any aspect of his power and authority, so also was it against his duty, "to let the people be ignorant, or misinformed of the grounds, and reasons of those his essential rights; because thereby men are easy to be seduced, and drawn to resist him..." (*Leviathan*, EW, III, p. 323).

However, instruction, teaching, and learning can all take place without being educational (that is, if one holds a concept of "education" which does not cover any change whatsoever in behavior). In order to decide whether this instruction was educational, we would need to know more about Hobbes' specific proposals.

When he discusses the particular details of what should be taught as part of the Sovereign's duty, he mentions such things as: not to be in love with any form of government which they see in neighboring States, not to be led by fellowmen, not to dispute the Sovereign's power, to honor their parents, and not to harm others (*ibid.*, p. 326), but it is unclear whether Hobbes is talking about the development of favorable attitudes, which is compatible with development through fear of adverse consequences, or of favorable attitudes to be developed from and as a result of reasoning.

This ambiguity reoccurs in a similar passage (*ibid.*, p.327):

they ought to be informed, how great a fault it is to speak evil of the Sovereign representative, whether one man, or an assembly of men, or to

argue and dispute his power; or any way to use his name irreverently, whereby he may be brought into contempt with his people and their obedience, in which the safety of the commonwealth consisteth, slackened...

In order that people can "...hear those their duties told them and the positive laws, such as generally concern them all read and expounded" (*loc cit.*), Hobbes suggested that a special day should be set aside for this education. Laws and duties are to be told and read - hardly education. Yet, on the other hand, they are to be expounded and the people must come to know and understand "the grounds and reasons of these his essential rights" (*ibid.*). That sounds more like education.

Hobbes believed that *Leviathan* revealed knowledge of man and his social organization which was of a scientific kind - but we must know what Hobbes meant by scientific. Here, he was influenced by the physician Harvey who had in turn been influenced by Galileo (Watkins 1973). An idea common to all three was that if we are to understand something, we must first take it apart or resolve it. In Galileo's hands, the motion of a projectile is broken down or resolved into principles of horizontal and vertical motion: for Harvey, it is literally dissection. Starting from sensible wholes, one proceeds by dissections to the discovery of activating principles or causes. Once the nature of the sensible whole has been ascertained, then the whole is literally put together again or recomposed. It is essentially this view of science, - resolve, idealize, compose - that underlies Hobbes' thought. Science, he says (*De Corpore*, EW I, p.26.):

...is the knowledge we acquire, by true ratiocination, of appearances, or apparent effects, from the knowledge we have of some possible production or generation of the same; and of such production as has been or may be, from the knowledge we have of the effects.

The method of "true" ratiocination (*loc cit.*) "is either compositive or resolute, or partly compositive and partly resolute. And the resolute is commonly called analytical method as the compositive is called synthetical."

Analytical method is seen by as the method by which one comes to understand and to arrive at definitions (*ibid.*, p.69):

For example, if there be propounded a conception or idea of some singular thing, as of a square, this square is to be resolved into a plane, terminated with a certain number of equal and straight lines and right angles. For by this resolution we have these things universal or agreeable to all matter, namely, *line, plane* (which contains *surfaces*), *terminated, angle, straightness, rectitude and equality*; and if we can find out the causes of these, we may compound them altogether into the causes of a square (and) ...by resolving continuously we may come to know what those things are.

Thus, the analytical method is concerned to arrive at definitions. We understand what things are when we have the definition. The method is to subsume particular under universal and universal under universal, and thereby arrive at universal terms of the widest generality, e.g., “body” and “motion.”

Synthesis for Hobbes is the deduction of the consequences from certain primary propositions which essentially are the definitions arrived at by analysis. To this extent, there are explicit parallels to logical and geometrical systems.

In presenting his views, Hobbes placed greater emphasis on deduction and *composition* than either Galileo or Harvey who were more concerned, perhaps, to give a detailed account of how they had arrived at their primary propositions. Galileo had been more concerned with logical or mathematical deduction; Harvey, however, believed that in piecing a biological whole together, some account should be given of its biological history and thus presumably of how changes and adaptations in a species had assisted in its survival or even in its flourishing.

It is this latter aspect of composition which Hobbes appears to take from Harvey and which makes his account of political organization in *Leviathan* not strictly deductive from his primary principles. Hobbes’ starting point is a sick society. He resolves, idealizes, and composes to arrive by a genetic-historical-deductive trail not at a sick society but, rather, at a regenerated society – the *Commonwealth*.

Apart from his genetic-historical trail of composition, considerable weight is thrown on the primary propositions or definitions. Hobbes says that a person who refuses to accept these primary

propositions is in the position of refusing to be taught (*Leviathan*, E.W.III, p. 73f). These propositions can be explained, or they can be “caused” by the senses (e.g., motion can cause us to acquire the concept of motion). The primary propositions are also like imperatives. Hobbes believed that people really *knew* these imperatives even if they were not aware of them. The teacher has to make the primary propositions and imperatives clear, and if these procedures were followed, then obligation to obey the Sovereign would occur through education.

Whether or not we agree with Hobbes’ *Commonwealth*, or with his view of education, it is clear that he is offering an account of *how* citizens can be obliged to follow the laws of society. For Foucault, traditional political philosophy, theories of the State, and studies inspired by Marxism concerning class domination give us answers to the question, “Who exercises power?,” but such answers require at the same time a further resolution. He argues that simultaneously we must answer the accompanying and intertwined question “How does it happen?”. His answers to this question are to be found in his account of *governmentality* (Foucault 1979).

In his accounts of governmentality, Foucault places much stress upon the subject’s refusal to be subjected. But, given that power can only be exercised upon a free agent, and not upon a slave in chains, and that for Foucault, freedom must be continuously exercised if it is not to be lost, then the liberty of the subject is an important presupposition of the exercise of freedom. Thereby, one can see why refusing to be subjected or subordinated must be associated with attaining and maintaining liberty. Foucault’s genealogy of liberty, from the heretical practices of dissenting religious sects in the time of the Reformation to the Enlightenment, may then be seen as establishing the historical importance of insubordination as a means of preserving liberty. As the liberty of the subject is a presupposition of exercising freedom, it becomes also a presupposition of ethics for Foucault. Somewhat paradoxically it would seem, insubordination, or refusing to be subjected, becomes a necessary aspect of ethics.

In his response to Kant's "What is Enlightenment?" (Foucault 1984), Foucault sees enlightenment itself as being an attitude toward the present. According to Foucault, what we have lost in Kant's message of Enlightenment is his message of maturity and its attainment through the critical use of reason. While Foucault disagrees here with Kant's universal notion of reason, he agrees that theory must be critical. He also applauds Kant for addressing actual features of the period of his existence and designating a form of modernity where self-awareness and norms must be created out of themselves. To accept the authority of others here was for Kant to be in a state of immaturity and to accept a form of self-imposed tutelage. Maturity required knowledge therefore of the self and whether one was subjected in forms of tutelage. Foucault also applauds Kant's challenge to know and to exercise reason publicly (an audacious stand in the times of Frederick II).

Enlightenment for Foucault and Kant requires then both self-awareness and a certain attitude toward the authority of others. For Kant it was immature and unenlightened to accept that authority and to be subjected, to be in a position of self-imposed tutelage.

Foucault was often dismissive of Hobbes. What he did not seem to acknowledge, however, was that Hobbes had offered a theory of governmentality an answer to Foucault's "how" question. Of course, the account offered by Hobbes of an education system designed to impose tutelage and suppress insubordination and different beliefs was anathema to Foucault.

Introduction

Axel Honneth is the foremost representative of the so called third generation of the Frankfurt School. He started his academic career as a Habermasian Marxist influenced by Foucault's philosophical and anthropological ideas. In his early writings, Honneth connected Foucault with the tradition of critical theory. Honneth launched his theory of recognition in 1994 and re-orientated the whole Frankfurt School research. Ever since there has been intensive discussion concerning the Honnethian theory of recognition.

Honneth's project is distinctive and central to the third generation of critical theory including, first, the idea of society and history based on the struggle for recognition by social groups. Second, Honneth contextualises the normative foundations in the deep structures of subjective experiences such as disrespect and misrecognition. These ideas, struggles and subjective experiences, are elicited from Hegel's philosophy. The first element, the idea of the struggle for recognition between groups aims to show that freedom occurs through conflicts between groups rather than through conflicts between individuals. For Honneth, social groups represent both the driving force of historical development and a vital condition for human flourishing. Honneth's three forms of recognition, love, rights and social esteem are the basis for moral growth and denial of these forms causes struggles for recognition. Honneth connects Hegel's three forms of recognition to the social psychological examinations of identity development. Moral growth flourishes only when the development of three psychological self-relations is guaranteed, self-confidence, self-respect and self-esteem. For Honneth, the history

of western countries provides the empirical support for his thesis that the spheres of family, market economy and will formation have developed towards more moral and democratic practises via struggles for recognition. The historical struggles in the spheres of social freedom enable individuals now to form more freely intersubjective relationships in love, rights and social esteem.

In recent writings Honneth has extended his influential work in the theory of recognition to address the question of public education. Honneth explores recent neoliberal tendencies towards privatisation and economic competitiveness in schooling. These tendencies are violating educational equality and emptying democratic virtues from public education, downgrading the role of public education in the reproduction of democratic societies. Secondly it empties democratic virtues from public education downgrading the role of public education in the reproduction of the democratic societies. Honneth introduces alternative educational policy by contending that democracy needs democratically oriented public education. Fulfilling this demand, it is necessary to revive the philosophical tradition of Kant, Durkheim and Dewey. Honneth contends that the revival of this tradition generates cogent ideas for democratic education.

Axel Honneth on Moral Growth

Honneth's theory of struggle for recognition and moral growth relies on two writings the young Hegel: *Natural Law* (Hegel 1975) and *System of Ethical Life* (Hegel 1979). In *Natural Law*, Hegel criticizes natural law and social contract theories because they are unable to conceive society as an ethical totality (see Honneth 1995, p. 12): a community of morally mature persons who behave virtuously toward each other. According to theories of natural law, society is just a constellation of single egoistic subjects who have made a contract that they do not fight against each other in order to live peacefully and practice economic activity. In such a community, there is no prospect for moral growth. When Hegel speaks of ethical totality, he

has in mind the polis of the Ancient Greek style (city-State) in which every citizen behaves virtuously enabling “universal and individual freedom” (Hegel according to Honneth 1995, p. 13). For this reason, Hegel intentionally uses the term *Sitte* (habits, customs). *Sittlichkeit* (virtuously behaving) grows from *Sitte*. In other words, the ethical totality grows from reciprocal good behavior. The ethical totality does not emerge from laws of the State (social contract theories) or moral conviction of atomic individuals (Kant’s moral theory). Moral growth is possible only in ethical totality. Morality comes from living customs and habits that are actually acted out in the community.

One might ask, what is the motivation behind *sittliche* (ethical) conduct or reciprocal good behavior? Why do individuals not stay at the immature moral state of civil society (market society) where everyone seeks only their own interests? Hegel provides the answer in his text *System of Ethical Life* (*System der Sittlichkeit*; Hegel 1979). The answer is that recognition is the basic motive for moral social action. On the other hand, recognition is also the basic source of social conflicts. Honneth uses Hegel’s quite unknown text as a foundation for his theory of the struggle for recognition. According to Honneth’s Hegel interpretation, relationships of mutual recognition are the source of a subject’s self-knowledge and basic striving for moral growth (Honneth 1995, pp. 16–17).

Hegel inherits the idea of struggle from Thomas Hobbes, although the purpose and outcome of the struggle is different in Hegel’s social theory. The struggle is not for self-preservation like in Hobbes’ social contract theory, but for recognition, and the outcome of the struggle is not a contract among individuals but a more mature level of ethical relations. “Instead of starting from a struggle of all against all, Hegel begins his philosophical account with elementary forms of interpersonal recognition, which he presents collectively under the heading ‘natural ethical life’” (Honneth 1995, p. 18). Natural ethical life (*natürliche Sittlichkeit*) includes both family relations and formal legal relations in the civil society. It might seem strange that Hegel places

civil society (in the meaning of economic activity; a market society) under the label of natural ethical life. The family is somewhat natural in every society, but what is “natural” about the civil society (market society)? Perhaps Hegel thinks that the family and some sort of civil society will arise spontaneously in each complex social constellation. The thing that does not appear in a spontaneous way is absolute ethical life (*sittliche* State; fatherland). It requires major personal and socio-historical moral development, which mature Hegel calls the phenomenology of the spirit. For Hegel, the absolute ethical life is a kind of final solution (*Aufhebung*) to all social conflicts and ethical dilemmas (e.g., *Das Adam-Smith-Problem*, see Huttunen 2011) in society. According to Honneth’s interpretation, Hegel’s theory includes three levels or social contexts in which the struggle for recognition happens: the family, the civil society, and the state. From these three instances follow three modes of recognition and three objects of recognition. These three modes of recognition are also states of moral growth:

1. The family for Hegel is “the universal reciprocal action and formative education of human beings” (Hegel according to Honneth 1995, p. 18). In the family, individuals recognize each other mutually as emotionally needy beings. In the family, the source of morality (*Sittlichkeit*) is not a cognitive concept (rights and duties) but the feelings of love and care (Honneth 2007, p. 153). The mode of recognition is an affective intuition (*Anschaung*), and the object of recognition is to meet the individual’s concrete needs (food, care, love, etc.). The denial of these needs (misrecognition) is the same as denying one’s humanity. *Sittliche* behavior on this level means loving and caring, i.e., affective intuition. The purpose of the family labor of raising children is to promote the child’s “inner negativity” or independency.
2. As the individual grows older, he or she begins to struggle for the recognition of his or her autonomy. On the level of the civil society (market society), persons reciprocally recognize each other’s right to ownership, i.e., the

right to be a legal person. As a legal person, an individual has the right to say “yes” or “no” to all offered transactions. This is called negative freedom in Hegel’s terminology (Honneth 1995, p. 19). Robbery or other illegal action in the civil society (e.g., forming a cartel is a form of stealing) means that the wrongdoer is denying others the right to say “yes” or “no” as a legal person. The mode of recognition in civil society is the “cognitive concept” with which persons reflectively recognize each others as legal persons. The object of recognition is to satisfy a person’s need for formal legal autonomy. *Sittliche* behavior in this level means respect for the “abstract law” (cognitive concept). Hegel’s notion of abstractness of law means that the law “does not yet have its reality and support in something itself universal.” The abstract law does not contribute to the formation of the concrete ethical totality (*sittliche* State; value community). It contributes only to the formation of the abstract legal person and formal legal relations between persons.

3. Hegel claims that people seek and struggle for a more advanced form of personality and mode of recognition. The civil society is a constellation of abstract legal persons who do not affectively care for each other. It is a formally just society but it is not a decent society. I believe that this decent society is what Hegel means with the notion of “absolute *Sittlichkeit*.” The movement from natural ethical life (*Sittlichkeit*) to absolute ethical life (*sittliche* State) is a process of moral development or learning both on the social and the personal level (Honneth 1995, pp. 23–24). For Hegel, the *sittliche* State represents the true or absolute *Sittlichkeit*. The State is not a constellation of egoistic individuals but an organic whole which consists of “whole persons.” It is the highest phase of an individual’s moral development. Hegel believes that intellectual intuition (*Anschauung*) emerges in this future community. Hegel claims that the individual “intuits himself as himself in every other individual” (Hegel according to Honneth 1995, p. 24). Intellectual intuition is a kind of reflective family love between the “members

of a whole.” Honneth thinks that the concept of solidarity depicts Hegel’s intention well. On the level of the state, the mode of recognition is intellectual intuition which is an “affect that has become rational.” The object of recognition is individual particularity or a person’s formation into a free subject who knows his own particular abilities and recognizes the particular abilities of others.

With his creative interpretation of Hegel’s *System of Ethical Life* (Hegel 1979), Honneth produces his own theory of identity formation which is at the same time a theory of an individual’s moral growth. Honneth thinks that recognition must be based on some of the person’s existing abilities and skills. By receiving recognition from others, one achieves one’s identity: one learns to know oneself and one’s special characteristics. When one receives positive recognition because of some particular ability, one starts to form a positive self-image. One becomes aware of one’s abilities and qualities. According to Honneth, humans require the intersubjective recognition of their abilities and achievements in order to develop a productive relationship with themselves (Honneth 1995, p. 257).

Honneth states that the recognition is given on three hierarchical levels. The person begins at the first level and gradually moves on to the higher levels. Accordingly, Honneth’s theory includes three so-called practical self-relations in the moral development of personality: (1) self-confidence, (2) self-respect, and (3) self-esteem. These practical self-relations are achieved at the three levels of the struggle for recognition, which are family (love), civil society (rights), and state (solidarity) (Honneth 1995, p. 126).

An individual’s self-confidence is established and reproduced in the relations of friendship and love. This is the first level of recognition. At this level, one seeks recognition of one’s existence, that is, recognition that one has the right to exist as the kind of person one is. This elementary form of recognition takes place in the primary socialization process within the family and within circles of other persons that one is close to. Through one’s very first contacts with one’s parents, one

Honneth on Moral Growth, Table 1 Intersubjective relations of recognition (Modified from Honneth 1995, p. 129)

Dimension of personality	Needs and emotions	Moral responsibility	Traits and abilities
Forms of recognition	Primary relationships – <i>love, friendship</i>	Legal relations – <i>rights</i>	Community of value – <i>solidarity</i>
Practical relation to self	Basic self-confidence	Self-respect	Self-esteem
Forms of disrespect	Abuse and rape	Denial of rights, exclusion	Denigration, insult
Threatened component of personality	Physical integrity	Social integrity	Honor and dignity

gradually achieves a basic level of trust. One learns to express one's needs without the fear of abandonment. Love and friendship are the forms of recognition by which parents create basic trust. The experience of love and care is a precondition for the formation of an individual's identity and morality (*Sittlichkeit*; Honneth 1995, p. 253). This first level of recognition and individual moral development does not have any similarities with Kohlberg's preconventional moral consciousness. Actually Honneth comes close to Carol Gilligan's notion of self-love as the first level of moral development (see Gilligan 1993, p. 73; Kakkori and Huttunen 2010).

At the second level of recognition, the individual strives for the practical self-relation called self-respect. Self-respect, in this context, means that a person in a community of rights gains recognition as a legally and morally mature person. Hegel refers to this community of rights with the term civil society. On this level, the individual either receives or does not receive basic legal rights. Recognition on this level also means that one is accepted as an autonomous person who has the right and the competence to take part in the discourses in which people reach consensus on political and theoretical issues. The issue is not just that the person has a right to ownership and a right to take part in contracts, but it is also the Kantian universal respect for the freedom of the will of the person. On this level, "the individual is recognized as a person who ascribes the same moral accountability as every other human being" (Honneth 1997, p. 30). To put it differently, this level of recognition entails regarding this individual a person who is responsible for his or her own actions. The opposite of this is a paternalizing attitude which denies the

individual's freedom of will, autonomy, and ability to work independently. Self-respect grows out of recognition of responsibility, which the individual gains on the level of the civil society (community of rights).

On the third level of recognition, the individual strives for self-esteem. Self-esteem is built through the respect one receives for one's work. Here, it is essential that one is recognized for work through which one expresses oneself. Only through self-directed and autonomous work can one perform one's freedom of will. And only when one begins to work out of one's own free will for a common good can one become respected in a community (or the State, in Hegelian terminology). Self-esteem means that one sees one's work being acknowledged and recognized. On this level, "the individual is recognized as a person whose capabilities are of constitutive value to a concrete community" (Honneth 1997, p. 27). This way, the individual really becomes recognized as a person who has something to give to the community. The reciprocal recognition of each other's work creates a strong feeling of solidarity in the community.

Table 1 summarizes Honneth's view of the various components of recognition. The forms of disrespect are also presented in the table. The first level of disrespect insults one's physical integrity. Its most extreme form is physical abuse. The denial of physical integrity could lead to permanent psychological damage, which would then interfere with the development of practical self-relations. The denial of social integrity means that the individual is not considered a mature person. One is not treated as a person having freedom of will – that is, one is not considered a subject of one's action, but rather an object that causally

reacts to stimuli. This way, one's moral responsibility is kept in an undeveloped stage. The disrespect that occurs on the third level of recognition implies that no recognition is given even though one's work is worthy of such recognition. When one only receives feedback regarding one's actions on making a mistake, one's self-esteem does not develop (Honneth 2007). This kind of disrespect is directed to a person's honor and dignity.

For Honneth, full moral maturity means that the person feels connected with other members of the value community (communitarian view), is able to give honest recognition to the work of other people, and, vice versa, is able to receive recognition from them. By his own action, he creates a possibility for good life for others and for himself. Only by working together people are able to achieve good self-esteem and full moral maturity which are *sine qua non* for good life.

In his recent writings, Axel Honneth (2012, 2013, 2015) has dealt with such themes as *Bildung*, educational policy and education for democracy. These writings elaborate Honneth's view on individual's moral growth through dialectic of recognition. According to Honneth, after defeating Nazism in Germany, it was natural to retrieve the unlearned practices of democratic decision-making through nationwide education. Nevertheless nowadays the important link between educational concepts and democracy has been broken. Honneth worries that contemporary political philosophy has lost sight of the educational processes which produce cultural and moral conditions vital for democracy and its existence. Honneth claims that the studies of educational processes should be at the center of political philosophy (Honneth 2012, pp. 430–431). Honneth asserts that democratic theory as political philosophy is unable to make a proper contribution to the normative function of preschool, general school, and adult education (Honneth 2012, p. 431).

Honneth illustrate the gap between theories of democracy and the theories of education with the so-called *Böckenförde theorem*. This theorem states that liberal democracy in its constitutional form, comprising the rule of law, the protection of

fundamental rights, the separation of powers, and so on, possesses no secure foundation for its legitimacy and effectiveness. On the one hand, the liberal democratic State can function only when liberty, guaranteed for its citizens, is exercised and regulated from within the moral substance of the individual and by shared values in society. On the other hand, the liberal State is unable to command or enforce these inner regulative forces through authority or legal power without first giving up liberalism. The *Böckenförde dictum* highlights an inherent problem of democracy by suggesting how to defend the moral ground of democratic society without heading for totalitarianism. The general misinterpretation of *Böckenförde theorem* states that democracy has only minor possibilities to reproduce its own moral and cultural basis, and eventually this basis can only be justified by returning to something predemocratic or to pre-modern life-forms, tradition-oriented communities governed by substantive ethical or even religious conceptions (Böckenförde 1991; Honneth 2015, p. 22; also Hirvonen 2016).

Honneth argues misinterpretation of *Böckenförde theorem* leads to a conclusion that State-organized educational processes have no reason to teach democratic-promoting behaviors (Honneth 2012, pp. 432–433). This general misinterpretation of the *Böckenförde theorem* has created the illusion that democratic virtues like the moral attitudes of collaborative decision-making, abilities for tolerance, empathic skills, abilities to understand the perspective of the other, and the ideas of the common good are not the tasks of public education. These ideals necessary for the reproduction of a functioning democracy are widely thought to develop through a process of ethical socialization in pre-political communities. Because democracy itself has no means to reproduce its moral and cultural grounds, democratic education seems futile. Honneth claims that the tradition of Kant, Durkheim, and Dewey defends State-organized mandatory public education that cultivates democratic values, empathy, and communicative decision-making skills (Honneth 2012, pp. 433–434, 2015).

The danger in the misinterpretation of the *Böckenförde theorem* is that these ideas will

effectively displace the democratic elements from State-administered education. Honneth refers to the term “civic minimum,” introduced by neoliberalism, as the new requirement for public schools. According to premises of civic minimum, the publicly mandated requirements to teach democratic virtues and civic knowledge in schools must be minimal. Thus parent responsibility is increasing in the cultivation of these values. Civic minimum is defended by the arguments that public decisions on the contents of the school subjects will be less time-consuming, bureaucratic, and quarrelsome. The civic minimalism is carried out with the school voucher system where the State gives parents a certificate of funding which parents are able to apply toward tuition of the school of their choice, public or private, secular or religious. The idea of civic minimalism is defended by arguing that the only way to solve the problem of achieving the consensus on civic education under the conditions of pluralism is to minimize the civic component of schooling and leave parents to decide what education would be best for their children. In this way, democratic disagreement over public schooling can be minimized. Following the idea of a civic minimalism, parents have constitutional rights to determine every feature of their children’s schooling except the civic minimum. It introduces itself as an alternative to democratic deliberation (Honneth 2012, pp. 433–435).

Conclusion

For Honneth, full moral maturity, i.e., self-esteem, is possible only in an ethical totality in which persons reciprocally recognize each other’s importance in the community. Honneth’s third phase in the development of individual’s self-relation and morality is pretty much the same as Robert Williams’s interpretation of Hegel’s universal consciousness (see Huttunen 2011). The difference is that Honneth prefers notions of the *sittliche* State (value community) and does not engage Hegelian philosophy of (universal) consciousness. In this sense, Honneth comes close to Gilligan, who also dislikes the philosophy of

consciousness and who emphasizes the relational nature of morality. Nevertheless Honneth has some prejudices toward Gilligan’s view. Honneth presents an explicit criticism of Gilligan’s feminist ethics (Honneth 2007, p. 174): “If we follow Deigh’s presentation ... we will quickly get the impression that he is seeking to rehabilitate Carol Gilligan’s thesis of two moralities (men’s moral against women’s moral) in a psychoanalytic fashion.” Honneth has an unjust interpretation of Gilligan’s view. Gilligan does not hold the notion of men’s and women’s separate moralities. She has done empirical research against this kind of feminist ethics (Kakkori and Huttunen 2010).

Gilligan’s critique of Kohlberg parallels Hegel’s critique of Kant’s ethics like all communitarian critiques of neo-Kantianism, and in this sense, Gilligan’s ethics has many similar features with Honneth’s ethics of recognition. In an Hegelian manner, Gilligan wants to take moral feelings seriously and put emphasis on the social nature of morality. Nevertheless Kohlberg’s Kantian moral theory should not be abandoned. It needs to be revised and improved but not abandoned. This actually is Gilligan’s intention. She does not want to reject Kohlberg’s theory but supplement it with the aspect of ethics of care and relational nature of morality (see Kakkori and Huttunen 2010).

Thus if we reconstruct Kohlberg’s view on moral maturity in Gilliganian fashion, we end up with Honneth’s Hegelian view on the third level of morality and self-relation. This mature level refers to the ethical social totality (*Sittlichkeit*) in which the other person is encountered (faced) in a reciprocal dialogical relationship of recognition. From Honneth’s ethics of recognition and social theory, we can learn that moral maturity has to include the aspects of love, virtues, communal moral habits (*Sittlichkeit*), and democratic virtues provided by proper public education.

Horkheimer and Philosophy of Education

Ilan Gur-Ze'ev

University of Haifa, Haifa, Israel

Max Horkheimer (1895–1973) was the general manager of the Institute of Social Research at Frankfurt University from 1930 and its dominant figure. Together with Theodor Adorno, Herbert

Marcuse, Erich Fromm, Walter Benjamin, Leo Lowenthal, Otto Kirchheimer, Friedrich Pollock, and Franz Neumann, he formed what became known as the “Critical Theory” of “The Frankfurt School.” However, each of these thinkers developed unique theories and perspectives that problematize considering their work as a “school” (Gur-Ze'ev 1996).

Two stages of development characterize Horkheimer's work in Critical Theory. A positive utopianism and optimism toward the possibility of revolutionary change characterize the first stage in his thinking. His Critical Theory of this period was committed to social and cultural transformation. The second stage, starting in 1944 and the joint publication (with Adorno) of “Dialectic of Enlightenment” (Horkheimer and Adorno 1988), manifests a negative utopianism and a harsh critique of Marx and orthodox Marxism. In Horkheimer's words this shift represents a move from Marx to Schopenhauer (Horkheimer 1985a, p. 309) and from the quest for revolution to a commitment to education (Horkheimer 1985b, p. 417). The dividing lines are sometimes unclear and unstable. We can find philosophical pessimism in the writings of the young Horkheimer and his letters (Horkheimer 1927) and optimistic attitudes in his later work (especially in his public speeches on education while serving as rector of Frankfurt University) (Horkheimer 1985a, pp. 361–456). However, fundamental changes in his philosophical orientations and its educational implications evolved, as he himself readily acknowledged (Horkheimer 1985b, pp. 336–353), with the advent of World War II and the Holocaust. For all the common ground between the first and the second periods of Horkheimer's work, two essentially different philosophies of education are articulated. The first, or the immature stage of development of Horkheimer's work, is its best known and most influential part, especially in the Anglo-Saxon world. This is especially true regarding the influence of Critical Theory on the New Left in the 1960s and 1970s. This part of Horkheimer's work was of special relevance, influencing Critical Pedagogy as developed by thinkers such as Paulo Freire, Henry Giroux, Ira Shor, Cathleen Weiler, Peter McLaren, and Stanley Aronowitz.

While in the first period Horkheimer did not devote much of his energy to schooling, one can understand the whole project of constituting a critical theory as an effort to articulate a philosophy of education. Here education has to be understood in the broader sense, as relating to practices, concepts, and symbolic development that constitute emotional formation, conceptual apparatus, conscience, and consciousness and the historical, local, collective, and individual possibilities and limitations.

Already in his now classic “Critical and traditional theory,” the production of knowledge is not to be detached from social power relations and interests. Science too has to be understood not only as part of the reproduction of the hegemonic order; it is to be seen also as part of its protection, regardless of the opinions and the consciousness of the individual scientist (Horkheimer 1977, p. 18). Nor is Critical Theory neutral, but it identifies with specific and concrete social interests: “It has no unique evaluative standard beside its interest in the overcoming of social injustice” (Ibid. 64). Critical Theory manifests itself not only as a struggle on the stance of knowledge but of the possibilities for human liberation. This aim of Horkheimer’s Critical Theory is manifested in a critique of ideology, with a materialistic dimension on the one hand and a commitment to an interdisciplinary and unifying new science on the other. The educational implications of this kind of Critical Theory are constructed by its positive utopianism: “a vision of a better reality, which overcomes the present oppressive reality. This transformation [of Utopia] becomes the arena of today’s theory and praxis” (Horkheimer 1985c, p. 105). In other places in this period, Horkheimer presents the aim of Critical Theory as nothing less than “building a new world” (Horkheimer 1985d, p. 294). Here the critique of the hegemonic ideologies and the struggle against the present order of things is an educational process in line with the Enlightenment’s humanist tradition, from Lessing’s *The Education of the Human Race* to Marx’s *Communist Manifest*. The historical struggle itself is conceived as an educational process of humanity to which Critical

Theory makes an irreplaceable contribution. This is because the struggle over the control of knowledge, the representation of reality, and the representation of relevant knowledge about knowledge and about the context in which it is produced is inseparable from the potentials for social responsibility and the prospects of emancipatory political activism. This is also a central element of Critical Pedagogy as a realization of Critical Theory in the schooling process. Here it is important to note some of the central preconceptions and assumptions of Horkheimer’s project:

1. A human essence, in which reason, solidarity, and quest for freedom are central. This is the foundation of the Enlightenment’s conception of unlimited human potential for emancipation and elevation. In this sense it is a moral imperative as well as a political need to struggle for progress in the realization of unfulfilled human potential.
2. Critical Theory offers a liberating concept of knowledge, which is capable of dividing “emancipatory” from “oppressive” representations of knowledge and its legitimization apparatuses.
3. The foundation of an enlightened critique is unproblematic. Immanent critique, not fundamental justification and metaphysical argumentation, ensures the stance of Critical Theory and its educational implications not as mere contingent and contextual rhetoric.
4. Social reality not only justifies Critical Theory; it also contains the potentials for its realization and for the constitution of a better human coexistence. The irrationality of capitalist production, distribution, and consumption; the actual interests of the proletariat; and the inconsistencies within the system as evident in bourgeois philosophy – all manifest the justification of Critical Theory as well as its future victory.

The second stage of Horkheimer’s project can be described as philosophical pessimism. In contrast to many critical theorists who refer to his Critical Theory with or without postmodern

adjustments, the later Horkheimer explicitly dissociates himself from the Marxian tradition. He dissociates himself from the tradition which believed in the possibility of “the good society,” wherein not only social relations but also thought itself could be elevated (Horkheimer 1985b, p. 339). He abandons the revolutionary project since, according to Horkheimer, by his essence the revolutionary tends to become an oppressor. This is because the claim for justice cannot have the upper hand without its transformation into its opposite. As long as there is room for liberty, collective violence will continue to rule, he asserts (Horkheimer 1985e, p. 247). Freedom and justice are contradictory in terms (Horkheimer 1985b, p. 340). Progress has not come to a temporary halt – there is no room for progress in principle!

Horkheimer’s pessimism has three levels: metaphysical, theoretical, and historical. On the metaphysical level, according to Horkheimer, power as the will to life or as will to overcome life governs being, and within it there is no room for meaning, aim, or a struggle detached from the total role of power as active meaninglessness. On the theoretical level, Horkheimer understood the immanent critique of Critical Theory as related to conceptual possibilities of the Enlightenment that have been dissolved by the victory of instrumental rationality over the tradition of objective reason. The second half of the twentieth century is marked not by lack of rationality but by the omnipotence of rational organization of social relations, production practices, and the culture industry. According to the later Horkheimer, Critical Theory has lost its conceptual context, and within the current culture industry can no longer justify its aims (Horkheimer 1974, pp. 101–102). The essential point here is that this historical moment is conceived not as a temporary situation or a historical accident: it is essential to being, in which for humans the “adjustment to the power of progress contains the progress of power. And each time it produces degeneration which does not manifest the defeat of progress but its success, which reveals itself as its opposite” (Horkheimer 1988, p. 42). The successes of capitalism and the

integration of socially antagonistic elements such as the proletariat set the historical dimension of his pessimism. The “totally administered world” (which already Marx was committed to) is rational and self-regulatory, and within it there is no room for the historical possibilities that were open in previous stages of modernity (Horkheimer 1985b, p. 348). This is because the present system has been successfully developed into a stance where not only does it master the consciousness of collectives, it even constitutes and controls the instincts of the individual in accordance with the needs and imperatives of the system (Horkheimer 1974, p. 141). This position is highly relevant for emancipatory education today, especially in face of recent postmodern feminist, multicultural, postcolonial, and other alternatives to hegemonic education. Note that on this point Horkheimer presides over the “hard” postmodern discourse, which addresses the end of the subject and the contingency of hegemonic knowledge, as well as resistance to the system (which is actually part and parcel of the system). Horkheimer, however, did not abandon Utopia and responsibility to the Other or the commitment for transcendence. His pessimism is not a preview for solipsism, nihilism, or escapism. It is a new setting for the realization of the principle of hope and for the struggle over a potential counter-education.

Horkheimer’s later Critical Theory abandons optimism but it is unconditionally Utopian. The possibilities for transcendence and change are not grounded in the present reality but in the essence of being and in the human subject qua subject. The powers, which produce the “subject” and control his or her consciousness, knowledge, identity, and actual social function, normally have the upper hand. However, according to Horkheimer, as “facts” they do not have the last word. Hegemonic knowledge and power structures are not disregarded in the name of actual authenticity, autonomy, or freedom to act in line with “genuine interests.” The openness of being and the human potentials to become different from constructed by the system are vital elements for the constitution of a non-repressive and non-naïve educational alternative. Horkheimer

calls this alternative “negative theology,” but it is theology without a God or messianism without a messiah. Horkheimer’s mature work does not abandon critique of ideology and resistance to the triumphant culture industry and the logic of capitalism. It does not give up the struggle for counter-education, but it certainly urges us to beware of today’s exile of spirit on the one hand and the arrogance of the revolutionary tradition on the other. The sensitivity to the presence of power and meaninglessness within dogmatic revolutionary alternatives is no less important than the emancipatory potentials of ideology critique and democratic activism within the present political order. The later Horkheimer connects this humanistic tradition to the fundamental philosophical questions and challenges the realm of self-evidence not only within the hegemonic power relations and groups but also in the praxis, theory, consciousness, and self of the critical educator herself. Within this framework life becomes, again, a mission, and within dialogical settings the struggle over self-constitution and re-articulation of identity, knowledge, and intersubjectivity becomes concrete, even within a (almost) totally constructed and controlled reality.

Human Capital Theory and Education

Patrick Fitzsimons

Independent Researcher, Auckland, New Zealand

Throughout Western countries, education has recently been retheorized under Human Capital Theory as primarily an economic device. Human Capital Theory is the most influential economic theory of Western education, setting the framework of government policies since the early 1960s. It is seen increasingly as a key determinant of economic performance. A key strategy in determining economic performance has been to employ a conception of individuals as human capital and various economic metaphors such as “technological change,” “research,” “innovation,” “productivity,” “education,” and “competitiveness.” Economic considerations per se in the past, however, have not determined education.

In *The Wealth of Nations* (1776) Adam Smith formulated the basis of what was later to become the science of human capital. Over the next two centuries two schools of thought can be distinguished. The first school of thought distinguished between the acquired capacities that were classified as capital and the human beings themselves, who were not. A second school of thought claimed that human beings themselves were capital. In modern Human Capital Theory all human behavior is based on the economic self-interest of individuals operating within freely competitive markets. Other forms of behavior are excluded or treated as distortions of the model.

A prominent explanation for that move is provided by a recent reformulation of Human Capital Theory which has stressed the significance of education and training as the key to participation in the new global economy. In one of its recent reports the OECD (1997a, p. 7), for example, claims that the radical changes to the public and

The original version of this entry was revised: An erratum can be found at https://doi.org/10.1007/978-981-287-588-4_900

private sectors of the economy introduced over recent years in response to globalization will be “severe and disturbing to many established values and procedures.” In another report that explains internationalization in higher education as a component of globalization, the OECD (1997b, p. 11) believes that “internationalism should be seen as a preparation for twenty first century capitalism”. (This form of capitalism is based on investment in financial markets rather than in the manufacturing of commodities, thus requiring dependence on electronic technology). That organization also boldly asserts that internationalism is “a means to improve the quality of education” (OECD 1997b, p. 8). In keeping with Human Capital Theory it has been argued that “the overall economic performance of the OECD countries is increasingly more directly based upon their knowledge stock and their learning capabilities” (Foray and Lundvall 1996, p. 21). Clearly, the OECD is attempting to produce a new role for education in terms of the human capital subject required in “globalised” institutions.

In terms of structural reform, under Human Capital Theory the basis for nation-State structural policy frameworks is the enhancement of *labor flexibility* through regulatory reform in the labor market, as well as raising skill levels by additional investment in education, training, and employment schemes, and immigration focused on attracting high-quality human capital.

Human Capital Theory has been criticized on a number of counts. Two critiques are outlined here: one external and one internal. The clearest statement of the deficiencies of Human Capital Theory goes to the heart of neoclassical economics. The revival of economic sociology, in particular at the hands of Fred Block (1990, p. 21), seeks to challenge the basic assumptions motivating the methodology of neoclassical economics. He claims these rest on two basic building blocks. The first is the idea that the economy is an analytically separate realm of society that can be understood in terms of its own internal dynamics. Economists are perfectly aware that politics and culture influence economy, but they see these as exogenous factors that can be safely bracketed as one develops a framework that focuses on purely economic factors. The second

key foundation is the assumption that individuals act rationally to maximize utilities. Here, again, economists are acutely aware that individuals are capable of acting irrationally or in pursuit of goals other than the maximization of utility, but the strategy of excluding these deviations from the rationality principle is justified by the effort to identify the core dynamics of an economy.

For Block (1990), these assumptions on which neoclassical, and therefore also, Human Capital Theory depends are cast in universal and ahistorical terms. Given the facts that they emerged from a body of theory which was first formulated in the nineteenth century and that they continue to provide the basis for neoliberal restructuring of the State in the 1980s and 1990s within most western liberal democracies, it is, perhaps, time that these original assumptions were reexamined. Together the two assumptions provide a basis for the model of the self-regulating market which harmonizes transactions for products, labor, and capital.

Economic sociology challenges the first assumption by arguing that the society and culture can not be arbitrarily split from the economy. Clearly, both the society and culture shape the preferences of individuals in various ways. Social factors also influence economic contractual transactions. Even the contract rests on cultural understandings and the legal framework which is itself historically determined. The methodological foundations of neoclassical economics obscure the social, cultural, and political determinants of economic action. Marginson (1993, p. 25) argues that this results in an analysis that is ahistorical and, through a tautological procedure, continually rediscovers the centrality of purely economic notions. Based as it is on the false premise of the “naturalness” of the pursuit of economic gain by human inclinations, the “economic fallacy” imagines that capitalist societies do not have cultures in the way that primitive or premodern societies do. When we recognize that the pursuit of economic self-interest is itself a cultural creation, then it is apparent that we too are ruled by deeply held, but unexamined, collective beliefs.

Human Capital Theory, then, is an impoverished notion of capital. It is unable to understand human activity other than as the

exchange of commodities and the notion of capital employed is purely a quantitative one. This misses the point that capital is an independent social force where the creation of social value comes about through its capital accumulation and continual transformation through the circulation of commodities. Under capitalism, labor is structurally separated from the means of production. Labor and the means of production are concentrated as commodities and capital in the hands of an opposing class. The means of production are not only physical but also appear in social relations. The individual under capitalism can only come to grips with the means of production through selling his or her labor commodity. The struggle of the laborer to improve life's conditions is mediated then through the social relations within which they find themselves. Given this explanation, human capital is an abstract form of labor – a commodity – and not capital. Commodities such as human capital are therefore part of the life cycle of capitalism as a form of labor and not able to be exchanged independently of it.

The second assumption exposed by Block (1990) which is of primary importance to Human Capital Theory is also open to criticism on a variety of grounds. In modern human capital theory all human behavior is based on the economic self-interest of individuals operating within freely competitive markets. Other forms of behavior are excluded or treated as mere distortions of the model. Friedman (1962, pp. 100–101), for example, has argued that all the benefits of vocational and professional education are limited to the individual who is educated. The maximization of rational self-interest separate from the social group that the individual belongs is a central article of faith in human capital theory. A criticism of the rational utility maximizer (Block 1990, p. 25) suggests that the elevation of self-interest to a position of dominance on which much economic analysis rests is itself a consequence of social arrangements.

What constitutes rational action depends to some degree on the context which Human Capital Theory denies with its individualistic methodology. From a poststructuralist perspective, Elster (1983)

emphasizes the problematic nature of individual rationality that is behind any notion of self-interest. According to Elster (1983), under conditions of complexity and uncertainty, the gap between rationality in action and perfect rationality can be substantial.

Further criticism of Human Capital Theory concerns a more technical problem with criticisms about the employment of the theory as a means of accounting for national economic growth. Arguments about economic growth accounting such as Becker's (1994) show at best that education contributes to differences in earnings between people and then only in certain circumstances. This criticism comes from Blaug (1987a, p. 233), who contends, "it has to be said that the models so far examined in the growth accounting literature fail utterly to explain the mechanism by which this effect is produced." The contention that economic growth emanates from education is a non sequitur because, while it may be granted that education contributes to growth, so do many other activities. Blaug (1987a, p. 231) says that what must be illustrated is "not that education contributes to growth, but that more education would contribute more to growth at the margin than more health, more housing, more roads, etc."

The fundamental thing that growth accounting ignores is the costs of the resources already invested in the educational system and therefore the calculations tell us nothing about the net returns of spending on education. In this respect, Blaug (1987b, p. 134) argues that "public expenditure on tertiary education depends not only on the costs of instruction but also on the volume of direct aid to students." Blaug (1987b, p. 135) further notes that the "levels of public spending on student aid can encourage or discourage the private demand for tertiary education but *cannot* directly affect levels of economic development or rates of growth of GNP per head." Even within economic discourse, "investing" in education does not necessarily bring equity. Nevertheless, the commitment of Western governments to education policies of economic growth through human capital development is increasingly funded through private debt in the form of student loans.

Human Capital Theory in Education

Donald Gillies

University of the West of Scotland, Ayr,
Scotland, UK

Introduction

This entry is a critical exploration of the rise and limitations of Human Capital Theory (HCT) within the field of education. In recent times, HCT has become one of the most powerful underpinnings of education policy discourse worldwide. At both supranational level, within such

bodies as the OECD and the EU, and within national education systems, the influence of HCT is considerable. Promoting education as an “investment” which yields returns in due course to the individual in terms of pay and to the State in terms of employment and economic growth, HCT provides a captivating model for neoliberal governance of State education. The theory thus promotes State education systems as subservient to the vaunted knowledge economy, as instrumental for economic growth. In this entry, the nature and development of HCT are outlined, its current influence indicated, and its effects highlighted. The entry concludes by pointing to some of the weaknesses of the theory as applied to the field of education, as well as some of the problematic issues around conceptions of schooling and of young people which the theory produces.

Historical Background

Since its formulation in the early 1960s, Human Capital Theory has developed into one of the most powerful theories in modern economics. The growth of the concept of the “knowledge economy” in the last 20 years has also afforded it a further degree of importance because of the strong connections it sees between education and training and economic growth. Where economic activity becomes focused on knowledge, on intellectual rather than physical labor, then the importance of education to that economy seems all the more crucial. Human Capital Theory thus lays considerable stress on the education of individuals as the key means by which both the individual accrues material advantage and by which the economy as a whole progresses. In a simple equation, the more and better education individuals possess, the better their returns in financial rewards and the better the national economy flourishes.

Human Capital Theory has thus promoted education to a key instrumental role in boosting economic growth. The better the investment made by individuals in education, the better they and the

economy will do. This elevated status, however, is not without its problematic aspects. There is a risk of education being narrowed to economic goals, of the broader aims and purposes of education being submerged, and of the person being reduced merely to “human capital,” not as a life to be lived, but as mere economic potential to be exploited (Gillies 2011).

The modern roots of Human Capital Theory are usually traced to the work of two key theorists, Theodore Schultz (1902–1998) and Gary Becker (b. 1930), both associated with the “Chicago School” of neoliberal thought, although Jacob Mincer (1922–2006) had made earlier reference to the concept. There are, essentially, two elements to the theory. The first relates to theorizing that wage differentials or income distribution can be causally connected to education (in this case understanding the term as including schooling, tertiary education, training, and professional development). Much of the early research within Human Capital Theory looked at how earnings could be linked to educational experience: in its simplest form, longitudinal studies compared the earnings of high school graduates as opposed to college graduates in the USA. Schultz (1960, p. 571), noting that college graduates earned more, argued that in this sense the costs of a college education could be viewed as an investment, embodied education becoming “human capital,” which offered later returns in the form of relatively higher wages. Research showed that there was a financial return for the time and resources dedicated to education and training and so families and individuals could be interpreted as undertaking these as a form of investment which would pay dividends later in the form of higher earnings. Education, therefore, was no longer to be viewed as “consumption” but as investment.

The second core element in early Human Capital Theory is related to this finding. Whereas classical economics had tended to view the workforce in purely quantitative terms, Human Capital Theory introduced a qualitative aspect. Education and training were seen as the most important ways in which the quality of the workforce could be enhanced. College graduates did not earn more by

chance: it was because of the quality of their work that they earned more. Thus, education and training yielded broader economic returns than individual earning power. There were generic economic benefits for society which accrued from a well-educated and well-trained workforce. Just as individual choices about education and training could be understood in relation to judgments about likely returns on such investment, so at a national level, the education system could be justified in the light of likely returns in the form of economic growth.

It was this second aspect of Human Capital Theory that had the greatest political effect. Schultz (1962) suggested that the rapid recoveries of both Japan and Germany after World War II could be more easily explained if one took note of the preexisting high levels of human capital in these well-educated countries. Developing human capital was therefore an important way in which economies could grow and, indeed, survive or recover from setbacks. Becker (1992) argued that, outside of the Eastern Bloc, human capital investment in the form of educational opportunities was central to those countries experiencing faster economic growth from 1960. In its appropriated form, the theory was thus held to be able to account for economic growth *per se*.

Becker (1975, 1993) also sought to develop Human Capital Theory in a particular way. Concentrating primarily on individual decision making in relation to personal educational investments, Becker fused the theory with rational choice theory and began to explore its explanatory potential in a whole range of social activities previously untouched by economics such as family and marriage. Becker’s analysis, therefore, shifted paradigmatically from economics in terms of a relational mechanism between things and processes within a social structure to the analysis of an activity – the internal rationality governing an individual’s choices and behavior.

In recent times, the definition of human capital has widened somewhat so that it is not simply knowledge or skills but also “competencies,” “attributes,” and “attitudes” such as “reliability, honesty, self-reliance, and individual responsibility” (Becker 2002, p. 6). Education remains center

stage, however, as the key factor in forming such human capital, which itself remains crucial for “economic success.”

It is clear from even a cursory glance at government policy across the world that education has a highly elevated status, constructed in one particular sense – as instrumental to the economy – and so conceptualized quite differently from how it has been widely understood in the past and, perhaps, in the vernacular. While Human Capital Theory has thrust education into the political limelight, it is education in one particular role only, and its continued central importance relies almost entirely on its capacity to continue to be seen as economically vital.

Human Capital Theory and Education

From its very earliest days, however, Human Capital Theory has been controversial. There is concern at seeing education viewed in such narrow economic terms, omitting broader and richer purposes and practices. Whole areas of the curriculum such as the expressive arts, and the humanities in general, struggle for perceived relevance when bald economic purposes are given exclusive attention. Similarly, conceptualizing humans as mere capital goods seems excessively reductivist, omitting much of what it means to be a person. The notion of humanity becomes narrowed to that of economic agency, risking constructing people as mechanical objects as opposed to living persons. Even when relationships and shared values are taken into account, HCT tends to view these as crudely instrumental to providing the stability for economic activity rather than of intrinsic worth. These represent two significant challenges for Human Capital Theory: that it diminishes the concept of education and that it diminishes the concept of the human. The development of Human Capital Theory in relation to rational choice theory also fails to take account of motivation in human behavior, other than for personal advantage. The idea of an altruistic motive, or being motivated by the public good, or concern for others, is essentially denied by its adherents. Even in relation to career

development, issues around job satisfaction, challenge, enjoyment, status, and so on are all absent from the account. The model also assumes that all further education is geared for the labor market and so cannot account for the expansion of educational activities within the retired population for whom there cannot be any hope of financial benefit accruing nor of employment advantage.

Human Capital Theory does not, of itself, necessarily involve such a narrow view of education, but there is a tendency within the theory for a very pared-down model of education to be presented. Education – and so prosperity – becomes entirely focused on the human as an individual unit and on education as solely a matter of individual choices, leaving as unproblematic the nature of the system, and the nature of the socioeconomic, cultural, and political context which has shaped and continues to shape educational provision and experience. Inequalities of outcome can be attributed to the shortcomings of individuals in respect of their choices or capital returns. The overarching economic, social, and political system is essentially absent from any analysis.

Human Capital Theory does present a central role for teachers as those who help create and develop human capital. Far from being minor public servants cocooned from the harsh realities of tooth and claw capitalism, teachers now become repositioned as key figures in developing the human capital necessary for the goal of economic growth. A major focus for the OECD and others, therefore, has been “teacher quality.” Children will not develop as desirable human capital unless they have been educated effectively, and that requires a high-performing teacher workforce. Human Capital Theory does also position education as both an individual and a public good. The theory holds that the returns on education investment are both personal and social. The individual is rewarded financially, and the economy as a whole is boosted by individuals with advanced human capital. The education system and its quality becomes an extremely important focus for State investment, whether that is public money or in some partnership with private finance.

Human Capital Theory and Economic Debate

Beyond education, however, there is a long-established debate within economics which addresses a whole range of contested issues around Human Capital Theory and its variants. One is that without a preexisting successful economy, it is not obvious that human capital development has positive national economic impacts. A weak economy typically sees the flight of human capital to more rewarding economies and so local investment in education may have no local return whatsoever. Well-qualified young people emerging into a weak economy will not find the expected rewards which HCT would promise; instead, it may only be through migration to stronger economies that such people will find financial gain. In times of severe economic downturn, the best that educational qualifications may provide is the chance of securing any job rather than growth-enhancing employment. They serve as a security net against the worst which an economic crisis may threaten. Overall, it may be not so much that educational qualifications derive benefit but that lack of qualifications derives loss.

Critics also question the simplicity of the model of education-economy causality which some HCT theorists offer. Schultz himself (1971) has sought to clarify that because of the “long gestation period” between educational investment and economic return, it was “absurd” to think that sudden crises in relation to inflation or deflation could be tackled by turning on and off the education tap. Nevertheless, this pared-down model persists particularly in political discourse.

A further economic argument centers around the idea that educational qualifications do not themselves endow the individual with relevant human capital but that they merely act as a “signal” to employers. Indeed, it is now recognized that while educational qualifications may signal evidence of human capital, they say nothing explicitly about work ethic, for example. Thus, later conceptions of human capital have broadened out to encapsulate issues around attitude and other attributes (Becker 2002), which are also seen as key factors.

There is also a rich seam of criticism directed at Human Capital Theory from a Marxist perspective, which typically argues against the absence of the notion of social class within the theory, the failure to recognize value and surplus value within the Human Capital Theory model, the elision of the labor/labor-power distinction, and the failure to recognize labor relations within the workplace nexus.

The view that economic woes can be tackled through the refocusing of the education system leads to a number of challenges for the education sector. In austere times, reduced resources will tend to be concentrated in areas seen as most closely linked to the economy. This can be seen most starkly in relation to higher and further education where considerable pressure has been exerted on the arts, humanities, and social sciences. Such disciplines which have no simple correlation to economic activity or growth become viewed as an expensive indulgence, and their continued existence becomes dependent on attempts to demonstrate their economic importance rather than on the promotion of any fuller conception of education.

In the schools sector, pressure on the curriculum tends to be more in relation to its focus as opposed to structure. The emphasis shifts from knowledge and disciplinary depth to transferable skills, and especially those seen as conducive to market profitability. As pressure to reduce costs in the private sector grows, industry increasingly looks to shift the costs of training to the education sector itself. A key focus becomes the quality of school leavers and college and university graduates in relation to employability. When allied to the view that national economies need to compete in a global knowledge economy, it is easy to see how the demands to increase the quality of employability in young people become increasingly critical. There is a clear risk of narrowing the curriculum to “skills for work,” and the concept of personal growth, or of development as “whole” individuals, is lost.

Schultz (1967) pointed out decades ago that the poor and disadvantaged represented the “best unexhausted investment opportunities” compared to the rich and the middle class. In other words, the State had failed to exploit their potential

sufficiently, and, given their lowly status, the opportunity for high returns was considerable. However, the public investment required to counteract systemic inequality has proved to be much higher than the willingness of politicians to act, and the result has been that very little has been done to address this aspect of Human Capital Theory. Because it has been fused with rational choice theory, the focus in Human Capital Theory since has been on individuals and equality of opportunity rather than on equalizing starting points through socioeconomic adjustment. In times of economic difficulties, governments will cut back even more on the sort of additional support required for less advantaged communities and individuals to improve their educational and vocational prospects. Crude credit balance approaches may override issues around equity, fairness, and access, and it is not surprising to see funding challenges around inclusion, special education, and related issues. Here, the human capital/investment approach can be seen to clash with a children's rights approach. Education for all, when founded on rights, is in a much more secure position when compared to one merely conditional on notional investment returns. Because Human Capital Theory views those experiencing socioeconomic disadvantage, or those with learning difficulties, as wasted investment opportunities rather than in terms of justice, equality, or morality, then only a very obvious financial return can justify the costs incurred in the educational provision for such groups. This would seem to leave the theory in a very questionable ethical place. Many young people, because of the physical or cognitive difficulties they face, will never be able to generate for themselves or for the economy, the sort of financial returns expected of HCT, far less to "repay" the costs of their care and education. It is this cold calculation bereft of compassion or empathy that renders HCT repugnant to many.

Conclusion

Despite these reservations – economic, political, and moral – Human Capital Theory remains

central to current global economic policy. At national and supranational levels, it remains the dominant discourse. It offers a simple model for politicians and governments to understand and a manageable way of seeking to boost economic growth. As such, it affords a prominent place to education, but it positions education in a subordinate, instrumental role which many find narrow, dispiriting, and inadequate.

Introduction

Humanity is facing at present a deep transformation in every domain of human life: politics, economics, social relationships, religious beliefs, etc. If we accept Castells's approach (Castells 1997), the core of this transformation is the process of globalization dominated by the web and the flows of information. Both web and flows are characterized by flexibility, so that they can adapt very fast at any change in the environment, and mobility, because they keep changing all the time. There is not any specific center of the web, only nodes that also can change, grow, and disappear.

Societies are connected through rapid, large-scale networks on interaction, modifying daily our notions of time and space. However, as long as these globalization processes are dominated by neoliberal conception of society, it is economics that is the mainstream of every policy implemented by governments and all social institutions; and only those policies that yield an increase in money benefits are the good ones, not to say that they are the only possible policies. Free market is accepted as the only point of reference and as the yardstick everybody uses to assess the achievements of social life: the more free

market we have, the best for all and for everything. One of the worst consequences of this reductive approach (economics, free market, and managerial manners) is that instead of globalization offering a more inclusive and solitary relationship between nations and cultures, it has fostered exclusion and has broadened and deepened the gap between the wealthy and the poor. Poverty (cultural, social, or economic) is at present a worse problem than it was 30 years ago when the process of globalization just started its new and accelerated pace.

This pessimistic conclusion is in tune with Lyotard's earlier analysis of the postmodern condition (Lyotard 1984). Some tendencies Lyotard identifies in advanced technological societies have not faded away; even more, they are at present more deeply rooted in social life than in 1979, when Lyotard published his critical description. I want – just for the purposes of this entry – to mention only two characteristics: first, performance and effectiveness have displaced justification as criterion of personal and social behavior, and knowledge, as any other thing, has been commercialized to the point of becoming one of the main commodities in economic markets; second, people have difficulties in accepting a vision of humanity as a whole (“metanarratives”), and they have the tendency to take into account only individualistic conceptions of human action where everybody upholds their parochial and limited point of view. The impressive growth of non-governmental organization in the last years can be understood as a good example of this narrow-minded approach to the problems of humankind: people feel more comfortable cooperating in small organizations that focus on very specific and concrete goals. At the same time, private, charitable, and nonprofit organizations replace the more systemic and inclusive project of the welfare State.

So, what we have got in the course of these last two decades is a big global market where everybody and everything is transformed in a potential commodity ready to be sold or bought in the market or listed in the stock exchange that, thanks to the web, is open 24 hours a day for buyers all around the world longing for making money as fast as possible. The growing rate of immigrant

workers, living and working in subhuman conditions, the increase in women trade and white slavery, or the augmentation of exploitation of children in too many countries is just the ugliest and more terrible consequence of those tendencies. At the same time, what we are missing is some common values that, as Arendt used to say, allow us to build a civil democratic community, in such a way that we can solve conflicts without resorting to raw force and live together keeping the balance between our individual or national identities and the required universal identity.

In the Vienna Conference, summer of 1993 (United Nations 1993), after a long period of discussions and with the opposition of some countries, a declaration was signed – as you know, in the UN language, declarations are no more than a set of moral principles, without juridical or legal implications, that offer all of us a moral goal; in that document human rights were labeled in a very explicit way as universal values: “All human rights are universal, indivisible and interdependent and interrelated. The international community must treat human rights globally in a fair and equal manner, on the same footing, and with the same emphasis. While the significance of national and regional particularities and various historical, cultural and religious backgrounds must be borne in mind, it is the duty of States, regardless of their political, economic and cultural systems, to promote and protect all human rights and fundamental freedoms.” This universality has a double meaning. On the one hand, human rights were a conquest or achievement out of the contributions from many cultures, many countries, and many people along the history of humankind; they were not a Western-biased invention or ideology, even if we have to accept the outstanding contribution of Western civilization, mainly from 1770 onward, to transform human rights in legal precepts binding governments and also individuals. On the other hand, human rights are a minimal (although also very high or maximal) moral standard that has to be respected and enforced in every country all around the world: not any single country can reject or violate any specific right on the grounds of their specific cultural characteristics or their special social and economic conditions.

Human rights are a necessary condition for human life, and they are universal, that is, they are valid for every human being whatever she/he may be: woman or man, African or European, child or adult, Muslim or Catholic, or illegal immigrant or native citizen.

So, human rights should be considered the common set of values we are looking for, and they are those values on which the global world has to be built. Any of us can become citizens of the world not because we can travel quickly and easily from one country to another, not because we can communicate with everybody else in the world using the enormous facilities that offer us the new technology of communication, and not in the least because we can buy a Kodak film, wear Nike sneakers, or eat a McDonald’s Big Burger or Chinese food in any county in the world. We are citizens of the world insofar as we actually are entitled to a set of rights that any government and its representatives (civil service, police, army, etc.) have to respect and protect, regardless of the country where I was born, the nationality written on my passport, or even the fact that I do not have any passport at all. World citizenship and holding human rights is almost one and the same thing; if we split the one from the other, we can get a banal cosmopolitanism, like another commodity in this consumerist society, instead of a reflective one that involves true and solidary respect for others (Delanty 2009).

There is, of course, a deep gap between reality (the domain of *be*: how human rights are respected at present) and ideality (the domain of *ought*: how they should be respected). This is a serious problem I cannot discuss in this entry, important as it is. There are also governments and some people, even philosophers, that do not recognize the universality of human rights and, at best, consider all the discussion about those rights as empty rhetoric, ideology, or wishful thinking; once again, I cannot discuss this criticism in this entry, criticism I have cope with in other papers and books (García Moriyón 1998). I just take for granted, or I assume, that human rights are the moral values we need to help children and all of us to become moral citizens of the world and of our own country, nation, or community. They can help us to

resolve and adequately define some of the complex issues which modern societies have to face, as it is illustrated by the challenging work of many activists of human rights that know how to adapt those universalistic values to particular context, specific cultures, and societies. Even so, the problem we have to face and I want to tackle in this entry is how can we, as teachers, and the school system, teach human rights. There are, luckily, some good contributions to the teaching of human rights that I assume and can be considered as the underpinning of my own reflection (UNESCO 1995a, 1998).

The Content and the Process

To begin with, human rights is not a topic or a subject we can approach in our teaching in the same way we approach mathematics, grammar, spelling, history, or natural sciences. There is no doubt that human rights involve some specific content, some data, and information students need to know if they want to become familiar with all the questions and problems related with this domain. We can think, for example, in the history of human rights, a question people have a tendency to ignore, just considering that the rights they are entitled to have been a part of the social life of their community for hundreds of years; they have also a biased understanding of the implementation of human rights, and they used to think that the violation of basic rights is something that never happens in their own country; they are only violated in dictatorships or impoverished countries. In this narrow and specific sense, human rights education (HRE) is a discipline as any other else in the school's curricula. The real difference becomes obvious as soon as we address the process dimension of teaching, the "know-how" dimension.

According to the point of view of almost every scholar and practitioner in teaching, you cannot teach any topic without paying attention to the "due process" imbedded in that topic. If we want children to learn mathematics, they also have to learn how to "do" mathematics: learning mathematics (language, history, or philosophy) goes

together with doing mathematics (language, history, or philosophy). Although it is possible to talk about general high-order thinking skills, needed in each and every one subject matter, every discipline has its own skills, and if you do not foster those skills, you only get rote learning. It is this "doing," necessary for teaching and learning, that makes a real difference between other disciplines and human rights: "doing" human rights is a very complex and demanding task, as much for teachers than for students. It calls for the involvement and commitment of the person as a whole, in such a way that they can become politically aware and responsible individuals and ready to engage in political and social action. HRE is closer to moral education and has to cope with problems very similar to those moral educators try to solve (Brabeck and Rogers 2000).

One of the most challenging, and more distinctive, features of human rights is that they are not legal or moral prerogatives that authorities (political, economic, educational, or whatsoever authority you can think of) bestow, concede, or give to people. A bestowed right is not a real right. They have rights only people who are able to defend or conquer their rights, to oblige authorities to the recognition, protection and respect of those rights that they are always ready to forget or violate; even more, they have rights only as long as they keep struggling for their rights, as part of a broader struggle for recognition (Honneth 1995). This is not an individualistic approach: the struggle for basic and fundamental rights has been always a cooperative and collective action where mutual aid plays a crucial role; at the same time, our rights come together with our duties in behalf of other people and of society as a whole. However, the personal commitment is an obligation any of us cannot evade. It might be the case that we need help to get our rights respected and fulfilled, sometimes because we are in extreme circumstances, as people suffering torture under dictatorships, and sometimes because certain individuals or groups cannot have power enough to defend themselves, as children, terminally ill people, or quadriplegic. However in all these cases, the help cannot go on longer than strictly needed, and the goal of the given aid is to have them back

as full moral agents, empowered citizens ready to defend their rights.

Then, the aim of HRE is to empower students, that is, to give them all they need to develop or grow as active participants in their lives and as citizens able to discover their rights, to develop new rights that at present are only tentative or confused ones, and to get from authorities the recognition and respect of those rights. It, according to Biesta's proposal, fosters the process of subjectification, together with the process of socialization (Biesta 2013). Children need, first, to develop high-order thinking skills, critical and creative, so that they can look carefully at themselves and the world around them and analyze, criticize, and make good judgments based on sound criteria and tested evidence, proposing then new alternatives to solve the problems they encounter in their activities. These cognitive dimensions are fostered as long as students have the opportunity of discussing all the questions related with human rights in the classroom, in an open, rigorous, and cooperative dialogue with their classmates and the teachers as facilitator of the discussion. The relationship between education, thinking skills, and democracy was strongly emphasized by Dewey and more recently has been the main contribution from Freire, who stressed the need of literacy to empower poor people in a democracy, and Lipman, who claimed for the presence of philosophy in the compulsory curriculum to cultivate thinking skills in the classroom, transformed in a community of inquiry committed to democracy (Lipman 1991).

In the second place, students also need to develop some specific affective dimensions that are the cornerstone of the ability of human beings in the pursuit of their own projects, human rights included. Some scholars at present prefer to talk about character education (Lickona 1992; Rest 1999), and I would agree partly with them, at least in the sense that the kind of moral citizen I am looking for in this entry needs to have a good and strong character, that is, the combination of a set of moral habits (virtues): as a consequence of the practice at school, they incorporate those competences or skills as habits of behavior. We should understand this character not as a well-defined

and stable personal identity, but as a cluster of characteristics in some homeostatic relationship to one another. It involves – and what follows is not an exhaustive enumeration of personal characteristics – an accurate self-knowledge, coupled with self-confidence, that is, being conscious of our own limitations and possibilities, our strengths, and our weaknesses and then trying to braid with all of them a solid and balanced personality but at the same time flexible enough as to adapt itself to mutable circumstances. It also entails courage, strength, or the self, a cornerstone in moral behavior that can be found in many philosophers from Plato (courage) to Maquiavelo (virtu), Spinoza (conatus), or Nietzsche (will of power); courage is a quality that enables children to face difficulty and danger without fear and to act in accordance with their own beliefs, in spite of criticism and pressure from peers and other people. It is deeply related with the challenging characteristic of human rights I just mentioned before.

Another very important bunch of personal dimensions basic for human rights education are those named as social abilities or social personality. Empathy is the ability of climbing out of our own skin and into another's; people need to develop the capacity of taking different perspectives, looking at the situation from the point of view of other people, and trying to share the feelings they have. And they must be capable of empathy not just toward their close relatives or friends but also toward people they meet for the first time, mainly people who are suffering from violence caused by other people or by themselves, or toward those who live far away from them. Other social abilities are openness, as being receptive to new ideas and different viewpoints and attitudes; tolerance, that is much more than the capacity of enduring and goes to interest and concern, to a positive attitude, for ideas, opinions, and practices that differ from one's own, that is to say, a tendency to consider that difference and variety are a social and personal richness (UNESCO 1995b); cordiality, as the readiness to caring for other people's well-being and to being concerned for their suffering; and, last but not least, solidarity and a cooperative disposition.

All these social attitudes are fundamental for the implementation of human rights. I agree with those who admit that human rights are always aimed at personal (individual) rights and that, then, it is meaningless to talk about the rights of a community, ethnic group, or nation, except in those cases where just the fact of belonging to a specific group (gypsies, women, children, etc.) is a handicap in the exercise of your rights or, even worse, is the reason your rights are violated (López Calera 2000). Notwithstanding in these situations we struggle for the rights of every single individual in the group, such that it is expressed in the first article of the Universal Declaration of Human Rights. In any case, even if we talk about personal rights, they are only meaningful in a society where everybody else is entitled to the same rights as us. This social dimension of human rights has two different sides. First, rights are always a social question because you have rights as a member of a community or country where your rights are recognized and respected, and the whole social life is organized according to those rights, and that is the reason why struggling for your personal rights involves always social changes that affect all the members of the group. Second, your rights are meaningful only if they are recognized by people who have the same rights as you; your rights do not finish where the rights of other people start, but just the opposite; your rights and theirs go together in a close and deep binding. Third, rights involve duties in a “vicious” circle in such a way that you can never say what is first; as expressed in Article 28 of the Universal Declaration:

Everyone has duties to the community in which alone the free and full development of his personality is possible.

Two very important things are needed in order to foster these cognitive and affective dimensions or attitudes in our students – and in ourselves as teachers. First, we have to offer them the opportunity of acting as moral autonomous agents in every activity across their school life. Unfortunately, in the current school system, that active implication of students is not very frequent; the school system focuses its attention mainly on

handing down to children the values and knowledge society thinks worth transmitting, and this asks of children an active participation in the process of learning in order to understand and assimilate all that stuff, but nothing else. Teachers and principals, education administrators, and society as a whole think that children and teenagers are not qualified to participate in the design and implementation of school policies. That is such an important topic that I will develop it at length in a section below.

On the other hand, just as in moral education, in HRE children learn much more from what we do than from what we say. Children do not like at all to be moralized at any place and any time, and from the point of view of moral education, all that moral talk with children and young people is useless. They listen carefully, even if they feel bored to death while we are lecturing them, but do not pay real attention to what we are saying to them: all our lecture goes in one ear and comes out the other. Even more, they can agree with the principles of human rights, but that is not more than repeating the official and accepted moral discourse. As far as their behavior is concerned, modeling is a more appropriate approach to HRE (Bandura 1986): children will develop behavioral patterns similar to those of adults they are living with. A necessary condition for them to internalize human rights and to have them as moral standards of their behaviors is that they discover that we, teachers and adults in general, follow those moral standards in our everyday life. Let’s explore this a little deeper.

Deconstructing the Curricula

As I emphasized in the introduction, human rights are a set of values that everybody, all around the world, accepts as the moral standard they use to evaluate social, political, and economic activities. They are also proposed as guidelines for legal system in such a way that they become promulgated as laws or inform the current legislation of every country; the final step of a universal declaration is to be converted into a convention that, after signed by a number of countries, is binding

on everybody and every country. It does not follow that they are actually embodied in social and personal behavior or in the proceedings or performances of public and private institutions. Most of the time, the promises in the introduction to the Universal Declaration fail to materialize, and the violation of basic rights is the rule everywhere. All of us have the feeling that people – especially those who hold public office or a position of power in society – just pay lip service to human rights and use them as a tool to the pursuit of goals very far from those involved in the ideals of the 1948 Declaration. That is the standard practice in foreign policy all around the world; a perfect example is those countries that use human rights to justify wars and totally forget any right as long as it is a question of making business wealthy and powerful nations. Annual reports from independent institutions, such as Human Rights Watch or Amnesty International, show us an ugly scene for human rights implementation.

However, this contradiction between the values people say to respect and honor and the moral standard they do keep up throughout their life is not only a problem for all those people in positions of power. It is a contradiction that pervades and penetrates every social institution and almost every human person, even those who abide by specific educational responsibilities. We are supposed to follow the principles and directions from the Convention on the Rights of the Child, and that is what we sustain and teach to our students, but with shocking regularity we do not put all those children's rights into practice. Sometimes we skip those rights on account of some harmless oversight; once in a while we think that those rights are not important enough and they have to be put aside in behalf of children's education (I should say "children's training"); even worse, there are many adults who actually think that children do not have as many rights as those included in the convention.

For students themselves it is as if we, adults, would say to them "Do as you are told to do, but not as we do"; they realize that we are asking them to conduct themselves responsibly and to keep up some moral values that we ourselves do not have and do not keep. The most probable consequence is

that they will do just as we do and will pay more or less the same limited attention to human rights as us. They will learn that this moral inconsistency is the normal way of doing, something you can live with without any special annoyance for your emotional equilibrium. More than that, as they have developed at school a wide repertory of thinking skills, they will use them – just as we do – to justify almost every behavior, even those that at first sight are against the main values of human rights.

This distinction between the hidden and the open curricula imposes on us a reflection about what is actually being taught to students in the school system. It is not a question of wonderful public declarations or any other kind of wishful thinking. This is determined by educational policies adopted by the government, and it rests on the implementation of these policies at school by teachers, principals, janitors, trainers, and all those who work with children at formal education. As Apple (1993) said, "the politics of official knowledge are the politics of accords or compromises"; different groups and social movements in society struggle to protect their own interests and to make them legitimate and also to increase their own share of power. At the present time, when the neoliberal political agenda has been imposed on all social life without a very strong critical opposition, the concerns of the less powerful are not really taken into account. Managerialism and business are the models for education; all of us are told that it is needed to bring school and the business sector close together and develop educational models of training where professionalization, entrepreneurship, competitiveness, and social cohesion play an essential role, although the two first goals (employment and competitiveness) get the best of the education and competitiveness, as expected, reinforces social exclusion (Brandsma 2000). The school system is at risk of becoming not the place to empower children, but the place to reinforce the position of those who are in control and to teach children how to be obedient citizens that accept with resignation an official curriculum that legitimates personal submission and exclusion.

Even more complicated is that teachers and students are not equal parts in the educational

relationship. Students attend compulsory school, that is, they are obliged to go there in order to receive the education adult people have decided is good for them to receive; teachers are supposed to have the knowledge and they are paid for handing down all that stuff to children. From the very beginning in kindergarten or primary school, children perceive that they are subjected to social and moral pressure to take their education seriously and to learn all that is taught to them, even when they are unwilling to do so, and that is a frequent attitude after they are 10 years old. Teachers, principals, parents, and every adult person used to say to children that they know better than children themselves what is good for them to do; so, if children want to become good persons and good citizens, they have to accept and follow adults' advice and directions, even if they do not understand very well what are the terrific advantages they will get in a distant future, thanks to their present complete obedience.

As a consequence of all this constant pressure on children, although we are in favor of autonomous thinking, freedom of speech, and creativity as basic ingredients of personal development and democratic societies, we do foster, much more than it would be needed, dependent thinking, acquiescence, conformity, obedience, and a critical acceptance of authority. In the 1920s, Piaget gave a theoretical support to this educational approach when he described children behavior before 12 as heteronomous, and he, as much as Aristotle more than 2000 years before, postponed autonomous and rational thinking till they were 12 years old. Piaget's own intention was to help children to become autonomous and cooperative persons; as a matter of fact, one of his main theses was that children developed a moral sense of their behavior guided by justice as soon as they had contact with their peers, people of their own age; however, in a certain way, he favored just the opposite: to undermine, even ignore, the capabilities that children have from the very beginning of their lives (Gopnik 2009). In the last decades, an important number of studies by psychologists and moral educators have offered us sufficient data to consider that children's heteronomous thinking is more an imposition by adults than a basic

characteristic of a specific stage of children's development. If you treat children as dependent and heteronomous people, they might grow as dependent and submissive. That might be the reason why Dewey, also in the 1920s of the past century, emphasized that the relationship between education and democracy – and, in our case, human rights – is not something we must take for granted.

Had we taken seriously the teaching of human rights at school, we would have undertaken also seriously this deconstruction of teaching and the official curriculum. We had discovered with Basil Bernstein, (2000) that compulsory education does not offer equal opportunities to everybody, owing to the fact that curricula are biased and favor those students whose cultural and social background fits with the standards teachers use to evaluate and assess children's processes of learning. There is an effective discrimination against children who do not speak the language of middle and upper social classes. We had also discovered how girls and boys internalize gender discrimination, because the school reproduces the sexist conditions that are at work in society, no matter how much we insist our devotion to gender equality. And just to give a third example, we had realized that we keep all the time singing praises of cooperation and mutual aid, but our students are assessed and graded by their individual performance, and most of the time we actually foster competitiveness and indoctrinate them into the basic social myths of neoliberal societies.

All these cases, and many more that we would be able to cite, show us that the patient work of deconstruction is a cornerstone of human rights education. That is a necessary step for teachers to wake up to the fact that they are not so committed to human rights as expected and that they are modeling a very different behavior. It does not matter that usually they are not conscious or voluntary supporters of those values that contradict human rights. Be that the case, it does not diminish the fact that those of us who are teachers need to be held accountable for what we do with our students in the schools we are working at. Our own educational practices are flawed as a consequence of living in a society where we are caught

in multiple and sometimes contradictory social relations whose hidden rules we accept. More often than expected, we follow those social conventions just because we want to play the social game, and, in order to do that, we accept its rules; we do not want to be excluded from the game since that would be in any respect the worst of all possible situations. At other times we act as if it is socially expected from us, accepting traditional social norms without thinking carefully about their moral value. We are technical workers that restrict the profession to follow the regulations and conventions that are given to us by educational officials, mass media, and other social institutions. We are not critical and creative professionals that reflect on the ends and means of our educational practice; however, if we do want to take human rights education seriously, we have to develop an autonomous, critical, and creative behavior, and that involves a constant critical reflection on our own practice and on the “hidden side” of the educational system.

The Democratic School

As I just mentioned earlier, it is of course important to include in the compulsory curriculum a specific time in the school schedule devoted to the topic of human rights, in the same way that there is a place for mathematics or language. The actual curriculum of the compulsory school is the result of a social negotiation and a social choice aimed to decide which topics or disciplines are important or valuable enough as to be covered in the schedule. If there is not any specific time when students and teachers work seriously on human rights, we can give little credit to the declared interest in human rights from the part of those who are in the position of making decisions about educational policies. Of course, children can learn basic social values in their everyday life, at school or home, with friends or adults, and they learn their mother language in this way. However, this would be a faulty and superficial learning because they will lack the critical skills needed to get a sound and creative mastery of those topics.

So children should have time to think and talk about human rights. They need, first, to have a better understanding of the history of human rights to discover that many of the rights they are entitled to or they take for granted, as attending school or having medical care, are social conquests that were obtained thanks to the fights of many people, and they can disappear from social and political life as soon as people stop urging them. As a matter of fact, that is the case at present, when under the pressure of neoliberal forces, led by multinationals, the World Bank and International Monetary Fund, the welfare State is being dismantled especially after the great crisis of 2007. The impact of rising inequality is damaging one of the most important goals of public education – the ability of compulsory schooling to offer children an equal chance at academic and economic success (Duncan and Murnane 2011). They also have to ascertain that in today’s world, not everybody enjoys the same human rights, even those more basic and fundamental; they might not know that there are countries where some or many specific rights are systematically violated by the same authorities that are supposed to protect those rights. They should be familiar with reports such as those published by private or public organizations (Amnesty International, Worldwatch Institute, United Nations Development Programme, United Nations Population, or UNICEF, just to mention only a few) and with the new 2030 Agenda for Sustainable Development, which includes a set of 17 goals (<http://www.undp.org/content/undp/en/home/presscenter/pressreleases/2015/09/24/undp-welcomes-adoption-of-sustainable-development-goals-by-world-leaders.html>) to end poverty, fight inequality and injustice, and tackle climate change by 2030. It would also be very helpful for children to discover that there are many people and institutions all over the world that keep struggling for human rights, sometimes putting their own lives at serious risk. Many times, moral educators and people who work on human rights have the tendency to focus on the violations of basic rights, offering students an approach that makes them feel downhearted and hopeless; it is much more fruitful to emphasize the active social

role of all those institutions, groups, and individual people who struggle in favor of human rights. Children learn that some do care; according to this pedagogical approach, violations are kept in the background, and civic movements deeply engaged in social transformation are in the foreground.

Important as it is in all this discussion, during the regular timetable and on the same or similar terms with other subject matters, we need to take a step forward and to get the whole school pervaded by human rights, not only as a theoretical topic but also as a practical matter, as the cornerstone or the backbone of the school life. Therefore, human rights should be the guiding criteria of the school as an institution, where many people, children and adults, boys and girls, live together and have to establish and follow the rules of their peaceful and fertile coexistence. Children need to be given the opportunity of participating as responsible moral agents in the elaboration and implementation of school policy. Principals, teachers, and all those who are in charge of the education of children tend to think that they cannot participate in the organization of their own education, because they lack the needed skills and knowledge to carry on with those responsibilities, but this is an unjustified prejudice. First, they underestimate children's ability to manage all those problems that are related with their familiar environment (home, school, playground, etc.) and with the social relationships they are used to (parents and siblings, classmates and teachers, friends, etc.); however, if we offer them the opportunity of using their cognitive and affective skills, we realize that they can face successfully their own responsibilities, as the International Democratic Education Network proves (Waghid 2014) (<http://www.idenetwork.org/>) proves.

In the second place, they also tend to undervalue children's reasonableness when their interests and motivations are concerned, and they assume that adults know better than children what is good for them; once again it is a misconception of children's minds and abilities. They have problems – as much as adults have – to keep a balance between personal and social interests and between the present

satisfaction of their needs and the future demands that sometimes oblige us to defer that satisfaction. They can also tell moral rules from conventional or social ones, and they know that it is possible, although not always easy, to change the second kind of rules, whereas moral rules should be respected in a deeper sense: you can modify social and conventional rules after negotiating with all those affected – and sometimes without any negotiation, just using a power position that allows some people to impose their own decision; however, you are abided by moral rules, even in those cases when the pursuance of your duty has adverse effects for you. And all this moral stuff is not something children are not familiar with or they cannot grasp. They can perceive the moral dimensions of many events of their everyday life, events that require them to make moral judgments and to act in a way that can be consistent with their own principles and judgments. They only need to grow in their capability to analyze situations of rising complexity and to find the best solutions for any specific moral problem (Hoffman 2000).

In the third place, as much as moral and political stuff (and that is what is involved in school policy) are concerned, it seems that we forget a golden rule of education: if you want somebody to learn something, give them the opportunity of putting it into practice. People learn to swim in the swimming pool, so children learn citizenship (and human rights involved in civic virtues) participating in assemblies in their schools, where they set the agenda of the topics, then expose aloud in a reasoned form their own view on these controversial questions, and listen carefully to the arguments of his/her classmates and teachers. Eventually, if needed, they make a decision, usually voting the different specific proposals and they are committed to the implementation of their resolution that will be analyzed in a next meeting. As Dewey made it very clear in his deep and sound philosophy of education, democracy is much more than a form of government, we would be able to explain children through lecturing in history or social sciences classes. A democracy is “primarily a mode of associated living, of conjoint communicated experience” (Dewey 1966). Living together in

the school, children participate in a common interest so that each one has to refer his/her own action to that of his/her classmates and to think on the interest of others as something that can give point and direction to his/her own. The biggest the varied points of view and contact, the strongest the feeling of richness and complementarity. In a safe environment of trust and mutual aid, as a democratic school is supposed to be, children internalize slowly but deeply the basic values of democracy, and they realize how worthy and precious they are.

In such a way they are not just passive subjects of the educational policies of their country and school, but active participants in its elaboration and implementation. They will grow as active moral citizens because they, after practicing as active school citizens from the very beginning at their educational process, get the habits and skills needed for citizenship. And they will internalize human rights because they will discover that those rights are the basic conditions that all of us have to respect if we want to solve social problems in cooperation with other people who have different (sometimes contradictory) interests and points of view. Notwithstanding all that involves deep changes in the present way of ruling the school system. The most habitual and widespread practices in the educational system are very hierarchical: officials from the Ministry of Education plan the big lines of educational policies, following in democratic societies the laws enacted by the parliament. Local educational officials adapt those lines to their own specific community. Principals have the responsibility of guaranteeing the right implementation in their school of those educational policies, although they have to adapt them to their specific school. Teachers themselves are the last link in this well-defined chain of command. Their job is reduced to the technical adaptation of educational directions to their students. Of course, students attend the school just to learn, but that learning is many times reduced to listening, memorizing, and obeying. As a consequence of this model, after 12 years attending the schools, children will become good citizens, but in the sense of citizens that respect authority, obey the laws, and never question seriously the orders of

those who hold the top positions in every domain of social life: politics, business, or family.

If we want good citizens, in the sense of persons who can think for themselves, cooperate in the discussion about the ends of society, and live as moral and political agents committed to the principles of justice and the values of human rights, we should put the school upside down. We should, first, transform the classroom into a community of inquiry where everybody has an active role in the process of learning and teaching, a very interesting idea elaborated by Lipman (1991). Students discover that they have their own learning agenda and their own interests than can be accepted as the starting point of their process of education. Teachers stop lecturing and start seeing themselves much more as experienced people who are responsible for the education of their students, and that involves facilitating personal and communitarian development; of them; they find out at the same time that they are also persons who have to learn from their students and whose social role goes further than just looking after technical procedures. In such a way, students and teachers become those active citizens democratic societies are longing for, and they transform the fundamental values of freedom, equality, and fraternity in well-rooted habits of heart.

It is not enough just to transform the class; we have to transform the school itself into a democratic school, pervaded by the principles of mutual respect and mutual aid, where everybody, students, teachers, and workers, is equal and has the same rights. In order to build the school as an institution that models for children and adults what it means to live in a small society guided by human rights, we have to implement an active action to guarantee that those rights are actually respected. We should offer students, from the very beginning of their school life, the opportunity of playing a major role in their own education. This demands two main lines of action; the first one is to create the characteristic institutions and procedures of a democracy: student meetings to discuss openly about the school policies and problems, elections of representatives that will have to account for their behavior as representatives to their schoolmates, and school boards and

commissions where the decisions are made and where there is an appropriate balance between adults and students in such a way that student contributions actually make a difference. There is a long tradition of this style of democratic school that goes back to the anarchist educational practices since at the end of the nineteenth century (Autores Varios 1986) and has very good contemporary examples including the democratic schools in the USA (Apple and Beane 1997). The second line of action cares for the most appropriate moral climate of the school, which goes together with its democratic procedures. Everybody at school is supposed to be responsible of the moral atmosphere that is needed to guarantee that nobody suffers from discrimination or violence and that their opinions are respected and taken into account. Those moral questions come to the front page of the school agenda and are discussed openly, and the right steps are taken to remedy the misbehaviors and to implement the active policies of promotion and defense of human rights. This is the “just community” approach to moral learning developed from Kohlberg’s theory of moral development (Kohlberg et al. 1989).

The Scapegoat and the Forlorn Hope

Any time that society has to face all kinds of social problems and mainly those problems that might be related with morality and the behavior of young people, it is very common that people focus on education and school system and analyze attentively what is going on. If a couple of very young people, 12 years old, commit a violent crime, such as a murder, people tend to think that their behavior has a lot to do with their specific individual characteristics that have turned them into very dangerous people, but at the same time people think that family and school, parents, and teachers have some particular and definite responsibilities for that misbehavior. The feeling that schools and teachers are accountable to society for children’s and teenagers’ behavior grows as long as we have to cope with more common social disorders, such as vandalism, hooliganism, robbery, or just bad manners. The argument is very simple: as core

habits of human behavior are developed early in childhood, those who have to look after children – parents and teachers – have a specific responsibility if children do not get the “good habits” society expects of them. This responsibility is even bigger for teachers because they are supposed to master the appropriate pedagogical techniques in order to get children to internalize those habits; they are paid for that, and if they do not achieve their goal, they are accountable for their failure and they deserve all the criticism from society.

This argument is partly right, and teachers should be much more careful with questions related with moral education of children and also with human rights education. After playing with other children in the park or the playground, the school environment is the place where children start to meet other people in a systematic way, and discover the constraints and advantages of living together. It is the beginning of their social life that, since that moment, should be ruled by social justice. That is the main reason why teachers have to play a very important and active role in empowering children to develop a behavior guided by the respect of all the members of the community and by the consciousness of their own rights and duties. As I tried to state earlier, teachers, curriculum, and the school as an institution have to be committed to the promotion of human rights as the basic values that have to govern social and personal life. And we have to admit that more frequently than desired, they do not pay the needed attention to those questions; they do not attach much importance to human rights and moral values, obsessed as they are by the content dimension of their discipline. HRE is put aside, and it is left to the hidden curriculum that very often involves values against human rights, such as racism, sexism, intolerance, etc.

On the other hand, the arguments of those who launch an attack on teachers and schools are biased arguments, and they want to turn teachers into the scapegoat for a social failure that much more people are accountable for. It is true that human rights are at present that set of social values everybody is committed to, and they are supposed to guide the policies from government and any

other social institution, public or private; however, it is also true that the implementation of those policies is far from meeting those basic values that are the moral content of human rights. So they are modeling for children a social behavior that is only partly consistent with human rights; there is a certain loss of the civic virtues that hold together a society. People, obsessed with the dominant values of competitiveness and efficiency, try to keep all they have got, their standard of living; they just look after their own interest and they wash their hands of the whole public affair. Frightened by the risk of losing their social position and of falling in the black hole of social exclusion, they try to protect themselves in their homes and in their neighborhood, well guarded day and night by police officials and private security companies that offer their protection against any kind of threat and use any kind of security measures. At the same time, obsession for security is undermining fundamental values of democracy (Engelhardt and Greenwald 2014).

There is a serious risk of society falling to pieces, with the gap between the winners and the losers and the wealthy and the poor deepening more and more. At the same time, the social glue that keeps together all the members of society and helps them to share a common project tends to fade. The old liberal myth maintained that the institutions and principles of a society, its public life, might be virtuous, though the individuals composing it were vicious, and the rational choice of individual motivated by enlightened self-interest was sufficient – thanks to the hidden laws of free market – to give rise to the best possible society. Notwithstanding, they took for granted that private virtue and commitment to public welfare were basic ingredients of the social fabric, and they never gave up the ideal of citizenship that sustained the republican order. The good order and the welfare of society hinged on the people taking a public responsibility for each other, even without specific ties or familiarity. It follows that families and teachers should work shoulder to shoulder with many other informal educational settings; children have to learn public virtues and social habits from all those people they meet on the street, in the stores, and in the movie

theaters. It is a big mistake just to delegate civic obligations over to professional bureaucrats or over to formal agencies of law enforcement. If we want to help children to grow as moral agents, committed to human rights, we have to implement social policies that involve everybody in their neighborhoods. It is not fair to wash your hands of public life and then to criticize the professionals we pay to do the job we are abided by.

Teachers themselves are members of this ultra-liberal society that relieve individuals of most of their civic obligations and foster the increasing power of professionals of public welfare. At the same time, they have been taught in the actual values of this society, and they are impregnated by the discourse of competitiveness and self-interest in a worldwide free market. That means that they have some problems to help children to grow according to some values they partly disagree with. As Marx explained in his *Thesis on Feuerbach*, “The materialist doctrine concerning the changing of circumstances and upbringing forgets that circumstances are changed by men and that it is essential to educate the educator himself.” So, much more attention should be paid to the education of educators and to the involvement of the whole society in the challenge of teaching human rights to children and to young people.

There is another momentous difficulty in the path of HRE. Alasdair MacIntyre said some years ago that teachers are the forlorn hope of the culture of Western modernity, because they are entrusted with a mission that is both essential and impossible (Macintyre 1987). On the one hand, they have to shape the young person so that they can practice a specific profession or job and occupy a well-defined social role; this purpose involves legitimization of hierarchical social positions. On the other hand, it is a central purpose of education, and of teachers, to teach young people to think for themselves and to acquire independence of mind so that they, as enlightened people, can play an active role in the society as moral agents and committed citizens. As long as we focus on this second goal of education, it is possible for teachers to add human rights to their daily teaching; and that is the case in compulsory

education, where young people are introduced into the membership of those enlightened people who dare know and think for themselves. However, even in compulsory (and comprehensive) education, teachers tend to focus on the training young people need to become a professional, an expert, or a specialist, with narrowly defined social roles and narrowly delimited interests.

The problem teachers have is that they cannot put aside these contradictory goals of the educational institution. The increasing economic growth and the present globalization of the world market expand the need of specialized professionals, so society demands from schools a stronger involvement in the formation of those people who will occupy the top of the economic system. For most of the people, such a sophisticated education is not needed at all, as long as their jobs are only monotonous and mechanical, without entailing any specific high-order skill. Those persons have to face in their professional activities complex problems that require creative thinking, and they have to make decisions that will have a great impact on society as a whole. On the other end of the economic chain, workers only have to obey the orders and follow the directions they receive from their managers and supervisors; so, society expects of teachers that they will foster those people with the minimal thinking skills required to fulfill their small part in the chain of production or the assembly line and with the basic values of obedience and respect for authorities and superiors. The better the school achieves this goal of selecting people and legitimating the selection, the worse it can accomplish its other goals, to empower children so that they can think for themselves. And MacIntyre is right as he underlines that the gap between those two very different kinds of workers is becoming deeper in modern societies.

However, teachers are seriously committed to the second purpose of education, and they can never give up on the aim of building a community of people with the capacity of critical and creative thinking to dialogue about things that actually matter to those involved in the community. There are, however, three serious difficulties that we should overcome in order to build this

educated and enlightened community. The first one is strongly related with the economic growth and the professionalization and specialization it requires; every person is restricted to the limited area of his/her discipline or subject matter, but they have problems to grasp the whole picture of social and political economy, and they have lost the ability to reflect on the ultimate ends that society is pursuing. The second factor is size; according to the ideals of ancient Greek and modern enlightened political thinkers, such as Rousseau, a democratic society could only flourish as an independent small-scale community. As soon as societies involve millions of people living together in the same city and they are seriously affected by decisions taken thousands of miles away from their own social environment, it becomes extremely difficult to develop in them the feeling of active citizenship and participatory democracy. There is a third factor strongly related with the other two just mentioned. Enlightened thinking and reflection on the ends of society is becoming more and more an activity reserved for experts and specialized professionals, and critical and creative thinking has been confiscated as an occupational responsibility of those who are holding official positions in public agencies or private companies.

Taking all these problems into account, we should not follow MacIntyre too far in his criticism and his very pessimistic conclusion. Those are, of course, serious problems teachers have to cope with, and they have good reasons to feel overwhelmed by those social responsibilities they can hardly carry out. Although the present context offers a specific and very worrying configuration of education, these contradictory purposes can be traced back to Plato. His proposal was to guarantee every citizen with the basic sense of morality and justice, as he himself exposed in the myth of Prometheus and Epimetheus (*Protagoras* dialogue), and to offer those best gifted from birth the best and highest education so that they could occupy the top positions in the polis, the philosophers (*Republica*). Dewey follows this contradiction up to the modern times, but he keeps alive his confidence in the possibility of school contributing to the overcoming of the

contradiction between social classes that have contradictory interests and between national loyalty and the cosmopolitan ideal. But according to Dewey's approach, education, as a necessary social process, must attend to that which connects communities in such a way that the goal of education as a freeing of individual capacity be bound up with education as a progressive growth directed to social aims. This conception of education implies a particular social ideal that has to be defined and implemented not just by teachers and school, but by all the members of society and by political institutions.

A society which makes provision for participation for the good of all its members on equal terms and which secures flexible readjustment of its institutions through interaction of the different forms of associated life is democratic. Such a society must have a type of education which gives individuals a personal interest in social relationships and control and the habits of mind which secures social changes without introducing disorder (Dewey 1966).

The school is, then, a necessary institution in modern and complex democratic societies, and it is a cornerstone in the formation of the active citizens that society needs to achieve the ambitious goals it set itself for its future. School is a necessary condition, but it is not a sufficient condition; it only can contribute its specific share in the human rights education task as long as every other social institution contributes their own share in a common project. The gray clouds that darken the horizon of a society where people live together sharing common interests and acting in accordance with human rights as basic values have been always out there; however, there is not any other way out but working together – teachers, parents, and everybody else in society – to keep alive those values we think are worth struggling for (Garcia Moriyon 2011). Some educational experiences, such as those conducted by Freire in Brazil in the 1960s or the most recent ones, such as the Accelerate Schools Project (<http://www.tc.columbia.edu/accelerated/>) in the USA, or the School As 'Learning Communities' in Spain (<http://utopiadream.info/ca/>) just to mention some of the many examples we could bring

up, give us some hope and help us to think that teachers (and society) have to face serious problems, but they are not the forlorn hope of Western society.

The Good Citizen and the Good Person

Important as they are, human rights are not enough, even if we are focusing on the human rights education. Although there is a well-rooted myth in Western culture about the necessary and advisable separation between the private and the public life, so that many people think, following the old Mandeville's ideal, that private vices give rise to public virtues, this is not more than a prejudice and a narrow approach to social life. If we do want to have human rights values as basic values in social life, we have to pay attention to something more than just human rights.

To begin with, there is a handicap in all human rights declarations. At best, they are high moral standards that allow people and institutions to guide their behavior and that can be used as criteria to assess and judge those behaviors demanding a perfect compliance with those rights. Usually, human rights are no more than wishful thinking, a bunch of good desires to be achieved in a distant future, all the political, economic and social circumstances permitting. Worse, they are just ideology in its worst meaning such as it was defined by Marx and Engels. According to both thinkers, ideology is a system of false ideas, a statement of class position, and a justification for class rule and for an unequal and a hierarchical society. They tend to sustain a society based on human being's alienation and bondage and create a false consciousness in the oppressed social classes because ideology – in this case, human rights – makes them believe that they are living in a society where "all human beings are born free and equal in dignity and rights. They are endowed with reason and conscience and should act toward one another in a spirit of brotherhood," (Article 1) although in this society some people are actually much more equal than others. They are, therefore, weapons for oppression instead of weapons for freedom.

Even if I accept that Marxism despises too much human rights as a bourgeois ideology rejecting any positive values on those declarations, they do hit a raw nerve of social problems. That was the reason why in 1948 socialist countries did not sign the Universal Declaration and struggled for a new declaration where the formal rights were completed and enhanced: almost 20 years later, in 1966, a covenant on economic, social, and cultural rights was signed and entered into force in 1976. This covenant sustained that “the ideal of free human beings enjoying freedom from fear and want can only be achieved if conditions are created whereby everyone may enjoy his economic, social and cultural rights, as well as his civil and political rights.” That risk is still with us, and we have to care not to convert human rights into an empty and formal set of big words that in reality are used to conceal the actual social relationships from those who are suffering poverty, injustice, and social exclusion. In order to build a democratic society, human rights are necessary but not enough; they have to be accompanied by effective social and economic policies aimed to transform society into a just society. At present, this is a well-accepted ideal that directs the policies of international institutions, such as the UNDP: human rights and human development share a common vision and a common purpose – to secure, for every human being, freedom, well-being, and dignity.

As Paul Ricoeur used to say (Ricoeur 1990), moral life of human beings covers three different domains. In the first place, we have moral duties with ourselves, as individuals who are looking for meaning and happiness and who want to accomplish a project of personal development to live our lives to the full; this hard task is related to personal characteristics – or virtues – such as courage, self-knowledge, self-esteem, and moral consciousness, etc., a set of dimensions teachers have to foster in their students and in themselves. Second, we have moral duties with our relatives, close friends, and classmates, that is, with all those we share our everyday life with; in this wider area of social relationship, a different bunch of personal characteristics occupy the stage: friendship, shame, gratitude, forgiveness, empathy, caring,

etc. In the third place, we are members of a society, with its political, economic, social, and cultural institutions; it is in this area where the problem of justice and equality, solidarity, and impartiality comes up, and it is also a domain that demands from us specific moral duties that make possible social welfare and peaceful coexistence of many peoples with different personal projects and different approaches to social and political questions. It is the place for tolerance, empathy, open-mindedness, etc. These three moral domains with different problems and requirements overlap in many ways, and they are also present in distinct moments of our lives or in distinct social roles, and in other cases they come into conflict.

The point of Ricoeur’s way of looking at the problem is that human rights are relevant in the domain of social life, but they are values of minor significance especially in the case of close social relationships. The whole universal declaration of 1948 is, of course, fundamental to recover a basic value for the moral growing of the person; it clearly states the dignity of each and every one of all human beings, an essential element for personal self-esteem and courage, and also lays the foundations of personal well-being and happiness. However, it is almost silent over most of our personal identity and over our specific and distinctive project to develop a meaningful life. And it remains also silent over the second domain of our life, that of close social relationship. Human rights as a juridical body of principles to protect people against oppression was born in the move of modern revolutions, American and French, and it is too dependent on the liberal ideas that were built up in the seventeenth century; one of its goals at the very beginning was to guarantee that everyone in society could pursue his/her own personal project without being subjected to persecution by the government. A key concept that helped society to tolerate a wide array of personal conceptions of the good life and moral good was the scrupulous separation of the private and public life, and this was a big conquest we can neither put aside nor despise. However, contrary to this liberal conception of social and political life, it is impossible to have public virtues unless you foster private

virtues, and we must not push the separation too far. The way you live in your private life, with your family and close relatives and friends, and in your job and neighborhood is strongly related with the way you behave yourself as a citizen. If we want people to be committed to human rights values and if we want good citizens, we have to foster those personal moral habits that define a good person; and it works just the same the other way: if we want to have good moral persons, we have to offer them a good society, guided by the principles of freedom, equality, and brotherhood and sustained on public virtues.

One of the most fruitful discussions between moral and political thinkers for the last 30 years has been centered on the issue of the foundations and procedures of liberal democracies. Rawls began the discussion in 1971, in his book *A Theory of Justice*. Even if after years of discussion he has revised and modified some characteristics of his approach, accepting some ideas from his critics, he still is one of the best representatives of the liberal tradition that overemphasizes the formal dimension of political activities and consider freedom as the cornerstone of democracy. On the other hand, Robert Bellah and some other scholars attacked the roots of Rawls' proposal denouncing what the authors called "utilitarian individualism" – rampant competition and concern for the bottom line, income polarization, and contempt for the "losers"; their proposal was to focus our attention on forms of social organization, be it civil society, democratic communitarianism, or associative democracy, that can humanize the market and the administrative State: they insisted that citizens in democratic societies should go back to the affective warp of the social fabric, those habits of the heart banished to the private sphere of our lives in modern societies. Other scholars, such as Taylor, Walzer, or Sander, followed a similar path to recover the missed democratic strength and to recover the bonds that characterize any community (*Gemeinschaft*), ties that go further than those that define an association (*Gesellschaft*). A version of this controversy in the smaller area of moral education has been sustained between Kohlberg, close to Rawls' standpoint, and Gilligan, whose emphasis

on caring as the central virtue of social life and moral development is close to the communitarians, although her point of view is based on very different theoretical and practical grounds.

In a sense, the whole corpus of human rights declarations and covenants, strong evidence of this need of a moral approach to social life and politics, a project of surmounting a narrow way of elaborating and implementing social policies that at present are too technical, too much under the control of professionals and experts, and too far from the genuine welfare of human beings. According to Chantal Mouffe (1993), a good consequence of this controversy is the recovering of the republican tradition, that all along modernity has stressed the exigency of public virtues; it is not necessary to give up to the beneficial separation of the private and public spheres of human life, provided we cultivate and foster the public moral of the citizens. There is a place for plural conceptions of the moral good, and there is also a place for a shared political good; and both are so interrelated that if one of them vanishes in our society, the other one will vanish shortly afterward. The amazing propaganda apparatus of neoliberal heralds has tried for the last two decades to hide this simple evidence and to conceal with a shroud of silence this republican tradition that just in the American and French revolutions kept together equality, freedom, and brotherhood. That is the reason why as long as we want to offer our students a sound HRE, we have to help them to become good persons and good citizens.

Human Rights, Postcolonialism, and Education

Ali A. Abdi

University of British Columbia, Vancouver, BC, Canada

Introduction

It should be a complex task to connect the notion of human rights to postcolonialism both historically and in the present. To position education as both an enabler and explainer of human rights in the postcolonial raises further questions about how to understand these couplings. Indeed, there exists a Western bias in the construction and understanding of human rights, education, and even postcolonial discourses. Moreover, assumptions of fixed meanings often override the multiplicities of meaning, origin, and operationalization of the concepts. Thus, while the birth of human rights discourse is geographically multifarious, its historicization has been dominated by a Western imaginary and epistemology.

The problematic occidentalization, to borrow a Saidian line (Said 1978), of human rights in their praxical notations from the past millennia and half and into current political and cultural settlements is an issue that needs to be investigated. The first section of this entry seeks to contribute to this investigation through an historical analysis of the

theoretical and, by extension, practical incongruences that should characterize the space between colonialism and human rights. Following this, through a much needed revisiting of colonialism and connecting it to postcolonialism, the theorizing of the complex story of postcolonialism will be revealed as deserving many more question marks in both its conceptual and semi-pragmatic deployments. This analysis uncovers some of the ongoing descriptive and analytical threads that should operate at the intersections of the three main constructs implicated in the title of this entry. Finally, the last section of the entry is an analysis of the continuities of colonial education and the need to frame new learning possibilities that can advance viable human rights platforms and decolonizing postcolonialism.

A Brief History of Human Rights

As mentioned above, the history of human rights, its social and political constructions, and its possible regimes of implementation are and should be very contentious. A cursory glance of which countries and societies human rights are currently associated with the systematic construction of human rights does not correctly depict the origins of human rights discourse. From a knowledge claims perspective, that should be categorically readjusted. While the idea of human rights and its diverse practical extensions should have been inherent to all social contexts and formations throughout history, in currently dominant Western knowledge analysis, these are usually associated with the Magna Carta (1215), the English Bill of Rights (1689), the French Declaration of the Rights of Man and Citizen (1789), and the Bill of Rights in the US Constitution (1791). These associative historical mistakes with respect to the origins of textualized and tempo-spatially binding codes of human rights might have some relationship with the decline of earlier Islamic, Asian, African, and pre-Columbus Americas civilizations during the past eight centuries. The concomitant rise of the West seems to have secured new western-centric hegemonies of history, ideas, and knowledge (cf. Abu-Lughod 1995), including the

presumptive invention of the idea, as well as the operationalizations, of human rights. As Montgomery Watt (2011) shows, though, the noble invention of the first textualized and documented and, later, most comprehensive early platforms of human rights were made by Muslims.

It is therefore argued that the first official document on human rights was drafted by the Prophet of Islam, Muhammad (peace be upon him) through the Medina Letter in 622 AD when he stipulated select rights and responsibilities regimes among the many tribes that resided in the city of Medina (in current Saudi Arabia). As Watt (2011) noted, this document was the first written and officially constituted human rights platform with binding signatures that stipulated both individual and inter-group rights under one system of governance. Interestingly or, perhaps more correctly, consequentially, the second written document on human rights was also created by Muslims, this time by Shiite Muslims in Persia. This more comprehensive human rights platform, called the Treatise of Rights and produced in 659 AD by Ali ibn Al-Husayn, the Fourth Imam of the Shia, contained a detailed set of rights perspectives and expected practices that were as comprehensive as anything created since then either in the West or elsewhere. In a very comprehensive way, especially for a document that did not have any precedence for inclusive categories, the Treatise of Rights discussed and concluded on individual rights, rights of leaders, rights of subjects, and rights of others with this last category concerning how one should relate to and treat “foreigners.” Indeed, familiarizing one’s self with this document, it seems to contain almost everything that has been brought into all successive bills of rights which have been especially purported via Western governance and political systems.

With respect to current major human right documents and contexts, the main one is of course, the United Nations sanctioned Universal Declaration of Human Rights (UDHR). This important document which is at least politically agreed upon by all countries, perhaps appears unproblematic *prima facie*. Clearly, all articles in the UDHR were constructed with good intentions and viewing the

first few of these, one can indeed experience a mental state of hopefulness that all people's human rights could be protected. Just to share the focus of some of the first articles, Article 1 states that "all human beings are born free and equal in dignity and rights"; Article 3 theoretically affirms that "everyone has the right to life, liberty and security of person." In Article 4, it is stated that "no one shall be held in slavery or servitude; slavery and the slave trade shall be prohibited in all their forms," and Article 5 asserts that "no one shall be subjected to torture or to cruel, inhuman or degrading treatment or punishment." In reading these and other articles in the UDHR, and while acknowledging that no human rights regime can ever be exhaustive, attending to every human condition and relationship, one can still appreciate the post-World War II temporalities of the principles. Furthermore, once can see how, if implemented, the situation could be better for billions of people across the globe. But alas, that is far from the case. In viewing the history of the world with respect to human rights violations, especially since the formulation of the UDHR principles, one can categorically say that each of the 30 articles including the few mentioned above are being violated by governments and others in almost every country in the world. So, close to 70 years after the adoption of UDHR, there is much human rights rhetoric, but the practical record is not encouraging; thus, the need for the implementation of all UDHR principles remains imperative.

Human Rights and Colonialism

While the facts about the original credit of human rights invention in a systematic documented form, although notions and select practices of human rights should have always existed among human populations everywhere, could be settled here, the role colonialism as a massive human rights violation project coupled by deliberate epistemic deformations that accorded all viable ideas, knowledge, and civilizations to the West has resulted in a very different history of human rights. The necessity of sharing an analytical precis on colonialism should

be helpful in connecting it more effectively to the thinning horizons of the postcolonialism belief system. A belief system that, while it continues to be conceptually expounded all over the land, and to be fair, in most cases with good intentions, its expected practicalities (i.e., the end of colonialism in all its forms) are at best shaky, if not majorly absent. The misnaming of colonialism as a civilizing mission (Said 1993) affirms the western perception that others were inferior to them in their human achievement and especially in knowledge and technological achievements. In addition, examining the writings of some of Europe's most important thinkers and their written justifications for colonialism also reveals their conclusion that Africans, Asians, and others they perceived as less endowed in their human faculties were deserving to be invaded, cheated, and multi-purposively commoditized (Abdi 2008a). Reading the factual representations of these then and now dominant opinions, one has to conclude that European human rights, however they were constituted or intended, were not *de facto* or even *de jure* constructed or intended for the colonized. Indeed, even when one studies the UDHR principles, which were announced in 1948, mainly as a response to the destruction caused by the Second World War including the horrible crimes of the Holocaust, one need not miss that the powers who were shaping the agenda of the UN were none other than those colonial powers who were still holding so many colonies in Africa, Asia, and elsewhere. In fact, the word colonialism, let alone any discussion of the issue, is conspicuous in its absence from all 30 articles of the document. Apparently, the crimes of colonialism were not bad enough for their perpetrators as to claim some space in this otherwise comprehensive document that touches almost every other category of violations that could be heaped upon the lives of people.

The Precarious Claims of Postcolonialism

This very brief focus on colonialism is deliberately designed to underline the weaknesses that are inherent in the claims of postcolonialism.

Certainly some worthy works have been written and prepared on the topic (Goldberg and Quayson 2002; Loomba 2005; Ashcroft et al. 2006), with many authors believing they have taken some critical stance on the topic and its potential pragmatizations. Yet more care needs to be exercised with respect to the dangers of unintentionally validating the politico-economic and by extension, livelihood viability of something called postcolonialism. Minimally, the situation needs to be qualified to the extent that while the conceptual constructions and potential practicalities of postcolonialism are more or less temporally meaningful, such cannot be said about the post-“independence” transformational hope of the previously colonized. That is, in terms of power relations, the claim of postcoloniality is not sustainable and cannot be defended theoretically, epistemically, or practically by any serious observer or researcher. From a periodic stance, it can, perhaps, be agreed that the contemporary represents an epochal post facto in relation to the overall global project of physical (not mental) colonization. Yet, if it is the case that colonialism was structured on hugely uneven power relations (Rodney 1982) which spanned across cultural, educational, political, and economic platforms that willfully violated the basic rights of the subordinated, then there remains the need to critically assess the current state of affairs in today’s so-called postcolonial world.

In real terms, while the colonial administrators and military commanders physically left their posts in the old colonies, that viable postcolonial spaces emerged from this is a topic of enduring debate. An example of the mental colonization that ensues in the supposed postcolonial is evident in the fateful words of Thomas Macaulay (2006), former colonial British Governor of India. In his short observations, *Minute on Indian Education*, Macaulay divulged, for epistemic posteriority, the onto-epistemological designs of the British in assuring the loyalty of Indians to colonial ways of reading and acting on the world. Indeed, this piece which spoke about creating limited legions of Indians who are only Indian in their physical contents but British in their mental and resulting behavioral dispositions, and who also act on

behalf of the colonial power as a controlling mechanism for the country’s less Europeanizable masses, is indicative of the power as well as the endurance of mental colonization. Looking both back and forth on the issue, especially as these relate to cultural, educational, and linguistic platforms, one cannot but affirm the almost perfect mechanics of Macaulay’s farsighted designs, especially as these relate to the rhetoric of postcolonialism and the actual continuities of cultural and, by extension, mental colonialism in the country and its large diaspora.

Technically therefore, the claims of postcolonialism, especially with respect to their relationship with human rights, are at best shaky if not mainly untenable. The example of India used here is more or less generalizable to many places in the so-called postcolonial world. Clearly therefore, and unless there is a deliberate and substantial shift or slow evening out of the cultural, linguistic, and educational platforms, then for all practically harnessable intentions, today’s world still favors the colonialist vis-à-vis the rest. With this understanding, there is a need to restart the debates and critically examine the possibilities of epistemic and, by extension, countable freedom achievements that could equitize people’s beings and inter-group global relations. Proceeding from the example of India and checking the postcolonial conditions that are politically or economically more dire, one can actually starkly see the heavier precariousness of the claims of postcolonialism. In the case of Sub-Saharan Africa, for example, the level of control Western countries and their institutions have on the subcontinent hardly fits any notions or practices of postcolonialism.

More often than not, human rights violations that have been mostly learned from colonialism are carried out by local elites that were mostly trained and supported by the old colonial powers. This is now complemented by the perforce impositions of neoliberal globalization (Harvey 2007) with the draconian and recolonizing importations of Structural Adjustment Programs (SAPs) that were designed by Western institutions such as the World Bank and the International Monetary Fund (IMF). SAPs which have been already discredited but still not disowned by the West

have actually led to a recolonized public and educational policy spaces where the ideologically driven and organized violations of people's basic economic rights (Abdi 2008b) are spread over the lives of hapless masses who should still be yearning for some postcolonial redemption and more meaningful livelihood possibilities. But, with no recourse available, the governance structures built on Western nominated nominal democracies that mainly function to facilitate the flow of aid money to the local regimes actually stifle any genuine postcolonial decolonization of politics, economics, or education. These realities also continuously reconstitutionalize the collaborative rules of locally and globally interlocking elite groups (Hoogvelt 2001; Wedel 2009) that hardly respond to the basic needs of the public. Thus, despite the claims of postcolonial politics, the continuing logics and practice of colonialism ensures the ongoing violation of the rights of people. To be sure though, this is happening at a different time, so as indicated above, it is temporally disconnected from colonialism but not in theoretical and practical terms.

Educating for Critical Postcolonialism

In giving concise observations about human rights and colonialism/postcolonialism, one component of the title, education, has to be deployed here as something that instigates new possibilities in the constructions of the former two. Hence the use of "critical postcolonialism" which should minimally do two things. Firstly, it affirms that the situation in former colonies is not a condition of postcolonialism that can recover those primordial citizenship and human rights situations that were lost under colonialism but mostly a continuation of colonialism by other means. Secondly, rather than spread a program of analytical despair on the topic, it should be affirmed that there is hope for the achievement of projects of genuinely decolonized postcolonialism. This is partially related to the important and concretizable perception that despite the thickness of the colonial onto-epistemological restructuring of the world, we never lose at least a residue of human agency

that can be realigned and recapacitated for subjective and social redemption. Minimally or by extended intention, the deployment of the term "critical" should also herald, with important attachments to the original meaning of criticism as contextually improving upon a situation, that there are always some viable liberatory spaces, where the epistemic as well as viable livelihood anticolonial resurrections can be achieved.

To strive for those possibilities, though, in a world so savagely torn asunder in its historical, cultural, politico-economic, and original as well as refurbishable human rights dimensions is not easy. In addition, the idea of educating for something other than current world knowledge and rights disorders requires a novel ideational, analytical, and implementable platforms that can predict and achieve new anticolonial learning perspectives and programs that could reestablish the actionable consciousness of peoples and nations, partially in the way Freire (2000 [1970]) intended, so as to redo the world of the colonized now and for the long term. The need for this thinking and design need not be belabored. But it is still worth reiterating in this short entry piece that an organized and incessant focus on educational analysis in the current context of postcolonialism should be mandated by the enduring force and contemporary curricular continuities of colonial education which, even when it was so counter-communal wellbeing and not conducive to social and environmental sustainabilities, still reigns supreme in the classrooms and lecture halls of almost former colonies. Needless to add for extra emphasis and in relation to the central issue of the human rights perspective discussed here, that an educational system deliberately designed and undertaken for the oppression of the masses cannot, in its original structure and contents, redeem people from its own subjugating qualities. Briefly but firmly, such education was conceptualized, theorized, and implemented for the full scale exploitation of the colonizeds' psyches, cultures, physicalities, and thought processes, thus effecting a primary and enduring depatterning of their worldviews and overall existentialities. Interestingly and quite unfortunately, the basic philosophical and epistemological foundations of

colonial education still characterize almost all learning systems in former colonies. In places like Sub-Saharan Africa, such designs of education did not liberate most people from global political hegemony or from economic deprivation (Abdi 2008b). As such, comprehensively decolonizing colonial education must be directly attached to decolonizing the mind (wa Thiong'o 1986) which, as stated above, remains an important prerequisite for seeking and achieving a viable postcolonial situation.

Clearly therefore, educating for critical postcolonialism requires critical education that is constituted with thick anticolonial pedagogical and learning missions that comprehensively excavate, examine, and speak about the future with conceptual boldness, measured theoretical adventure, and pragmatic prognosis that refuse the racist one-truth paradigms that have been masquerading as the real, indeed only knowledge, for too long. In Gianni Vattimo's (2011) terms, the European/Western claim of one truth ethnocentrically refuses to acknowledge pluralistic epistemologies and multicultural sciences that factually represent the real histories of human beings and their epistemic establishments and modifications (Harding 1998). Educating for decolonized postcolonialism and for inclusively redeemable human rights platforms all in their historical, cultural, political, and economic dimensions requires, therefore, that the reconstructed pedagogical and learning contexts and intersections be thickly connected to a continuing search for epistemic and epistemological rights that should be constitutive of the new struggles to achieve cognitive social justice and rescind the ongoing regimes of epistemicide and linguicide (Santos 2007, 2014; wa Thiong'o 2009). Basically, this should go back to Nyerere's (1968) focus on education for self-reliance which cannot be achieved in contemporary contexts and systems of dehistoricization and deculturation as these are never conducive to social wellbeing and community advancement. As Nyerere himself repeated many times, you cannot decontextualize your society and your world, and then expect to achieve cultural, educational, and economic achievements. It is with this in mind that the connections between human rights, postcolonialism,

and education need so much more than just presumptions about the ending of colonialism as ushering in new human rights platforms that create and sustain decolonized life systems which could benefit the lot of all. Instead, the urgent mission is to do so much more in aiming for, designing, and achieving genuine conditions of newly decolonized postcolonialism that can redefine and maintain contextually useful and horizontally binding human rights regimes which could be equitably applicable to all.

Introduction

It is not unreasonable to claim that humanism has been, and perhaps continues to be, a foundational principle for education. While it may be the case that fewer scholars and teachers would explicitly refer to humanism in the contemporary era, traces of its influence can be seen in the ideals and

commitments expressed by educators from the early childhood through to the tertiary sector. Schools that promote themselves as developing their students holistically, as persons, are just one example of this. However, humanism has encountered a range of critiques since the burgeoning in the 1960s of structuralist and poststructuralist theories. This entry will seek to outline some of the ways in which postcolonial theory has critically engaged with humanism and the effects of this for education. Though it is a term widely used, humanism, ultimately, cannot be neatly defined. Any attempt to do so would be to fix it in an ahistorical space. But humanism has always been historically located and, therefore, constituted. Subsequently, to begin to be able to approach humanism as a concept within the field of education, it is necessary to historicize it however brief and incomplete the task maybe. Indeed, it is only through a historical framework that one can understand the postcolonial engagement with humanism. It is the case that humanism has been interpreted in different ways in various times and spaces. Yet, as it relates to the understanding of education and knowledge today, it is Western notions of humanism that have been most prominent and will therefore be the focus of this article.

History of Humanism

It is generally agreed that humanism goes back at least as far as the Ancient Greeks. Even at this early stage, humanism was implicated in the thinking and practice of education. The classical humanism of Plato and Aristotle enunciated education as having a civilizing function and that knowledge was intrinsic to the concept of the good. There was no need to qualify education as “humanistic” because education as person-centered development of intellectual character for the sake of the good was implicit and assumed. Indeed, this early form of classical humanism that prioritizes the cultivation of the self can be seen also in Confucian and Islamic humanisms (Goodman 2003). Classical humanism tended to be very much focused on how individual moral

cultivation, especially through virtuous living, would lead to the civilizing of humanity. To think of Plato's *Phaedo* here is instructive. Education should help the individual to ensure that the rational part of the self overcomes the irrational, eros-driven part of the self. Importantly, though, this self-cultivation does not merely have its end in the individual, but for the common good. Both the idea of self-cultivation and the ethical orientation toward human flourishing, understood in historically contingent ways, are characteristic of various humanisms over a long period of time.

Over the last 200 years, Western humanism has largely revolved around the contrasting perspectives of the great Enlightenment philosophers, Immanuel Kant (1724–1804) and Jean-Jacques Rousseau (1712–1778). These two philosophers can be used as examples of the different emphasis that can be given to either the individual or the common good within humanistic thinking. The following Kantian assertion links the education of the individual with the betterment of humanity: "... children ought to be educated, not for the present, but for a possibly improved condition of man in the future; that is, in a manner which is adapted to the *idea of humanity* and the whole destiny of man" (1960, p. 14).

Kant's more macro understanding of humanistic education can be contrasted with Rousseau's greater focus on the individual.

The philosophical anthropology which drove Rousseau's thinking was that each human is constituted by an inherent self that needs to be developed through the process of education. A Rousseau-inspired education would seek to elicit the goodness out of the child, helping them to grow through their own natural engagement with the world around them. But just as it would be unfair to ignore Kant's focus on the development of the individual self, it would be unfair to completely extract a larger vision from the goals of Rousseau's philosophy of education. Boyd (2009) suggests that the kind of child-centered education found in Rousseau's *Emile* has as its aim "the making of good human beings and through them of a good society" (p. 250). Nevertheless, it can be argued that the emphasis of this humanistic education is on the individual human,

thus leaving the creation of a better society as a secondary consequence.

Within the field of education in more recent times, however, critical pedagogues such as Paulo Freire, Peter McLaren, and Henry Giroux, among others, bring societal transformation into sharp focus as the main aim of education. These scholars argue for an education that exceeds the idea of individual freedom and aims at breaking down the systemic and structural injustices of society. An education that encourages critique of dominant institutions and ideas will lead to this. Here, the emphasis shifts to human flourishing, rather than self-cultivation, as the central focus of humanistic education.

Of course, there are many more examples of humanism at work in education through history, but what these three influential humanistic approaches to education demonstrate, apart from the commitment to the betterment of self and society, is a tendency toward universalizing and essentializing the human. It is this assumption of Western exceptionalism which postcolonial theorists critique, with particular aim taken at this ethnocentric humanism.

Postcolonial Challenge to Humanism: Overview

The postcolonial challenge to humanism can be understood most basically as a critique of the essentialist terms in which it is often articulated and its complicity in colonialism. This focuses on the arrogance of assuming that the ultimate normative conception of the human is the civilized European and that colonialism was a civilizing mission in the name of this humanism. It remains an open question as to whether a humanism that seems to have been so tainted by European forms of knowledge and cultural traditions can survive in a postcolonial and globalized world.

Oddly, perhaps, the particular kind of anti-humanism that comes out of postcolonial critique might well enable the survival of a reconceptualized and rearticulated humanism. One must first understand that postcolonial anti-humanism sees Western humanism as inextricably

tied to the violence – both physical and epistemic – of colonialism. As Young (2004) puts it, this postcolonial antihumanism “starts with the realization of humanism’s involvement in the history of colonialism, which shows that the two are not so easily separable. For from the colonial perspective, humanism began as a form of legitimation produced as a self-justification by the colonizers for their own people, but later. . .was utilized as a form of ideological control of the colonized peoples” (p. 161). What we see emerge, then, from a set of very specific and local historical contexts, is a challenge to humanism that is less concerned with the category of the human in a philosophical sense and more concerned with the cultural politics of humanism. That is to say, the problem with humanism after the onset of colonialism is largely to do with the cultural and political work that it does, or at least is done, in the name of humanism.

However, it could be argued that such a critique, rooted as it is in the realm of the social, leaves open the possibility to imagine and produce a new humanism. In fact, this is the very thing to which Frantz Fanon gestures at the end of his final work, *The Wretched of the Earth* (2001). While this presents some productive possibilities for education, it will first be worthwhile to briefly consider some examples of postcolonial theory’s critique of humanism, those of Frantz Fanon and Edward Said.

Frantz Fanon

Fanon’s critical engagement with the idea of humanism is indelibly marked by his experience of leaving his colonized home for that of the colonizer and by his involvement with the Algerian Revolution. Growing up in Martinique and educated in a French colonial school, Fanon considered himself in some way French; his education had successfully worked to develop such a sensibility and identity. However, on leaving the Caribbean and arriving in France, first to join the French army during WWII and, later to study psychiatry, he was immediately confronted with the reality of his difference.

For Fanon, this difference was inextricably tied to the blackness of his skin. In *Black Skin, White Masks*, Fanon wrote of the way in which white men saw themselves as superior to black men and the way in which this kind of binary logic was at the core of the colonialist’s imagination. No matter how educated and “European” the black man was, Fanon writes that “the European has a fixed concept of the Negro” (2008, p. 23), and this fixed notion was, of course, one that images the black man as inferior. Thus, for Fanon, it was this encounter with the white man through his time in France that opened his eyes to the way in which the black man’s sense of identity was determined by the relation with the white man. He writes, “Ontology. . .does not permit us to understand the being of the black man. For not only must the black man be black; he must be black in relation to the white man. . .[t]he black man has no ontological resistance in the eyes of the white man” (pp. 82–83). This recognition of a difference that was structured unequally posed a significant challenge to the universal assumptions of European humanism and was the beginning of Fanon’s attempt to repudiate this false humanism.

Fanon’s involvement with the Algerian fight for independence sees his relationship to colonialism, and its humanism become more political. While *Black Skin, White Masks* might be read as the theorizing of a psychiatrist, *The Wretched of the Earth* (Fanon 2001) emerges from the lived experience of participating in the Algerian anti-colonial revolution. As such, the way in which colonial violence is treated is much more sensitive to the actual shedding of blood. Thus, for Fanon, any humanism that results in the destruction of humans is not worth its name and certainly not worth standing for. In *The Wretched of the Earth*, he implores his audience to, “Leave this Europe where they are never done talking of Man, yet murder men everywhere they find them, at the corner of every one of their own streets, in all the corners of the globe” (2001, p. 251). That the violence of colonialism was violence against humans could do no less than call into question the very possibility of speaking about the human in any universalist sense.

Edward W. Said

It is often claimed that the publication of Edward Said's *Orientalism* (1978/2003) marks the beginning of postcolonial studies. In the book, Said seeks to demonstrate the Eurocentric knowledge production of the "oriental other." Thus, *Orientalism* refers to the way in which Western colonialism creates a fixed, essentialized, image of the Orient that is, importantly, necessarily inferior to the dominant and civilized West. Leela Gandhi (1999) suggests that *Orientalism* elucidates colonialism "as the epistemological and cultural attitude which accompanies the curious habit of dominating and, whenever possible, ruling distant territories" (p. 67). Such an articulation of colonialism is important insofar as it makes clear that colonialism was not merely an economic (as one may imagine in the case of the East India Company) endeavor and nor did it only result in the kind of violence wielded by bayonets and guns but, more deeply, colonialism carried a certain "epistemological and cultural attitude." In this way, Said demonstrated in *Orientalism* the ways in which knowledge production itself can be considered as violent.

But how does this relate to humanism? Perhaps most simply, insofar as postcolonial critique uncovers the complicity between Western knowledge and Western power, humanism must also recognize its own complicity in colonialism. That is, *historically* speaking rather than *philosophically*, humanism participates in – and perhaps propels – the civilizing mission of colonialism. This is particularly well captured by the now infamous quote from Sir Thomas Babington Macaulay's *Minute on Indian Education* of 1835 in which he claims that those who were "Indian in blood and color" would, through English education, "become English in taste, in opinions, in morals, and in intellect" (cited in Loomba 2005, p. 75).

In terms of the impact of Said's *Orientalism*, arguably the most important was that it conceptualized colonial relations in a way which carried significant implications for humanism and, more broadly, postcolonial studies. As such, this early work of Said's is interesting not so much for what

it says about humanism per se but what it says about ethnocentrism and, more specifically, European ethnocentrism as dominant in a world structured unevenly. Thus, as the quote from Macaulay's *Minute* implies, European colonialism had significant effects in regard to knowledge. In the case of India, for example, the *content* of education was largely British – that is, about British history, culture, politics, and literature. However, it was also a British *style* of education: wooden desks, uniforms, English language, and manners. Furthermore, it was also a British *epistemology*; the empiricism of the post-Enlightenment came to become the common sense and, therefore, largely unquestioned arbiter of what counted as knowledge. *Orientalism* became foundational for postcolonial theorists because of the way in which it so clearly and persuasively argued that orientalist discourse produced the European as superior and the non-European as its inferior "other."

Response to the Challenge

Postcolonialism – as an historical moment, a condition, and a theory – may be seen as marking the end of humanism on empirical, moral, and theoretical grounds. However, the way in which much postcolonial theory has sought to critique binary logic in favor of an acknowledgment of the processes of hybridization and the mutual effects of colonialism on both the colonized and the colonizer has meant that any easy dismissal of humanism might suggest an all-too-simple essentializing of it. Loomba (2005) writes that "Postcolonial studies have shown that both the "metropolis" and the "colony" were deeply altered by the colonial process. *Both* of them are, accordingly, also restructured by decolonization" (p. 22). And while she acknowledges the unequal ways in which the colonizer and the colonized were affected, the key point is that neither the metropolis nor the colony can be represented as a static, essentialized entity. Such an acknowledgment of the restructuring of identity and subjectivity has consequences for the way in which Europe, humanism, the subaltern, or any other representation can be conceptualized.

Dipesh Chakrabarty demonstrates a nuanced critique of colonialism and its effects by acknowledging not just the positives of European thought but also the inevitability of Europe. Indeed, he writes, “provincializing Europe cannot ever be a project of shunning European thought. For at the end of European imperialism, European thought is a gift to us all. We can talk of provincializing it only in an anticolonial spirit of gratitude” (2000, p. 255). Implicit here is a committed resistance to the basic project of colonialism, but not a complete dismissal of the effects of colonialism. For an attempt at the repudiation of Europe would not only be futile, but also foolish.

The same might be said of the humanism that seems to have been inextricably bound to the colonialists’ civilizing mission. A strident anti-colonialism ignores the lessons of Chakrabarty (and others, such as Bhabha) by perpetuating the simple binary which results in a colonial/anti-colonial dialectic, thus producing essentialized notions of both. Instead, Chakrabarty’s aim in *Provincializing Europe* is to relativize the construct of Europe. He seeks to show the way in which European modes of thinking can be challenged and decentered by the telling of histories from the colonies which represent a different logic. A clear example of this is the way in which subaltern histories involving spirits or deities challenge the idea that European thought became universalized through colonialism. What Chakrabarty was able to show was that, despite the attempt to explain or translate local Bengali stories of divine action from the perspective of a European disenchanted, secular worldview, in actual fact these local Bengali ways of thinking and acting continued even after the onset colonialism. The remembering of these local stories is important because they ensure that European thought does not ameliorate difference.

However, by also refusing to dismiss all European thought as “bad,” Chakrabarty provides for the possibility of negotiating new ways of knowing and understanding in the postcolonial. It is this postcolonial way of thinking relationally and critically which also provides the possibility for different forms of humanistic education to be imagined and practiced.

Possibilities for Humanism and Education

Despite postcolonial and other critiques of humanism, calls for its renewal, rather than repudiation, remain. Such a call implies at least three things: first, that the ideas behind humanism are worth retaining; second, that the form which humanism takes can change; and third, that conceptions of humanism need to change. Yet it also seems to imply that there is actually something core to humanism that makes it worth preserving and reconstituting for a global future; such a claim would seem to ignore the particularity of culture. The universal and the particular, it might be suggested, exist as an irresolvable tension. Indeed, Chakrabarty suggests, “we need universals to produce critical readings of social injustices. Yet the universal. . . [produces] forms of thought that ultimately evacuate the place of the local” (2000, pp. 254–255).

Within an educational context of global interconnectivity and interdependence, in which the travel of ideas, people, and knowledge becomes ever more extensive and intensive, it could be conceived that the inevitability of cultural difference could either be trampled by an imperialist global hegemony (a new universalism) or ameliorated and trivialized by a polite cultural relativism. It is here that a humanism emerging from postcolonial theory might have something to contribute.

Indeed, Seth (2011) suggests that “at the heart of the notion of humanism is that something that we all share and which sanctions our aspirations towards equality, despite our differences” (p. 6). So, while humanistic education might be understood as having an impulse or an ethico-political imperative toward the (universal) good, precisely what it is that constitutes the good remains as something which must always be negotiated and reconsidered according to the particular. Through adopting a postcolonial strategy, educators may seek societal transformation in ways that refuse simplistic binary representations of good and bad. As teachers and students increasingly find themselves in places marked by cultural difference, it will be even more important that shared goals and aspirations can be affirmed despite real and

continuing differences. In other words, a post-colonial humanistic education seeks to maintain, rather than release, the tension between the particular and the universal. Articulated in this way, postcolonial humanism has much to contribute to the future of education.

Humanistic Education

Nimrod Aloni
Kibbutzim College of Education, Technology,
and the Arts, Tel Aviv, Israel

The term humanistic education is generally used to designate a variety of educational theories and practices that are committed to the world view and ethical code of humanism, that is, positing the enhancement of human development, well-being, and dignity as the ultimate end of all human thought and action – beyond religious, ideological, or national ideals and values. Based on a long philosophical and moral tradition and

manifested in the UN's Universal Declaration of Human Rights and the Rights of the Child, the commitment to humanism further implies the fostering of the following three fundamental tenets:

1. The first is philosophical, consisting of a conception of man – men and women – as an autonomous and rational being and a fundamental respect for all humans by virtue of being endowed with freedom of will, rational thinking, moral conscience, empathetic imagination, and creative powers.
2. The second tenet is sociopolitical, consisting of a universal ethics of human equality, reciprocity, and solidarity and a political order of pluralistic, just, and humane democracy. The ultimate commitment is to provide every man and woman with the rights and opportunities to participate meaningfully in the cultural, social, and political spheres of life.
3. The third tenet is pedagogical, consisting in the commitment to assist all individuals to realize and perfect their potentialities and "to enjoy," in the words of Mortimer Adler, "as fully as possible all the goods that make a human life as good as it can be" (Adler, 1982, p.18).

History

Historically, humanistic education can be traced back to the times of classical Athens with its central notion of *paideia*, a few centuries later to the times of ancient Rome with its central notion of *humanitas*, and then the Renaissance's humanists, and in the early nineteenth century, it was the German educator Niethammer who coined the concept of humanism as indicating liberal education toward full humanity.

Traditionally, humanistic education and liberal education – *studia humanitatis* and *artes liberales* – were interchangeable synonyms, designating the education appropriate for a free man. The aim of such education was the attainment of full and worthy human life with the possession of cultural and civic spirit. In the last two centuries, however, the cultural trends of the Enlightenment – the shift to scientific and critical

thinking and to liberal and egalitarian democracy – brought about changes in the theories and practices of humanistic education. It has become much more democratic and pluralistic, open minded and critical, and sensitive and considerate to cultural and individual differences and needs.

Notwithstanding the differences in approaches and emphases, it seems that all contemporary humanistic educators share a commitment to humanize their students in a spirit of intellectual freedom, moral autonomy, and pluralistic democracy. They strive to provide the kind of education that, on the one hand, liberates their students from the fetters of ignorance, caprice, prejudice, alienation, and false consciousness and, on the other hand, empowers them to actualize their human potentialities and lead autonomous, full, and fulfilling human lives.

The Forms of Humanistic Education

Theoretically, humanistic education can be classified into five distinct forms or approaches.

Classical-Cultural Humanistic Education

The first might be called the classical-cultural, which inherently implies the existence of an ideal of human perfection – comprising notions such as *paideia*, virtue, nobility, justice, goodness, and beauty – that should serve as a universal and objective model for regulating the education of all human beings qua human beings. As mentioned earlier, the origins of this form of humanistic education lie in ancient Athens, especially in the ideas of Pericles, Socrates, Protagoras, Plato, Aristotle, and Isocrates. A few centuries later, it was the Romans who established the *studia humanitatis* as a normative and formative education for free persons, which aims at the cultivation of sound judgment and noble character. The Renaissance was the first era in which people called themselves humanists. These humanists were determined to emancipate themselves from the ignorance, dogmatism, and self-abnegation of the “dark ages” toward the kind of truth, beauty,

freedom, and dignity that could be produced by the human faculties if only properly cultivated and exercised. It was also these humanists who established the central theme in all classical humanistic education, adopted by Hutchins and Adler, that “no man was considered educated unless he was acquainted with the masterpieces of his tradition” and that “the best way to a liberal education in the West is through the greatest works the West has produced” (Hutchins, 1954, ch.1). Finally, from the Enlightenment to the end of the twentieth century – with the ideas of Kant, Mill, Newman, Arnold, Babbitt, Hutchins, Maritain, Livingston, Adler, Kirk, and others – classical humanistic education has become more egalitarian, critical, and liberal. Its ultimate ideal, however, has not changed: as put in the words of the Renaissance humanist Pier Paolo Vergerio, humanistic education includes “those studies by which we attain and practice virtue and wisdom; that education which calls forth, trains and develops those highest gifts of body and mind which ennoble man” (Panofsky, 1940, p. 92).

Romantic-Naturalistic Humanistic Education

The second form of humanistic education is most commonly known as the romantic-naturalistic approach. It makes its first appearance in the eighteenth century with the writings of Rousseau who blamed the obsession with cultural progress, encyclopedic knowledge, authoritarian education, and the pursuit of social status for the ills of society and for the production of the alienated, other-directed, and corrupt personality of the bourgeois. Rousseau introduced an alternative conception of the good life that ascribes goodness to man’s natural inclinations and self-regulated development, to spontaneous and playful exercise of natural powers, and to self-directedness and personal authenticity. Good human beings, he contended, should manifest holistic integration of sentiment with reason and of personal interest with the common good. These new images of human goodness and naturalistic education have generated in the nineteenth and twentieth centuries a manifold change in educational theory and practice. In the

modern educational thought of Pestalozzi, Froebel, Dewey, Neill, Korczak, Rogers, Maslow, Combs, Noddings, and others, we encounter all of Rousseau's basic intuitions. To these they have added the presently familiar notions of care, growth, self-actualization, personal fulfillment, self-regulation, trust, experience, relevance, authenticity, and democratic and pedagogical therapeutic climate – all as growth-promoting conditions for the “young plant” in its continual and self-actualizing process of becoming. In sum, the romantic form of humanistic education can be characterized by its fundamental premise that there exists in every one of us an “inner nature” or a “fixed self” that is fundamentally good and unique and that pushes to unfold and actualize itself – in accordance with its built-in code – toward healthy existence and full humanity. True education, therefore, consists of careful “drawing out” and attentive actualization of the individual's inner nature.

Existentialist Humanistic Education

The third form of humanistic education is existentialist, based mainly on the philosophical insights of Kierkegaard, Nietzsche, Heidegger, Jaspers, Sartre, Camus, and Buber. Existentialist educators reject the classical notion of human beings as “rational beings” as well as the romantic assumption that there exists in every one of us an “inner nature” or “fixed self” that is fundamentally good and unique. The alternative advanced by most existentialists is that since the essence of man is freedom, in the matter of values, humans can appeal to no external authority, either natural or supernatural, and are therefore destined to choose, define, and create themselves as the true – and therefore responsible – authors of their identities. As Sartre put it, in the “Humanism of Existentialism,” “Man is nothing else but what he makes of himself” (Sartre, 1979, p. 36). Authentic human life, therefore, exhibits an acute sense of self-concern and acceptance of his or her freedom and responsibility for becoming the kind of person he or she eventually becomes. As posited by Martin Buber, Maxine Greene, and other existentialist educationists, it is neither the curriculum nor the teaching methods that are crucial in education but

rather the ability of educators to educate by example, to be present to their students in their full being as individuals engaged in authentic self-creation and self-affirmation. In light of these philosophical and moral insights, existentialist humanistic educators seek to humanize their students by urging them to pursue neither ultimate truths nor self-realization, but to constantly choose, form, and create their identities and life projects – enlarging their sense of freedom and responsibility for the meanings, values, and events that constitute the public as well as the private realms of their lives.

Radical-Critical Humanistic Education

The fourth form of humanistic education is most often identified with radical education or critical pedagogy and with the counter-hegemonic pedagogical theories of Freire, Apple, Giroux, Simon, and Kozol. From this vantage point, to consider educational issues independent of the larger cultural, social, and economic context involves either serious ignorance or cynical, if not criminal, deception. Poverty, crime, homelessness, drug addiction, wars, ecological crises, suicide, illiteracy, discrimination against women and ethnic minorities, technocratic consciousness, and the disintegration of communities and families, to name some of our most pressing problems, are facts of life that effect directly the physical, emotional, intellectual, and moral development of the great majority of children in our culture. Hence, radical educators argue, “pedagogy should become more political and the political more pedagogical” (Aronowitz and Giroux, 1985, Dedication). This implies three major changes in our educational system. It requires:

- That educational discourse, policy, and practice would deal directly with the notions of power, struggle, class, gender, resistance, social justice, and possibility
- That teachers would aim to emancipate and empower their students toward the kind of critical consciousness and assertive point of view that allow people to gain control over their lives

- That teachers, in the words of Giroux, “would struggle collectively as transformative intellectuals . . . to make public schools democratic public spheres where all children, regardless of race, class, gender, and age, can learn what it means to be able to participate fully in the ongoing struggle to make democracy the medium through which they extend the potential and possibilities of what it means to be human and to live in a just society” (Giroux, 1989, p. 186).

Ecocentric-Participatory Humanistic Education

The fifth approach in humanistic education, characteristic of the twenty-first century and to which many relate as postmodern and post-colonialist, might be characterized as ecocentric, non-essentialist, participatory, inclusive, and multicultural. Unlike the previous four approaches, the vantage point is no longer anthropocentric (originally denying the existence and authority of supernatural deities and establishing human sovereignty and responsibility). It is rather ecocentric or environmental: seeking flourishing and harmony not only to the “human kingdom” but to nature as a whole – natural resources and landscapes, biodiversity, and animal rights. This new sense of modesty is apparent not only in man’s relations with nature but also in the social and international realm of ethics and politics. The “participatory” principle or quality refers to an *a priori* denial of any superior cultural code, philosophical stance, or ideological doctrine and substituting it for a constructed and ever-changing intersubjective and intercultural consensus reached by means of a participatory, democratic, reasonable, cosmopolitan, and all-inclusive discourse (inspired by the philosophies of Habermas, Appiah, Hansen, etc.). In terms of educational policies and practices inspired by this outlook and manifesting its tenets, the most dominant and familiar ones are education for environmental and social sustainability, cosmopolitan-multicultural education, and education for a culture of peace and shared life.

Conclusion

Notwithstanding the differences among these five forms of humanistic education, it seems that in their educational projects of humanization they all accept Whitehead’s point that “there is only one subject-matter for education, and that is Life in all its manifestations” (Whitehead, 1979, pp.6-7). In more explicit terms, humanistic education consists in the general and multifaceted cultivation of humans – in a social atmosphere that manifests human dignity and intellectual freedom – toward the best and highest life of which they are capable in three fundamental domains of life: as individuals who autonomously and authentically realize their potential, as involved and responsible citizens in a democracy, and as human beings who enrich and perfect themselves through meaningful and constructive engagement with the collective achievements of human culture. It consists, to use a more recent terminology, in facilitating persons to lead flourishing lives: to develop and employ soundly their innate powers, to make the best use of humanity’s greatest achievements, to actively engage in world betterment, and ultimately to shape for themselves autonomous, meaningful, and worthy life.

Humanistic educators, it is commonly agreed, should further seek to develop well-rounded and integral persons whose culture is manifested not only in their broad learning but also in demonstrating critical consciousness, moral sensitivity, empathetic imagination, social concern, and responsible utilization of knowledge – so that the “tree of knowledge” would also serve as a nourishing “tree of life.” Its ideal is to achieve in their students the right integration as well as the right tension between a commitment to high cultural standards and a strong sense of individuality in both the forms of autonomy and authenticity. Finally, to achieve this and truly facilitate flourishing lives for their students, humanistic teachers take the responsibility to set personal example in the art of living as well as to create at their schools a pedagogical atmosphere of care, trust, support, dialogue, respect, fairness, tolerance, inquiry, freedom, commitment,

responsibility, multiculturalism, and reciprocity. Without these last elements, even the most beautifully woven theory of humanistic education would fail to become a lived reality for its teachers and students.

Iconic and Symbolic Language

Simon Glynn

Florida Atlantic University, Boca Raton, FL, USA

Introduction

Not only does one communicate in language, but one thinks in language also, as readily attested to by many of those living alone, who, when observed to be talking to themselves, will respond that, so far from going mad, they are merely “thinking out loud.” Indeed one has only to listen to young children, alone in their beds at night, running through the events of their day, or perhaps in communication with siblings, articulating, often humorously, the *relations* between, for example, arms and legs, hands and feet, fingers and toes, and wrists and ankles, not to mention necks, and in such a manner familiarizing themselves with, and often consciously and humorously disrupting, established conceptual categories, to recognize that in addition to being a means of communication or system of *signifiers*, language is also a system of the *concepts signified* thereby. The linguistic *signifiers* and the concepts

signified by them being as Ferdinand de Saussure (1959) and, following him, Jacques Derrida (1973, 1981, 1982) have both noted, like two sides of a sheet of paper, *distinguishable* but *inseparable* aspects of any language. While given that thinking involves having and manipulating ideas or concepts, and the relations between them, then it is entirely unsurprising that, as philosophers as different from them and each other as Ludwig Wittgenstein (1953, 1961) and Willard V. O. Quine (1960), not to mention cultural anthropologists such as Benjamin Lee Whorf (1954) and natural scientists such as Humphry Davy (2015), have all concluded, in addition to being a means of communicating ideas or concepts, language is also a medium or “vehicle” of thought.

“Language” as the *Only* Medium of Thought

What is perhaps more surprising however is that, in addition to claiming that one *can* think in language, many go even further, claiming that one *can only* think in language, a proposition to which others have objected, arguing that, on the contrary, one can, and indeed often does, think “visually” in pictures or pictograms, and that in any event many have thoughts which they have difficulty in putting into words.

In response, it is argued that pictures or pictograms are a form of language also and that in

addition to *symbolic* languages, such as the one which is here being used to think or constitute the concepts or ideas which are, hopefully, being communicated via writing, and which may also be constituted in and communicated via speech, there are also *iconic* languages, consisting of pictures, pictograms, etc., in or by which concepts or ideas may also be constituted and communicated. For instance, when searching for a lavatory, while one may happen upon the *symbolic* sign “Men” or “Women” signifying which room it is appropriate to enter, equally one may happen upon *iconographic* pictures or pictograms of a man or a woman, which perform the same function. Given then that words are not the only form that language may take, so far from the difficulty that some may have in putting their thoughts into words demonstrating that their thoughts are independent of language, it may merely demonstrate that they are having difficulty translating a thought initially delineated in iconic pictograms – or indeed any other nonsymbolic form of language (such as an indexical language) – into the written or spoken words of a symbolic language. Although it may, of course, alternatively, simply be indicative of the fact that even though the thought they are having is constituted entirely in words, it is incomplete or confused.

Concrete Icons Versus Concrete and Abstract Symbols

Now unlike iconic signs, which must, at least to some degree and in some significant respect, *resemble what they represent*, symbolic languages are in no way so constrained; the symbolic words “Men” and “Women” do not remotely *resemble* men or women in the flesh so to speak; their capacity to signify who should go into which lavatory depends not upon *resemblance* but upon *convention*, as is clear from the fact that, adopting a foreign language, such as French, for instance, the terms “Hommes” and “Femmes” may, by the conventions of that language, perform the same task as the terms “Men” and “Women” do in English. Consequently, and most importantly,

while iconic language, constricted as it is by the need to in some degree resemble, or “look like,” what it represents, is therefore *largely* confined to facilitating thought and communication about *concrete* individuals, relations, circumstances, events, etc., symbolic language, being in no way so constrained, readily lends itself to thought and communication regarding *abstract* ideas also, which, precisely as abstract, do not “look like” anything. Thus, while the concrete event of the Norman invasion of Britain, for example, or certain ancient Egyptian personages and events may be iconically depicted and communicated, at least to some degree, by the Bayeux Tapestry and the iconic elements deployed by hieroglyphics, respectively, it is clear that in no way could the abstract ideas and relations, which are being here delineated and articulated in a symbolic language, be *adequately* delineated or articulated by or in an iconic language.

This is not to claim that abstract ideas and relations, etc., cannot be represented at all, albeit often inadequately, by iconic signifiers, for, having conceived of the abstract notion of justice as comprising of the impartial “weighing” of evidence concerning the likelihood of alternative claims regarding the “facts” and the dispensing of punishment, if it is due, in proportion to the degree of injustice involved, justice may then be iconically depicted by a blindfolded (impartial) individual, holding a pair of scales (with which to “weigh” evidence) and a sword (with which to dispense punishment). Nevertheless, this does not alter the fact that, ultimately, such a concrete, iconic delineation and articulation of the notion of justice, and even more so that of the relatively more complex and general abstract ideas and relations also being dealt with here, will fall short of that afforded by a symbolic language.

Iconic Language and Misleading Reification

Moreover, in addition to being *inadequate* to the delineation of complex abstract concepts, ideas, and/or thoughts, iconic language and the thinking it facilitates, relying as they do on mimetic

resemblance, have an inveterate tendency to conceive of what they seek to represent as substantial, which may often be entirely *misleading*.

For instance, while the very existence of a supposedly *immaterial*, yet nevertheless *ubiquitous*, and apparently *male* deity, involving, as it clearly does, a couple of logical contradictions – an immaterial being, by definition cannot occupy material space, and therefore can hardly be ubiquitous, nor, having no DNA, much less any genitalia, can scarcely be male – is, a priori, impossible, the iconic misconception of such a supposedly immaterial deity as a bearded, usually white, man, located in the sky, certainly contributes to, if it does not indeed initially engender, such confusion.

And it was precisely René Descartes' common nonsensical iconic misconception of consciousness – properly understood as a *state* of awareness which, as such, is, as Edmund Husserl has pointed out (Husserl 1962, 1970a, b) (“intentionally”) conscious or aware of the world and its objects – as a reified, which is to say substantial, albeit thinking, *thing* (a *res cogitans*) or mind, a realm of closed interiority, which rendered its relationship to and knowledge of the world problematic. This iconic, reificatory misconception of the consciousness or *state* of awareness definitive of the human subject, as a *thing* or object, resulting, as Jean-Paul Sartre has observed (Sartre 1991), in an erroneously deterministic view of human behavior.

While turning to the misleading impact of iconic reification upon the natural sciences, as Charles Sanders Peirce has pointed out (Peirce 1935), none of the supposedly empirical scientists have ever experienced gravity *per se*, which is to say, independently of those very motions, which, with breathtaking circularity, it is supposed to explain. And as with gravity, so too with gravitons, which, like atoms and molecules, wavicles, positrons, and neutrinos, not to mention electricity and magnetism, strong and weak interactive forces, and thus all the supposed major components of a unified field theory, are nowhere observable in themselves, which is to say independently of the events (e.g., tracks across bubble chambers of photographic

emulsion, twitching of galvanometers, heating of water, etc.) which they are taken to explain. The belief in their independent existence therefore also being the reificatory consequence of iconic thinking.

And it is precisely a symbolic language, whose signifiers, which, operating by virtue of convention rather than resemblance, therefore do not need (and indeed are unable) to resemble the abstract concepts, ideas, and/or thoughts which they may therefore be called upon to directly signify, which enables one to entertain, understand, reflect upon, and communicate these relatively complex insights concerning the, often grossly misleading, limitations of iconic language, and to dissolve, by symbolic conception and the understanding of the sort which we are here engaged in, many of the problems and paradoxes to which it gives rise.

Pedagogically Relevant Implications

Now clearly those who have greater exposure to, and are consequently usually more “at home” in, symbolic language, as spoken in conversation, and/or on the radio, or written on paper or computer screens, will, on average and in general, be much more adept not only at expressing and communicating abstract thoughts but also, most significantly, at delineating, and thus entertaining or *having*, and understanding *them* in the first place, than those who are more exposed to *predominantly* iconic or pictorial modes of communication, such as TV, video, and film. For even though TV, video, and film are generally comprised of symbolic as well as iconic elements, the *sensible iconic image* or surface has a tendency to distract attention from, and even eclipse, the more abstract (or, to employ a symbolic description of an iconic misconception, “deeper”) *intelligible symbolic meaning or thoughts* which the scripted dialog is capable of articulating. And while those living in a *predominantly iconic* culture are often highly competent at dressing, accessorizing, standing, striking a pose, and the like, the predominance of such surface imagery tends to result in whatever *symbolic* communication or conversation they do engage in being focused on

the discussion of concrete things, events, and other people rather than abstract ideas.

All of this being so, it is perhaps unsurprising that despite spending much (often several times) more per capita on high school education than any other nation on earth, the USA, whose culture is increasingly saturated with iconic media, continues to see a drop in the symbolic literacy of its high school students, who currently rank 20th among the leading industrial nations (which is to say those with a comprehensive formal education system) in their average performance on standardized literacy tests. Consequently, although the capacity to write reasonably clearly is generally regarded as the minimum necessary prerequisite of university entry in the rest of the world, many US universities have had to invest extensively in writing courses and even writing centers, primarily geared not, it should be understood, to the fostering of creative, technical, or other forms of specialized writing but to teaching what often amounts to not much more than 7th grade writing skills!

However, although having taken, and passed, such remedial writing courses, students nevertheless often remain demonstrably incapable of writing even minimally coherent papers on or about abstract ideas. Thus while, in their remedial classes, they may well have shown themselves reasonably capable of writing on topics such as "A Day at the Beach" or "What I Did During the Holidays," a very large proportion of these same students, having later attended and completed extensive lectures and reading on topics such as "The Difference Between Belief and Knowledge and the Role of Experience and/or Reason in Justifying Beliefs," nevertheless still have the greatest of difficulty in writing coherently on such topics. Indeed, despite having done all of the above, many students equate the claim that "We are all entitled to our own beliefs" to the claim that "All beliefs are equally justified." The obvious reason for the disparity between their performances in writing and philosophy classes is that whereas the writing class topics, relating to *concrete* situations, events, and relations, *initially* lend themselves to *iconic* delineation or thought, the only difficulty being that of *subsequently* "translating" such *iconic* thoughts into *symbolic*

languages (which even should reference to first-person accounts of feelings also be included, remain largely *descriptive*), philosophy topics, relating more to *abstract* ideas, usually cannot be satisfactorily envisioned iconically but can, from the get-go, only be adequately conceptualized or thought about *symbolically*, and involve much more than purely descriptive articulation.

Difficulty in Writing/Communication Abstract Ideas Is Indicative of the Incapacity to Think Them

This being so, it is unsurprising that – and the pedagogical significance of this cannot be overstated – not only do those who experience difficulty in writing coherently upon more abstract topics also have considerable difficulty in speaking in anything like a vaguely coherent manner about them, but that, even more tellingly, upon being questioned about these difficulties, it soon becomes clear, which as they themselves frequently admit, despite the aforementioned lectures and reading, they never really understood what was being communicated in the first place. *Their difficulty in expressing themselves, whether in speech or in writing, upon such abstract topics, is therefore finally revealed as symptomatic of a more fundamental incapacity to think about or understand abstract ideas, relationships, and interactions.* A capacity which may be most effectively *first* fostered and nurtured in free-flowing conversations, discussions, and/or arguments, not unusually about politics, sex, religion, drugs, and the like, that might take place around increasingly rare family meals or in similar venues.

Small wonder then that, with an ever greater number of single-parent families, as well as two-parent families which, in the face of declining inflation-adjusted median incomes, have found that both parents are forced to work and/or to work longer hours to provide economically adequately for their families, and the consequent reduction in such communicative communal family experiences, children, who therefore increasingly turn to television, film and video games, etc., as a substitute, are missing out on the acquisition,

fostering, and nurturing of symbolic skills. Symbolic skills, which are as essential to thought about abstract ideas, relations, and interactions, as to communication of them; the incapacity to write, or even talk, about abstract ideas and their relations and interactions therefore is largely indicative of an incapacity to think about them also.

Active Participants Versus Passive Recipients and “Inner” Monolog/Dialog Deficit

Furthermore, as if all of this were not, in and of itself, sufficient cause for concern, there are, unfortunately, at least two other troubling consequences of the prominence of the iconic over the symbolic.

Firstly is the fact that unlike symbolic communication via the written or spoken word, which “hot” media, as Marshall McLuhan designated them (McLuhan 1967), require of the reader or listener a high level of *active participation* in the process of decoding as well as imaginative or creative *interpretation* (e.g., readers of A.A. Milne’s books must actively engage in creative co-constituting, along with Milne, the world of Winnie the Pooh), iconic communications, such as afforded by film and television, are, in contrast, “cool” media, or low in such participation (Disney’s “imagineers” offering us already constituted images of Winnie the Pooh and Tigger too), thereby encouraging *spectatorial passivity* in their audiences *rather than the active, imaginative and interpretive participation by which abstract ideas may be delineated and nurtured*.

Secondly, in contrast to symbolic language, as utilized in novels, for example, which, enabling as it does the deployment of abstract ideas or concepts, can readily present, in the form of descriptions of often highly nuanced psychological states and, via monologs, subjects’ thoughts, iconic media have much less facility in this regard. While even though TV, film, and video are, as previously noted, not merely iconic, but also symbolic, media, only clumsily do they accommodate voice-over or other symbolic presentations of the abstract ideas and concepts representative of

subjects’ psychological states and thoughts. Indeed it is for just this reason that one cannot imagine a truly successful film ever being made of J. D. Salinger’s *Catcher in the Rye*, for instance. This being so then, just as the predominance of the iconic over the symbolic not only attenuates communication of, but – given, as we have seen, that we think in language – the development of, abstract ideas, so too we may reasonably infer that it not only attenuates the communication of highly wrought and nuanced psychological states but their development also.

And as with the conscious self, so too, apparently, is the case with the unconscious. That is to say that if, as Jacques Lacan claimed (Lacan 1977), the unconscious is truly structured like, or indeed in, language, then the increasing dominance of *iconic* language will similarly attenuate the development of the unconscious as well.

In light of all this, then we should not be surprised at emerging evidence indicating that the brains of those children for whom television and video have come to replace traditional social intercourse and reading display significantly suppressed neuronal network development in critical areas.

Summation

In sum then, given the centrality of language not only to communication but to thought also, it would appear that the limited capacity of many students to write, or indeed speak, coherently in anything but the most descriptive mode, on all but the most concrete topics, which is to say their lack of fluency in symbolic language, is symptomatic of a limited capacity to think symbolically about anything but the most concrete things, events, relations, and interactions. An incapacity, which rooted, as has been argued, in the increasing eclipse of the symbolic by the iconic, is further exacerbated by the relative passivity encouraged by the latter and the consequently limited capacity for the imaginative innovation and interpretation central to the delineation and development of abstract concepts and/or ideas and, thoughts about their relations and interactions.

The Solution

In light of all the above, it is clear that the endlessly proliferating distance learning and online courses, usually characterized both by delayed feedback, as well as the preponderance of iconic representations, together with increasingly pervasive Power Point “pictogram” presentations, and the incessantly proliferating pedagogic technologies of film, video, computer graphics, and the like, while undoubtedly useful in some contexts, are nevertheless not merely usually inappropriate to the attempt to foster the symbolic thought core to much academic or intellectual development, but may actually suppress it; it is a conclusion empirically attested to by the recent Organisation for Economic Co-operation and Development (OECD) Program for International Student Assessment (PISA) study (OECD 2015) of school children in 31 nations, which – without attempting, as here, to analyze or explain why, nevertheless – found broadly speaking their intellectual development to be negatively correlated or inversely related to the employment of such technologies.

It would then seem that by far and away the best way to acquire and nurture symbolic fluency, and the many, not merely expressive but cognitive, capacities associated therewith, including, not inconsequentially, the capacity to write coherently, is by engaging, via ongoing dialogical discussion, characterized by immediate feedback, in abstract analytic conceptualization, thought, and expression, of which the philosophically oriented symposium is most surely paradigmatic. This, aided where appropriate by predominantly symbolically articulated lectures and the reading of written manuscripts or books, as well as the writing of essays which should be speedily graded and returned with comprehensive comments thereon, and should then, ideally, be further discussed, will be most likely to foster students’ active participatory engagement in imaginative and interpretive decoding, thought about, and expression of abstract ideas, situations and relations, and interactions, indispensable to their intellectual development.

Thus not only “In the beginning was the word” but pedagogically speaking it would seem that far beyond the beginning the word, or symbolic thought and communication, should continue to predominate.

Ideology

Manuel Anselmi
University of Perugia, Perugia, Italy

Introduction

Ideology is a very wide and polysemous concept that can have different definitions depending on the theoretical frame of reference. Generally, we speak of an ideological phenomenon when there is a conditioning of action of one or more individuals by a social power on the basis of objectives and criteria which are not critical and rational but rather in compliance with the objective of power domination.

Studies on ideology got under way in the 1920s and became widespread in the 1960s by means of the spread of Marxism. In the 1980s and 1990s, it was taken up again in the anthropological field with Geertz's research and in the field of political science with Freedman's work.

One of the milestones in this field was the volume *Ideology and Utopia* by Karl Mannheim (1936). This work, even before having the merit of giving a new definition of the concept of ideology in opposition to the concept of utopia, delineated a genealogy of the concept of ideology for the first time enumerating the different preceding meanings and establishing authors such as Machiavelli and Bacon as the philosophical antecedents,

Destutt de Tracy as the founder, Napoleon Bonaparte as the first great detractor, and Marx and Vilfredo Pareto as the classical critics. This book particularly underlined the fact that speaking of the ideology form of thought meant to speak of the historical social formation of knowledge, thought, and cultural processes in general. Mannheim's objective was to demonstrate the existence of what he defined as "nontheoretical" elements of thought, in disagreement with the logical mathematical approach inaugurated by the Vienna circle and by authors such as Russell and Wittgenstein.

Mannheim's theories and the theories of the sociologists of knowledge laid the groundwork for the future sociology of education, to which discipline Mannheim himself later dedicated some important essays.

During the Second World War, a work was written that contributed to a first revision of the historiographical formulation of the problem of ideology which had been advanced by Mannheim. It was entitled *Wahrheit und Ideologie*. It was written by the philosopher Hans Barth and had a first ill-fortuned German edition in 1945, followed by a second edition also in German in 1961 which made it famous and eventually made it a benchmark for successive studies. The novelty of this essay was the way it dealt more attentively with the single phases of the formation of the concept of ideology – the important role of Destutt de Tracy, creator of the term ideology, the clash between the *ideologues* and Napoleon Bonaparte, the political implications of Helvétius' and Holbach's sensationalist theory, and Marx's criticism of ideology in regard to the concept of alienation – but especially Barth examined the theme of ideology in relation to the thought of Schopenhauer and Nietzsche, defining Schopenhauer a "critic of reason."

Nietzsche had already been referred to by Mannheim in *Ideology and Utopia* but only regarding the theory of resentment. Barth's writing, on the other hand, bolstered by the Nietzschean interpretations of Heidegger and Jaspers, emphasized the operation of criticism of occidental metaphysics which Nietzsche had promoted, as, for example, in the work *The Twilight of the Idols*.

Norberto Bobbio wrote an important essay on Pareto entitled Vilfredo Pareto and the critique of ideologies (Bobbio 1973) in which he explained the Paretan term “derivation” with the term of ideology.

At the beginning of the 1960s, authors like Daniel Bell with his work *The End of Ideology* and Jean Meynaud in 1961 with *Destines des ideologies* announced the end of ideologies. But instead of the promised end, those years saw a genuine *renaissance*, both on the social historical level with the formation of collective protest movements of western societies and on a strictly theoretical level with the igniting of a debate which involved almost all of the philosophical and sociological currents of the time.

After the Second World War, Marxism was undoubtedly the thought movement most greatly involved in the debate on ideology.

The benchmark definition is the passage from *German Ideology* in which Marx and Engels equate ideology to a *camera obscura*, identifying it with this process of overturning and even falsifying reality. Within the Marxist scene, there were many important attempts at clarification of the Marxist concept of “false conscience” as well as important revision work. Analyzing this theme, we get the clear impression from a distance of many years and with a critical historiographical observation that we cannot speak of an Italian Marxism as if it were a single and homogeneous block, but rather we must instead speak in the plural of Marxisms, each one of which with its own identity, its own history, and its own destiny. As to the Marxist interpretation that stuck the closest to the negative formula of ideology as a “false conscience,” the meticulous analyses of Georges Gurvitch, who found another 12 meanings of the term ideology in Marx’s work, stood out from the innumerable studies that constituted the Marxist exegesis of the period.

Two heterodox interpreters of Marxism who both proposed a positive understanding of ideology, Gramsci and Althusser, represented a novelty. Gramsci, whose prison writings were published postmortem starting with his *Letters from Prison* in 1947 up to the critical and philological edition of *The Prison Notebooks*, edited by

Valentino Gerratana in 1975, described ideology as a “conception of the world” fundamental for the organization of the masses (Gramsci 1975).

Althusser, on his part, felt the effects of a stronger Hegelian ascendancy and defined ideology as a cultural system with its own internal coherence characterized by a practical social function.

The Althusserian positions were held in great consideration in the empirical studies of the sociologists of education, also called the theorists of social reproduction. It is opportune to mention Bourdieu and Passeron from among them, who wrote one of the classics of neo-Marxist criticism of bourgeois ideology and of scholastic institutions of the bourgeois State, *Les héritières*, in which they denounced how in French schools there were selection mechanisms that were independent from the skills acquired by the pupils but instead dependent upon their social membership.

The Institute of Social Research of Frankfurt, known as the School of Frankfurt, dedicated one of its famous sociology lessons to the concept of ideology in 1954. The Frankfurt analysis dwelt upon the ideological aspects that were intrinsic to mass communications and to the process of Hegelian and Marxist-type alienation produced by these phenomena. It was a denouncement of the implicit, latent, and negative training of the individuals of mass society on the part of post-industrial capitalistic production structures.

The School of Frankfurt warned against a negative, noninstitutional pedagogy that was intrinsic to the very form of postindustrial society and highlighted the spread of alienating non-democratic models of behavior. These themes are to be found to some extent in almost all of the works of the thinkers who were, each in his own way, animators and protagonists of this thought orientation, such as Max Horkheimer, Theodor Adorno, Erich Fromm, or Herbert Marcuse. This last was the author of a work, *One-dimensional man*, which proposed the controversial task of reopening the question of ideology of advanced postindustrial society. Just as the subtitle suggested, the work opened with a denouncement of the paralysis of social criticism that had begun in the period after the war, which

for Marcuse had led to a society without opposition. Thus Marcuse exhorted the reader to oppose with criticism the specious mechanisms of ideology of the society in which he found himself living.

One of Horkheimer's young students, Gerhard Vinnai, published a work entitled *Football Mania: The Players and the Fans: the Mass Psychology of Football*. The work stirred up a great debate because it analyzed the phenomenon of soccer underlining the mechanisms through which the dominating classes exerted their control over the masses by insinuating a politicalness and an unexpected ideological reality into the sport experience so important in the values of the young.

On the semiotic studies front during the 1960s, Umberto Eco's works tried to analytically characterize the ideological forms inherent in some products of mass culture, combining instances of Frankfurtian, Gramscian, and structuralist origin. This is the case, for example, of *Superuomo di massa. Retorica e ideologia nel romanzo popolare*, a 1976 study. In this work he drew from one of Antonio Gramsci's intuitions about the presence of a superman rhetoric in the serial novels of the nineteenth century. This can be seen first of all with Dumas, who had a determining effect in the development of vitalism in the first decades of the century. Umberto Eco brought out a new individualistic ideology promoting pedagogical values that took inspiration from a rough supermanism and a populist vitalism in the contemporary pulp fiction heroes like James Bond or the comic book heroes like Superman and Batman (Eco 1976).

In the field of psychology of that period, Erik H. Erikson highlighted a typical function of the ideological cultural process in his work *Identity: Youth and Crisis*. It is the reinforcement of a group's social identity. There is in fact a profound relationship between ideology, social identity, and institution. Erik Erikson defined ideology as "the guardian of identity." For Erikson ideology is able to cement the relationships of social actors making up a group because first of all it allows them to elaborate their common needs and difficulties at a superior level of rationality and with a clear and

usable discourse. On the basis of this analysis of reality, which is already discursively aggregating because it is clear and persuasive, ideology furthermore offers a general practical solution to individual problems whose ability to be solved is rationally founded, shared, and convincing. Definitively for Erikson it deserves a more extensive explanation. Ideology cements identity due to its high degree of coherence which is expressed on an individual as well as a social level (Erikson 1968).

Later the scientific works on ideology began to diminish, both within the science of education field and in the more general field of social sciences. Nevertheless two noteworthy contributions on the part of two social scientists of different extraction are to be mentioned. The first in chronological order is the essay by the American anthropologist, Clifford Geertz, entitled *Ideology as a Cultural system*, which received its due attention at the beginning of the 1980s as an alternative to the structuralist approach in decline by that time. Geertz's texts were translated into Italian during those years, and his positions on the theme of ideology reported a resumption of studies and an evaluative theory (Geertz 1973).

In 1986 the book by Raymond Boudon, *Ideology, Origin of Prejudice*, came out. It returned to the theme following the methodology of methodological individualism with a Weberian ascendancy particular to the author. It resumed the classic concept of ideology as a false judgment or self-interested judgment (Boudon 1989).

Another important French contribution came from Michel Foucault's work which constitutes a fundamental reference point for the studies of ideologies. Even if he does not approach this theme explicitly, Foucault develops an analysis and a genealogy of widespread power that can be considered a critique of ideology. Foucault particularly elaborates concepts such as "disciplinary society," "power devices," and "total institutions" which open profound study perspectives of the individual's social conditioning.

In the last few years, in light of the end of the soviet socialist systems and of the ideological greats, Michael Freeden has elaborated new theories on ideology, particularly "thick-centered"

ideology which explain the new contemporary ideological forms. These forms are more strategic and less long term, often to be found in contemporary political populisms (Freeden 2003).

Recently the philosopher of language, Teun Van Dijk, defined a “strategy of ideological discourse” which he outlined in a series of prepositional pairs:

Speak about Us in a positive way.
 Speak about Them in a negative way.
 Don't say negative things about Us.
 Don't say positive things about Them.
 Stress the positive things about Us.
 Stress the negative things about Them.
 Play down the negative things about Us.
 Play down the positive things about Them.

In every ideological discourse, we may observe this integral opposition which may be evident to a greater or lesser degree. We may note, for example, a high degree of this opposition in racist ideologies where the controversy with regard to the dimension of Them reaches the maximum degree: the will to eliminate (Van Dijk 1998).

The reasons for this expressive characteristic have their roots in the nature of group dynamics. To belong to an ideology means in fact to identify oneself with a social group which expresses itself though the cultural apparatus which the name of the ideology designates, but it also means to place oneself in a condition of exclusion and the refusal to have anything to do with whoever does not identify himself with that group.

‘Ilo

Seu’ula Johansson Fua
 Institute of Education, University of the South Pacific, Nuku’alofa, Tonga

Introduction

The term ‘ilo is present in a number of Polynesian languages with a general translation as seeing or knowing. The terminology ‘ilo in the Tongan language refers to a body of knowledge, as in knowledge about agriculture, fishing, and weather systems. The term ‘ilo also refers to the process of finding, recognizing, and knowing. Thaman (1999) refers to ‘ilo as both the “process of knowing and to the knowledge itself.”

In the process of knowing, *'ilo* is taken to be part of a learning process, *ako*, with the desired outcome of a person having mastered a body of knowledge and become *poto* or *tangata poto*, a learned person (Kavaliku 1966). In the Tongan context, there is a marked difference between *'ilo* as knowledge and *poto*, being the use or application of *'ilo* to a particular situation – in other words, it is applied knowledge. *Ilo* and *poto* and *ako* are three main concepts generally used to describe education in the Tongan context (Thaman 1988). Thaman (1999) further defines *'ilo* in an educational context to include:

- To find – *Na'a ne sio ki a Mele 'i kolo.* (She saw Mele in town)
- To recognize someone or something – *Na'e 'ilo koe e Atu?* (Did Atu recognize you?)
- To find out – *Na'a ke 'ilo 'a e ola e sivi?* (Did you find out the results of the examination?)
- To discover – *Na'e 'ilo 'e Sela ha koloa mahu'inga.* (Sela discovered a treasure)
- To know – *'Oku 'ilo 'e Tevita 'a e ngaahi me'a lahi.* (Tevita knows a lot)
- To be well-informed or knowledgeable – *Ko e faiaiko 'ilo lahi 'a Seini* (Seini is a well-informed teacher)
- Knowledge or information – *'ilo fakatufunga.* (knowledge of carpentry). (p. 728)

In brief, *'ilo* refers to the process of discovering new knowledge as it is also about the knowledge itself.

'Ilo Is in the Discovery Process

The process of finding, recognizing, and discovering, *'ilo*, is a process that is intricately linked to the sociopolitical context. All *'ilo* in Tonga is ranked and classified and to some extent is structured along similar lines to the traditional political structure of the country. For example, particular knowledge system about the sacred kava ceremony (*taumafa kava*) is guarded by certain clans of *matāpule* or talking chiefs. The language, protocol, and traditions associated with the knowledge system of the sacred kava ceremony are specific, rich with tradition, and practiced by a selected number of *matāpule*. The process of discovering, finding out, and knowing about this

sacred ritual is accessible at two key platforms. As this knowledge is taught in the formal school curriculum, every student in Tonga should be able to recognize features and follow through the protocol of the kava ceremony. However, to know and to become knowledgeable and well informed about the *taumafa* kava ceremony, this knowing is only accessible to a few people within defined clans.

The process of discovering, of finding out, and of knowing is to some extent defined by the knowledge itself and the person seeking that knowledge. For example, there are knowledge systems associated with traditional medicine that are often guarded by a clan or family group. There are beliefs often associated with this kind of knowledge that relates to how the clan acquired or come to know of the medicine. Further to this, there are often beliefs about usage of the knowledge and about protection and precautions regarding the use of the knowledge. Seeking of this type of knowledge then is only accessible to defined persons within a clan and remains closed to general public.

However, when knowledge is clearly accessible to all the process of discovering, finding out, and knowing is again linked to Tongan way of thinking. Taufe'ulungaki (2009) describes Pacific people's ways of thinking to be "creative, holistic and spatial; divergent instead of linear logical; interpersonal, which favours groups activities, spoken over written language, and demonstration and doing rather than verbal direction; and kineshetic, which lends itself to physical activities." (p. 15). Further to this, Taufe'ulungaki (2009) argues that the "common learning strategies that emerge from this specific cultural context are: observation, imitation, listening, participation, and asking. The questions are of the information seeking-type and to obtain technical advice" (p. 15). What this highlights is that the act of *'ilo* in the process of discovering is about observation, listening, modeling, and joining in the processes. The *'ilo* process of discovering also involves seeking technical advice, practical to do type of skills and with practical participation in the learning. When carefully examined, this process of *'ilo* or discovering new information is closely

associated with technical and vocational programs offered as an alternative pathway to often heavy academic curriculum in Pacific schools. The *'ilo* process of discovery is practiced in the informal learning sphere as people continue to learn and gain *'ilo* about fishing, agriculture, farming, weaving, carving, and other traditional crafts.

'Ilo Is in the Knowledge System

There is an intrinsic value placed on *'ilo* as a knowledge system. *'Ilo* is worthwhile and valued particularly when it is considered as being useful for the nation and for others. Education is seen as a place where parents invest time and money for their children to acquire *'ilo*, so that they may earn a livelihood and meet cultural obligations. For Tongans, *'ilo* has to be worthwhile and useful for their families and their communities.

In Tongan context, what is considered knowledge and *'ilo* is a body of knowledge that has been tested over time, critiqued and validated through collaboration and consensus. *'Ilo* as a body of knowledge is also recognized to be susceptible to changes over time.

There is a range of knowledge system present within contemporary Tongan culture. Like many other Polynesian cultures, Tongan culture through Christianity, education, and “development” has evolved and lost a number of traditional knowledge systems. The loss of some traditional knowledge systems has been due to decline in usage of the knowledge, changes in environment limiting access to natural products needed in the preservation of some knowledge systems, and change in beliefs regarding certain practices and *'ilo*.

Tonga has a number of traditional knowledge systems (Fua et al. 2011) that include:

Time – traditional time is based on reading signs of nature (sun, moon, stars) and behaviors of animals such as birds and insects.

Beliefs and psychic knowledge – beliefs about dreams, signs, and natural phenomena still play a strong influence in Tonga’s psyche.

Music – traditional knowledge about the use of metaphors and imagery in music and

composition are still in use, but also evident are influences of new forms and knowledge of music.

Dance – there is a range of dances that are still being practiced with some dances inherited from other Pacific countries that were under the Tongan Empire prior to European contact (eighteenth century).

Agriculture – knowledge systems surrounding planting, harvesting, and conservation methods are still practiced with agriculture being one of the main sources of income for the country.

Fishing – although there are some signs of decline in the knowledge system associated with fishing, there still remain strong practices of traditional knowledge and contemporary knowledge added to fishing in both reef and ocean waters.

Navigation – despite a rich navigation history, existing traditional knowledge system on navigation is on the decline, with limited usage of the skills and few people still practicing this knowledge.

Medicine – knowledge on traditional medicine is still practiced together with associated beliefs and the use of medicinal plants.

Rituals and customs – the changes in the knowledge associated with rituals and customs are most evident in all of the knowledge systems. Changes in beliefs, practices, and influences of economics impact on the practices and consequently on the changes in the knowledge systems associated with rituals and customs.

Taufe’ulungaki, Fua, and colleagues (2008) highlighted that *'ilo* when used wisely, people can live sustainable livelihoods in Tonga. Tongan people who live a life of *mo’ui fakapotopoto* demonstrate not only the range of *'ilo* and knowledge systems, but are able to use these knowledge systems wisely to sustain life in Tonga. Further to this, Taufe’ulungaki and colleagues also point out that when people practice *mo’ui fakapotopoto*, there are also behaviors, values, philosophies, and beliefs that are lived and are clearly part of the *'ilo*, of the knowledge system. Taufe’ulungaki and colleagues add another dimension to the

understanding of 'ilo, in that it is not only about knowing and a knowledge system, but being able to live out and practice the philosophies and beliefs that are associated with the knowledge systems.

The Use of 'Ilo in Educational Frameworks

In an effort to translate the philosophy of 'ilo into practice, two educational frameworks have emerged to date.

Langafale ako framework was developed by Fua (2008) as a response to a need from the Tonga Ministry of Education for a framework to guide the professional learning and development of teachers. The *Langafale ako* framework was later used by the Tonga Institute of Education to guide the redesign of the institute's Diploma in Education for primary and secondary teachers.

At the core of the *Langafale ako* framework is the aspiration of a Tongan teacher to be of service to the country, and this is espoused in the phrase *Faiako ma'a Tonga*. In the Tongan context, teachers, teacher educators, and administrators use the phrase *Faiako ma'a Tonga* when referring to the *Langafale ako* framework. When the phrase *Faiako ma'a Tonga* is used, it evokes a sense of duty, honor, and responsibility among teachers.

The *Langafale ako* framework is based on the building of a traditional Tongan fale. In this framework, it recognizes 'Ilo as one of four pillars of a professional learning and development framework for teachers. Within this framework, teachers are required to master a range of knowledge pertaining to teaching that fit the local context as well as respond to a changing global context. The pillar of 'Ilo also encourages teachers to not only share knowledge but also to be knowledge builders themselves. The use of 'Ilo in this framework recognizes that teachers are creators of knowledge and are responsible for ensuring that this 'Ilo is grounded on Tongan context, value systems, and beliefs.

The *Founga ako* framework put forward by Vaioleti (2001) is based on Tongan theories of education, and he presents this for Pasifika

context in New Zealand. The *Founga ako* framework is more detailed in its presentation and exploration of 'Ilo through a number of educational dimensions. The *Founga ako* framework is presented as a guide for both teachers and students to engage in a learning that preserves the knowledge, values, and language of Pacific and Maori people as well as maintain their well-being. In the *Founga ako* framework, it weaves 'Ilo through a number of educational dimensions that considers diversity, identity, social interaction, culturally safe classroom, language, culturally inclusive content, and assessment. An example is the use of 'Ilo expressed within the dimension of culturally safe classroom. In a culturally safe classroom, a teacher's pedagogical behavior recognizes the "knowledge of cultures of community; political and spiritual concerns have key community contacts." In response the students' cultural display shows a search "to understand social, spiritual and academic matters for others readily. Treat classroom as a place to recharge, a home where friends are" (pp. 256–258).

The *Langafale ako* framework (Fua 2008) and the *Founga ako* framework (Vaioleti 2001) are both frameworks build on Tongan education philosophy of *ako*, 'ilo, and *poto*, demonstrating the link between all three concepts. The two frameworks also demonstrate attempts by academics to further explore the 'ilo as a process of discovering and 'ilo as knowledge itself as applied to teaching and learning processes. While the *Langafale ako* framework firmly situates itself in the Tongan context with its people and culture and designed specifically for Tongan teachers, the *Founga ako* framework is more daring in that it takes traditional Tongan education philosophy out of Tonga to a New Zealand context. Further to this, the *Founga ako* framework goes even further to argue for the consideration of this distinctively Tongan education philosophy to be applied for other Pasifika, including Maori, communities in another context. While the *Langafale ako* framework focuses on the professional learning and development of the teacher and traces the teachers' development from preservice stage to in-service training, the *Founga ako* framework gives consideration to both the teacher and the

student. The *Founga ako* framework can be seen as an extension of the *Langafale ako* framework.

Conclusion

'Ilo in a Tongan context is about the process of searching, finding, seeking, and discovering new understandings. 'Ilo is also about the knowledge itself; in fact it is a knowledge system with its associated beliefs, structures, language, skills, and context. 'Ilo in the Tongan context is always situated within a space and purpose but it also remains open to dialogue and critique. 'Ilo is also highly valued when it is purposeful, useful, and worthwhile. Traditional knowledge systems where 'Ilo is grounded are a vast system of knowledge that spans time and space. Tongan traditional knowledge systems range from ocean-based 'ilo to astronomy, to agriculture, to music and dance, and to protocol and customs. While traditional knowledge systems remain strong in some areas, there are also evidence of changes, decline, and new knowledge systems growing.

In an effort to rethink the inherited education systems of the missionaries and colonial administrators, Tongans have been trying to incorporate 'Ilo into the education system. The work of Vaiioleti (2001) and Fua (2008) demonstrates the journey thus far in this effort to incorporate Tongan philosophy of education and specifically of 'Ilo into the education of Tongan people.

Images of the Child and Learning in the Early Years Curriculum: A Historical Overview

Lynley Tulloch¹ and Margaret Stuart²

¹University of Waikato, Hamilton, New Zealand

²Independent researcher, Matangi, New Zealand

Introduction

Western early childhood education (ECE) curricular traditions have emerged from philosophical thought of the Enlightenment (late seventeenth to early nineteenth century). This entry is a thematic exploration of images of the child (for example, child as rational or spiritual being), conjured by Enlightenment philosophers. The image of the child sat alongside imagery used by these philosophers in explaining theories of children's learning and teacher pedagogy. The authors suggest that this imagery has underpinned traditions in ECE including developmental psychology (DAP) and sociocultural models.

Enlightenment philosophers conjured a curious mix of imagery to help explain their ideas of childhood and pedagogy that, nonetheless, make sense within their sociohistorical context. Thus, this entry demonstrates a genealogical exploration of philosophical imagery that reflects a modernist privileging of scientific knowledge, individualism, and reason (empiricist trend). These were positioned alongside a focus on the child as a

spiritual being (spiritualist trend) and Romantic themes of nature as divine (nativist trend). In addition, the child was also positioned through Enlightenment imagery as an interconnected being, part of a wider community and not just an isolated biological entity (interactionism trend) (Bruce 2011).

The Enlightenment Period

Over the past three centuries, philosophers have presented differing views of the child: images that posit the child variously as *tabula rasa*, an unfolding organism, a developing moral and spiritual being, and as a scientist exploring nature. Many eighteenth century images of the child were drawn from biological assumptions of the child based on the science of evolution. Other views regard the child as developing according to God's divine plan, expressed in nature.

These two insights of the child as a spiritual masterpiece and as "developing" according to evolutionary science were not contradictory within the context of seventeenth and eighteenth century Western traditions. The science of evolution that children's fetal and childhood stages were in fact recapitulating evolutionary and societal stages was a critical insight that forged an understanding of "childhood" as a stage and of the child as "developing."

During the European Enlightenment, concepts of humankind such as those of life, of work, and of language became integral to the State and to curriculum. The mediaeval city as God's "heaven-on-earth" was replaced with a belief in society and self-seeking beings bound together by civic contracts. Now rational humankind should engage with the world to discover God's plan. Rational civil beings were able to draw on the natural laws of the sciences, mathematics, and logic to make sense of the world. Childhood was the period for molding the child-to-be-citizen, with curriculum the mechanism for developing civil domains required by society.

However, as European societies became industrialized, later philosophers adopted images of the mind as a machine, of learning as architecture. An

understanding of the child as a spiritual being were overtaken in the twentieth century by the concept of "child development" which was shorn of its deeper spiritual meaning.

The modern construction of "the child" as a rational human being emerged to remain embedded within contemporary child development psychology and by association early childhood education (ECE). So in this entry, the authors discuss some of the historical imagery that has descended to inform current principles in ECE. For example, the widespread use (particularly in the United States) of DAP owes its genesis to the Enlightenment philosophers discussed such as Froebel, Montessori, and later developed by Piaget, Erikson, and Skinner (Pound 2011). To illustrate this, the authors discuss the imagery of Froebel who focuses on ages and stages and Montessori who looks at sensitive periods in the developmental process.

Philosophers' Images of the Child and Children's Learning

In this section, we trace some of the historical ideas that have occurred across time and place to construct the modern child and theories of children's learning. The categories of spiritualist, empiricist, nativist, and interactionist, identified by Terri Bruce (2011), are used alongside the additional theme of spiritualist. These overlapping themes discussed below have emerged and become central in understanding the child and learning within society. They have significantly contributed to the construction of certain ontological images of the child, teacher, and curriculum.

Spiritualist

Spirituality was powerfully embedded in Enlightenment images of the child and learning. It was linked to emerging ideas of science, nature, and civil society.

Frederich Froebel (1782–1852) is notable in ECE for creating educational toys that he called "gifts." Froebel's "gifts" had metaphysical connotations: the sphere as "the first, and the last, natural form," universal, experienced by all. For example,

his first gift was the balls which were soft, made of yarn and of a solid color, designed to teach the child (through her interaction with them) the physical laws of the universe such as motion, object, weight, and gravity. The gifts were designed to foster in children a knowledge of humankind and of God and nature (as God's garden on earth') (Adleman 2000, p. 104). Thus the spiritualist and nativist themes were not discordant within Froebel's overall philosophy.

Maria Montessori (1870–1952) combined spiritual and scientific planes. Both planes worked to ensure the unity of spirit, soul, and body. For Montessori, the young child learned through natural laws of development imbued with psychic energy. Montessori used the image of the child as a "spiritual embryo." In the early unconscious stage, Montessori said, this spiritual embryo was guided by natural laws of development which are seen as akin to the psychic life of the child. She argued that this psychic force is cosmic and runs through all of humanity in its natural state. The mind absorbs impressions so that the child undergoes a transformation and does not remain separate from them. The child absorbs language, habits, and customs effortlessly and unconsciously whereas adults have to work hard to acquire these. Thus the spiritual and natural laws of development worked concordantly in the child's growth and education (Tzou 2007, p. 37).

In addition, the child went through what Montessori called "sensitive periods," which were nature's plan to support psychic aspects of mind. Montessori also held that birth to age 3 is the time of the "unconscious absorbent mind," whereas age 3–6 is the time of the "conscious absorbent mind" (Edwards 2002, p. 6). Montessori suggested that the child was engaged in valuable "work," guided by psychic natural laws involving the construction of a "masterpiece" – the future adult. She had a very specific use of the term "work" as a metaphor for construction of the future adult. The child has the potential to provide new direction for the future of humanity.

The spiritual dimension was all-encompassing for Montessori who likened sinful tendencies in the teacher as to weeds in a field: unable to see the child as Jesus saw him.

Empiricist

John Locke's (1632–1704) tract, *Some Thoughts Concerning Education* (1690), addressed the issue of the child's character, of the child as rational being. The newly emerging concept of the child's will was central in such philosophies. The child being free to express him/herself was seen as important in the development of individuality and reason, both of which are pre-requirements of a civil society.

Locke's image of tabula rasa was of young children as analogous to white paper, or wax, to be fashioned by the tutor. Children were "prerational" and required the teacher to mould their emerging rational capacities. This imagery supports a deficit view of the child as lacking and needing to be filled with experiences, concepts, knowledge pre-identified by the teacher (Bruce 2011).

Nevertheless, Locke did suggest that education proceeded best when based on the child's interests and acknowledged the child's need for self-expression. Hence, Locke argued that teachers of young children should offer books appropriate to their interest, such as Aesop's fables and integrate reading with games, for example pasting letters on the sides of dice to familiarize them with vowels, letters, and syllables. Children while playing could be taught to read.

Nativist

Jean-Jaques Rousseau (1712–1778) believed that the child was biologically preprogrammed to learn naturally. He suggested that immersion in nature was the best way to facilitate the child's growth toward a rational, civil, and empathetic adult.

Here the Romanticist tradition is positioned precariously alongside the Enlightenment belief in rationality. Rousseau did not shy away from explaining how the two themes are connected. Using the image of unripened and immature fruit, Rousseau argued that because children differed in important ways from adults they should be educated in the natural world, the locus of all reality. Trying to force them to reason when they do not have the faculty is to impose adult prejudices on them. This could result in their corruption (like rotten and unflavored fruit).

In his novel *Emile* Rousseau used the metaphor of cultivation to express the nature of education (Rousseau 1762/2011). *Emile*, a fictitious character, served to demonstrate Rousseau's educational proposition that the child needs to interact with nature independently from human theories and bodies of knowledge that construct it in terms of inert highly verbal information. Rousseau rejected Hobbes' view of civilization as the state that ordered society, of the social contract. He was deeply skeptical of civilization, and he argued that all humans were born equal and innocent but through social processes humans become affected and manipulated.

Rousseau held that children have natural inquisitive impulses that are always correct. The child rather than the tutor governed their interactions, in an inversion of Hobbes' or Locke's view of the child-tutor relationship. "Take an opposite course with your pupil. Let him always believe he is master." He ought to do only what he wants, but "he ought to want only what you want him to do" (cited Baker 2001 p. 257). Free will is retained by the child but is supported by the tutor to choose wisely.

Froebel drew on Schelling's philosophy, and his contemporary Johann Heinrich Pestalozzi's pedagogy, in stressing the importance of children's interactions with natural phenomena. The kindergarten – meaning literally "garden of children" – refers to his educational philosophy of creating the "right conditions" (environment) for children to flourish (grow and learn). The kindergarten was an idealized view of German society, removed from outside influences (Adlemen 2000; Baker 2003). As with the development of inner spirituality, so Froebel's pietism portrayed children's development as requiring the same series of steps for the religious life as is found in the development of the human race.

Interactionist

Interactionist philosophies stressed the child as more than just a biological unit preprogrammed to learn naturally, but one who must interact with both social (family/society) and natural elements in order to develop. The child's sense impressions were regarded as critical in this interaction

between the interior will, innate developmental predisposition (often regarded as divine), and external world.

To **Johann Friedrich Herbart (1776–1841)**, the child was born without a will of his own (see Baker 2002). It was in the family he initially learned of authority and love. The teacher fostered – through cultivation and exercise of the child's sense impressions – each individual soul to a greater knowledge of their will. Herbart focused on governing, rather than punishing. The teacher guided her charges' mind through a variety of "presentations" which supported the student's "apperception," always building on what had gone before. An ordered program (the "reals") offered a balance between the interior will and the exterior world. Learning built on earlier knowledge, as it was from previously understood perceptions that the child made new sense.

For Montessori, the child's interaction with the wider environment was critical to her development. The role of the teacher was to observe the child closely to see where they expressed interest, in order to take advantage of "sensitive periods of development." Doing so was regarded as the basis of a relevant scientific pedagogy – a premise still significant today. For Montessori, children "revealed themselves" and their "natural intelligence" through free exploration of the didactic material set up and demonstrated by the teacher. The teacher's role was that of a person being precise like the scientist, yet spiritual like the saint; being skilled in techniques of science, yet open to the wider social world. The Montessori equipment was designed to develop the child's sense through which she makes sense of the world.

Herbart also believed that training was most effective when the teacher worked through the student's observed interests and facilitated her interaction with the environment. Learning, Herbart believed – seeing parallels with the laws of Newtonian science – involves action and interaction by an individual seeking equilibrium. The teacher's role was to guide this through careful scientific observation. The power of education to guide the child to societal morality was central to the interactionist theme. Herbart argued that the

teacher should train the child's moral sympathies by introducing the knowledge of previous generations: a science based on ethics and psychology.

Philosophers such as Frederich Froebel, J H Pestalozzi, and Maria Montessori believed that by following their own interests, and reflecting on their learning, children develop civil behaviors and judgments. This is strongly linked to the modern day premise that children should be able to choose their own equipment and follow through with their play. Governance of children, by the State and tutors, would lead to habits of self-governance. For Froebel, the kindergarten was an idealized view of German society, removed from outside influences.

Enduring and Marginalized Images Over Time

In this entry, the authors explore the roots of the current ECE curriculum through an analysis of imagery and images of the child used by Enlightenment philosophers. Current ECE traditions (whether those based on the principles of sociocultural theories or DAP) began as explorations of the metaphysical purposes of being – of life, learning, and civil engagement. The four themes identified (spiritualist, nativist, empiricist, and interactionist) above are highly influential in current ECE contexts.

Thus the images of the child and imagery used by philosophers still inhabit curriculum concepts to a greater or lesser degree (Davis and Sumara 2002). Bruce (2011) has identified a set of common principles that are generally accepted in current ECE theory and practice based on the work of early pioneers such as Montessori and Froebel. For example, intrinsic motivation is based on the early ideas of the child's will discussed above. It also rests on nativist ideas of natural internal impulses. Currently the idea of intrinsic motivation is highly valued in ECE, resulting in environments being prepared to foster child-initiated and self-directed activity (Bruce 2011).

Another common principle in ECE is that of the child's education being based on interactions between themselves and the wider social and

natural environment. Enlightenment philosophers discussed in the interactionist section above focused on this critical educational insight which informs both sociocultural and DAP traditions. The idea that there are certain times when children can learn things best is another principle originating in Montessori's sensitive periods.

However, many of the ideas discussed above have lost any connection to their original social and historical contexts and thus the original intent has become significantly altered. Cut loose from their original source, children's curriculum and teachers' knowledge has become a universal educational "science." While the spiritualist theme has in many cases been cast to the margins, other key ideas have descended to significantly inform both DAP and sociocultural approaches. Arguably, both these approaches coexist in curricula documentation today, with the DAP being dominant.

Universalized assumptions, under the status of "the science of Human Development" operate often undisputed in the global society of today. DAP theories draw on both the empiricist and interactionist trends. They privilege the individual and ahistorical stages of development each child must pass through. For instance, children are seen as infants, toddlers or young children, as they progress through their early childhood years.

Sociocultural theories point to the significance of the cultural and historical contexts that shape teacher-student interactions and aspirations. They also draw significantly on the interactionist thought of early philosophers.

Other insights have been marginalized rather than altered. For example, the centering of theodic curriculum, of moral development by Froebel and Montessori, is less evident today in ECE. Today, Enlightenment images like "divine sphere" or concepts of "will" are shorn of their spiritual meanings in curriculum. As nature has become sanitized, teachers as agents of the State order the child through curriculum with foci on early literacy, numeracy, and social and emotional skills that relate to later employable competencies. The concept of child as a spiritual being has descended so that in most western curricula it is, at best, covert.

Nativist themes have also become marginalized with structural images replacing biological

images; the child-in-nature of Froebel is no longer valued. Rather the science of development prevails. Balls are merely balls: no longer representations of that which connects the child with nature as the universe connects man with God.

Improvement and Accountability Functions of Assessment: Impact on Teachers' Thinking and Action

Gavin T. L. Brown

Faculty of Education and Social Work, The University of Auckland, Auckland, New Zealand

Introduction

Assessment is everywhere in schooling. In some countries, it begins before schooling starts with screening tests and interviews for selection into elite or competitive nursery schools or kindergartens. Nonetheless, for most children and adolescents, if assessment is not a regular occurrence, it looms in the background, perhaps haunting or driving their learning. Likewise, assessment plays an important role in curriculum and teaching; assessment is how teachers monitor students' progress through the curriculum and how curricula can be evaluated for effectiveness. Unsurprisingly, assessment is also used by governments, the media, and parents to determine the quality of schools and teachers even though there is strong evidence that such uses have generally negative consequences on teaching, curriculum, students, and learning (Hamilton et al. 2007); although some positive consequences (e.g., teaching being focused more directly on the curriculum underlying the test) have been documented (Cizek 2001).

Educational policy shapes the context in which teachers perform their multifaceted work (e.g., planning, teaching, and evaluating). Policy expresses the societal and cultural norms valued by members of that jurisdiction. Thus, the introduction of policy reform around assessment (e.g., No Child Left Behind or National Standards

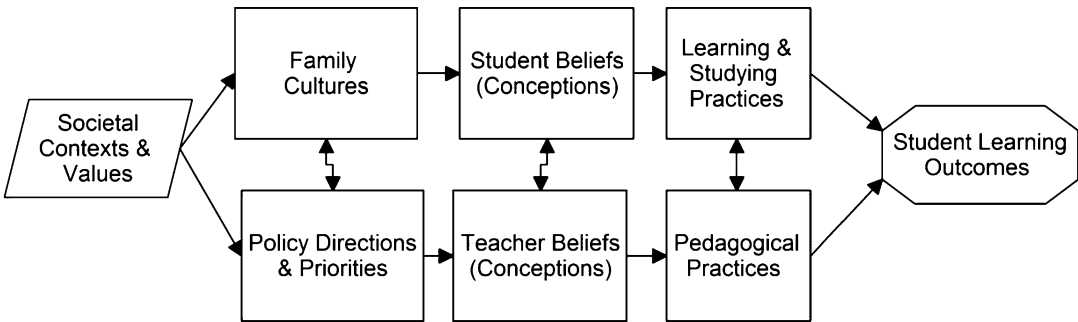

vs. Assessment for Learning) may express values not necessarily held by teachers employed to implement such policies. When policy needs to be implemented by teachers, it cannot be assumed that teachers will enact policy as intended. Indeed, there is strong evidence that how teachers conceive of a phenomenon acts to filter (i.e., control what they pay attention to), frame (i.e., control how they understand what they pay attention to), and guide (i.e., influence their behavior) their responses to that phenomenon (Fives and Buehl 2012). Hence, attention needs to be paid to the conceptions or beliefs teachers have surrounding current assessment policies and priorities so as to better appreciate how they are likely to understand, respond to, and implement assessment reforms. This is especially the case when school systems place increasing responsibility for assessment in the hands of schools or teachers, rather than solely in the control of external examination boards. If teachers conceive that assessment is primarily about evaluating student performance or if they conceive that learning from assessment (i.e., improvement) is largely what the student is supposed to do, then it is unlikely they will use assessment information to reconsider their own teaching practices, even if students in their class do poorly on one or more topics covered by the assessment. Offering teachers more training in test statistics, test item writing skills, or curriculum content knowledge, without addressing their conceptions of what assessment is and what it is for might simply create better skilled teachers who still think assessment is about the student rather than their own practice (Brown 2008).

Conceptions

The term conceptions is frequently used in examining teacher beliefs about assessment because it captures not only how assessment is perceived but also the cognitive and affective thoughts, opinions, and attitudes that teachers form about a phenomenon such as assessment. Teacher conceptions are arrived at through perceptions and embodied experiences leading to the formation of beliefs. Since societies offer different

experiences, it is only to be expected that differences in culture or society lead not only to differing policies but also to distinct conceptions of practices or processes. For example, transmission teaching coupled with high respect for teachers and formal examination scores characterizes East Asian societies (Hofstede 2007) as a legitimate means of motivating students, rewarding diligence, and overcoming negative social effects such as promotion through collusion, corruption, or nepotism. In contrast, the Anglo-Commonwealth schooling world is characterized by strong attention to the needs and values of individual children in which the teacher facilitates each child's talents or personal priorities (Stobart 2006). In such societies, assessments that prevent children from gaining access to further learning opportunities is frowned upon, at least by schooling professionals. Thus, it is expected that teacher beliefs within each jurisdiction or ecology will be broadly shared and coherent with the priorities of both policy and society. Under these conditions, teacher beliefs will lead to decision making that could be understood as ecologically rational within that environment (Rieskamp and Reimer 2007). Beliefs that are ecologically rational lead to actions and priorities that make sense within the overall set of priorities of a society. This implies that in a contrasting context, such beliefs might be seen as irrational or unacceptable.

Hence, the conceptual model underlying research into teacher beliefs about assessment (Fig. 1) has twin, interacting tracks leading to student outcomes; the conceptions of both teachers and students in a jurisdiction are influenced by various policy directions and family priorities and these beliefs, in turn, guide their separate teaching and learning practices. These two pathways are shaped by and respond to societal and cultural contexts, meaning that there will be different beliefs and practices in differing social, ethnic, and cultural groups. The model has three important characteristics. First, teacher beliefs moderate or mediate what happens between policy directions and student learning outcomes, rather than relying on processes external to the implementation environment. Second, policy directions are seen as a function of

Improvement and Accountability Functions of Assessment: Impact on Teachers' Thinking and Action,
Fig. 1 Conceptual framework of relations leading to outcomes

priorities within society and culture, suggesting that variation in conceptions and practices within societal contexts will be less than those between contexts. Third, the beliefs students themselves have about schooling, learning, teaching, knowledge, curriculum, and assessment play a strong contributing role in shaping their outcomes.

It is worth considering, as Pajares (1992) suggested, that teacher beliefs or conceptions arise out of their student experiences within a system. This interaction is shown in the double-headed arrows between teacher and student in the diagram. This means that it is likely that the conceptions of assessment students develop through successfully navigating assessment in schooling (i.e., passing tests or exams, doing well on performance or portfolio assessments, gaining qualifications, etc.) stimulate beliefs about the nature and purpose of assessment that student teachers bring with them upon entry to teacher education. These beliefs, of course, may not be appropriate for the role of teacher, depending on policy and practice environments.

Assessment Purposes

Instead of focusing on assessment formats and types (e.g., essays, multiple-choice tests, etc.), it seems more useful to focus on the purposes teachers have for whatever assessment techniques they employ. Assessment has many uses – selection, promotion, retention, deciding awards, grouping students, certification, reporting, tracking progress, and so on (Newton 2007). Many of

these uses are largely administrative rather than educational. While administrative demands are legitimate, in and of themselves, they are often only indirectly related to the primary concerns of educators. Educational uses of assessment focus much more on the possibility that assessment can inform improved student learning and better teaching.

Popham (2000, p. 1) eloquently and forcefully stated:

if educational measurement doesn't lead to better education for students, then we shouldn't be doing it ... the only reason educators ought to assess students is in order to make more defensible educational decisions regarding those students. That's really why educators should be messing around with measurement-to improve student learning. [italics in original]

While Popham uses the term measurement, we can infer that he means assessment – a process of collecting information about student learning that leads to educational decision making. The key educational decision that every teacher needs to engage in is deciding *who needs to be taught what next*. While educational improvement is an essential goal of assessment, this ambition is often overwhelmed by not just administrative, but also accountability uses, normally imposed by political authorities.

Accountability has to do with a simple idea: everyone has to give an account of what they have done in their work. In education, teachers are accountable for their students' learning and they are required to account for their effectiveness to their managers, leaders, and supervisors and,

naturally, the parents of their students. A simple way, though not without problems, to evaluate teachers is to test their students – if teachers have done a good job, their students will do well, or at least better than they did previously, on any assessment of the curriculum teachers were supposed to teach. However, there are many reasons students might not do well on an assessment, independent of how well the teacher has done his or her job. For example, the teacher may be working with students from poor homes, whose parents have little education, or use a language different to that of the school. Alternatively, even an average teacher may appear very good, if the home resources of his or her students are high and those students are extensively helped to learn in out-of-school tutoring for the assessment.

What makes accountability assessment important is that there are often negative consequences for schools and teachers who receive low scores. In examination driven societies, student assessment results are published in the media and used to determine the worth or quality of schools and teachers. In extreme cases, teachers have been fired, students have been forced to repeat grades, and schools have been disbanded. Being associated with high or low achieving schools brings reflected glory or shame to teachers. However, accountability that depends on tests or assessments is a two-edged sword. On the one hand, higher scores are meant to indicate that students have achieved what society expected from schools, and, on the other hand, high scores can be inflated without ensuring that the expected learning has taken place. Teaching to and cramming for the test, let alone cheating, can result in higher scores. Evidence exists that when teachers believe that the negative consequences associated with low scores are unfair or unethical, test score inflation practices will take place (Ravitch 2013). These consequences are easily understood when we realize that accountability has fairly consistent and powerful effects on humans – we tend to comply with the views of those to whom we must give an account of our work (Lerner and Tetlock 1999). This means that teachers will produce results that meet what they know their superiors expect – and if the consequences of failure

are extreme for the individual concerned (e.g., loss of reputation) – then we should expect teachers to deliver high test scores, through whatever means at their disposal. It may also mean that if schools are truly community-based, then teachers may disregard standardized tests completely, if that is what is expected by a parent and leadership group to whom they are responsible. Further, it may mean that teachers would ignore high scores on tests if the students in their class, to whom they are also accountable, press for a broad and diverse curriculum experience rather than a narrow teaching-to-the-test version.

Teacher Beliefs About Assessment

Brown (2008) has framed teacher beliefs about assessment as a multidimensional space in which four competing purposes interact with each other; these are: (1) assessment informs improved teaching and learning, (2) assessment holds schools and teachers accountable, (3) assessment holds students accountable, and (4) assessment is irrelevant or ignored. Extending this framework, assessment purposes can be positioned on a continuum from extremely pedagogical to extremely accounting (Barnes et al. 2015). Harris and Brown (2009) positioned teacher beliefs about assessment in a 2*2 frame according to whether they were predominantly (1) about students or schools and (2) positive or negative evaluations. Generally, their analysis of 26 New Zealand teachers concluded that teachers were most in favor of assessments that improved pedagogical interactions between teachers and students and among students themselves.

Research with the Teachers' Conceptions of Assessment self-report inventory has provided insights into teacher thinking by examining both mean scores and correlations among these four major factors. International comparative studies have generally concluded that teachers give the highest level of agreement to the use of assessment for improvement or pedagogical applications. In addition to New Zealand and Queensland, the improvement purpose had highest value in all jurisdictions (see summary in

Brown 2012). Consistent with the idea that teacher beliefs about assessment develop initially from their experiences and perspectives as students (i.e., assessment evaluates me the student), research studies have found that prospective teachers do not have improvement as their dominant. However, deliberate training of prospective teachers to take on a formative or improvement-oriented approach to assessment has found that future teachers do become more oriented towards pedagogical approaches to assessment (Smith et al. 2014).

Societies can be grouped as to whether the assessment policy focuses on high-stakes consequences (e.g., ranking of schools, entry awards for students, sanctions for poor performance, etc.) or focuses more on low-stakes consequences (e.g., diagnostic analysis of student needs, provision of support to students or teachers, etc.). An important trend is that similarity in teacher beliefs is found across jurisdictions with similar policies and cultures. For example, Hamilton et al. (2007) reported that teachers in California, Georgia, and Pennsylvania had very similar responses, experiences, and attitudes towards standards-based accountability assessments, attributable to similarities between the systems. Likewise, in New Zealand and Queensland, which both have low-stakes, child-centered, formative assessment systems, primary school teachers had statistically equivalent responses to the Teacher Conceptions of Assessment inventory (Brown et al. 2011b). Similarly, teachers in Hong Kong and China, both of which are high-stakes, public examination societies, had statistically equivalent responses to a Chinese Teacher Conceptions of Assessment inventory (Brown et al. 2011a). The similarity of Hong Kong and China and their consistent differences with New Zealand and Queensland has been attributed to the Confucian heritage cultural features of the assessment system in which examinations are a force for both improved learning and improved personal character, while the latter two societies have a more open view in which assessment does not function as a barrier to further opportunity.

Where problems arise for teachers is when supposedly low-stakes policies (e.g., assessment

for learning) are implemented alongside high-stakes examinations or school evaluation systems. In these situations, it is highly likely that formative, diagnostic approaches to assessment will be treated as a “soft” policy, in contrast to formal examinations or school evaluation systems that function as “hard” policy (Kennedy et al. 2011). For example, although Hong Kong has an assessment for learning policy, the society is characterized by high-consequence examinations that determine life chances for children and, by inference, determine the quality of schools and teaching. Thus, teachers strongly associate improvement with holding students accountable (Brown et al. 2009, 2011a), unlike teachers in New Zealand and Queensland (Brown 2012; Brown et al. 2011b). Interestingly, New Zealand and Queensland (Brown 2012) secondary school teachers both agreed more with the purpose that assessment holds students accountable than their primary counterparts; this consistent difference was attributed to the role secondary teachers play in assessing students for qualifications and the greater responsibility adolescents are expected to take for learning.

Hence, teacher conceptions of assessment are, in part, a product of how teachers individually experience assessment in their student careers (usually successfully through the application of individual effort and home and school resources) and how society constructs the role and function of assessment in schooling. At the same time, a consequence of teacher conceptions of assessment is a replication in their practices of the societal norms that contributed to their own success as assessed learners. In other words, *what worked for me as a student* (usually assessment evaluates me – Brown 2008) is *how I will teach*. Since successful students do accept the legitimacy of having their learning evaluated, teachers who emphasize this conception potentially close off the questions that effective teachers should ask: *if my students do not succeed on an assessment, is it because I didn't teach them as well as they needed?* Reflective and effective teachers are open to the possibility that the assessment data are correct and that questions ought to be posed instead concerning their teaching. Good education

systems support the teacher in discovering the ‘bad news’ about their own teaching, rather than laying responsibility solely upon society or students.

Nevertheless, policy change around the use of assessment (e.g., increased accountability or increased formative expectations) cannot be successfully implemented without consideration of the existing conceptions that teachers have and an awareness of the potentially contradictory uses and functions of assessment in the environment. Change in assessment practice clearly involves changing teacher beliefs, but also requires ensuring environments (e.g., tools and policies) support teachers in deploying the desired changes.

Introduction

Educational policies have significant impacts on the lives of those involved, silencing or strengthening one mode of pedagogy over others in society. The way that issues are re/presented within policies limits what is considered to be desirable or even possible in society (Bacchi 2000). Consequently, looking into how a certain issue is problematized and framed in policies invites individuals to unpack the unspoken regulations and issues that derive from these policies. Examining a predominant parenting policy in early childhood education such as *Incredible Years* provides much insight into “what is unsaid yet present” assumptions and taken-for-granted values and beliefs in the current field of parent education.

Foucault’s concepts of “governmentality” and “discursive normalization” are particularly helpful in this respect as they provide tools to systematically unpack a regime of truth and other ways of being that are “eclipsed” and “hidden” underneath this “truth” (MacNaughton 2005). Foucault (1991) describes “governmentality” as “the conduct of conduct”; “a form of activity aiming to shape, guide or affect the conduct of some person or persons” (p. 2). He argues that this activity enables only a certain type of practice and thinking possible and visible to its practitioners and those on whom it is practiced. If a system of power produces a specific form of knowledge as the only conceivable way to understand and characterize a particular context, how can one see what is supposedly made to be “invisible” and “unthinkable” while she/he operates within the same system of power?

Foucault suggests looking deeper into what has been presented and considered as “normal/natural” as well as into the gaps and silences in the milieu and to reconstruct a particular mode of “techniques of power” or “power/knowledge.” He argues that practitioners of this method are enabled to discern how and what power/

knowledge relations are at work “to observe, monitor, shape and control the behavior of individuals situated within the range of social and economic institutions such as the school, the factory and the prison” (Foucault 1991, pp. 3–4).

Drawing from poststructural and postcolonial theories, the problems of current parenting education in early childhood education and the possible implications of these issues are explored. By unpacking discourses of parenting produced by *Incredible Years* (IY) as an accepted parenting program through Foucault’s notion of “governmentality” and “discursive normalization”, the “norm” of parenting that is promoted by the current system and how this concept of “truth” in parenting influences the everyday life of families are examined.

What Is *Incredible Years*?

For its wealth of “evidence” and “science-based” strategies, *Incredible Years* [IY] has been chosen and implemented by many countries as an official parenting program “to prevent and to treat” children’s conduct problems. The aim of the program is to equip “high risk” parents with behavior management skills and developmentally appropriate techniques, so that they can provide better support for children’s development of social and emotional competence and school readiness. Presenting reports of various clinical trials as evidence, the developers and the supporters of IY argue that the program is an efficient tool to prevent “predictable negative consequences” such as violence, delinquency, and substance abuse among these child/ren in adolescence and adulthood (The Incredible Years® 2013). This argument, however, needs more thorough consideration because evidence-based approaches can be criticized for the gap they leave in our knowledge of the reality of children and families’ daily lives. Whether IY does provide sufficient, sustainable, and meaningful support for children and families as trial reports suggest still remains to be seen.

“Desirable/Positive” Parenting in *Incredible Years*

A particular model of parenting is identified as “desirable/positive” within the policy: a self-managing, economically sound, and functional individual who are in control of their children’s education and behavior. The discourses of IY provide a clear illustration of what is considered as a desirable norm of knowledge and valued forms of relationships and interactions between parents and children in the current system. Individuals who demonstrate these attributes are presented as capable and valuable members of society, turning the domain of parent education into a “a site of intense regulation” (Baez and Talburt 2008).

Scientific Discourses as the Universal Truth

Attributable to the last few decades’ growing interest in different approaches to child development (e.g., Vygotsky’s cultural-historical account and Bronfenbrenner’s ecological theory), the use of terms such as “developmentally appropriate practice” has been less popular and is even avoided in some educational disciplines (Burman 2008). However, this does not necessarily herald the decline of developmental psychology. On the contrary, developmental assumptions have become ingrained and naturalized in the way professionals understand and assess children’s learning so that their subtle yet effective power has become less obvious and more difficult to notice at times (Burman 2008; MacNaughton 2005). Traces of Piaget’s stage model of cognitive development still can be found in many teacher training courses and research journals in education, perpetuating the privileged status of developmental psychology as universal, factual, and absolute truth (Burman 2008).

The discourses produced by IY are no exception to this. These discourses portray children’s development as linear and universal progress toward a more logical, intellectually advanced being. Following statements about IY’s theoretical framework, contents and outcomes are

provided by the IY's developers to promote the program (The Incredible Years® 2013; Webster-Stratton 2014). Consider how these narratives establish implicit and explicit truths about the normal child and desirable parenting.

Each of the programs is thematically consistent, includes the same theoretical underpinnings, and is based on the developmental milestones for each age stage.

Each of these core programs emphasizes developmentally appropriate parenting skills and includes age-appropriate video examples of culturally diverse families and children with varying temperaments and development issues.

The programs have been found to be effective in strengthening teacher and parent management skills, improving children's social and emotional competence and school readiness, and reducing behavior problems.

With such a certainty, the discourses in these narratives authorize developmental psychology as the only factual and correct truth by which to understand and measure children's learning and behavior management skills as the "one-fits-all" answer for the challenges that all children and parents face in life. In this way of thinking, other types of knowing, beliefs, and values in parenting must be set aside and are considered unnatural (abnormal), incorrect, and inconsequential for *normal/good* individuals because scientific knowledge is "*The*" *universal/absolute truth*.

The assumption underneath this approach to knowing is that all human beings are the same, thus discovering and implementing the universal and absolute truth that encompasses this essence of human existence will solve the problems of society and achieve further human progress (Smith 1999). Subtleties, complexities, and the messiness of real life are ironed out neatly, reducing the multifaceted challenges individuals experience to a simple and straight problem. In the case of immigrant children and families, there could be a variety of reason for their *less than favorable behaviors* (in the eyes of teachers and other experts). These children and families experience adjustment of social and verbal languages, and environments (climate, food, cultures, and beliefs), which could make it more difficult for

them to demonstrate the desirable conducts in particular contexts. Or it could be financial strains and working at a job that is much less than they are qualified for in their home countries that add extra stress and pressures on immigrant parents.

However, the problem with perceiving and judging individuals in relation to the absolute/universal truth of what postcolonialists refer to as "the West" (Smith 1999) is that the complex challenges immigrant children and parents experience are ignored, while the whole weight of the children's welfare/success rests on parents (Suissa 2006). Instead of endeavoring to understand and support the genuine issues in children and parents' lives, this approach concentrates on highlighting what they are *not* doing right in accordance to the norm, and how to fix this (Suissa 2006). Through this developmental/behavior psychological lens, the immigrant child's frustration that derives from difficulties to master different social skills and languages may be seen simply as aggressive behavior and the manifestation of his/her parents' inadequate skills and knowledge in parenting. Regardless of various socio-economic backgrounds, genders, contexts, cultures, and beliefs, the normalizing discourses suggest that being equipped with this universal/absolute truth should improve the behaviors and performances of problem children and parents.

Foucault (1977, 1980, 2003) challenges this notion of scientific knowledge as universal, indisputable, absolute truth with objectivity. Using an example of penal system and mental institutions, he highlights the regime of truth as "culturally prejudiced, partial, situated and local" for it is a product of particular knowledge/power relations (MacNaughton 2005, p. 23). Therefore, he claims that the regime of truth, or the politics of truth, should be understood as the manifestation of a power struggle over meanings in a specific milieu, rather than as *indisputable truth* that encompasses all human lives (Foucault 1980).

For example, to traditional Korean parents who are brought up in Confucian discourses, what is perceived as good parenting may include teaching children to respect elders and to value a strong

family morality (e.g., teaching children to offer help such as lifting heavy things for elders, and putting the family's needs first, if need be sacrificing their own gains). These values and beliefs are considered as the truth of parenting by some Korean parents, yet they become invisible, irrelevant, and even inadequate in a context where scientific knowledge is positioned with privileged status.

This does not imply that the traditional truth of Korean parenting holds less value/worth than the scientific knowledge. More accurately it unveils the excessive singularity of psychological discourses in modern societies like ours and how it enables the modern disciplinary power to punish the soul of the normal/the abnormal. Contrary to the widespread representation of scientific knowledge as a *neutral* and *universal truth*, it is highly political, and situated (Foucault 1980). Neither does the knowledge re/produced in Korean parenting have more value than the scientific way of knowing as it comes with its own sets of problems and limitations. The strong value placed on family responsibilities and social hierarchies should be understood in terms of how these discourses support the mechanism of power operating in the particular Korean context, rather than as a representation of higher moral values and stronger family bonds within the population. It is a manifestation of "the subjection of those who are perceived as objects and the objectification of those who are subjected," thus providing a useful insight into how the existing power mechanism sustains its authority by producing certain discourses (Foucault 1977, p. 185). In other words, "truth" should be understood as a system of power that regulates and distributes the body, governing the soul of individuals for economic and political production in societies; how normalizing discourses differentiate between the normal and the abnormal; and by whom and how these discourses are authorized.

The Normal/Natural Relationship

The dominating presence of child development knowledge in early childhood education establishes such a convincing picture of "how to 'be' that it is difficult to imagine how to think, act and

feel in any other way" (MacNaughton 2005, p. 33). The discourses of IY offer a clear description of normal/desirable interactions between children and parents:

The foundation of the Incredible Years programs focuses on building warm and nurturing parent-child and teacher-child relationships through children directed play, social and emotion coaching, praise and incentives. (The Incredible Years® 2013)

Drawing from behavioral science and developmental psychology, these statements emphasize the "warm and nurturing" type of adult-child relationships, and the "positive" verbal interactions for a child's learning. The problem arises from the subjective nature of the terms "warm and nurturing" from culture to culture. Some of the more traditional contexts in Korean and Tongan cultures may discourage verbal acknowledgement of desirable behaviors and may seem firm and strict, yet there may be a strong and nurturing relationship between child and parents nonetheless. However, as relationships and interactions between these children and parents do not match the exact representation of the norm, they may appear harsh or inadequate/abnormal childrearing practice to people who are in a position of power to assess and to control (e.g., early childhood educators, health professionals, and social workers).

By presenting discourses of the "normal/desirable" way to be as a parent and a child in an explicit manner, these narratives implicitly categorize those who do not fit into this norm as abnormal, rationalizing the disciplinary power to intervene and conform these individuals (Foucault 1977, 2003). Once *abnormal* individuals are identified, various institutions get involved to *catch them early* so that "predictable negative consequences" will be prevented (The Incredible Years® 2013).

In addition, the appropriate forms of parent-teacher and child-adult relationships are identified in the document. Parents are "to partner with teachers and to be involved in children's school experiences," and to engage in "child-directed play" for the child's academic success and social/emotional competencies (The Incredible Years® 2013). There is no regard for different

cultures' approach to child-adult, parent-teacher dynamics, not to mention a complexity and multiplicity within the same culture. The discourses in IY present active involvement at school and child-led play as the normal parenting practice, whereas other norms of childrearing practice are ignored.

For instance, among various styles of parenting that exist in Japanese and Korean cultures, those who are brought up with more traditional values expect a distinctive role for each individual in relation to the social hierarchies. In the case of the child-adult dynamic in these cultures, it is adults who are assumed to be wiser and more knowledgeable, placing them in a higher position in a social hierarchy. This is not unlike the way that "Western hetero-patriarchal cultures" (Smith 1999) perceive children and adult hierarchies. The difference, however, is the trajectory of this dynamic. Some Japanese and Korean cultures have a more candid manifestation of this child-adult relationship expressed with a more authoritative approach and with defined roles for each party. Either parents decide what is good for their child, expecting the child to comply with their commands, or the child and parents get engaged in separate activities that are appropriate for each position (i.e., "Playing is for the child, and adults need to work, and be responsible and mature.").

The normalizing discourses of active involvement and child-direct play fail to grasp these subtle cultural interpretations and representations of power in complex social dynamics, condemning these parents as unhelpful, uninterested, and incompetent. It is highly presumptuous to assume that these parents care less or have no interest in their child's learning just because they do not demonstrate the precise style of parenting provided in IY. On the contrary, many of these immigrants choose to move overseas to give their children a better chance in life and high-quality education, even if it means making significant sacrifices such as giving up secure careers and being separated from families and friends.

The Normal/Natural Interaction

The program's content and objectives provide added insight into a standard/model behavior of child and parent. The IY's developers claim that

the warm and nurturing relationship can be achieved by applying positive tactics such as incentives and praises. It is also suggested that competent parents should coach/model socially and emotionally acceptable behaviors, and manage children's misbehaviors with "proactive" disciplinary techniques. The desirable interactions and relationships between children and parents are described in microscopic detail.

Program Two: Using praise and incentives to encourage cooperative behavior.

Part 1: The art of effective praise and encouragement

- Getting and giving support through praise
- Recognizing social and academic behaviors that need praise

Part 2: Motivating children through incentives

- Understanding how to "shape" behaviors
- Understanding how to develop incentive programs that are developmentally appropriate
- Understanding ways to use tangible rewards for problems such as dawdling, not dressing, noncompliance, not going to bed, and toilet training (The Incredible Years® 2013)

Many of these behavior management strategies promoted in IY entail verbal and explicit responses. To "shape" children's behaviors into desirable and normal patterns, parents are encouraged to use a great deal of verbal praise, "negotiate" with children, and "motivate" them with "developmentally appropriate" incentives. On the one hand, academic and social skills are distinguished as key competencies to be mastered in the early years and worthy of recognition and verbal praise. On the other hand, noncompliance, not sleeping at given bedtime, reliance on parents for toileting and self-care, and insufficient movements are placed at the opposite end, the abnormal/detrimental behaviors.

By providing these infinitesimal details of desirable parenting, the modern disciplinary power regulates the movement of the docile body, "clears up confusion; it dissipates compact groupings of individuals wandering about the

country in unpredictable ways,” and increases the efficiency of the power in the system (Foucault 1977, p. 219). This subtle and calculated technique of subjection enables the disciplinary power to establish a meticulous chain of surveillance, exploiting the body’s ability to produce to maximum capacity. Multiplicities of each individual are broken down and reduced into inconsequential and manageable pieces of movement for the systematic control of bodies. A fine web of surveillance across disciplines and institutions allows the disciplinary power to distribute the bodies in the most effective manner according to the individual’s attributes and skills, and if need be to recodify the soul of the citizens so they become useful/compliant subjects in the system.

For example, in some cultures (e.g., some traditional Afghani, Chinese cultures) children do not have a fixed bedtime. Being fully integrated into adults’ lives, children stay up with adults to participate in family gatherings and late night feasts. While this is regarded as a normal part of life for these families in their home countries, in the milieu where “Western hetero-patriarchal culture” (Smith 1999) is at the center, the parents may be criticized for failing to ensure enough length of sleep for the child’s health and his/her quality participation in educational settings the next day. The clash between their own values/beliefs and the dominant truth is most likely to be resolved by parents giving in to what is believed to be *normal* in the context in which they operate. Education, health, and welfare institutions identify abnormal children and parents, and refer them to intervention programs such as IY in order to *correct* and *cure* them. Or they may cave in to the pressure of normalizing discourses and make a decision to conform to the norm so that they will no longer be categorized with deficit labels: incompetent and irresponsible parents who have neither sufficient parenting skills nor knowledge. In spite of the dissonance these parents experience concerning cultural beliefs and dominant discourses in parenting, the elusive power of discursive normalization pressurizes individuals to perform according to the norm, reproducing and reinscribing a particular form of childrearing as the truth (Foucault 1977).

Conclusion

The attributes of “Desirable/Positive” parents reflect what is valued within modern society – autonomy, efficiency, economic productivity, science-based and measurable knowledge, and self-betterment. Throughout the policy parenting is described as a form of performance to prove your capability in society; thus failing to meet this specific norm of parenting practice not only indicates one’s inadequacy as a parent, but also incompetency as a member of society.

Caution must be exercised for this construction of parent education as it could operate as an apparatus of the current system, regulating/dominating parents’ and children’s soul and body to conform to the norm of the modern colonizing and scientific regime of truth. Compared with the norm, families and children with different values and beliefs are most likely demonized and pathologized as dangerous/abnormal, being excluded further, and suffering pressure to conform. By identifying these dangers that derive from the current way of understanding parenting, policy makers, educators, and other stakeholders in early childhood education may be able to disrupt what is considered as the only truth in modern parenting, and open up more possibilities for future.

Indigenous Philosophies and Education: The Case of Kaupapa Māori

Georgina Stewart

Faculty of Education and Social Work, University of Auckland, Tai Tokerau Campus, Aotearoa, New Zealand

Introduction

This entry focuses on the relevance and potential benefits for Māori and indigenous education of engaging more strategically and critically with philosophy of education, understood as the examination of educational ideas and theoretical frameworks.

To consider kaupapa Māori as an indigenous philosophy of education offers advantages as well as challenges for Māori education. This entry describes links between philosophy of education and kaupapa Māori and extrapolates some key messages in terms of their relevance to indigenous education more generally, starting from an acceptance that everything in education is of political significance (May 2012; Smith 2012).

Kaupapa Māori at the Nexus of Indigenous Education

Kaupapa Māori is widely acclaimed as an example of best-practice indigenous education and a world leader in the indigenous academy (Smith 2012). The two terms “indigenous education” and “indigenous academy” may seem clear and transparent enough but in fact signal a power-knowledge nexus: a complex theoretical site where contested meanings in education collide.

This complexity that characterizes indigenous education has several aspects: First, what counts as “indigenous education” differs between one national or social context and another. Second, there is an inherent tension between local and global levels of indigenous identity since the focus on authenticity privileges the local level, but political and future-focused indigenous aspirations inevitably look toward the global level (Dei 2011).

Paradoxically, the very concept of “indigenous” in a sense homogenizes and thus, arguably, desecrates the local identities and place-based knowledges on which it rests. This paradox is resolved by recognizing that all definitions are limited (Dei 2011): an insight that expresses a weak form of relativism; one that modifies rather than replacing the realist frameworks of universalism.

Seen in this nuanced way, the meaning of “indigenous” as a self-ascribed label (as subjectivity rather than a statistical category) incorporates a political challenge to colonization and Eurocentric subjugation (Dei 2011). In the above statements, a specific identity label such as “Māori” can be substituted for the more general term “indigenous.” The concept of “indigenous” makes a useful translator term, a “place holder” for particular indigenous identity labels, to facilitate meaningful scholarly dialogue among indigenous educators from different places around the world.

The central role of local knowledge in understanding indigeneity ensures that “authenticity” is a key consideration in indigenous education; and the importance to indigenous identity both of symbolism and political collectives, rather than individuals as in dominant economic models, underscores the multilayered concept of “representation” (May 2012). Authenticity and representation are more important concepts in indigenous than in traditional Western accounts of education. But every important educational concept is also important in indigenous education. Logically, therefore, indigenous education cannot achieve its goals without including the entire terrain of education theory. Indigenous philosophy such as kaupapa Māori provides a useful lens through which to reintegrate educational theory into the discourses of indigenous education.

The modifier “indigenous” for nouns such as “education” or “academy” produces a slippage or ambivalence between meanings, which invokes conceptual binaries and raises more questions, including: to which aspects of education or the academy does the adjective “indigenous” refer? Key possible answers are: the identity of groups of people involved in education, in particular students and teachers, and the identities represented in and by the curriculum content, which includes many aspects such as language medium, central concepts and large messages, implicit theories of human life and relationships, lesson formats, classroom materials, assessment, and so on (Dei 2011).

The complexity inherent in indigenous education is both an advantage and a disadvantage. The indigenous nexus provides inherent or philosophical tension that, under favorable conditions, is productive and creative and allows for new, transformative possibilities (May 2012). Given the history and context of political struggle and socioeconomic disadvantage for indigenous peoples around the globe, however, this productive tension is notoriously difficult to maintain, which erodes the criticality of indigenous scholarship. In the case of Māori education, this tendency toward loss of criticality contributes toward the “domestication” of kaupapa Māori (Graham Hingangaroa Smith in Hoskins and Jones 2012, p. 10).

The section below sketches the state of kaupapa Māori research in education after three decades of development, while the third section delineates overlapping theoretical interests for indigenous education and other allied traditions of research. The conclusion draws together these discussions and makes a prediction about likely trends in kaupapa Māori research methodology and scholarship.

Current Practice: What Is Kaupapa Māori Research Like?

Kaupapa Māori theory and research methodology developed first in the academic discipline of education in the 1980s. The emergence of kaupapa Māori as a new form of scholarship capitalized on

the success of kaupapa Māori education before later expanding to include other social science domains such as health, legal studies, and many more. Kaupapa Māori research has been a powerful vehicle for representing previously silenced voices and perspectives of Māori individuals and collectives in education in contexts such as school communities. But there is an unhealthy tendency in education research to equate “data gathering” only with conducting interviews, and this trend is even more pronounced within kaupapa Māori education research (Smith 2011).

The need to establish and consolidate kaupapa Māori learning communities and the imperative to continue to engage with real-world political struggles are two substantive reasons why kaupapa Māori research has been understood mainly in empirical terms (Hoskins and Jones 2012). Indigenous research practices and preferences such as “kanohi ki te kanohi” (face to face) foster the maintenance of the overly simplistic view that kaupapa Māori educational research is essentially empirical in nature. One recent article goes so far as to describe kaupapa Māori as “action based” and an “approach [that] cannot exist without practice” (Mane 2009, p. 2). In short, kaupapa Māori theory has so far been mainly understood and utilized in educational research as a set of principles or guidelines for empirical methods of data collection, usually interviews.

Along with the dominant empirical notion of kaupapa Māori research has gone a corresponding **lack** of kaupapa Māori research of a theoretical or philosophical nature. For example, the above paper avoids labeling kaupapa Māori as a “theory” because “theorising is seen as a luxury not afforded to Māori” (Mane 2009, p. 2). Despite emerging first in education, therefore, kaupapa Māori theory remains under-utilized as a resource for rigorous analysis of ideas and concepts in Māori education, from critical, indigenous, kaupapa Māori perspectives. This means much work in Māori education, and by extension of indigenous education, is still to be done.

After three decades of successful development, kaupapa Māori research in educational theory and philosophy remains a fledgling approach, with great potential to expand beyond current

dominant conceptions, in order to develop further possibilities for Māori empowerment and emancipation (Hoskins and Jones 2012; Mahuika 2008). Despite the success of kaupapa Māori research methodology and its popularity as a basis for many conference papers and postgraduate research dissertations, there is little traditionally published scholarship (i.e., journal articles and books) on kaupapa Māori theory and research methodology. Other than the short reference list given below, small collections of published and unpublished writings on kaupapa Māori, including several literature reviews, are available through the websites www.kaupapamaori.com and www.rangahau.com.

Political Alliances and Intersecting Theoretical Concerns

As a key principle of kaupapa Māori, Māori exercise the right to assert cultural difference from the dominant Pākehā or mainstream culture in Aotearoa New Zealand (Smith 2012). At the same time, Māori practices in contemporary social contexts, including in education, are clearly adaptations of Māori traditions. Hence contemporary Māori forms including kaupapa Māori are, by definition, hybridized cultural forms (May 2012). Implicit in the recognition of Māori difference is a renewed acceptance of social binaries and cultural hybridity. The complex nature of the theoretical nexus of indigenous education intersects with other critical philosophical traditions, including feminism, postmodernism, poststructuralism, and postcolonialism, plus newer forms such as post-humanism, ecofeminism, and new materialism (Ahmed 2000). In each of these traditions, ethnic, gender, class, ability, or other social binaries are refracted through mutually reinforcing sets of social structures (legal system, media, education, health, police, etc.), which maintain and reproduce extensive networks of power relations within society, generation on generation.

Shared theoretical concerns for indigenous education, including kaupapa Māori educational research and other traditions, ultimately derive from the philosophical shift in the paradigm of

science, famously sparked by the book titled *The Structure of Scientific Revolutions* by Thomas Kuhn. A revolution in epistemology has since unfolded, with consequential and ongoing effects across the entire academy, including the important question for Māori education of what counts as “social science” (Smith 2012).

The indigenous perspective in education, like other critical traditions, pays attention to the changing boundaries between disciplines of knowledge at local, national, and global levels, which, among other things, influence the ranges of methodologies considered acceptable in each field and subfield. Conservative forces line up with societal power bases, in Māori and indigenous contexts no less than in the mainstream, and therefore contribute to the unfortunate tendency to equate or reduce kaupapa Māori research to empirical (mainly interview) research, as discussed above.

A second related result of the twentieth-century revolution in epistemology was the collapse of the “objective researcher” position in social science. This collapse has given rise to, among other things, the “auto” turn in social science research methodologies. The auto turn in research has included various educational traditions of autoethnography and self-study. These are closely related to traditions of writing as methodology and furthermore linked to the recent blurring between social science and literature (King 2003). On the basis of these connections, narrative theory and data find a place in researching indigenous education.

In Aotearoa New Zealand, the Māori-Pākehā ethnic binary has been effectively exploited in local arts and literature, with the short story proving one of the most effective literary forms. Narrative research is able to capitalize on Māori and indigenous traditions of storytelling, with Jenny Lee’s “pūrākau” methodology being an example of kaupapa Māori educational research heading in this direction (Lee 2007). The importance of language and oral traditional texts and narratives in indigenous traditions also aligns with narrative research (King 2003). A narrative is a vehicle for portraying more complex sets of ideas than quantitative data or interviews, so is fitting for research in the complex contexts of indigenous education.

A narrative can include authentic indigenous and cultural texts by being presented in a bilingual format or entirely in an indigenous language. Narratives are thus able to adequately represent and express the nuanced details that comprise the experience of cultural difference, also referred to as “world view.” The world view concept emerged in the 1970s, again as a result of the epistemological revolution in concepts of science and knowledge discussed above. One of several short stories to explore the consequences of differing world views in Māori contexts is the story *Parade* by Patricia Grace, published in her 1986 collection, and *Waiariki and Other Stories*, which generated a small amount of social science scholarship.

Conclusion: The Future of Kaupapa Māori Educational Research

A key message promulgated in the work of two leading kaupapa Māori scholars, Linda Tuhiwai Smith (2011) and Graham Hingangaroa Smith (Hoskins and Jones 2012, pp. 10–20), is that kaupapa Māori is less a fixed “thing” and more a set of ideas that can be used as an indigenous toolkit for guiding practice, including scholarship, in a wide range of domains (Hoskins and Jones 2012; Smith 2011). Kaupapa Māori in this sense remains something to be created rather than a fixed body of knowledge to be taught and learned. Kaupapa Māori as theory and philosophy allows for creative possibility; that is, for its own change and development, in response to turbulent, unpredictable, and changing external and internal social conditions. Without such an open flexibility, there is no possibility that the dreams of the iwi (people), which largely rest on the potential of kaupapa Māori ideas, could ever be realized.

From this perspective, the future possibilities for kaupapa Māori research are literally open-ended and therefore unable to be determined in advance. But clearly there is a logical, if as yet largely unexplored, role for narrative and autoethnographic methodologies within kaupapa Māori educational research. Accordingly, to predict that significant growth will occur over the

coming years in the number and diversity of kaupapa Māori educational research publications employing these sorts of approaches is a relatively safe bet.

Individual and Community in Muslim Education

London, London, UK

Introduction

This entry surveys the writings about the relationship between individual and community in contemporary Muslim education thought. In particular, it will be concerned with the issue of personal autonomy as an educational aim. Following Douglas and Shaikh (2004), Muslim education is defined as *education for Muslims* which includes religious and secular subjects and *education in an Islamic spirit and tradition*. The primary focus will be Muslim faith schools, such as those in Britain. Underpinned by Islamic religious orientation, these schools seek to provide full time education including both the religious as well as secular (national) curriculum subjects.

The relationship between individual and community, autonomy and identity, is an extremely important matter for any collectivity, including those with a religious character. The survival of collectivity depends, at least in part, on the individuals adopting some element of shared identity and practice. At the same time, and particularly in dynamic environments, the community requires people who can show a degree of independence of mind and character to enable it find creative solutions to the challenges thrown by the environment. Individuality does not exist outside of a social milieu; social milieu remains dynamic because of individuality. Education, formal as well nonformal, is often seen as the primary means by which this balance can be struck. It will be seen below that as Muslim education operates increasingly in a global context, there is now a need to revisit the traditionally held ideas about the relationship between individual and community.

Muslim Education and the Issue of Personal Autonomy

There are more than 150 Muslim faith schools in the United Kingdom, thirteen of which are State-funded. The origins of these schools are rooted in parental and communal concerns about the preservation of tradition and safeguarding of Muslim children against what was perceived as the onslaught of a Western secular tide. This conservation goal has always been accompanied by another aim, that of socio-economic mobility through education or academic performance (Halstead 1995; Hewitt 1996; Panjwani 2012). These two aims are intertwined as they are reflected in the mission and objectives of most Muslim schools.

Notwithstanding the long tradition of faith schools in the UK, their desirability and role remains controversial (Ameen and Hassan 2013). This is particularly true of Muslim faith schools. One significant flashpoint in this ongoing debate is around personal autonomy and by implication the relationship between individual and community.

The liberal critique of Muslim schools, and faith schools generally, is that they violate the aim of nurturing personal autonomy among students by exposing them to religious instruction in powerful setting of schooling at an age when they are unable to assess religious views, thereby coercing them – through school policies and social pressure – into adopting school's religion (BHA 2001). In some cases, only Muslim schools are signaled out as incapable of promoting personal autonomy (Levinson 1999).

The proponents of Muslims schools also acknowledge that opposing views on autonomy are a main point of contest in arguments for and against Muslim schools in Britain (Tinker 2006; Meer 2007; Shah 2012). Though some defenders of Muslim schools dismiss liberal critique about autonomy as Islamophobia (Tinker 2006), a closer look at the writings of many Muslim educators shows that autonomy does not receive a prominent place in their work. As Rissanen (2014) notes, "Many Islamic educationalists criticize the individualism of liberal education precisely because of its emphasis on the freedom of individual choice: instead of autonomy, they value the consensus of the community and respecting tradition (p. 31). Submission to the will of God and to the cumulative tradition and its guardians are thus seen as the "soul" of education (Husain and Ashraf 1979, p. 36). This can be seen in the aims of many Muslim schools. For example, the Al-Aqsa Primary School in Leicester seeks:

- To develop the whole personality of pupils with Tauheed at the core and Islam as the main focus of their lives
- To help children acquire a moral attitude to life through conscientious awareness and the practice of divine guidance in all their affairs and transactions (Al-Aqsa n.d.)

In the writings of the critics as well as the defenders of Muslim faith schools there is a widespread acceptance that these schools are non-autonomy supporting and provide education which does not seek to create independent minded students. Rather, their focus is seen by many to be community and tradition centered.

However, this position creates a challenge for Muslim schools because their stated goals also seek an education that prepares students for living a modern life while retaining Islamic identity (Ameli et al. 2005). Given the demands of modern life it is difficult to see how this can be done with an education that does not seek to develop autonomy. In fact, in practice Muslim schools do promote autonomy and independence of thought without which their students would not perform as well as they do. Hence, the issue is theoretical; how to reconcile, if at all, the educational aim of autonomy with Muslim tradition.

Recent Developments: Towards “Overlapping Consensus”

This challenge is now being recognized in recent writings and some Muslim educators recognize that autonomy should be an educational goal in Muslim education (Ahmed 2012; Hussain 2007; Sahin 2013). However, those who take a positive stance on personal autonomy still find it difficult to show this aim can be drawn from Muslim tradition.

One way forward is the proposal to develop “overlapping consensus” between liberal and Muslim traditions (Panjwani 2009; March 2011). Developed by the political philosopher John Rawls, the concept of “overlapping consensus” is underpinned by the recognition of the permanency of the diversity of reasonable comprehensive religious, philosophical, and moral doctrines in modern democratic societies. The concept assumes that despite this diversity, people holding different highest ideals and worldviews are capable of developing agreement around aims such as peace, prosperity, and equal liberty. In the educational context, this would mean that major religious and secular traditions would be able to agree on key values such as autonomy not by an imposition by one tradition over another but by each tradition drawing the elements of consensus from its own historical and cultural roots. The concept takes all major religious and cultural traditions as plural and carriers of resources that can lead them to the acknowledgment of shared values as the

common ground for co-existence. The proponents of “overlapping consensus” between Muslim and liberal educational traditions believe that it is possible to find intellectual resources within Muslim tradition to create a theory of autonomy that has authentic depth in the tradition.

The first point to note in this regard is that religions are interpretive phenomenon. They are neither static nor homogenous. Through fresh interpretation of sacred texts, authorities, and historical movements, religions remain fluid: “Although stable over time, and not subject to sudden and unexplained changes, it tends to evolve slowly in light of what, from its point of view, it sees as good and sufficient reasons” (Rawls 1993, p. 59). Through interpretation, religious community both keeps its sense of rootedness in a tradition while gradually responding to the changing circumstances around itself. This means that new concepts can be developed by drawing upon the tradition, including theological, resources. Such new concepts can facilitate a community’s engagement with its contemporary issue without feeling alienated from its past. But, for this to happen traditions must carry seeds that can germinate through interpretive exercise. It is thus worthwhile to ask whether there are any potentialities in Muslim history for such germination to be possible with respect to personal autonomy.

At the outset it is important to note that developing “overlapping consensus” is not an exercise in anachronism of searching the concept of autonomy in premodern Muslim history. Autonomy is a modern concept; “philosophical reflection on autonomy is modern” (Frank 1992, p. 1). It is not found in premodern Muslim contexts. However, to say that autonomy is a modern concept is to give it a history, to make it contingent. If it originated in the modern West, it also means that it did not exist in the premodern West. If so, there must have been conditions, material as well as intellectual, which led to the recognition of personal autonomy as a value in the modern West. In recent years, the intellectual genealogy of the concept of autonomy has received significant scholarly attention (Schneewind 1998). These work show that there were *potentials* in the

premodern West that were actualized in the “invention of autonomy.” Kant’s *invention* of autonomy was based on these potentials. And, it was not the end of the story. The concept of autonomy has continued to acquire new formulations since Kant. In particular, in late twentieth century, in response to the communitarian and feminist critiques, there arose a move towards dialogical and relational models of autonomy which acknowledges that “individuals are much more deeply dependent on their social environment for the acquisition, maintenance, and exercise of their autonomy” than earlier conceptions have usually accepted (Christman and Anderson 2005, p. 13). The key point in this reconceptualization of autonomy is that socialization does not equal indoctrination. The person who grows up in a religious tradition and comes to discover his/her identity-defining commitment to that tradition may still be able to subject that commitment to critical reflection. It is now acknowledged that culture, socialization, and listening to expertise are an essential part of being autonomous. The claim, more accurately, is that an individual is then able to process the information and fashion their own path – and therefore become the author of their life, as noted by Will Kymlicka:

What is central to the liberal view is not that we can perceive a self prior to its ends, but that we understand our selves to be prior to our ends, in the sense that no end or goal is exempt from possible re-examination. . . . My self is, in this sense, perceived prior to its ends, i.e. I can always envisage my self without its present ends. But this does not require that I can ever perceive a self totally unencumbered by any ends. . . . (Kymlicka 1989, p. 52)

This recent developments in understanding autonomy already shows that the presumed gulf between liberal stress on individual and Muslim stress on community may not be as wide as it is usually assumed to be. Still, it is one thing to claim that autonomy is not necessarily inimical to valuing community and tradition, another to say that Muslim schools should have it as an educational aim. For this the ideal of autonomy needs to find some resonance in Muslim cultures. The question is: are there intellectual and cultural *potentials* in Muslim history that can help forge a

contemporary concept of autonomy that will have authentic depth in Muslim tradition?

One indicator of the existence of such cultural *potentialities* in Muslim contexts is shown in many current political and societal developments in Muslim contexts that imply acceptance of personal autonomy. For example, there is a growing practice of civil society in many Muslim contexts. The lawyers’ movement in Pakistan as well as the Arab Spring are good example of such civil society activism. While it is arguable that any Muslim majority country is genuinely democratic, by voting in large numbers whenever an opportunity has risen, people have indicated their preference for democratically elected governing systems. All these practices presume personal autonomy. Their presence can be seen to indicate that personal autonomy is not in conflict with, what Braudel (1994) calls, the “structural elements” of a civilization, in this case Muslim. Braudel has argued that a civilization refuses “to accept a cultural innovation that calls in question one of its own *structural elements*.” If, as many proponents of Muslim schools argue, personal autonomy is incompatible with Muslim cultures, how does one explain wide acceptance of the above noted practices in these cultures? Perhaps these reflect an intuitive appeal of individuality and autonomy, made possible by cultural *potentialities* already present in the structural element of Muslim cultures

A reading of Muslim history is possible that shows that individual moral responsibility, freedom to make ethical choices, engage in critical reflection on one’s intellectual and social options, and belief in reason’s capacity to discern moral qualities of acts – ingredients that can serve as the basis for personal autonomy – are part of Muslim historical experience. We will briefly focus on three elements: *individual moral responsibility*, *freewill-predestination debate*, and the *Intellectualist theory of ethics* (Panjwani 2009).

The history of Muslims begins with Prophet Muhammad preaching his message to individuals in Makkah. Arabian society in Prophet Muhammad’s time was collectivist. The tribe was the source of honor, safety, and identity. An individual was nothing outside the tribe not only

socially but often even physically because of the harsh ecological conditions (Tabari 2003). In this social context, Prophet Muhammad's act of preaching to individuals rather than tribes collectively presupposes (on his part) that those whom he was addressing have a capacity to think for and reconstitute themselves, to make a moral choice. He spoke to individuals, expecting that listening to his message they would be able to put some distance between themselves and their social and intellectual attachments and constitutions, assessing them against his message. It is proposed here that while the society in Prophet Muhammad's Makkah may not have had a concept of autonomy, the presence of the phenomenon (at least a form of intellectual autonomy) and its presupposition by Prophet Muhammad is hard to deny. Prophet Muhammad's act of preaching indicates his implicit acknowledgment of individual human being's capacity to think for him/herself in a highly tradition-directed society.

The second element is the theological debates about freedom in Muslim history. The Quran contains several verses that proclaim God's power over universe and human affairs; it also has many verses which make humans responsible for their actions and its consequences. Over time, some people began to note possible tension between these two types of verses. God's omnipotence cannot be denied but justice required that human beings must merit reward or punishment. This, in turn, required some way in which human acts must be owned by humans; that their acts become *their* acts. Freewill appeared to be an obvious candidate but was it possible in light of the necessity to accept divine omnipotence? From the eighth century there was a protracted debate about the possibility of human moral freedom in the wake of God's power. The constraints of space will not allow me to go into details. In short, starting from the early eighth century individuals such as Hasan al-Basri (d.728) came to be associated with the position of freewill. In time a powerful theological school called *Mutazillah* argued for human freewill. The Mu'tazila held that not only were human beings free to make moral choices but also that humans were capable, independent of revelation, to know what these choices

were. In other words, the agent, at least in some cases, was seen as capable of knowing the moral quality of acts independent of revelation. The distinctiveness of Mu'tazili theory was its claim that this moral quality of an action was known to an agent, the human beings, necessarily (*'ala d-darura*) or by intuition. In support, it appealed not only to the rational character of human beings but also pointed to the ethical knowledge of people, Brahmins of al-Hind (India), for example, who were believed to have not received any revelation. Mu'tazila thus adhered to ethical rationalism or intellectualist theory of ethics, a position whose dominance in early modern European intellectual life was seen by Schneewind (1998) and others as critical to the subsequent rise of autonomy in modern period. The Mu'tazili position on knowledge of ethics was opposed by the Ash'ari and other positions. The resulting debate was reminiscent of the discussion about the relationship between piety and deity in Plato's *Euthyphro*. There was a rationalist current which took ethics to be ontologically objective and opposed voluntarist position.

For our purpose, the Mu'tazila and Ash'ariyya positions and the freewill debate in Muslim history generally show that the question of human moral responsibility was extensively debated. The intuitions that individuals must somehow be responsible for their acts and that ethics stand objectively apart from the subjective desires of agent (or even the divine) remained strong enough that it could not be sidelined, even if it could not be successfully reconciled with belief in divine omnipotence.

Conclusion

The Muslim tradition, like all religious traditions, had historically emphasized community over individual. Yet, this history also carries a deep seated respect for individual moral responsibility and freewill. Both the necessities of everyday life and requirement of justice required this. Consequently, the resolution of the antithesis [freedom and determination] that came to dominate "recognized the inescapability of affirming freedom in

some sense or other” though it could also “not disavow the Koranic concept of God’s overwhelming domination and supremacy...” (Fakhry 1997, p. 19). Perhaps because of this recognition, modern Muslims in their practical lives have been able to adopt many institutions and practices that are underpinned by personal freedom. Examples ranging from democratic impulse to the adoption of child-centered education across the Muslim world indicate that, rhetoric of some proponents of Muslim education notwithstanding, in pragmatic terms personal freedom is highly valued.

The entry has showed that Muslim educators are engaged in developing new understandings of the relationship between individual and community which can lead to an “Overlapping Consensus” (Rawls 1993) between the liberal and Muslim tradition around the value of independent thinking and autonomy. This requires a reconsideration of both the liberal and Muslim tradition. Rethinking of the concept of personal autonomy in the liberal context, as noted above, has helped in recognizing that nurturing autonomy is not antithetical to initiating children into religious-cultural traditions. There are potentials in Muslim tradition that can be drawn upon to create educational theory that accepts autonomy as an educational idea. Perhaps, through such endeavors will emerge practices that increase “the volume of human autonomy, but not autonomy which, for the absence of solidarity, results in loneliness; and ...[increase] the intensity of human solidarity, but not solidarity which, for the absence of autonomy, results in oppression” (Bauman 1988, p. 231).

Indoctrination and Science Education

Darrell P. Rowbottom
Lingnan University, Hong Kong, China

Introduction

Can students be trained to be excellent scientists purely, or failing that mainly, by means of indoctrination? And if not, what role, if any, should

indoctrination play in science education? These are the main questions discussed in this entry. They are epistemic and pragmatic, rather than moral, in character.

Two preliminary questions are crucial to answer effectively, however. First, to what does “indoctrination” refer in the present context? Second, to what extent is indoctrination possible to avoid? In the remainder of this section, these are tackled in turn.

“Indoctrination” might conjure up images of cults using tactics such as sleep deprivation in order to seduce the vulnerable, or of a Bond villain using a brainwashing machine to acquire henchmen. But such a narrow construal of the term is unsuitable in the present entry, which is more concerned with practices and approaches that are typically legally permissible, and are sometimes employed, in contemporary classrooms and lecture halls. So it is better to understand “indoctrination” to refer to teaching, and hence learning, via a highly authoritative, stereotypically transmission-oriented, process. Most notably, absent in such a process is any open critical engagement by the learner with the teacher, and critical engagement with the claims made by the teacher is discouraged, “off-limits,” in the educational context (although it might occur nevertheless, e.g., surreptitiously). No exploration or self-discovery on the learner’s part need be encouraged, or expected, either. (For more on different views of indoctrination, see Snook 1972a and 1972b.)

But can indoctrination, construed in the broad way described above, be avoided altogether? Surely the authority of the teacher on some factual claims, at least, must be sacrosanct? It would be a mistake to think of the matter in an “all or nothing” way. “To indoctrinate or not to indoctrinate?” is not (necessarily) the question. A better one is “When, and to what extent, should teachers indoctrinate?” or, more precisely, “To what extent, and when, should teachers explicitly rely on authority in advancing claims as true, and suppress objections?” As will be shown in the next section, it’s crucial to bear in mind the proper epistemic role of testimony, both inside and outside the classroom, in attempting to answer such questions.

Testimony

As Peter Lipton (1998, p. 1) notes, the importance of testimony can hardly be underestimated:

Mundane beliefs – such as that the earth is round or that you think with your brain – almost invariably depend on testimony, and even quite personal facts – such as your birthday or the identity of your biological parents – can only be known with the help of others. Science is no refuge from the ubiquity of testimony. At least most of the theories that a scientist accepts, she accepts because of what others say.

Indeed, even autodidacts rely heavily on testimonial products produced by others, such as books, articles, and websites. And to the extent that observation is theory-laden, the observation statements people make, and hence believe to be true, typically depend on testimony too. Even the author's belief that he sits at a desk as he writes is dependent on testimony, in so far as his concept of "desk" derives from instances of others showing him what counts as a desk.

Hence testimony cannot be avoided in the educational process, and teachers cannot avoid being testifiers. But even assuming that testifying on something is presenting oneself as an authority on the matter to *some* extent, many interesting authority-related questions about best teaching practice remain. For example, there is scope for a teacher to avoid testifying on some matters, while actively testifying on others. Consider, for example, secondary school students conducting a simple laboratory experiment in which it is hoped that they will see for themselves that Ohm's law – $V=IR$ – (approximately) holds. A teacher might decide to avoid testifying about the law, at least in the first instance, although she might actively testify about how to set up and conduct the experiment, and intervene to help any students having difficulties doing so. Moreover, she might avoid directly testifying about the approximate truth of the law even *after* the students complete the experiment. She might instead offer testimony *about* the testimony of others, namely the scientific community, concerning the law. (This may include explaining what scientists say about results that superficially appear to violate the

law, e.g., that the resistance of circuit components is temperature dependent.) Such meta-testimony – testimony about the testimony of others – might be used to indicate some deference, on the teacher's part, to the authority of the scientific community. She might explain to the class her belief in the reliability, or probable truth, of the community's findings concerning empirical laws.

But is such an approach right? Should one defer to the dominant scientific views of the time in which one finds oneself? And why? Granting that testimony must play *some* central role in science education doesn't answer these questions, which we'll tackle, with reference to the work of Thomas Kuhn and Karl Popper, in what follows. For more on testimony from a contemporary philosophical perspective, Gelfert (2014) is recommended.

Kuhn Versus Popper on Criticism and Dogmatism in Science Education

It's plausible that one's account of good science education will depend to some extent on one's view on what constitutes good science. The reason is simple. Good science education should produce good scientists, or at least have a high probability of producing good scientists (relative to other possible ways of educating scientists). That is, assuming that the students involved have the capacity, or potential, to become good scientists. So let's look at what two of the most influential philosophers of science in the twentieth century – Thomas Kuhn and Karl Popper – said about scientific method, and resultantly science education.

Thomas Kuhn took science education – especially in his own time, in the USA – to centrally involve encouraging dogmatic commitment to the status quo:

[S]cientific education is... conducted through textbooks... [T]he student... is seldom either asked to attempt trial research projects or exposed to the immediate products of research done by others – to, that is, the professional communications that scientists write for their peers. Collections of "source readings" play a negligible role in *scientific* education. Nor is the science student encouraged to

read the historical classics of his field. . . [S]cientific education remains a relatively dogmatic initiation into a pre-established problem-solving tradition that the student is neither invited nor equipped to evaluate. (Kuhn 1963, pp. 350–351)

It may be of some surprise to modern readers that Kuhn took this approach to be good, rather than bad, for science:

Scientific education inculcates. . . a deep commitment to a particular way of viewing the world and of practicing science. . . By defining for the individual scientist both the problems available for pursuit and the nature of acceptable solutions to them, the commitment is actually constitutive of research. . . In addition, commitment has a second and largely incompatible research role. Its very strength and unanimity with which the professional group subscribes to it provides the individual scientist with an immensely sensitive detector of the trouble spots from which significant innovations . . . and almost inevitably educed. (Kuhn 1963, p. 349.)

Later, Kuhn (1970a, p. 5) even went so far as to declare: “It is precisely the abandonment of critical discourse that marks the transition to a science.” The penultimate quotation gives some indication of why Kuhn thought of this, but in order to understand his perspective more clearly, it is useful to grasp his view of how science typically does and, indeed should, proceed. (Kuhn derived methodological norms from historical descriptions. His stance on science education was similar: he sought to find an explanation of the status quo, as he saw it, in terms of its utility.)

To put it simply – for more detail and further references, see Rowbottom (2011) and note especially that the discussion here makes reference only to theories, although paradigms involve considerably more – Kuhn thought that science involves two key phases, namely normal science and extraordinary science. He thought that normal science is the most distinctive part of science and that dogmatism about the theories of the day is crucial, for scientists, in that phase. Why? Because strong commitment to theories encourages scientists to work hard to see what can be achieved with them, over an extended period, and also encourages them to assume that any failures they encounter should not be blamed on the theories. So dogmatism makes science resistant to theory change and also, for related reasons, likely

to expose the limits of existing theories. This is why Kuhn compares normal science to puzzle solving. Puzzles are defined by rules. If a crossword puzzle requires a six letter word, for example, one cannot use a seven letter word instead. To do so would be to fail to engage with the puzzle.

Extraordinary science, on the other hand, is reserved for those periods where repeated failures to solve puzzles come to be blamed on theories. Kuhn is vague about when exactly this should happen. He also admits that it couldn’t happen if every scientist were completely dogmatic. He mentions, for example, that changes in a field are often fomented by relative newcomers and that older scientists may be perfectly reasonable to resist such changes come what may.

So that’s Kuhn’s view. Good science involves long periods of normal science, punctuated by occasional and relatively short periods of extraordinary science. And the periods of normal science are enabled by dogmatism. Thus suppressing and discouraging criticism of standard existing theories is an important part of science education. (For more on the educational aspect, see Matthews 2004.)

Criticisms of Kuhn’s view of science have been many and varied. For example, some have denied that the pattern he sees in the history of science exists in general (even if they concede that it was present in some areas and episodes that Kuhn studied). But more interesting for present purposes is whether such a pattern is genuinely required for, or is even sufficient for, good science. And to probe this, one need not deny that normal science – or something approximating it – is a real phenomenon. Popper, for instance, admitted the existence of normal science but took a dim view of it:

‘Normal’ science, in Kuhn’s sense, exists. It is the activity of the non-revolutionary, or more precisely, not-too-critical professional: of the science student who accepts the ruling dogma of the day; who does not wish to challenge it; and who accepts a new revolutionary theory only if almost everybody else is ready to accept it—if it becomes fashionable by a kind of bandwagon effect. . . In my view the ‘normal’ scientist, as Kuhn describes him, is a person one ought to be sorry for . . . He has been taught in a dogmatic spirit: he is a victim of

indoctrination. He has learned a technique which can be applied without asking for the reason why ... (Popper 1970, p. 52)

Popper's view was that scientists should typically be open to renouncing their theories and should spend much of their time attacking – and trying to refute – said theories. On a related note, he thought that good scientific theories were typically improbable, due to their simplicity and scope. In short, for Popper (1970, p. 55), there should be no “domination of a ruling dogma over considerable periods. . . [because] the method of science is, normally, that of bold conjectures and criticism.”

We cannot hope to resolve the dispute between Kuhn and Popper here. However, it is worth noting that both assume that almost all scientists should be dogmatic, or all scientists should be critical, at any given point in time. (For Popper, almost all should be critical at any point; theories should be cut slack only in relatively early stages of development. For Kuhn, almost all should be dogmatic in normal science, and almost all should be critical and try to proliferate alternative theories in extraordinary science.) Neither seriously considers the possibility that good science can involve a balance of dogmatic and critical practitioners, or a balance of scientists performing critical (or offensive) and dogmatic (or defensive) functions – that is, among other functions. This possibility is articulated and defended in Rowbottom (2011). The basic idea is that proper division of labor between individuals with different dispositions can benefit the scientific community. For example, the presence of someone who dogmatically defends his favorite theory come what may does not prevent scientists as a whole rejecting said theory. And his activities may benefit science in the event that he discovers something new using his theory, even if that is improbable. His presence might help the community to hedge its bets, so to speak.

On this picture, good science education partly involves exploring how a prospective scientist might best contribute to the enterprise of science as a whole. Again, the central idea is relatively

simple. Different scientists do radically different things. And just as some experimentalists would make relatively poor theoreticians, and vice versa, so some theoreticians excel in creative activities, e.g., generating interesting new theories and models, whereas others excel in destructive ones, e.g., finding the flaws in the theories and models of others. And so on.

Even if this is correct, however, it may not be possible to split students into different groups and give them different treatment “ahead of time,” so some difficult choices seem forced. Consider, for instance, the proper role of the history of science in science education. (See Brush 1974; Siegel 1979; Matthews 2015, Ch. 4.) For Kuhn, it's a good thing when “Partly by selection and partly by distortion, the scientists of earlier ages are implicitly represented as having worked upon the same set of fixed problems and in accordance with the same set of fixed canons that the most recent revolution in scientific theory and method has made seem scientific” (Kuhn 1970b, p. 138). And anyone who has studied science, and subsequently the history of science, will know that this happens to a considerable extent in science education. Even at university level, for example, the famous gold foil experiment conducted by Geiger and Marsden, under the direction of Rutherford, is typically presented as having showed that all the positive charge in (gold) atoms is concentrated in a central nucleus. The reality is quite different, in many respects. For one thing, Rutherford considered the possibility that positively charged alpha particles could be “slingshot” by areas of concentrated negative charge and preferred the view that the nucleus was negatively charged at one point. In short, the heavy metal foil experiments weren't nearly so decisive as they are almost always presented as having been. For the details, and supporting quotations, see Rowbottom (*In Progress*, Ch. 4).

Popper's view, by contrast, is compatible with – and highly suggestive of – the idea that studying past scientific controversies would be useful, and proper, for fostering a critical spirit and sharpening critical ability.

Clearly one cannot take both routes. But there are middle roads worth considering. For example, one might typically use heavily simplified history, and admit this explicitly, and occasionally use more detailed historical case studies to allow students to consider how, and why, one theory won out over another. (Scientists are not typically historians and philosophers of science, and this may be a good thing.) One might decide to “distort” somewhat by downplaying the social factors that were responsible for theory change, but perhaps shouldn’t have been.

Indoctrination and the Un-growth of Morality

Rauno Huttunen

University of Turku, Turku, Finland

Synonyms

Critical thinking; Gadamer; Habermas; Indoctrination

Introduction

The concept of indoctrination means unethical influencing in a teaching or learning situation imposed by teacher, teaching content, or educational institution (see Snook 1972; Hare 1964; Cuypers and Haji 2006; Kilpatrick 1972; Puolimatka 2001). When successful indoctrination causes infiltrating (drilling, inculcating, etc.) concepts, attitudes, beliefs, and theories into an individual’s mind by passing his or her free and critical deliberation (Huttunen 2003). When on a general level we define indoctrination in this pejorative way, it is easy to reject indoctrination. Its rejection means that we condemn the indoctrinative as teaching morally wrong and demand that teachers, parents, textbooks, or educational institutions should not endorse it. One major reason for indoctrination being reprehensible is that indoctrination prevents moral growth or it represents moral un-growth. According to Richard Mervyn Hare, the aim of indoctrination is to keep children perpetually children, aka keep them in the state of moral immaturity. “Indoctrination only begins when we are trying to stop the growth in... capacity to think for themselves about moral questions” (Hare 1964, 64). Indoctrinative teaching prevents those learning processes that facilitate critical thinking and moral maturity. If the context is adult education, the aim of indoctrination is to turn morally mature person into morally immature person.

Indoctrinative education thus contributes a kind of moral unlearning or un-growth of morality.

One can claim that indoctrination tends to cause un-independent thinking and moral immaturity. In his famous text *An Answer to the Question – What Is Enlightenment*, Kant (2015a) defines immaturity as follows: “Immaturity is the inability to use one’s own understanding without the guidance of another. This immaturity is self-incurred if its cause is not lack of understanding.” In the case of indoctrination, this immaturity is not self-incurred, but it is production of indoctrinative teaching, indoctrinative teaching contents, or indoctrinative teaching institutions.

Indoctrination in Habermasian Sense

Jürgen Habermas (1991, 169) criticizes Hans-Georg Gadamer’s view on education being indoctrinative, although Habermas does not explicitly use the term indoctrination but instead Habermas speaks of *legitimieren mit Autorität* (legitimation with authority): “Gadamer has in mind the type of educational process through which what is handed down is translated into individual learning activities and appropriated as tradition. Here the person of the educator legitimates prejudgments that are inculcated (*legitimieren mit Autorität*) into learner with authority – and this means, however we want to look at it, under the potential threat of sanctions and with a view to gratifications. Identification with the role model creates the authority through which an internalization of norms, and thus sedimentation of prejudgments, is possible. The prejudgments in turn are the preconditions of possible knowledge. This knowledge is raised to the status of reflection when it makes transparent the normative framework within it moves... Made transparent, the prejudgment structure can no longer function as prejudgment. But that is precisely what Gadamer seems to imply. For authority to converge with knowledge would mean that tradition, working behind the back of educator, so to speak, legitimates the prejudgments inculcated into the person growing up; these prejudgments could then be confirmed

only in the reflection of that person. As the person, having become mature, confirmed the structure of prejudgments, he would transfer, in reflected form, the once involuntary acknowledgment of the personal authority of the guardian to the objective authority of a context of tradition. Yet it would remain authority, for reflection would be able to move only within the limits of the facticity of what was handed down. The act of recognition, mediated by reflection, would not have altered the fact that tradition as such remained the only basis for the validity of prejudgments.” In this supposedly Gadamerian model of education – for the sake of clearness I rely on Habermas interpretation – the formation of Kantian autonomous moral subjectivity is impossible. In this model the individual is unable to critically reflect on internalized norms and prejudgments until he or she has learned to follow them blindly.

If Habermas accusation is correct, Gadamer’s view on education is vulnerable to indoctrination accusation. For Gadamer only when the person has become mature, then he or she can critically reflect prejudgments he or she has received from the tradition. This reminds Jack Mezirow’s (1991) concept of critical adult education. Mezirow thinks that school education is always indoctrinative and only adult education could be emancipator and non-indoctrinative. Habermas’s counterclaim is that once individual has internalized norms and prejudgments of tradition, his or her mature reflection would be able to move only within the limits of the facticity of what was handed down by tradition. In the Gadamerian model, the individual is unable to critically reflect on internalized norms and prejudgments until he or she has learned to follow them blindly. Gadamer’s philosophical hermeneutics which demands us to be open to the authority of tradition makes rejection of indoctrination impossible because pupils and students have to first adopt the tradition before they can critically reflect the content of tradition (for Gadamer-Habermas debate, see Hoy 1978; Holub 1991; Misgeld 1991; Jay 1982; Vattimo 1989; Ricoeur 1990; Giddens 1977; McCarthy 1978).

It is a very difficult task to reconstruct a model of education which provides a faculty of critical

reflection that makes possible for the learner to transcend the context of tradition and be a Kantian autonomous moral thinker. How can an individual and more precisely a child transcend the context of tradition? Without this ability to transcend tradition, a person is not an autonomous moral thinker and his or her competence for moral reflection remains in undeveloped phase.

Stefaan E. Cuypers and Ishtiaque Haji (2006) have very interesting proposal for this dilemma. They name this dilemma with phrase “indoctrination objection” which “calls into question whether education, aimed at cultivating autonomous critical thinkers, is possible” (Cuypers and Haji 2006, 273–274). Cuypers and Haji propose that before autonomous critical thinking, there is non-autonomous “proto critical thinking” which lacks the autonomy but forms foundation for later autonomous critical thinking (Cuypers and Haji 2006). Habermasian model of emancipator learning also presupposes some kind of capacity for critical thinking before mature critical thinking. We might call this as preliminary communicative and moral competence. Before proper Kantian moral maturity, there must be some sort of moral maturity which makes moral development and moral growth possible.

The Kantian idea moral maturity is itself a content of tradition. The problem is that a child must learn essential content of tradition and at the same time she or he must learn to critically reflect this content. Any other form of learning is indoctrinative and represents “a moral unlearning” or un-growth of morality. Gadamer’s hermeneutics implies that learning is always indoctrinative. For Gadamer, *Bildung* (education) is socialization into tradition and its values. Gadamer thinks that we must first understand the tradition and open up to the tradition before we can evaluate and renew it. Habermas wants us to have a critical and reflective attitude to begin with and demands us to trust our own power of judgment. In the Habermasian model of critical learning, the enlightened Cartesian and Kantian autonomic subject postpones prejudices and authority until she has decided which part of the tradition is worth saving. In some sense Gadamer himself acknowledges that his philosophical hermeneutics does not show the

possibility for critique of tradition or breaking free from tradition and thus it is one-sided (Gadamer 1998, xxxvii):

This raises a final question, which concerns less the method than the contents of the hermeneutic universalism I have outlined. Does not the universality of understanding involve a one-sidedness in its contents, since it lacks a critical principle in relation to tradition and, as it were, espouses a universal optimism? However much it is the nature of tradition to exist only through being appropriated, it still is part of the nature of man to be able to break with tradition, to criticize and dissolve it, and is not what takes place in remaking the real into an instrument of human purpose something far more basic in our relationship to being? To this extent, does not the ontological universality of understanding result in a certain one-sidedness? Understanding certainly does not mean merely appropriating customary opinions or acknowledging what tradition has sanctified. Heidegger, who first described the concept of understanding as the universal determinateness of *Dasein* [“human being,” RH], means by this the very projectiveness of understanding – i.e., the futurity of *Dasein*. I shall not deny, however, that – among all the elements of understanding – I have emphasized the assimilation of what is past and of tradition. Like many of my critics, Heidegger too would probably feel a lack of ultimate radicality in the conclusions I draw.

On the other hand, Gadamer has a point when he is claiming that there is no escape from tradition. Everything that we have learned about moral behavior, we have learned from tradition. The problem here is this: Where does this Kantian autonomic subject come from if not from the process of education itself? How can a student or a pupil exercise her Kantian autonomy toward tradition in the process of education, if Kantian moral autonomy is an outcome of education? This situation is called the pedagogical paradox (see Kant 2015b; Løvlie 2007), or it is one aspect of this paradox. Both Gadamer and Emil Durkheim try to avoid the pedagogical paradox by identifying education with socialization. For Gadamer education is the process through which an individual adopts the content of a tradition and becomes a mature member of a community. An individual must first grow into a tradition before she can evaluate the content of the tradition. Durkheim’s view is more or less the same, though he lays more emphasis on the socially

functionalistic role of educational institutions. Durkheim defines education in the following way (Durkheim 1956, 71):

Education is the influence exercised by adult generations on those that are not yet ready for social life. Its object is to arouse and to develop in the child a certain number of physical, intellectual and moral states which are demanded of him by both the political society as a whole and the special milieu for which he is specifically destined.

According to Paul Fauconnet's interpretation of Durkheim, "autonomy is the attitude of a Will that accepts rules because the Will recognizes their rational ground. First a child receives rules from society. The child is not able to evaluate which rules are valid and which need to be either rejected or renewed. Only autonomic attitude is capable of this evaluation, and autonomy grows gradually in the process of education" (Fauconnet in Durkheim 1956, 45). Habermas, on the other hand, claims that evaluation of rules and norms, which happens afterward, is bound to tradition. Habermas claims that if the only basis for validity of norms is tradition (like legal positivism states), then no one possesses true autonomy. Nevertheless, the Habermasian model of education cannot escape the pedagogical paradox. Where does autonomy come from if young pupils are not communicatively competent to critically evaluate the content of tradition? If critical learning requires critical evaluation and reflection of the tradition, a communicatively incompetent learner is unable to learn critically which in turn prevents the moral growth or causes moral un-growth. Through what kind of learning process is a critical and communicatively competent subject formed? Asking this question is the same as asking how *Bildung* is possible, because *Bildung* means formation of a Kantian morally mature (*Mündigkeit*) subjectivity.

For this purpose, I have constructed a model of communicative teaching which tries to preserve the idea of critical learning while recognizing the authority of the teacher and tradition. This model is based on Habermas's theory of communicative action (1984) and discourse ethics (Habermas 1990, 1992). Communicative teaching is close to the ideals of collaborative learning, peer

interaction, and non-teacher-directed communication (see Littleton 2000; Light and Littleton 1999). Empirical studies by Karen Littleton and others show that pupils in schools have better capacities for independent and critical thinking that is generally believed even among the professionals of education. Cuypers's and Haji's (2006) notion of proto critical thinking is well in accordance with this line of thinking. My model of communicative teaching does not totally solve the problem of pedagogical paradox, but it shows the principles that contribute to the formation of conditions for peer learning, the practical intersubjectivity in teaching (see Biesta 1994), and for situation where a teacher and her pupils can cooperatively participate in the formation of meanings and new meaning perspectives.

Communicative Teaching as Facilitator of Critical Thinking and Moral Growth

As I said before, Habermas has not directly dealt with the theory of indoctrination, but there are two versions of Habermasian criteria for indoctrination: Robert Young (1989) Habermasian theory of indoctrination and my own (Huttunen 2003, 2009). Robert Young was first to apply Habermas to the theory of indoctrination, but Young's concept of indoctrination has its own inherent problems. Young's theory concentrates solely on the speech acts of the teacher, which should not be the point in the theory of indoctrination. This is why I presented a revised version of the Habermasian concept of indoctrination. I have to say that my critique toward Young concerns only a small portion of his larger critical theory of education. With the exception of this concept of indoctrination, I am very much in agreement with Young's critical theory of education.

I understand communicative teaching to include value orientations in which the teacher commits herself or himself to "universal" presuppositions of argumentation and acts in accordance with these maxims as to the best of her or his ability (Mollenhauer 1972, 42). Pedagogical communication is a kind of simulated communicative action (see Masschelein 1991, 145), and it is more

simulated in early stage of education. When a teacher teaches 7-year-old pupils, the words “to the best of her or his ability” have different practical consequence than in the case of a teacher teaching 20-year-old students. The value orientation is the same, but the practice or application of presuppositions of argumentation is different. When we understand communicative teaching in this way, as an exceptional form of communicative action, the concept of communicative teaching is looser than the concept of communicative action itself. I think that communicative teaching as an exceptional application of communicative action still remains within the realm of communicative action, although teachers sometimes use language in strategic ways. I could imagine that the amount of strategic use of language is higher in elementary school than in institutes of higher education, but the value orientation of teaching is still the same in both cases. Because teaching situation is asymmetric situation, teaching cannot fully satisfy rigorous requirements of communicative action. At best teaching could be simulated communicative action where pupils can practice their preliminary communicative competence (Masschelein 1991, 145).

In dealing with the dilemma of indoctrination, we should refrain from focusing specific attention on the singular speech acts of a teacher. When the aim of education is to produce mature and communicatively competent people and the content of teaching provides materials for independent and critical thinking, then the teacher may use methods that, when taken out of context, may resemble strategic action and the perlocutive use of language.

In this respect, I have set two parallel criteria for indoctrinative teaching: (1) the communicative method and intention criterion and (2) the empowering content and consequence criterion (Huttunen 2003, 2009).

1. The most important element in the non-indoctrinative teaching is the respect for other persons. Habermas defines the communicative action as a kind of linguistic interaction in which one's fellow man is considered as a genuine person and in which aims and ends

of action are decided in an environment free and equal discussion. Opposing to this communicative action, there is the strategic action in which one treats others as a natural object, solely as a means to an end. I define the strategic teaching as the kind of teaching in which the teacher treats her students solely as objects, as objects of series of didactical maneuvers. This strategic teaching is a form of indoctrination (strategic teaching is not same as indoctrination), when a teacher tries to transfer teaching content to the students' minds, treating them merely as passive objects, not as active co-subjects of the learning process. Then the teaching is in no sense the simulation of the communicative action but the pure strategic action.

I define the communicative teaching as contradictory to the strategic teaching. The aim is a communicatively competent person who does not need to rely on the teacher or any other authority for that matter. In the communicative teaching, students are not treated as passive objects but as active learners. In the communicative teaching, a teacher and her students cooperatively participate in the formation of meanings and new perspectives. In the communicative teaching, the teacher does not impose her ideas on the students but rather they make a joint effort to find a meaningful insight regarding the issues at hand. What I refer to as the communicative teaching very closely corresponds with Biesta's “the practical intersubjectivity in teaching.” Biesta does not understand education “as a one way process in which culture is transferred from one (already accultured) organism to another (not yet accultured), but as a co-constructive process, a process in which both participating organisms play active role and in which meaning is not transferred but produced” (Biesta 1994, 312). Unlike Biesta, I do not consider teaching (no matter how good a teacher is) as a symmetrical communicative action.

The communicative teaching is nearest to the ideal of communicative action that it can get in a real teaching situation. The communicative teaching is a simulation of

communicative action, a simulation of a free and equal discourse. It is also a simulation of democracy and democratic mode of action. This means that there could be no communicative teaching in the school, if there exists no kind of practice of a school democracy. Nevertheless, pedagogical action essentially remains as an asymmetrical relationship, because the teacher and her students do not share a common level of communicative competence. Only after a person has completed her education (*Bildung*) is she prepared to engage in the proper communicative action.

However, even my revised version of the method and intention criterion does not recognize the unintentionally or structurally caused indoctrination. In some teaching situations, no matter what a teacher's intentions and methods were, the outcome was still an uneducated morally immature indoctrinated person. Thus, it is clear that we need aspects of the content and the consequence of teaching.

2. The starting point in the empowerment content criterion is the constructivist view of knowledge. Nowadays, teaching cannot be based on the notion that there exists a group of objective facts, which are deposited into students' minds like money is deposited in a bank. According to the constructivist view, knowledge is constructed through social processes. Knowledge does not imitate outer reality but rather the system of knowledge is a construction of the reality. When the constructivist nature of knowledge is recognized, higher demands with regard to the teaching content are directed. The teaching content should provide students with opportunities to construct their own creative and multidimensional view of reality. The teaching content should also promote students to engage critical self-reflection. Thus, if we want the teaching content to be non-indoctrinative, the teaching content should contribute to students' reflectivity toward those meaning perspectives that they have already adopted, as well as toward those that are taught (see Mezirow 1991). The teaching content should not provide any easy answers but rather should improve students'

own power of judgment and capacity for mature deliberation. I consider content that limits students' meaning perspectives and minimizes as opposed to increases students' own power of judgment as indoctrinative. In the case of indoctrination, the teaching content tends to keep students at an immature stage. The non-indoctrinative teaching content gives students both the freedom and faculty to determine their own differentiated identity, world-view, and conduct of life.

The consequence criterion of empowerment is related to the theories of modern identity and reflective modernity (Beck et al. 1994). The idea of this criterion is to promote such kind of education that contributes to the formation of reflective and relatively open identities. In modern societies, identities are open to a certain extent. I would call this as modern person or modern personality to contrast traditional personality. In every society, some part of identity is solid as a result of primary socialization, but, in modern societies, the individual tends to remain somewhat "incomplete." The modern person is conscious of her capacity to change her own identity, and she possesses the perspective of many possible identities. This relatively open form of identity produces the pluralization of life worlds and meaning perspectives. People tend to grow up differently in modern societies. This corresponds with the situation that Emile Durkheim called organic solidarity (Durkheim 1984). In the stage of organic solidarity, society needs autonomous, independent, critical, and professional individual personalities. My claim is that if educational institutions tend to systematically produce closed identities (traditional personalities), we can presume that these institutions impose some form of indoctrination. In modern or postmodern society, educational institutions should encourage a reflective attitude toward one's own identity. Without this kind of reflectivity, moral growth is difficult or even impossible. Modern educational institutions should contribute to the formation of a modern personality which corresponds Kantian notion of enlightened morally mature person.

Conclusion

Indoctrinative teaching, indoctrinative teaching contents, and indoctrinative educational institutions tend to produce uncritical and morally immature person which is opposite to the Kantian enlightened morally mature person. Indoctrination does not facilitate moral learning and it tends to produce moral unlearning or un-growth. In modern times we appreciate moral maturity and enlightenment; that is why we disapprove indoctrination. We want education contribute to the formation of morally autonomous mature person, but this is easier said than done. We encounter the pedagogical paradox. How can we teach anything, e.g., independent moral thinking, without unintentionally indoctrinating individual to some moral system or tradition of moral behavior? This issue touches the essence of the so-called Gadamer-Habermas debate. I admit that Gadamer has a point when he is defending the authority of (moral) tradition, but nevertheless (supposedly) Gadamerian model of education does not facilitate the Kantian notion of enlightened morally mature person. Habermas' critique of Gadamer hermeneutics is effective, but Habermas's theory lacks the proper educational theory which could show how pedagogical paradox can be avoided or at least mitigated. That is why I have reconstructed a Habermasian model of communicative teaching which aims at overcoming indoctrination and moral un-growth.

Inequality

► Education and Political Theory: Prospects and Points of View

Informal Assessment

Maria Araceli Ruiz-Primo
Stanford University, Stanford, CA, USA

Assessment is practiced everyday in all social interactions. It is the way we naturally, even automatically, assess each other as we socialize in a variety of situations everyday: “Whenever we take the time to look and notice, we find naturally occurring, unremarkable, and unremarked assessment activities that nevertheless are fundamental in making human collaboration possible. . . [.] . . in-a-glance, on-the-fly mutual assessments underlie all of human sociality, and in fact, the sociality of all social species” (Jordan and Putz 2004, p. 348). This on-the-fly assessment has come to be known as *interactive* (Bell and Cowie 2001) or *informal assessment* (Shavelson et al. 2003) in education, or *inherent assessment* in non-education organizations (Jordan and Putz 2004).

These terms have been used as differentiators from those at the other end of the continuum, i.e., more *planned* or *formal* assessment as applied in education (Bell and Cowie 2001; Shavelson et al. 2003; Wiliam and Black 1996) and *documentary* assessment as applied in organizations (Jordan and Putz 2004).

At any point of the continuum between informal and formal, the assessment process is a cycle of *gathering*, *interpreting*, and *acting* upon the information collected, all *guided with a particular goal* in mind. This goal could be to know if our interlocutor understands what we are saying or to know if students are achieving the intended learning goals.

Any assessment process can be characterized by the following dimensions: (a) the *agents* involved (i.e., the assessed and the assessor); (b) the *role that each agent plays* in a larger social context in relation to other individuals (e.g., supervisor/supervisee; expert/novice; teacher/student/peer); (c) the *purpose of the assessment* or how the information will be used (e.g., to check understanding in a conversation, to improve the assessed performance, to judge and assign a number to the assessed performance); (d) the *type of evidence collected* (i.e., incidental or purposeful; informal or formal); and (e) the *strategies* used to communicate the results of the assessment (e.g., body language, tone of speech, gestures, actions, oral feedback, graphic representations, a score).

The informal-to-formal continuum includes intermediate points. The extremes of the continuum and their intermediate points vary according to the characteristics of each of these dimensions. Informal assessment at one end of the continuum may be completely implicit, as, for example, when a listener in a conversation “looks perplexed and confused” and his interlocutor rephrases what was just said without any justification (Jordan and Putz 2004). In this situation, the listener relied on the speaker's facial gestures to interpret what was being said and what was not fully understood, then rephrased to clarify the intended message. As we move to the other end of the continuum what was implicit gradually becomes explicit, and the assessment message is shared with the assessed (an individual, a pair, or a group). This

explicitness is made evident across all the dimensions.

Informal assessment can be practiced minute-by-minute because everything can be used as a source of information to guide our next move. For example, we can use the interlocutor's gestures and body language, the questions she may ask you or others, the conversation she may be having with another person, or how she responds to the questions posed by you or others (orally or written).

An important element in informal assessment is to maintain an *interpretative* (Davis 1997) state of mind, which allows us to gather the desired information and to know what to do next. Only by maintaining this state of mind is it possible *to notice* – that is, to attend, interpret, and decide what to do next (Jacobs et al. 2010).

A good way to exemplify informal formative assessment and its impact is to focus on a context. Then, the rest of this entry focuses on thinking about informal formative assessment in the context of teaching and learning in classrooms. There are at least two reasons for doing so. First, classroom interaction is a core part of teaching (Alexander 2008) and, as such, offers the ideal setting for analyzing informal formative assessments at a more molecular level. Second, informal formative assessment in classrooms allows analyzing the process with the single goal of improving students' learning.

Informal Formative Assessment in the Classroom Context

Daily ongoing informal assessment in the classroom makes use of various informal strategies to gather information about students' learning. When this process is conducted for the primary purpose of advancing students' learning, this becomes *informal formative assessment* or *informal assessment for learning*.

A critical premise in informal formative assessment is that much of what teachers and students do in the classroom can be described, potentially, as an assessment that can provide evidence about where students are in their learning. Informal

formative assessment, then, involves taking advantage of the numerous opportunities within a class period to collect evidence about where students are relative to the learning goals, and then to use this information to help improve students' learning. That is, much of what occurs every day in the classroom offers potential assessment opportunities. Informal formative assessment has been named **on-the-fly assessment** because it takes advantage of the opportunities, planned (such as a carefully thought question to ask students) and unplanned (such a question asked by a student in the middle of a discussion) to collect evidence about students' level of understanding. For example, when a student asks a question indicating confusion about something, teachers can use this as an opportunity to better understand the students' thinking – that is, they interpret. The important characteristic of this interpretation is to find out *what* the student knows, understands and can do, and not only *if* the student knows, understands, and can do something. The latter one involves a yes/no response approach rather than searching for what exactly students' know and in which way this knowledge can contribute to help reach higher levels of understanding. Only with this type of interpretation, teachers can then decide which action to take that can facilitate, support, and advance the student's learning (e.g., provide feedback, make an instructional adjustment, or suggest additional practice).

Based on classroom observations (Ruiz-Primo et al. 2015), we know that informal formative assessment is not necessarily done consciously: something is noticed, and how to respond to what it is noticed is decided very quickly. Proficient teachers attend; they observe; they look at what students are doing, writing, or saying; and they ask questions that help them understand their students' thinking. All this in turn will inform the teacher's next steps and decisions. For these strategies to work, there is a critical requisite: the teacher needs to fully understand what to look for when attending to what students are thinking. That is, the learning goal should be very clear so it is obvious what to attend to and how to respond to what it is noticed. Informal formative assessment

then can be generally characterized by the conscious discovery of novel information about student understanding in any interaction at any given point in time; it is the constant searching for making sense of students' responses, actions, comments, and behaviors (Ruiz-Primo 2011).

Different from formal formative assessment, informal formative assessment is not necessarily associated with a particular assessment instrument, rather teachers use four sources of information readily accessible to them that offer opportunities to gather information: what students say, what they write, what they do, and what they make. Among all these sources, what students say during any instructional interactions is critical; "...talk is the most pervasive in its use and powerful in its possibilities...[it]...vitaly mediates what the child knows and understand and what he or she has to yet know and understand" (Alexander 2008, p. 118). Thus, one of the most important tasks for teachers is to create interaction opportunities that directly and appropriately engineer such mediation (Alexander 2008; Bellack et al. 1966; Edwards and Westgate 1994). This is true independently of whether the interactions are between the teacher and a student, or the teacher and many students, or among the students themselves.

Instructional dialogues can be viewed as *assessment conversations* (Duschl and Gitomer 1997) in which dialogues become a source of information for interpretation and deciding what to do with the information collected. Assessment conversations are dialogues usually embedded in any activity that occurs in the classroom. "The main purpose of assessment conversations is to make students' thinking explicit, or to voice their understanding so that teachers can recognize and act on it to promote learning. Assessment conversations make evident *what* and *how* students are thinking, enabling teachers to recognize their students' conceptions, mental models, strategies, language use, and/or communication skills. Teachers can then use this information accordingly to guide the next activities" (Ruiz-Primo 2011, p. 17).

Earlier it was mentioned that the formative assessment process is a cycle of *gathering*,

interpreting, and *acting* upon the information collected that is *guided with a particular goal* in mind. In what follows the critical characteristics of informal formative assessment are presented considering this cycle. The discussion starts with what should guide the other activities, clarifying the learning goal and expectations.

1. Clarify what students are expected to learn and how they can show that they are learning.

Assessment conversations can only take place when there is a clear goal that guides the interaction. The classroom instructional activities assigned can be both a learning experience as well as a window into students' thinking. When the most central things students need to learn are clear, the ways to gather information can be streamlined and efficient. The learning goals that guide informal formative assessment conversations tend to be discrete and immediate (e.g., what students need to get from a class discussion or from a task). Reminding students about the learning goals and targets during the interactions make them more purposeful (e.g., remind students the purpose of an activity or a conversation).

2. Gather Information: "*How can students' thinking be made explicit?*"

The key is to design questions and activities that can create windows into student's thinking. They should be designed to reveal *how* students arrived at an answer and their thinking behind the answer. Asking questions, observing, and listening become critical tools for informally gathering evidence about student learning:

Questioning. Questions are asked for a variety of reasons: to make sure students are on task ("Does everyone have their planners out?"), to see if students are paying attention ("Can everyone see this?"), to model our thought process ("Okay, what is the next thing we do when we are solving problems of this type?"), to see if students know or can do something ("What is the density of water?," or "How do we read volume with a graduated cylinder?"), to push students' thinking ("What do you think would happen if we continued this experiment for two more weeks?"),

and to understand students' thinking ("Can you tell me more about why you think that?," or "Show me step by step how you solved this problem?").

Whether conducted with a student, a group of students, or the whole class, questioning, when done purposefully, can reveal a great deal about students' thinking. The questions asked and the interpretation of the students' responses should be based on the learning goal(s). The most informative questions ask students to explain their answer, elaborate on their response, or provide information about why they think something. Asking multiple questions with increasing focus can help to hone in on the source of rationale behind students' thinking or source of confusion. Questions that begin with "why does...?"; "how would you...?"; "could you explain...?"; "why do you think...?"; "why is _____ an example of _____?"; "why is _____ and not _____?" can help to develop dialogical interactions. When we seek to learn something about students thinking, these types of questions become the most fruitful. "Good diagnosis relies on rich questions that elicit learners' higher-order thinking" (Stobart 2014, p. 118). Questions that are closed (with a yes/no answer or with specific correct answers in mind) can help to find *if* students know something, but they may not help to find *what* students know.

Observing and listening. Most teachers observe or listen to students while they are working. What is less common is to observe and listen to students with the purpose of **noticing** – that is, observing and listening with the purpose of learning about students' thinking. It has been observed that when teachers circulate around their classrooms they focus mainly on making sure students are on task (Ruiz-Primo et al. 2015). When teachers focus on knowing more about students' thinking, they use circulating around the room as an opportunity to observe students working and to listen to their conversations, which in turn helps them to learn more about individual student progress. Observing and listening are usually event-oriented activities;

therefore, the teacher should use her knowledge about the content, the potential students' misconceptions, and the nature of the task to make decisions about whether to intervene or not based on her interpretations of what is happening during the event. As teachers walk around, they can use the information gathered to adjust their instruction accordingly on the next instructional episode or they can decide to intervene with a student or a group as they do so. There is a fine line between becoming intrusive and becoming a learning facilitator when a student is working autonomously or a group of students is discussing a task. When to intervene will depend on the stage of the event (e.g., is it the beginning of the task, the middle, the end?), the nature of the intervention based on the teacher's interpretation of the situation (e.g., asking a question that can help a student to see another perspective or deciding that a deeper conversation is necessary), the time constraints (e.g., will the intervention require a conversation with the student that is longer than the time required to complete the task?), and the student's affective stage (e.g., is the student becoming frustrated because there is not advancement in the task while others are moving forward?).

3. **Interpret the collected information.** As mentioned above, on-the-fly formative assessment requires teachers to make quick decisions about how to help students, and teachers typically make these decisions based on quick interpretations of what they noticed. Most of the time, these interpretations are unobservable to another person. They are derived naturally based on what teachers know about the content being taught and how to teach it, students' conceptions, and potential issues the students may have with certain tasks. For example, when walking around the room and the teacher is observing and listening, she may intervene by asking a question to the students working in pairs based on the interpretation of her observations and the students' conversations. The teacher may have decided at a particular moment that a group of students were having a circular discussion and, therefore, they are

not advancing their reasoning about how to solve a problem. A question is asked as a way to assist students in their discussion; the question becomes a scaffold (e.g., Have you all considered the volume of the object?).

4. **Use the evidence of students' understanding to decide what to do next.** The purpose of gathering information on-the-fly about students' thinking is to use it. A critical characteristic of formative assessment, what defines it, is the use of the collected information to reduce the gap between where the student is and where she should be. If teachers do not decide what to do next using the relevant collected information, the gap is not altered. It follows then that there is no improvement of learning and no formative assessment.

Some strategies are more effective than others in helping students to move forward in their learning. For example, rather than just evaluating a student's response (i.e., stating that they are correct or incorrect), teachers can explain or elaborate for the students *why* something is correct or incorrect, *when* something (such as a procedure) can be used, and *how* to use it. Teachers can decide on-the-fly to reteach something or, if the source of the student's confusion is centered in a particular problem, they can guide them through the solution to a problem by modeling with or without the help of students. Sometimes all a student needs is for teachers to clarify or reexplain the task that they need to accomplish. At other times a student's response reflects clear and deep understanding of the content, in which case we might do something to further push their thinking.

There are two additional aspects related to the implementation of informal formative assessment:

Create ways for all students to have the same opportunities to participate in formative assessment. Asking a question and receiving an answer from one student or calling on

the students who most often provide correct answers makes it difficult to conclude that everybody in the class is thinking the same thing. However, it is natural to make assumptions about the whole class from only one or two students' responses. Thus, to make instructional decisions for the whole class (e.g., deciding to move on or assign additional work), it is important to ask a handful of students the same question, including those who are often too shy or tend not to volunteer to participate. When teachers pay attention only to those students who volunteer their participation, they can inappropriately decide to move on even though many students are not ready; therefore, the achievement gap within the classroom can widen. It is important to allow all students the opportunity to advance their learning.

Interact with students while they work independently. A good time to work with individual students is when students are working on something either by themselves, or in pairs or small groups. This could be the best opportunity to visit with identified students who can use individualized feedback and assistance. Research shows that the more proficient teachers tend to provide feedback to almost all their students during this independent work period (Ruiz-Primo et al. 2015).

Informal formative assessment can be conceptualized around the idea that everyday activities can be treated as potential sources of assessment information, from physical gestures during a conversation to body posture or words written or spoken. Such information is used by participants to guide their personal social interactions in a variety of nonschool settings. In the classroom context, informal formative assessment is critical to supporting continuing academic progress for every student. When students' thinking can be explicitly described, it can be thoughtfully examined, questioned, and shaped into an "active object of constructive learning" (Glaser 1995, cited in Duschl and Osborne 2002).

Inquiry Learning and Teaching in Science Education

Introduction

Inquiry teaching is one approach for communicating the knowledge and practices of science to learners. While inquiry approaches to science education offer potential learning opportunities, they also pose constraints on what might be available to learn. Inquiry teaching and learning have a history in science education that warrants analysis from pedagogical and philosophical perspectives. Pedagogical arguments for inquiry approaches are grounded in social epistemology, which makes clear the need for building from extant disciplinary knowledge of a relevant social group in order to learn through inquiry. Establishing a social epistemology in educational settings provides opportunities for students to engage in ways of speaking, listening, and explaining that are part of constructing knowledge claims in science. This perspective on epistemology emphasizes the importance of dialectical processes in science learning. Thus, an inquiry-oriented pedagogy needs to attend to developing norms and practices in educational settings that provide opportunities to learn through and about inquiry. By considering the situated social group as the epistemic subject, inquiry teaching and learning can be viewed as creating opportunities for supporting the conceptual, epistemic, and social goals of science education.

Inquiry in Science Education

Inquiry in science entails conducting an investigation into the natural, social, or designed world

and applications of scientific knowledge to societal issues (Kelly 2014). In education, inquiry approaches are often designed around student-centered activities or investigations. Such investigations typically concern a domain for which at least some of the participating inquirers do not know the results prior to the investigation. Inquiry has been characterized as engaging learners in scientifically oriented questions, proposing hypotheses, formulating and evaluating evidence, arriving at agreed explanations, and communicating results (National Research Council 1996). As such, inquiry is derived from views of knowledge, is underwritten by interpretations of knowledge, and instantiates perspectives on knowledge. Thus, inquiry science poses epistemological questions, and with a focus on science education, these questions can be addressed from a philosophy of science point of view.

It is important to recognize the distinction between the aims of scientific research groups, whose task it is to produce new knowledge, and the aims of education, which include acculturating novices into ways of understanding the natural world. Scientific and educational institutions have different purposes, and failing to recognize the differences confounds aspects of inquiry regarding discovery and learning. Inquiry in scientific research may lead to new knowledge. Inquiry in education serves to instruct members how to engage in relevant, specific processes of investigation, use concepts in context, and develop means for understanding community practices. Under some circumstances, inquiry in educational settings generates new knowledge within the local community, thus showing some similarity with scientific communities.

Challenges for Teaching Science as Inquiry

There are a number of important challenges to teaching science as inquiry. First, students are typically unable to induce sophisticated scientific concepts from empirical phenomena, such as those available through inquiry. As some knowledge is required to learn, then inquiry approaches that situate the student at the center of investigation need to recognize that only with sufficient, relevant background knowledge can answerable

questions be posed by students. Thus, inquiry approaches to science learning need to consider the importance of learning from more knowledgeable members of a community and the necessity of transmission of knowledge and technique.

A second challenge for inquiry instruction is that learning science entails more than learning the final-form knowledge of scientific communities (Schwab 1960; Duschl 1990). While propositional knowledge (*knowing that*) is important, knowing how to engage in scientific practices and how to make epistemic judgments ought not be neglected. Therefore, science learning should include conceptual, epistemic, and social goals (Kelly 2008). While much of inquiry has focused on students' engagement in practical or laboratory activities, pedagogies focused on socioscientific issues and science in social contexts pose important opportunities to learn through investigations in unknown domains. Inquiry can arguably include evaluation of expertise, certainty, and reliability of scientific claims of others. Epistemic criteria must be brought to bear on evaluation of knowledge claims.

A third challenge to learning science as inquiry is the nature of the intended knowledge. Science topics and community practices may be more or less appropriate for an inquiry approach. Some knowledge and practices may be attainable through a student-centered approach, while others require the direction of more knowing others. Clearly, at least some scientific practices can be learned only through intensive effort, which may require extensive participation in a community of learners. Methods of assessment, either formative or summative, need to be carefully chosen to match the learning goals appropriate to the knowledge sought.

Fourth, learning the conceptual knowledge, epistemic criteria, and social practices over time in science domains may require coordination of scope vertically (across grades over time) and horizontally (across subject matter areas at a given grade) across the curriculum. While academics find ways to separate disciplines, and there may be interesting epistemological distinctions, students experience schooling as a whole. Science may not be separate from views and

knowledge of history, mathematics, reading, writing, and so forth. Thus, the challenge for teaching science as inquiry includes understanding how such approaches can be supported or undermined by other curricular decisions and pedagogies, both from within and from outside science programs.

Contributions from Philosophy of Science

The philosophy of science offers much potential to inform science teaching and curriculum development. The perspective from the philosophy of science offers at least four contributions to education: methods for posing questions about science, models for serious thinking about science, understandings about aspects of scientific inquiry, and a skeptical orientation regarding ways that science is characterized in curriculum materials and instruction.

Philosophy of science provides methods for posing questions about science, scientific activity, and values entailed in such inquiry (Machamer 1998). Philosophy of science steps back from the details of specific scientific investigations, debates, and controversies and seeks to examine the rational basis for theory choice. Over time, the characterization of theory change as depicted in philosophy of science has changed, and the debates continue. For example, certain early versions of logical empiricism sought to understand the logic of theory choice. This perspective attempted to view theories as predicting devices and focused on the cognitive content (often viewed as the empirical consequences) of particular theories.

Alternatives of various sorts to this depiction emerged after Kuhn's (1962/1996) influential view of theories as connected to overarching paradigms that influence the nature of observation. Recognizing the importance of theories, beyond their empirical consequences, led to a number of developments in empiricism and scientific realism, also to various social constructionist views of science. Across the perspectives, philosophy of science continues to investigate the inquiry processes of science.

Philosophy of science may identify educational perspectives on science that are not readily available through causal observation or even participation. Careful analysis of theory change,

induction, and explanation in the field of philosophy of science can lead to understandings about the nature of science. Furthermore, increasingly philosophy of science is being influenced by the empirical study of scientific practice. The disunity of science and the range of the many fields that can properly be called science require that understandings such as the nature of science, and disciplinary inquiry such as the philosophy of science, look at specific ways the actual work of science is accomplished. In each of these ways, philosophy of science informs inquiry approaches to teaching science.

Philosophy of science identifies both cognitive and ethical values undergirding scientific inquiry. Such values are relevant to inquiry in science education. For example, Longino's (2002) social epistemology articulates ways that productive discourse can be accomplished in scientific communities. Such discourse provides a normative account about the ways that differences in theory and orientation can be adjudicated through public discourse in a manner that invites publicly recognized standards, equality of intellectual authority, and fair criticism.

Philosophy of science can help educators promote a healthy skepticism regarding how science is characterized in curriculum materials and instruction. As philosophy of science is a discipline dedicated to the study of the history and structure of inquiry (Machamer 1998), it can provide insights in the ways that science is portrayed in educational settings. Such insights identify aspects of the ways that disciplinary knowledge is constructed, assessed, used, and communicated and can inform curricula.

Social Epistemology and Inquiry

Scholarship in philosophy of science, particularly those areas informed by the empirical study of scientific practice, has made the case for a shift of the epistemic subject from the individual learner to the relevant social group (Kuhn 1962/1996; Longino 2002). Such a shift provides the basis for a thoroughly social view of knowledge and practice in science and science education (Kelly 2008). There are clear curricular implications for a social epistemology. These include

creating practical experiences that take into account the extant knowledge of the students, designing investigations that acknowledge the interpretative flexibility of empirical evidence, and situating decisions about experimental results and socioscientific issues in dialogical processes.

The importance of the sociocultural basis of scientific progress is illustrated in three ways: the *sociohistorical contexts of scientific discovery*, the *acculturation of new members to a community*, and the *relevance of epistemic criteria and evaluation of knowledge claims*.

Advances in science emerge from *sociohistorical contexts* where relevant groups of inquirers draw from extant knowledge, design and execute ways of collecting evidence, and propose solutions and evaluate solutions to outstanding, communally recognized problems. The history of science shows examples of the cultural context and fundamental assumptions of the participants at the time need to be taken into consideration to make sense of the development of ideas through inquiry (Kelly 2014).

A second example of the epistemic shift relevant to inquiry for education is the manner that newcomers are acculturated into particular ways of seeing, communicating, and being. This realization about the substantive and important socialization into the ways of being in science counters forms of positivism that based scientific progress on logic and objective experimental facts. These ways of being are dependent on the social practices of a relevant community. Coming to know the scientific ways of seeing, communicating, and being entails active participation in the practices of a relevant community; it requires a form of apprenticeship. Learning to participate and become a member involves collective action. Understanding the ways that the language of a group operates, the nuances in meaning, and the path to modification in such meaning involves use of discourse in contexts. Furthermore, the completion of such an apprenticeship may be critical to being taken seriously by peers.

A third example of social processes involved in scientific progress concerns the epistemic criteria for the evaluation of knowledge claims. Rather than viewing reasoning in science as a logical process of hypothesis testing, contemporary

philosophy of science recognizes the dialectical processes of persuasion, debate, and critique. Indeed, scientific knowledge is social knowledge to the extent that knowledge claims are judged in relevant disciplinary communities.

Longino (2002) and Habermas (1990) each have proposed norms for productive conversations in communities that respect alternatives, but focus clearly on the strength of marshaling evidence. This leads to implications for inquiry centered on the social basis for decisions and the importance of using evidence in science. A dialectic approach to the construction of knowledge claims has plausible relevance to education. Nevertheless, such an approach needs to consider the local context and participants. Interesting questions about inquiry can be raised about students' developmental ages and abilities and variations regarding the science topic at hand.

Philosophy of Science and Learning

The relationship of philosophy of science and learning has been a central part of numerous developments in science education. One intersection occurred during a focus on constructivist learning in science education. Constructivism entered science education through a focus on students' ideas and understandings. These learning theories brought a welcomed focus on students' conceptions. Through careful attention to how students made sense of science phenomena, researchers were able to examine learning from the learners' point of view. This had a significant impact on science education and brought in philosophy of science. For example, the development of the alternative conceptions movement and conceptual change theory both used the work of Kuhn (1962/1996) and others to consider how students' constellation of conceptions served as framework for sense making. These foci led to pedagogy attending to students' sense making and provided opportunities for students to be actively involved in knowledge construction. These constructivist perspectives were criticized as focusing too heavily on the mind of the individual learner and thus were ill equipped to integrate discourse and consider the value of social practice.

A serious competitor to constructivist theories of learning emerged in the form of sociocultural

theory. This view of learning conceptualizes the problem of learning as one of participation and appropriation of knowledge and practices of some relevant group. Central to this view is the important role of discourse processes through which everyday events are constructed. By viewing learning as acculturation, the role of social processes and cultural practices are emphasized. From this point of view, as groups affiliate over time they form particular ways of speaking, acting, and being that are defined by the group membership and evolve as the group changes (Kelly 2008). Discourse practices established by the group become cultural tools for members to construct knowledge. These cultural tools, signs, and symbols mediate social interaction, which forms the basis for learning (Vygotsky 1978). This view of learning entails more than changes in the internalized cognitive structure of individual minds; in addition, participants learn to be members of a group with common knowledge, identity, and affiliation through shared cultural practices that constitute membership in a community.

Sociocultural psychology and philosophy of science share some important central tenets and premises about science, knowledge, and inquiry. Both represent a shift in the epistemic subject from the individual learner or scientist to the relevant epistemic *community*, the relevance of agency within the potential created by a social language, and the value of dialectical processes for proposing, evaluating, and testing knowledge claims. Perspectives from Vygotsky (1978) evince the importance of considering how interpsychological processes can be internalized by individual learners. Much like the social epistemology in the philosophy of science (Longino 2002), the individual has agency and plays a key role in the development of knowledge, but does so within the social languages of a relevant community. This suggests that instructional design for inquiry should consider how social practices are established and used to communicate ways of inquiring into the natural world. Such communication occurs across events leading to the development of knowledge, including the problem-posing phase of inquiry, the sense-making talk around investigations, deliberation around

meaning of results, and evaluation of the epistemic criteria for assessing proposed ideas, models, and theories.

Philosophical Considerations for Inquiry Teaching and Learning

Science education has considered inquiry as a goal for reform a number of times across decades (DeBoer 1991). Whether or not inquiry was in the foreground, we have seen proposed educational change in the form of goals, standards, and frameworks. Reform is a process that can include participants as part of a vibrant democracy where agency and identity are formed through active engagement in educational decision-making. Philosophy has a role in developing the minds of citizens.

Philosophy has the potential to inform educational practice and ways of thinking about reform in educational policy. First, philosophy offers ways of posing questions. Posing questions and examining implications represent a contribution of such philosophical considerations. Posing questions and examining in detail any proposed reform offers a contribution to the overall debate in educational reform. Second, philosophy can contribute through conceptual sorting. Through philosophical analysis of the conceptual content of educational texts (policy, curriculum, frameworks, standards) and of education events (research, teaching), philosophy can bring clarity or identify areas of ambiguity. Developing understandings about the nature of knowing, inquiry, and meaning are central to reform that progresses and advances thinking about education. While such meanings can be informed by empirical study, understanding the meaning of inquiry requires careful thought and analysis. Normative decisions about directions for science education cannot be answered by empirical study alone – a balance must be struck between careful, descriptive studies and philosophical considerations of meaning. Third, philosophy of science can inform our field by scrutinizing the nature of education research, including the important work of understanding ways to develop productive conversations across theoretical traditions. Science and education are human endeavors that require ideas to be generated and assessed through

dialectic processes. The field of educational research should consider ways to enhance discourse around educational practice.

To meet the conceptual, epistemic, and social goals of science education, educators require critical analysis and discussions about the nature of inquiry. This approach can be reflexive about inquiry into inquiry. Work in science studies and the philosophy of education may be helpful for understanding how inquiry can be conceptualized in science education. The field of science education can be informed by both descriptive, empirical studies of science and science education, as well as for the importance of the normative or moral arguments for reason, science, and education. Inquiry most broadly construed entails learning and self-actualization. The educational goal of inquiry should not only be to meet specific standards, concepts, or procedures but rather to develop the capacity for further learning. Through engagement in the sociocultural resources of other people and through interaction with the natural, designed, or social world, learners can develop an enhanced capacity to learn and develop new ideas. Education from inquiry should develop the ability to engage in more inquiry.

Intellectual Virtues and Educational Practice

Jason Baehr

Philosophy Department, Loyola Marymount University, Los Angeles, CA, USA

“Virtue epistemology” is an approach to the philosophical study of knowledge that foregrounds “intellectual virtues” such as curiosity, open-mindedness, intellectual humility, and intellectual courage. Intellectual virtues so conceived are the character traits of a good thinker, learner, or inquirer.

Intellectual virtues are also related to but distinct from natural cognitive ability. A person can be extremely intellectually “gifted” while also being intellectually arrogant, careless, or lazy. Conversely, a person of mediocre natural intelligence can be highly curious, open, careful, and thorough in her thinking. Again, intellectual virtues are the strengths of *character* needed for the competent and successful pursuit of “epistemic goods” like knowledge and understanding (Baehr 2011: Chap. 2).

Intellectual Virtues as an Educational Aim

Intellectual virtue concepts are useful for fleshing out a plausible but elusive “third aim” of education. To be sure, a good education will equip students with a broad base of knowledge and a wide range of cognitive skills, from reading and writing to basic arithmetic. But it will also do more than this. As one often hears, education at its best also inspires a “love of learning” and shapes students into “lifelong learners” or “critical thinkers.” Such claims are of a piece and

intuitively appealing. They suggest an important educational aim that is at once epistemic and personal. However, the concepts they invoke tend to be vague or slippery. The language and concepts of intellectual virtue offer a richer, more concrete, and compelling way of capturing this aim (Baehr 2013, pp. 249–250).

To illustrate, consider the notion of “lifelong learning.” Plausibly, a “lifelong learner” is someone who pursues new topics and questions, makes time to feed her mind, thinks deeply and carefully about what she is learning, has a good sense of what she doesn’t know or understand, is open to new ways of thinking, and so on. This is another way of saying that she possesses intellectual virtues like inquisitiveness, open-mindedness, and *intellectual* tenacity, carefulness, thoroughness, and humility. Consider also the notion of “critical thinking.” Critical thinking is partly a matter of being *able* to reason well. However, a person can have this ability while lacking either an appropriate sense of when it should be used or the motivation to use it. Such persons fall short of being “critical thinkers” in the relevant, normatively robust sense. To be a critical thinker in this sense, a person must also, as Harvey Siegel has put it, possess a “critical spirit” marked by qualities such as “intellectual honesty, justice to evidence, sympathetic and impartial consideration of interests, objectivity, and impartiality” (1988, p. 39). These qualities also are plausibly understood as intellectual virtues. Because intellectual virtues have both a “judgment component” and a “motivational component,” they secure the kind of rational excellence lacked by the person who possesses the ability to reason well but is disposed to use this ability foolishly or not at all (Baehr [forthcoming](#)).

Virtue epistemologists have given extensive, psychologically rich, and philosophically sophisticated accounts of intellectual virtues like open-mindedness, curiosity, intellectual courage, intellectual humility, and intellectual perseverance (see, e.g., Riggs 2016; Whitcomb 2010; Baehr 2011, Chaps. 8 and 9; Whitcomb et al. 2015; Roberts and Wood 2007, Chaps. 8 and 9; and King 2014). Given the connection just noted between these virtues and the relevant personal-

cum-epistemic educational aim, virtue epistemology contains resources for better articulating and explaining what this aim amounts to. Moreover, the resulting characterization is personally compelling and attractive. Part of what it is to be a “good person” or to be good *qua* person is to possess qualities like inquisitiveness, open-mindedness, attentiveness, intellectual humility, and intellectual courage (Baehr 2011, Chap. 6). We desire these qualities in our colleagues, friends, and spouses. And we seek to impart them to our children and students. This is significant vis-à-vis education, for teachers and students alike are more apt to enthusiastically pursue goals like “critical thinking” or “lifelong learning” to the extent that they are construed in the kind of concrete and personally compelling terms afforded by a virtue epistemological framework (Baehr 2013, pp. 253–255).

Implications for Educational Practice

Given that growth in intellectual virtues is a worthy educational aim, it is important to consider the implications of this point for educational practice. What difference, if any, should it make to how practitioners approach their work with students? The remainder of this entry outlines several principles drawn from philosophy, psychology, and educational theory that together comprise an initial response to this question (for more on this topic, see Baehr 2016, especially Chaps. 10–14; Battaly 2006).

Engaging Agency

One overriding implication is that education should be conducted in ways that systematically engage the *agency* of students. It should not be geared toward the passive absorption of information or the rote memorization of facts and formulas. This is a consequence of what intellectual virtues are and how they are formed.

Intellectual virtues are dispositions of thought and (intellectual) action: they involve observing, wondering, listening, contemplating, judging, doubting, affirming, and much more. As such, an exercise of intellectual virtues engages the

rational and volitional capacities of their possessor in a deep and systematic way (Baehr 2011, Chap. 2). Further, as Aristotle noted long ago (e.g., in Book II of the *Nicomachean Ethics*), character virtues arise (in part) through the repeated *practice* of activities characteristic of the virtue or virtues in question. While Aristotle's point was about moral and civic virtues, it applies no less to intellectual virtues conceived of as character traits. A person develops open-mindedness, for instance, in part through repeatedly taking up and giving a fair hearing to perspectives very different from her own (Battaly 2006).

The upshot is that, where intellectual virtues are taken seriously as an educational aim, students must be actively engaged in the learning process. In particular, given that intellectual virtues are manifested in and “perfect” the activity of thinking, students must be given frequent and well-supported opportunities to thoughtfully and critically engage with the subject matter. (While this can be accomplished in a variety of ways, Ron Ritchhart's work on “thinking routines” [2011 2015, Chap. 6, and 2002, pp. 147–160] provides an excellent example of how teachers can incorporate opportunities to practice intellectual virtues across the curriculum.)

Self-Reflection

A student's progress in intellectual virtues can also be facilitated by her understanding of her own “habits of mind,” that is, her own intellectual character strengths and limitations. Such understanding can help the student identify which areas of her intellectual character might need improvement as well as some steps she might take to bring this improvement about. If conveyed to her teachers, this understanding might also help them to identify interventions with a similar aim and impact.

For these and related reasons, self-reflection is also an integral part of educating for intellectual virtues (Socokett 2012, Chap. 9). Such reflection can incorporate not only a student's first-person, introspective reports about her own intellectual character but also the third-person perspectives of other knowledgeable and trusted parties like

the student's teachers, parents, and friends. This kind of activity should, of course, be developmentally informed and appropriate. And it should be designed with sensitivity to the sorts of biases and other psychological factors known to limit the reliability of self-reflection. When opportunities for self-reflection are structured in this way, they can yield a “working model” of a student's intellectual character that can be utilized by the student and her teachers in the service of the student's intellectual character development.

Attention to Value and Significance

Educating for intellectual virtues also calls for giving serious consideration to the epistemic *motivation* of students. Part of the aim of doing so, as suggested above, is to help instill or inspire in students a desire for understanding and an enjoyment of the learning process, both of which are central to the possession of intellectual virtues. Shaping the epistemic motivation of students is, of course, a complex and challenging process. At a minimum, it requires that students regularly perceive the *value* or *significance* of what they are learning.

Many familiar modes of instruction neglect this principle. Students often are asked to master a subject or skill with little or no reflection on the importance or significance of doing so. In cases like this, it should be no surprise when students exhibit lackluster epistemic motivation (Newmann et al. 2001). Thus, where growth in intellectual virtues is the goal, taking pains to shore up the underlying value and meaning of the curriculum is critical.

This requires, first, that teachers themselves locate and attend to the value of what they are teaching; and, where no such value exists, that they do what they can to alter the curriculum. Importantly, “value” or “meaning” need not be understood in narrowly instrumental terms. Teachers needn't always have an answer to the exasperated student's question, “When I am ever going to use this in real life?” Rather, a great deal of knowledge and many intellectual skills are valuable in a richer, broader sense, for example, on account of helping students better understand their place in the universe, shedding light on how the world works, shaping students into more

informed and competent citizens, yielding insight into the deeper themes or concerns of the human experience, or otherwise contributing to a richer and more meaningful existence.

However, it is important not just that the curriculum have significant meaning or value but also that practitioners call *attention* to this value and give students opportunities to reflect on, explore, and even challenge it (Russell 1926, p. 154). They must be willing to entertain the question “Why are we learning this?” and be prepared with an answer that is thoughtful and reasonable. Again, if students fail to see (or feel) any value in what they are being asked to do or learn, their level of epistemic motivation is likely to remain low, and their intellectual character growth limited.

A Supportive Environment

A practitioner’s best efforts at fostering intellectual virtues in her students will be limited in their impact to the extent that these efforts are undertaken in a classroom environment or ethos that is out of alignment with the practitioner’s goal. For, as virtue theorists have long observed, virtues arise most readily in the context of supportive environments and communities that bolster other more direct efforts at bringing them about (MacIntyre 1981).

Many factors contribute to a classroom climate or ethos. These include the prevailing evaluative language, the core principles that are upheld and practiced, the allotment of time, classroom rituals and routines, and more. Hence, a further implication of treating intellectual virtues as an educational goal is that practitioners must do what they can to create classroom environments that are themselves supportive of intellectual character growth. In such environments, a rich epistemic vocabulary is employed, intellectual growth is regarded as possible, intellectual struggle is valued alongside accuracy and speed, deep understanding of the subject matter is a dominant aim, and there is a well-established expectation that students will actively and rigorously engage with the subject matter (Ritchhart 2002 and 2015). (These works by Ritchhart are an excellent source of concrete examples of how teachers can create classroom “cultures of thinking” that support their students’ growth in intellectual virtues.)

Classroom environments conducive to intellectual character growth also tend to be marked by two *moral* values, namely, respect and care. While epistemically oriented, intellectual character growth remains a profoundly *personal* process. It involves the shaping of students’ fundamental beliefs, attitudes, and feelings about thinking and learning (Baehr 2013, pp. 251–253). Both commonsense and empirical research suggest that such change and transformation does not occur in a relational vacuum, and certainly not in an environment that is relationally hostile. Rather, they require, at a minimum, that students feel safe and respected (Siegel 2012; Berkowitz and Bier 2005; Lickona 1992). Consequently, teachers interested in educating for intellectual virtues must operate with a high standard of respect, both in how they interact with their students and in how they expect their students to interact with each other. Ideally, however, students would not only feel respected by their teachers but also positively *cared* for. While this sets a high bar for teachers, there are ways of interacting with students that can foster a caring teacher-student connection that do not demand unreasonable amount of a teacher’s time or other resources (see, e.g., Porter 2016, pp. 235–237). In any case, it can be expected that a teacher’s other efforts at fostering intellectual virtues in her students will be considerably amplified to the extent that these efforts are undertaken within the context of a relationship that is at once respectful and caring.

Modeling

A final pedagogical implication of treating growth in intellectual virtues as an important educational aim is that the traits in question must be *modeled* for students. Students do not acquire intellectual virtues just by learning *about* them from their teachers. Rather, intellectual virtues, like other kinds of virtues, arise via a complex psychological and sociological process (Kristjánsson 2015). Several aspects of this process have already been touched upon. But a further aspect consists of exposure to compelling examples and “exemplars” of intellectual virtues. Such exposure has the potential to facilitate experiences of intellectual *admiration*, which can lead to the *emulation*

of intellectually virtuous agents, which in turn can facilitate positive growth in intellectual virtues (Zagzebski 2013).

This can be accomplished by sharing stories or other depictions of intellectually virtuous exemplars from history, literature, film, or contemporary life (Bohlin 2005). Perhaps more importantly, teachers can and should manifest intellectual virtues in their own intellectual activity, for example, by demonstrating wonder and passion for their subject matter (curiosity), being willing to admit when they don't know something (intellectual humility), giving a fair and open hearing to multiple perspectives (open-mindedness), searching for and conveying deep understanding (thoroughness), and so on. As this illustrates, it is important that teachers not "keep their thinking to themselves"—that they "think out loud," raising the curtain on what intellectual virtues look like in practice (Ritchhart 2002, pp. 210–217, and 2015, Chap. 5).

Conclusion

Intellectual virtues are an important educational aim on par with knowledge and intellectual skills. Several implications of this fact for educational practice have been identified. Two final observations are in order.

First, in many respects, the sorts of pedagogical principles identified here are ones that the best teachers already abide by and exemplify. This is as it should be, for it is widely thought that education at its best fosters qualities like curiosity, open-mindedness, intellectual humility, and intellectual courage.

Second, it is important to bear in mind that these principles should be understood and adhered to *as a whole*. If a teacher creates a caring and respectful classroom environment, say, but fails to model virtuous thinking or neglects to give her students frequent opportunities to practice the virtues of good thinking, then she is likely to have a minimal impact on the intellectual character of her students. Thus, the principles sketched here point in the direction of a comprehensive educational approach.

International Philosophy Olympiad

Ivan Kolev
Sofia University, Sofia, Bulgaria

Synonyms

[History of IPO; Philosophy in high school](#)

Introduction: Olympiad of Culture and Education

The International Philosophy Olympiad is an educational contest for high-school students.

It was inspired by the agonal element of the European cultural heritage – one of the main factors for the “cultural miracle” of Ancient Greece which Elada managed to achieve within a very short historic time frame. They compete not only with athletes but also playwrights, artists, and philosophers. In the twentieth century, the modern *Homo Ludens* expanded vastly the scope of competitions, and one of those, which has acquired large publicity and popularity, is the educational contest, part of the Olympiad.

School Olympiads

In the second half of the twentieth century, many educational contests emerged under the title of Olympiads. They were organized in different school subjects and usually target high-school students.

This is the chronological order of those Olympiads and where they were held:

- 1959 – *International Mathematical Olympiad* (Romania)
- 1967 – *International Physics Olympiad* (Poland)
- 1968 – *International Chemistry Olympiad* (the Czech Republic)
- 1989 – *International Olympiad in Informatics* (Bulgaria)
- 1990 – *International Biology Olympiad* (the Czech Republic)
- 1993 – *International Philosophy Olympiad* (Bulgaria)
- 1996 – *International Astronomy Olympiad* (Russia)
- 1996 – *International Geography Olympiad* (the Netherlands)
- 2003 – *International Linguistics Olympiad* (Bulgaria)

As is clearly seen from the list, the start of such Olympiads before the fall of the Berlin Wall was

done in the “former socialist countries.” The explanation may be found in two aspects: firstly, in Eastern Europe those contests were seen as part of the competition between the two political blocs and a way to prove the “superiority” of socialism in the area of education. And, secondly, the motive of cooperation in the area of education and culture may not be underestimated: it was aiming to aid the process of disarmament and peacekeeping in Europe and the world. Thus, many Olympiads were supported by UNESCO.

History of the International Philosophy Olympiad

The first International Philosophy Olympiad was held in 1993 in Bulgaria. This initiative was born at a seminar, part of the program of *Philosophy for Children*, organized in the summer of 1992 in Varna, Bulgaria.

At that time there were two national Olympiads taking place: one in Bulgaria and one in Poland. Both took place simultaneously but independently in 1989, several months before the fall of the Berlin Wall.

In Bulgaria the initiative for the International Philosophy Olympiad emerged in 1988 as a means which the philosophers at Sofia University “St. Kliment Ohridski” used to further the process of liberalization in Eastern Europe and start teaching classical philosophy in schools. The goal was to replace the Marxist-Leninist subjects taught and rather dominant in Bulgaria all throughout the era of socialism (1947–1990).

The first International Olympiad was held in 1993 in Smolyan, Bulgaria. Three international teams participated, representing Bulgaria, Romania, and Turkey. In the second edition of the Olympiad, in 1994 in Petrich, Bulgaria, the teams of Germany and Poland joined. At the third edition in 1995 in Stara Zagora, Bulgaria, the participants voted for every future edition of the Olympiad to be held in a different country, under the supervision and guidance of the International Committee.

This is the chronological order of the International Philosophy Olympiads: 1993 (Bulgaria),

1994 (Bulgaria), 1995 (Bulgaria), 1996 (Turkey), 1997 (Romania), 1998 (Poland), 1999 (Hungary), 2000 (Germany), 2001 (the USA), 2002 (Japan), 2003 (Argentina), 2004 (South Korea), 2005 (Poland), 2006 (Italy), 2007 (Turkey), 2008 (Romania), 2010 (Greece), 2011 (Austria), 2012 (Norway), 2013 (Denmark), 2014 (Lithuania), and 2015 (Estonia).

In the autumn of 2000 in Istanbul, Turkey, the regulations of the International Philosophy Olympiad were voted and have been used for organizing the Olympiad ever since.

Goals of the International Philosophy Olympiad

The regulations of the IPO define six main goals of the Olympiads:

1. *“To promote philosophical education at the Secondary-school level and increase the interest of high-school students in philosophy.”*

In many participating countries, the organization of the IPO has had positive impact on the place philosophy takes in the school curricula for secondary education, e.g., in Bulgaria after 1990 the substitution of Marxist subjects with classical philosophy was done by members of the team, organizing the National Philosophy Olympiad. In Argentina, a special institute was created to organize and manage the Philosophy Olympiad and facilitate the participation in the IPOs. In Bangladesh the experts who represent the country at the International Philosophy Olympiad helped include the subject of philosophy in the national school curriculum. In 2015 the number of students who took part in the National and International Philosophy Olympiads exceeded 10,000 people altogether.

2. *“To encourage the development of national, regional, and local contests in philosophy among pre-university students worldwide.”*

The prestige and the impact of the IPO have helped initiate new philosophy contests.

- (a) One of those is the *Baltic Sea Philosophy Event* which is organized by the Finnish

representative at UNESCO and is held every year at the end of November on the *Philosophy Day*, under the auspices of UNESCO.

- (b) Another contest is the *Philosophy Owl* which started in 2014. It requires that participants solve different philosophical and intellectual problems, as well as answer questions, based on good knowledge of the history of philosophy.

3. *“To contribute to the development of critical, inquisitive and creative thinking.”*

The criteria for evaluating the essays help achieve this goal: those who strictly use literature style or express subjective opinions or share standard common opinions are not highly evaluated.

4. *“To promote philosophical reflection on science, art, and social life.”*

Each annual Olympiad is based on a specific topic, agreed upon by the organizers. Their aim is to get the participants involved in a current philosophical debate which is held during the days of the Olympiad, and usually philosophers and intellectuals from the host country take part therein, as well as students from the local schools. This topic, however, is accompanying the Olympiad and does not affect the choice of topics for the contest.

5. *“To cultivate the capacity for ethical reflection on the problems of the modern world.”*

There are always ethical problems on the agenda for lectures and debates, held during the days of the Olympiad, and they are discussed by students of tens of countries from different continents and cultures. This helps clarify issues, reflect on them from different perspectives, and overcome prejudice or limitations, thus facilitating the process of forming a well-supported personal ethical stand by the participants therein.

6. *“By encouraging intellectual exchanges and securing opportunities for personal contacts between young people from different countries, to promote the culture of peace.”*

Each Philosophy Olympiad turns into a vivid international forum for young people, and many of the contacts they make during

the event are lasting. They continue to stay connected when they go to university and when they become professionals later on in life. The participants created a group in one of the social networks which functions as a means of exchange of information, opinions, views, as well as a tool for monitoring the personal and professional development and supporting professional cooperation.

National and International Levels of IPO

The Philosophy Olympiads have two levels: national and international.

National Committees. At a national level, the Olympiads are organized by the National Committees who are elected among the philosophy societies, members of FISP, or other similar organizations. The format of the National Olympiad is determined by the National Committee. In some countries the contest strictly complies with the procedures of the International Olympiad, while others use specific forms for the contest (debates, tests, etc.)

The National Committees determine the participating students and teachers, based on their own criteria. The most common procedure is as follows: the winners in the National Olympiad become eligible in the selection process for the International Olympiad. Thus, an extended team is formed of all the winners at national level. This team prepares for the International Olympiad, and at the end of the preparation, two people are elected to represent the country at the international event.

The team that each country sends to the IPO consists of four people: a team leader, a teacher, and two students. The most common practice is the team leader is a standing representative of the country, while the other member is usually the teacher of the student who won the first prize in the selection process.

Apart from those four people, it is possible for guests to attend the official opening and closing of the International Philosophy Olympiad, from the host country, as well as from other countries.

Administrative Bodies of IPO

International Jury

All teachers who take part in the national teams form the International Jury. The members of the jury take part in the evaluation of the written essays. The technical committee of the Olympiad caters for the whole process of evaluation. The regulations of the IPO do not allow representatives of a country to evaluate the works of students from the same country.

International Committee

The representatives of countries who have hosted the International Philosophy Olympiad form the International Committee. The sessions of the International Committee are managed by the chairperson of the National Organizing Committee of the host country. The International Committee is responsible for guaranteeing the stability and integrity of the Olympiad. The Committee discusses the future development of the Olympiad and decides on the countries where the next editions of the IPO are going to be held.

The Committee is entitled to initiate changes in the statute of the Olympiad.

Within the jurisdiction of the International Committee is the selection of two representatives at the Steering Board.

National Organizing Committee

The sessions of the International Committee are managed by the chairperson of the National Organizing Committee, formed by the representatives of the host country. This Committee functions from 1 June of the year, preceding the Olympiad, to 31 May of the year when the country hosts the International Philosophy Olympiad. The National Committee carries out the preparation and the conducting of the Olympiad. The Committee is responsible for covering the expenses of the two participants, the team leader, the members of the International Committee, and the Steering Board for their whole stay. After the Olympiad has finished, the National Organizing Committee sends a report to the International Committee, to the Steering Board of the International Philosophy Olympiad, and to other institutions and

organizations who are connected with the Olympiad in some way.

Steering Board

Another administrative body is the Steering Board. It is comprised of six members: a UNESCO representative, three FISP representatives, and two representatives of the International Committee. The Steering Board is chaired by the president of FISP or by another of its representatives. The successful development of the International Philosophy Olympiad is very much dependent on the cooperation between the International Committee and the Steering Board. The Steering Board is responsible for informing the members of FISP about the Olympiad, as well as for finding ways to fund the organization of the Olympiad. Whenever a dispute arises in the process of organizing the specific edition of the IPO, the Steering Board is entitled to make the final decision on the issue.

The Steering Board determines the prize seats and the prizes. The winners are awarded either medals, golden, silver, and bronze, or an honorable mention.

The secretariat of the International Committee of IPO is located in the Department of Philosophy at Sofia University, Bulgaria.

Participants on the IPO

Only students who are legitimate high-school students during the year of participation may take part in the Philosophy Olympiads.

Each country takes part with a team of two students, while the host country is entitled to a team of 10 students.

The following countries took part in the International Philosophy Olympiad for the period between 1993 and 2015.

Argentina, Armenia, Austria, Bangladesh, Belarus, Belgium, Bulgaria, Canada, Chile, China, Colombia, Costa Rica, Croatia, Czech Republic, Denmark, Estonia, Finland, Germany, Greece, Guatemala, Hungary, India, Israel, Italy, Japan, the Republic of Korea, Latvia, Lithuania, Macedonia, Mexico, Montenegro, the Netherlands, Nigeria,

Norway, Paraguay, Poland, Portugal, Romania, Russia, Senegal, Serbia, Slovenia, Spain, Sweden, Switzerland, Turkey, Ukraine, and the USA.

In the 2015 edition in Estonia, 42 countries took part.

Topics at IPO

The task of the contestants is to write an essay on one of the four topics they receive.

The representatives of each participating country have the right, and are encouraged to use that right, to send to the secretary general of FISP, no later than 1 March, their suggestions for topics to be included in the four topics at the contest. Among all these suggestions and those of the members of the Steering Board, the representatives of FISP at the Steering Board determine the four contest topics.

The topics may be quotes by philosophers or statements, formulated by the Committee.

The quotes may be no longer than five lines. There are no limitations on the circle of philosophers whose quotes may be selected. The criteria for evaluation are defined in such a manner that the contestants need not know the specific philosopher, school of thought, or paradigm. This is necessary to be guaranteed because the philosophy curricula in different countries vary a lot and thus no specific common area may be defined from where the topics may be selected.

The contestants are not required to present or discuss other ideas of the philosophers on whose quote they are elaborating. It is permissible that quotes by less known or completely unknown philosophers are used because the contestants are not required to discuss the overall ideas or views of the author. The successful essay may discuss the topic as completely isolated from the author or the context.

Examples of Quotes, Used for Topics

1993 (IPO in Bulgaria)

- “Home is far more a state of mind than landscape” (G. Bachelard).
- “Children are antiquities” (G. Bachelard).

- “Everything we see could be otherwise” (L. Wittgenstein).
- “Without ‘now’ there wouldn’t be time and without time there wouldn’t be ‘now’” (Aristotle).

2015 (IPO in Estonia)

- “The adversaries of philosophical literature argue, rightly, that the signification of a novel or a play, or of a poem for that matter, cannot be translated into abstract concepts. Otherwise, why construct a fictional apparatus around ideas that one could express more economically and clearly in more direct language? The novel is justified only if it is a mode of communication irreducible to any other. While the philosopher and the essayist give the reader an intellectual reconstruction of their experience, the novelist claims to reconstruct on an imaginary plane this experience itself as it appears prior to any elucidation.” – Simone de Beauvoir, *Philosophical Writings*, ed. Margaret Simons, p. 270.
- “Death and life, survival and perishing, success and failure, poverty and wealth, superiority and inferiority, disgrace and honor, hunger and thirst, cold and heat – these are the transformations of events, the proceedings of fate. . . . So there is no need to let them disrupt our harmony” – *Zhuangzi*, 5:15. In Brook Ziporyn, *Zhuangzi: the Essential Writings* (Hackett 2009).
- “Thoughts are neither things of the external world, nor representations. A third domain has to be recognized. What belongs to this domain has in common with representations the fact that it cannot be perceived by the senses, but with things the fact that it needs no supporting subject, on the consciousness of which it depends” – Gottlob Frege: “Der Gedanke. Eine logische Untersuchung,” in: *Beiträge zur Philosophie des deutschen Idealismus* 2 (1918/19), p. 69.

Examples of Topics

1997 (IPO in Poland)

- Is philosophy a science?

1999 (IPO in Hungary)

- Is knowledge power?

2015 (IPO in Estonia)

- Some philosophers and theologians since Plato have claimed that the human body is a kind of prison of the soul. Michel Foucault has recently suggested that “the soul is a prison of the body” (*Surveiller et punir*, p.34). Consider some of the conceptions and arguments that might support these opposing views.

When selecting a topic, no two topics of the same philosophical area may be selected. For example, only one topic from *Ethics* may be selected or only one from *Philosophy of Science*.

The topics are presented to the contestants in written form, translated into the four languages of the International Philosophy Olympiad. In translating the topic, editions of the text in the respective language are used, if available. If not available, the quotes are translated into the respective language by the members of the Steering Board.

Essay Writing

The contestants choose one of the four topics and they write an essay thereon in one of the four official languages: English, German, French, or Spanish. However, they are not allowed to write in the official language of the country they represent.

This rule was established in order to give the contestants equal opportunity and a fair start to all. Besides this main goal, the rule helps encourage and facilitate the communication between the participants from different countries, continents, and cultures.

The time limit for essay writing is 4 h.

Essay Evaluation

The essays are evaluated by an International Committee in three stages.

In order to guarantee equal rights to all, the names of the contestants are being coded. The

Technical Committee at the National Committee is responsible for guaranteeing anonymity in the evaluation process and prevent from any conflict of interest.

The essays are evaluated by using the following criteria:

- Relevance to the topic
- Philosophical understanding of the topic
- Persuasive power of argumentation
- Coherence
- Originality

The maximum score is 10 points and the increment is 0.5.

The evaluation scale is as follows:

- 7.5–10 points mean: I suggest this essay for the next stage.
- 5.5–7 points mean: I myself don't suggest this essay, but I will agree if somebody else selects this essay.
- 1–5 points mean: I suggest that this essay should not be accepted for the next stage.

The evaluation process goes through three stages. At the first and second stage, the members of the International Committee evaluate the essays, while at the third stage the members of the Steering Board perform the evaluation.

At the first stage each essay is evaluated by three experts. When the score differs by more than 3 points, the essay is evaluated by a fourth expert.

Only essays which have scored 7 or more points continue to the second stage. At this stage each essay is evaluated by two other experts.

The final score of each essay from the second stage is the average score of all the points, accumulated at the first two stages.

Based on this score, the jury decides which essays proceed to the third stage.

At the third stage the essays are evaluated by members of the Steering Board who make the final rank list and decide who qualifies for prizes and to what prize they are entitled.

A clear evidence of the scope of the IPO, its attractiveness, and its prestige is the fact that among the organizers and the evaluators, many

former contestants may be found, as well as winners of the National Philosophy Olympiads and the International Philosophy Olympiads.

Introduction

The educational study of gender is incomplete without an analysis of the intersection of gender and ability. As this entry discusses, gendered schooling structures and practices, schooling expectations, student and teacher experiences, as well as theoretical analyses of gender in schooling are always at once shaped by discourses and material practices surrounding what it means to be able or disabled. This entry explores the entanglement of gender and ability/disability within educational theorizing and the material practices of schooling, drawing especially from the work of critical and feminist disability studies. Gender is always intricately tied to ability/disability and understanding the role and impact of these social identities or constructs, including within educational systems, necessarily involves understanding their relationship with one another.

This entry consists of three parts. First, it describes how gender and ability are entangled as constructs relevant to educational theory and practice. Second, it discusses how normalizing practices within schools that structure inequalities among students in relation to their gender identities must also be understood as informed by a paradigm of “compulsory able-bodiedness” (Robert 2013) (and able-mindedness) that simultaneously structures inequalities among students in relation to their ability status. Finally, it develops an understanding of how theorizing about and practitioner responses to gender differences in educational achievement and classroom behavior are informed by and interpreted through notions of ability and disability. The entry focuses on a specific schooling phenomenon: the gendered and racialized interpretation and framing of “problem” behaviors and intellectual competence through special education labeling and discourses. In exploring these examples of the intersections of gender and ability/disability in schools and educational discourses, the entry aims to highlight new and promising avenues for gender studies in educational philosophy and theory.

The Entanglement of Gender and Disability

A number of disability studies scholars, and in particular those who identify with the growing field of feminist disability studies, have worked to illustrate an important intersection between gender and disability (Hall 2011; Garland-Thomson 2005, 2006; Wendell 1996). Rosemarie Garland-Thomson, whose work on the intersections of gender, race, and disability has been widely influential in disability studies, describes what she calls the “disability system” as a complex web of cultural norms and expectations, modes of representation, and forms of political power that mark some bodies as normal and others as abnormal (Garland-Thomson, “Integrating Disability,” Garland-Thomson, “Feminist Disability Studies”). Says Garland-Thomson, “The disability system functions to preserve and validate such privileged designation as beautiful, healthful, normal, fit, competent, intelligent – all of which provide cultural capital to those who can claim such status, who can reside within these subject positions” (Garland-Thomson, “Integrating Disability,” 260). Thus, one can understand how the aesthetic policing of women’s bodies and behavior, perhaps especially by and through schooling and related institutions, is enacted through notions of ability and normalcy. Practices of bodily conformity, including surgical interventions, consumer products, and fitness regimes, then, are all upheld by a bodily ideal that is a function of what Robert McRuer has called “compulsory able-bodiedness” (2013); that is, they are upheld by the ability-disability system (McRuer, “Compulsory Able-Bodiedness”). For McRuer, compulsory able-bodiedness emerges as a gendered and sexualized imperative of social and political membership as it is comingled with heteronormativity or the social imperative of heterosexual sexuality and gender-binary normalcy. Being able-bodied is a state of healthfulness, normalcy, and virtue that is displayed through gender normative behavior (McRuer 2003).

Two examples, separated by close to a century, are especially apt in illustrating the entanglement of gender normativity, heteronormativity, and able-bodiedness. The first is highlighted in Douglas Baynton’s “Disability and the Justification of Inequality in American History” (Baynton 2013) in which he argues that historical rationalizations and arguments for perpetuating unequal social relations – between men and women, between whites and people of color – have drawn heavily on constructs of naturalized disability. Baynton describes how, in challenging Western suffragists’ arguments for democratic equality, anti-suffragists drew on arguments about women’s natural cognitive and physical inferiority and presented these in propaganda campaigns:

A popular theme in both British and American suffrage posters was to depict a thoughtful-looking woman, perhaps wearing the gown of a college graduate, surrounded by slope-browed, wild-eyed or “degenerate” men identified implicitly or explicitly as “idiots” and “lunatics.” The caption might read, “Women and her Political Peers.” (Baynton, “Disability and the Justification of Inequality,” 44)

In this example, the rhetorical work of arguing against women’s political equality operates through fears and anxieties provoked by disability. Not only does the comparison between women and so-called “idiots” and “lunatics” mark women as disabled – and in particular as intellectual incompetence – but it also perpetuates the idea that those labeled with cognitive or psychological impairments are democratic unequals. Moreover, the juxtaposition of a woman’s educational achievement against disablement suggests distrust in women’s educational pursuits (perhaps especially because educational attainment threatens the gendered social order).

A second example is drawn from C.J. Pascoe’s ethnography on gender and sexuality in high school, aptly entitled *Dude You’re A Fag* (Pascoe 2007). Pascoe describes a scene in which a group of teen boys are working outside on lawnmowers during shop class:

A group of boys grabbed rubber mallets and began pounding away at the tires and other parts of the

mowers instead of quietly dismantling them with screwdrivers the way they had been instructed to do the previous week. . . I laughed along with the boys, who had formed a circle around those who were ferociously beating a lawn mower. Colin, standing next to me in the circle, said, "We have a whole class of retards who hit like girls." (Pascoe, *Dude, You're a Fag*, 37)

In this second example, a put-down operates to position women and people with disabilities in the same group of undesirables. By manifesting physical weakness and mental weakness, respectively, women and so-called "retards" (a highly pre-judicial word very much still in circulation) are positioned as social others, all the while upholding the physically and mentally strong (read able-bodied and heterosexual) male as the social center. Doing the work of theorizing gender within these examples requires understanding the entanglement of ability/disability and gender.

"Compulsory Able-Bodiedness"

In her *Reclaiming a Conversation: The Ideal of the Educated Woman* (1985), educational philosopher Jane Roland Martin writes, "Philosophers do not construct theories of education in a vacuum. Viewing education as preparation for carrying on societal roles, they tie their proposals to some vision of the good society" (Jane Roland 2000). Martin's purpose is to show how educational philosophy and theory have been dominated by a presumption of masculinity, the male mind, and the male student and have neglected the lived experiences and cultural contributions of women. When women's experiences and social roles are marginal in this way, the picture of education that is produced tends to naturalize those ways of knowing, learning, and doing that are articulated and experienced by men.

Many feminist theorists and philosophers have decried the emphasis on the male subject in theorizing societal institutions. This has been perhaps especially clear in the feminist (and post-structuralist) critique of the humanist subject, characterized by reason and rationality, autonomy, and independence (Mohanty 2014; Erevelles 2002; Foucault 1965). According to the feminist

critique of the concept of reason, reason and rationality – objectivity, judgment, philosophical logic – have been seen as the purview of men, while emotion – the affective, the subjective, the everyday – has been conceived of as the purview of women. This has left women as the philosophical and academic Other to men, not only because it denigrates the affective expressions attributed to women but also because it couples femininity with compromised intellect. To bend a phrase from the example quoted in the introduction, women's "educational peers" are cognitive incompetents. Nowhere is this coupling more evident than in attributions of "craziness" that are lodged against women and girls who fail to conform to or tolerate social expectations. Pathologization of women's minds thus occurs through the attribution of mental illness and "the construct of mental disability is deployed as a gendered tool of oppression and social control that positions the labelled subject as incompetence, incredible, and in need of management" (Taylor 2015).

Nevertheless, while the feminist critique of the concept of reason has been the subject of considerable debate within philosophy, (For discussion, see Nagl-Docekal 1999) only a few have acknowledged that what is at stake in these discussions is not only the demotion of the feminine subject but equally the demotion of the cognitively "impaired," dependent subject (Carlson 2001; Kittay 2005). Eva Kittay, for example, discusses how philosophy has long regarded an individual's place in the moral community – their status as a person – as dependent on the possession of particular psychological capacities, especially rationality and autonomy (See Kittay, "At the Margins of Personhood," 100). For those who are unable – or regarded as unable – to possess such capacities, their personhood and status as a social subject are precarious. Thus, the privileging of traditional conceptions of rationality and autonomy leaves both women *and* people with disabilities on the margins social institutions, including education.

The entanglement goes further still. Not only does the emphasis on psychological capacities privilege the historically constructed male subject,

it also privileges the educational emphasis on the mind at the expense and neglect of the body. Yet bodies populate classrooms and, in many ways, frustrate the processes of schooling. Bodies get sick, they can be hurt, they must fit into schooling spaces, and they are, quite simply, uncooperative with the frequently rigid norms of behavior, teaching practice, and educational structure that characterize schools. In her institutional ethnographic study of women with chronic illnesses enrolled in postsecondary educational institutions, for example, Karen Elizabeth Jung (2011) describes how her participants were forced to reveal and expose their bodies – both literally and through physicians notes, and so on – in order to receive accommodations (Karen Elizabeth 2011). While Jung’s participants were positioned so as to reveal themselves and “claim disability,” instructors and administrators were permitted to occupy an “investigative stance” in which they were the deciders of who is authentically disabled and who is not (Jung, “Chronic Illness and Educational Equity,” 276). Yet being on the receiving end of this empowered gaze leaves disabled women exposed to the conditions of erasure – both as they become their bodies and as they face the possibility of having their body’s needs denied (Jung “Chronic Illness and Educational Equity,” 282). Chronically ill women’s “social invisibility” “makes it difficult to incorporate the realities of chronic illness into both mainstream disability and feminist disability research, effectively reinforcing mistaken beliefs that people with disabilities are unable to make significant contributions to traditions of learning in the academy” (Jung “Chronic Illness and Educational Equity,” 282–283). Educational spaces of the university are naturalized as able-bodied spaces – by or through design, in fact (Lennard J. Davis, “Why is Disability Missing from Discourses on Diversity,” *Chronicle of Higher Education* (September 25, 2011).) – and this means that bodies that fail to “fit” (Garland-Thomson 2011) whether in virtue of their disability, their gender, their sexuality, or their race are seen to threaten the natural order of things.

Nirmala Erevelles (2000) uses the term “the unruly body” to signify that bodies, in their

materiality and imperfection, are uncontrollable and always, to some extent, outside of our control (Erevelles 2000). Yet the fear that we cannot control our bodies is precisely what leads to the kinds of bodily interventions that enforce gender and ability perfectionism: fitness regimes, diets, beauty products, plastic surgery, and so on. The imperative of the able body is always gendered because it imposes a disciplinary system that is binarized male–female. As shown in the earlier example from Pascoe – and as her book’s title suggests – displays of strength and destruction help boys to distance themselves from the pathologizing attribution of homosexuality. For girls, displays of femininity – make-up, high heels, hair treatments – afford power and social status (think *Mean Girls*) even as they maintain women’s powerlessness within patriarchal structures. (Indeed, it is interesting to think about the physically disabling and immobilizing effects of high heels, even as they are used as gendered markers of beauty). The maintenance of “compulsory able-bodiedness” thus operates not only as a social and political injunction to power but also as a material constraint against disturbing the social order of the schooling system.

Gendered Pathologization in Schooling Practices

The entanglement of gender definitions, identity, and experience with the social phenomenon of disability shapes how educational theorists and philosophers respond to gender in education, whether implicitly or explicitly. The growing understanding of ability/disability as a social organizing construct and a complex social system can help us to better understand how and why gender is framed as a problem in schools, how students’ gendered and sexuality differences and experiences are pathologized, and, perhaps especially, how institutions of education organize themselves around gender.

Of the many gendered schooling phenomena that educational researchers have focused on in the last several decades, the notion of the disparate social behaviors and success of boys and girls

(The presentation of a gender binary here – boys and girls – is not meant to advocate a view of gender as binary. Rather, gender binaries can be understood as in fact reinstated in schools through discourses and practices of ability and disability.) has been prevalent. Beyond important analyses of how girls and boys are socialized into different roles through and by schooling practices, researchers have also been fascinated by the changing educational attainment patterns that occur between boys and girls' educational achievement both in K-12 schooling and higher education. Among the many areas of focus within this research is the differing social behaviors of girls and boys in schools as well as the different ways in which these behaviors are interpreted. Returning to the earlier example from Pascoe, it is possible to imagine how teachers might interpret the behavior of the boys with the lawnmower as simply "boys will be boys" behavior, as does one of the teachers in Pascoe's study (Pascoe, *Dude, You're A Fag*, 37). On the other hand, the "boys will be boys" interpretation can take on a whole new meaning when attached to particular racialized interpretations of ability/disability. How might this interpretive difference account for why poor black, Latino, and indigenous boys are disproportionality more likely to be labeled with disabilities in school, for example? (Harry and Klingner 2014) How might it explain gender differences in disciplinary and behavioral intervention practices in school that break down along the lines of race and disability label? (Skiba et al. 2002; Lopez 2003).

Certainly, race and gender on their own form a complex web in studying the achievement of boys and girls in schools. In her qualitative study of race and gender disparities in urban education, Nancy Lopez (2003) observes that "notwithstanding the fact that men were generally more rambunctious than their female counterparts, teachers were generally less understanding of young men and more likely to discipline them harshly for the same infractions committed by their female counterparts" (Lopez, *Hopeful Girls, Troubled Boys*, 88). These race and gender complexities are of particular interest to scholars who study the

phenomenon of overrepresentation in special education as well as the discursive coupling of femininity with cognitive incompetence that can position women and girls as educational others.

Overrepresentation refers to the disproportionate number of students of color who are identified within and through particular disability categories in special education (Ferri and Connor 2005). Where an analysis by race and class markers does go a long way towards explaining this disproportionality, Beth Ferri and David J. Connor point out that "within-group gender differences in identification rates confound attempts to explain racial differences as primarily due to race and class" (Ferri and Connor, "In the Shadow of Brown," 95). Gender plays a significant role in how students' racial identities are interpreted and in how they are constructed as disabled. Educational scholars who apply a disability-conscious analysis to understanding the pathologization of behavior have focused not only on how diagnostic and identification practices in special education assessment lead to imbalanced identification along the lines of race but also how the interpretation of social behaviors influences the way that students are seen as able and disabled. To understand these phenomena, some disability studies in education theorists have focused in on understanding how unwanted or unwelcome behaviors are interpreted in the classroom. Fernanda Orsati and Julie Causton-Theoharis (2013), for example, describe how classroom behaviors are interpreted as not only challenging or disruptive but also as evidence of an internal student deficit or disability (Orsati and Causton-Theoharis 2013). These authors argue that the interpretation of behavior – and subsequent assessment of impairment – depends greatly on what they call a "discourse of control" that teachers and other educational professionals draw upon to interpret students. Importantly, these responses focus less on interpreting students' behaviors as they do on interpreting the students themselves. For example, the authors describe the phenomena of teachers grouping students whose behaviors are unwanted: "'they scream', 'they run' 'you need to chase them'"

(Orsati and Theoharis, “Challenging Control,” 516). These kinds of grouping descriptions imply that teachers see these students as “other” and, moreover, that the behavior is evidence of an inherent pathological deficit rather than a social experience (Orsati and Theoharis, “Challenging Control,” 521). Disability becomes that marker of internal deficit.

Thus, for many young men of color the “boys will be boys” adage works not to excuse unwanted behavior but rather to mark it as pathological – as emotionally troubled or disturbed. Susan Baglieri and Arthur Shapiro (2012) describe the disability category of emotional disturbance as a “soft disability” because of the subjective nature of its identification: “soft disabilities” are ones that lack any known or discernible physical or biological markers and are thus based solely subjective methods of assessment and identification (Susan and Arthur 2012). In the case of emotional disturbance, teachers’ expectations of correct or normal behavior – and their reports of apparent abnormal and disturbing behavior – account for much of the identification process and likely much of the phenomenon of overrepresentation of students of color carrying the label of emotional disturbance (Baglieri and Shapiro, *Disability Studies*, 119). Indeed, “being a boy, being Black, and/or poor increases one’s likelihood of being identified as emotionally disturbed” (Baglieri and Shapiro, *Disability Studies*, 119). These theoretical analyses of behavior and pathology-attribution illustrate the intersecting components of gender and ability in schooling. Importantly, in the above examples, one’s perceived or experienced gender identity is significant in determining how one is interpreted relative to disability in schools.

Conclusion

The purpose of this entry is twofold. First, it uses specific examples to describe how ability/disability and gender are entangled as social identities. Whether it is the normalizing practices in schools that maintain gender binaries and reward heteronormativity or it is the disciplining and

pathologization of behavior, interpretations of gender are always entangled with “compulsory able-bodiedness.” Second, it discusses how these examples illustrate the necessity of an intersectional approach to studying gender in educational philosophy and theory. The entry began with the strong claim that the educational study of gender is incomplete without an analysis of the intersection of gender and ability. The purpose of this strong claim is to encourage educational theorists and philosophers who study gender and disability to attend to these important intersections and the complexities they raise for theory, policy, and practice in education.

Introduction

The term “philosophy of education” can be misleading in for understanding the Islamic philosophy of education. Even though this term is well known in educational circles today, it is by no means the case that it can be helpful in finding out the relevant contents in different cultures, including the Islamic culture. As Nicholas Burbules (2000) has aptly pointed out, the technical term “philosophy of education” referring to an academic discipline is not even common in the European countries, let alone the non-European cultures. He holds that in some of the European countries, the terms “educational theory” and “pedagogical science” are used in order to introduce the themes subsumed under the rubric of the philosophy of education. According to him, this gets even more complicated in the case of non-European cultures where the borders of intellectual development and ethical or religious development get blurred, and, thus, terms such as “philosophy of faith” or “philosophy of duty” take the role of introducing what is meant by philosophy of education.

The same difficulty that Burbules refers to is felt in dealing with the Islamic philosophy of education. No doubt something as “Islamic philosophy” appeared in the interface of Islamic civilization and the Greek philosophy which paves the ground for understanding the Islamic philosophy of education by contemplating on educational views of Muslim philosophers. However, something like anti-philosophy was developed too in reaction to so-called Islamic philosophy among Muslim thinkers such as Ghazali. While his views should no doubt be included in the Islamic philosophy of education, he explicitly avoids the rubric of “philosophy” for his views. This suggests that we should take a more comprehensive point of view in dealing with the Islamic philosophy of education than what the limited term of “philosophy” provides us with.

In what follows, three strands of thought will be introduced as the main features of interface of Islam and philosophy of education. In the first strand, “philosophy” and famous philosophers’ thoughts are explicitly avoided, and, instead, a full and exclusive embrace to Islamic scriptures is taken as the key entrance to Islamic educational views. In the second strand, philosophy is taken to be compatible with Islam as a religion, and, thus, it is held that the “Islamic philosophy of education” can be sought properly under this rubric. Finally, in the third strand, which I am going to show as preferable to the other two, philosophical methods and procedures are used in order to formulate the educational thought introduced in Islamic scriptures. It is worth noting that the difference between the third and the first strand is that while the latter avoids any philosophical thought and terminology, the former embraces philosophical methods even though there is a similarity between the two strands in dealing with the scriptures.

The First Approach: Inference from Muslim Philosophical Systems

In this approach, it is held that religion does not only contradict philosophy, but in fact there is a harmony between them because philosophy is

trying to use rationality to reach the same truths that religion has introduced by revelation. In this approach, Muslim philosophers’ systems of thought are used as a basis for deducing educational points of view.

Philosophical Foundations

In this part, some examples of ontological, epistemological, and axiological views of the followers of this approach are introduced. Al-Attas (1980/1996), for instance, in discussing Islamic ontology gets close to mystical metaphysics. Therefore, in Islamic ontology, he puts God at the first level of the hierarchy that the mystics refer to as “Oneness” (ahadiyyah). At this level, God is purely absolute without being determinable in any way whatsoever. The second level of the world is called “the most sacred emanation” (faiz al-Aqdas) of God. This level being somehow limited is divided into three levels: the divine solitary level, the divine names and attributes level, and the level of subsistences (aayan sabetah). Finally, the third level of the world has two sublevels: external objects (aayan kharejiyyah) and the experimental phenomena. In terms of human nature, al-Toomi al-Sheibani (1394/1985) has relied on the Greek philosophers’ opinion that the human being is a rational animal. In his view, this philosophical definition of the human being is acceptable from Islam’s viewpoint.

As for epistemology, in this approach it is held that philosophical or rational thinking is not only compatible with the Islamic view but also this sort of thinking ranks higher in Islam. Motahari (Tabatabai and Motahari 1350/1969, Footnote p. 71), for instance, by criticizing some who hold that Quran talks about the world in a scientific and empirical way, believes that the Quran’s talk is not limited to this but also includes the philosophical and rational method and that the latter, in fact, ranks a higher level.

As for values, the proponents of the first approach have paid attention to the agreement between philosophical ideas and the Islamic viewpoint. For instance, Al-Attas (1980/1996) holds that the Aristotelian virtues are compatible with the Islamic view insofar as they can be integrated into the framework of the Islamic value system.

Educational Implications

The first approach, with regard to its belief in the possibility of agreement and union between philosophical thoughts and Islamic views, deals with a genuine Islamic “philosophy” of education. In what follows, by relying on al-Toomi al-Sheibani’s work as an example, the content of the “Islamic philosophy of education” in this approach is explored.

In the first approach, not only is it permissible to use the term “Islamic philosophy of education” but it is held that the proper way of developing it is to rely on Muslim “philosophical systems” and deduce from them implications for education. Al-Sheibani (1394/1985) by considering the literal meaning of philosophy (to love knowledge) maintains that the term “Islamic philosophy of education” is consistent. Thus, the Islamic philosophy of education, as far as it is a philosophy, possesses the main characteristics of philosophy (such as comprehensiveness, vast prospect, insight, and knowing the ways of applying knowledge) and, as far as it is concerned with education, it brings about those characteristics to the domain of education, and, finally, being Islamic, it is based on Islamic knowledge and is harmonious to the spirit of Islam.

Al-Sheibani (*ibid*, p. 30) holds that assuming Islam as the basis in philosophy of education does not prevent us from using other sources for compiling philosophy of education. Of course, these sources will be considered secondary and should be harmonious to the spirit of Islam. Islam and its cultural heritage are the primary sources, but in addition to them, the cultural and scientific heritage of humanity including philosophical theories and scientific findings of natural sciences and humanities (especially philosophies of education) should be used if they are in accordance with the spirit of Islam. Therefore, the Islamic philosophy of education is always evaluated by indicators such as not being paradoxical, being scientific and practical, being comprehensive in comparison with new philosophical and scientific findings, being dynamic for change and improvement, and being fitted to new findings in knowledge and religious endeavors.

The Second Approach: A Purely Religious View

The second strand in Islamic thought that relates to the themes of philosophy of education, though not to its name, takes it for granted that there is an opposition or a basic difference, to say the least, between the Islamic view and those of the ancient Greek philosophers as well as mysticism. Ghazali (1997) can be considered as a representative of this strand even though his reliance on a particular kind of mysticism makes it difficult to properly classify him into this strand. More recently, some Islamic scholars have supported this view including Ali Ahmad Madkoor (1411/1990) among others.

The Basic Lines of Thought

In relation to ontology, Ali Ahmad Madkoor (1411/1990), among others, holds that, in terms of ontology in Islam, God is the beginning and the end, namely, existence is originated from God. Then, the divine truth, in all forms and shapes of existents – tangible or rational – flows through to the lowest of them, and once again this flow returns to the divine truth that the process has been originated from. As for human nature, as part of ontology, this approach maintains that the image of the human being in Islam is essentially different from the one that philosophers represent. Madkoor (1411/1990), for instance, believes that while “nature” (physic), including human nature, in Greek concerns material things, in Islam the meaning of human “nature,” considering its literal root (tab’e: to bring about an effect), has the connotation that the human being is the creature of God.

Secondly, in terms of knowledge, relying on Ghazali, Madkoor (1411/1990) believes that what is meant by knowledge in religious terminology is to know God. This knowledge includes the sciences of nature, history, etc., only when they are based on the divine foundation. Thus, one can say that the sources of knowledge are religion and reason, while the primacy is for the former and, thus, religion determines the boundaries of rationality.

In regard to the essential or instrumental value of knowledge, Madkour (1411/1990) holds that in Islam a mere subjective knowledge that does not influence human life and behavior is worthless. In dividing the sciences based on Islam, he puts them in two categories: the sciences related to human beings and pure sciences. He maintains that the former should be acquired by religion, and one should not rely and use non-Muslims' findings in that area; such reliance is permissible only for pure sciences.

Finally, in the realm of values, Madkour believes that the source of values is Islamic Shari'a, not social agreement, and since the source is definite, the Islamic values are fixed too (Madkour 1407/1987, p. 208).

Educational Viewpoints

In the second approach, as a result of the general avoidance from philosophy and the differences held between the intellectual bases of Islam and philosophy, a different view is presented regarding education. Madkour holds that one should not use the term "Islamic philosophy of education" because Islam is a divine religion, while philosophy is a human endeavor, and they are not compatible. He prefers the term "Islamic way of education" (p. 45). Based on Madkour's opinion, some of the main features of "Islamic way of education" are as follows: systematic characteristic, divinity, monotheism, universality, stability, comprehensiveness, and balance.

The Third Approach: Philosophy as a Method and Procedure

A third approach in formulating the Islamic philosophy of education is to use philosophical methods and procedures in order to organize Islamic viewpoints in accordance with the structures of philosophies of education.

There are similarities and differences between the third approach and the other two. As far as the comparison between the third and the first approaches is concerned, they are similar as both enjoy the findings of the philosophical world. In

both approaches, dealing with the world of philosophy is accepted and considered favorable. Therefore, using the term "Islamic philosophy of education" is permissible in both of them. Meanwhile, there is a difference between these two. The difference is that while the first approach uses the content of other philosophies, the third approach uses merely methodological insights of other philosophies. For example, in the peripatetic Islamic philosophy a lot of the content of Aristotelian philosophy is accepted. This sort of usage of other philosophies puts an Islamic philosophical system at the risk of being amalgamated and becoming incoherent or coherent at the price of modifying Islamic conceptions to be adjusted to the target philosophical system. Even though philosophical methods and procedures are also somehow dependent on some backgrounds, their dependence is not comparable to that of philosophical thoughts or contents. For example, the dialectic methods of Plato and Hegel are used by contemporary philosophers such as H. G. Gadamer and J. Derrida, but the findings of the latter two are quite different from those of the two former philosophers. This shows that the philosophical methods and procedures have a much higher level of independence from the philosophical systems of thought.

As for the comparison between the third and the second approaches, the similarity is that they both rely on the texts that are peculiar to Islam. However, the difference is that in the second approach philosophy is completely avoided, while in the third approach there is a relation to other philosophies and they are used in a certain way, namely, in terms of methods.

A study which is done in accordance with the third approach is the two volume authored by Khosrow Bagheri Noaparast (2008, 2012). Using Frankena's (1996) model in a progressive way, a structure is suggested for the Islamic philosophy of education including the basic concept of education as well as ontological, anthropological, epistemological, and axiological foundations and principles for guiding educational activities. A brief account of the Islamic philosophy of education according to this work is reported below.

Foundations of the Islamic Philosophy of Education

The ontological characteristics of the Islamic view are as follows:

1. The universe is not exclusively natural.
2. God is at the highest level of the universe.
3. The universe has a teleological characteristic oriented by God.
4. The biological life is only the lowest level of life being ascended to higher levels of life.
5. The ascending levels of life are toward God and associated with self-flourishing.
6. God is the basic good and the basis of goodness.

The anthropological foundations are as follows:

1. The human being is a unified whole comprised of the soul and the body.
2. The human being has an intuitive knowledge of God.
3. Reason can provide the human being with reliable truths.
4. Human agency makes it possible to talk about human actions and individual identity.
5. Interaction among human beings leads to collective action and identity.
6. There are limitations for human beings within which they acquire opportunity for action.

There are ten epistemological foundations of which the first five refer to the known and the rest refer to the knower, as follows:

1. Knowledge has an explorative nature.
2. True knowledge has a correspondence to reality.
3. Knowledge has different levels.
4. True knowledge has stability.
5. Knowledge has unity as well as plurality parallel to its different levels.
6. Creativity is involved in knowledge development.
7. Knowledge is a response to human needs.
8. There are different levels of relation between knowledge and human needs.

9. Knowledge has a dynamic process.
10. Knowledge has a conventional dimension.

Finally, the axiological characteristics are as follows:

1. Values have a subjective aspect in addition to the objective aspect.
2. There are two sorts of values: absolute and relative.
3. Nature has an instrumental value for humans.
4. The human being has a profound dignity.
5. The human being has a profound freedom.
6. Justice is the most important social value.
7. Justice is completed by beneficence.
8. Aesthetic values are partly subjective and partly objective.

Educational Implications

The final aim of Islamic education is achieving a pure life (*hayat tayyebah*). This aim is a comprehensive account of the ideal human life comprising the dimensions of the physical, the thought and belief, the tendency, the will, the action both individual and collective, and the aesthetic. The pure life requires health and strength in the physical dimension; truth in the thought dimension; ethical control of inclinations in the tendency dimension; a will to goodness in the will dimension; good actions in the individual realm; richness, sanctity, justice, and beneficence in the social realm; and finally the transcendence of human aesthetic taste. This aim can lead us to decide about the curriculum and what is to be taught.

As for the basic concept of education, given the human agency in the Islamic view, education in the official sense needs to be understood in terms of an asymmetrical “interaction” between the teacher and the students, as well as a symmetrical “interaction” among the students. That is to say, in any case, a student’s agency should seriously be taken into account rather than being repressed, and, thus, a student should be taken as the other side of an interaction rather than being reduced to a passive and recipient entity. This is because, according to Quran, people’s real identity is what they make by their actions (Quran, 53: 38–42).

There are some educational principles that should guide the educational interactions. These

principles are derived from the three types of anthropological, epistemological, and axiological foundations mentioned above. Giving prescriptive content to these foundations will show the principles.

Conclusion

The Islamic philosophy of education has been introduced under different names and contents. There are at least three approaches in this regard. In the first approach, it is held that Islam does not contradict philosophy, but in fact there is a harmony between them because philosophy uses rationality to reach the same truths that religion has introduced by revelation. In this approach, Muslim philosophers' systems of thought are used as a basis for deducing educational points of view. The second approach relates to the themes of philosophy of education but not under this name. This approach takes it for granted that there is an opposition or a basic difference between the Islamic view and philosophical views derived from the ancient Greek philosophy under the rubric of Islamic philosophy. The first approach embraces rationality by appealing to different philosophical views, but its originality in terms of Islamic views remains a real concern. On the other hand, the second approach obsessively deals with originality in terms of Islamic views but is pessimistic to philosophical thought. In the third approach, at stake is to combine the strengths of the first and the second approach, namely, rationality and originality. In formulating the Islamic philosophy of education, the third approach uses philosophical methods and procedures in order to organize Islamic viewpoints in accordance with the structures of philosophies of education.

Islamic Education and Educational Technology: In the Quest for Democratic Engagement

Zayd Waghid¹ and Faiq Waghid²

¹Cape Peninsula University of Technology,
Cape Town, South Africa

²Stellenbosch University, Stellenbosch, South
Africa

Introduction

In this entry the authors examine, firstly, three understandings of Islamic education and show as to how democratic engagement can be enhanced.

Islamic education can be explained as nurturing (*tarbiyyah*), critical action (*ta'lim*), and transformative or good action (*ta'dib*) which they show can be connected to the practice of democratic engagement (Waghid 2011, p. 1). Secondly, they show how technology is advocated in relation to the primary source of Islamic education, namely, the Holy Quran. They specifically refer to the use of “the pen” (*al-Qalam*) in the Quran as an instance of technology and show as how the concept, like Islamic education, is geared towards the attainment of socially just human relations. Thirdly, they argue that Islamic education is commensurable with an application of technology as both practices are oriented towards the cultivation of justice in society.

Islamic Education as Nurturing, Critical Action, and Transformative Action

Firstly, *tarbiyyah* denotes the action of socializing people into a situated body of knowledge (Waghid 2011, p. 2). This necessitates nurturing Muslims about the testimony of their faith (*shahādah*); understanding Almighty Allāh's Angels (*malā'ikah*), Revealed Books, Prophets (*al-Anbiyā*), and the Day of Judgment (*al-Qiyāmah*); acting righteously and justly (*'adl*); and performing practices associated with a Muslim's life ranging from prayer (*salāt*) performed five times a day to pledging of charity (*zakāt*) to the destitute, fasting (*siyām*) during the holy month of Ramadan, performing pilgrimage (*hajj*) at least once in a Muslim's lifetime (if he or she has the means to do so), the life history (*sira*) of the Prophet Muhammad – may the peace and blessings of Allah Almighty be upon him – and the law governed by Islamic jurists for Muslims to enact their lives in consonance with primary sources of Islamic education (Waghid 2011, p. 2).

Tarbiyyah also implies that students need to be exposed to both rational and theological elucidations of knowledge. What this means is that when students are socialized, they do so with the intent of producing more informed and reasonable interpretations of the Quran, with the hope that more

contemplative learning would emanate. The Quran states the following: “Indeed, in the creation of the heavens and the earth and the alternation of the night and the day are signs for those [(wo)men] of understanding” (*al-Imran*, 3: 190). This verse emphasizes the importance of contemplating about the universe in the life of humans. In this way, socialization (*tarbiyyah*) does not merely mean to accept things at face value but rather to reflect deeper about situations and events.

Secondly, *ta'lim* signifies a Muslim's commitment to learning texts and putting some texts to memory from the Holy *Quran* (primary source of Islamic education), *ahādīth* (sayings of the Prophet Muhammad and his life experiences), and learning through public deliberation (*shūrā*) (Waghid 2011, p. 3). *Ta'lim* assists one in articulating one's reasons and in acting responsibly in communities. Such a form of learning would acquaint students with justifiable reasons to explore and explain economic and sociological occurrences in society. Through *ta'lim*, the attainment of knowledge is connected with the freedom of seeing others' points of view, through argumentation and persuasion in accordance with one's epistemological understanding of Quranic verses. And, being able to undertake such an activity of critical action would further require of students to be autonomous, democratic, and responsible citizens. This means that when students read the Quran (the primary source of Islamic education), they do so with the intent of reflecting on the text (and its verses) and by situating themselves within an imaginary realm that would provoke in them thoughts to enhance “socially just” human relations (*al-Nisa*, 4:135). This view of learning is corroborated by al-Attas (1991, p. 34), who posits that one's understanding of knowledge determines one's just relations with other human beings in communities and to come up with ways as to resolve unjust and inequitable situations.

Thirdly, *ta'dib* (good action) considers all humans as equals irrespective of cultural, linguistic, religious, socioeconomic, and ethnic differences (Waghid 2011, p. 4). Goodness is for all individuals in society on the basis of his or her just

or virtuous actions. This is reaffirmed in the Quran: “[And] uphold justice and do good to others and give to the relatives” (*al-Nahl*, 16: 90). Three aspects of *ta’dib* are denoted here: First, “justice” signifies being fair and reasonable in one’s actions towards and in relation to others; second, “doing good to others” through strengthening relationships and establishing trust with others; and third, “giving to the relatives” which means doing good to others instinctively just as one would do to one’s close relatives. *Ta’dib*, therefore, promotes the efforts to expand social justice through shared values, common objectives, and opportunities of mutual benefit to all human beings on the basis of deliberative relationships among communities.

Now, being able to offer one’s reasons, act critically, and in accordance with the values of social justice, transformative (good) change agents would require a deep attraction to democratic contexts on the premise that such contexts would allow people to engage communicatively (deliberatively). According to Benhabib (1996, p. 69), a democratic context could most appropriately be understood as a “model for organizing the collective and public exercise of power in the major institutions [such as schools and universities] of a society on the basis of the principle that decisions affecting the well-being of a collectivity can be viewed as the outcome of a procedure of free reasoned deliberation among individuals considered as moral and political equals.” What Benhabib (1996, p. 69) argues for is a deliberative democratic environment premised on public deliberation in which citizens and their representatives move beyond self-seeking and restricted points of view and skewed power relations, through self-reflection for the common good or general interest. In this regard, Benhabib (1996, p. 70) argues for a deliberative model of democracy, governed by the norms of equality and symmetry; affording equal chances [to all citizens] in initiating acts of speech, questioning, interrogation, and open debate; having the right to question the assigned topics of conversation; and having the right to initiate reflexive arguments about the very rules of the discourse procedure and the way

in which they are applied or carried out. In this way, democratic action is not out of congruence with conceptions of Islamic education as the latter encourages Muslims to act reasonably, deliberately, and justly.

Central to Benhabib’s (1996) elucidation of deliberative democratic action is the notion that such an undertaking among educators and students, say, in Muslim institutions, is guided by autonomous questioning, debate, transparency, reflexivity, and critique – all democratic practices which may enhance communal (*ummic*) engagements among citizens in a society. Following Benhabib’s (1996) notion of democratic deliberation, which resonates with the concepts of Islamic education (*tarbiyyah*, *ta’lim*, and *ta’dib*), institutions of Muslim learning ought to cultivate reflexive and open pedagogical spaces for educators and students to offer their contrasting points of view or interpretations of *Quranic* texts and *ahādīth* in a responsible, deliberative, and just manner.

Being able to critique others also involves “the endeavor to know how and to what extent it might be possible to think differently, instead of legitimating what is already known” (Foucault 2002, p. 191). And, when students become critical, they would create more possibilities for themselves and others (their peers) to imagine things differently with which they might be confronted (Waghid 2014, p. 235). By affording capable students the opportunity to have their voices heard, the possibility exists in enhancing just relations among educators and students. Pedagogically speaking, this makes sense because democratic practices cannot take place if people are made to feel that they should merely memorize the verses of the *Quran* or *ahādīth*, without critically understanding its meanings in engendering just human relations. Learning is a life experience of knowledge acquisition and reflexive understanding, and in such democratic settings, the authors hold that it is through the (re)interpretations of knowledge that are democratically shared and experienced upon which humans could further uncover new meanings and work towards rebeginnings. This brings them to a discussion of Islamic education in relation to educational technology.

The “Pen” as an Educational Technology in the Quran

The concepts of *tarbiyyah* and *ta’lim* can be linked to the enhancement of creative autonomy among students (Kazmi 2015, p. 71). This means that by nurturing within students a sense of innovativeness, the possibility exists for them to be meaningfully engaged in creatively constructing their apprehension of Quranic verses. Now such a notion of creative autonomy is generally perceived as antithetical to a dogmatic view of knowledge construction. However, history seems to suggest the contrary (Kazmi 2015, p. 71) as Islamic education has also been linked to critical action (*ta’lim*) and transformative or good action (*ta’dib*).

As for any enduring civilization, the Islamic civilization could not stand on a narrow plinth of restricted freedom and creativity (Kazmi 2015, p. 72). Many verses in the Quran serve as a testament to the latter claim. For instance, verses in the Holy *Quran* stating “Read in the name of your Lord” and verses which converse about knowledge and teaching humans the use of a “pen” (*al-Qalam*) reinforce this notion of human creativity (*al-‘Alaq*, 96: 1). In the verses of Chapter 68 (*al-Qalam*) of the Quran, the notion of “the pen” (*al-Qalam*) is depicted metaphorically to individuals as a social and pedagogical tool in orientating their actions towards the exercise of creative autonomy (Kazmi 2015, p. 72). In the context of the verses of this Quranic chapter, *al-Qalam* is not referred to as an instrument in a literal sense but rather a condition encouraging an individual to construct deeper meanings or understandings and to share the derived knowledge. Consequently, one finds that the Quran in Chapter 68 encourages humans to have clarity of mind and even relates the concept of *al-Qalam* to being a “reminder” for humanity that nothing in the world can be resolved without clarity of understanding (*al-Qalam*, 68: 52). What is important to note in this apt depiction of *al-Qalam* is that creative freedom (autonomy) is considered a prerequisite for deeper thinking and analysis. Without such a liberty of creativity and contemplative action, *al-Qalam* would simply be considered as a tool

used for reproducing old meanings – an idea that stands in stark contrast to the Quranic emphasis on reflexivity and renewal, whereby people can produce more defensible judgments (*al-Qalam*, 68: 36). In this sense, *al-Qalam* cannot be delinked from educational technology as the latter is inextricably connected to harnessing human reflexivity and renewal – a matter of acting autonomously and innovatively. So when the Quran announces *al-Qalam* (“the pen”) in relation to contemplation and sound reasoning, the authors infer that this can also imply a reference to the use of educational technology.

In our contemporary era, the role of *al-Qalam* has evolved, and many technologies are able to support this metaphorical account of “the pen” as an instrument to foster the sharing and development of deeper meanings and understandings. This claim is echoed in the work of Jeremy (2000), who suggests that educational technologies such as social media platforms can foster the creation of a sphere in which students can demonstrate critical thinking and student autonomy. Furthermore, educational technology studies have shown a tangible difference in how knowledge is transmitted and constructed (Gimbert and Cristol 2004, p. 207).

Hence, through the effective utilization of an educational technology, conditions can be created for active engagement encompassing the sharing of experiences and interpretations among students. Further, humans are commanded to “Read in the name of Allah” rather than reading the name of Allah (*al-Alaq*, 96: 1). By implication, individuals are encouraged to construct new meanings and understandings in relation to their faith (Kazmi 2015) rather than merely echoing what they encounter as if they are obliged to merely repeat the name of Allah Almighty – that is, to see things at face value without contemplation and deeper thinking. These Quranic verses do not set limits on the freedom to construct informed and reasonable interpretations of the Quran but rather encourage Muslims to explore and reexamine in relation to deep thinking and spiritual closeness to Allah Almighty. In other words, using *al-Qalam* (“the pen”) points towards pedagogical advancement through the creative autonomy of people to

think and act transformatively – that is, their actions can engender change that will hopefully be beneficial to the advancement of knowledge.

In today's contemporary era, educational technologies such as social media platforms often serve as deliberative spheres for human engagement – an idea that resonates with Benhabib (1996) explication of deliberative encounters. Through *ta'lim*, individuals are afforded the freedom to critique different points of view by being able to search the Internet for expositions to critically support their points of view. In this way students' understandings or meanings are able to be shaped by their inclination to search for new knowledge from abundant online sources using the Internet. Students are therefore seen as critically active participants in their own knowledge construction and not mere passive recipients of information. Therefore, educational technology holds the promise for enhancing the concept of *ta'lim* by affording students unrestricted choices in the quest to construct new knowledge in a deliberative manner – that is, through engaging with multiple sources of knowledge, students can articulate more tenable and critical understandings of knowledge.

It can be argued that social networking sites such as Facebook, WhatsApp, and Twitter (instances of *al-Qalam*) offer participating individuals deliberative pedagogical spaces according to which they can harness their engagements. In such an instance, individuals may be free from cultural, linguistic, religious, socioeconomic, and ethnic prejudices that may exist in face-to-face interactions. However, the author's potential critic might argue that such a form of anonymity could potentially be detrimental to the expansion of socially just relations among students. That is, with anonymity, a subsequent reduction of accountability on the part of individuals engaging on social networking platforms could ensue. For instance, an "anonymous" student potentially could verbally attack another student in altering their points of view in a belligerent manner, on say the latter's argument for stricter government policies on the influx of African refugees into South Africa and its implications on food shortages, lack of shelter, and other securities. However, this does

not undermine the enormous potential of social media to engender opportunities for students to engage deliberatively, thus allowing even more pedagogical spaces for reflexive and autonomous learning.

Perhaps an act of belligerence could be driven by temperamental emotions on the part of some students. It is here that the concept of *ta'dib* can be most apposite as it expects of students to be good towards others in what they say or do – that is, to act justly and, hence, respectfully towards others. Such a form of goodness would expect of students to engage with others in a responsible and dignified manner. This is not to say that one should always avoid confrontation. What the authors are arguing for, following the concept of *ta'dib*, is that one engages with others in a deliberative manner as Benhabib (1996) explains, listening to the reasons of others and offering one's account so as to prevent hostility and aggression that can undermine more engaging democratic relations among students and educators.

Hence, *al-Qalam*, more specifically the application of a technological "pen," can cultivate more engaging social communication among students, in terms of which ideas and understandings are able to be developed, critiqued, and shared for communal benefit in consonance with the application of concepts such as *tarbiyyah*, *ta'lim*, and *ta'dib*. Put differently, applying "the pen" (educational technology) in the realms of socialization, critical learning and virtuous action would invariably contribute to the (re)construction of more deliberatively enriched understandings of important social concepts on the basis that Islamic education in its various forms is geared towards the attainment of justice in and through human action. It is to such a discussion that the authors now turn to.

Islamic Education and Educational Technology as Practices Oriented Towards the Cultivation of Justice in Society

Institutions are shaped by their practices according to the latter's physical, cultural, social, and economic manifestations in such institutions

(Griffiths 1965, p. 188). Islamic education actions such as *tarbiyyah*, *ta'lim*, and *ta'dib* in relation to *al-Qalam* (educational technology or “the pen”) are practices that give institutions of learning their distinctive forms. And, if one considers that these action concepts are further connected to the attainment of *'adl* (justice) in society, then the authors shall next show as to how such just actions can be realized. First, through *tarbiyyah*, students are initiated into Islamic teachings in maintaining good relations with both Muslims and non-Muslims and in constructing new knowledge from both rational and theological perspectives in order to harness engaging and just human relationships; second, *ta'lim* requires students to be articulate and critically responsible in their actions geared towards the attainment of deep democratic encounters. In other words, Muslims are encouraged to deeply reflect about their lives in relation to all other human beings without prejudice; and third, through *ta'dib* the goodness of one's actions is reflected within a socially just society often to the mutual benefit of all communities without marginalizing others or excluding them from societal matters.

The authors have argued that *al-Qalam* (educational technology) as a pedagogical activity or practice opens up creative possibilities for educators and students to engage in educational settings both deliberatively and autonomously. In other words, it has the potential to create a democratic environment by bringing educators and students into virtual spaces engendering equal and open deliberative encounters. The notion that the aforementioned understandings of Islamic education could be enhanced through educational technology can be further explained in relation to the work of a “community of thinking” (Derrida 2004, p. 148). Such a way of thinking, in the words of Derrida (2004, pp. 148–150), “must prepare students to take new analyses” and “to transform the modes of writing, the pedagogic scene, the procedures of academic exchange, the relation to languages, to other disciplines, to the institution in general, to its inside and its outside.” Now the pursuit of using such a pedagogical framework of thinking in relation to educational technology opens up the possibility

of enhancing critical and innovative thinking among students. Derrida (2004, p. 153) posits that such thinking is “always risky; it always risks the worst.” A community of thinking with the intent of enhancing such forms of risk taking would become more perceptive to new and unimagined possibilities. Here the authors think specifically of how students could be exposed through the use of educational technology in devising risky Islamic educational contributions that can address issues of racism, inequality, poverty, starvation, abuse, human trafficking, war, and suffering.

Furthermore, a community of thinking demands that reasons be rendered which could appositely be couched as “critique” (Derrida 2004, p. 162). This implies that as individuals, one questions and challenges, opening up new possibilities for diverse interpretations through risk taking, which may lead to the establishment of structures or spaces necessary for others to contribute towards the shaping of imaginative ideas. Hence, educational technology as a pedagogical practice could enhance just relations among students and educators in Islamic educational contexts. Similarly, such a notion of educational technology with its connection to a critical and transformative framework of Islamic education can contribute towards resolving some of the most pressing concerns plaguing humanity. Here, the authors specifically think of using educational technology to encourage communities to address their differences on the basis of deliberation and recognition of the other – an understanding of Islamic education that can be situated within a concept of educational technology that resonates with *al-Qalam* (“the pen”). Such a discourse of educational technology invariably draws on notions of *tarbiyyah*, *ta'lim*, and *ta'dib* to cultivate autonomous, deliberative, and just pedagogical encounters.

Conclusion

In this entry the authors have argued that Islamic education as *tarbiyyah* (socialization), *ta'lim* (critical learning), and *ta'dib* (virtuous action)

intertwined with *al-Qalam* (“the pen”) can enhance autonomous, just, and deliberative pedagogical relations among students and educators. In turn, such a notion of Islamic education that is not remiss of technology can initiate students into a discourse of social justice, whereby they can critically reflect on the most pressing concerns permeating their communities and educationally find ways to address such problems. Moreover, teaching and learning through the use of educational technology have the potential to enhance the notion of a “community of thinking,” and through deliberative democratic encounters, students and educators would be stimulated to act more judiciously in disrupting social injustices.

Islamic Perspective of Vocational Education

Khosrow Bagheri Noaparast

Faculty of Psychology and Education, University of Tehran, Tehran, Iran

Synonyms

Action; Religious education; Skills; Social responsibility; Training; Vocationalism; Work

Introduction

In “vocational education,” some have put emphasis on the first part, namely, “vocation,” while others subordinated it to the second part, namely, “education.” The first trend has led to vocationalism that undermines theoretical subject matters, and the second trend has been supported by liberals, among others, who take training as secondary to education having rational as well as social dimensions.

The failure of traditional education associated with old vocationalism to overcome the dichotomy of theoretical/practical some urged some to introduce a new trend in education that blurs the borders between theoretical and practical education. This new trend is differently embraced, for instance, in pragmatism (Dewey 1916/1985) and new vocationalism (Grubb 1996). It is argued in this trend that high-level skills, such as problem-solving and learning capability, require that theory and practice be combined. This combination is called “all aspects of an industry” in Perkins Act of 1990 in the USA (Rosenstock 1991). New vocationalism and its slogan of “competence standards” was supported in Britain in 1986, in the USA in 1994, and in Australia in 1992 (Forster 1996).

The controversy of education versus training is still continuing. Conservatives in Britain, for instance, hold that liberalists who prefer academic over vocational qualifications had education in their hands for too long and this had damaging

effects on the economy of the country. On the other hand, even though new vocationalism has attempted to combine theoretical and practical education, it is claimed (Connell et al. 1994) that working-class students are “trained,” but middle-class students get “educated,” and parity of esteem is continuing to be a problem.

Having these problems of education versus training in mind, this entry is going to address vocational education in the view of Islamic education. In what follows, first human agency is introduced in Islamic view as the basis for dealing with vocational education. Then, relying on it, some principles of vocational education is suggested from an Islamic perspective.

Human Agency in Islam

Human is introduced in the Qur'an as agent who has actions (Bagheri Noaparast 2016). An action is different from a pure behavior in terms of some underlying layers. While a behavior is what it is seen from the outside, an action is a behavior that presupposes some underlying layers and thereby finds certain characteristics. These layers can be different depending on particular action approaches.

As far as the Qur'an is concerned, at least three types of underlying layers are at issue for a behavior to be taken as action. The first foundation of action is cognitive in nature. The following verse, for instance, refers to such a foundation in relation to human action: “As for those who disbelieve, their deeds are like a mirage in the desert which the thirsty takes for water. . .” (Qur'an, 24: 39). Here an illusion which is cognitive in nature is at the root of an action.

The second foundation of action in the Islamic view is inclination. This verse refers to this type of foundation: “We have made attractive to every person their deeds” (Qur'an, 6: 108).

The third foundation of action is will. Cognition and inclination are necessary but not sufficient for a behavior to be an action. The will as a foundation of action indicates that humans have a choice in their deeds. Inclination, even a strong one, by itself does not lead to an action, but it

could be the subject of a choice or rejection. The following verse refers to this point: “Have you considered him who takes his own lust for his god?” (Qur'an, 25: 43)

Human actions with the mentioned foundations have some characteristics. First of all, when done, human actions find an objective feature with internal as well as external consequences that cannot be helped. These consequences are effects of actions, and in this respect, they are real occurrences that cannot be helped. Referring to this point, the Qur'an states: “As a consequence of breaking their promise made to God and telling lies, He filled their hearts with hypocrisy. . .” (Qur'an, 9: 77).

Secondly, actions constitute the core of human identity. The real identity of every person is not but the sum of his or her actions. “That no one who carries a burden bears another's load; that a man [*sic*] receives but only that for which he strives” (Qur'an, 53: 39–40). This is not to say that human identity has no other dimensions, but the point is that some dimensions of identity are accidental as is the case in, for instance, national identity. If I am an Iranian, this is no doubt a dimension of my identity, but it is accidental to my identity. By naming it accidental, it is not meant that it is not important but that it provides me with some opportunities as well as limitations or, one might say that, with a field for action. Then, the core of my identity is shaped by my actions in this field and similar fields.

Thirdly, humans are responsible for their actions: “Every soul is pledged to what it does” (Qur'an, 74: 38). Being based on choice, an action involves responsibility. People are responsible for the intended consequences of their actions as well as the unintended consequences that the person being informed of because they are also part of action.

Principles of Vocational Education

Viewed from the standpoint of Islamic account of action, vocational activities should be taken into account in terms of action and its three cognitive, emotional, and volitional layers. This indicates

that Islamic view of vocational education is not skill oriented. Vocational activity in terms of action is something more than a bundle of behaviors. This is because cognition, inclination, and will are involved in vocational activity. In addition, having the characteristics of action, vocational activity has important roles to play. For instance, in terms of identity-formation characteristic of action, vocational activity has a role in the formation of identity of the person. Depending on of the kind of contents of the layers, an action, including vocational action, can be a desired or undesired action each having its own role in constituting a human identity. Thus, given the foundations and characteristics of action, vocational education needs to go beyond skills.

In order to provide a desired vocational action, Islamic education puts forward some principles in terms of the three internal layers as well as consequences of actions on oneself, people, and the environment. The four resultant principles are explored below.

Principle 1: Giving a Higher Meaning to Vocational Activity

In order to go beyond the behavioral approach and its skill-oriented view, vocational activity needs to find a meaning. Giving a meaning to vocational activity requires that pupils are provided with a rationale for the activity at the level of cognitive foundation of their actions. The rationale that Islamic view puts forward for vocational activity is threefold as follows.

Firstly, vocational activity is taken to remove the obstacles of human development. Human instinctive needs are so strong that if they are not satisfied, they would prevent humans from going ahead on the development ladder and the satisfaction of the needs is dependent on work and vocation. Referring to this role of vocational activity, the prophet of Islam has stated: "A person who finds water and soil and at the same time remains poor, God prevents him from His grace" (Ameli 1993, Vol. 2, part al-Tejarat). God's grace here has a reference to positive developments that people would and should have access to, and this is taken to be dependent on overcoming deprivations. Accordingly, vocational activity has the value of

removing the obstacles of human development. Seeing vocational activity at the light of this rationale is the first dimension of giving meaning to this activity.

Secondly, vocational activity is introduced in Islam as a spiritual endeavor. Spirituality in Islam is associated with getting close to God by worshipping. However, worship is not confined to particular forms of activity such as doing prayer. The criterion of worship is getting close to God, and whatever provides the person with it, it would be a worship. Thus, the prophet of Islam states: "Worship has seventy parts and its highest part is decent (halal) business" (Ameli 1993, Vol. 2, part Al-Tejarat). It is interesting to note that a decent business is the highest part of worship.

But how is it that a vocational activity can be taken as a worship that plays a spiritual role? Given the two aforementioned features of vocation, namely, removing the obstacles of a person's development and providing a source of self-esteem, the spiritual roles of vocational activity are made clear. This is because getting close to God is associated with personal development and self-esteem. God is introduced in Islam as the main source of perfection and pride; then, whoever is closer to this source would be a person with more perfection and self-esteem.

On the whole, in the Islamic education, a meaning is given to vocational activity according to which human development, self-esteem, and spirituality are involved in this activity. Thus, vocational education requires that pupils take such a grasp of this activity.

Principle 2: Transcending Lower Motives in Vocational Activity

The second principle in vocational education is related to the emotive layer of action. According to this principle, the person's lower inclinations should be transcended. In Islamic education, this transcendence involves three realms of inclinations: toward oneself, toward others, and toward God.

As for the inclination toward oneself, greed should be replaced with contentment. Greed is a disease in which the instrument takes the position of the end. Income is an instrument, and no doubt

an important one, for satisfying the needs. However, when providing income turns into an end and is valued for its own self, the vice of greed is going to be established. Thus, in Islamic education contentment in business is valued and greed is undermined. Thus, Imam Ali ibn Abi Talib states: "Deficiency of wisdom is due to wanting the surplus" (Tamimi Amedi 1987, p. 476). This indicates that vocational education involves the management of one's desires in relation to greed.

When it comes to inclinations toward others, Islamic vocational education involves being trustee about others' belongings and sensitive to their deprivations. Concerning the trustiness, the Qur'an mentions approvingly the statement of Ischia's daughter to his father about the employment of Moses because he is trustee and powerful (Qur'an, 28: 26). As for sensitivity to others' deprivations, any urgent social needs is introduced in Islam as a necessity that calls every person of the society to address it. The prophet of Islam, for instance, during the establishment of the first Muslim society in Medina, stated: "Anyone who starts a day while he or she does not attempt to address the affairs of Muslims, he or she is not a Muslim" (Kolaini 1984, Vol. 2, p. 164).

There is an intriguing point in the relation between the two types of abovementioned inclinations. While contentment is desirable in personal inclinations, sensitivity to others' deprivations might require excess work to address social deprivations. This seemingly contradictory relation between the two types of inclinations is in fact one of the most difficult tasks of vocational education. The ideal state is that people be contempt as far as their personal needs are concerned, whereas in their relation to others, it is desirable that they be greedy in addressing social needs. No doubt, the first state of human's inclinations is at odds with this, but the goal of transcending the inclinations is to change the direction.

Finally, in terms of inclination toward God, vocational education in Islam requires that people do not get overwhelmed by desires of sale and purchase so that they forget the remembrance of God. As mentioned above, business itself is taken in Islam as a way of worshipping God. Thus, business should always be compatible and even

identified with worship. However, when it becomes incompatible or worse an obstacle for the remembrance of God, then the business is not the desired one. Referring to this, it is stated: "By men not distracted from the remembrance of God either by trade and commerce or buying and selling..." (Qur'an, 24: 37). That is why in some Muslim countries when the time of prayer comes up, people leave their business and do their prayers. This is to show that their business is compatible and in congruence with worshipping of God.

The upshot of the second principle in vocational education is to transcend pupils' inclinations at the three personal, social, and divine levels.

Principle 3: Supporting the Will to Work

The third principle of vocational education relates to the volitional layer of action. An educated person in the realm of vocational activity in the Islamic view is who has got a will to work. A will to work is different from avoiding laziness and undergoing work. The two latter cases are negative, whereas the former is positive, that is, to say, in those two cases work itself is not desirable, but it is tolerated; however, in the desired state, work itself is valuable. According to this principle, the desirable is to reach the point of will to work, but we usually deal with journey from bottom to top, from avoiding the negative states to embracing the positive state. In vocational education, laziness should be abandoned, and works should be undergone with the hope that the person reach the point where a positive will to work is achieved.

Wooziness and weakness are strongly undermined in Islam. For instance, Imam Ali ibn Abi Talib states: "People whose weaknesses continue their aspirations decline" (Tamimi Amedi 1987, Vol. 5, p. 187). When the will to work is achieved, its important advantage is that it safes the person from alienation. When there is a distance between people and their works, they are alienated from their works, they do not enjoy what they do, and they live in two different and contrasted worlds. However, having the will to work, people are unified with their works. Even though every person prefers one job to the other, when it is not possible to have the preferred job, he

or she having the will to work would do the work with full engagement.

Principle 4: Comprehensive Appraisal of Vocational Activity

So far the internal layers of vocational activity are addressed. However, the consequences of vocational activity are also relevant in achieving the desirable state in vocational education. Without taking these consequences into account, vocational education cannot save the person from being overwhelmed by subjectivity. There are four types of consequences for a vocational activity: an immediate one on the doer, one on other people, one on the environment, and a mediated one on the person through appraising the last three types of consequences.

In Islamic vocational education, the fourth principle concerns a comprehensive appraisal of vocational activity. The comprehensive appraisal concerns the first three types of consequences, and the result of each appraisal or all of the appraisals would affect the action and would lead to the fourth type of consequence. The appraisal in the first type of consequence can show how an action by itself strengthens its foundations. This type of appraisal can show how an activity is constructive or destructive of the person depending on the characteristics of the activity. For instance, a vocation that needs precision, such as pilotage, makes you accurate in the long run as a vocation that involves violence, such as butchery, can make you violent in the long run. It is interesting to note that, when there is a choice, some of the vocations are not recommended in Islam such as butchery and working in a mortuary. The appraisal in the second and third type of consequence makes it possible to see the positive or negative effects of a vocational activity on people and the environment. Having considered the results of appraisals, people can have an opportunity for changing their activities if needed.

Conclusion

An important problem in vocational education has been a skill-oriented view which stems from a

reductive account of education. This trend can also be observed in the so-called new vocationalism in which there is an intention to blur the borders of theoretical and practical education. The remedy of this problem has been sought in the literature by appealing to a distinction between training and education and emphasizing the general education.

This entry addresses the problem of vocational education from the standpoint of Islamic education. There is a potentiality in the Islamic view to deal with the problem of vocational education. This potentiality resides in the agency Islam holds for human being. What distinguishes action from a mere behavior in Islamic view can be sought at least in three sorts of underlying layers of behavior. These layers contain cognitive, emotional, and volitional contents. Relying on this account, four principles are suggested for vocational education. The first principle dealing with the cognitive foundation is concerned with giving meaning to vocational activity. The second principle addressing the emotional foundation holds that motivations of vocational activity need to be transcended from a low personal to high personal and social and divine level. The third principle suggests supporting a will to work in pupils. Finally, the fourth principle deals with a comprehensive appraisal of consequences of vocational activity and enriching it thereby.

Introduction

Aesthetics is the fourth branch of philosophy. It has only recently become relevant to practitioners and scholars in educational administration, most presciently with the rise and importance of organizational culture and aesthetics emerging critically to the success or failure of educational change and reform. This entry presents a brief overview of the nature of aesthetics in schools and

educational institutions as well as a description of the actions administrators take of an aesthetic nature.

The Nature of Aesthetics

Aesthetics is grounded in the human body's sensory experiences. It involves taste, touch, smell, perception and sound; the entire human sense-making capacity intimately interconnected to intellectual development and theorizing. It has been called "human world making" (Laird 2013, p. 49). The range of areas of aesthetics began as a focus on theories of art fusing painting, music, dance, sculpture, and poetry into a single field of philosophy in the eighteenth century. Named by Alexander Baumgarten in his *Reflections of Poetry* (1735), aesthetics was derived from the Greek *aisthanomai* which meant "to perceive" (Feagin 1999, p. 12).

Today aesthetics has greatly expanded its purview. Newly grounded theories, called *somaesthetics*, center on the full range of sensory experiences and self-fashioning practices including yoga, martial arts, aerobics, clothing and cosmetic fashions including jewelry and the application of body tattoos (Shusterman 2008). A study of the theory and criticism of such practices consists of *pragmatic somaesthetics*, especially as it relates to specific normative or prescriptive actionable contexts.

The link from this expanded perspective of aesthetics to educational administration surfaced as researchers and policy developers in the field became interested in how schools could be changed. It became obvious that change in educational settings was more than making a rational case for doing things differently. They understood that change was only partially an intellectual and rational process. It also involved how groups worked together and the norms they shared and how those norms impacted their collective behavior. Within such collectivities, individuals would be permitted or bound, overtly or tacitly, by the norms approved by the whole collectivity. This perspective came to be designated by early change agents as "the cultural perspective" (Firestone and Corbett 1988, p. 338). It is now encapsulated by the notion that "The administration of education is

therefore in part the administration of culture that through its construction and allocation of aesthetic, symbolic or culture capital serves to administer and perpetuate social hierarchy. The role of educational administrators is to preside over systems and institutions that structure and allocate access to aesthetic experience in particular socially conservative ways, thus matching the possess of economic capital” (Samier et al. 1999, p. 11). Organizational culture can be considered a kind of grammar in which individual speech actions occur. It represents the “deep structure” of linguistic expression. It shapes the formulation of thought and provides a kind of coded boundary for both linguistic content and possible administrative actions.

Organizational Culture as Aesthetic Expression

Schein (1992) has indicated that there are three levels of organizational culture. Paraphrased they are: (1) artifacts which are the most visible of organizational aspect of organizational life, but which may have multiple meanings and interpretations; (2) espoused values which are comprised of goals, objectives, and philosophies as common justifications; and (3) tacit, unconscious thoughts and feelings which are the springboard of values and ultimately actions.

In schools, some artifacts would be mission statements which are sometimes posted on the walls in staffrooms or in the school’s administration foyer that encapsulate the special function or purpose of the institution. Other artifacts might be a stated educational philosophy that appears in the school’s prospectus or school website. School mottos such as “strive to excel,” “we all smile in the same language,” and “concern, love and justice” send a strong message as to what the school stands for and what it values. Yet some artifacts are hard to decipher although easily visible. For example, the selection of a school mascot or team name. What does it mean when a school says it is the home of the “Fighting Mustangs”? To an outside observer this announcement might connote an aggressive pursuit of victories in some

forms of athletic or academic competition. To an insider it may connote a shared common set of values around a struggle to educate the most difficult of the pupil population being served by the school.

Espoused values usually begin with someone such as the school principal proposing a stance on addressing educational, social, philosophical, or political issues. Indeed, according to Schein (1992), this juncture is the connection between leadership and culture, the indispensable act of the school administrator considered essential for creating a framework for institutional purposing. Such values may be articulated in a vision as a condition that “ought to be” in the world or in the school. They remain simply an individual’s perspective until and unless a group moves to realize the vision to try and bring it into reality. The process of bridging from individual values to shared values involves a transformative process which moves from shared values to shared assumptions. Schein (1992) avers that not all shared assumptions survive an institutional adoption. Only those that demonstrate consistency are able to do that. Those that deal with aesthetic or moral issues are the most difficult to confirm as a shared value to become a common base of shared assumptions. They often lack accurate definition and reside in shades of meaning where ambiguity is present and discernment is slippery. However, when they reach the point where they are no longer questioned and become taken for granted assertions, the organization has worked through the third and final stage of the transformation process. At this stage, members of the group often find any other alternative assumption or value inconceivable. The values supporting these assumptions are extremely difficult if not impossible to change because to alter them threatens to destabilize the entire unit. Challenges of this sort are often considered heresies and met with defensiveness, denial, and/or social ostracism of skeptics, doubters, or violators. Administrators who depend upon the stability of their organization to survive may find their first task is to protect the social stability of their unit. The dissolution of such stability may find the administrative leader thrown into the role of a conformist and chief protector of the status quo.

A more detailed perspective of organizational culture involves the nature of the shared assumptions including how truth is determined, the nature of time and space, the nature of human nature and human activity, and the nature of human relationships. A second and important aspect of organizational culture involves the actions of the educational administrator and how that individual functions and what he/she consistently pays attention to.

There are many ways groups may discern the nature of truth. They range from received dogma based on tradition or religious absolutism, rational-legal mechanisms embedded in bureaucratic functionalism, truth based on scientific method, truth by what works as a kind of temporal pragmatism, and truth as a way of sense or world making of an aesthetic nature. In this latter category, an aesthetic competence is required for the administrator to create and apply images and symbols and to engage in and support rituals, legends, and ceremonies that formulate, fixate, and sustain social coherence and provide a context of meaning for them.

Organizational culture also hinges on shared assumptions regarding the nature of time. Some cultures are centered on the past, some primarily in the present, and some, those of the Western, industrialized world live in the future. This is the reason for such aesthetic constructs as mission and vision statements regarding the future and philosophies centered on desired states of existence or of organized performance that are embodiments of a desired not yet realized state. Such constructs serve to describe a kind of secular *promised land* and are found in some religious doctrines assuring one's arrival in a heaven, nirvana, or some other utopian place. The existence of such a future desired location is then related to a possible range of actions which will result in the arrival at the sought for destination. Inevitably in many cases, the future state is described in aesthetic terms and understood in such terms. They involve perception and feelings of the senses, that is, what it will feel like when one has entered the kingdom of heaven. Such expressions of administrative aesthetics are "all children are learning" or "every child finds happiness and satisfaction

with himself/herself" are sensory statements. Within the perspective of time lie related symmetries such as whether time is considered as a kind of linear ribbon or whether it is symbolically multidimensional. The phrase, "one thing at time" or "tick the box" is a monochromatic conceptualization of time, whereas simultaneous actions are polychromatic and many tasks of a different nature can be undertaken all at once. Likewise whether one is "late" or "early" or "on time" is similarly linked. Being late in monochromatic time is different than in polychromatic time.

Another dimension of administrative aesthetics involves shared assumptions regarding the nature of space. Space has a powerful symbolic meaning in organizations. Consider that the executive space is normally larger as one proceeds up the administrative hierarchy. The enlargement of space often accompanies an expansion of administrative authority. The higher one goes in the organization, the higher the spatial position on the respective floors of the organization. The chief executive often resides on the very top floor of institution. For this reason, one of the most crucial aesthetic decisions made in institutions is architectural. The construction of space is a time honored functional way to convey administrative power, status, and reach. Administrators with the most power often have corner offices with a wide view complete with more expensive furniture and art decorations than lower-paid employees who have smaller offices or perhaps simply cubicles in one large room without the benefit of complete wall to ceiling offices that ensure any form of privacy.

Another form of sensory knowledge concerns how to comport one's body to display forms or rituals of deference and subordinate demeanor as for example who to bow to, how to disagree with a superior, and where to sit at a conference table for a meeting. These are the aesthetic dimensions of organizational life. Another form of aesthetic knowledge is distance and displacement of oneself in a spatial way within a hierarchy of power as well as the tone and loudness of one's voice. There are several types of spatial distance involved with interpersonal conduct. The distance for intimate discourse is much closer than for normal personal discourse. Likewise, addressing a group of people

in a meeting or an audience of a hundred or more is still much more extended. Such distances are not formally taught but learned in social situations. Think of a time when you were in a restaurant and parents of a child had to keep shushing a child who was speaking too loudly or making a fuss. What they are teaching is the proper spatial relationships for different types of social discourse.

Administrative Actions of an Aesthetic Nature

Educational administrators take actions on a broad array of aesthetic dimensions in schools and educational institutions. Some examples are provided below.

1. *Organizational decision and physical structural determinations* (architectural aesthetics) – Schools are “cultural artifacts” that exist long after the individuals who designed them are gone. Schools constructed on the factory model are now being replaced by schools for smaller learning communities supported by collaborative instructional practices and technology (Lackney 2011). This dimension refers to architectural and ergonomic decisions made by educational administrators about how visible, accessible, or private they wish to be to others in the organization and which types of learning/teaching arrangements are to assume priority over others.
2. *Designated systems and routine procedures* – This dimension refers to a set of actions that are not creative but essentially technical and managerial in nature but still essential for the smooth sailing of the organization. Decisions made in this area are called pragmatic aesthetics because they involve normative and prescriptive practices. They may involve such areas as student dress codes, school schedules and classroom manners, courtesies and rules. Other areas may include procedures for budget development and the allocation of resources and the development of various forms of planning, from strategic to monthly or daily.
3. *Organizational rituals, rites, and ceremonies* – In contrast to designated systems and routine procedures, this dimension refers to actions that reveal educational administrators as performers who preside over important rituals and ceremonies, shaping the organization’s purpose. Rituals reveal and communicate a range of cultural assumptions held by individuals and groups, and they serve to reinforce organizational priorities. Sometimes rituals, rites, and ceremonies can be very powerful symbolic exchanges and reinforce deeply held values shared by all.
4. *Organizational myths, stories, and legends about people and events* – This aesthetic dimension refers to the significant and inspirational stories told by educational administrators and others in the organization that celebrate personal and professional triumphs and provide a forum for reflection on challenges and adversity that later become myths and legends. These human centered stories provide a sense of shared meaning and understanding and contribute to an organization’s collective memory, becoming enshrined in its history. This permits newcomers to the organization to gain an understanding of their membership in it and to realize how they fit into longer and more cherished patterns of communal work.
5. *Formal statements regarding philosophy, mission, and visions for the future* – This aesthetic dimension refers to visible artifacts in which educational administrators work with and through others to share and negotiate meanings about the bigger purposes of the organization now and in the future. Such statements, sometimes referred to as an ideology, are necessary to explain and justify the actions of the organization. They are comprised of three essential assertions: (1) statements which illuminate the circumstances in which the organization acts and which rest on its moral values believed to be ultimate; (2) statements about the purpose of the organization and its structure; (3) statements regarding how the purposes are to be attained within the circumstances and context in which it is located. These statements serve to

create unity with the organization, and “they bind the members to the organization and to one another in respect of the fact that they assert, presumably, what each member takes to be the case” (Dunham 1964, p. 17). *Personal role modeling, mentoring, recruitment, and promotion* – This set of aesthetic actions refers not only to educational administrators who mentor and provide support to others by setting an example through their own personal and authentic behaviors but also ensures that key practices valued by the organization are manifested in fair and transparent human resource decisions pertaining to recruitment, selection, and promotion of staff. Leaders are observed both formally and informally by subordinates. Of the two, informal observations are more potent and powerful for others to learn and emulate (Schein 1992, p. 241). The demonstrated behaviors of a leader do much to provide an example of what is actually valued and will lead to advancement in the organization. Those who are congruent with the formal statements of organizational purpose provide visible role models for their realization in the day to day operations of it. Role models are perhaps the most ancient exemplar of aesthetic teaching and coaching in the human social world.

Aesthetic Dimensions of Research in Educational Administration

In addition to the aesthetic dimensions of administrative decision making in schools and educational institutions, certain research methods about educational administration also embrace aesthetics, specifically with ethnographies and portraiture. Ethnographies are attempts at producing contextualized descriptions with the intent of deriving from them an understanding of actions taken by administrators from an insider’s perspective. The idea behind ethnography is to discern situated meaning, that is, understanding within interaction and context. Ethnography begins with observation first and then derives

meaning from those observations secondly. One of the first full ethnographies of an educational administrator was written by Harry Wolcott (1973) entitled *The Man in the Principal’s Office*. This ethnographic mile marker was filled with aesthetic images and messages. For example, there was an entire entry on the principal as a person “behind many masks” as well as the search for stability within role ambiguity of an elementary school principal. A decade later, compelling ethnographic portraits were also produced by Sara Lawrence Lightfoot (1983) on six public and private secondary school principals. The descriptions of these leaders are vivid examples of the fecundity of aesthetic analyses to understand styles of administrative performance and communication, how social relations around ideals, values, and emotions are acted out in the symbolic and linguistic lives of educational administrators, and how their organizations are constructed through aesthetic means and activities.

John Locke's Thoughts on Education

Dwight Goodyear

Westchester Community College, New York,
NY, USA

Introduction

John Locke (1632–1704) was a British philosopher, medical doctor, economist, political theorist, psychologist, and biblical exegete who made impressive contributions in many areas of inquiry. In 1693, after writing extensively on topics such as human understanding, government, economics, and toleration, he published his influential book *Some Thoughts Concerning Education*. The book followed an established tradition of British instructional books for parents seeking guidance on child rearing. These books were not philosophical treatises, and it is important to understand that Locke's book was not meant to be a systematic philosophical work. In fact, it is based on a series of letters to his friend, Edward Clarke, who sought advice from Locke regarding his son's education (despite the fact that Locke was a bachelor with no children). To be sure, it has observations that are quite systematic. For example, he delineates stages of educational curriculum and psychological development. But these should be taken as guides for further inquiry rather than dogmatic models to be applied without sensitivity to the particular circumstances. John Locke was

an empiricist – someone who thinks all knowledge must be directly or indirectly derived from sense experience – and as a result he placed the concept of the *particular* at the center of his philosophy. John and Jean Yolton explain the relevance of this concept for Locke's pedagogy:

The centrality given by Locke to particulars in his metaphysical system is reflected in his account of persons and in his work on education. Each child is to be dealt with individually; children have particular traits, biases, humours, tempers, a bent and a tendency of their minds. Locke urged the tutor and the parents to pay careful attention to these natural dispositions, for they must be reckoned with in rearing children. Some can be altered to some extent, others can perhaps be replaced, but by and large the tutor must work around them. (Yolton and Yolton 1989, 14)

So we must keep in mind Locke's empirical effort to be sensitive to context and avoid generalization. As the title of the book makes clear, he is sharing some thoughts on education with us, and these thoughts, appropriately enough, flow from his close engagement with one child. Thus, it is no wonder that he writes in the concluding paragraph "there are a thousand other things that may need consideration; especially if one should take in the various tempers, different inclinations, and particular defaults, that are to be found in children; and prescribe proper remedies." [All textual quotations will be from the 1824 Rivington edition with modernized English.]

It does not take long to see why *Some Thoughts Concerning Education* was one of the most

important and popular books on the topic for over a century in England (it was published in 21 English editions in the eighteenth century alone). Locke's work is full of fascinating examples and rich descriptions that make you want to keep reading. He also addresses education in relation to a wide variety of topics such as health, authority, virtue, trade, travel, the equality of the sexes, play, the social and physical context of learning, and the various subjects of study. No overview can do justice to the complexity of Locke's insights on all these topics. But I think they can be philosophically illuminated if we focus on three more general and fundamental topics: (1) the development of self-discipline through esteem and disgrace rather than force or reward; (2) the significance of developing a good character; and (3) the importance of developing reason in a child by treating the child as a rational being. Locke's thoughts on these topics were quite revolutionary and controversial at the time. For example, Jean-Jacques Rousseau, while acknowledging his debt to Locke's book, argued that children should not be treated as rational beings. Today, of course, these themes may strike us as humane and sensible. Nonetheless, we will see there are still some controversial implications for us to consider. I will focus on one in particular: Locke's belief that the pupil's mind is like a piece of wax that passively receives simple ideas from the active educator.

Self-Discipline

Locke begins his book by noting that a sound mind in a sound body is the formula for happiness. The problem is that nature rarely supplies an individual with both; thus one needs education to acquire physical and mental fortitude. Locke writes in paragraph 33:

As the strength of the body lies chiefly in being able to endure hardships, so also does that of the mind. And the great principle and foundation of all virtue and worth is placed in this, that a man is able to deny himself his own desires, cross his own inclinations, and purely follow what reason directs is best, though the appetite lean the other way.

Locke's "great principle," that which allows one to cross one's inclinations, is self-discipline. But in order to achieve such discipline one must first *be* disciplined: "The great mistake I have observed in people's breeding their children has been, that this has not been taken care enough of its due season; that the mind has not been made obedient to discipline, and pliant to reason, when at first it was most tender, most easy to be bowed" (para. 34). However, parents typically err by being too lenient or too strict. Either extreme prevents a child from growing up as an adult with self-discipline. For a spoiled child will end up having no mastery over inclinations and a severely disciplined child will lose the vigorous, self-confident spirit necessary to amount to something in the world. What is needed is a *balance*:

To avoid the danger that is on either hand is the great art: and he that has found a way to keep up a child's spirit, easy, active, and free; and yet, at the same time, to restrain him, from the many things he has a mind to; and to draw him to the things that are uneasy to him; he, I say, that knows how to reconcile these seeming contradictions, has, in my opinion, got the true secret of education. (para. 46)

But how can we approach this secret? How can we reconcile these seeming contradictions? Well, one approach is physical punishment or *the rod*. This common chastisement is the most unfit of any to be used in education insofar as it: (1) leads to no mastery over our inclination to indulge corporeal pleasure and avoid pain but rather encourages it; (2) leads to an aversion of what the tutor is trying to get the student to be interested in; (3) leads to the development of a "slavish temper"; and (4) leads to a timid creature who has no spirit and will therefore be "useless to himself and others" (para. 51). All four criticisms are united by the same insight: the rod ends up producing and/or strengthening the faulty disposition it was employed to remove. As a result the rod is self-defeating as a means of developing the discipline that leads to self-discipline.

Perhaps children will work and obey if they have some *reward* in view rather than punishment? But then children do not learn the material *for the sake of the material* but for the sake of the

reward. And, insofar as rewards typically play to the appetites, they are inconsistent with the general function of education: to engender a mind that can resist inclinations. Of course, the question arises: “But you take away the rod on the one hand, and these little encouragements, which they are taken with, on the other; how then (will you say) shall children be governed?” (para. 54).

Locke's answer comes to us in paragraph 56: the incentives of *esteem and disgrace*. Disgracing a child entails casting a cold shoulder and using the silent treatment when a child does wrong. It can also entail making a child experience shame in front of others. These methods are effective since children neither want to be left out nor feel ashamed. Conversely, esteem leads to acceptance, recognition, and productive social cooperation insofar as children do not want their actions to go unrecognized. The important thing to grasp is that esteem and disgrace can *indirectly* develop *self-discipline* since children have opportunities to *reflect upon* the consequences of their behavior. And this self-discipline can allow children to begin to *educate themselves*. This is fortunate since the ultimate function of a tutor “is not so much to teach him all that is knowable, as to raise in him a love and esteem of knowledge; and to put him in the right way of knowing and improving himself, when he has a mind to it” (para. 195).

Reason and Character

The second and third themes that run through Locke's work are the development of reason and character. Character is developed by imitation – especially imitation of the tutor who should exhibit the virtues she would impart – and repetition until a task no longer depends on memory or reflection. Locke stresses that such repetition should start at an early age. For when a child is young one can implant all the good habits and rules necessary for further development (para. 64). Of course, we should recall here that Locke is committed to the concept of the particular and was sensitive to what inclinations a pupil brings to any learning experience. Moreover, he believed

there is a set of natural faculties common to all humans such as reason, understanding, memory, and sensation. These inclinations and faculties provide limits an educator must respect. But the fact remains that for Locke the early ages of childhood are when the proper foundations for future growth are most easily established. In order to properly establish these foundations, Locke recommends children stay at home with their tutors rather than going away to boarding school. In doing so, they can learn in a context far more free and pleasurable than the compulsory and burdensome environment of school. Education, for Locke, should not be a matter of force; it should activate the love of learning and make the subject matter enjoyable (para. 72–74). We should note here that Locke always has this tutor/pupil relationship in mind as he writes – a relationship only accessible to well-off families. But with a little imagination we can see how his insights can translate into other pedagogical contexts (Cahn 1997, 144). Indeed, Locke did just this when he investigated how to bring education to the poor in his *Essay on the Poor Law* (1697).

One of the most important habits in the development of self-discipline is the habit of reasoning well. Why? Because it is the habit that allows other good habits to be formed. Of course, the question arises: *can* one reason with a child? Rousseau and other romantics did not think so: to reason with a youth is to impose those adult-like constraints that rob childhood of its innocence and wild freedom. But Locke disagrees:

It will perhaps be wondered, that I mention reasoning with children and yet I cannot but think that the true way of dealing with them. They understand it as early as they do language; and, if I misobserve not, they love to be treated as rational creatures sooner than is imagined. It is a pride should be cherished in them, and, as much as can be, made the greatest instrument to turn them by. (para. 81)

Locke does not expect one to reason with a child like one would with an adult. Yet, he thinks a teacher should find the appropriate level of discourse and situate herself there. The point is to *treat children as rational beings so they become rational*: “The sooner you treat him as a man, the

sooner he will begin to be one: and if you admit him into serious discourses sometimes with you, you will insensibly raise his mind above the usual amusements of youth, and those trifling occupations which it is commonly wasted upon" (para. 95). For children, according to Locke, are curious; therefore, a good teacher will be one who can activate this natural curiosity and satiate it by giving answers that are true, clear, and understandable within the sphere of the child's experience. These answers should be accompanied by *reasons* and, wherever possible, *inspire* a student's desire to learn by discovering more and more reasons.

It is crucial to understand that the development of reason for Locke was a means to understanding the natural moral law, established by God, which serves as the ground for moral prescriptions and natural rights (see his *Essay Concerning Human Understanding*, 2.28.8). By becoming rational, the student is therefore humanized and can, on the one hand, participate in a civilized community and, on the other hand, flourish as an individual. But the natural moral law is not only something to be eventually known by students; it also provides the moral imperative to educate students in the first place (para. 34). Children have a natural right to education and the natural law grounds this right. These mutually enforcing factors help us see just how closely connected Locke's thoughts on character and reason are to the natural law tradition and the values of the Enlightenment. It should be noted that these thoughts allowed Locke to see farther than most on the issue of gender equality. In a 1685 letter to Mrs. Clarke, mother of the boy Locke was tutoring, he wrote that the education of her daughter would require no substantial adjustment due to her rational mind's shared capacity for truth and virtue: "since therefore I acknowledge no difference of sex in your mind relating . . . to truth, virtue and obedience, I think well to have no thing altered . . ." (Axtell 1968, 344). In the end, Locke hopes education will develop persons who have virtues such as civility (para. 145), feelings of humanity (117), generosity (110), gracefulness of voice and gestures (143), honor (56), humility (145), industry (70, 94), kindness (139), love of

God (136), love of study (128), modesty (70), politeness (117), prudence (91), reverence (44), self-control (48), self-denial (45), and self-restraint (38, 39). Some vices to avoid developing are domineering (103), hasty judgment (122), hypocrisy (50), indolence (123), lies (131, 133), malice (100), negligence (141), rashness (115), sheepish bashfulness (141), stubbornness (111, 112), and timidity (115) (Yolton and Yolton 1989, 22–23). These insights provide a helpful vantage point from which to understand and connect Locke's various prescriptions regarding the topics mentioned earlier: travel, health, work, play, trade, and so on. In each case, it will be a matter of seeing how certain practices support or thwart the development of virtue. I will let Locke's words, which link this discussion of reason and virtue to the previous overview of self-discipline, close this section:

These are my present thoughts concerning learning and accomplishments. The great business of all is virtue and wisdom.

Nullum numen abest, si sit prudentia.

[No heavenly power is wanting if there is wisdom]

Teach him to get a mastery over his inclinations, and submit his appetite to reason. This being obtained, and by constant practice settled into habit, the hardest part of the task is over. To bring a young man to this, I know nothing which so much contributes, as the love of praise and commendation, which should therefore be instilled into him by all arts imaginable. Make his mind as sensible of credit and shame as may be: and when you have done that, you have put a principle into him, which will influence his actions, when you are not by; to which the fear of a little smart of a rod is not comparable; and which will be the proper stock, whereon afterwards to graft the true principles of morality and religion. (para. 200)

A Few Tensions

It is to be expected that a work proclaiming to be some thoughts on a subject will leave us with internal or implied difficulties a more formal treatise might be expected to avoid. I will quickly mention a few before moving to one in detail. First, Locke thinks reason should have the ability to deny our appetites so we can gain self-discipline. But he also argues in various places

that we are essentially hedonists motivated to seek pleasure and avoid pain (*Essay concerning Human Understanding*, 2.7.3). Can we expect reason to succeed given this hedonistic theory of the good? Second, Locke's strong emphasis on social esteem, social integration, and natural law may foster conservative dispositions potentially at odds with his commitment to a liberal society populated by critical citizens. Third, Locke's vision of education as a means to character development for the sake of citizens in a liberal social order appears to conflict with modern liberal social arrangements that, unlike illiberal ones, try to limit or remove the development of virtue in public education. Fourth, Locke's Enlightenment vision of education forming rational citizens seems, on the one hand, to apply to a relatively few individuals who have the luxury of a tutor and, on the other hand, needs to apply to far more people if it is to be successful. It has been pointed out that Locke's optimism, while not overlooking the inevitability of human bias, habit, and prejudice, seems to have underestimated people's capacity for political evil and fanaticism (Tarcov and Grant 1996, xii). But are not such capacities to be expected given the limited scope of his pedagogical vision? And fifth, Locke's emphasis on the social utility of education led him to be very critical of the arts and humanities if these things are pursued for their own sake. Everything we learn must have a demonstrable use in a social context: no idle metaphysical speculation or mastering archaic languages! This position is understandable given Locke's modern agenda, influenced by Francis Bacon, of sweeping away scholastic metaphysics and emphasizing science and practical skills. But then, the question arises: Was not Locke the one telling us to avoid giving rewards for learning lest we make learning a mere means to an end? It seems clear that Locke's emphasis on reason and utility prevented him from adequately addressing how creativity, imagination, and esthetics, topics more readily embraced in the romantic era, play a crucial role in education. It is remarkable to see how similar issues regarding the value of the arts in education continue to be an important topic of debate.

These tensions can, perhaps, be resolved with the resources of the text and/or by integrating insights on education Locke gives us elsewhere, for example, in a work posthumously published in 1706 entitled *Of the Conduct of the Understanding* (see Tarcov and Grant 1996) or his three other unpublished manuscripts on education (Yolton and Yolton 1989, 67–68). But there is another tension commonly associated with Locke's book that is worth considering in some detail. In Book II of his *Essay concerning Human Understanding* Locke writes:

Our observation employed either about external sensible objects, or about the internal operations of our minds perceived and reflected upon by ourselves, is that which supplies our understanding with all the materials for thinking. These two are the fountains of our knowledge, from whence all the ideas we have, or can naturally have, do spring. (2.2.2)

Unlike philosophers committed to rationalism, Locke argued there are no innate ideas or ideas present in the mind from birth. Ideas come only after we engage in sense experience and reflect on that experience. Now there are, as we have seen, innate *faculties* – such as understanding and memory – as well as personality *dispositions*. Some of these dispositions of character even come from God: “God has stamped certain characters upon men's minds, which, like their shapes, may perhaps be a little mended; but can hardly be totally altered and transformed into the contrary” (para. 66). But in the *Essay* Locke argues that at birth our mind is like a sheet of white paper (2.1.2) or an empty cabinet (1.2.15) as far as *ideas* are concerned. This is not to say that all ideas come ready made into the mind: Locke certainly makes room, contrary to what some commentators have said, for the powers of imagination and creativity in his philosophy of mind: without these powers we could not manipulate the simple ideas given in sense perception and form complex ideas out of them. But it is to say that *all* the elements of our ideas ultimately originate in sense perception. This, of course, calls to mind the famous, or perhaps infamous, *tabula rasa* doctrine – the doctrine of the mind as a blank slate. But it is imperative to note that Locke did not actually use the

phrase “*tabula rasa*” in his *Essay*; it has been attributed to him by critics going as far back as G. W. Leibniz. And, unfortunately, the doctrine typically attributed to Locke states that the mind is without structure, dispositions, and essential nature – and this, as we have seen, is simply false.

Locke's theory of mind and its close connection with his empirical epistemology can have profound pedagogical consequences. Consider this passage from paragraph 167: “It should therefore be the skill and art of the teacher, to clear their heads of other thoughts, whilst they are learning of anything, the better to make room for what he would instill into them, that it may be received with attention and application, without which it leaves no impression.” And: “Keep the mind in an easy calm temper, when you will have it receive your instructions, or any increase of knowledge. It is as impossible to draw fair and regular characters on a trembling mind, as on shaking paper.” At one point Locke actually refers to his pupil as a piece of paper or wax: “I considered [the son] only as white paper, or wax, to be molded and fashioned as one pleases” (para. 216). In the *Essay*, a connection between passivity and simple ideas is made that illuminates these passages. Locke claims that a simple idea is one “in itself uncompounded, contains in it nothing but *one uniform Appearance*, or Conception in the Mind, and is not distinguishable into different *Ideas*” (2.2.2). And, importantly, the mind “is wholly passive in the reception of all its simple *Ideas*” (2.12.1). So we see that learning, given this model of the mind in relation to its acquisition of simple ideas, will be most successful when the paper is clean, the wax is smooth, and the cabinet is empty. Only then can the educator instill simple ideas into the pupil's passive mind leaving a lasting impression.

Now this approach may be appropriate in certain circumstances. But can this model of the active educator stamping the passive mind of a pupil be embraced as a general principle of acquiring ideas? Well, Locke, as we have seen, supported the effort to see each student as a particular individual with various unique and innate traits. And his theory of the mind, as we have seen, does make room for the mind's activity as

it forms complex ideas and applies what it learns. Locke was all for active experimentation, investigation, and criticism – he was not advocating a general passivity in his pedagogical theory. But it appears that his descriptions of the mind fail to do justice to the mind's *active role in acquiring* simple ideas. By way of contrast, consider this passage from John Dewey's *Democracy and Education* (1916) in which Dewey presents the “educational moral” of ideas as anticipations of possible solutions:

It is that no thought, no idea, can possibly be conveyed as an idea from one person to another. When it is told, it is, to the one to whom it is told, another given fact, not an idea. The communication may stimulate the other person to realize the question for himself and to think out a like idea, or it may smother his intellectual interest and suppress his dawning effort at thought. But what he *directly* gets is not an idea. Only by wrestling with the conditions of the problem first hand, seeking and finding his own way out, does he think. (Dewey 1985, 166)

Here, we see that the acquisition of any idea is the outcome of an active and problematic engagement with materials. For Dewey, the mind is active in the acquisition of facts. But it must be all the more active if it is to acquire an idea based on these facts. The pupil's active engagement is the condition for the possibility of an educator indirectly facilitating the grasp of a new idea. If the basic thrust of Dewey's vision is correct – or at least correct in some important cases – then Locke's pedagogical strategies may prove inconsistent with theories of the mind that stress the active acquisition of ideas, even simple ideas.

We can also argue that a pedagogy emphasizing the active acquisition of ideas would prove fruitful in ways consistent with Locke's social and political commitments. Wouldn't this kind of pedagogy have positive political consequences? Locke, of course, was an eloquent and influential supporter of democracy. But at times it can be difficult to reconcile a pedagogy that makes room for minds as passive receptacles with the critical involvement so integral to a thriving democratic society. Wouldn't this form of passive reception, over the years, develop habits more conducive to obeying authority than questioning

it? And wouldn't these habits then thwart the rational development of children? Maybe not if we take into account Locke's overall emphasis on the development of rational autonomy and the many practices to bring it about. It may be that the passive acquiring of simple ideas is not really such a threat given these practices. Whatever the case may be, these are important questions that need to be addressed by any serious consideration of his pedagogy.

Conclusion

Locke should be admired for his holistic, rational, and humane pedagogy that seeks to develop virtuous individuals and productive citizens. His keen psychological insights, sympathy, and common sense can still be used to challenge ineffective pedagogical and parental strategies. Even the limitations and tensions in his work – and there are many as we have seen – can be instructive and can help us think more profoundly about those “thousand other things that may need consideration; especially if one should take in the various tempers, different inclinations, and particular defaults, that are to be found in children; and prescribe proper remedies.” I think it is this searching quality of the book and its detailed commitment to the particular – the particular student, teacher, immediate learning context, and larger social and political environment – that struck a chord with countless laypeople in its wake and earned the admiration of figures such as Rousseau, Sarah Trimmer, and Maria Edgeworth. In 1772 James Whitchurch wrote, in his *An Essay Upon Education*, that Locke was “an Author, to whom the Learned must ever acknowledge themselves highly indebted, and whose Name can never be mentioned without a secret Veneration, and Respect; his Assertions being the result of intense Thought, strict Enquiry, a clear and penetrating Judgment” (Pickering 1981, 12). And it is common in all subsequent time periods to see Locke referred to, whether critically or not, as a powerful influence on educational practices (for some examples, see Yolton and Yolton 1989, 35–43; Cleverley and Phillips 1986). Indeed, this

ability of *Some Thoughts Concerning Education* to generate inquiry and empower so many readers of diverse backgrounds to think philosophically about education is what makes it worth reading today: the book itself is a powerful argument for its view that education is about making autonomous rational agents who can, in turn, help others become more rational as well.

Synonyms

Judicialization; Legalization

Introduction

This entry brings together scholarly work on juridification (the systemic drift toward legalism) and education – two strands of research that so far have evolved in largely separate scientific communities and rarely communicate with one another. The strands will be brought together in three steps – first, by presenting a brief overview of research on contemporary conceptualizations of juridification in modern societies; second, by tracing some of the central historical antecedents that inform such juridification; and third, by identifying how the juridification of education proceeds on different paths at different rates, issuing in different relationships to institutional structures in different regions, nations, or societies, thus precipitating different kinds of problems and frictions in different local situations. The article covers all levels, encompassing preschool, K-12 and higher education. Further, it is comparative, involving vignettes from research in several countries. The multiple, complex, and variegated denotations and connotations of juridification are sketched, and their engendering of changes in the education arena is discussed.

Conceptualizations of Juridification

The term juridification – sometimes called judicialization or legalization – is in legal theory described primarily as a growth phenomenon that encompasses both descriptive and normative content. In current research, the term at the most

abstract level designates the spread of legal discourse, jargon, rules, and procedures into the different social and political spheres and policy-making fora and processes (Hirschl 2008). A number of characterizations have been suggested. Niezen (2010), for example, suggests that one form of juridification involves legalistic intensification, i.e., “a widened jurisdiction of legal institutions and increased recourse to formal processes within societies in which law already preponderates in bureaucratic procedure, dispute resolution and governance.” (p. 218). This legalizing aura can be distinguished from what Niezen calls legal substitution, i.e., “the processes by which formal law is introduced to or becomes dominant in societies or communities that have previously relied more exclusively on informal customary institutions and procedures.” (p. 218). In addition to tangible developments in which an entity or activity becomes subjected to legal or legal-like regulation or accommodation, juridification can also encompass a range of intangible developments. Examples of the latter are the individual’s awareness of his status or potential as a legal actor or the less distinct process in which members of institutions increasingly come to define themselves and others in legal terms (Blichner and Molander 2008). As many scholars have noted, there is an ever-greater popularization of legal jargon and an ascendancy of legal discourse in a wide range of areas of modern life. Issues that have previously been negotiated in an informal or nonjudicial fashion have come to be dominated by legal rules and procedures or even quasi-legal ones; reference to a law that does not actually exist or pertain may be seen as a form of juridification (see more of this argument in Blichner and Molander 2008).

The relationship between juridification and the rule of law is complex. There is a scholarly disagreement about whether the two should be harmonized or be kept apart. In advocating the latter, Blichner and Molander (2008) argue that, in descriptive terms, the rule of law represents one type of juridification, whereas in normative terms, it constitutes a standard that may be used to evaluate tendencies of juridification or dejuridification. Indeed, the rule of law can be

seen as something relational and mutable or changeable, serving a particular historical social situation determined by ideological, political, and economic factors. Changes in the rule of law are linked to the processes of change in society at large, purposive or not, and have a political significance in that they deal with what government can do or should do. Seen from such a perspective, the rule of law is not to be understood primarily as a characteristic of a legal system but as a dynamic concept capturing the relationship between the individual and the State (Gustafsson 2002).

While juridification might seem to be a quantitative phenomenon, it is based on features that are essentially qualitative or experiential. These qualitative features, some argue, can be traced to processes in which the traditional “formal” attributes of modern law are increasingly replaced with “material” attributes as the interventionist State seeks ways to legitimate the welfare State and brings about specific changes in order to achieve particular substantive ends (see, e.g., Teubner 1987). The next section will explore this point further.

Historical Roots and Contemporary Branches

Among the most influential analyses of the roots of juridification in modern times are the works of Max Weber (1864–1920) and Jürgen Habermas (b. 1929). Despite important differences, they share an understanding of juridification (“Verrechtlichung”) as something essential to the foundations of political sovereignty and political legitimacy. Weber analyzed the implications of the general processes of secularization and rationalization on the character of modern life in terms of a distinction between “formal rationality,” the strategy of adapting one’s own conduct to the predetermined purposes built into the capitalist system, and “material rationality,” the rationalization of the conduct of the life of the individual with respect to ultimate value positions (Lash and Whimster 1987). Weber (1978) argued that the legal order tended to develop the characteristics of a formal rationality to serve as a normative

foundation for society. According to Habermas, this “colonization of the life-world” – as in the tendency of materialization of formal law that certain historical conditions have brought about – has led to fundamental and far-reaching changes of societal structure.

Habermas (1986) distinguishes between four epochal “thrusts” of juridification in Western industrial nations. Each one of these thrusts is connected to the emergence of various forms of the State and involves specific features of legal functions and normative structures. With references to the bourgeois State, the bourgeois constitutional State (*Rechtsstaat*), the democratic State, and the welfare State, it can be argued that, historically, law has played an emancipatory role of the highest order, partly because all four forms have been freedom guaranteeing, although the freedoms addressed have varied. For the bourgeois citizen, it was important to prevent the State from attacking or even intervening in the rights of private ownership. It was necessary to guarantee by law bourgeois civil rights pertaining to private property, the freedoms of speech, assembly, the press, economic activity, etc. Further characteristics were rules on how to pass and effectuate political acts, limit political power, and protect individual rights, as well as to give one part of a political system’s exclusive competencies. The concept of the rule of law in the bourgeois constitutional State grew obsolete with the emergence of the democratic State and the welfare State. Guaranteeing every person within the jurisdiction of the national State, a protection of a private autonomous sphere against arbitrary government action was no longer an issue. Instead, the State was to manage the task of allocating prosperity and social welfare, which meant the managing of new distributive functions and responsibilities (cf. Gustafsson 2002).

According to Habermas, the thrusts of juridification that followed are to be understood as the gradual constitutionalization of the economic and political systems. These frameworks place the “life world” at the disposal of the market. Universal and equal franchise, freedom of organization for political associations and parties, norms of employee protection, complex networks of

social security, the intensification of company constitutions, and antitrust law interventions on the market can all be seen as part of the latest epoch-making thrust of juridification. In this thrust, the intervening social State uses law as a means of control. Governance through the new juridification is dependent for its legitimation on forms of rationality, which, in turn, depend upon the efficiency of the market, but also of market actors. The next section will consider practices of the “self” as actor in relation to education.

Linking Juridification and Education

Education may be understood broadly as part of the historical process by which the social relationships necessary for societal function are reproduced. While the informal education that goes on in the home and in various contexts outside institutional practices is of crucial importance, this entry concerns only formal schooling, in particular, its development and governance. Changes in the relationship between the internal and external conditions of formal schooling tell us a great deal about the historical struggle between society and the State. The historical record of juridification is worth recounting because it registers the intellectual roots connecting education ideals with citizenship. Weber and Habermas offer a theoretical background against which to understand juridification as an important aspect of the processes of social and cultural formation that we call “education,” which can be qualified by policy challenges posed by educational research.

Formal State schooling and State-prescribed curricula were established in Western nations in the mid-nineteenth century for the purposes of nation-building. Early advocates of common schooling envisioned it as a vehicle for producing a unified citizenry; through schooling, the social foundation of national identity would be laid. In order to understand the connection to juridification, we may consider the initial legal movements in Western nations. The establishment of civil rights in the bourgeois State aimed at protecting the individual from State interference by safeguarding individual freedoms (of speech,

conscience, and religion, along with the right to ownership of property and legal access). The emergent democratic States acknowledged for a growing number of people the right to participate in the exercise of political power. New social groups in society were brought into the political process and suffrage was gradually extended. In this context, schooling gained in importance for instilling in each child the set of values deemed necessary to make them capable of participating in civic and political life.

Alongside preparing new members of society to safeguard the values of democracy, economic prosperity became an increasingly central motive. The rise and expansion of formal schooling, on the one hand, and the development of the modern industrial State, on the other, are tightly interwoven. Education significantly affects labor market outcomes on both for the individual and for the nation. The transformation from agrarian economy to urban industrialization brought about significant changes in societal structure. Urbanization and education became key for the labor market, for individuals, as well as for industries, and this also for the State.

The shift from equal opportunity for an *adequate education* to equal access to *all education* arose in Western nations at different times, but in each case, it was an important step in the historical record of legal movements. In the USA, the question of equalizing educational opportunity pivoted on its 1954 Supreme Court decision in *Brown v. Board of Education*. In order to appreciate the significance of the shift from pursuit of adequacy to the pursuit of equality as it pertains to juridification, it is important to consider the emergence of the welfare State and the State’s task of allocating prosperity and social welfare. The equalization of educational opportunity had become entangled with equalizing access to society’s goods more generally. The democratization of societies in the welfare State was further accelerated by world trade, international competitions, and collaborations boomed in the aftermath of World War II.

What occurred in Western nations has been described as a tendentious shifting from a society-centered tradition of democracy, in

which the starting point was the idea of a sovereign people in which every individual is a member of the collective, to an individual-centered democracy, which starts from the sovereign individual taking responsibility for his or her own future. The specific character of the individual and his freedom to create his own conditions is emphasized in the latter. It has been argued (Englund 1994) that the shift from a society-centered tradition of democracy to an individual-centered tradition of democracy means a shift from education as a “public good” to a “private good.” In a “public good” model, the collective, shared democratic principles and citizenship rights are conveyed via the State. Each child is guaranteed an equivalent right to an education with form and content established in a collective system through democratic processes. In the “private good” model, on the other hand, education is seen as related to the interests of each individual family and its children. In this perspective, parents are to be given greater authority (responsibility) to make decisions regarding the children’s education. The shift to a private good makes it possible to differentiate schooling in relation to the specific desires and aspirations of families. Theoretically and practically, it offers the foundation for starting private and/or charter schools with distinct profiles, values, and/or teaching methods.

With “freedom of choice” as the prioritized value in the governance and development of formal schooling, there was increased advocacy of differentiation, branding, and student and parental rights to choose between alternative school forms, while earlier aims at desegregating society and promoting social equality faded into the background.

The globalization of economic life, together with the ubiquity of information and technology, posed challenges to existing modes of national governance. The advent of the “knowledge society” accentuated the importance of education for a country’s global competitiveness. Behind this specific economic rationale was a plethora of further and more acute issues, rendering nations “at risk.” *A Nation at Risk* was also the title of a major US report in 1983 – a landmark event in modern American educational history.

New forms of standardization emerged as the idea of uniform standardization was discredited. The operation of UNESCO and UNICEF adopted the language of “rights-based” legislation. A rights-based approach calls, among other things, for the translation of universal standards into locally determined benchmarks for measuring progress and enhancing accountability. Since, as it was argued, State control of education should not constrain the potential for finding new ways of meeting or adapting to a changeable society, changes in the way in which education is governed were necessary. Where such inhibiting structures were suspected, processes of regionalization, fragmentation, and decentralization of authority delegated powers downward. How to find new adaptable mechanisms for governance to replace the slow and cumbersome bureaucratic State was of the essence (Segerholm 2007). This forward march of neoliberalism, with its rhetoric of greater choice, accountability, efficiency, consumer empowerment, and privatization of the public sector, has also been seen as undermining the role and authority of the State (Hudson 2007).

A general trend is that greater fragmentation of responsibility between the State, local government, schools, and individuals within institutions (e.g., school leaders, teachers, students, and/or their parents) is accompanied by a move from detailed regulation to framework legislation. Here the role of law is transformed from one of direct regulation of behavior to a more indirect, but no less constraining, regulation of procedures. Put differently, law becomes instrumentalized as a guidance mechanism for the interventions and compensations of the welfare State (cf. Teubner 1987). A transition from detailed legislation to legislative framework often means an increased need for systematic monitoring and follow-up.

Although the exercise of converting a detailed regulation into a legal framework of facilitative arrangements was aimed at hollowing out the regulatory dimension in the shift from a centrally governed to a decentralized system, it has, somewhat paradoxically, encouraged governments in many countries to embark on major legislative programs, such as the “No Child Left Behind” program in the USA, the UK’s “Every Child

Matters” program, and the Schools Inspectorates in Sweden and England, as well as others. The application of framework legislation has thus acknowledged a greater scope for local variations, while evaluation has gained importance as a governing instrument.

The shift from a centrally governed to a decentralized educational system has attracted much scholarly attention. Questions of responsibility, of accountability, and of the means by which schools ought to be governed (with prominence of the control of the output side of education by, e.g., quality controls, standardized testing, evaluations etc., and the introduction of national bodies responsible for carrying out these controls) have been the central political issue and remain a contentious theme in research and debate. At the same time, there has been a change in discourse as a previous strong focus on the obligations of the local government has been replaced with a greater focus on the rights of the student. For example, the significance of the legislative history of the 2010 Swedish Education Act lies in the adoption of the language of “rights-based” legislation (“legislative history” refers to materials such as bills, committee hearings, committee reports, congressional debates, and other documents generated by Congress during the passage of a statute. The legislative history can provide insight into the legislative intent of a particular law or valuable background and factual information on the issue being addressed by the legislation). In the case of Sweden, as well as Norway, a transition has been witnessed from an Education Act that was primarily based on obligations of the municipality to one that operates a legislative enactment concerned with rights of the student. This juridification is horizontal, from one view of the law to another, but the effect may also be vertical, with an increase or decrease in constraint.

In many Western countries, the implementation of common schooling and the subsequent expansion of schooling options through the introduction of the school market have resulted in a complicated system of educational administration and social control. The developments in schooling point to the reorganization of the entire school system in accordance with the market model.

When the *right to choose* is a precondition for the education arena to serve as a market, various educational providers compete for attracting (and keeping) students. This model of governance means that the State leaves the responsibility for adequate education in the hands of the students and their parents. Here, the State’s task is to guarantee individuals the right *to be able to make* choices and regulating and controlling the quality of what is offered on the market. This includes ensuring the individuals’ right to access information so that they will be able to make decisions on solid grounds. The State then allows the market to operate and takes responsibility for the market behaving in a “legally sound” manner, for instance, by conducting output control through inspections, evaluations, and the like and requiring content declarations for education, so that the consumer can make an informed choice on the basis of such information.

Education – and thus prosperity – becomes bound up with individual choices. Inequalities of outcome are partly attributed to the deficiencies of compliance with law, and the problem of structural coupling may then be reduced to a problem of technical effectiveness. Though the practical and technical aspects of managing education is important, it may be equally important to consider how such an inalienable value for democracy as “the rule of law” is changed from protecting the student’s right to an education for active citizenship and civic life to one of economic interest-controlled policy concepts with legal sanctions.

Conclusions

Juridification processes, as understood by many scholars, are embedded in ideas of serving national governments and assume a particular kind of relation among agents and between agents and institutions in society. Juridification is not to be understood solely as a quantitative phenomenon; its essential features are qualitative in the sense that the traditional “formal” attributes of modern law are increasingly replaced with “material” attributes as the interventionist State seeks ways to legitimate the welfare State and brings

about specific changes in order to achieve particular substantive ends. The most recent “thrust” of juridification became actualized through the emergence of new adaptations of democracy and the proliferation of rights discourses globally. While some of the changes are rhetorical rather than substantive, rhetoric has a discursive force in encouraging people to define the(ir) world differently. The role of juridification in framing and constraining the possibilities for contemporary education raises both the general question of the relationship between education and society and specific questions about how schooling serves the interests of the State, enacting particular educational values and posing the State as an icon of values and interests.

Introduction

The world is a vast family, and humans are children of the earth and sky, and cousins to all living things. Such unity means that nature is the ultimate teacher about life (Royal 2010, p. 9).

For Māori (indigenous peoples of Aotearoa New Zealand) the term kaitiakitanga (pronounced, kye-tee-ah-key-tar-ngah) is often used to refer to the active guardianship and management of natural organisms and their environments. Mātauranga Māori or Māori knowledge positions humans within nature and focuses on ways in which cultural understandings and intergenerational connections between people and their biophysical contexts assist in the retention and protection of biodiversity and ecologically sustainable ecosystems. This entry critically reflects notions of kaitiakitanga and bio-cultural connectivity as important and meaningful contributors for young children and their relationships with and for the world.

Kaitiakitanga

A Māori perspective of the natural world encapsulates a holistic epistemological world view. Māori ways of knowing, being, and doing are

connected with Papatūānuku (earth mother), Ranginui (sky father), and their many children, including Tangaroa (oceans). All of whom act as guardians of the natural world and its domains. The role of *ira tangata* or humans is to act as *kaitiaki* (caretaker), with an obligation to nurture and protect the physical and spiritual well-being of the natural systems that surround and support humankind. *Kaitiaki* are agents that perform the task of active guardianship. They are charged with the responsibility to safeguard and manage natural resources for present and future generations.

Decisions enacted by *kaitiaki* are based on the intergenerational observations and experiential understandings of *mātauranga Māori* or traditional tribal ecological knowledge and *pūkenga* or informed environmental practitioners and experts.

This process ensures the active engagement and retention of bio-cultural information and ecological management practices into the future.

The notions and practices of *kaitiakitanga* have developed over generations of use and the active, sustainable guardianship of natural resources. Intergenerational observations and ecological understandings of species interactions and patterns of use have been accumulated and grounded in the existence of Māori and indigenous cultures, which are intimately bound to residing in one place for many generations (Cheung 2008). All forms of knowledge were directly or indirectly sourced from the environment. The act of observation and information gathering was integral to the range of established sustainable management practices that governed the harvesting and use of natural resources.

However, *kaitiakitanga* is not about ownership or control of the natural world. Ownership implies the position of one who is separated, isolated, and removed from that which is perceived as being owned. For Māori, “the resources of the earth did not belong to man [sic] but rather, man belonged to the earth. Man as well as animal, bird, fish could harvest the bounty of mother earth’s resource but they did not own them. Man had but user-rights” (Marsden 2003, p. 67). The principles of *kaitiakitanga* are derived from an organic epistemological world view whereby the concept of

caring, nurturing, connecting, and safeguarding the natural world is based on understandings of connectivity and relationships with the natural world. Understanding the role of relationships is pivotal to understanding the world (Royal 2006).

Kaitiakitanga takes for granted that all elements of the world are related and it is upon those relationships that survival depends. This ideology suggests that the natural world is an intricate and intimate system, comprised of many interacting and adaptive structures and components. All elements move and interact within a complex holistic framework of relationships both abiotic and biotic, each supporting and benefiting the other. This complex, uncertain, and ever-changing natural world system is encapsulated in predator–prey relationships, adaptation, distribution fluctuations, and hierarchical disputes. Humans are positioned within the world, as an interactive, contributing, and sometimes destructive component. As with all species, human presence and activities have a flow-on effect to other species and systems (Berkes and Davidson 2008). In the natural world, no species or system is an entity unto itself. Everything is connected (Dovers and Hussey 2013). A holistic Māori world view of *kaitiakitanga* considers the well-being of natural resources to be directly related to the well-being of the people.

Kaitiakitanga and Connectivity

A biological-cultural (bio-cultural) perspective positions humans within nature and focuses on the ways in which cultural understandings and interconnections between people and their biophysical contexts produce complex, adaptive, and resilient systems (Morehouse et al. 2008; Rotarangi and Stephenson 2014).

Māori world views are shaped by a relational and conscious connection of humans with and within the natural world (Royal 2010; Marsden 2003). This world view is central to the ways in which humans experience and make sense of the world and our place within it (Mead 2003; Royal 2006; Cheung 2008). Within a Māori context, when people introduce themselves, it is appropriate

to name their whakapapa (genealogical ancestry), which positions their ancestral affiliation with particular mountains, rivers, and land as priority. As an oceanic and seafaring people, it is considered relevant to also name the waka (ancestral canoe) followed by tribal connections, ancestors, and parental lineage. Only after the tribal landmarks and names of the ancestors have been spoken does an individual name themselves (Royal 2010).

For many Māori, it is the tribal landmarks, events, and relationships between humans and the natural world that represent the identities of the people and their connections with the cosmos. Māori tribal senses of identity and belonging are exemplified by the language, stories, songs, rituals, and practices unique to a particular place, by a particular people, over many generations. Notions of identity and connectivity to nature are essential to Māori epistemologies or ways of knowing, being, and interacting with the world.

Part of the process of “knowing” belies a fundamental element which reflects the abilities for survival and enhancing the collective with the knowledge that as a people, Māori are capable of coexisting and making sense of the world, as their ancestors once did. It is the task of the present generation to honor their ancestors by caring for the natural world, as they had before them. In caring for the world, they will in the process strengthen their sense of place and connectivity to their ancestors and histories, ensuring a cultural and environmental future for their grandchildren. Kaitiakitanga identifies the diverse realities of a modern world, and the ability to effectively interweave the past with the future, in accordance with Māori tribal and sub-tribal entities, for the betterment of people and the environment (Hapū, Iwi Working Party 2005).

Cultural connectivity encapsulates the values important for Māori to undertake activities in ways that are meaningful and pertinent to Māori. Providing space for connectivity as it applies to young children’s relationships with the natural world is about recognising that “people are considered to live culturally rather than in cultures, with the generative source of culture being human practices rather than in representations of the world” (Stephenson 2008, p. 129). At its core,

the indigenous experience with the world is one of connectivity and, in particular, the experience of “being” perceives all entities of the world, human and nonhuman, as an interconnected community (Reid et al. 2013). Connectivity is the basis on which the world is ordered, the organizing principle of Māori knowledge, the sources of genealogy, and the origin of all rights and obligations – including kaitiakitanga over the environment (Waitangi Tribunal 2011).

Kaitiakitanga and Taonga

There is no specific term in Māori for the word value. From a “holistic view of the Universe the Māori idea of value is incorporated into the inclusive term ‘taonga’ – a treasure, something precious; hence an object of good or value” (Marsden 2003, p. 38). From a Māori perspective, the word “taonga” as it applies to natural resources or species are identified as those which have been harvested and the populations sustained by generations of Māori. These species are considered taonga as the knowledge and customs pertaining to traditional harvesting practices are still very present and relevant today. Examples include: when to harvest, how to harvest, environmental signs and conditions, preparation for storage, and traditional management practices to ensure the sustainable future. These types of intergenerational knowledge and associated cultural practices are recognized as having survived into modern times, hence the title “taonga” or treasured species.

There are three main categories of taonga. The categories are spiritual, psychological, and biological (Marsden 2003). The three categories are interrelated and are pertinent to understanding Māori principles of and for the natural world. The first category of spiritual or wairuatanga is concerned with mana (prestige, personal power), tapu (sacredness), and noa (unsacred or common). The “importance of mana within Māori society is paramount. Mana is a difficult idea to translate succinctly into English. It embraces virtues such as honour, and prestige but also represents authority and control” (Kearney et al. 2013, p. 9). The second category of psychological denotes the

quest for security, a sense of belonging, of place, whakapapa (genealogy) identity, self-esteem, and dignity. Whakapapa denotes a world view of a vast and complex family, where everything, humans and nonhuman are related. The traditional principle of whanaungatanga or relationships denotes pertinent understandings of the natural world that are important and meaningful to Māori (Royal 2010). The third category of biological pertains to a conscious ethic of and for the environment, survival, resilience, connectivity, and mauri, which can be translated to encompass the life force sustaining capacity of environment and society (Reid et al. 2013).

Kaitiakitanga and Children

Kaitiakitanga acknowledges the role of humans including young children to undertake active guardianship and responsibilities for the ecological communities and environments on which our survival and continued existence depends. As previously stated from a Māori perspective, people are not superior but related through whakapapa (genealogy) to all aspects of the environment. Whakapapa denotes the genealogical descent of Māori from the divine creation of the universe to the living world (Berryman 2008). It informs relationships and provides the foundation for inherent connectedness and interdependence to all things (Cheung 2008). Māori can trace genealogy back through whakapapa to Papatūānuku (the earth mother), therefore they not only live on the land but are part of the land (Ministry of Justice 2001). Humans are not superior but are related through whakapapa to all aspects of the environment, connected to everything in it; therefore it requires respect.

Māori children are intimately connected to the people and land; past, present, and future; and to the spiritual world and the universe (Mead 2003; Te Rito 2007), and gaining knowledge and experience of this connectivity is imperative for active participation in the community. Traditionally this knowledge acquisition sometimes began before birth and continued through life. It was essential that young children acquired the appropriate

knowledge, skills, and expertise to contribute to the community and in so doing support the survival of the present and future generations. Teaching and learning were therefore an important community responsibility (Makareti 1986; Te Rangi Hiroa 1987). Within traditional community contexts, teaching and learning were supported by highly sophisticated knowledge structures, educational practices, and principles. These processes aimed to maintain and extend knowledge and develop understandings of harnessing, sustaining, and extending environmental resource bases (Berryman 2008; Hemara 2000; Salmond 1983).

Living and sleeping in intergenerational environments allowed the transmission of important knowledge from the old people to the young, including knowledge of history, stories, legends, and their environment. In this way intergenerational ecological knowledge, grounded in specific contexts of existence, was handed down through the generations. These elements of a classical education in family and tribal history continued on through adolescence. Education of the Māori child was related to preparing the child to actively participate in Māori society, and to ensure the survival of future generations through coexisting, making sense of the world and protecting the well-being of natural resources. Learning experiences had immediate practical application. As the child matured, the tasks became more complex. Children absorbed cultural mores by following adults and learning through observation, imitation, and practice (Berryman 2008; Hemara 2000; Salmond 1983). There was a fundamental relationship between theory and practice and a requirement that learners demonstrate this in the context of their learning. These understandings are consistent with holism, which has a critical role in the theoretical foundations of contemporary early childhood education practices in Aotearoa New Zealand.

Kaitiakitanga and Early Childhood Education

Te Whāriki is the New Zealand Ministry of Education's early childhood curriculum policy

statement. Te Whāriki: He Whāriki Matauranga mo ngā Mokopuna o Aotearoa/Early Childhood Curriculum (Ministry of Education 1996) is a bicultural, socioculturally conceived curriculum document, written in English and Māori, founded on the aspiration that children “grow up as competent and confident learners and communicators, healthy in mind, body and spirit, secure in their sense of belonging and in the knowledge that they make a valued contribution to society” (p. 9). Te Whāriki translates to “a woven mat” that allows for diverse patterning depending on knowledge bases, beliefs, and values which all may stand upon. Accordingly, “. . .the whāriki concept recognises the diversity of early childhood education in New Zealand. Different programmes, philosophies, structures and environments will contribute to the distinctive patterns of the whāriki” (p. 11).

One of the strands of Te Whāriki, exploration, incorporates the view of the child as an explorer who learns through active exploration of the environment. A number of general goals highlight the importance of respect for the natural environment for all New Zealand children. These include the goal that young children develop:

- A relationship with the natural environment and a knowledge of their own place in the environment
- Respect and a developing sense of responsibility for the well-being of both the living and the nonliving environment
- Working theories about the living world and knowledge of how to care for it (Ministry of Education 1996, p. 90)

The Māori text of Te Whāriki provides more specific, historical, and cultural imperatives in order for young children to develop understandings and make meaningful connections and contributions to the natural world. Mana Aotūroa, the Māori interpretation of exploration, relates to children exploring and seeking knowledge and understandings of their world and their relationships to it. Mana at a basic level can be translated as “authority, control, influence, prestige, power, psychic force, effectual, binding, authoritative

. . . and take effect” (Hemara 2000, p. 68). Aotūroa translates to “light of day” or “this world.” Mana Aotūroa in the context of the curriculum statement refers to metaphysical or intellectual journeys of self-discovery about the world and one’s place in it. Mana Aotūroa highlights teacher’s responsibilities of kaitiakitanga for the natural environment and reflects Māori perceptions of the natural environment, as taonga to be nurtured and preserved. Mana Aotūroa connects the young child to the natural world and everything in it.

The child learns his/her similarities and differences with the natural world. The child is able to see the depth and breadth of the gifts of the world, the trees, the animals, the food, the fish, the stars in the sky, the gifts of creativity. The child’s develops understandings of the shape of the land, the world and people.

The child understands that all living things have a spiritual element. From these understandings the child is familiar with Ranginui (sky father), Papatūānuku (earth mother) and their children. The child develops warmth and compassion for Papatūānuku and works to nurture the land. The child learns about the environment through listening, seeing, hearing, smelling, touching, seeing, and from the heart.

Teachers and families should: research the gifts of the environment, the natural world, utilising the the knowledge of the ancestors and others; develop understandings of the complex nature of Papatūānuku, Ranginui and their children; develop understandings that aspects the world are within the person; develop understandings around the negative effects of pollution on the environment; develop understandings of the signs of when to plant food, when to catch fish to ensure a sustainable sea food resource; develop understandings of the appearance of the insects, birds, stars and fish. In this way the child is strengthened to learn.

(Interpretation of Māori Text – Ministry of Education 1996, p. 37)

While acknowledging the English version of Te Whāriki offers a starting place for the development of connectivity to and understandings of the environment and the natural world, a more purposeful and coherent approach is required for young children and the future well-being of the natural environment. The Māori text of Te Whāriki highlights the critical place of kaitiakitanga in ensuring a sustainable and healthy environment and offers a coherent and sustainable approach to implementation.

Indigenous cultural beliefs are often found to be a key factor in apparent long-term sustainable use of resources by many groups around the world. This is especially pertinent to maintaining the health and resilience of environments and the relevance of integrated human-nature concepts. Cultural diversity is related to biodiversity, and both are important for improving the sustainability of the world's ecological systems (Berkes and Folkes 1994).

Kakala

Konai H. Thaman

The University of the South Pacific, Laucala, Fiji

Introduction

In a book entitled, *Education in Australia, New Zealand and the Pacific* (Crossley et al. 2014), The author outline some of the educational problems facing many of the island nations of Oceania and the need for Pacific people to reclaim their education by making the school and university

curricula more relevant and meaningful for learners through incorporating elements of Pacific indigenous and local knowledge skills and values. In the Pacific region, Kakala is a research framework that is sourced from Tongan culture and is being used by researchers as well as graduate students (see Johansson-Fua 2006; Toluta'u 2015).

The movement to better contextualize Pacific research is the result of critical reflection by a number of Pacific researchers and educators upon what has been happening in our region in the name of educational reforms that began in earnest almost 40 years ago. The fact is that in the culturally and linguistically diverse region we call Oceania, there are hundreds of indigenous communities who have their own unique ways of knowing and understanding the world, dating back thousands of years. Those of us who continue to live and are involved in education in Oceania have come to the realization that the best way to address educational challenges of our region is to try and create (alternative) approaches to teaching and research by bringing together the best of Western and Pacific values and ways of knowing and working together in order to better contextualize our work in education in general and in research in particular. The continuing underachievement of many Pacific students at university among other things has also contributed to a more diligent questioning of the value assumptions upon which Pacific school and university education continue to be based. What it was found was that formal education's claim of cultural neutrality is at best naïve and at worst arrogant. The authors also believe that the core values of our various Pacific indigenous communities need to be identified and underpin our education systems in order for more children to learn about their responsibilities to themselves as well as their communities and countries.

The *Rethinking Pacific Education Initiative* (RPEI), established in 2001, is a movement of Pacific educators and researchers who were concerned about the deteriorating quality of education in most of the small islands of Oceania despite heavy investment in educational reforms

by many foreign donors (now known as development partners), including New Zealand and Australia. The Kakala Research Framework (KRF) was borne out of an attempt by Pacific scholars and researchers to contextualize the dominant research paradigms advocated by higher education institutions that the authors attended, in order to make research more culturally democratic and relevant to the needs of Pacific peoples. First described by Thaman (1992) as a philosophy of teaching and learning, Kakala, the research framework, is closely associated with Pacific research, defined for the purposes of this entry, as research that is informed by and embedded within Pacific Knowledge Systems (worldviews, knowledges, practices, and beliefs), involves the active participation of Pacific people, and is relevant and responsive to their needs (see Nabobo-Baba 2006; Taufe'ulungaki 2007). The term Pacific will be used here to denote different Pacific cultural communities who share common values, knowledges, and principles.

Pacific Research Ethics and Protocols

As well as acknowledging and valuing Pacific Knowledge Systems and worldviews, Taufe'ulungaki identifies a number of ethical principles which would help guide Pacific research and researchers as well as provide a foundation for understanding and conducting research activities that engage Pacific peoples and communities. These principles include: relationships, respect, cultural competence, meaningful engagement, reciprocity, usefulness, collective and individual rights, balance, protection, capacity building, and participation (Taufe'ulungaki 2007).

By the mid-1990s, the Pacific research movement had become stronger as more Maori and Pacific Island people found alternative ways with which to engage Pacific communities to deal with serious educational and health issues. Two events in 1996 are important to me personally because they provided opportunities to share my views about education and research with a wider audience. The first was a keynote address, "Reclaiming an education," presented at a

national symposium on Pacific learning in Auckland, New Zealand, organized by the Education and Training Support Agency (ETSA) where the author argued for more culturally democratic learning environments for Pacific students in schools and universities. In the same year, the author was honored by the Polynesian Society of New Zealand with the award of the Rusiate Nayacakalou medal for contribution to Pacific studies. The author again shared ideas about Pacific education in a paper, "Towards a Pacific concept of education for cultural development," and described my philosophy of teaching and research – Kakala – with the society.

More opportunities emerged for sharing Kakala with students outside the Pacific Island region, including teaching a paper on culture and education for the MEd cohort at the University of Auckland in 2000. The course included, among other things, a discussion on alternative Pacific research frameworks and methodologies including Kakala. It was heartening to see a growing interest among Pacific postgraduate students not only in obtaining higher degrees but also developing and using Pacific research frameworks and methodologies. Since then, the author has examined numerous masters' and doctoral theses written by Maori and Pacific university students, using distinctively Maori and/or Pacific research frameworks and methodologies.

The Kakala Metaphor

In fashioning *kakala*, the author draws from both Western and Pacific epistemologies. Kakala, in Tongan culture, refers to a garland or a collection of fragrant flowers and leaves, required for the making of a garland. Many of these flowers are ranked according to their importance, which is often reflected in the finished product, the *kakala*. Three processes are central to the making of a *kakala*: *toli*, *tui*, and *luva*. *Toli* is the gathering of the material needed for making a *kakala* such as different types of flowers, leaves, etc. This process requires knowledge of and experience in picking/gathering the appropriate materials at the right time and the right place and storing them in a

cool and safe place in order to ensure freshness until the *kakala* is ready to be made. For example, the highest-ranked flower in Tonga is the *heilala* (*Garcinia sessilis*) often referred to as the royal flower. There is mythology associated with *heilala* unlike more recently introduced flowers such as the rose or the frangipani. A *kakala* with *heilala* in it is regarded more important than one without.

Tui refers to the actual making of a *kakala*. This too requires special knowledge and skills in making different types of *kakala*, which would depend on the occasion and/or the one who is meant to wear the garland or *kakala*. The *heilala*, for example, is a chiefly flower (*kakala hingoa*) and is often placed on top of the garland, while others that are less chiefly or more common (*kakala vale*) play supportive roles and are placed underneath the more important ones. However, the combined effect of all of the *kakala* ingredients is of paramount importance because it makes a *kakala* complete and appropriate for the next step, *luva*.

Luva, the third aspect of *kakala*, is the gifting or giving away or presentation of a *kakala* to someone else. In my culture, a *kakala* is always meant to be given away as a symbol of two Tongan core values, namely, '*ofa* (compassion) and *faka'apa'apa* (respect)'. For the author, *kakala* has been a useful and culturally meaningful philosophy and framework: It ensures cultural inclusivity and provides for ownership of the process as well as the product, whether we are talking about teaching, curriculum development, or research.

Kakala Research Framework (KRF)

The need for Pacific researchers and scholars to develop, use, enhance, and critique Pacific research frameworks in order to test their relevance and appropriateness cannot be over-emphasized. Toward such ideals, Kakala has been critiqued and used by Tongan and other researchers in the last decade or so. An enhanced and more robust version of Kakala was developed out of self-reflection and critique by colleagues. An enhanced version of Kakala was developed by Taufe'ulungaki and Johansson-Fua (2005), when

planning for a research project, known as Sustainable Livelihood and Education Project (SLEP). They added two new steps to the original Kakala Framework comprising of “*teu*” (to precede *toli*) and *mālie*/*māfana* (at the end after *luva*). *Teu* literally means to prepare for something, a time for conceptualizing, designing, and planning for the work ahead (Johansson-Fua 2014, p. 53). *Mālie* and *māfana* (after Manu’atu 2001) are important after *luva*, to address concerns about monitoring and evaluation and create a better *kakala* the next time around. These additions have made the KRF more robust and may be seen as a self-improving kind of framework.

The KRF as we know it today therefore consists of five steps: *teu*, *toli*, *tui*, *luva*, and *mālie*/*māfana*. *Teu* literally means to prepare for an event or a type of work. In this stage, questions are asked about what type of research that is needed; who is doing the research and why; what is the source of conceptualization; and what is going to happen to the results of the research.

Toli, the gathering and choosing of flowers and other materials for a *kakala*, symbolizes data gathering, a critical stage for research as field researchers would need to know the contexts in which data is to be gathered together with the required (ethical) behavior in order to collect data that is relevant for the research study. During this stage, the Tongan research tools of *nofo* and *talanoa* are further developed and used.

Tui is used to refer to data analysis. Just as in making a garland (*kakala*), flowers are used to provide important motifs or patterns, so in research analysis, patterns, variations, and similarities are often sought from the data gathered. In *tui*, changes and corrections may be done and additional flowers may be sought. The research analysis process is one of negotiation and readjusting of original plans depending on the information received. Questions asked include: Does the information make sense? What is the context behind the context? Where is the solution/answer? Are emerging solutions meaningful or sustainable for addressing the problems?

Luva is the gifting or giving away of a *kakala* underpinned with ‘*ofa*’ (compassion) and

faka’apa’apa (respect). As a research framework, *luva* refers to the reporting and dissemination of the research results which may be gifted back to the people and communities that provided the knowledge in the first place. This is because of a belief that the results of the research must benefit the people who are participants in the study. The reporting needs to be done with care, compassion, and respect for those whose knowledge has enabled the study to be successfully completed and the results useful to the people concerned.

Mālie and *māfana* were first described by Manu’atu (2001) and are the final stages of the KRF. The two concepts are sourced from Tongan dance where *mālie* refers to the overall quality of the dance and the skillfulness of the performer. An audience would commonly call out “*mālie*” during and after a dance, so as to show their appreciation of the performance and provide encouragement and support for the performer(s). For a dance to be “*mālie*,” the music, costume, and performance of the dancer need to be interwoven in a way that successfully tell the story behind the lyrics which contain the poetry that is being danced. According to Johansson-Fua, *luva* is like a stage for evaluating the whole research and questions such as the following are often asked: Was it useful? Was it worthwhile? Who was it useful for and who benefitted from the research process and products? Was it meaningful for the participants and did it serve the needs of the community? The evaluation process occurs throughout the life of the research study as researchers continuously monitor their activities beginning with the conceptualization, data collection, and analysis in order to ensure the achievement of the key ideas of usefulness, applicability, and relevance of the research (Johansson-Fua 2014, p. 55).

The notion of *māfana* (a warm feeling), on the other hand, refers to an emotional response among the audience, to the dance performance and performer. In Tonga, one of the indicators of *māfana* is when people get up and join the dancer and/or gift her with money or goods such as pieces of cloth, a *ngatu* (tapa cloth) or prized mats. This is a time of joy and happiness, exemplifying important connections between and among people

motivated by a special performance. *Māfana* is said to be the final evaluation of the research as well as the KRF itself against the achievement of transformation, application, and sustainability. As Johansson-Fua suggests, it is the stage when the researcher and knowledge giver are transformed and in their transformation create a solution for, or a new understanding of the problem, a stage that is empowering because it provides ownership of the research processes and products. Important questions that are often asked at this stage include: Were the outputs practical and sustainable? Were the participants transformed and empowered to make changes? What was the impact of the research process on the researchers as well as all those involved in the research (Johansson-Fua 2014, p. 56)?

Research Tools Associated with KRF

In Tonga, the use of the KRF is commonly associated with the use of Tongan research methods of gathering data, namely, *talanoa* and *nofo*. Some Pacific researchers have written extensively about *talanoa* and its usefulness as a research tool (see Vaioleti 2010 and Latu 2011). A pan-Polynesian term and concept, *talanoa*, is a conversation where ideas are shared between or among people and a popular tool with many researchers in the past decade or so. *Talanoa* may be formal as when a chief is talking to his/her people or informal as when people get together for a chat over tea, coffee, or wine. Johansson-Fua suggests that when used in conjunction with the KRF, several features emerged, including that of a good tool for qualitative research, operating from a constructivist perspective where knowledge is socially constructed during the *talanoa* process. It is also good for data collection and analysis as it requires participants to muse, reflect upon, talk about, critique, argue, confirm, and express their conceptualizations of cert in phenomena, in accordance with their beliefs and values.

Nofo (to stay) compliments *talanoa* in the sense that researchers actually stay and observe the activities of the participants – including how they live and interact with one another. The

researcher becomes part of the community of knowledge providers, as it were, and freely interacts with the people around her. The actual time spent would vary with the nature of the research problem and the time available to the researchers. *Nofo* is similar to what is usually expected in ethnographic research.

According to Johansson-Fua, a user and advocate of the KR, several features are made obvious when *nofo* is used as a research tool:

- (i) The researcher is engaged in observation and participant observation and, through *talanoa*, is emerged in the research context.
- (ii) The flexibility of *nofo* is such that it can be carried out in a community/village, school, or workplace.
- (iii) It can be done continuously in one place for a period of time or a series of sessions spread over time.
- (iv) *Nofo* often provides additional information to that obtained through *talanoa*, thus enabling the researcher to establish the validity of information from *talanoa* sessions.
- (v) Combined with *talanoa*, the data collected is rich and descriptive, and data saturation is reached quickly in the fieldwork allowing the researcher to have an immediate understanding of the research context through analyzing the participants' experiences.

Nofo however is often a challenge to the field researcher because it is demanding and time-consuming. Despite this, since its pilot in Tonga in 2005, *nofo* has been used in Fiji, Samoa, Marshall Islands, and Nauru by other Pacific researchers (Johansson-Fua 2014, p. 57).

Advantages of the KRF

Although the KRF has been used by some researchers, it was not until 2005 that the revised KRF was used in a joint NZAID/IOE research project on Sustainable Livelihood and Education Project (SLEP) in Tonga. According to the researchers, who were Tongan and used the Tongan language in all aspects of the research, the

following were notable advantages of the use of the KRF:

Data obtained was rich, informative, and robust.

Researchers reported a broader, more fluid, and less structured way of conceptualizing sustainable livelihoods than is commonly assumed in ESD literature.

The importance of human relationships as markers of identity and sustainable development was easy to demonstrate as the design of the Tongan study involved nurturing the relationships among scholars and researchers who were related in both cultural and professional contexts.

The research was conducted using the Tongan language.

The information about sustainable livelihood obtained from SLEP provided an authentic contribution to the global literature on ESD (Johansson-Fua 2006).

Conclusion

Doing anything differently often always has its challenges. In relation to the further development and use of Pacific research frameworks including Kakala, there are still serious challenges including institutional indifference, lack of institutional support, lack of critical examination of the (frame) works developed so far, and lack of advocacy by Pacific people themselves and of Pacific knowledge and value systems as legitimate systems for study and research in the formal sector, including in the academy. Consequently, there continues to be a need to assist more Pacific students to theorize and reclaim their education as a prerequisite to developing personal philosophies of teaching, learning, and research.

The author continue to advocate for the incorporation of Pacific cultural knowledge and values in formal education from preschool to university, based on my belief that intercultural understanding is predicated upon our understanding of our own cultures first. The author also believe that teaching about and studying Pacific cultures is an important activity in itself. Reimagining and

rethinking my own work have helped me to move from protesting the dominating and dominant paradigms to creating something that is more culturally inclusive of my students by drawing from the rich oral literatures of the Pacific as well as the written texts of world writers and thinkers.

Some of these challenges seem particularly insurmountable today given the intensity of the recent revolution created by new ICTs that seems to be causing havoc to social relationships, as well as social institutions such as the family, workplaces, and school. However, Pacific people are using new ICTs to stay connected to one another as evident in the numerous personal and community websites on the World Wide Web. In the context of globalization and the dominance of the imperative of the marketplace in education systems, especially higher education, perhaps the time is now right for Pacific scholars to more seriously work toward the decolonizing agenda in Pacific education in general and in research in particular.

Introduction

Friedrich Wilhelm August Froebel (1782–1852) introduced the term Kindergarten in 1840. The educational institution of Froebel’s design was to

promote family, nation, and mankind, by “encouraging the child’s impulse to activity, investigation and creative work. It will be an institution where children instruct and educate themselves and where they develop and integrate all their abilities through play, which is creative self-activity and spontaneous self-instruction” (Froebel 1967d, p. 92). This project began in 1816 with the establishment of the Universal German Educational Institution – a first experimental school and the intended beginning of a network of institutions. He then focused in on the early years as critical to the success of the whole system (Lilley 1967).

The Crystallization of Experience

It is true that we now seldom see the unspoiled original state, especially in human beings. For that very reason it is all the more necessary to assume it until it has been clearly proved that it does not exist. Otherwise there is the danger that, where it is still to be found, it will only too easily be destroyed. (Froebel 1967d, pp. 52–53)

Lilley (1967) identifies Froebel’s German Romantic influences in Fichte’s philosophy, Hegel’s method, the Naturphilosophie of Schelling, the mysticism of Boehme, and the pedagogy of Pestalozzi. Having spent time with Pestalozzi at Yverdon, he developed a critique of what he considered to be an excessive and unsophisticated empirical approach to education, arguing that education is “the treatment of man as a creature who is developing awareness and understanding of himself” (Froebel 1967d, p. 49). Education is education when the learner learns about their purpose. This wisdom is evident in our ability to educate ourselves (Froebel 1967d). Through his belief in unity, he regards the realization of self as becoming a proper part of the whole.

In answering the question, “What is the purpose of education?” I relied at that time upon the following observations: Man lives in a world of objects, which influence him, and which he desires to influence; therefore he ought to know these objects in their nature, in their conditions, and in their relation with each other and with mankind. (Froebel 1886, p. 69)

In his writings, Froebel claimed that one can observe in childhood the source of all life

experience (Froebel 1887). He recognized his own childhood as the source of this idea. For instance, he regards his mother's death, when he was 9 months old, as the critical event that shaped his life (Froebel 1967a).

Unfortunately, throughout his life, man rarely shakes off the impressions absorbed in his childhood just because his whole being is opened like a great eye and he is wholly surrendered to them. In later life a person's hardest struggles with himself and his most serious setbacks are often grounded in this phase of his growth, and for this reason the care of the infant child is so important. (Froebel 1967d, p. 61)

He wrote that he was poorly prepared for education because of his life experiences, and that his personality was not well suited to contemporary methods of educating the child (Froebel 1967a). For instance, he opposed the limiting of instruction to the passing on of facts and explanations. His early years of occupation are characterized as an "apprenticeship to Nature" (Lilley 1967, p. 6) when, working for a forester, he was given freedom to explore his surroundings. Intent on expanding his knowledge of the Natural world, he attended Jena University, Göttingen, and then Berlin where he was employed as an assistant in the study of crystals at the University of Berlin's mineralogical museum. The study of crystals and their formation revealed the connection between nature and human activity (Froebel 1967a).

Self and Society

Froebel (1967a, p. 33) explained his life as a dedication to "unceasing self-contemplation, self-analysis and self-education." Man is called by nature to search for the "art of living" (Froebel 1967c, p. 44) but does not know how to begin this search. Froebel took his task as being the revealing of the beginning of the path. The clearing of the way is, for Froebel, education.

Education as developing self-consciousness is begun through observing nature's qualities. He focuses on the role of the senses in the early years, because through the senses we come to understand the properties of nature, but then must use this knowledge to transform the self, to

reconnect with nature. Children need to see their family's dedication to God at the earliest possible time and to be a part of that duty and dedication. The child then observes the social world. Like nature, the trades and occupations are also critical to the child's learning.

It is impossible to show all that a child gains by taking part in his parent's daily work. It would be even more advantageous if parents would make more use of this association for the instruction of their children later on. (Froebel 1967d, p. 88)

Observations of the child's physical growth led Froebel to suggest that this should not be inhibited so that she might develop her senses, her knowledge of herself, and of her surroundings. He emphasizes the importance of light, warmth, and fresh air, allowing children to develop according to the laws of Nature (Froebel 1967d). He seeks to highlight the value of all of the child's behaviors, drawing adult attention to recognize evidence of the child's learning about the world and herself through initial sensory exploration, expressions, and use of language, and on to the ways in which the child plays.

The Organization of Play

Based on a view that childhood is the critical phase of human development, Froebel proposed play as the vocation of the child that connects the child to world. He observed: "Why is it that all childhood is unaware of its great riches, which are lost before they can be appreciated?" (Froebel 1967a, p. 37). Play is evidence of the child's innate urge to understand both the world and her own self (Froebel 1967d). Through self-directed play the child becomes aware of the world's properties, leading to an awareness of those properties in her. The role of the adult is then to constrain any urge to burden the child with lessons and objects. The adult observes and offers language to the child for understanding her play in the world (Froebel 1967d).

Froebel developed a set of gifts and occupations to reflect and build upon the stages and patterns of child development. He organized activities into increasingly complex play:

The goal of the gifts was not simply to train and organize the mind but to make the “form or law of mind” the principle of its training and organization. And in the course of such training material objects were transformed into “spiritual” things with moral import. (Cavallo 1976, p. 150).

The gifts are organized and introduced in a sequence from balls to globes, cubes, and cylinders, and then building blocks, with the sphere as the basic and essential symbolic structure. Symbols have a self-educational function, “symbolic statements of the growing consciousness which . . . the child had of the nature of the universe” (Lilley 1967, p. 32) and “metaphysical truths and designs intuitively comprehensible to the child” (Cavallo 1976, p. 150). The sphere is symbolic of unity and perfection or completion. “In their spherical constitution all things remain in connect; they each possess their own centre point, and so retain the capacity for re-union in their essential being with the absolute centre of all” (Lilley 1967, p. 14). We can take as a central concern for Froebel that around him there was a false division of life, a failure to realize and celebrate and to come into being with unity of the world (Froebel 1967a).

Structure is of critical importance to Froebel and so he looks to determine that which is constant in development, the “thread in the labyrinth of living shapes” (Lilley 1967, p. 11). He was convinced of the simplicity of this thread, a unifying pattern, through which beings are naturally equipped.

Stages and Systems

The task of education is to preserve the connection of the child to nature and to support the child’s progress through transformative developmental stages of awareness and relationship. These developmental stages are imbued with a holistic interconnection between the gift, the child’s play, their developing language, sense of self, understanding of the world and the properties of things in it, and their cognition. These different elements of the curriculum reveal the interconnections and purposes of life (Froebel 1912) and are manifestations of a unified pattern, so carefully designed to emphasize this patterned unity.

He warns, however, that the stages of development are not hierarchical (Froebel 1967d). Froebel rejects age as a marker of stage, preferring indications of “intellectual, emotional and physical needs” (Froebel 1967d, p. 64) being satisfied. His views of stages of development were that they were not distinct but rather blended, and this blending is important because of the importance of reflection on each stage. When a child is ready to transition from a developmental stage, she begins to reflect on her experiences to understand them *as* a stage. For instance, the point at which she reflects on her childhood years is the point at which she transitions, with the wise guidance of an adult, into a new phase of development.

He began developing a networked system of educational institutions that would appeal to the German parent and would equip them with an understanding of their roles as mother and father in supporting the child’s developmental progress. The mother, in the protective space of the home, creates in the child a passion for exploring the world, which the father then furnishes through his wider knowledge and contacts. “He called on German women to join in setting up local Kindergartens, and on German men to found educational unions which would start the urgent task of improving infant education as a *preliminary to general reform*” (Lilley 1967, italics in original, p. 22).

In his instructions to parents and kindergartners Froebel told them to be aware of their own life from its early stages, to search into the child’s life so as to establish its present phase of development and its requirements, and to examine the child’s environment in order to see how far it meets his needs. (Lilley 1967, p. 24)

He advised that a proper educational relationship is one in which the teacher and pupil share their journey (Froebel 1967a). Whatever might happen as a result of the teacher and student relationship, the ways in which their interconnection leads is an important message to the educator to be noted; it is the natural unfolding of what should be.

He criticized a behavioral approach to education, arguing that assumptions about the causes and effects of a child’s behavior are often

misunderstood and that these misconceptions inhibit education (Froebel 1967d).

It is difficult for an observer to pronounce with any truth or certainty on the situations which produce and condition a child's behaviour. Therefore a man needs to have the particular details of his remarks and conduct during childhood preserved so that later on he can analyse his experiences and find in himself traces of the causes of early childhood behaviour. (Froebel 1967d, p. 79)

Froebel (1967d) argued that not only the teacher but education in its essence should not prescribe or inhibit the child's learning, but rather create the safe space for nature to take its course. However the educator needs training in order to be this kind of spiritual guide.

While campaigning for a national system of kindergartens, he began training "kindergarteners." Lilley (1967) notes that Froebel had already attracted advocates of his philosophy, and many active kindergarteners became responsible for promoting his work worldwide. In particular, Baroness von Marenholtz-Bülow visited Froebel's institutions, kept a biographical account of his later years, and advocated his work (Lilley 1967). The influence of the Kindergarten Movement is largely attributed to the kindergarteners who ensured a series of ideas would be sustained in practice (Cavallo 1976).

A Movement Abroad

While his work gained little purchase in Germany, his followers took the Kindergarten Movement to England and America where, by the twentieth century, it was influencing public systems. In England, a Froebel Society was set up in 1874 and was involved in the training of teachers and reform of the public education system (Lilley 1967). State schools were using his activities by the turn of the twentieth century, yet with little, and decreasing, attention to the underpinning idealism.

In America, Froebel's principles were taken up by Elizabeth Peabody, Bronson Alcott, William T. Harris, and Susan Blow (Cavallo 1976). Idealists focused on the development of morality in the child, holding that societal wellbeing is established through individual development

(Cavallo 1976). They looked to limit external regulation of the child's moral compass. Education, rather than adding to external influences, should remove these distractions so that the child could look within herself for the proper moral pathway.

In the kindergarten crude materialism, unrestrained individualism, ruthless ambition, and cold-blooded competitiveness would be nipped in the bud by the "motherly" virtues of love, compassion, and cooperation instilled into the child by female kindergartners. (Cavallo 1976, pp. 148–149)

Towards the end of the nineteenth century, a new generation of kindergarten educationalists began questioning the idealists and challenging the spiritual core of the movement. Criticism was aimed at both his apparent mysticism, scholarship, and method. His idealism was contested on the grounds of a lack of philosophical and theoretical coherence (Lilley 1967). Lilley (1967) comments that Froebel did not attempt to enculturate himself in the philosophical and scientific thinking of the time but rather took fragments and strands of thought that appealed to his sense of purpose. According to Lilley (1967) his work did not appeal to a wide audience; his ideas were too radical and so what survived is predominantly a selection of technical and pedagogical ideas without the deeper ideological essence and purpose.

The Age of Behavior

Led notably by G Stanley Hall, John Dewey, and Edward Thorndike, pragmatism and progressivism became the key drivers and the focus shifted to the ways in which the child would be best prepared, rather than rescued, from the new world (Cavallo 1976; Lilley 1967). The movement turned, in contradiction to the work of Froebel, to the Behaviorist theories of Hall and Thorndike. Hall advocated for a connection between physical activity and social responsibility believing that the child would be conditioned through exercise into understanding her role in society. The work of Thorndike pushed the Movement further still from Froebel's intents, regarding

the child as requiring repetitive behavioral intervention.

Cavallo (1976) suggests that a shift to Behaviorism, along with biology, provided the impetus for assimilation of kindergarten's techniques in the public system at the turn of the twentieth century. The curriculum was designed around moral "projects" that "made behavior – the physical act – the sole dimension of the child's moral experience. In the conduct curriculum morality was meaningless outside the context of a shared, group directed, problem solving experience" (Cavallo 1976, p. 159). The progressive reform of society was not resistant to but enabling of industrialization through an interest in increasingly efficient ways to educate children for their society (Cuban 1992). Cuban summarizes:

Begun in the glow of the Progressive urban reform, late nineteenth century kindergartens sought to rescue ignorant children and their parents from poverty and ignorance and bring them into full-fledged citizenship. . . . As decades passed and kindergartens became a regular feature of public schools, pressure rose and fell to get five-year-olds academically ready for the first grade, to ease their transition from play to expression to academic work, and to compress the time taken to transform irrepressible five-year-olds into obedient students (Cuban 1992, p. 173).

Knowledge, Violence, and Education

Ilan Gur-Ze'ev
 University of Haifa, Haifa, Israel

Knowledge is inseparable from processes of its production, reproduction, representation, distribution, reception, and realization. At the same time, it also should not be disconnected from the question of the legitimization of its truth-value.

The control of knowledge, its legitimization, its representation, and its distribution, determines

Ilan Gur-Ze'ev is deceased.

the constitution of normalizing education. The inner goal of any education is normalization of the subject in the service of reproducing the hegemonic sociocultural order and its realm of self-evidence. Within this setting, the legitimization of knowledge as well as the marginalization of knowledge of the other and her legitimization apparatuses is preconditions for social control, economic productivity, and well-protected cultural borders. Traditionally, the protection of these borders was entrusted to educators, teachers, intellectuals, and administrators, who were expected to demarcate and preserve culture from nature, true from false, moral from immoral, nice from nasty, and good from evil.

The protection of the wall of (worthy, true, and legitimate) knowledge is a precondition for social control and cultural productivity and for the prevention of essential change in hegemonic knowledge. It reflects concrete powers, operating in specific historical moments and contexts. With the historical development of certain social power relations on the one hand and of specific symbolic settings on the other, knowledge is changed and transformed. With its transformation, the ways of its legitimization, representation, distribution, and consumption are transformed, too, and the gates are opened for new human possibilities.

Since knowledge relates to the world, to the human subject, and to the knowledge about knowledge, strong linkage exists among changes in the image of knowledge, the stability of the body of knowledge, and the creation of new human possibilities. All these reflect how changes in the image and content of knowledge transform reality, as well as reflecting social changes in undetermined and ever-changing combinations, degrees, and ways. Even the acknowledged borders between fact and interpretation, interpreter and interpretation, are in constant rearticulation and change.

The control of the legitimization, production, representation, and distribution of knowledge makes possible the reduction of the human subject into a "subject" who will function as an object or an agent of "her" system. In this sense, control of knowledge allows much more than the

possibilities of policing social behavior: it provides the means for establishing an unchallenged legitimization for a certain hegemonic version of the production of the "subject," the normalized subject, her possibilities, and limitations. Such control is usually called "education."

Normalized education constitutes and commands the "subject" on four levels: (1) control of the psychic constitution of the "subject," her psychological possibilities, and strivings, as well as the limits of controlling and changing their borders; (2) control of the conceptual apparatus and associations and their integration with the psychic level and its presence on the conceptual level; (3) control of the collective and private self-conscious; and (4) control of the function of the "subject" in "her" reality and the minimization of the possibilities for change in the representation of reality that normalizing education reflects and serves.

In this respect, it is wrong to articulate the Nietzschean question: are there facts about reality or only interpretations (Nietzsche 1968, p. 267)? It is equally wrong to separate controlling knowledge from guarding the walls that protects the (changing) limits of knowledge about deciphering the apparatuses of constituting reality and controlling its representations. This preordained control that normalizing education is posted to guard is to be understood historically and contextually. It is in constant evolution, subject to struggles between conflicting interests and social powers, and influenced by the threatening, actual or expected invasion of new conceptual and psychic possibilities. These are always positioned within changing horizons of a spirit that is determined to prevent the challenges of its external and internal rivals. When a new spirit chances to burst into the relatively protected realm of self-evidence, a new setting and power relations become reality, new ways for control of knowledge are established, and new horizons are opened for education and counter-education. These new horizons incubate new possibilities for the constitution of the "subject" and the representation of reality and its legitimization apparatus (viz., for education as oppression). By the same token, however, it also presents possibilities for cracking the system, for

struggling over the potential autonomy of the subject, for the Utopia of self-constitution, and for life as living prayer, as art of interpretation and responsibility for the otherness of the other and the not yet. Normalizing education, which is committed to prevent this Utopian struggle, is also committed to camouflaging the apparatuses of the control of knowledge, and it hides the systematic attempts to eliminate possibilities of challenging the hegemonic version of the production of knowledge and the normalized “subject.” As such, hegemonic knowledge is committed to preventing what Walter Benjamin called “the messianic moment,” as opposed to “now time” (Benjamin 1972, p. 701) in which “the totally other” than historically legitimate knowledge bursts into the system and challenges the established realm of self-evidence.

Within the Marxist tradition, the issue of the relation between knowledge and power is elaborated in the context of the relations between the economic “base” and the “superstructure” which the hegemonic ideology reflects and serves. Within this tradition, ideology, or false conscience, provides and legitimizes means for controlling the conscious and the performance of people in relation to their class, ethnicity, race, nationality, gender, and sexual preferences. Ideologies of the hegemonic as well as the marginalized collectives affect the ways they conceive and articulate their others, their identity, and their positioning and repositioning. Hegemonic education cannot become neutral, apolitical, or indifferent to ideology, because its central aims are reproduction of the present order and camouflaging the violence of normalizing education relations between interests and the material “base” and knowledge. The naturalization of the violence of normalizing education veils oppression and presents the knowledge, standards, aims, and prepositions of the hegemony as legitimate or self-evident. As such, hegemonic knowledge alienates human beings from their world and domesticated human beings from their (abandoned) otherness, them from their Others, and current reality from possible other, more humane, realities. According to Karl Marx, this relation is not ontological. It only reflects a certain

historical moment in the material production (which includes the production of knowledge). Marx conceives this stage as prehistory. For some Marxists, such as Herbert Marcuse, this alienation leads to a possible historical stage in which the human condition will be transformed. After this tiger jump, there will be no more alienation between reason and reality and work and play, and life will become a living art (Marcuse 1967, p. 864). From the Marxian point of view at this stage, knowledge will cease to be a manifestation of power (in the form of class struggles and alienated work) and will become a manifestation of human reason, freedom, equality, and solidarity, as genuine human emancipated potentials. Until that stage, the quest for true knowledge can appear only as critique of ideology and as the negation of the reality which hegemonic knowledge represents and serves (Horkheimer 1974, p. 27). In different versions, this critical conception of knowledge is present in Western philosophy all the way from Plato to St. Augustine, Marx, Marcuse, and Freire.

A different conception of the relation between knowledge and power is developed within today’s postmodernism. For Michel Foucault, knowledge is one of the manifestations of the presence of power (Foucault 1979, p. 27), which also produces the subjects that will enhance it, change it, and resist it – as one of its manifestations Foucault 1995, p. 210). However, for Foucault, as for Richard Rorty, Jean-Francois Lyotard, and other “soft” postmodernists, the gate is open for human resistance and for struggle against the oppressive uses of knowledge. From Friedrich Nietzsche to Andre Beteille, however, “hard” postmodernists have seen the human subject and her striving for knowledge as a mere relation in linguistic settings or as a manifestation of meaningless, aimless power which is also responsible for possible “resistance” attempts and Utopian quests for transcendence, authenticity, or truth. Yet “hard” and “soft” postmodernists are united against positivistic- and functionalistic-oriented conceptions of knowledge (that look for the facts or the efficient manipulation of facts). By the same token, it also targets what it conceives as the arrogance, naivete, and violence of critical conceptions of knowledge that

combine their critique of hegemonic knowledge with a transcendental dimension: the struggle for “genuine” critique and for human emancipation and demystification of knowledge. The quest for “true knowledge” is irredeemable. Human contingency and the impossibility of reflection, transcendence, and dialogue are conceived, as an ontological must. Within the postmodern discourse, it is normally no less dogmatically presented than those dogmatic and naive presentations that it deconstructs and attempts to replace. However, some postmodernists present their conception of knowledge as a mere rhetorical gesture. Nevertheless within this tradition, there is no longer room for traditional binaric divisions such as true-false, nice-nasty, virtuous-evil, and emancipation-oppression. Within such a cultural setting, there is no room for the quest for emancipation, elevating learning, resistance, and transcendence. Normalizing education cannot be challenged when there is only room for change – not for advancement or emancipation and for a different gaze or representation – not for reflection and critical dialogue. Within such a postmodern setting, there is no room for the promise of the humanist and critical tradition. From a coherent postmodern perspective, only naivete can today offer to resist the hegemonic social powers and to allow a more humane context: that of a critical dialogue which opens new possibilities for the self-constitution of each of its participants.

From the perspective of counter-education, the stance of knowledge is in permanent historical change. With it, it also changes human possibilities for resistance as “subjects” within the system and as part of it on the one hand and the possibilities for struggling for emancipation from functioning as “subjects” and becoming subjects who transcend normalizing education on the other. Technological progress and changes in capitalist production as well as in social organization emphasize the relevance of instrumental knowledge.

In postmodern arenas, knowledge is transformed in seemingly two opposite directions. In one, knowledge is reduced to bits of information, a symbol targeted at successful control in the

service of aims which are produced with their ways of satisfaction. In the other, an alternative is introduced to instrumental rationality, to linear thinking, to hierarchies, to domination, and to aims that were typical in traditional male-oriented phallogocentrist knowledge (Turtle 1993). In both versions of the postmodern conception of knowledge, the tension between knowledge and power is supposed to be dissolved. One can claim, however, that here too knowledge – even as contingent symbolic play and rhetorical gestures – must comply with the demands of the logic of control and the commitment to reduce the subject to a mere “subject” who complies with the imperatives of normalizing education. Postmodern normalizing education, it will be claimed within this line of argument, is neither less violent nor less effective for the system’s need than previous ways of normalization and control. Even when control is not external but is internalized by its victims, who become agents of the system, the mission of education as normalization does not come to its end. It is only being advanced.

Within current globalization processes, symbols become equal to any other commodities, including theological, artistic, and philosophical knowledge. This process of instrumentalization of knowledge also contains the reification of human relations that fabricate and consume this knowledge. Within this reality, there is no room for humanist education, which traditionally was committed to the elevation of the subject by enhancing autonomy, reflectivity, and solidarian human dimensions as a challenge to the self-evidence. The current change in the conceptual possibilities makes this educational aim impossible.

The globalization process is part of the postmodern condition, and within it there is room neither for transcendence, emancipation, and redemption nor for systematic critique of the sociocultural context. There is also no room for the Utopian axis that will enlighten or allow the legitimization of the “ought” and the imperatives of the struggle for emancipating human knowledge. Within these life conditions, the cumulative concept of knowledge and its enlightened emancipatory axis is abandoned. In modernity, the progress of social and cultural knowledge was

supposed to become part of the advance of “hard” scientific science.

In current postmodern discourses, especially in postmodern feminist discourses, it is often asserted that in the postmodern arenas, such as cyberspace, hierarchical, syllogistic, male-oriented knowledge is replaced by nonhierarchical, intuitive, not centralized, kaleidoscopic, “female” or non-phallogocentric knowledge (Plant 1997). This trend is tied to the cheerful abandonment of the quest for truth and human emancipation.

The era of the cyberspace has brought not only a change in the stance of knowledge in the sense of the “emancipation from the quest for emancipation” and from the arrogant claim for an independent, non-contextual view and representation of reality. It has also brought the erosion of other pre-assumptions, quests, and concepts such as the dividing line between the object and the subject, reality and fantasy, syllogism and rhetoric, true and false, good and evil, and man and woman. The educational rhetoric which praises the advance of the possibilities for improved control of information and of the world normally disregards major developments in the postmodern condition: the advance in the possibilities for normalizing the human being in a noncentralist and seemingly nonviolent manner, the centrality of the issue of understanding as a critique and as a challenge to the self-evident and the current order, and the issue of the dialogical self-constitution of human beings as opposed to their construction by normalizing education. The stance of knowledge in postmodern societies does not permit questions that do not have installed answers. There is no room for a secret, for prayer, and for Utopia. The new stance of knowledge makes possible a certain kind of technological advance and effective economic and social control of the system or of imperatives of “the market,” which is of extreme effectiveness yet is of extreme dehumanizing potential. To a certain degree, the truths or imperatives enhanced by the market fashion or the consumers are no less effective in protecting the walls of the self-evident from transcendence than the myths of prehistoric human collectives. At the same time, normalized subjects who are deprived of the critical eros are faced with new possibilities

for counter-education that will challenge the hegemonic production, reproduction, representation, distribution, and consumption of knowledge. Plato and Nietzsche join forces: on the one hand, the individuals jailed in the cave cannot emancipate themselves, and the very problematic of false conscious or genuine knowledge or struggle against dehumanized fabricated knowledge is irrelevant for them. On the other hand, it is an arena where not only the dividing line between fact and interpretation becomes problematic – even identifying the line of separation between myths and the human agents of the system becomes a conservative, sentimental quest for knowledge. Well-adjusted and successful cyborgs can only smile at such an attempt and continue “their” enjoyable postmodern or post-human alternative.

[Labor: From Industrial to Digital](#)

Introduction

Drawing attention to the striking contrast between Stephen Daldry's *Billy Elliot* and Douglas Rushkoff's *Generation Like* might be a productive way to open this entry. Despite differences in terms of genre, the contrast between these two provides major entry points to discuss the transformation that education, culture, and labor have gone through in the last 45 years, resulting in the consolidation of what Dan Schiller (1999) has described as "digital capitalism." As far as education is concerned, the shift to online platforms is forcefully moving forward, creating the conditions for a globally networked higher education system, paving even the way for discussions of de-tenuring within North American universities, casualization of academic labor, and the emergence of a culture of precarity across the globe (Berlant 2011; Gregg 2011). In contrast to the hard manual labor of the miners and their

resistance against the neoliberal policies of Margaret Thatcher in Daldry's *Billy Elliot*, today's society is marked by the digital natives featured in Rushkoff's *Generation Like*, which narrates the lives of contemporary youth for whom life is experienced fundamentally on laptop screens, smartphones, game consoles, and the algorithms of social network sites. While *Billy Elliot* documented what David Harvey (2005) calls the "restoration of class power," the increasingly visible fragmentation of the white working class, and emergence of new identities, *Generation Like* depicts the completely mediatized experience of contemporary youth, ultimately raising important questions as to what this new digital condition implicates as far as cultural studies of education are concerned. For instance, how does one think of labor and working class culture that Paul Willis (1981) vividly describes in his seminal *Learning to Labor*? Do central concepts of critical theory such as alienation and exploitation still have currency today? What does one make of the question of leisure as far as youth culture is concerned? *Generation Like* provides some answers to these questions, and the goal of this entry is to briefly describe the material world in *Generation Like* and then ultimately come back to the theoretical concerns mentioned earlier.

A comparison between Douglas Rushkoff (2001) *The Merchants of the Cool* and *Generation Like* (2013) would be an appropriate way to reveal the transformation of contemporary youth culture. Rushkoff's former documentary signified a world

where MTV had to conduct ethnographic research to understand the dynamics of youth consumption. *Generation Like*, on the other hand, uncovers how today's young people love to "share," "like," and "tweet" what they find cool and what this means as far as digital leisure is concerned. Indeed, the narratives in the documentary demonstrate how "like's" and "follower's," rather than the prospect for a stable job, are the currency of the digital age. As Jonathan Beller (2006) suggests, this is actually an attention economy where the act of looking itself has become a labor. Post-modern flexible capitalism (Harvey 1990; Jameson 1991) works by interpellating young subjects where, for example, a young woman named Ceili Lynch spends hours to be "retweeted" by Jack Quaid – an actor in *Hunger Games* – and to become "one of the greatest fans" of the famous transmedia franchise. Internet phenomenon Tyler Oakley presents even a more striking case for the online valorization of human desire since Oakley's decision to open a YouTube account in order to communicate with his friends in college now became his job and made him an Internet celebrity, who by now has worked with such brands as Pepsi, Audible, Virgin Mobile, MTV, and Taco Bell.

As these examples illustrate, to be recognized, perhaps a universal feature of human kind becomes the gateway to being cool. In this sense, Trebor Scholz's description of Facebook is appropriate: "Social participation is the oil of digital economy" (2010, p. 242). But, if participation is the oil of this digital economy, who are the workers then? What does work look like in the digital domain?

Even though Karl Marx is mostly associated with constructing work as toil and accused of economic determinism, his earlier writings present a more complicated picture. For Marx, in addition to being the source of misery, work is also a creative process through which human beings activate conceptual thinking, transform the nature, and in turn are transformed by it. As David Spencer summarizes in *The Political Economy of Work*, work for Marx meant "creative fulfillment and self-actualization. . . Human work had a vital role in the expression of activity and

thus was to be regarded as an essential positive activity" (2009, pp. 47–49).

It is important to highlight the connections between Marx's conception of work and the discourse of the youth in *Generation Like* because Rushkoff's interviewees in the documentary make a number of allusions to how their social media participation *empowers* them for *self-expression*. It is this contradictory intersection of play and labor that makes the realm of digital media particularly interesting in terms of thinking about labor in the digital age and raises important questions regarding the status of *alienation* and *exploitation* in relation to the cultural studies of education because while the world of the lads depicted in *Learning to Labor* glorified hard manual labor and rejected school discipline, today's digital media not only highlights elements of youth aesthetics but also intensifies extraction of value.

Two different cases are useful to illuminate the realm of labor in the digital age: video game industry and social media. They demonstrate that exploitation and alienation are indispensable concepts to understand labor in the contemporary moment and that cultural studies of education need to pay more attention to the ways in which pleasure of work intensifies exploitation, as well as how data is valorized at the expense of a disconnect between the user and her online production. In this respect, cultural studies of education should pursue a research agenda that goes beyond the realm of representation and identity and rather work toward a media literacy that takes into consideration the enclosure of play and commodification of personal data (McGuigan 2012).

Play, Digital Games, and Exploitation

Perhaps one classic way of depicting labor practices in the video game industry is to call it "the dream job." When work is conflated with dream in the popular discourse, one cannot but wonder what Charles Fourier, the utopian socialist frequently quoted by Walter Benjamin, would think of employment in the video game industry. When challenging the mythical discourse of equating

industrialization with historical progress, Benjamin refers to Fourier's theory of work:

The distinguishing characteristic of the labor process' relationship to nature is marked by this relation's social constitution. If humans were not genuinely exploited, then one could spare oneself the disingenuous talk of the exploitation of nature. Such talk strengthens the illusion that raw material receives "value" only through an order of production which rests on the exploitation of human labor. If this order ceases, then human labor for its part will cast aside its characteristic exploitation of nature. Human labor will then proceed in accord with the model of children's play, which, in Fourier is the basis of the *travail passionné* [passionate labor] of the *harmoniens* [dwellers in his utopian communities]. To have situated play as the canon of a form of labor that no longer exploitative is one of the greatest merits of Fourier. Labor thus animated by play aims not at the production of value, but at an improved nature. (Buck-Morss 1991, p. 276)

Passionate labor is precisely the same phrase video game industry employees communicate to college or even high school students who "dream" of finding a job in the video game industry. Yet, the cost of passion in this industry is not negligible. Passionate creative labor – or immaterial labor in the lexicon of Autonomist Marxism (Lazzarato 1996) – comes with precarity, self-exploitation, and alienation. Although precarity is often associated with independent studios or so-called "low-skilled" below the line game developers, it is perhaps more appropriate to think about precarization as a process, which depends on the peculiarities of a game studio, its location, and the occupational skills of a particular game developer (Dyer-Witheford and de Peuter 2009; Bulut 2015). And while the materiality of being precariously employed itself leads to a culture of overwork, the dynamics in the industry (Kerr 2011) produce extreme forms of self-exploitation, as well. Doing more with less is almost the default work setting in the industry, leading to domestic crisis (Dyer-Witheford and de Peuter 2006) and creating clashes within game development as collaborative practice (O'Donnell 2014). This culture of self-exploitation is exacerbated by the fact that the workforce is youthful and extremely competitive, while the industry is hard to get into. That is why

willingness to work for long hours and acceptance of frequent layoffs is a major skill set to possess if one would like to get a job in the industry.

While this dark account pertains more to professionals from the industry, the world of skilled amateurs – *modders* – presents a highly fluid terrain as far as cultural consumption of games and labor is concerned. Modders are passionate gamers who use their major programming, art, and design skills to edit narrative structures or characters of the games they love to play. While reminiscent of the more optimistic discourse of "participatory culture" (Jenkins 2006), modding "straddles the lines between professional production and amateur contributions more thoroughly" (Postigo 2010). This blurring of professional and amateur production is actually enhanced and encouraged by the video game industry, which actively reaps profits off of modders' labor of love and their desire to set a foot in the industry by simply giving away Unreal Development Kits in order to "capture modding" and enclose its value-producing mechanisms.

Then, professional production practices and modding in the video game industry reveal a contested terrain for cultural studies of education to explore and intervene, especially by way of drawing on the contributions from scholars operating within the political economy of digital culture (Fuchs 2014). This is especially important within a neoliberal culture, which, through the discourse of creativity, channels youth desire and labor into voluntary mechanisms of surplus value extraction and processes of precarization, mostly handled in quite individualistic ways and without the remnants of the institutions one gets to see in *Billy Elliot* (Neff 2012).

Learning to Labor 2.0: Alienation Strikes Back

In their Foucaultian analysis on digital media, Mark Cote and Jennifer Pybus (2011, p. 170) define the kind of labor that pertains to social networks as "immaterial labor 2.0" and argue that "learning to immaterial labor 2.0 is an integral process to the reproduction of cognitive

capitalism.” Underlining the affective nature of social networks within which contemporary youth rush to participate, Cote and Pybus reflect on the relationship between Willis’s lads and today’s digital youth: “They learn to produce their networked subjectivity on social networks, which offer an unprecedented milieu for myriad forms of circulation and valorization. It is, then, a polyvalent pedagogy. That is, this apprenticeship is not only socially ‘profitable’ for youth, it helps capital construct the foundations of a future of networked subjectivity and affect” (2011, p. 178). Such is the “pedagogical imperative of cognitive capitalism,” to which “linguistic and communicative elements are so integral” (2011, p. 181).

In a sense, then, to like, to tweet, or to communicate in general has become a form of labor. In this “social factory,” everybody is a worker, whose free time is valorized by social media corporations. If the society is all put to work, who are the business owners or the capitalists, then? What does our contract with Facebook or YouTube tell us? And even at a more fundamental sense, do alienation and exploitation still describe the social media presence of contemporary youth?

Although there are striking differences between the miserable world of industrial work described by Marx and the joyful connections youngsters make with their smartphones, alienation and exploitation are still valuable concepts to account for the contradictory mechanisms of digital consumption. To begin with, alienation is useful simply because users grant their rights to social media corporations and are disconnected from their own product: data, texts, images, relationships, and connections. However, the question of exploitation seems to be trickier because if, for example, workers performing hard manual labor in the Foxconn factories are exploited, can one really make a similar case for Facebook users?

A major criticism regarding the utility of the concept of exploitation in the context of social media is the abundance of pleasure and lack of violence in digital networks. To answer these criticisms, Mark Andrejevic argues that “the point of a critique of exploitation is neither to disparage the pleasures of workers nor the value of the tasks

being undertaken” and further states that “the critique of exploitation does not devalue individual pleasure any more than such pleasures nullify exploitative social relations” (2013, p. 153). The crucial point in Andrejevic’s argument is to rather interrogate processes and practices of *coercion* and *freedom* in relation to the constitution of capital-labor relations. While nobody seems to force young populations to join Facebook, their lack of control over data and profits made from their own data makes it clear that “coercion is embedded in the relations that structure so-called free choices” (2013, p. 154). In other words, one does not seem to be making a free choice, just as it is not the case for wage labor. More importantly, there is an inextricable relationship between alienation and exploitation. As suggested by Andrejevic, “alienation subsists not just in the surrender of conscious control over productive activity, but also, consequently, in its product. Exploitation, then, is not simply about a loss of monetary value, but also a loss of control over productive and creative activity” (p. 154). Indeed, what makes social media a total factory is its capacity to harness collective knowledge and information, or “general intellect”: “the general social knowledge or collective intelligence of a society at a given historical period” (Hardt and Virno 1996, p. 262, cited in Cohen 2008, p. 13). As Nicole Cohen suggests, the kind of exploitation is not necessarily to be taken in the strict sense of the Marxist term but rather as “the expropriation of the common” (Hardt and Negri 2004, p. 150, cited in Cohen 2008, p. 14).

Conclusion

A major question cultural studies of education need to consider in the digital age, then, is the dynamics of the network economy within which “affect, intellect, and knowledge are put to work in the form of social labor power for the purpose of capital accumulation” (Dyer-Witheford 1999, p. 79). The practitioners of cultural studies of education especially need to be aware of the neo-liberal discourse and its emphasis on empowerment and choice because as Trebor Scholz (2012,

p. 243) aptly put it, “we all must admit that a big achievement of capitalism, really, is to make workers believe that digital labor does not exist.” Even though participation in social media platforms seems to be voluntary as opposed to the violent form of wage labor, the dynamics of today’s flexible capitalism force diverse populations to be present online 24/7, accomplish human intelligence tasks for almost no compensation (Aytes 2013), and learn to constantly fashion and reinvent themselves. In this sense, the differences of the digital economy from the industrial economy turn out to be less than assumed since the former also “functions through forms of market discipline” (Hearn 2010, p. 423) and claims regarding post-racialism of the new economy are far from truth (Javadev 2001; Noble 2013; Nakamura 2009).

Ultimately, today’s young populations are coming of age in an era within which being indebted and precarious represent the core of being a human being. Unions are dysfunctional and schools do not deliver the job security they used to. Popular culture and specifically digital media have emerged as the haven for the futureless youth, but even this haven is not immune from exploitation and alienation. Still, the dialectics of technology and culture means that human subjects have the potential to create nodes of resistance and alternative modes of labor and being. It is this struggle that cultural studies of education will need to explore in the second decade of the new millennium.

Introduction

Martinus Jan Langeveld (1905–1989) was one of the most prominent educational theorists in the Netherlands in the second half of the twentieth century. He was one of the originators of the Dutch tradition of “pedagogiek” (“pedagogy”; but see further, section “[A Note on Translation](#)”) and was the founder of the study of “pedagogiek” at the university in the Netherlands after WWII. During his own years of study he was mentored by the Dutch philosopher and educational theorist Philipp Kohstamm and the Dutch philosopher Hendrik Pos and was taught by such prominent philosophers and scholars as (among others) Edmund Husserl, Martin Heidegger, Wilhelm Stern, Karl Jaspers, Herman Nohl, and Ernst Cassirer. He obtained his doctorate in 1934 with a dissertation entitled “Taal en Denken” (Language and Thinking), under the supervision of Kohstamm. In 1946 he was appointed Professor of “Pedagogiek” at the University of Utrecht. Not unsurprisingly his own work on education was mainly based on the German traditions in education, philosophy, and psychology. But from the 1950s onwards Langeveld also made contacts in the Anglo-Saxon academic scene with scholars such as Karl Bigelow. He authored more than a dozen books and hundreds of articles and shorter essays. He was a member of numerous associations and boards, one of which was the board of the *International Review of Education*. Intertwined with his academic work, Langeveld also ran a clinical practice for parents and children to help parents deal with (what now are called) “parenting” issues and problems.

For a more extensive overview of the life and work of Langeveld and a broader contextualization of his work (in relation to other scholars, disciplines, positions taken in educational research), see Levering (2012). In this entry, the focus is on Langeveld’s main work, *Concise Theoretical Pedagogy* (but see below, section “[A Note on Translation](#)”) (1945). References are to paragraphs in the 10th revised edition (1965) (All translations are by the author).

Langeveld was deeply skeptical about research based on quantification of qualitative data and

vehemently argued against the reductive propensities of the empirical-analytical paradigm. Instead he consistently propagated a phenomenological approach to studying the child – an approach adopted by what at some point was called the *Utrechtse School*. He wanted to study upbringing as it appears to us in daily and ordinary experience, starting from “a vague notion of upbringing based on common-or-garden experience” (§5). It is a study of upbringing *as such*, “taking account of the phenomenon of upbringing in its form of appearance that is accessible to anyone” (ibid.).

In educational theory, Langeveld is commonly taken to voice the standard position of the traditional, hierarchical account of the relationship between an educator and a child. By educator is meant: any grown-up (usually, but not necessarily, a parent) responsible for raising children to become independent human beings.

A Note on Translation

Saying something about Langeveld in English is undertaking an impossible exercise in translation. (*Concise Theoretical Pedagogy* is used as literal translation of *Beknopte Theoretische Pedagogiek*, but the book itself has never been translated in English.) It is unclear what word to use to translate “opvoeding” (or in German, “Erziehung”) in English: Upbringing? Childrearing? Education? Similar problems arise with the verb “opvoeden” (“erziehen”): To bring up children? To raise children? To educate children? “Education” and “to educate” are problematic translations given its close association with schooling. In Dutch “opvoeding” and “opvoeden” are not normally used to refer to what happens in schools. These are used, rather, to capture the bringing up of children in the context of a family. But then again, the English “educator” does seem to be used not only for referring to teachers but also to any grown-up responsible for raising a child. Further complications abound with the fairly recent use, in English, of “parenting,” for which there is no direct equivalent in Dutch. Remarkably, childrearing and parenting both have a reference

to a person (the child, the parent), something that is not the case in the Dutch words “opvoeding/opvoeden.” Mainly for this reason, “upbringing” will be used here.

To complicate matters further, it is not unproblematic to use “pedagogy” as translation for “pedagogiek.” Pedagogy is more closely related to the concept and practices of teaching than to the concept and practices of bringing up children. Using “pedagogy” would then unduly narrow down one’s understanding of “pedagogiek” to the domain of schooling. But “pedagogiek” refers, first, to something more generic than what teaching is referring to. In its ancient Greek form, the first part of the word, “pedagogie” can be taken apart in “agein” and “pais”: “leading a child.” Originally this refers to the process in which someone (usually a slave) would lead a child to school, but it has come to mean something broader than that, i.e., leading a child into adulthood, into independent or autonomous personhood, a process or activity which comprises anything parents do to help their children grow to become responsible adult human beings. Second, “pedagogy” is conceptually associated more with practice than with theory. The crucial distinguishing marker of “pedagogiek” lies, precisely, in the -k at the end of the word. This denotes to the Dutch “kunde,” which is usually translated as “craft” (as in craftsmanship) meaning not so much a skillful knowing how, but rather an insightful knowing why. “Pedagogiek” entails a reference to something that is “systematic.” It is standing for *logos*, a system of principles. “Pedagogiek,” then, as the *logos* or system of upbringing, is properly understood as the theory of (or behind) upbringing, the “science” of it, if you will.

To complicate things even further still, Langeveld conceives of “pedagogiek” as a “practical science.” This is different from what is ordinarily taken to be an applied science. The latter refers to the situation in which the principles developed in a certain field of scholarship and research are applied in a field that is external to the scholarship (e.g., teaching as applied psychology). “Pedagogiek” as a practical science is expressing the sense that studying upbringing is necessary in order to know how to *act* and on what *grounds*.

The Necessity of Pedagogy for the Educator

The practice of upbringing needs justification. Without justification, it is unfounded, irresponsible. It is pedagogy that provides this justification. Pedagogy, as a science, is a “systematic body of knowledge” (§2) that provides “coherence, meaningful unity and orientation, against which practice can test itself” (§20). Since it concerns upbringing, the justification in play is of a moral nature. Furthermore, pedagogy imposes an *obligation* on the educator. Through theoretical reflection the educator is obliged to justify her actions, to open herself up for criticism, to take a critical look at herself. “It enforces to completeness and thoroughness, it makes possible the self-perfection of the educator.” (§3) Pedagogy does not teach technical control or command but leads to an understanding of meaning and to knowledge of value. Pedagogy helps the educator to determine her place in life, where she finds herself in life. It also helps (and is necessary) “to guard against the infringement of human dignity” (§3).

Upbringing

For Langeveld “[a]ny work that helps a child to find (or provides the child with) the image which enables her to lead the life of a human being, is pedagogical work” (§4). This clearly is work that is “normatively laden” (§4). In the first place, parents are bearing primary responsibility for this. Irrespective of the fact whether or not they are doing a good enough job, parents are assisted by other representatives of what counts as “a desirable or acceptable idea of a human being” (§4). Langeveld speaks of these people as “image-bearers” (§4), such as politicians and priests, not, to be sure, as, respectively, members of this or that party and confessionals, but those who put forward the image of a dignified human life.

For Langeveld, upbringing is

- A relation between grown-ups and those who are not yet grown-up or immature (i.e., children)

- In which a certain kind of influence is intentionally exerted by grown-ups on the immature
- With an eye to helping the immature to become mature (in Dutch: “mondig”) (In Dutch and German the word “mondigheid/Mundigkeit” entails the word “mouth” (“mond/Mund”), which elucidates that being grown-up means being able to speak responsibly, to make good use of one’s ability to speak. In French, this relation between adulthood and speaking can be observed in the Latin origin of “l’enfant” – infans, meaning “mute” and “without eloquence”, and infantia, meaning “the inability to speak,” “lacking eloquence.” Raising a child thus means: helping her to move from being “onmondig/unmündig” to becoming “mondig/mündig,” to become “able to speak,” to make free and public use of her reason.)

Upbringing takes place *in* daily interaction between children and grown-ups. Not all daily interaction between grown-ups and children is upbringing, according to Langeveld. In his view we can only speak of upbringing when it is characterized by a specific finality, that is, when a specific kind of influence is involved, i.e., an influence that is exerted or exercised with an eye to the specific goal to help the child to become mature. Upbringing is that special kind of daily interaction between grown-ups and children that is deliberately aimed at the child’s reaching adulthood. So this daily interaction between grown-ups and children is a “pedagogically preformed field” within which “the phenomenon of upbringing” can arise (§9). “After its completion the relation of upbringing eventually always returns to a relation of daily interaction” (§9). This also implies that not any relationship can be called a relation of upbringing. A relationship between grown-ups among one another, e.g., can never be a relation of upbringing: “a grown-up always is and remains self-responsible” (§5). A relationship between children can also not be a relation of upbringing, not in the least because what is lacking here is a relationship of authority, the presence of which for Langeveld is a necessary condition in order to speak of upbringing (see below).

Adulthood

The goal of upbringing is adulthood: being capable of autonomously fulfilling a task in life worthy of a dignified existence. This clearly involves a normativity since not every single fleshing out of such a task can be called an example of a dignified existence. The criterion against which to test this is what Langeveld calls “self-responsible self-determination.” This entails:

- Having authority over oneself, meaning: being capable of committing oneself to what one has imposed on oneself, not being at the mercy of someone else’s judgments, having personal access to standards of value. In short: stability of character (Cf. §14).
- Being capable of recognizing a form of higher authority whenever that is needed, exerting “normative stability” (§14), meaning: being able to account for one’s actions against the background of a moral order. Langeveld stipulates this as a condition of freedom: being free means being capable of freely obeying that which one has willfully imposed on oneself. Put paradoxically human freedom is “being bound” (§16).
- Being capable of participating in communal life in a constructive way.

Self-responsible self-determination, or adulthood, is thus a form of autonomy. Autonomy derives from the Greek *autos* or “self” and *nomos* or “law” and thus means to impose the law on oneself, to commit oneself to what one imposes on oneself. And, clearly, the “law” one imposes on oneself does not refer to just any arbitrary measure but to the law of moral reason.

The Child: Condition of Helplessness

Compared to a grown-up a child finds herself in a state of “natural helplessness” (§7, 9). In pedagogical terms this is as much as saying that a child cannot grow up to become an adult person by herself. In line with his phenomenological starting point, it is no surprise to see Langeveld saying that

taking the child to be independent and autonomous is clearly in contradiction with the most evident facts. We can all “see” that in the human world children are being raised, in order to become adult persons. What is more, the necessity of upbringing cannot be denied. Denying this necessity is tantamount to positing “born adulthood,” which is clearly an absurdity, Langeveld says (§24), a “contradiction to the most simple facts” (§17). The child is an “animal educandum” (§67), an animal that needs to be raised.

Following the Continental pedagogical tradition from Herbart on, Langeveld conceives of this helplessness in terms of spiritual helplessness or “moral immaturity” (§14). Being a child means being morally irresponsible. A child’s grasp of norms does not rise above self-interest. “Left to her own devices a child is only capable of following her reflexes, instincts and urges” (§24). In accordance with his definition of adulthood, the child’s condition for Langeveld is one wanting for freedom, a condition of being unfree. A child is entirely *at the mercy of* her reflexes, instincts, and urges. Given that the condition of freedom is understood by Langeveld as being able to freely determine oneself after the demands of (moral) reasonableness, the child clearly is unfree for not yet capable of catering to the demands of a higher, moral order. As said, pedagogically this means that the condition of the child requires guidance by a grown-up.

Kant’s Heritage

It is hard to miss the spirit of Kant wandering through Langeveld’s *Concise Theoretical Pedagogy*. “The child nor the educator may be reduced to a thing-like object, upbringing nor being brought up may be reduced to a mechanical process, to a domain that one tries to condition by means of determining forces” (§24). This is more than just vaguely reminiscent of the second formulation of Kant’s categorical imperative, which states the following: “Act in such a way that you treat humanity, whether in your own person or in the person of any other, never merely as a means

to an end, but always at the same time as an end” (Kant, *Grounding for the Metaphysics of Morals*). As human beings we are not only creatures of nature (which we obviously clearly are: subject to all sorts of causal influences from inside and outside our body), but, also and importantly, we have a higher destination, i.e., to become moral beings. As creatures of nature we are subject to the laws of physics and hence unfree. But as moral beings we can overcome our own instincts and urges, through upbringing, and hence experience freedom.

Kant’s famous saying, in *Über Pädagogik*, that a human being can only become a human being through upbringing and that he (sic) is nothing except what upbringing makes of him, may serve as an adagio to capture Langeveld’s understanding of upbringing. As should be clear, for Langeveld the essence of being human is not given naturally from birth on. *Human Beings Are Not Born* (1979) is the telling title of one of his other books. Obviously, Langeveld is not denying here that human beings are born in a physical sense, but he is denying that a human being, when being born, bears in itself some kind of “model” of (a full) human life which a child is somehow spontaneously able to develop. Being (more) fully human is a *task* and one in which upbringing has an important role to play. This is not to say that raising children is a process of molding or “making” them. In this regard, the application of Kant’s famous *dictum* on upbringing to the position Langeveld takes may be misleading because of the use of the verb “to make.” Langeveld is not conceiving of upbringing as a one-directional process. Raising children is something in which children themselves have a very active role to play. Importantly, Langeveld does not conceive of this in terms of some kind of bidirectional or transactional model of parenting (that is so popular these days), for this would render upbringing as a network of interrelated factors having (some) causal influence on one another. It is not causality among (sets of) behaviors that interests Langeveld when saying that the child also has an active role to play in upbringing. His point is that in upbringing we relate not to (the child as) an object but to (the child as) a subject

who engages in a “self-creative process” (§24). The process of becoming (more fully) human, then, is one for which the child herself also bears responsibility and increasingly so while growing up. That is, the child is bestowed with (an increasing sense of) responsibility “for what she *herself* makes of herself *with* her own innate qualities and *with* the upbringing she has received” (§31).

Authority

The condition of the child requires guidance in the form of a relation of authority (§12ff). Exercising authority is not something required of grown-ups out of an ethical appeal; it is, simply, *technically* necessary: it is a necessity implied in the peculiarity of the work that is upbringing. Authority for Langeveld is the inescapable and necessary condition of upbringing, simply because the child, by herself, is not capable of becoming who she is expected or destined to be (a grown-up person). It is necessary so that certain desirable ways of behaving and acting can be pointed or hinted at and undesirable ones can be prevented. The following points about authority in the relation of upbringing need to be taken into account:

1. A grown-up’s authority is justified on double grounds: on the factual condition of the child (immature, irresponsible, not yet grown-up, unfree, etc.) and on the grown-up’s knowledge of the goal of upbringing.
2. A grown-up is not acting on her own personal behalf but on behalf of a higher moral order. Her authority is not founded in her personal choices of what is a dignified existence. As said, a grown-up is accountable to a higher moral order.
3. This implies that what or who the child is *ultimately* obeying is not the concrete person the educator happens to be but the very values and norms this grown-up is representing. This is not to say that the concrete and particular person of the educator is of no matter whatsoever or that the personal bond between educator and child is not important. Clearly in the

beginning (i.e., phenomenologically given) this is of major importance, and the child is behaving in certain ways (listening to the grown-up) because of the fact that it is *this* particular person who is speaking to her (e.g., prohibiting her to do something). Here Langeveld does not speak of the child exerting obedience in a true sense of the word but of “being ‘contaminated’ with the educator’s initiatives and spontaneously joining in” (§13). Not obedience but docility or meekness is in play here. (In Dutch the word is “volgzaamheid,” which contains the verb “to follow” (“volgen”). The connotation at work here is that the child is “following” the grown-up and the example she sets.) But gradually the child comes to realize that who/what she is following/obeying is not just this particular person. Her identification with whom/what she is obeying is gradually being depersonalized until she is exerting true obedience, i.e., complying with self-recognized authority (cf. §15).

Taken together, the second and third points come down to the fact that the structure of the relationship of authority within upbringing is a reflection or representation of the structure of adulthood. As an educator a grown-up places herself under the very values and norms she is representing to the child.

4. This further implies (and clarifies) the following two issues: (a) It is important that the grown-up personally realizes or actualizes the values and norms she is upholding to the child. What she is conveying (by acting and speaking) to the child through a relation of authority is something that should have authority for herself in her own life (Hence also the importance of self-knowledge on the part of the educator; cf. above, the necessity of

pedagogy). (b) The educator is, in the end, merely a connecting-piece, a mediator, or a go-between between the child and her future.

5. As long as the child is not yet capable of placing herself under the authority of a higher moral order, the grown-up takes responsibility instead of the child. The grown-up acts as a substitute for the child. She acts, literally, in the child’s stead as long as the child is not capable of acting herself (i.e., acting responsibly). Clearly this “substitution” is a matter for the grown-up of finding the right balance as the child is growing up, since the child, being active in the process of upbringing, has “an increasing *duty* to autonomously fulfill her task in life” (§15).
6. There is no antithesis between authority and freedom. On the contrary, authority sets up the conditions for freedom, for becoming a free adult human being. Though a child *in principle* is capable of being free (in the sense indicated), she cannot take this freedom herself. Freedom is bestowed upon her by a grown-up. Autonomy as something that belongs to what it means to lead a grown-up dignified existence is granted to the child by the educator, through upbringing. In a sense, upbringing on this account is an act of “violence”: a certain form of coercion needs to be exerted with an eye to the child’s autonomy. “Freedom is laboriously instilled through upbringing” (§16). So, paradoxically, the child’s reasonableness, maturity, responsibility, etc. only comes to fruition through “coercion.”

The Autonomy of Pedagogy as a Science

As should be clear, Langeveld’s account of concepts such as responsibility, freedom, authority, obedience, etc. are derived from the ways in which these figure in the pedagogical relationship itself. The significance of these concepts to upbringing is not shown by first offering a general (say philosophical) account of them, after which these accounts are “applied” in upbringing. Their significance is shown as pedagogical concepts in themselves not as philosophical concepts having

an application (also) in upbringing. In this sense, pedagogy for Langeveld is an autonomous discipline, fully capable of generating a theory of upbringing by itself. To be sure, in generating such a theory, fruitful use is made of other disciplines, such as developmental psychology and philosophy. Specifically the second is important because it offers an account of the values and the order of values which are acknowledged as being part of what it means to lead a human life, and hence offers an idea of the goal(s) of upbringing. It is a matter for philosophical anthropology, not for pedagogy, to reflect upon an account of what is worthy of a human life (Cf. §21). Pedagogy simply accepts this account as one of its most evident starting points for theorizing upbringing. What needs to be theorized by pedagogy is not the goal(s) in itself but the role of upbringing in the process in which a child develops to maturity and how it relates to the goal(s) set out for it. As it comes to the relation between pedagogy on the one hand and philosophy and developmental psychology (and other disciplines) on the other hand, Langeveld operates with a clear division of labor in mind. Put very simply: reflecting on the meaning of life and what it means to lead a dignified existence is a matter to be taken care of within philosophy; reflecting on how to raise children to lead such an existence is a matter to be taken care of within pedagogy. In this regard, pedagogy has a very important task to fulfill, i.e., “to complement what is worthy of a human life with what is worthy of a children’s life” (§21). Pedagogy determines “which values are pedagogically acceptable, meaning: reconcilable with the values that need to determine a children’s life” (§21). Pedagogy may in the end not decide upon the ultimate order of values, it does however have the indispensable task to ensure a kind of harmony or rapport between the goals of upbringing and *this* particular child.

Language and Identity in Haiti: Central Issues in Education

Ashlyn Haycook

Loyola University of New Orleans, New Orleans, LA, USA

Introduction

Haiti is often called the poorest country of the Western Hemisphere, despite having been called the Pearl of the Antilles during the period of colonization. It achieved its independence before any other nation in Latin America, but that independence has been followed by centuries of social, economic, and environmental problems. It was colonized by the French rather than the Spanish or Portuguese, and the remnants of French imperialism found in its society lead to serious tensions between a French-speaking elite and a Creole-speaking minority. This paper will attempt to examine the history of Haiti and its

history of domination compared to its perceived independence as well as the way language plays into these dynamics. I will synthesize writings by various French, Haitian, Martiniquais, and American authors while adding a new perspective on the subject. The majority of information on this history of Haiti comes from *Dominican Republic and Haiti: Country Studies*, a book compiled by the Federal Research Division of the Library of Congress.

The early colonization of Haiti was similar to most other islands in the Caribbean. Hispaniola, the island where Haiti is located, was one of the first identified by Christopher Columbus. The Western third of the island, what is now Haiti, was colonized by the French in the seventeenth century under the name of Sainte-Domingue. During its status as a colony, Haiti was used predominantly for sugarcane production, necessitating immense amounts of slave labor. In 1791, when the Haitian Revolution began, the colony's slave population totaled between 500,000 and 700,000. During this period, the African majority was controlled by an elite French minority, which would set the tone for future relations within the country. The 13 years that followed included mass bloodshed and destruction of infrastructure, but ended in Haiti's declaration of independence in 1804. For the first time, not only had a slave rebellion succeeded, but a slave rebellion had led to the foundation of a nation of former slaves.

Unfortunately, Haiti would not experience the prosperity for which its revolutionaries had hoped. In the years following Haiti's independence, it experienced a division between the north and south as well as decades of instability. This instability continued until the United States occupied the country in 1915, from which point it was permanently involved in Haitian affairs, whether or not it formally occupied the country. The presidencies of infamous dictators François Duvalier and his son Jean-Claude, which included the murder and exile of tens of thousands of Haitian citizens, received millions of dollars of aid from the United States government. Following the fall of Jean-Claude Duvalier, Haitian citizens voted in their first democratic election in 1991 and elected Jean-Bertrand Aristide. However, a

military coup occurred shortly after his election and forced him into exile until 1994 when he was able to return and take his place as president for 2 years. He was elected again in 2000, but was again ousted by a coup in 2004. Many theorize that both coups were orchestrated on the part of the United States government, but this has never been confirmed.

Thus, it seems that Haiti has spent a majority of its history under the thumb of the Northern nations. The first of Latin American countries to achieve its independence experienced years of continued domination by wealthier nations. This led to a population dependent on foreign aid and governed by an elite minority. And semblances of the country's colonization and enslavement remain in the dominance of the French language over the country.

Perspective

The dominance of the French language can be found throughout Haitian society. Creole was not considered an official language of Haiti until the 1980s, despite it being the language spoken by the majority of the population. In fact, it is estimated that only 5% of the Haitian population, at most, is fluent in French. Suze M Mathieu discusses this in her book *Depi Nan Ginen, Nèg Renmen Nèg*. Mathieu's work particularly focuses on the relationship between the Creole language and the democratic society in Haiti. She states that colonial domination was not only enforced using weapons but also using an ideology that values a series of cultural elements that do not coincide with the culture and identity of the population (Mathieu 2005, p. 31). Many different ideologies are responsible for valorizing the colonized over the colonizer. Physical appearance, religion, intelligence, and level of development have all been historically used for this valorization of the colonizer's culture over the colonized. Language is much less often discussed in discourses about colonial and postcolonial domination and ideology. Yet it is through language that we valorize these qualities. Mathieu uses several examples of this specific language of domination including

using words like religion versus superstition, speaking a language versus speaking a dialect, civilized versus primitive, and developed versus undeveloped (p. 32). If associating specific words with a dominated group can have such a drastic effect on a group's identity, then devaluing a group's entire language must have an even more profound effect.

Thus, even after gaining its independence, Haiti remained in a state of domination by the French, incarnated through their language. However, as with any system of oppression, there were those who resisted. Beginning in the 1960s, at the height of the Duvalier regime, a group of Creole speakers formed what was known as the *Sosyete Koukouy* or the Society of the Firefly. This group sought to promote the use of the Creole language as a symbol of resistance and resilience. The group encouraged literature written in Creole as a form of self-expression (Banbou 2000, p. 13). This act of writing in Creole itself also served as a political statement. In a society so adamant about preserving the prestige of the language of its colonial oppressor, writing in the language of the common people served as an act of defiance.

A similar movement occurred around the same time in the French department of Martinique, where Jean Bernabé, Patrick Chamoiseau, and Raphaël Confiant authored *Éloge de la Créolité* or *In Praise of Creoleness*. The three spoke of their situation in Martinique as well as discussing the case of Haiti, asserting, "We have seen the world through the filter of western values, and our foundation was 'exoticized' by the French vision we had to adopt. It is a terrible condition to perceive one's interior architecture, one's world, the instants of one's days, one's own values, with the eyes of the other" (Barnabé et al. 1993, p. 76). Their manifesto sought to express the complicated identity of the Creole Caribbean. "Neither Europeans, nor Africans, nor Asians, we proclaim ourselves Creoles" (p. 75). Through the *Créolité* movement, citizens of Haiti and the French Antilles were finally able to express themselves in their chosen language. The book *Open Gate: an Anthology of Creole Poetry* was published, chronicling decades of

Creole poetry that express resistance movements through Haiti's history. Haitian citizens were encouraged to read and write in their own language, and this literature was made available to the public. And eventually, Creole was added as the second official language of Haiti.

Unfortunately, the stigma associated with Creole remains. French continues to be the chosen language of instruction, administration, and publication in Haiti. While Creole is spoken in the household, it is often seen as lesser than the prestigious French is. Yet the word "creole" is used to describe everything from food to architecture to clothing in Haiti. Thus, this word used to describe the culture of the nation's people is also the name of the language considered to be a mere "dialect" or "corrupted version" of the colonial French. Students were instructed in French rather than Creole. They were unable to learn the grammatical structure of their native language, thus impeding their instruction in any other language, namely, French. Students not fluent in French could not pass the exit exam from high school. Thus, those who only spoke Creole were considered less intelligent than their bilingual counterparts, which was again a mere 5% of the population. Citizens could not properly participate in a democratic society without speaking the language of that society. Mathieu expresses this problem in *Depi Nan Ginen*, stating, "When we speak Creole, everyone is included. Each and every Haitian! They can exercise their rights to participate in any business that concerns them. But because we have chosen to speak French, 95% of the population, at least, is not included. This system is precisely anti-democratic" (Mathieu 2005, p. 35). This language of domination hinders 95% of the population from fully participating in their own society.

However, there is hope on the horizon for Creole to gain a prestige relative to French in Haiti. The 1987 Haitian Constitution called for the State to create an academy for the development of the Creole language. And decades later, this was finally achieved through the Haitian Creole Academy, which met for the first time in December of 2014. This group seeks to encourage

the production of materials in Creole, standardize a written Creole, and valorize the Creole language and identity in every way possible (Akademi Kreyòl Ayisyen 2005).

Analysis

Several factors come into play when discussing the ideological structure in Haiti that continues to keep French as the dominant language in the country. The first of these is perhaps the most obvious reason – French is a language of diplomacy. Learning French gives a Haitian citizen infinitely more opportunities than a monolingual Creole speaker does. This idea alone is not necessarily problematic. It is certain that keeping records in French and having government officials who are fluent in French benefits the nation. However, this is not a form of justification for Creole having a lesser status. Many European nations have their own languages with a similar amount or fewer speakers than Creole – including Greece, Sweden, and the Czech Republic – and these languages are all recognized and valued. Additionally, according to Suze Mathieu's research from 2004, a total of 11.5 people in the Americas speak Haitian Creole or a Creole similar to it, while only 10 million speak French (Mathieu 2005, p. 21). This statistic affirms that French does not remain the official language of Haiti because of its versatility, but because of its perceived power and domination.

A second factor keeping the French language in power in Haiti is the stigma attached to Creole identity in other parts of the world. Evidence of this is dissipated throughout American media. For example, Haiti's native religion is Vodou, which is a synthesis of African religions and the Catholicism brought by French colonizers. Yet American media portrays it as a make-believe black magic full of Voodoo dolls and curses. The only times Haiti is depicted in news segments is to discuss its poverty and need for aid from the American people. Haitian culture, and by extent Creole culture, is reduced to a country in need of aid from the Global North. When visiting Haiti, one would of course

see various signs of poverty, but would also find a rich culture of music, food, and art similar to many cities in the United States. Yet this Haiti, this Creole culture, is not what news outlets choose to portray. Cities in Haiti are full of countless signs of USAID, United Nations troops, and Red Cross relief efforts. These benevolent acts by northern countries also give the Haitian people the idea that they are in need of aid from these countries and continue the cycle of dependence and domination created during colonization. Thus, to be Creole is to be in need of aid. To speak French is to identify oneself with these wealthier nations.

A final factor perpetuating the dominance of the French language in Haiti is the difficulty of identifying a language as a form of oppression. Discourses on oppression often include discrimination based on race, gender, ethnicity, religion, nationality, sexual orientation, and countless other factors. Yet very rarely is language discussed. In 1948 the United Nations published its Universal Declaration of Human Rights, which stated in Article 2 that "Everyone is entitled to all the rights and freedoms set forth in this Declaration, without distinction of any kind, such as race, color, sex, language, religion, political or other opinion, national or social origin, property, birth or other status" (United Nations). Language was specifically mentioned in this article, but continued to be left out of discourses on oppression. The paradox of this is that any discourse occurring would have most likely occurred in academic spheres of northern nations and in languages that had been used as forms of oppression. This paper is written in the same language that dominated the indigenous people of nations like India, South Africa, and Australia. Thankfully, there are now discourses occurring in Creole about the dominance of the French language in Haiti. This is absolutely necessary to reverse the system of oppression currently in place. Paulo Friere remarks in his *Pedagogy of the Oppressed* (2014) that the oppressed must be involved in bringing about their own liberation. The discourse of groups like the Haitian Creole Academy that occurs in Creole about language and power is indicative of an overturning of this system of oppression.

Interpretation

Various history and language courses in the United States continue to teach that former French colonies, like Haiti, speak the language of their former colonizers. Yet the idea of these countries being completely francophone is false and perpetuates the cycle of dominance in these countries. It is remarkable that Haiti fought so brutally for their independence from the French yet continued to use their language over the language of their own people. This self-imposition of the French language indicates a continuation of colonial dependency. While Haiti gained its independence in 1804, it has remained dependent on northern nations since then. The French language is displayed all over the country. This language of domination and colonization is also used on the Haitian flag that represents its independence. Domination and dependence mask the independence and resistance of the Haitian people. This dependency is engrained in the mentality of the Haitian population. The Haitian author Jacques Roumain wrote the book *Masters of the Dew* (1978) chronicling the symbolic struggle of Manuel who has to save his village by convincing two rival groups to work together. In it, almost every other character embodies the idea prevalent in Haiti that God forgot their country and all they can do is pray for forgiveness. Haiti is constantly receiving aid and missionaries from northern countries, which further perpetuates this idea.

However, as previously mentioned, there is a great amount of hope that the social situation in Haiti will change in years to come. Schools in Haiti have begun teaching Creole classes, and more written publications are being printed in Creole. Courses in Haitian Creole are being offered in universities in the United States. The Haitian Creole Academy is standardizing the Creole language to better facilitate this. It is likely that as the Creole language becomes more acceptable in formal settings, a rise in Creole pride will occur in Haiti. This affirmation that the language of the people is indeed valid also serves as an affirmation that the culture, the identity, and the experiences of the Haitian people are valid. While changing the

status of a language will by no means solve every problem that Haiti faces, it will serve to restore a sense of dignity to the Haitian people that was lost when their language was made subservient to the language of the French colonizers.

There is hope that the case of Haiti will give way to a greater discourse on the way we treat languages in general. The case of Haiti is not unique. Within Latin America, countless indigenous languages were suppressed by the dominant Spanish or Portuguese. Globally, almost all of Africa or Asia has experienced some form of colonial domination exercised through language. This may potentially be one of the next great discourses on postcolonial domination.

Conclusion

Haiti has had a very unique experience with colonization historically. It was the first nation to gain independence in Latin America, the first successful slave revolt, and the first independent black republic. Yet it is also one of the poorest countries in the Western Hemisphere plagued with social inequality and environmental degradation. Language is but one of many issues on the forefront of Haiti's social radar, but it has the potential to transform the mentality of the Haitian population. By giving the Creole language the same level of prestige that French language has, the Haitian government has the ability to give its people a sense of dignity it had previously lacked. People will be able to fully participate in the nation's democratic society and to get an education that will open a plethora of opportunities from them.

This is an issue that is currently undergoing so much advocacy that it is hard to predict exactly how the movement will continue. The Haitian Creole Academy has detailed plans for years to come that will change the face of Haitian society. Moreover, on a global scale, this may change the discourse on postcolonial dependence and domination. While these developments in the status of Creole in Haiti may be unpredictable, they are sure to be a fruitful topic for further research.

Latino and African-American Social Relations

Paul Green
University of California, Riverside, California,
USA

Introduction

Latinos and African-Americans are often compared against one another in a contest for which group comprises the “largest minority.” These groups are defined as ethnically and culturally exclusive communities with distinct social and cultural histories and identities. The binary identity that defines Whiteness and Blackness often defines whether you are either Latino or whether you are Black. Forgotten in the binary are Afro-Latinos whose social and cultural history occupies a forgotten and unspoken place in contemporary racial and ethnic relations in the Western Hemisphere.

The term Afro-Latino has been used by international agencies to reference people of African descent in Latin America and the Caribbean. The

terms “Negro,” *afrolatinoamericano*, and Afro-Latino defined the movements and causes gaining social and political momentum throughout the Western hemisphere. Starting in the 1990s, intellectual cross-fertilization between northern and southern scholars ignited focus upon the Afro-Latino experience (Tillis 2008). The “Afro” prefix and other racial markers questioned and challenged the homogenizing and xenophobic social constructs inherent in national and regional identities. Afro-Latino identity soon surfaced in the United States as a strategy to identify the cultural and socioeconomic diversity within the vague social constructs of Latino while shedding light on antiblack racism in Latino communities and institutions.

The “Afro” prefix challenges the African-American and English-only cultural monopoly inherent in the US context of Blackness, thereby redefining its implications throughout the Western hemisphere. Further, it serves to bind struggles by linking communities and their experiences. Importantly, the prefix lays the foundation for the historical and cultural connections to the continent of Africa therein deconstructing the Eurocentric ideologies that have characterized Latin America and Caribbean.

What does the term “Afro-Latino” mean in the context of race formation and racial identity in the United States? First, it refers to Latinos of visible and/or self-proclaimed African descent. It is a self-imposed group identification demonstrating a sense of tradition and shared social and cultural realities connected to African cultural traditions. Since European conquest and early US colonial history and forward through the nineteenth and twentieth centuries, Blacks with their first language as Spanish have forged a rich and enduring legacy of cultural beliefs and expressions that have transmigrated national boundaries often differentiating it from the social and cultural experiences of the African-American community. Nativist discourse and xenophobia surrounding Latinos and illegal immigration and a history of institutional racism and structural discrimination against persons of African-American descent characterize a long social and political history in the United States. In spite of this history, the

“Afro-Latino” community offers a unique opportunity to bridge a growing divide between the Latino and African-American.

The term “Afro-Latino” as well applies to a transnational discourse or identity connecting Black Latin Americans and Latinos across national and regional lines. The substantive interactions and intersections between African descendent people in Latin America and among US Latinos remain a significant cultural marker in the North American social context. Afro-Latino clearly signals what some researchers have described as an *ethnoscape* capable of global reach. Therefore, it has become increasingly important to delimit Afro-Latino as a social and cultural phenomenon residing solely within the borders of the United States.

What is particular to the US context is that the Afro-Latino problematic has to do with the cross-cultural relationships between the African and the Latino, which means the relation between Latinos and African-Americans. This is evident in the lives of prominent US Afro-Latinos like Arturo Alfonso Schomburg, Mario Bauza, and Piri Thomas. This relationship is an eminently Afro-Latino phenomenon. Countless biographical narratives make clear that Afro-Latino is at the personal level a unique and distinctive experience and identity ranging among and between Latino Black and US American dimensions of the lived social reality. The Afro-Latino quest for a sense of social identity is often pulled in three directions and shares a complex multidimensional optic on contemporary White Anglo Saxon Protestant culture and society. In the African-American experience, W. E. B. Dubois referred to this experience as triple consciousness.

The presence of Afro-Latinos covers the earliest recorded history of the United States predating the first English settlements of the United States. The cultural influences of Spanish-speaking persons of African descent in Spanish settlements of San Augustine, Castillo de San Marcos, and Gracia Real de Santa de Mose in 1565 reveal forgotten social, economic, political, artistic, religious/spiritual, and linguistic influences of the Afro-Latino community upon the history of the

United States. Afro-Latinos coexisted as both free and enslaved communities subordinated by a caste system as servants, reconnaissance scouts, and militiamen; as intermediaries, attendants, field hands; and as slaves. While Afro-Latino culture was marginalized by Anglo-colonial hegemony, it shaped the formation of North America while unearthing the weaknesses and structured silences of Anglo-American culture and its history of omissions.

Many Afro-Latinos in the United States are predominantly of Hispanic origin immigrating from Cuba, Puerto Rico, the Dominican Republic, Panama, and the coastal areas of Colombia and Venezuela. By the mid-nineteenth century, the centrality of Afro-Latino relations in the war with Mexico coincided with the extension of slavery in Mexican territories and the introduction of Black Cubans to southern Florida supporting the cigar industry. Each of these events brought thousands of Cubans, Puerto Ricans, Columbians, Venezuelans, Spaniards, and Italians to the cities of Tampa, Key West, and Ybor. Between 1870 and the 1940s, Key West, Florida, served as an extension of Havana, Cuba.

Afro-Cubans comprised the majority of the cigar workers in Florida, while White Cuban Spaniards owned and profited from the labor of the tobacco farms and cigar manufacturing. As the cigar industry declined in the 1920s, the Afro-Cuban population also declined. Afro-Cuban workers that transmigrated established cross border cultural and linguistic relationships. In fact, Afro-Latinos enjoyed cross-cultural relations with both the White Cuban and African-American communities. History across the Americas, particularly in the United States, suggests that strong cultural, social, and political bonds existed among Cuban, Latino, and Black communities in response to policies and practices or entrenched xenophobia and antiblack racism often forging opportunities for solidarity between Afro-Latinos and the Black community.

The US occupation of Cuba and Puerto Rico and the migration of Afro-Latinos to New York and to other northeastern cities, occupied by generations of Afro-Caribbean and African-Americans, further fomented a social, cultural,

and political solidarity with a broader African diasporic world. Arturo Alfonso Schomburg, a Black Puerto Rican bibliophile of the Africana experience, made immense educational and intellectual contributions to knowledge about the realities of the African diasporic experience. Schomburg's work resulted in the founding of the Schomburg Center for Research located in New York City. Importantly, Schomburg's activism and intellectual accomplishments illuminate the ambiguities of the Afro-Latino social experience. Puerto Ricans outnumbered Afro-Cubans as the largest Latino group in New York City.

By the end of the 1950s, the Puerto Rican community outnumbered Cubans as the largest and most socially, culturally, and politically vocal community of US Afro-Latinos. The civil rights movement of the 1960s fueled this vocal expression thru literary and cultural expression giving voice and perspective to persons proudly identifying as Puerto Rican and Black. A strong sense of Black cultural identity in its poetry, storytelling, religion, sports, food, and language documented and translated the uniqueness of Afro-Latino culture.

The area of music and performance is where Afro-Latinos made their most visible and lasting cultural influence upon the United States and North America. Renowned Jazz artists like Jelly Roll Morton noted that you cannot play jazz if you are not aware of and understand the Spanish tinge which served as the essential role of Afro-Caribbean music and shaped the unique American musical idiom called Jazz. The Afro-Caribbean influence on the unique art form of Jazz with the Haitian social and musical presence in New Orleans from Caribbean tinged composer and Creole prodigy Louis Moreau Gottschalk. In fact, Jazz was also flourished under the influence of Afro-Caribbean beats and styles.

During the twentieth century, cultural appropriation by the majority through musical fads like the tango, the rumba, the boss nova, the conga, and the mambo originated from Afro-Latino traditions primarily Cuban and Brazilian. The 1940s and 1950s saw cultural and rhythmic interchanges between Afro-Cuban and African-American music with collaborations between Cuban artists

and African-American jazz innovators. The exchange of rhythmic expressions resulted in a musical genre called Cubop while promoting further musical interactions leading to Latin jazz and salsa. This diasporic cultural mingling between Afro-Caribbean, Afro-Latino, and African-American music traditions morphed into the contemporary performance styles and genres of hip-hop while often obscuring the central influences of the Afro-Caribbean and Afro-Latino role in creating and shaping styles in rap, urban graffiti, and break dancing as both artistic expression and social protest.

Race and Ethnicity in the United States: Afro-Latino Population and Identity as Change

According to the report *Black Diversity in Metropolitan America* (2003), the 1990s witnessed sweeping demographic shifts from persons with roots in sub-Saharan Africa and the Caribbean. One of the primary reasons for these massive immigration shifts arises from global trade agreements that destabilized regional and local development in the Caribbean and Africa. Almost 25% of the growth of the Black population between 1990 and 2000 was due to newcomers from Africa and the Caribbean. The number of African-Americans increased 10% to 31 million in the 1990s. But the number of Blacks from Africa practically doubled to 537,000 in the same period. The number of Blacks from the Caribbean increased 63% to more than 1.5 million (Logan and Dean 2003). The report sheds further light on the residential patterns, socioeconomic profiles, and educational backgrounds of these groups.

For the United States, recent immigration has produced sweeping demographic increases in underrepresented populations at a time when vast technological changes have occurred. Horton (1998) states, "the population and structural change thesis holds that changes in the relative sizes of the minority and majority populations interact with changes in the social structure to exacerbate racial and ethnic inequality" (p. 9). While the technological change has affected the professional class, the

blue collar labor force has been affected the most. In short, the privilege of being White and educated is no longer a guarantee of employment. The rise in the minority middle class further exacerbates an expanding and diverse labor force. Hence, underrepresented groups for the first time have become a threat to White middle-class workers (Horton 1998). Traditionally, majority communities have often turned to discriminatory policies and practices to eliminate or reduce underrepresented groups from social, educational, and economic opportunities (Omni and Winant 1994). Therefore, it is not surprising that cries of "reverse discrimination" and legalized resegregation of schools via charter schools and State actions like Proposition 209 in California have served the needs of the White middle class more than the needs of poor and disenfranchised communities.

W. E. B. DuBois' declaration that the problem of the twentieth century would be the "color line" echoed far beyond the borders of the United States and beyond the twentieth century. DuBois' research spoke not just about the condition of African-Americans but the "color line" in other words, the darker and lighter races in Asia, Europe, Africa, the Americas (Canada, United States, Mexico, Central and South America), and island colonies and nations. He recognized that social and cultural differentiation was not solely a national phenomenon but a global one. While the transnational scope of the Black experience is not new, recent attention to the nation's "Black diversity" needs to be understood in relation to the shifting "race" landscape in the United States.

Surprisingly, Afro-Latinos are not counted by the census as part of the growing "Black diversity." So, "Hispanic" is a social construct that is decidedly non-Black and in some ways discursively antiblack. This postcolonial disconnect between Hispanic and Black lends continuity to racial denial in Latin American and Caribbean countries and their communities. Some Latinos even pride themselves in the socially graded Latin American racial formation suggesting it represents an alternative to the Black and White binary in the United States. Not acknowledged by White middle-class Latinos is the historical fact that multiracial Latinos are the social replacements for the category called

“mulattos” quite prevalent in US racial stratification and social order.

This exceptionalism is encouraged by a present-day post-racial discourse in the United States that resembles the dominant ideologies located throughout Latin America and the Caribbean. A reluctance by White Latinos exists to engage any discussion of racism within the Latin Diaspora but rather to “blame the victim” who voices resistance to race-based injustice in the Afro-Latino Diaspora. The invisibility of Afro-Latinos in Latin America and Caribbean reaffirms itself in the population and structural stratification and inequality in the United States.

Consciousness, Miseducation, and Afro-Latinos

History informs the past and the present of how Afro-Latinos identify themselves today, and it assists in defining its path for the future. Afro-Latinos, just like other groups who choose to migrate to the United States, come to the United States in pursuit of economic opportunities and better education for their children. However, assimilating into a society with contrasting demarcations of Black and White and where race is a factor much greater than ethnicity creates culture shock and the need for immediate cultural adjustment of identity. The first level of awareness often occurs during enrollment in public education where children are identified by race or given a classification that may not include Afro-Latino. Undoubtedly, when this identification does not focus on other attributes, other than race, then the identification neither validates the history nor culture of Afro-Latino learners rendering their African identities from Latin America and the Caribbean invisible, nonexistent, or unimportant.

More than two decades ago, the National Census Bureau evolved in its identification of residents and immigrants in the United States, changing to a wider range of classification by race and ethnicity. School districts particularly in border regions and States quickly reflected this wider range and classification, namely, Latino/Hispanic and Afro-Latino/Hispanic communities

and students. Normative classifications of racial classification failed to identify or acknowledge Afro-Latino and Afro-Caribbean communities and students. Florida public schools, for example, require parents or guardians to select and register their child under one or more of five race codes (e.g., American Indian/Alaska Native, Asian, Black/African-American, Native Hawaiian/Other Pacific Islander, or White).

These traditional race and ethnicity classifications do not account for Afro-Latino/Hispanic or Afro-Caribbean communities and students. These students and their communities are often compelled to self-classify as either Black non-Hispanic or Hispanic-Latino rendering the true identity (cultural and social knowledge) of these students and their communities as Afro-Latino/Hispanic and Afro-Caribbean invisible. Afro-Latino students are given little choice but to locate common ground with the group that most closely shares their cultural and social experiences. In brief, Afro-Latino students are forced to assimilate at the expense of living under an alternate identity.

Children who come to the United States from coastal areas off the Atlantic Ocean of Latin America including Colombia, Costa Rica, Panama, and Venezuela and in communities in Veracruz, Mexico, are identified as English language learners. US public schools often define their identities as other than Latinos or Hispanics rarely considering their experiences of African, Latino, and indigenous heritage that is vivid and distinct to the communities from which they came. Families of mixed ethnic identities often prefer to celebrate the unity of family heritage by embracing their diverse cultural Mosaic, versus celebrating based upon the prevalent family physical identity. Even though many of these children qualify as second language learners and will require English language learning, they are required to make adjustments to the larger school culture and the curriculum where their social and cultural knowledge and history is often not valued, not discussed, and not represented.

The supposed invisibility of ethnic differences arises from the melting pot ideology espoused during the immigration of Western Europeans to the United States. The rise in immigration from

non-Western European countries to communities and schools in the United States shifted the paradigm to the salad bowl ideology or cultural pluralism which espoused acceptance of individual differences. Yet, important democratic institutions like US public schools created to assimilate its students versus promote cultural pluralism continue its mission to acculturate students versus acknowledging the wealth of contributions made by these communities to the character of what is the United States.

The opportunity for an inclusive society through schooling might be attained through the acceptance of our differences once differences are viewed in the context of history, life experiences, and culture. Every community has a cultural framework that influences surface cultural action such as the way people dress, foods eaten, holidays celebrated, and other observable behaviors. Yet it is at the deeper level of cultural manifestations where behaviors are not as obvious and lead to misunderstanding and rejection that matters most in building deeper understanding and acceptance of cultural behaviors. Gonzales-Mena (2005) asserts that it is the narrow view of culture that contributes to a cultural perspective of others. According to Mena,

Identity includes more than gender and more than where a person comes from. I may not be thinking of race, class, sexual orientation, religion, and age unless I experience being a target of oppression because of one or more cultural attributes. I'm probably not thinking of how all of these parts of my identity are defined by culture. It may not even consider how my culture and the culture of the group and power are related. But my identity formation isn't the same as everyone else's... When an aspect of a person's identity makes him or her a target of oppression, ignoring that aspect doesn't make the oppression go away. (p. 11)

School socialization brings many challenges for children like Latinos who are part of the underserved ethnic groups within the school community of learners. It presents even greater challenges for Afro-Latino children who may use dialects and idioms and therefore exhibit cultural and social behaviors unlike their Latino peers. The goal for teacher education in a culturally plural classroom, school, and community is the celebration of diversity as the function of

teaching and learning through an inclusive multicultural curriculum in which a wide array to diversity, learning communities is included and embraced. Curriculum and instructional strategies that encourage and invite a learning environment that values diverse ways of knowing the world enriches the learning experiences for students and teachers (Lee et al. 2003).

A responsive and reflective curriculum can be attained, not by adding an additional month to celebrate often the incorrect symbolic culture of students like Afro-Latinos but rather by including topics in the curriculum that educate and challenge Afro-Latinos and all students to value the history, music, artistic expressions, and worldview of Afro-Latinos. Clearly, the goal of diversity in education is to expand and challenge the consciousness of students by making visible the cultures of the diaspora. Therefore, students in public education should experience growth and learning in a community of learners that promotes diversity of consciousness (Lee et al. 2003).

Creating pedagogies that respond to the invisible Afro-Latino student requires an inclusive model that integrates and reinforces the history and culture of Afro-Latinos as significant knowledge in the academic content. The model should encourage the teaching of academic content through literature that leads to the development of didactic materials and activities appropriate for teaching the rich history and culture of this important community. The integrated model, while deliberate in its content, can avoid conflict with standardized curriculum expectations already designed by school districts. The curriculum approach therefore can infuse rather than supplant content already expected at various grade levels. The model can integrate and reinforce the teaching of academic content like Afro-Latino history, society, memory, cultural expression, appropriate teaching methodology, and strategies for second language learners and planning and designing instruction leading to hands-on application.

Embracing an Inclusive Paradigm

A new focus on teaching foreign-born students or students with an identifiable culturally diverse ancestry requires that teachers and teacher

candidates acquire more profound cultural experiences to effectively educate Afro-Latinos and other diverse students in the United States. The efforts to expand the cultural experiences and worldviews of teachers might include intercultural and academic exchanges in which teachers visit diverse student populations like Afro-Latinos in the US schools and when possible in schools in designated countries. It is the deep cultural experiences such as visiting and observing educational practices in schools, community cultural events, and other social contacts within the educational practices and cultural events that provide sound experiences for a true initiation and acculturation of educators.

- groups of Hispanic origin, for example, native-born Chicanos. Arguably, imitations on their social mobility – especially their legal status as undocumented immigrants – as well as a failure to instill reflexive awareness (Giddens 1991) of the political value of building alliances with other Latinos perhaps may have led to diminished person rights (Apple 1982). That is to say, cultivating both a sense of collective praxis (Mirón 2016) as well as reflexive awareness of their culturally situated material circumstances would in the long run serve their interests to secure improved opportunities such as employment and increased wages. Concretely, for some cultural groups, for example, Central Americans who are more-assimilated minded Latinos, Chicanos conjured images of intensely politically active West Coast residents from dynamic, civic-minded local communities in Berkeley and the California Bay Area, along with the Chicano labor movement in Southern California (Valle and Torres 2000) – all of whom held historical traditions of protest and free speech. Asserting their civil liberties through community organizing and coalition building proved too much of a risk. This example is but one anecdotal evidence in a series of narratives surrounding the question of what constitutes Latino cultural identity. Moreover, the question of the construction of cultural identity for Latinos, as will be shown, has profound implications for a critical pedagogy, of Latino education, critical pedagogy having been historically associated with Latin America (Kirylo 2011).

The contours of these narratives indicated above are such that sociopolitical tensions are embedded in contradictory cultural images of Latinos. On the one hand, Latino cultural identity has often been essentialized within a sociocultural framework known as "pan-ethnicity." In so doing these essentializing images of Latinos in the social imaginary have ignored the usefulness of the "sociological metaphor of hybridity" in the deconstruction of the processes of globalization (Kraidy 2002, 2005). Pragmatically speaking, furthermore, the failure to pose effective rhetorical and political strategies around the issues of cultural diversity and public policy has had negative consequences on the plight of Latinos in this

Latino Praxis

Luis Mirón
Loyola University New Orleans, New Orleans,
LA, USA

Introduction and Overview

Until recently, Latino populations in the USA, although often citizens by birth or naturalization, did not regularly associate themselves with other

country and abroad. This essay seeks to fill this intellectual gap, focusing on the implications for a theoretically sophisticated, culturally situated Latino identity and critical pedagogy.

Much of the scholarly and popular literature, I would argue, is further problematized by what Anthony Giddens (1991, p. 16) conceives as the “situatedness of place” within the Project of Modernity, or “spatial markers.” An example of Giddens’ complex theory of self-identity in the context of advanced modernity is the multiple constructions of Latino identity in the continent of North America. For example, within the Chicano social movement, cultural identity is situated within in the plight of Mexican and Mexican American farm workers in the geographic region of the Central Valley in California. The early Chicanos migrant workers, moreover, gave rise to Cesar Chavez’ United Farm workers, whose labor struggles for social justice for grape pickers were often at odds with more assimilated-minded Latinos/Hispanics. A contrasting example is the representation of the ethnic group most prominently identified with cultural assimilation – Cuban Americans, most notably the vehemently anti-Castro refugees who fled to the USA in the 1950s and 1960s. In summary, it is clear that on the issue of cultural identity, it appears that to lump a fragmented cultural group of Latinos, whose only historical commonality is liberation from Spain into a unified Pan ethnic whole, would reproduce an essentialized representation of Latinos. But as I will assert below, unify we must.

The Fluidity of Cultural Identity

As asserted, the term “Latino” is problematic for the understanding of the constitution of cultural identity between a plethora of disparate racial and ethnic groups, the majority of whom in Latin America and the USA situate themselves in multiple discourses, dialect differences, and their individual and collective sense of place. These discourses of Latino cultural identity are often referred to, among others, as “Hispanic,” “Chicano,” or “Mestizo” (the signifier “Latin” is also deployed, but represents a somewhat dated demographic marker, which in the main refers to Latin Americans who migrated to North America post-

World War II). Perhaps more significantly for purposes here is the endemic hybridity (Kraidy 2002, 2005) of Latino cultural identity. Hybridity among Latinos gives rise to conceptual challenges when formulating a theory of action and social change to alleviate historical inequities experienced among the cultural groups described above and other victims of the *Hispanic Diaspora* across continents, which are associated with globalization generally and transnational and internal migration in particular (Mirón et al. 1998). At the end of this essay, I provide implications for global strategies designed to alleviate varying forms of inequality. Hopefully these strategies together build toward a transformative critical pedagogy of Latino education one which is grounded on a profound awareness of difference and seeks to transition beyond the “accomplished fact” of identity, which Hall observes is “always constituted within representation (1990, op cit).” The goal of this transition is the collective fulfillment of the Common Good in the context of global capitalism. The “Common Good” is operationalized as the reduction of inequality writ large (Walker 2015).

On cultural identity, Stuart Hall (1990, p. 222) notes, “[W]e should think. . . of identity as a ‘production,’ which is never complete, always in process. . . .” A contemporary example is the case of Cubans and Cuban Americans, who after five decades are now able to increase mobility and perhaps transnational migration (Mirón et al. 1998) from the island of Cuba to the Florida coast and back. Arguably, prior generations of Cubans who fled the Castro regime in the 1950s, mostly settling in Miami, psychologically abandoned the cultural roots of their homeland. They formed new cultural identities, largely assimilating into US culture. Later generations of Cubans who were born in the USA, however, grew up bilingually and biculturally. These spatially connected identities were “always in process” and provided these second-generation, culturally different Cubans held a grounded sense of place and a vivid sense of self, which was anchored in a “reflective awareness” of their spatial position in relation to US culture (Giddens 1991). These new Cuban Americans experienced a life that was

markedly different than their parents and grandparents. These cultural vignettes provide evidence for Hall's assertion that cultural identity is never a completed product. Rather, cultural identity is always a process of ongoing formation, which is not tied to temporality. It is helpful to probe Hall's theoretical notions of cultural identity more deeply as they relate to the concrete processes of Latino cultural identity at the intersections of globalization and locality (Giddens 1991; Kraidy 2002, 2005).

Cultural Identity and Globalization

For Hall, cultural identity is an ongoing process of *becoming*, never fixed in an eternity of *being*. Rather than looking backward in time to the historical roots of cultural identity, Hall (1990) argues convincingly that while recognizing the impacts that the Diaspora has had on the identity of colonized populations (Blacks, Latinos), theorists of cultural studies, identity, and the formation of subjectivity should gaze toward the future of postcolonial subjects, who creatively participate in the reconstruction of multiple forms of cultural identity in relationship to local communities and other sites of everyday lived experience. Stated differently, the discontinuous impacts of globalization, including locally grounded aesthetic resistance to the excesses of advanced capitalism such as hypermarketing and the "monetization" of art and culture (see McCarthy 2016) – these all combine to potentially alter the global processes that seem to trend toward the reproduction of Otherness in postcolonial contexts. It's with Hall's useful distinctions between the idea of a cultural identity fixed by temporality and the more fluid notions of identity production that I wish to proceed in furthering the understanding of Latino cultural identity in particular and the implications for a culturally situated critical pedagogy more generally.

The Significance of Mestizo Cultural Identity

The idea of Mestizo identity among Central and South American populations is one that theorists can appropriate to the conceptualization of Latino

cultural identity in the social imaginary in North America and across the globe. Put differently, the postmodern cultural "flows" (Mirón et al. 1998) of ideas, capital, and culture render possible on the ground of lived experience Hall's notion of the fluid, ever-evolving theory of cultural identity. Within some Latin American societies, such as Guatemala and Mexico, cultural identity stems from a fusion of indigenous and European (Spanish) racial, ethnic, linguistic, and in remote communities such as Chichicastenango in Guatemala, hybrid religious practices. Demographically, in Latin American societies, Mestizos comprise 50% of the population, having socially "inherited" a mixed European and indigenous influences (Arredondo et al. 2006), which combine to on the one hand, problematize cultural identity and on the other, open up possibility for the transformation of cultural identity across previously fragmented groups marked by profound difference.

In the USA, Mestizos account for approximately 37 million people, 66% of whom self-report Mexican heritage (Arredondo et al. 2006). I will have more to say about the consequences of sociocultural transformation in situ, transformations, leading to Freire's notion of a liberatory pedagogy (King and Swartz 2016), one which I have elsewhere described as "collective praxis" (see Mirón 2016). Underpinning these pedagogical practices of liberation are "generative themes" (Freire 2000), which Paulo Freire theorized from the ground of everyday lived culture in Brazil and, subsequently, across the world. These diasporic themes at once embrace cultural and historical differences, while seeking to reconcile difference with the goal of attacking shared oppression in the name of communitarian values.

I wish to argue that the processual formation of cultural identity emanates from a philosophical perspective of identity that is intersubjective and a pragmatic (Biesta 1994) process, which subjects actively and creatively construct. In Hall's language, cultural identity is an enduring process of becoming. Hall contrasts this conceptualization with the reified idea of a relatively static – and psychologically essentialized, completed product of being.

For example, multiple groups of Hispanic descent in the USA such as Central and South Americans, Afro-Caribbeans, and Mexicans self-identify in varying ways, depending upon their individual history, geography, and political affiliations. These groups share an identity grounded in a shared Latino culture. However, it may be argued that theirs is, nonetheless, an identity that suffers from what Popkewitz (1997) has referred to as a kind of “population reasoning.” As culturally distinct as these demographic groups are, they give rise in one fashion or the other to a sense of self that is personal, which views individuals as pitted against one another across cultural groups, while imagining a shared culture within their groups as “Mexican,” “Cuban,” “Caribbean,” etc. In post-structural parlance, the processes of governmentality, for example, population census reports define even Latino cultural groups, whose self-identity in relation to a powerful connection to family and other representations of collectivity subordinates cultural identity to a kind of atomistic individualism. Elsewhere (Mirón 2016), I have characterized these effects of structuration in the USA as states of hyper-libertarianism. These excessive states of being are marked, in turn, by extreme narcissism, all the while rationalized and politically sloganized in the name of individual liberty and freedom. The question remains: how to transcend these hegemonic trajectories and transition to a Latino praxis and critical pedagogy, which is culturally situated. And on a macro level, pedagogy and praxis are governed by the “cultural logic of hybridity” (Kraidy 2005). I assert that a prerequisite to this transformation of praxis is an embrace of cultural differences within and across multiple Latino cultural groups identified above.

A Struggle for a Postcolonial Cultural Identity for Latinos

At the outset it is important to situate the production of Latino cultural identity, one in which in turn leads to new understandings of critical pedagogy in Latino education, by situation in their manifold social, historical, political, and geographical contexts. To borrow a term, these contexts arise in situ (Reynolds et al. 2001). The struggle for a contextually specific Latino cultural

identity is an incomplete century-old postcolonial process. Despite long-forgotten victories over the colonial empires of Spain Britain, France, and arguably the USA in the case of Cuba, Latinos may yet consistently find themselves in a position of marginality. Their shared revolutionary resistance is often dismissed with a new rhetorical narrative of illegal immigration. Thus their sense of cultural (socially constructed) identity is objectified and reduced to individual pathologies such as rape (Trump 2015). The struggle unfolds along two dimensions: 1. a hegemonic narrative of delinquent behavior (and concomitant victimization) and 2. transcendence of cultural difference in pursuit of the Common Good. It appears that any sense of transcending cultural differences within and across multiple groups seems forever relegated to the self-interests, often political and economic, of the here-to-fore political and economic elites of once colonial empires (witness the emergent, current neofascist ideologies of northern Europe and the border States of the USA).

The struggles, to which I refer, therefore, are concretely human, existential, conflicts – often over cultural and moral-ethical values. These are socially ingratiated practices that operate in a Foucauldian regulatory methodology to socially control the processes of becoming – the production of cultural identity – and fix these processes in an imaginary state of a fictitious eternal being. The “trick” for formulating a sense of Latino praxis and pedagogy in Latino education is a globally construed social movement aimed at the reduction of multiple forms of inequality, which diverse Latino groups collectively share. As stated above, such a transformation of hegemonic narratives (to borrow a term) must be constituted in situ (Reynolds et al. 2001).

A Transition to a Transformative Critical Pedagogy of Latino Education

To move beyond postcolonial struggle within the context of the cultural logic of globalization (Kraidy 2005), the following two global strategies are offered: community empowerment and collective praxis. The normative rationale for these twin

pedagogical strategies are that, first, *communitarian* values must supersede individual ideals – even at the risk of compromising on the fulfillment of person rights (Apple 1982). Letting go hard-fought entitlements, for example, for the gain of the Common Good may in the long run prove fruitful for Latinos who need to build political and moral alliances with African-Americans and other victims of the Diaspora. The latter are situated in the politics of identity germane to the development of social movements such as civil rights and feminism. Second, and related to the first strategy, is that only by embracing “a collectivist orientation” (Kraidy 2005, p. 15) that shares the Latino cultural values of interdependence among kingship and extended friendship can critical pedagogy transition from its Latin American historical roots to North America and beyond.

Community Empowerment

The normative rationale provided above locates community empowerment within an inherently contradictory space. It is paradoxical. I assert that community empowerment may achieve practical utility and functionality by enabling relatively powerless individuals in political institutions – schools and universities – to exercise moral power (Mirón and Elliot 1991). Post-colonial Latinos *must achieve morale power*, that is, open the doors of power left ajar by the vacuum of any notion of the Common Good in a neoliberal culture run amok. This optimism, admittedly, borders on a utopian dream, but that without which the US society in particular must resign itself to a life of moral and cultural nihilism. Theoretically stated, an abundance of Foucauldian mechanisms of social control paradoxically opens up social space for discursive practice, which politically moral agents may exercise to reconstruct conversations about what is culturally and pedagogically possible within the realm of Latino education. After all, as documented above, it is Latino culture that is most historically equipped to pursue moral values that are both spatially proximate to differentially represented populations, as well as able to cross institutional orders (c.f. schools and neighborhoods), embraces extended friendships and a sense of family. All of these cultural assets are

markers of inclusivity. In turn, a value premium on inclusivity is a significant transitional strategic move to achieve community empowerment, leading to the ultimate transformation of critical pedagogy of Latino education and other cultural groups in the USA such as African-Americans. Ideally, this transitional strategy can be “scaled up” to a global scale.

Collective Praxis: The Sum Is Greater Than the Parts

Collective praxis is a kind of politically conscious gestalt, which brings personal, self-reflective, awareness of the historical and contextual conditions that lead to oppressed circumstances need not stop with the individual. Indeed, personal awareness is merely the starting point for a shared theoretical understanding of the conditions that wrought, among other forms of oppression, poverty, racism, the exploitation of women, and homophobia. It goes without saying that, rarely, if ever, solely individuals in isolation experience systemic disenfranchisement. By definition, this understanding of systemic suffering is *holistic*, meaning it affects entire populations of people, local communities, and in some cases, large swathe of cities, for example, Detroit and New Orleans. One data point is sufficient to drive home the fact that these forms of systemic oppression are experienced collectively, the poverty rates in urban centers such as New Orleans whose rate among African American males exceeds 50%. This collective experience of oppression, I would argue, precisely opens space for the ultimate transformation of oppression through praxis.

Affirmatively stated, both individualized and a holistic understanding among communities of systemic oppression morally necessitate an enlightened social action to change the world. I refer here to a global critical pedagogy that originates from a deep understanding – a theory of social circumstances including poverty, sexism, and racism – and culminates in an intense emotional revolt against a sometimes-nameless enemy, while at the same time embracing a deep, compassionate love for the downtrodden. Elsewhere (Mirón 2013) I have described the latter as “armed love.” To be clear my revolutionary

vision here is to move beyond militaristic metaphors to cultural weapons comprised of a sophisticated knowledge of what in a social context often involves socially constructed structures, political institutions, and social practices that embrace putative scientific conclusions. To my mind among the most prominent of these are the proposition concerning the genetically inferior nature of blacks. This deeply flawed logic caused the obvious serious misunderstanding that blacks are genetically less intelligent than whites. To this repugnant image, I add the demagoguery of the representation of Mexican Latinos as rapists and killers alluded to above (Trump 2015).

Summary

In summary, this essay has sought to comprehensively map the nuanced character of Latino cultural identity and the implications for a transformative critical pedagogy of Latino education. In so doing the essay has consistently stressed the fluid, as distinct from fixed and static, conceptualizations of Latino cultural identity, and in particular the usefulness to examine the endemic presence of Mestizo identity in Latin culture in the formation of postcolonial, Latino subjects. It is possible that this map of Latino identity, relying on Stuart Hall and Anthony Giddens, is both culturally grounded and sociologically substantive. It is not inconceivable that this conceptual groundwork may undergird pedagogy and praxis, thus inspiring the dream of “bending the arc of history” toward equality.

Introduction

While it seems that educational leadership would be a field where scholars investigate the relationship between leadership and learning as a core pursuit, there is surprisingly little work in this area (Mulford and Silins 2011). There certainly is a plurality of approaches to the study of educational leadership, but the field has largely concerned itself with organizational efficiency, development, and administration of policy and sociocultural-political critiques of leadership practice and preparation. That said, there are some notable studies that inform the field on the relationships between leadership and learning and that help establish important conceptual and empirical understandings on which current and subsequent studies can build. This entry organizes extant knowledge into three overarching categories: (a) defining leadership and learning; (b) individuals, leadership, and learning; and (c) leadership and learning as a group dynamic. In doing so, each category considers both literature related to how people learn to lead

and literature that addresses how leaders facilitate (and impede) learning in organizations. This entry concludes with brief points about the strengths and weaknesses of scholarship in this area.

Defining Leadership and Learning

Leadership and learning are both contested areas of inquiry that are conceived and explored differently in all the social sciences (Normore and Brooks 2014). Those who study leadership have developed many ways of conceptualizing and studying the phenomenon and continue to search for definitions that might provide coherence across traditions and lines of inquiry. Northouse (2012) conducted a useful cross-disciplinary review of literature related to leadership theories and identified several approaches that cut across disciplines. His review identified the following perspectives:

1. Leadership as traits
2. Leadership as skills
3. Leadership as behavior
4. Situational leadership
5. Path-goal theory
6. Leader-member exchange theory
7. Transformational leadership
8. Authentic leadership
9. Servant leadership
10. Adaptive leadership
11. Psychodynamic approach
12. Leadership ethics
13. Team leadership
14. Gender and leadership
15. Culture and leadership

Rather than expanding on each, suffice it to say that leadership is conceptualized in a variety of ways that take into account various frameworks and variables that emphasize different individual and group dynamics.

In the subfield of educational and school leadership, the knowledge base has been shaped by a number of eras or movements (Brooks and Miles 2008):

1. **Spirituality and Values Movement.** In the final decades of the nineteenth century and into the beginning of the twentieth, the purpose of schooling was largely about teaching respect for authority and order in society, largely by inculcating youth with religious doctrine. Simple lessons in reading and writing were often so that students could read scripture and carry out basic job functions. Administrators of this era were often also teachers themselves, and they focused on individual discipline as a way of helping to produce an adult in-line with societal expectations.
2. **First Wave of Scientific Management.** Much thinking about administration in the early decades of the twentieth century was shaped by the likes of Ellwood Cubberley and George Strayer, who were heavily influenced by the work of Frederick Taylor. Taylor was focused on efficiency, and this led to a vision of management rooted in Rational Choice Theory that assumed that administrators' or managers' work was essentially to create the proper inputs or stimuli in order to yield the desired organizational results. This line of thinking heavily influenced early administrative practices, which may have provided some direction and improved outcomes in some respects, but also stifled creativity and innovation while championing the notion that there was one best way for an organization to function.
3. **The Theory Movement and the Social Science Movement.** These two mid-twentieth-century movements had related yet dissimilar ends. The Theory Movement sought to create and test theories of administration, management, and leadership that could capture the complexity of the work. The idea was to build elaborate models that might help advance a new science of administration. The Social Science Movement on the other hand sought to make management and leadership an extension of various social sciences – particularly political science, anthropology, and sociology. During this time, scholars adopted, adapted, and explored various theories and methodological approaches. Both of these movements continue to influence the way that scholars and practitioners conceive the work of educational administration.
4. **The Postmodern Turn.** The late 1970s and 1980s saw educational leadership research and practice embrace the notion that there is no “one size fits all” way to study and practice educational leadership. The field saw an increase in the number of scholars employing critical theory, multicultural lenses, feminist theory, and critical race theory as viable ways to interrogate extant inequitable practices.
5. **Second Wave of Scientific Management.** The 1990s and first decades of the twenty-first century saw the field again interested in efficiency, but now it was connected to a heightened emphasis on standardized testing and high-stakes accountability.

More recent developments also include an expansion of the concept of trust in relation to educational leadership practice and an interest in distributed leadership (Spillane 2006). These trends and eras have gone a long way to define the ways that modern scholars and practitioners conceptualize the relationship between leadership and learning. In some ways, certain aspects of all of these eras continue to find traction today, even as contemporary conversations have sought to define these elusive concepts in more precise ways.

Efforts to define learning are likewise varied in their orientation. Theoretical perspectives on learning include social cognitive theory, cognitive information processing theory, neuroscience, content-area learning, and motivational theories and examine issues such as memory, transfer, self-regulation, modeling, metacognition, forgetting, cognitive growth, attribution, and self-concept (Schunk 2008). In the field of educational leadership, it is common for scholars to use aggregate, and in a few instances disaggregated, standardized test data as a proxy indicator for learning, and to accept the notion that leadership has either direct or indirect effects on learning (Leithwood et al. 2006; Mulford and Silins 2011). Certain scholars have explored other perspectives on learning and educational leadership, such as Evers and Lakomski (2000) whose work explores

cognition and learning based on neuroscience and Spillane's (2006) introduction of distributed cognition. But there remains a paucity of perspectives on learning in the educational leadership literature.

Individuals, Learning, and Educational Leadership

Several issues are pertinent to the relationship of leadership for learning. One of the richest areas of inquiry over the past thirty years comes from an interest in educational leadership development. This interest has inspired a plethora of studies examining leadership preparation in school and university settings. Among key findings in this area are:

1. There is no single set of traits that ensures successful leadership – leaders are made or emerged; they are not born. This means that many people who choose (or are chosen) can practice their conceptual, technical, and relational skills, increase their knowledge, and develop their dispositions. That being said, certain traits, particularly those related to communication and relationship building, have shown to be associated with various forms of improved effectiveness (Leithwood et al. 2006).
2. Prior experience with education and with leadership forms an initial mental model that shapes the way that an individual develops skills, dispositions, and new knowledge. It is useful (and perhaps necessary) for people to interrogate their assumptions about leadership in order to learn new ways of thinking and behavior. The process of learning about leadership should be coupled with a process of unlearning erroneous assumptions about leadership.
3. Individuals need to develop both hard and soft skills to be effective as a leader. Leadership includes (at least) affective, technical, and cognitive aspects of personal development. Leadership development programs that neglect one or both of these are less effective than those that include both.
4. There is value in both classroom-based and on-the-job training and leadership development. If designed in concert, these two aspects of leadership development can be complementary, but if learned in isolation they can also create confusion and conflict. It is often the case that preservice leadership development programs work on a high level of abstraction, teaching about theory and purposes of leadership and helping students reflect on their assumptions, while on-the-job training is more focused on the day-to-day work of education and schooling.
5. Socialization and leadership succession are critical for individual growth and success as a leader. This pertains to both school and university settings and relates to the leader's induction and orientation into work roles and their learning with respect to the informal or unspoken dynamics of the organization.
6. Leadership entails ethical and advocacy components that individuals must develop through reflection and practice. Leadership demands that individuals take a stand on important issues and that they work with integrity and ethical practices.

In short, there is ample evidence that individuals can learn to lead (Darling-Hammond et al. 2007). As leadership includes psychological, social, cultural, cognitive, affective, and ethical dynamics that manifest as skills, dispositions, and knowledge, it is possible for people to develop in these areas through both formal programming and on-the-job practice.

Leadership and Learning as Dynamics in Groups and Organizations

Among fundamental questions that educational leadership scholars and practitioners ask is – does educational leadership influence the ways that teams, groups, and organizations learn? In order to explore this question, scholars have undertaken various studies that both deepen and challenge our understanding of leadership in various organizational contexts. In their

influential report, Leithwood et al. (2004) conducted a review of leadership research that led them to suggest that there are seven claims that can be made about school leadership. These seven points serve to frame the discussion about the relationship between learning and leadership in schools:

1. *School leadership is second only to classroom teaching as an influence on pupil learning.* One of the key debates among educational leadership scholars relates to whether leadership has a direct and/or indirect effect on learning. Mulford and Silins (2011) point out that when exploring the relationship between principal leadership and student achievement, teacher practice is a mediating variable, which suggests that the relationship between the two is necessarily indirect. Leithwood et al. (2006) likewise suggested that “leadership is second only to classroom instruction among all school-related factors that contribute to what students learn at school [and that] the total (direct and indirect) effects of leadership on student learning account for about a quarter of total school effects” (p. 5). Other scholars argue that:
 2. *Almost all successful leaders draw on the same repertoire of basic leadership practices.* These practices include (a) building vision and setting directions, (b) understanding and developing people, (c) redesigning the organization, and (d) managing the teaching and learning program. It is important to recognize that these practices are broadly conceived – there are many ways to approach these activities that may or may not work in a particular context or situation.
 3. *The ways in which leaders apply these basic leadership practices – not the practices themselves – demonstrate responsiveness to, rather than dictation by, the contexts in which they work.* Over the past several decades, educational leadership scholars have recognized the importance of context in both leadership preparation and practice. Initially, this manifests in the form of suggestions about shaping school culture, but has evolved into suggestions that leaders must be responsive to contextual dynamics rather than manipulators of said dynamics.
4. *School leaders improve teaching and learning indirectly and most powerfully through their influence on staff motivation, commitment, and working conditions.* Internal and external motivation has been at the heart of leadership studies since its inception. Scholars suggest that while both of these forms of motivation can yield effective results, teacher morale and effectiveness tend to be higher when the primary driver is internal as opposed to external. Positive external motivation in the form of bonuses or other incentives and negative external motivators such as punishments or sanctions can create competition between those who should be in collaboration, reducing the effectiveness of the entire organization. In terms of commitment, this is both individual and organizational. The school leaders must exhibit their own commitment to the school’s goals and help shape them in a way that followers can embrace and find motivation. Leaders are also uniquely positioned to influence working conditions, and indeed poor working conditions and lack of administrator support are commonly cited as reasons that teachers leave a school or the profession altogether.
5. *School leadership has a greater influence on schools and students when it is widely distributed.* Research on distributed leadership suggests that in order to capitalize on the expertise in schools, leadership should be distributed in a fluid manner among leaders, followers in different situations. This means, for example, that it is important for a principal to recognize when they should step forward and when they should empower others who have more expertise in a given situation. Moreover, this distribution should remain flexible so that leaders and followers can adapt to new and changing circumstances

rather than being bound by tradition or rigmarole.

6. *Some patterns of distribution are more effective than others.* Importantly, distribution is not delegation and cannot become leader disengagement. School leaders who share resources and time with followers rather than apportion them as rewards or punishments are more likely to be effective. Authentic empowerment of others is the most meaningful and positive form of leadership distribution.
7. *A small handful of personal traits explains a high proportion of the variation in leadership effectiveness.* It is important for leaders to be adaptable and to have a positive disposition. Indeed, “the most successful school leaders are open-minded and ready to learn from others. They are also flexible rather than dogmatic in their thinking within a system of core values, persistent (e.g., in pursuit of high expectations of staff motivation, commitment, learning and achievement for all), resilient and optimistic” (Leithwood et al. 2006, p. 14).

Strengths and Weaknesses of Current Conceptualizations About Leadership and Learning

As a field, educational leadership has made modest progress with respect to understanding the relationships between leadership and learning. That said, it is important both to critique extant research and to consider ways it might be improved. Broadly speaking, there are two issues that scholars should consider as they move forward with their work related to leadership and learning. First, it is important for scholars to explore new ways of conceptualizing learning. Relying only on possibly flawed student achievement scores is not always an appropriate way of understanding learning. While this certainly fits into many policy frameworks, there are many ways of conceptualizing learning, particularly in a developmental sense, that such scores cannot ascertain. It is important for educational

leadership scholars to begin to explore some concepts related to cognition, developmental scaffolding, memory, and other learning constructs in order to create a more rich and nuanced perspective on the topic (Schunk 2008). Second, it is important for scholars to explore learning and leadership using a variety of research methods. For the most part, this relationship has been explored strictly via quantitative analysis, but it is critical that scholars also explore the relationship using qualitative and mixed-method approaches. Only then will we have a deep understanding of the relationship between leadership and learning.

Leadership Research and Practice: Competing Conceptions of Theory

Introduction

A specialized knowledge base is a prerequisite for human enterprises to be considered professions and for the individuals associated with particular professions to be called *professionals*. Professionals are presumed to know things – and, consequently, be able to do things – that ordinary people do not know and are unable to do. So, if we need someone to design a bridge, we turn to an engineer who has scientific knowledge applicable to bridge building, and if we require surgery, we go to a physician steeped in the findings of medical science.

It is hardly surprising, therefore, that those involved with the enterprise of education have expected social scientists to generate specialized knowledge about various aspects of educational practice. Once generated, such knowledge presumably can be disseminated in university programs designed to transform ordinary individuals into teachers, school counselors, and school administrators. Furthermore, given social scientists' emphasis on theory development, it should come as no surprise that the knowledge educational researchers tend to seek – and that normally gets disseminated in education-related programs – is theoretical knowledge. The term *theoretical knowledge*, however, has a less precise meaning in the social sciences than it does in the physical sciences which ground fields like engineering and medicine. This discussion explores different conceptions of theory that

have influenced – and continue to influence – leadership research and practice.

An Organizing Framework

Whenever a topic being discussed is complex and multifaceted, it is helpful to have an organizing framework to structure the discussion. Here a framework first articulated by Habermas in 1968 will be employed. Habermas indicated that the generation of knowledge is influenced by three quite different interests or purposes:

- (a) The interest in predicting and controlling events and situations, which Habermas calls *the technical interest* and associates with the empirical-analytic sciences;
- (b) A so-called historical/hermeneutical interest in understanding and describing people and situations, an interest that is reflected in the work of most social/cultural anthropologists, as well as most scholars in the discipline of history (a discipline normally associated with the humanities rather than the social sciences);
- (c) What Habermas calls *the emancipatory interest*, an interest exemplified in the work of critical theorists and, more recently, by scholars characterized by labels such as *post-modernist*, *poststructuralist*, *feminist*, and *indigenous*.

Theory for Prediction and Control

Habermas (1968) was clear about what the term *theory* means for those who exhibit a technical interest in knowledge generation: "Theories comprise hypothetico-deductive propositions of connections, which permit the law-like deduction of hypotheses with empirical content," he wrote. He added that the "hypotheses with empirical content" he referred to "can be interpreted as statements about the co-variance of observable events; given a set of initial conditions, they make prediction possible" (p. 308). Of course,

once professionals have the power to predict what will happen under specified conditions, they also, in principle, have the power to arrange conditions to produce desired outcomes.

For more than a century, an interest in prediction and control has motivated a substantial number of researchers in the field of education. In the lead article of the inaugural issue of the *Journal of Educational Psychology* published in 1910, for example, Thorndike wrote,

A complete science of psychology would tell every fact about everyone's intellect and character and behavior, would tell the cause of every change in human nature, would tell the result which every educational force . . . would have. It would aid us to use human beings for the world's welfare with the same surety of result that we now have when we use falling bodies or chemical elements. . . . Progress toward such a science is being made. (p. 6)

Similarly, those who founded the educational administration field during the first half of the twentieth century, e.g., Ellwood P. Cubberley and Franklin Bobbitt, frequently compared schools to factories and suggested that the work of educational administrators was analogous to the work of industrial engineers.

By the middle of the twentieth century, many leadership researchers also had discovered theory. The so-called theory movement that emerged in the educational administration field in North America in the 1950s, for example, envisioned a symbiotic relationship between theory, research, and practice. Theory movement advocates argued that empirical work should be rooted in and guided by theory about cause/effect relationships and, equally important, that theory should be validated and, if need be, modified or even rejected based on empirical results. The expectation, in short, was no longer that the findings produced by particular studies should dictate leadership practice; rather, research findings were expected to validate theory and validated theory was to be used by practitioners to predict and control events.

In North America's educational administration field, interest in the theory movement per se waned after a decade or so. Its tenets, however, are still widely accepted by the educational

research community generally as evidenced by the publication in 2002 of the National Research Council's *Scientific Research in Education*. The authors of that small but influential book wrote,

Every scientific inquiry is linked, either implicitly or explicitly, to some overarching theory or conceptual framework that guides the entire investigation. Science generates cumulative knowledge by building on, refining, and occasionally replacing, theoretical understanding. (National Research Council 2002, p. 3)

In other parts of the world, North America's theory movement helped inspire much more sustained and sophisticated attempts to construct a defensible theory of educational administration. Evers and Lakomski's decades-long effort to develop such a theory, for example, went far beyond a narrow concern with prediction and control. However, even as they updated traditional conceptions of science, articulated criteria for assessing the relative worth of competing theories, and tackled a range of other complex issues, Lakomski and Evers (2001) were clear about their bottom-line goal: "We need to develop good theory . . . that makes prediction possible, and thus aids us in the development of guides to action" (p. 496).

Educational leadership/administration researchers' interest in generating theories that can be used for the purposes of prediction and control is understandable. Schools, after all, are expected to produce prespecified outcomes; consequently, it makes sense to try to develop theories about cause and effect relationships that will tell school leaders how to exercise leadership and organize educational environments to generate the outcomes desired.

There was an obvious problem that arose when researchers attempted to produce this sort of theory: Theory is general but schools, classrooms, teachers, and students are inevitably idiosyncratic. So even if a theory is strongly supported empirically by *aggregate* findings, it will not necessarily predict what will happen in a *particular* educational context. Consequently, even well-supported theories that have been developed with a technical interest in mind

might make school leaders more thoughtful gamblers; they cannot, however, function as definitive formulas for either structuring particular educational settings or engaging in specific leadership practices to achieve prespecified goals.

Theory and the Interest in Understanding

The idiosyncratic nature of educational phenomena is not a problem for researchers motivated by Habermas' historical/hermeneutical interest. Indeed, generating and validating general theories that promise the powers of prediction and control in a variety of settings is not the goal of either most historians or most social/cultural anthropologists (or of educational researchers influenced by the thinking and methods found in the fields of history and/or anthropology). Rather, their goal, more often than not, is to understand the idiosyncrasies of particular social settings. To use anthropologist Clifford Geertz's (1983) terminology, anthropologists want to generate *thick description* that explicates the complex (and invariably idiosyncratic) interpretations that members of a cultural group construct to make sense of the world in which they live. Most social/cultural anthropologists' (and, also, most historians') goal, in short, is to generate what Geertz calls *local* (as opposed to generalizable) *knowledge*.

Theory does have a role to play in the generation of thick description and local knowledge, but theory, within this orientation, is no longer the desired end product of the research process. Rather, theory is more a rhetorical tool for bringing some semblance of order to inevitably complex (and always idiosyncratic) social phenomena. To quote Geertz, theory's role is to "make thick description possible" (Geertz 1973, p. 28). Thus, the philosopher of history, William Dray (1966, 1957c, p. 47) noted long ago that when a historian subsumes a historical event under a theoretical construct, e.g., the construct of a *revolution*, the historian's work is far from finished. Indeed, the historian, in most cases, will be more interested in documenting how the particular revolution the historian is studying differs

from other revolutions than in describing how it is similar.

For the historical/hermeneutical researcher, then, theory serves a largely heuristic function. Theory links the idiosyncratic situation or event a researcher has studied with other idiosyncratic situations and events. But, it does so without masking the idiosyncratic elements in the setting that the historian has explored. Geertz, in fact, has noted that, in the field of cultural anthropology, at least,

the major contributions [of an anthropological study]...are very difficult to abstract from...[the details of particular cultures] and integrate into anything one might call "culture theory" as such. Theoretical formulations hover so low over the interpretations they govern that they don't make much sense or hold much interest apart from them. This is not because they are not general (if they are not general, they are not theoretical), but because, stated independently of their application, they seem either commonplace or vacant. (p. 25).

The potential utility of thick description and local knowledge for an applied field like educational leadership is not as obvious as the potential utility of theory that promises to provide the powers of prediction and control. Skeptics inevitably ask: What can an educational leader learn from reading thick descriptions of idiosyncratic organizations that, by definition, are different from the organizational setting in which the educational leader works?

One answer to the above question is that the historical/hermeneutical perspective can serve as an antidote for talk of prediction and control. The historical/hermeneutical perspective's focus on the idiosyncrasy of organizational life, in other words, is a reminder to school leaders to resist both the urge (a) to implement overly choreographed interventions and programs and (b) to require that an intervention or program be implemented with complete fidelity (rather than allowing for sensible adaptation to accommodate the uniqueness of particular schools, classrooms, teachers, and/or students).

Canadian scholar Thomas Greenfield (Greenfield and Ribbens 1993) suggested another answer to questions about the utility of work reflecting a historical hermeneutical interest:

Such work reminds us that educational organizations are, *at base*, more ideational than material and more associated with the meaning organizational members make of an organization's structures and policies than with the structures and policies themselves. Leaders who ignore this fact (and, consequently, ignore or even underplay the interpersonal dimensions of organizational life) do so at their peril.

Both of the rationales for the utility of historical hermeneutical research discussed thus far have more to do with the general perspective of historical/hermeneutical researchers than with the particular findings historical/hermeneutical oriented scholars produce. To understand the potential utility of particular historical or hermeneutical studies – to understand, for example, why it might be useful for contemporary principals (including female principals) to read Harry Wolcott's now classic thick description of a "man in the principal's office" or even anthropologists' accounts of initiation rites in so-called tribal cultures – one must consider efforts to expand the definition of generalizability.

At least one of these efforts suggests that even idiosyncratic findings can be generalizable if generalizability is conceptualized in psychological terms. Much like direct experiences in the world, the vicarious experiences provided by anthropologists' ethnographies and historians' accounts of different places and times can lead to the creation of more integrated and differentiated cognitive schema (Donmoyer 1990). Leaders with more complex and sophisticated cognitive schema at their disposal presumably will be able to perceive the world in more nuanced ways and, consequently, make more thoughtful, better-informed, and more appropriate decisions.

Theory and the Emancipatory Interest

Theory is once again the front and center in scholarship reflecting what Habermas calls the emancipatory interest. Indeed, the emancipatory interest was initially manifested in something called *critical theory*.

There are a number of different types of critical theory, and as was noted at the outset of this entry, other exemplars of the emancipatory interest also have emerged in the social sciences and humanities in recent years. Most of these exemplars bear at least a family resemblance to critical theory, but emerging intellectual and methodological traditions such as postmodern, poststructuralist, feminist, and indigenous research also have their own unique characteristics. Due to space limitations, this discussion will be limited to what, arguably, has been and continues to be the most influential emancipation-oriented tradition in the administration/leadership field: the critical theory tradition that educational administration scholars Richard Bates (1982) and William Foster (1986) imported from the so-called Frankfurt School during the final decades of the twentieth century.

Frankfurt School scholars (including, in the Frankfurt School's later years, Jürgen Habermas) espoused a form of Marxist theory. The Frankfurt School's neo-Marist theory, however, challenged a number of tenets of classical Marxist thought. Despite these challenges, neo-Marxist theory did embrace the Marxist assumption that society is structured in ways that automatically advantage some and disadvantage others. Also retained was the Marxist notion that social class is a determinant of whether one was in the advantaged or the disadvantaged group, though, especially when Frankfurt School thinking was transferred to the educational administration and leadership field, race and gender were added to the list of factors that determine society's winners and losers.

Critical theorists' indebtedness to Marxist thought has led some scholars to conclude that critical theory is less theory and more ideology, and some critical theorists do not dispute this claim. Instead, they argue that all forms of theory are ideological; critical theory is simply openly ideological, while traditional social scientists keep their ideological proclivities hidden, so well hidden, in fact, that those who develop traditional types of theory may not even be aware that theory development inevitably is a political act that benefits some while disadvantaging others. Even if they understand this point, critical theorists argue that traditional researchers normally do not realize

that the impact of their work has less to do with the data they collect than with the a priori framing that precedes data collection. Two brief examples may help clarify this last point, a point that undoubtedly will seem counterintuitive to some.

First, consider a researcher who opts to study the school achievement of students the researcher characterizes as being *culturally disadvantaged*. The researcher's decision to use the term *culturally disadvantaged* rather than, say, *culturally different* virtually guarantees that any problems that are identified in the study will be attributed to the students and/or their families and communities, not to the school or governmental policy.

The second example focuses not on the language used to frame a study but on design choices researchers make that largely preordain what their "empirical" findings will be. Where I live, many children's first language is Spanish rather than English, and, consequently, when they come to school, many are still in the process of learning the school's language of instruction (i.e., English). In addition, when the students participate in the government-mandated testing program to determine how much they have learned and who, in fact, has learned the most, the tests students take are entirely in English. Testing exclusively in English is a choice made by test makers, especially in an era in which many businesses greatly value bilingualism. But the exclusive use of English to write test items guarantees that certain students will be judged the school game's winners (even though they may have learned only one language) and other students will be tagged *losers* (even though many in the loser category have mastered one language and are in the process of mastering another).

Critical theorists in the educational administration/leadership field critique the sort of research and evaluation decisions that were just described in an effort to expose the very unscientific nature of supposedly scientific findings. Their long-term goal is to undermine what Marxist-inspired scholars call false consciousness and insure that biased story lines that inappropriately "blame the victim" and designate some as winners and others as losers do not become self-fulfilling prophecies.

Critical theorists' critiques almost certainly have contributed to the growing concern among school leaders with promoting social justice in schools. Still, skeptics might ask both whether a commitment to critique is sufficient to accomplish the goal of emancipation and whether emancipating school leaders intellectually is sufficient to withstand, in school contexts, forces that critical theory suggests are lodged primarily at the macro-level rather than the microlevels of society.

Conclusion

Educational administration/leadership researchers are often a rather Balkanized bunch. They tend to interact with those who think – and think about theory – as they, themselves, do and seldom associate with anyone who thinks differently. This discussion has explicated a variety of ways that theory has been conceptualized and considered, albeit briefly, both the potential utility of and the likely problems with each conceptualization.

Introduction

The advent of a multitude of digital sources has massively increased the scope and scale of information available to learners. Therefore, being media literate by having the ability to integrate, evaluate, and produce knowledge effectively from different sources has become a key life skill in the digital age. Being media literate enables individuals to maximize their use of technology across platforms within a range of social, ecological, and occupational contexts. For this reason, an understanding of how learners learn and how they develop the requisite skills to engage effectively with new educational technologies in different

learning contexts is required. This entry outlines the importance of understanding the concept of media literacy in theory and also how these skills develop and are used in practice. The socio-ecological contexts in which they develop and the psychosocial dimensions that underpin the effective application of media literacy skills for learning are considered.

The Development of Literacy Practices in Context

The increasing availability of information from a multitude of sources ranging from traditional expert texts, weblogs, and coproduced wikis focuses attention on how literacy practices change, along with the curation and coproduction of online content in educational and social contexts. Being media literate requires learners to be able to access, understand, and create such content. In turn, being media literate enables individuals to maximize their use of communicative technology across a range of platforms (e.g., Internet, television, games, mobile phones, and wearable communication devices) within a range of social, ecological, and occupational contexts. A bidirectional relationship exists between technology and literacy development: technological advances not only support new means of communication and interaction but also stimulate ways of so doing. Technology influences language itself, with the advent of textese, emoticons, and emojis (digital ideograms): their appropriate use and interpretation requires the appropriate media literacy skills.

Technological advances have had a major impact on learning and teaching across all educational sectors at all levels. Black-/whiteboards have been replaced with smartboards and laptops, and tablets are replacing jotters and notepads. Virtual learning environments (VLEs), initially repositories for information, now support interactive and collaborative activities. Technology is being used to increase access to learning (e.g., via distance learning) and to improve the learning experience by supporting the provision of timely formative feedback. More recently, the benefits of

Web 2.0 are being realized with the increasing use of networked learning, which takes place via, for example, collaborative games, simulations, and other forms of joint activity. This enables learners to develop their autonomy and manage their own learning. Most online content is multimodal, dynamic, context specific, and socially mediated in form (Coiro et al. 2008). Web-based ecologies of learning can be sought out by learners to suit their own learning habits, needs, and behaviors, with greater choice and discretion being afforded to the learner in terms of when, how, and with whom they learn. In summary, the learner is increasingly able to exert their individual agency to their benefit. Such agency, while crucial for deep and enduring learning, must nevertheless be accompanied by a number of skills and literacies, for learning to be effective. Central to these is media literacy, the ability to integrate, evaluate, and produce knowledge effectively from different sources (Ofcom 2015). The importance of media literacy is now examined from a critical perspective and then in relation to a range of new literacies.

The Importance of Media Literacy

A motivation for individuals (and, by extension, societies) to become media literate is that it enables exertion of individual agency, choice, and expression. By becoming media literate, individuals as learners in the narrow sense and individuals as citizens in the broader sense are able to not only identify, interpret, and evaluate sources of information: they, crucially, are in a position to apply their own judgment to both the sources used and the content found. They are able to make choices in digital domains where often a multitude of sources and materials compete for a person's time, attention, favor, money, and use. It is by exercising one's own agency that individuals can mitigate against other bodies and parties, be they social, political, or economic making those decisions for them. Such influences may never be entirely removed; however, they can be weakened by individuals being media literate. Media literacy also mitigates against the technology itself

making those decisions about material on behalf of the individual, e.g., the prioritization of material that is returned by search engines. Literacies of all kinds are practiced within social contexts that are subject to social conventions, broader cultural practices, varying dominant ideologies, social discourses and narratives, differing belief systems, and different regulation and legislation. With the rise of globalization and the global Internet, individuals need to be aware of and sensitive to such differing sociopolitical influences in the multicultural digital world and the way in which these forces shape the nature of information and the manner in which knowledge is constructed. Crucially, critical pedagogies along with critical social theories such as critical gender theory have been instrumental in empowering learners to deconstruct sources and materials. Deconstruction alone, however, is not enough: critical construction and critical reconstruction are at the heart of media literacy. Media literacy distinguishes itself from other literacies, with its inclusion of the ability to generate new content in collaboration with others. The critically analytic media literate scholar is in a position to engage critically with both materials and other people and to challenge them.

Media Literacy and Its Development

The term literacy is conventionally used to refer to the ability to read and write in traditional off-line print contexts. In contrast, the term media literacy was initially used to capture the ability to interpret mass media such as film, the press, and television but has come to reflect the use of web-based technology and expanded to include the production as well as the consumption of content. Media literacy is defined by the United Kingdom's telecommunications regulator as "the ability to use, understand and create media and communications in a variety of contexts" (Ofcom 2015, p. 19). The United Nations Educational, Scientific and Cultural Organization (UNESCO), by comparison, views media and information literacy as a composite concept needed for democratic participation. UNESCO (2015) nevertheless shares the

focus on the critical evaluation and production of content. The traditional tight focus of media literacy on the interpretation and response to mass forms of media nevertheless remains, with applications including a range of health-related interventions, to help promote critical thinking and reduce any potentially negative impact of mass media images both online and off. Given the proliferation of digital information available, especially learner-generated content, the ability to think critically about information must remain a key aspect of media literacy.

The Evolving Concept of Media Literacy

Being literate in the traditional sense of being able to read and write facilitates a fuller participation in society, self-development, employment opportunities, and social mobility. The same applies in the global digital world where digital media skills are essential to support digital inclusion. The complexity of technology and its use is reflected in the evolving concept of media literacy. Initially, terms were singular and referred to literacy, e.g., transliteracy (Thomas 2008) refers to the ability to communicate across all platforms, including electronic ones. Increasingly the terms are plural, e.g., multimodal literacy (Jewitt and Kress 2003), media literacies, digital literacies, and information literacies, reflecting an increasing understanding of the complex abilities, skills, preferences, and social norms that shape technology use.

Media literacy distinguishes itself from both digital and information literacy as it refers to the ability to maximize one's use of communicative technology across a range of platforms (e.g., Internet, television, games, and mobile phones) within a range of social, ecological, and occupational contexts. By comparison, information literacy can be defined as the ability to critically appraise the nature of diverse forms of information (JISC 2014), whereas participatory literacy refers to those abilities that enable content generation, especially collaborative production across a variety of online platforms. As formal methods of supporting learning give way to more open, informal, and collaborative methods that support

content co-creation in different contexts, media literacy is therefore the literacy that is of greatest importance in networked learning ecologies. It is by being media literate that the learner will be able to maximize the learning opportunity in these learning environments.

Media Literacy as a New Literacy

Media literacy is one of the “new literacies.” Within education the term refers to those abilities and skills that are required for effective use of digital platforms within and between digital ecologies. Therefore, understanding the reach of digital technologies necessitates input both theoretically and methodologically from disciplines such as computer science, psychology, sociology, and education. However, the stretching of the concept leads to a proliferation of definitions and different uses, leading to a lack of clarity. Focusing on definitions, while necessary, can also prove counterproductive for both policy and practice (Livingstone et al. 2012). Our understanding develops with technological advancement; therefore, working definitions that are open to development are essential.

Perspectives on Media Literacy

The different perspectives on media literacy mirror those relating to traditional print literacy and reflect the debate regarding whether literacy be viewed as an individual skill or as a social practice drawing upon social and ecological perspectives. Outlined below is an overview of the two main perspectives on media literacy: as individual competencies and as social practice. This discussion demonstrates the advantages to be gained by ultimately adopting a conjoint, interdisciplinary perspective that situates individual skills within their socio-ecological contexts.

Media Literacy as an Individual Skill

Despite learners potentially taking differing perspectives on knowledge that may influence their learning (Baxter Magolda 1992) and despite

differences in scope and focus, the definitions of media literacy and the related concepts such as information, digital and participatory literacy, share the common underlying assumption that media literacy is an individual skill. Initially such skills were limited to one's ability to use technology itself, typified by the European Computer Driving License. The scope of these skills has expanded to meet the requirements of evolving online contexts to include not only comprehension of content but also production, especially collaborative production. Much of the pioneering work concerning media literacy in educational contexts has been undertaken by the United Kingdom's Joint Information Systems Committee (Jisc). Their conceptualization of media literacy is broader in scope than most traditional skills-based definitions and is situated within the wider context of digital literacy. Digital literacy is defined not as a single entity but as a global skill set. There are seven elements within the Jisc model: (1) being able to critically read and create content across different media (media literacy); (2) identifying, understanding, and managing information (information literacy); (3) digital participation (digital scholarship); (4) formal and informal effective learning (learning skills); (5) taking up digital applications (information and communication technology literacy); (6) managing one's digital identity (career and identity management); and (7) participating in digital networks in order to learn (communications and collaboration) (JISC 2014).

Evaluation of the Jisc Model

The wider conceptualization of digital literacies proposed by Jisc extends our understanding of the complex nature of the skills required to operate in online contexts. Furthermore, this framework captures the fact that both media and digital literacy skills not only evolve over time but vary across contexts. This indicates the necessity of adopting a broad view of the digital literacy skills that support learning. Media literacy in its narrowest sense of being able to critically comprehend and produce digital content is a necessary, but not a

sufficient, skill to support learning in the digital age. Learners require a range of skills: finding, interpreting, evaluating, and managing information as well as the collaborative generation or production of new digital content in order to maximize their learning. This framework is therefore useful as it acknowledges the influence of context; however, the situated, social dimensions require greater scrutiny than it offers.

Media Literacy as a Social Practice

At the heart of the second perspective is the appreciation that media are used for a purpose within local, global, transactional and transformative, social, and political contexts. With its roots in Bronfenbrenner's Ecological Systems Theory, this perspective draws upon the transactional relationship between individuals (learners) and their context (Bronfenbrenner and Ceci 1994). As such, daily life is recognized as providing learning ecologies which both shape and are shaped by their inhabitants. Given the global nature of these learning ecologies, it is necessary to adopt a multi- and transcultural perspective on the use of social media by its ethnographically diverse users (Livingstone 2015). Sociodemographic factors such as age, gender, and socioeconomic status play an important role in determining one's media-related practice. Age predicts not only Internet use but the likelihood that new online content will also be created. The role of gender is complex, as it is influenced by other psychosocial factors. While women are less likely to post new content, this difference diminishes as the required skill set increases, and students with higher social status have been found to be more likely to generate new online content.

Media Literacy: A Situated Skill

The distinction between individual skills and more sociological situated practices has a long history with respect to literacy which carries over into the discourse on media literacy. Such polarization is unhelpful as it is only possible to understand the nature of media literacy when it is viewed in context. Recognition of the importance

of capturing both the individual skills and the context-dependent dimensions of media literacy skills is paramount. It should be noted, however, that the negative aspect of using the term literacy can be conceptualized from a number of different perspectives (Livingstone et al. 2012), at the level of the individual (i.e., an ability or skill) or at the level of society (sociological or ecological perspective).

The skills perspective recognizes both of these elements and provides a framework that supports the identification of context-dependent digital literacies in each context as required. Future conceptions of the skills required, whether termed media literacy or otherwise, must capture the dynamic and context-dependent nature of the requisite skills. This addresses the need to contextualize skills which is a weakness with traditional skills-based approaches. The Jisc approach addresses some of these weaknesses by highlighting the need to consider the context in which skills are used. However, a full understanding of the nature and application of skills is only possible if these skills are fully situated in their wider ecological context. A *situated skills approach* to media literacy reflects the fact that media literacy skills are shaped by a complex range of sociopolitical factors and a number of psychological factors such as self-esteem, working memory, and motivation and more general socio-technical factors (e.g., social norms, learner experience, and user experience (UX) design). While it is possible to specify which media literacy skill(s) may be required, it is not always easy for learners to develop and utilize these skills when necessary as their application may be shaped by these influences.

Becoming Media Literate

Parental behavior concerning information technology use generally, and behavior, attitudes, and media literacy skills of parents specifically, plays a major role in shaping media literacy skills (Marsh et al. 2015). The development of appropriate media literacy skills might entail parents scaffolding the learning of media literacy skills

by their children. For learners to inhabit rapidly changing, global, collaborative digitally enhanced learning spaces, they need to take charge of both their own learning and their responsibilities to other learners. There is a close relationship between media literacy skills and Internet safety which unfolds over time and with use and expertise. Therefore, knowing how to optimize the benefits of digital life in a secure way is an increasingly essential learning and life skill. Terras and Ramsay (2012) identify a number of challenges that learners encounter when using digital technologies. These include (but are not restricted to) becoming aware that their learning is distributed and situated across people and time and recognizing and accommodating the fact other learners may be in other time zones and locations, with different schedules of behaviors. The media literate learner is the one who becomes aware that learning in mobile contexts may require them to split their attention – the management of cognitive effort when attention is split can be taught (Roodenrys et al. 2012). Such abilities are underpinned by psychological and learning skills such as self-regulation, which involves being aware of what one is learning and how one is learning.

Conclusion

Media literacy is a dynamic and situated skill set that enables learners to produce and engage effectively with information from different sources, and it has become a key life skill in the digital age. Learners need to become more aware of the skills they require. There are a number of digital literacy-enabling policies and plans being developed, e.g., the Jisc framework aims to raise awareness of the necessary skill set that needs to be developed. Developments have been hampered by a lack of an agreed definition of media literacy; however, a situated skills perspective offers a promising way forward as it recognizes the developing nature of such skills and the importance of considering them within their context of use. Contextually situating skills offers a promising way forward for future research to inform the

understanding of the skills that are essential for education and society. Doing so ensures that technology is considered in partnership with the associated skills that are required thus keeping pace with technological advancement. It is in this way that the media literacy skill set will be sufficiently flexible and responsive to accommodate technological developments over time. Promoting an understanding of such skills, how they develop and change across contexts, and their psychological underpinnings offers a promising way forward to empower learners.

Learning Through Infrastructures: Cybercafes as Spaces for Digital Literacy

Fabian M. Prieto-Nanez

Introduction

In recent years, an interest in technological infrastructures has emerged in anthropology and social studies of science. As infrastructures exemplified the complex systems of contemporary society, they became central to understanding the link between technology and culture (Larkin 2013). Several studies follow the process of design and deployment, with special focus on nonhuman actors and the agency of nature. Moreover, infrastructure has been approached as a symbol of societies' development. In this symbolic nature,

the question of how users learn to operate or navigate these infrastructures has been central to studies in the field of human-computer interaction. This field of design has focused on user knowledge, as simplicity and ease of use remain a core value to most designers. However, in the larger systems of infrastructures, such successfully designed interaction cannot be generalized. As in other systems, mediation is necessary to achieve certain goals. It is in those scenarios that research on digital literacy brokers has to offer several entry points to understand how people around the world have been accessing not information but the telecommunication infrastructures of a networked society.

Infrastructures as Cultural Symbols

Infrastructures serve as a powerful symbolic element in everyday practices in modernity. As stated by Paul Edwards (2003) "to be modern is to live within and by means of infrastructures" (p. 186). In the context of developing countries' histories of technology, infrastructures accomplish a complex role of cultural significance. The political address of infrastructure has represented "the possibility of being modern, of having a future or the foreclosing of that possibility and a resulting experience of abjection" (Larkin 2013, p. 333). For that reason, to focus on the histories of infrastructure is to follow a path into the experience of modernity and, more importantly, into its links with local aspirations in a global context.

For Lisa Parks and Nicole Starosielski (Parks and Starosielski 2015), a focus on infrastructure "brings into relief the unique materialities of media distribution – the resources, technologies, labor and relations that are required to shape, energize, and sustain the distribution of audiovisual signal traffic on global, national, and local scales" (p. 5). Methodologically, research on media infrastructure combines discursive, archeological, phenomenological, and ethnographic approaches, where the materialities of things, sites, people, and processes reveal systems of power. Cybercafes, as nodes in these infrastructures, embodied ideas of citizen culture,

transformation on economic practices, representation of access, and connection to the global and changing sense of time in the city.

Central to this approach to materiality is human labor. As media infrastructures “require human labor for their design, installation, and operation,” the introduction of flexible labor policies and ideas of competence in the market reorganized the infrastructure of information access globally. To follow spaces like cybercafés is to consider “the remarkable neglect of the massive continuous work that is necessary to sustain the complex infrastructural systems” (Graham and Thrift 2007, p. 8). Moreover, the caring labor of allowing people to access relied on an emerging network of spaces where new users learn about information and communication technologies.

Cybercafés in Bogota

Cybercafés are addressed here as a case study focusing on their emergence in Bogota, Colombia. The objective, then, is not only to address the role of these spaces for allowing access to telecommunication infrastructures, but also to compare them with government initiatives. From a chronological perspective, the expansion of ICT infrastructure in Bogota followed a geographical pattern. Bogota is the capital city of Colombia. Located on the eastern side of the Andes Mountains in South America, it is Colombia’s main economic and industrial center. Since 1960s, Bogota has increased its population, after people move into the city, mainly because of the violence on the countryside. More recently, the city has reached a population of eight million people. As during the Spanish conquest, the downtown was established, indigenous settlements remained at the south. Local elites preferred the north part, a trend that has continued until recent years. As the city is surrounded by mountains on the eastern side, working-class neighborhoods emerged in the west and south sides of the city. As this process took place, immigrants and displaced people entered into the city in informal settings, until the city had a broader offer of industrial and commercial jobs.

The arrival of Internet cafes in the south of Bogota follows this displacement in the city, driven by different economic forces. Of the multiple nodes of access to the Internet, spaces where people gather together to navigate information automatically raise questions about how individualism functions as a driver of technology. For the case of China, Jack Linchuan Qiu (2009) argues that users of cybercafés could be labeled as the “have less” because “compared to the upper classes, they have limited income and limited influence in policy processes, although they have begun to go online and use wireless phones” (p. 4).

Internet and mobile access augmented in the city after the government introduced several policies to deregulate public services. Other measures, like the flexibilization of labor and State shrinking, characterized policy making in Colombia since the 1990s. Bogota, as the capital of the country, entered into a process of promoting itself as a global connected city. While the government invested in massive public transportation, telecommunication companies started huge campaigns to sell their services. Mobile phone advertisement stressed new ideas of mobility especially for upper classes. Similarly, Internet was advertised as a window to the world. As a way of promoting Internet for middle classes, several Internet cafes were inaugurated to show people the qualities of these new services.

As Nupia (2000) states, “the concept of the Cybercafé also moved to the neighborhood for working-class people, showing the easiness of its penetration and the offer of a service to a younger population, who demand mainly education and entertainment” (p. 60). Although the government initiated an effort to extend public access through the establishment of its own cafes/public libraries, the forces including local entrepreneurship and deregularization in telecommunications, led to the expansion of Internet access.

As cybercafés in Bogota are dispersed across the city, some of their services are aimed to a broad category of “low-income consumers and providers such as rural-to-urban migrants, laid-off workers, retirees, and youth who have gained access to ICT’s since the turn of the century” (Qiu

2009, p. 9). Representative of historical continuities, these spaces have emerged in connection with previous practices of knowledge production and consumption. In Bogota, cybercafés emerged in small businesses called *papelarias*, businesses dedicated mainly to sell supplies for students. If we talk in the computational lingo of update and versions, we can see that such spaces are updated with the introduction of such technologies. Cybercafé names in Bogota reflect an aspiration for global connection. Names like Bogota Ciberpace, Global Works, Cybertown Estudio-Café, Coffeemail Virtual Zone, Enjoyment Internet, and Coffee Shop connect some local references with the language of cyberculture.

In the “move to the south” discussed before, news articles in 2000 started to localize and somehow recommend some practices, to control the use of technology in cybercafés. In an article entitled “Cafe Internet, a trendy alternative,” the journalist describes the innovation introduced by cafe Internet to give their clients more services. According to an article published in *El Tiempo* from April 24, 2000 “Image scanning, text printing, webpage design, office supplies, cd copies, fax, international and national calls, translations,” the journalist expressed their concern when mentioning CD copies, especially for software and music piracy.

One of the most asked services at that moment was e-mail, which according to an interviewed operator “showed people how technology has notably progressed and made them appreciate their benefits.” As writing practices take place in these spaces, cybercafés in Bogota offer their clients templates for certain bureaucratic processes. Among the services are *cuentas de cobro* (letters for payment), *solicitudes* (requests), and *cancelaciones* (cancellations). Such elements contrast with Colombian government’s efforts to shift their services onto digital platforms through e-government. Both in the virtual and actual scenarios, learning the complexities of government and corporations’ legal processes relies on an established network of brokers that inhabit spaces like cybercafes where people find help.

Interestingly, such mediated processes can be traced back to the literacy brokers, described by

Judy Kalman in her ethnographic work on “Mexican scribes in the Plaza of Santo Domingo.” Kalman (1999) follows the interactions of scribes and customers in the process of writing documents and letters to the Mexican State. As Kalman (1999) states, “the scribes and their clients at the Plaza de Santo Domingo in Mexico city provide a case study for understanding the ways literacy is accomplished through intermediaries” (p. 12). The scribe, she adds, functions as a written language broker who allows clients to take part “in those social situations that require the use of writing, situations in which they might otherwise not be able to participate” (p. 12). The use of model letters and the services offered by scribes has connections to the literacy needs of people who visit cybercafés, and their operators assume such literacy broker jobs. As Sarah Harris (2015) demonstrates in Turkey, operators in cybercafés “coordinate, repair and teach in order to fill an infrastructural void for have-less users” (p. 213). Cybercafé operators, she adds, “are essential facilitators who either directly help or passively allow users to navigate around access barriers, decipher unfamiliar interfaces, languages and codes, participate in an Information society that exclude them, and create alternative information networks of their own” (p. 214).

Cybercafes: Between Development and Neoliberal Policies

As some of these actions also are performed in the government-funded spaces called telecenters, comparisons between them and cybercafes stressed the social commitment of the former. In their study of public access centers in Colombia, Luis Fernando Baron and Ricardo Gomez (2014) demonstrate that “cybercafés, not only represent, by far, the greatest number of public access centers, but they are also the preferred spaces by users for their information, communication and educational activities” (p. 10). According to the Ministry of IT, Colombia had in 2012 about 18,306 centers for Internet public access. Eighty-two percent of the access was provided by cybercafés, 15% by telecenters, and 3% by public libraries. For Baron and Gomez (2014),

“cybercafés have been multiplied in an exponential way, and they have achieved to cover broad sectors in cities and small towns” (p. 50). For them, business owners and operators had a great ability to adapt to technological change and to recognize their client needs.

Telecenters, on the other hand, were created to address several government programs. They not only referred to education but also health, local businesses development, and e-government. As expressed by Baron and Gomez (2014), “Telecenters have been a key piece in the development and appropriation of IT in Colombia. They emerged in the country by communication NGOs, alternative providers of electronic mail and internet, and social organizations with cultural, economic and political projects” (p. 60). Literacy projects share institutional infrastructure and ideas of economic change with the economic development that characterized social policies since the 1960s. In this context, the idea of sustainability is connected with investments from the government through World Bank loans or development agencies like IDRC or USAID. For that reason, prioritization depends on an institutional measurement about where these interventions could have more impact.

As they recognize the vivid expansion of cybercafés and their invisibility for the government, they propose to look at them as possible spaces for alliance in terms of government interest to bring access to a broader population. However, Baron and Gomez (2014) characterize cybercafés for their “good service and less social responsibility” (p. 60). In comparison with telecenters, they are mostly “the result of informal alternatives for entrepreneurship and income generation,” as most of them extended previous business of local telecommunication systems. In terms of education, they stressed the lack of more structured or formal proposal of IT training. Moreover, they consider the operator’s mediation in writing, for *cancelaciones* and *solicitudes*, for example, seems to generate laziness and apathy in IT logic comprehension and use (p. 57). Although they criticize the invisibility of cybercafés for the public sector, their approach reduces them for their lack of structure.

In their historical account of the evolution of public access, Gomez and Baron are interested in

following government policies and NGOs effort to create *telecenters*. They follow a side of the story of the “how” of telecommunication, one where Colombian government embraces the development of information technologies. However, they forgot to mention processes of telecommunication privatization and changes in work legislation that affect the people who use public access centers. For that reason, the configuration of practices in the cybercafé show in practice the conformation of an emergent labor force of working-class population connected to the networks. Moreover, the lazy literacy practices described by Gomez and Baron have historical roots on strategies developed to navigate the complex legal systems of the State and corporations. As Virginia Eubanks (2011) states, “interaction with these [IT] technologies provide moments of political learning for poor and working-class women, teaching lessons about the state, operation of government, and the efficacy of making political claims” (p. 83).

Jack Linchuan Qui (2009) emphasizes this change when he demonstrates that in China, “with rising mobility, workers and working families have lost much of the welfare that they previously enjoyed, included job security” (p. 6). As they have to maneuver to “find affordable housing, health care, education and other necessities,” cybercafés are connected to the circuits of commerce, most of them informal, to confront how these services are increasingly privatized and commercialized. In that sense, Alejandro Portes (Portes et al. 2005) shows how although neoliberal reform expectations in Latin America promised better employment, higher incomes and a solid basis for peace and social order, sociological research on informality, inequality, and delinquency revealed other results. The blurring of formal and informal labor, the appropriation of benefits for elites, and higher rates of insecurity characterized the general effects in Latin American urban life, during the years when Colombia finally was connected to the globe. If literacies in cybercafé are so vital, it is because they are grounded in people’s everyday economies, which involve notions of contesting the lack of attention in which they have laid out.

Conclusion

To consider processes of learning through infrastructure includes both designers' understanding of user cognitive process, through human-computer interaction, and the "human labor for their design, installation, and operation." As the case of Bogota shows, the caring labor of allowing people's access relied on a network of cybercafés where new users learn about information and communication technologies. The study of digital literacy includes not only the most evident efforts in teaching about technology but also layers of everyday practices of interacting with infrastructure that are residual in contemporary society and include new literacy brokers for the digitalized world.

Leisure: A Philosophical View About Leisure, Personal Freedom, and Politics

Elie Cohen-Gewerc

Beit Berl College, Kfar Saba, Israel

Introduction

The decrease in the number of hours required for making one's living and the improvement of the tools at man's disposal for everyday needs in postindustrial society leave ever-growing populations with surplus time for additional occupations. What does man do with this spare time?

What happens to a person who completes his obligations earlier than he did in the past? Does this change in the conditions of his existence modify his conceptions and alter his mood? How then does it happen, in spite of this, that people tend to complain that they have no time? How do society's institutions adapt to this state of affairs? "The state must determine a policy for a leisure culture" is a considerably popular statement, voiced by public figures and politicians. What have the State's public and political institutions to do with the fact that its citizens have more free time? Does this time, by its very definition as "free," not enjoy immunity from any kind of interference or attempt at it?

What has the relatively new term "leisure" to do with politics?

In the framework I have been allotted, I will not be able to relate to all the questions that have arisen,

so I will present short definitions of the conceptions of time, leisure, freedom, and politics.

Time

How does man conceive time? Something fleeting that passes like a dream? Something tiresome and burdensome that crawls between the point he is at present to that where the expected event will occur? What does he mean when he says, “I have no time,” “to pass the time,” “to kill time”? I am “racing against time”?

The constraints of schedule pressurize a person during the passing hours until it seems to him that he is caught in a ceaseless current, moving from one commitment to another, from one errand to the next as 1 day follows the next and years go by, years from which only few photographs remain, faraway pictures which seem like a dream.

And in spite of this, on the brink of each new day each of us is faced with precisely 24 h; no one has a minute more or a minute less. Each morning one may ask oneself: What will happen during this enormous time span? How many minutes will a person manage to salvage from the mechanical inertia of routine, minutes in which he will make an effort to remember that he has to look ahead in order to understand what is the purpose of life.

Life is entirety made up of the space of time contained in it, i.e., time and life are synonymous, and “time is never lost, the life of who loses time is lost” (Gonzalez-Pecotche 1953). How much of life is thus lost! How much of life is taken from us by the endless burdens that impinge upon our time, time that we would perhaps allot to some other form of fulfillment?

It happens that one hour is sufficient – an hour free from a predetermined schedule – in order to experience a challenging encounter with ourselves and our lives, with their direction and significance.

At a time like this, there is a chance that our consciousness will record that every approaching minute, every day that once again brings the sun in the sky and sends the birds flying among the branches of the trees, is new time – not a duplication of yesterday’s – time that is waiting, again and again, for man’s decisions. “Life is not

supposed to come to an end like a day comes to its end with the twilight we have to renew ourselves in the past and in the future. In the past, when we continually reconstruct on our mental screen all our strongly felt experiences; in the future, when we think about what is left to be done, what we wanted to fulfill, and in particular what we want to be in this future. And to the extent that man’s feelings of gratitude to the past, towards those happy hours, and to the same extent in relation to the moments of struggle and pain — by their very nature illuminating — so his life will open to new and broad perspectives of self-realization” Gonzalez-Pecotche (1953).

Leisure

Leisure in the antic world, *otium* in Latin, was the privilege and the attribute of free men. To be free meant that all activity done was the expression of own volition. A free man was not constrained to work in order to insure his living. Those who had to deal with some business *negotium*, i.e., *nec-otium*, no free time.

The victory of the bourgeoisie – the negotium’s class – had placed work as the main value of the modern time. In this context, short free time was totally devoted to recreation, i.e., to recover vigor and come back to work. More than 100 years of struggle and technical advance were needed to broaden this recreation, not only for rest.

Nowadays, the reduction of work hours, the increase in traditional vacation time, and the weakening of traditional frameworks really expand leisure time, time that offers alternative experiences, exposure to things that are beyond the expected in man’s accepted and routine life, in other words, free time, a creative and inviting time. However, it would be more accurate to say that it is not time that has become free and which presents opportunities, since this is its nature by definition, but rather it is the individual’s viewpoint that has been freed, to various degrees, from a busy and predetermined schedule that does not allow perceiving alternatives – that were always there – but passed by outside the boundaries of a framework in which the “correct world view” was

confined. There is a well-known saying that describes a person who deviates from accepted norms and anticipated behavior as “he suddenly opened his eyes.”

It is important to remember that the creation of real free time is a relatively new phenomenon that emerged in the Western world in the twentieth century. Until that time, in Europe too, “leisure time” (and also “culture” to some extent) was in the exclusive domain of the elite; the common man’s time was entirely devoted to life’s constraints and the dictates of the community. The measures required for survival flooded and filled the entire space of time, and if few intervals were created, they were all perceived as dedicated to social and religious commitments.

Moreover, in traditional society – no matter what the tradition – man was perceived as part of the society to which he belonged, and as such, his schedule was entirely subjugated to that of the community. The precepts of the Sabbath for instance (Katz 1984), according to which a man desists from all work, do not transform the Sabbath into leisure time. True, the schedule of the Sabbath is different than that of a weekday, but it is not less defined. Sacred matters take up the daylight hours of the Sabbath in the same way that issues concerning making a living inundate almost every minute of the weekday, from morning to night. Even during summer evenings, when the entire family or village gathered together around a bonfire or in the yard to listen to stories and legends, this time cannot be defined as “leisure time” because the individual had to take part and do the things that had been decided upon for the community and by extension for him as well.

Leisure time is time free not only from any work or other tasks but also from any kind of external commitment; it is time in which man examines, as an individual who perceives himself as separate and unique, the various possibilities and selects, of his own volition, with what to fill them, if at all. It is time that is free of commitments and supervision, as well as of an expected and structured future. The reduction of work hours, increased mobility, and weakening of community frameworks over recent decades have extended leisure time, those leisure hours that are the cause

of that obscure sensation of loss of control in all society’s authorities, from parents and teachers, heads of communities through heads of State. This is from where the increasing interest in the issue of leisure time stems, something which is connected, *inter alia*, with the subject of control.

Freedom and Leisure

Being free as a bird

Being free as a bird, as the Beatles son, is an idea that has inspired people throughout the ages.

We see the bird take off elegantly, take off far from the confined topography of human life. We look at it gliding peacefully, so far away from of earthy worries.

How can we, rooted in his life's circumstances, prevent our soul from going after the light movements of the bird?

Long live freedom! Let's reach out for happiness!

What longing! What confusion!

We work so hard, sacrifice a lot, and pays a high price trying to rebel against the decisions of parents, teachers, governors, and their employees who prevent him from attaining what we consider our individualistic happiness.

We haven't discovered yet that our real subjugation is to our beliefs, our prejudices, and the decisive statements that determine life.

Like the bird that gives itself up to the limited space that ensures refuge and food, the individual sees the views commonly held by those around him, as the bars of a mental cage providing a protected but sterile existence.

For the important issue is not the bird but the precious inner being. It is our responsibility to offer this inner being the possibility of rising up above the common life where we splash about, existence captured in mortgaged time.

There, on high, when we attain freedom, we will discover, in our inner and intimate being's landscapes, the virgin spaces of his potential self.

To fly far away to ourselves: that can be also the great lesson of the bird which flies through the landscape of our life, especially when time becomes free.

Leisure by its nature can be a great opportunity for the seeds of our freedom to germinate. Leisure

is this time away, this “time-out,” out of all roles, obligations, patterns.

Beyond any role, I’m aware that every decision I make – including doing nothing – will be no one else’s responsibility but my own. Here I am: me and myself. What an encounter! What an opportunity! Or not? Indeed this new state of mind inspired by leisure can be our second chance, a new opening for our inner self.

We emerge into life in a world already laid down for us, where we understand very rapidly that our survival depends on our appearance in the eyes of relevant others. The main issue will lie in being what I am expected to be, or more precisely, in behaving in harmony with the role I have to play in every scenario in my social life. In the human species’ long and mostly unconscious journey towards survival – in its wide meaning – accustomed to being shaped by life, a common pebble by the flowing water of a river, humanity gets its outline as a result of all the elements acting outside of it. Nowadays we must add the potent factor of the media, which makes of our humanity “a monitor in which are screened the desires, needs, and imaginary worlds fabricated by communications industries” (Touraine 2005).

In other words, we become what circumstances make us into, and we perceive ourselves through the image reflected in these mirrors all around, an image we try to upgrade constantly, at least outwardly. This maintenance demands every available energy, and we generally fall into a subtle and vicious cycle: as much as I invest in showing the personage that circumstances lead me to be, by the same token I remain distant from a large part of my authentic self.

Then something happens unexpectedly and I suddenly find myself pushed off the carousel of life. After an appreciable rest, I discover that there is nothing to accomplish, no role to fulfill, and nobody to satisfy. I sense myself being in the heart of a vaguely defined present, in a kind of “loose” time that stretches out into an infinity of futurelessness in which I am abandoned to myself, *alone* with my freedom.

Before now, I could say that most of the time I paid attention only to what was relevant to my specific roles, decided what was adequate to my

established trajectory – all in a sort of a state of mind that “there is nothing to do” except what I’ve induced myself to accomplish by what is expected of me.

Yet, being alone with myself and with my freedom, I can discover that there are many aspects of actual life normally covered over by disingenuous existence, many things moving inner and deeper chords, unknown to me until the precise instant they appeared. The world now seems to be wider and I am able to hear, to smell, to sense all around, and overall in my essential self. (We all had the opportunity to remark that birds are more present in town on Sunday morning when life around goes at holiday rhythmus.) A magic space emerges to my consciousness: “leisure time” where life springs out of all the old thinking patterns. There we are finally able – at a low price and sometimes at no cost at all – to liberate ourselves from the place assigned to us.

This is a magic space where I can meet my whole self, with all those facets not formerly expressed, because they were not necessary to anyone, not necessary even to my former self. Being free means, now, that I can consider myself and my life as a whole, beyond the straight paths determined by the various tracks of survival; I am no longer just a pile of characters reflected in the eye of others (“The all dram is, I think, in the conscience I have, that every one of us has, that I am ‘one’ while one is ‘hundred’, ‘thousand’ . . .” Pirandello (1921) in Touraine (2005), p. 160) and powered by tasks, missions, obligations, alien expectations, roles, and rules. I am no longer shaped like a river pebble; my freedom consists in being able to preside over my own changes, in becoming “a subject,” that is, “not only one who says ‘I’ but a man who is conscious that he has the right to say ‘I’” (Touraine 2005).

Leisure time is time without rules (Jankélévitch 1963), time that escapes from the molds of conventional thought and moves away from the repertoire of familiar occupations. This is empty time, empty of all of what used to occupy one’s customary mode of life. This is a moment when the void and the nothingness are revealed, in which the unique self will float up. This void is in

fact a pregnant one, pregnant with infinite perspectives and voices whispering from backstage, behind the scenes of “normalized existence.” Charles Baudelaire explained this well (1961, p. 62):

Sometimes one finds an old perfume bottle that still remembers,

From which bursts forth, full of life, a breath of scent.

*A thousand old thoughts, like cold cocoons,
Reverberate heavily in the deep darkness
Then spread their wings and take flight.*

There, in the lack of routine, one can meet the scent of a forgotten perfume that recalls one’s uniqueness, the central point of one’s essential existence – where concern arises. It is from here that one will awaken and a renewed vision will develop, a view that sees, looks, and observes from within, wonders about the unlimited richness of one’s own existence, and of existence as a whole. Here, one will renew a kind of authentic affinity, whose peak will be the awareness of human solidarity, of total responsibility for nature, and the awareness of the spiritual dimension. Here we are no longer in the delimited contours of a ready-made identity, whose narrowness cannot include all the new horizons we begin to distinguish.

The new feeling of freedom rests on the inner courage to face an unpredictable future, a future that draws those weary of the well-worn pathways. This is the space that comes out with the discovery that *freedom obliges* and invites us to be entirely what we aspire to be. Feeling free means then that we can transcend the limits that seemingly determine our existence, seemingly forever, and that we can recover the greatest of all human treasures: the ability to create.

Being free is not a theoretical inference; it is not merely what I pretend, nor only what I desire, to be. To be free is what I intend to be. It implies not merely a series of much needed vacations and breaks from routine, but essentially: creation. “If so, in all domains,” Bergson tells us, “life triumph is creation, we should suppose that human life has its *raison d’être* in a creation which can . . . continue throughout life in every man: the creation of one’s elf by one’s self, the expansion of

personality by an effort that takes much out of little, something from nothing, and adds continuously to what there is of riches in the world” (1966, p. 24).

To be free is not a unique, one-off performance. Realizing freedom is a constant purpose, a thought (– “In order to approach that reality, a thought must be established in one’s mind with sufficient authority to direct all the activities included for the achievement” of one’s unique individuality, “the authority-thought will be, from then on, *the direct representative of one’s conscience*” (Gonzalez-Pecotche (1996), p. 66)) carefully created, carefully crafted; to understand this, it helps to keep an eye on our personal commitment to our part of humanity, as well as being conscious of what we name *freedom obliges*. Keeping an eye on one’s essential purpose includes a serene accompaniment, a continuous dialogue between me and myself. Becoming free is the infinite empowering process of our consciousness, assuming one’s freedom is a lifelong endeavor.

It starts when I focus on my mind, when I succeed in creating some distance between myself and the world – an indispensable space to enable tranquil observation. It is like hugging someone we love, after a long absence – we “must,” the instant after our first embrace, hold him or her off and contemplate, to be sure, to be aware, to be conscious of whether what we really feel is in harmony with what we think. We should likewise hold off facts and events, according to Gonzales-Pecotche (1953), to pay a visit to our sanctuary within the mind, to our ensemble of thoughts. The quality of our life, the breadth of our vision, and the depth of our perception are always the results of the thoughts within us at any given moment and of the degree of awareness we have of their potential impact.

The crucial place for our personal freedom is not in the external theater of life. Rather, it happens behind the scenes, in our minds, where we try to be aware of all thoughts accompanying and entering into our decisions. It includes clear-cut concepts (some not so clear-cut), alien suggestions, conflict between thoughts and feelings, focused attention, or passive inertia. We all

understand and agree that the quality of the performance on stage is the result of all the energy invested during the rehearsals. The rehearsals of our stage acts take place in our mind. To be free means that I am the director, that I know and govern all the “thoughts” involved in every future event, their relative impacts, and the relationships between them. My steadfast, tangible freedom begins in my mind and continues in the concrete alchemy whereby I choose those thoughts able to perform as I want them to.

My mind, then, is no longer a simply given concourse of thoughts, abandoned to indeterminate input from the circumstances surrounding me. It becomes my HQ, where I gather perceptions, discernments, understandings, intuitions, and insights into a personal and deliberate ensemble in harmony with my emerging and free individuality, for which I am responsible.

In the perspective of freedom, one is not only responsible for one’s acts, one is also “responsible for [one’s] thoughts” (C.B. Gonzalez-Pecotche (1953, p. 68), the thoughts dwelling in one’s mind. Though, as we have said before, to be genuinely free – that is, to be conscious of our freedom – is never a final and definitive achievement. It’s a fragile acquisition, needing constant attention and sustained care.

Politics

The Front Populaire won the elections in France in 1936 and Léon Blum’s government gave the workers and employees a paid annual vacation for the first time. The same government, however, hastily established a ministry for leisure time. A government must never lose control.

Control of the population is achieved in two principal ways, the best being a combination of the two:

- An exclusive and self-evident collective identity that comprises beliefs, symbols, customs, mentality, etc.
- A framework of occupation and recreation for an active population and a setup of regulated frameworks for children, the elderly, and those

with special needs; in other words, the controlled promise of fulfillment, to the greatest possible degree, of all the life spaces of its citizens, i.e., the prevention of the creation of real leisure time

The compulsory education law successfully fulfilled, to a great degree, the first task, so long as those who held the dominant conception maintained it and vigorously represented it, not solely in educational institutions. But over recent decades, as a result of the expansion of leisure time, loss of control over an increasing part of the citizen’s time is growing, and with it the efficiency of institutionalized education regarding the formulation of a common identity that is gradually weakening. This is due to the fact that the educational activity during school hours, that does not gain ratification and reinforcement during the remaining hours of the day, can no longer achieve its complete goal.

At all levels of the hierarchy it seems that it is difficult to enforce authority, in other words, a clear framework in which the subordinates “can” do what they are expected to do, within a defined framework that has controllable boundaries.

From this follows the desire to organize and supervise leisure time as well.

Governmental monopolies, or the cartel of the governing and religious institutions, have succeeded in offering recreational frameworks for adults and social activities for children and youth over a long period and have thus maintained reasonable control over leisure time as well. Until a few years ago, monopolistic governmental radio and television programs were expected to fill the audience’s leisure time with contents and messages, the purpose of which was to strengthen national identity and social cohesiveness. However, at the end of the twentieth century, there are no more monopolies and it seems that life has taken a turn, without our being aware of it, from the “grocery store” in the small village of the 1950s, where everyone had to buy what was on offer, with almost no possibility of choice, to the huge and anonymous “supermarket” on the outskirts of the big cities, where the shelves are filled with merchandise, offering everything, an enormous choice

which faces man and where he alone makes his choice, without anyone allegedly interfering with his personal decisions. In the free market, it seems that each one fills his enormous cart with only his own choices. Thus we have moved on to free communications, open skies. Boundaries are being removed everywhere, and loss of control is spreading. In this state of affairs, what can the connection between politics and leisure time be?

Leisure Time and Politics

Life without clearly defined boundaries also means life without strict supervision in the variety of potential encounters which face the individual, even more so if the person is living freely in the spaces of time that have been freed, as mentioned earlier, from commitments and strict supervision. We should remember that every encounter, direct or indirect, of a person with a factor separate from his self-awareness contains an educational potential, i.e., a factor that affects his ongoing shaping process. True, formal education attempts to create a congruence between and within the frequent encounters with students, a congruence whose purpose is to present a unified world picture which may have a cumulative effect, and which will be able to divert potential energy to free will, to the favored direction of the influence generators. But we have seen that there, too, influence is gradually weakening. If school succeeds at all, it is in training the majority of its students for empty conformism. I mean conformism as an adaptive approach to life as it is without relating to a defined form of life. Under these circumstances we have a public that is prepared to adapt itself to any kind of “what we have now” approach and is also convinced that this is what should be because “there is nothing one can do.”

The truth is that the channeling and shaping of man in Western society since the end of the twentieth century is increasingly generated by power administrations and operational systems which duplicate themselves through the power and consciousness of people who are exposed to them and work in their service. The alleged transparency of life and the flood of information supposedly

produced for the benefit of the public actually work as shaping and operative tools.

A comparatively simple example can be found in what is called “the culture of rating.” Program editors supposedly present their audience with what they like in order to win their attention (and a share of advertising revenues), but at the same time these contents affect the same audience and shape it. In other words, those who affect and those who are affected are everywhere. This means that no individual or defined social group necessarily stands behind the influential powers. It is particularly the impersonal aspect of the system that constitutes its source of power and therefore it becomes a challenge for education, training people to face those influences.

This is all too clear to the leaders of the community and those making their living off the groups that have a well-formed ideology and who feel that their power is ebbing away and disintegrating in the increasing waves of that same anonymous forces. This can be seen in the massive efforts they invest in direct educational action (which they regard as a supreme mission), in this case, the overt colonization of the thinking setup and its subjugation to the “correct” viewpoint. In a sophisticated society, it is possible to achieve similar effects without employing direct mental colonization measures; it will suffice to release “market powers” and the people themselves will “voluntarily” complete their own colonization. Albert Camus wrote a play called *The Siege* (1941) at the same time that he researched his novel *The Plague* (1943), in which the plague is a man with an address book containing the names of all the city’s inhabitants. Occasionally he kills one of them by erasing his name from his list. When at last one of the potential victims succeeds in seizing the address book, a commotion arises around him and all join him and begin to “settle old scores” and erase names in the same address book. The figure of the plague then says: “What a wonderful thing. They themselves are doing my work.”

In this process the illusion of “freedom” helps to blur the senses and almost completely disconnect man from the potential powers of his imprisoned self, in a state of unconsciousness, in

a web of invisible oppression. The covertly directive powers cause the directed person to think that no one is actually telling him what to do.

In this state of affairs, political powers are faced with two main alternatives:

- An attempt to reorganize and supervise leisure time with rules and regulations, expand compulsory education to what is called social or informal education, which has already been initiated in the educational institution and may surely be extended to the late hours of the day.
- To be courageous and train the individual, the citizen of the State, to fulfill his freedom so as to actually control his life in general and his increasing leisure time in particular.

This first alternative is undoubtedly more attractive and more tempting for governing systems that toy with the idea that it is possible to return and tighten its governing powers, but the financial investment required may prove to be colossal and the effort Sisyphean.

If we return for a moment to the family, the primary hierarchy of society, every parent knows and experiences every day, and particularly every night, that he has no alternative but to rely on his son or daughter when he or she goes out to meet the “supermarket” of life, to know to differentiate between what nourishes the body and enriches the spirit, and what impairs them, and to have the courage to choose the first alternative.

In a State of open frontiers, open skies, free markets, and free time, man can no longer be unaware of his obligating freedom. “Freedom is either personal responsibility or pathetic clowning” (Buber 1963).

Conclusion

It is hard to expect the political powers not be tempted to cooperate with all those who invite man to spend his newly acquired free time, in other words, to pass the time in momentary excitement and diversion. Rule and *panem et circenses* have always gone hand in hand.

But despite all this, particularly from this sober viewpoint, it is possible to create a training program that will give the individual the ruling focal point of his life in general and his leisure time in particular. His time will then be his, or in other words, it will be dependent on his own decisions, his considerations, an opinion that he must acquire if he wants to have something to consider besides beliefs, fashions, and temptation.

First and foremost, he will have to know the value of time in general, know that it is the principal asset at his disposal, and that he must learn to manage it, not only in order to exist but also in order to give significance to his existence.

Managing the resource of time is, *inter alia*, knowing how to see, and there is no channel more appropriate than the culture of leisure time in order to learn to see how to understand what I see. In other words, to learn to cope with what we see and not be tempted towards what seems to us to be what we see on the surface. This process is also vital to the old issues that are in our consciousness, such as tradition and customs, as well as all the new phenomena that fill our lives.

It is important to know that substituting perception that is the product of long years of tradition, with a shallow and transient viewpoint, is not an expression of freedom but rather of new subjugation. Only courageous coping with the traditions that have been handed down to us and examining them in the light of the mental pictures that time has presented us with ensures a profound viewpoint which is also a look beyond.

Time that approaches man, which is life that approaches our consciousness, does not stop. The congeries of knowledge that is found in infinite forms and which is transferred through infinite channels, the accumulation of human creation which contains intensities of emotion and spirituality, are there waiting for us to look at them, for the vibration of life within us, in order to be resurrected. This might be the most worthy cause of “the culture of leisure”: to teach man to listen, absorb, and examine the multitude of voices and phenomena surrounding him and within him, without pressure, as befits true leisure time, at his own pace, in an enriching and complementing combination of emotions and

thought; a training process which will culminate in man's ability to choose, or in other words, make decisions and not only to be tempted.

The number of decisions that man is required to make today, in comparison with their negligible number 100 years ago, does not leave any alternative other than knowing how to make decisions and understand their meaning. This is the aim of leisure education (Cohen-Gewerc and Stebbins 2007; Cohen-Gewerc 2012).

To paraphrase Hegel and Sartre, one may say that on the brink of the third millennium, man will either become free or he will be sentenced to freedom!

Spending time or fulfilling it within the culture of leisure are the signs standing at the crossroads of our time. It is also the task of those standing among the political powers, in the broader sense of the word, and the prerogative of man in relation to time in general and his leisure time in particular.

However, men of good will would do well if, before making plans, they first tried to cope successfully with the central questions posed at the beginning of this entry.

Levinas in the Philosophy of Education

Guoping Zhao

Synonyms

[Impact of Levinas' Philosophy on Educational Theory, The](#); [Use of Levinas in Educational Philosophy, The](#)

Emmanuel Levinas (1906–1995), one of the most original philosophers of the twentieth century, has not only had considerable influence on several generations of contemporary French philosophers and played a major part in the “ethical turn” in postmodern philosophy but has also significantly influenced educators and educational theorists worldwide in their rethinking of educational theories and practices in the face of political, social, and ethical challenges. Against the modern Western convention that centers human subjectivity on the all-encompassing power of ego and consciousness, Levinas locates the origin of the subject in the pre-ego, preconscious connection with the Other and the world and has worked out an ethical theory of the subject in which the imprint of, and the self's responsibility to, the Other breaks open the enclosed identity and entails a formation of the subject that is open, transcendental, and ethical. Levinas's account of ethics and human subjectivity, his claim of ethics as the “first

philosophy,” and his discovery of the Other as the absolute alterity that cannot be comprehended and assimilated but calls into question and challenges the complacency of the self have all had a significant impact on how we think about ourselves and our relationships with others in the human world. Levinas’s philosophy has addressed many of the problems of modern Western thinking. The profound insights of his work have been enthusiastically embraced by educational philosophers and theorists in recent years and instigated fruitful conversations leading to new ideas and practices in education. This entry starts with a brief history of his life and career and situates his philosophy in a broader philosophical context. After a brief description of Levinas’s writing about education, mainly about teaching, this entry describes the “turn to Levinas” in educational philosophy in recent years, particularly in Europe and the United States. The entry ends with a discussion of the most recent developments in Levinas’s scholarship in the philosophy of education and the new approaches educational theorists have taken in exploring the relevance of Levinas’s philosophy to education.

Life and Philosophy

Levinas was born in 1906 in Kaunas, Lithuania, which was then part of prerevolution Russia, to a Jewish family who spoke both Yiddish and Russian. In 1914, in the wake of WWI, his family moved to Kharkov, Ukraine, and witnessed the Russian revolution there. They returned to Lithuania in 1920, two years after Lithuania gained independence from Russia. In 1923, Levinas went to Strasbourg University, France, to study philosophy and was a classmate to many of the later-known French intellectuals. There he met Maurice Blanchot, who was to become a prominent French philosopher and artist and also his lifelong friend.

In 1928–1929, Levinas went to the University of Freiburg in Germany to study phenomenology under Edmund Husserl. He also took Heidegger’s seminar there. Levinas was deeply influenced by

both masters, and his early work was claimed in France as one of the foremost interpretations of the work of Husserl. While his debt to both Husserl and Heidegger is evident in all his lifetime work, Heidegger’s *Being and Time* had the most profound and lasting influence on his thought. His critique of Heidegger’s being-toward-death was the point of departure for his own philosophical project.

After graduation in 1928 from the Institut de France, Levinas got a teaching job in Paris at the Ecole Normale Israélite Orientale (ENIO), a Jewish school. In 1932, he married Raïssa Levi, who was to be his lifetime companion. In 1940, serving as a French army officer after the outbreak of WWII, Levinas was captured by the Nazis and spent the next 5 years in a labor camp. His family in Lithuania was killed in the Holocaust and his wife and daughter survived by hiding in a French monastery.

After WWII Levinas resumed teaching at ENIO and became the director of the school. He took his first academic position at the University of Poitiers in 1961. From 1967 to 1979, he taught at the University of Paris (Nanterre and later the Sorbonne) and retired from there. He died of heart failure in Paris in 1995.

Levinas’s mature works were developed mostly in the 1950s, after his experiences in WWII. He published his first magnum opus, *Totality and Infinity*, in 1961, a work that attempts to accomplish an ethics apart from ontology, which means an account of personal responsibility to others that is primordial, not based on an exploration of the nature of existence. Like Husserl and Heidegger, Levinas has moved away from Western philosophy’s traditional preoccupation with metaphysical questions about being and epistemological questions about how we know. The face of the other human being is discovered as signifying a radical alterity (difference) that cannot be known and totalized but calls the self into a relationship of responsibility.

In 1974, Levinas published his second magnum opus, *Otherwise than Being*, in which he introduces the idea of alterity into the concept of the self and emphasizes the impossibility of total

appropriation of the self. This work is generally considered his most important contribution.

Levinas's philosophy is deeply rooted in the post-WWII antitotalitarian thought of continental philosophy. After the devastation and upon the wreckage of the last century, continental philosophy mounted a formidable challenge to the totalitarianism, essentialism, and fundamentalism that have dominated modern philosophy since the Enlightenment. German critical thinkers and French postmodern and poststructural philosophers have all traced the root of totalitarianism to false identity thinking (Adorno 1990), or, in Levinas's words, the logic of the same, that presents a picture of exhaustive identity and presence at the cost of difference and absence. In France, this challenge has evolved into the so-called philosophy of difference that concerns itself centrally with difference and its valorization (May 1997). This philosophy is associated with figures such as Jacques Derrida, Emmanuel Levinas, Jean-Luc Nancy, Gilles Deleuze, and, to a lesser degree, Michel Foucault, even though the manifestation of difference is conceived of differently by different thinkers (for Nancy, it is community; for Derrida, it is language; for Levinas, it is human subjectivity; and for Deleuze, it is primary to everything and every idea). While totalitarianism is the movement to reduce the other to the same either by eliminating or by absorbing the other, the philosophy of difference attempts to show the very irreducibility of otherness and the very impossibility of total sameness and presence. As a key figure in this movement, Levinas spotlights the irreducibility of the otherness of the Other both within and outside of the subject and the Other's ability to break out of the grip of knowledge and concepts and its constitutive power that leaves an indelible mark on the very "presence" and "identity" that is to be forged by our consciousness. In many ways, the anti-totalitarianism movement has irreversibly shattered much of the foundation upon which modern Western philosophy was built (Zhao 2016).

This antitotalitarian movement, however, particularly in the form of postmodern and poststructural thought, has also been frequently

criticized as inviting nihilism and relativism and thus as having little application to our social and political lives, including education. But such a critique cannot be launched against Levinas since one's relationship with and responsibility to the other are at the center of his philosophy. Levinas's work has been the driving force leading to the ethical turn in postmodern and poststructural philosophy. An increasing, deep confluence has been noted in recent years among thinkers such as Jacques Derrida, Jean-Luc Nancy, Jean-François Lyotard, and Levinas. Levinas's influence is enabling continental philosophy to participate more forcefully in our social and political lives and in education. Not only does his acute concern with ethics but also his novel idea of human subjectivity makes his work essentially relevant to education – a field that is ultimately concerned with the transformation and alteration of human beings (Zhao 2016).

Levinas on Education

Other than his essays to the male teachers in a Jewish school where he was the director, published in *Difficult Freedom* (1990), Levinas has not written extensively on education. His career as a teacher and an administrator at ENIO, however, has given him an educational language to express his philosophical ideas. Thus, these essays, as well as his mention of teaching and learning, teachers, and students, particularly in *Totality and Infinity*, convey educational ideas that are intimately incorporated into his ethical philosophy. He sees teaching as the Other's confrontation with the self, guiding the self in breaking its interiority and going beyond the confines of its nature. Levinas states, "Teaching is a discourse in which the master can bring to the student what the student does not yet know. It does not operate as maieutics, but continues the placing in me the idea of infinity. The idea of infinity implies a soul capable of containing more than it can draw from itself. It designates an interior being that is capable of a relation with the exterior, and does not take its own interiority for the totality of being" (1969,

p. 180). Thus, teaching and learning are about encountering the new and strange, about being interrupted and called into responsibility to the Other.

Noticeably in Levinas's description of the asymmetrical relationship between teachers and students, he is not reclaiming the traditional, authoritative structure between them. A teacher as a person does not embody power and dominance, nor does he necessarily represent superior knowledge. Levinas writes, "Teaching is not a species of a genus called domination, a hegemony at work within a totality, but is the presence of infinity breaking the closed circle of totality" (1969, p. 171). He is describing a relationship outside of the egological realm of antithesis and calculation, in which the self and other are separate and against each other. Thus, it is not about the teacher as a person having power over students but about the unknown that is being brought to the student that gives the student the opportunity to be in the presence of infinity. In this sense, both teachers and students can be teaching each other.

Levinas also suggests that teaching, like language, is where truth and knowledge are produced and transmitted. Unlike the Cartesian subject that alone is the ultimate determination of truth and certainty of knowledge, Levinas argues that truth has an intersubjective origin, and it is in teaching that knowledge and truth is produced and transmitted. "Teaching is a way for truth to be produced such that it is not my work, such that I could not derive it from my own interiority" (1969, p. 295). Levinas argues that in transmitting meanings and ideas, "I do not transmit to the Other what is objective for me: the objective becomes objective only through communication. . . . What I communicate . . . is already constituted in the function of others" (1969, p. 210). "To thematize is to offer the world to the Other in speech. . . . The basis of objectivity is constituted in a purely subjective process" (1969, pp. 209–210). Knowledge is possible only through, and as a function of, my expression to the other.

All of these ideas, along with his other philosophical and ethical thoughts, have had a

profound impact on educational theorists and philosophers in their rethinking of educational theories and practices.

Levinas in the Philosophy of Education

It has been observed that a "turn towards Levinas's ethical perspective" in educational philosophy has occurred in recent years (Nordtug 2013, p. 250). In 2003, the first special issue devoted to Levinas, based on a 2000 AERA panel presentation, was published by *Studies in Philosophy and Education*. In 2009, the first edited collection specifically to address Levinas and education, *Levinas and Education: At the Intersection of Faith and Reason*, was published by Routledge. Numerous articles on Levinas have appeared in almost all major philosophy of education journals, and presentations on Levinas are frequently featured at Philosophy of Education Society (USA) annual meetings. Several books centered on Levinas and education have also appeared in recent years (e.g., Todd 2003; Strhan 2012).

The welcoming of Levinas to the field of the philosophy of education is situated in the historical context of neoliberalism and the quest for certainty, uniformity, and accountability. Levinas's philosophy gives educational theorists the conceptual tools to resist dominance and to rethink educational theory and practice in ways radically different from modern Western conventions. The areas of education scholars have explored with a Levinasian lens are varied, covering a wide range of educational concerns, from the purpose of education, curriculum issues and pedagogy, teacher-student relations, and the educational aim of autonomy as contrary to heteronomy to art education. Not surprisingly, particular attention has been paid to the ethical implications of Levinas's philosophy in areas related to moral education, diversity issues, multiculturalism, and the politics of recognition. His idea that the knowing subject is interrupted and disarmed by the face of the unknowable Other has been taken up quite frequently by

educational theorists to envision the school as a site of ethics (Zhao 2016).

Throughout the years, there has also been an identifiable trend in the Levinas scholarship in education, developing from an earlier cautious exposition and concern for faithful interpretation to the later more full-blown, critical analysis and creative extension of his ideas. The early concern for faithful exposition came from the fact that while Levinas's philosophy is incredibly rich and extremely refreshing for educational scholars, it ultimately hinges on a disruption of Being and Presence and on the claim of the impossibility of thematization, and his writing is enigmatic and at times elusive. Unlike some other continental philosophers, Levinas does not shy away from the daunting and dangerous task of articulating something irreducible to concepts and knowledge; thus, his text is often, understandably, obscure. And since he locates the origin of human subjectivity in the pre-ego, preconscious connection with the Other and the world, applying his work to educational theories and practices is inherently difficult. Therefore, the first questions educational scholars often have to grapple with are "how to approach the writings of Emmanuel Levinas" (Biesta 2003, p. 61) and how to "think alongside Levinas, to think with his inversion of being as an ethical question" (Todd 2003, p. 3).

Hence, the earlier scholarship on Levinas and education is marked by the struggle to interpret some of his evasive ideas in a way that is authentic to his intentions, and multiple interpretations of the same idea frequently emerge. Distortions or facile readings of Levinas have been claimed, and debates on particular Levinasian themes are part of the scholarship (Zhao 2016).

After more than a decade, the scholarship has become more confident and mature, not in the sense that scholars are able to reach consensus, but in the sense that they no longer tiptoe around Levinas's writings but are more active and comfortable in drawing out Levinas's insights through sympathetic critique and extension to address some of the most pressing sociopolitical and educational issues of our time. Sharon Todd, for

example, suggests that in order for the hidden significance of some of Levinas's ideas to shine forth, we must take a more active role in engaging from the outside in a conversation with Levinas instead of only explicating from within his "tightly constrained systems of meaning" (2016, p. 406). The new trend is to engage with Levinas from outside perspectives, wedding his ideas to other schools of thought or placing social and educational demands on his work, so that clear meanings and logical implications can be elicited from Levinas's system of thought (Zhao 2016).

The recent publication of the special issue of *Educational Philosophy and Theory* on Levinas and the philosophy of education (2016) shows such development and maturity in Levinas scholarship in education. Many of the authors were part of the early "Levinas turn" and have been at the forefront of the Levinas scholarship along the way; therefore, this collection presents disparate and diverse readings and renderings of Levinas's thought to current contexts in education, innovative extensions of his ideas, and the productive blending of Levinas with other thinkers, perspectives, and fields of thinking.

Among the new approaches to extend the relevance of Levinas's philosophy to education is Anna Strhan's attempt at bringing together Durkheim and Levinas to deepen the understanding of education as the site of an everyday ethics and a prophetic politics opening onto more compelling ideals for education than those dominant within standard educational discourses. Another approach is provided by Guoping Zhao, who brings the issue of community and democracy into a conversation with Levinas's ideas of singularity and multiplicity, envisioning a genuine democracy that does not reduce and compromise our subjectivity. Yet another approach is provided by Paul Standish and Emma Williams who extend Levinas's concept of the Other beyond the relation to another human being to the understanding of human thinking. Gert Biesta, a well-known scholar for his writings on Levinas's philosophy and its implications for education, also strikes us with his new metaphor of "robot vacuum cleaners" and reclaims the place of teaching in

education. Clarence Joldersma, on the other hand, through an exploration of Levinas's idea of time, reframes the role of the teacher as the Other and as the transcendent who makes possible the learning of something new and something not yet contained (Zhao 2016).

Besides these more traditional, yet sophisticated and nuanced, renderings of Levinas's thought, there are more creative readings of Levinas through such lenses as feminism and the new materialism. For example, Sharon Todd, following a feminist and Deleuzian orientation to education, proposes that Levinas's views of sensibility and embodiment are quintessentially pedagogical aspects of his thought. Betsan Martin brings in indigenous worldviews and post-anthropocentric ethics to explore and extend Levinas's ethics of responsibility from a human-centered view to include humans as interdependent with nature (Zhao 2016).

The creativity and resourcefulness shown in Levinas scholarship in education demonstrates the deep pertinence of Levinas's philosophy to education. It is expected that his philosophy will continue to inspire new thoughts and ideas for the theory and practice of education.

Introduction

Liberal arts education is a model for undergraduate nonvocational studies most commonly practiced in the United States, at residential liberal arts colleges and collegiate universities. Its origins can be traced to the ancient, medieval, and Renaissance practices of *artes liberales*, although modern varieties are deeply affected by and dependent on reforms of higher education in the United States during the nineteenth century. Liberal arts education is associated with a holistic approach to learning, stressing the importance of intellectual, emotional, and moral growth of students. The model includes educational breadth and general education requirements and aims at character formation, critical thinking, communication abilities,

and the development of leadership and good citizenship. Like other forms of college education, liberal arts education in the United States is often preparatory for studies in, e.g., engineering, law, business, and medicine. In the United States, approximately 6.5% of higher education institutions offer baccalaureate programs in the liberal arts and sciences. The equivalent in Europe is less than 1%.

History

Liberal arts education traces its origins to the ancient, medieval, and Renaissance practices of *artes liberales*, a system which, during the fifth century AD, was fully shaped into the *septem artes liberales*, including *quadrivium* (arithmetic, geometry, music, and astronomy) and *trivium* (grammar, rhetoric, and logic) (Kimball 1996). The ancient origin of *artes liberales* is uncertain. One possible equivalent to the medieval system is the *enkuklios paideia* of ancient Greece, a term which can be taken to mean “general education,” i.e., education dedicated to subjects relating to, and intended for, the free citizen. Even during the Middle Ages, the essential function of this educational system was to educate the “free man,” *liberales* thus designating the class for which the education was intended. *Artes liberales* has thus since Seneca come to signify an education intended to liberate the individual, a connotation that has been retained up until today (Nussbaum 1997). During the Middle Ages, studies in the *septem artes liberales* belonged to the Faculty of Arts, i.e., the lower division of the university; *trivium* and *quadrivium*, respectively, were considered preparatory subjects providing basic methods required for studies in the higher faculties of law, medicine and theology. Studies in the liberal arts were thereby subordinate to professional education (Rothblatt 2003). Liberal arts education was modernized in the hands of the Renaissance humanists during the Renaissance and established as the basis for higher education, which it would remain throughout the Western hemisphere until the end of the nineteenth century. Renaissance liberal

education had a less practical and vocational orientation than in the Middle Ages and was oriented toward studies in the Classics as well as toward character formation in accordance with the ethical standards of the Antiquity. For this reason, it was characterized by an increased interest in the study of history, for the practical purpose of building virtue (Kimball 1995).

Modern developments of liberal arts education are largely dependent on the organization of higher education in the United States during the nineteenth century. As institutions of higher education were established in the United States in the seventeenth and eighteenth centuries, they were modeled after larger collegiate universities in England, e.g., Oxford and Cambridge, where studies in Latin and Greek constituted essential parts of the curriculum. During this period, liberal arts studies were similar to the curriculum offered by the European Renaissance humanists. After the Enlightenment, this changed, and consequently a new understanding of “liberal” emerged. The freedom associated with liberal arts was no longer only understood as freedom within specific cultural norms, or common bonds, but instead took on a more individualistic meaning associated with open-mindedness and freedom from prejudice. In conjunction with the emergence of modern science and the spread of Enlightenment ideals, liberal arts education came to be associated with concerns with human freedom, rationality, critical skepticism, tolerance, and egalitarianism gaining momentum at the time (Kimball 1995).

Changes in the understanding of “liberal” were followed by vital reforms of the college system during the nineteenth century. The Yale Report of 1828 is of special importance, since it formulated the essential principles of the future American college. The Yale Report emphasized the importance of the nonvocational orientation of higher education, just as it advocated the study of Classics and the significance of general knowledge. It thus constituted a vital influence for the liberal branch of higher education in the United States while at the same time other institutions aimed either at more vocationally oriented education or to become pure research institutions. Proponents of the liberal arts were consequently considered to

be “traditionalists,” in sharp contrast to “modernists,” who favored a larger proportion of elective courses while also emphasizing the importance of the progressive natural and social sciences.

One important reason why liberal arts education continued to play an important role in the United States in the latter half of the nineteenth century, despite its nonvocational orientation, was a wave of reforms of the educational system during the post-Civil War period. These reforms aimed at clarifying the roles of the university and college, respectively. The Morrill Acts of 1862 and 1891 are landmarks in the modernization of American college culture and had great influence on the development of the modern liberal arts college. The Morrill Acts included donations from the federal government to States in support of higher education; in exchange for a certain amount of territory, States were compelled to build at least one land-grant college. Since one intention behind this reform was to provide education for the industrial and agricultural classes rather than scholarly studies for gentlemen, the Acts contributed to determining the function of colleges and turned them toward the vital needs of society and the labor market. College education thus became both liberal and practical, oriented toward classical studies as well as professional life, combining the cultivation of character with the development of skills and competences (Lucas 1994).

During the nineteenth century, liberal arts education lost importance in Europe, largely due to the modernist conviction that higher education must become more specialized in light of the rapid developments of the sciences. To some extent, the liberal tradition prevailed in Ireland and Great Britain, and European ideas on higher education still had great impact on developments in the United States. John Henry Newman (1801–1890), the first rector of the Catholic University of Ireland, published a series of lectures called *The Idea of a University*, which influenced ideas on character formation in Great Britain and consequently the training of leadership. Newman also articulated the conservative view that universities should teach universal knowledge, and that research is only a secondary function. This, in

combination with his defense of theology and belief in eternal truths, had a major impact on many of the religious liberal arts colleges that emerged in the United States during the nineteenth century. Newman moreover stressed the essential role of teaching at universities, in contrast to research, an emphasis which still plays a vital role in contemporary liberal arts education.

American liberal arts education was also, to some extent, influenced by Wilhelm von Humboldt’s (1767–1835) vision of a new university. Although Humboldt primarily formulated principles for the modern research university, his vision included ideas of *Bildung*, of the individual and the world citizen, of the importance of teaching and of academic freedom that was of vital importance for the modernization of liberal arts education in the United States.

General Education

An essential part of contemporary liberal arts education is “general education,” a term sometimes used synonymously with liberal education, although the identification of the two is not uncontroversial (Rothblatt 2003). General education, as the term has been used in the United States since the 1920s, is comprised of studies outside of the major and constitutes the main vehicle for the educational breadth associated with liberal arts programs. Normally, general education comprises one third to one half of the 4-year curriculum at a liberal arts college.

There are three basic models of general education: core curriculum, free electives (open curriculum), and distribution requirements. Core curriculum constitutes the traditional form of general education, with a definite set of course units, required of all students. Before the 1960s, core curriculum was the predominant form of general education in the United States (Bourke et al. 1999). It was closely linked to the belief that every educated person should be familiar with a common body of thoughts and values, a view advocated by John Henry Newman in the mid-nineteenth century, for instance. Traditionally, the core contained studies in the Classics, in

the shape of Great Books courses, for example, and it is a clear testimony to the importance of a canon and the value of cultural heritage in American liberal arts education. As a result of the increasing specialization of science and higher education, however, the enforcement of the traditional core has diminished. Currently, less than 10% of liberal arts institutions in the United States practice this traditional form of general education.

The Distribution Model (distribution requirements) is the most persuasive form of general education in the United States. About 90% of all liberal arts institutions apply this model. Distribution requirements were invented in 1909 at Harvard University as a consequence of disagreements among academics concerning the most desirable content of liberal arts education (Kimball 1995). The model is comprised of a diversified core curriculum and as such constitutes a compromise between the traditional core and free electives. Within a diversified core, students choose among a large variety of courses within specified areas of knowledge. An important argument in support of the distribution model is that it satisfies the need for specialization in modern society, as well as the demands of general knowledge and character formation. The model also facilitates for students to delay their choice of major, just as it, conversely, lets them decide their major course of study at an early stage. It is thus a highly flexible model, making early specialization possible, yet within the framework of a common core. It consequently meets the demands of both the labor market and graduate schools.

The use of free electives is a tool for general education only if students actively choose to lay the foundation for educational breadth. Free electives thus often require academic advising as a means for facilitating broad and individually apt learning paths. Academic advising was initiated at Johns Hopkins University already in 1889, however, and it has been an integral part of all modern liberal arts education in the United States ever since. While free electives are important educational pathways even at European universities, they seldom arise within the framework of an articulated liberal arts education.

In the United States, general education is often divided into main areas such as foundation studies, core studies, and integrative studies. Integral parts of foundation studies are frequently a course in first-year writing, foreign language, and mathematical reasoning. Core studies sometimes contain courses in history, multicultural studies, theological studies, or studies in the natural sciences. Integrative studies may include courses in ethics. It is important, however, that the modeling of general education requirements in the United States is very diverse. Liberal arts colleges design their own curriculum in accordance with their academic profile. One reason for the relative absence of similar requirements in European institutions of higher education is the length and content of upper secondary education, where parts of what can be considered as general education, i.e., core subjects, are integrated.

Pedagogy

The holistic approach of contemporary liberal arts education entails close attention to the needs and requirements of each individual student. To some degree, this is reflected in the flexible curriculum provided by the diversified core and the use of free electives, models allowing both breadth and specialization in accordance with the demands and interests of each student. It is also evident in the emphasis of teaching as a cornerstone in liberal arts education (Crimmel 1993). Private liberal arts institutions in the United States often have a low teacher/student ratio, and a variety of teaching structures are applied, such as lectures, seminars, tutorials, preceptorials, and laboratories. Furthermore, teachers are essential as academic advisors to students. The small college atmosphere associated with liberal arts education is moreover very much in line with the holistic ideal. Liberal arts colleges in the United States are often private, small, residential institutions located in the countryside. A liberal arts campus consequently functions as a society in itself, providing learning environments where students face a variety of challenges in a multi- and interdisciplinary setting. In order to facilitate the intellectual as well

as physical, emotional, and ethical growth of students, liberal arts campuses often include theaters, art museums, concert halls, athletic arenas, chapels, broadcasting studios, and libraries. The idea is not only to expose students to a rich variety of cultural activities but also to involve them in a broad range of extracurricular practices, as theater actors, editors of magazines, teaching assistants, etc. Internships and volunteering, in community service, for instance, are other examples of the importance given to activities outside of the classroom and of the orientation to develop a wide set of skills and competencies.

Another important feature of liberal arts education, although not unique for this educational model, is the focus on writing skills. Since the 1970s, many liberal arts colleges in the United States apply writing across the curriculum (sometimes called communicating across the curriculum) (Russell 1991). Basically, WAC contains the use of writing as an educational tool outside communication studies or other fields to which it is considered to belong intrinsically, such as English. Writing assignments in courses that use WAC are designed both as ways of acquiring knowledge in the subject matter and as a means to document knowledge of the content studied. As such, it is an important aid for the development of critical thinking, which, under the influence of John Dewey (1859–1952), has become a central aim for modern liberal arts education.

Liberal Arts Education in Contemporary Society

Historically, liberal arts education has upheld a strong position in the system of higher education in the United States, as a consequence of its commitment to intellectual excellence and its close relationship to ideas of American democracy and citizenship. The quest for specialization and growing demands on the effectiveness of higher education has, however, raised criticism against the model. Utilitarian skepticism was evident already in the nineteenth century and is repeated in contemporary society with regard to high

tuition fees at private liberal arts institutions, the risk of unemployment, and the growing need for professionally, especially technically, trained people in the labor market. The criticism also reflects a traditional battle between the humanities and the sciences, where liberal arts education is considered as an unnecessary leisure.

Defenders of the model, on the other hand, often apply both utilitarian and ethical arguments in support of liberal arts education. Utilitarian arguments often point to the demands among employers for communication skills, honesty, teamwork skills, analytical skills, and ethical awareness, virtues, and abilities promoted by liberal education. It is also maintained that liberal arts education fosters flexibility, an essential capacity in a rapidly changing society and in the face of an increasingly unpredictable future. The ethically oriented support for liberal arts education is often paralleled by arguments for the necessity to reform the model and adjust it to changes in the society and in the world. Alongside with critical thinking, virtues such as civic engagement and social responsibility are put forward as qualities that a liberal education should engender. Martha Nussbaum has furthered this argument by connecting liberal arts education to the development of global citizens in order to sustain deliberative democracy (Nussbaum 2010). The Socratic self-examination that constitutes the core of liberal learning in Nussbaum's sense thus becomes an essential human capacity in order to counteract ethnic and religious antagonism, as well as fear and polarization, both at a national and international level. Accordingly, Nussbaum elevates the significance of liberal arts education to a context much wider than the United States, just as she observes an increased interest for liberal education in other parts of the world.

Although it is true that liberal arts education has attracted interest in parts of Europe and Asia, it comprises a very small part of higher education in these regions. In Europe, this is partly a consequence of the public funding of higher education. Promoters of liberal arts education in Europe often put forward the ideals associated with liberal arts education in the United States, along with

observations that European higher education has suffered from overspecialization and that there is an increasing demand on the labor market for generic knowledge among new employees. Liberal arts education has also attracted interest in Europe as a means to bridge the gap between upper secondary education and the university and to manage knowledge deficiencies among first-year students.

Liberation Theology, Power of Language, and Preservation of Guaraní: A Paraguayan Context

James D. Kirylo

University of South Carolina, Columbia, SC, USA

Introduction

The final stop of Pope Francis' 2015 three-country trip to the South American continent landed him in Paraguay. And while in the capital city of Asunción, he particularly wanted to visit the Norte Bañado neighborhood, one of the poorest areas in the city that rests alongside the Rio Paraguay. Constantly under the threat of being flooded, where shanties are made even worse by the elements, and where economic deprivation is common place, Pope Francis shared with the people of Norte Bañado, "I have looked forward to being with you here today. . . I could not come to Paraguay without spending some time with you, here on your land" (de Diego et al. 2015, para 2).

A Response to a Colonial Legacy: Preferential Option for the Poor

It was clear that this Latin American sojourn, which also took Pope Francis to Ecuador and Bolivia, reflected his continual emphasis on bringing attention to the notion of making a "preferential option for the poor" as a cornerstone of his papacy. A critical theme that illuminates liberation theology, the struggle of the poor, and God's preferential concern for them is central to both the Hebrew and Christian Scriptures. The point

is not whether God makes a preferential option for the poor because they are better or more loved than the non-poor; rather, God makes a preferential option because of the unfortunate circumstances the poor daily live and experience. The condition in which they live demands immediate attention (Kirylo 2001).

Shortly after Bishop Jorge Mario Bergoglio of Buenos Aires, Argentina, assumed the papacy in 2013 and took the name Francis, one of the first things on his list was to invite Gustavo Gutiérrez to Rome, holding private conversations and concelebrating Mass (Cox 2013). A brilliant theologian from Peru, Gutiérrez is often referred to as the “father” of liberation theology. The significance of his invited meeting with Pope Francis was indeed no small thing.

It is no secret that under the papacies of John Paul II and Benedict, Gutiérrez’s work had been marginalized, and even misunderstood by the Vatican, and though not officially silenced, he was not fully embraced. Thus, Pope Francis’ gesture was historic in its own right, prompting, Gutiérrez, to assert a “change of atmosphere” in the Church under Pope Francis’ reign in which he shines a light on a “poor church for the poor” (San Martín 2015).

As a foundational theme of liberation theology and the vessel that breathes life into Francis’ ministry, the emphasis on the poor emerges from the long continuum of the ongoing activist response to an ecclesial-political system which historically worked to dominate the poor and the different, beginning in 1492. Not only did Christopher Columbus and his men and those thereafter systematically invade the Americas, pillaging, raping, torturing, killing, and taking over the land, but they also calculatingly worked to strip the dignity of the language and culture of indigenous populations.

That is, particularly with respect to the latter, when Columbus arrived to what he thought was the shores of las Indias (Indies), he was greeted with welcome by the Taíno, letting him know that he was disembarking in an area called Guanahani; this important piece of information, however, did not deter Columbus to “rename” this newly encountered land as San Salvador (present day

Bahamas). In this deliberate renaming action, Columbus is not only justifying a position of privilege but is also simultaneously conveying a legitimization of his power and the subordinate role of the other (Banks 2006).

Language Matters

Paulo Freire, who significantly contributed to the thinking of liberation theology and also is well recognized for his worldwide adult literacy work, was acutely aware of how colonization had a tremendous impact on the consciousness level of the colonized. And whether it was his work in Latin America, Africa, or elsewhere, colonization severely worked to strip the culture, language, and person as subject. Through colonization, indigenous languages were marginalized and the colonized were constantly assailed with the idea that their languages were inferior and ugly, and conversely the language and culture of the colonizer was superior (Kirylo 2011).

Along with the unspeakable violence that was inflicted on indigenous populations in Latin America, the deliberate effort of geographically renaming the lands first encountered by the Europeans was part of an effort to systematically marginalize the language, customs, and culture of those populations. This enterprise not only wiped out the oral traditions of numerous indigenous groups but also at the same time Portuguese (in Brazil) and Spanish (all other Latin American countries) eventually became the language of commerce, the language inculcated in school, and the language of the “educated.”

To that end, Freire’s literacy work was not only a focus on the actual mechanics, but he also saw his work as a political act, one that engaged the learner in reading the world and reading the word, all of which was an effort to move toward the complex process of shedding vestiges of a colonized mentality (Freire 1978).

Henri Nouwen (1983) perceptively writes, “Poverty is so much more than lack of money, lack of food, or lack of decent living quarters. Poverty creates marginal people, people who are separated from that whole network of ideas,

services, facilities and opportunities. . .” (p. 118). In that light, therefore, the systematic marginalization of a language works to separate groups of people from fully participating in the network of ideas, services, facilities, and opportunities.

Realizing that historical backdrop, many in the Latin American community – to be sure – have been responding with pushback, diligently working to disrupt the colonizer mentality with efforts to preserve the language and culture of indigenous populations. And the focus here is on the Paraguayan context in which heroic work has proven to bare rich fruit in preserving the language and culture of the Guaraní.

Paraguay: Preservation of the Language and Culture of the Guaraní

Approximately 30 years ago, the powerful motion picture *The Mission*, starring Robert De Niro and Jeremy Irons, was released, bringing worldwide exposure to the aboriginal people called the Guaraní. Based on historical events in the 1700s in Paraguay, Brazil, and Argentina, the film was simultaneously moving and inspiring, yet a disturbing presentation whereby the Guaraní found themselves at the epicenter of a geopolitical, religious conflict between the Crown of Portugal, Spain, and the missionary Jesuits. With the riveting background musical score by Ennio Morricone, the picture ultimately ends with a spellbinding scene where three young naked, surviving Guaraní children board a small canoe heading to start a new life after their community was completely destroyed by the European troops.

Of the nearly seven million people who live in Paraguay, more than half live in urban areas, and most of which live in the surrounding area of the capital city of Asunción. The Paraguay River marks a natural geographic demarcation between the east and the west. East of the river is the Paraneña region where the land is more fertile, and west of the river lies the area known as the Chaco, which is a region that is flat, dry, and not easy to cultivate. Particularly driven by the exportation of soybeans, cotton, sugar, and other natural resources, Paraguay is primarily driven by an

agricultural economy. In addition, Paraguay is one of the largest exporters of hydroelectric power, co-owning Itaipu Dam with Brazil (Canese and Kirylo 2011; Canese 2010).

Indeed, the Guaraní survived the European invasion in Paraguay. But the preservation of their language and culture, however, has been one wrought with struggle. Moreover, unemployment, poverty, and illiteracy remain great challenges, and because most of the land continues to be in the hands of the few, ongoing friction between landowners and the landless is ever present, all of which are the remaining remnants of a legacy of colonialism (Canese and Kirylo 2011; Canese 2010). As a response, over the years, many educational leaders, activists, and others have tirelessly worked to change that tide, particularly – as is the theme here – to preserve the language and culture of the Guaraní.

In Paraguay, there are 17 different aboriginal groups, which are divided into five different linguistic families. The Guaraní is one linguistic family, which is comprised of six different tribes. And like all the various tribes in the Guaraní family, farming and the making of various crafts are the mainstay for survival. In order to assist in bringing more awareness of the important cultural contribution of the Guaraní and help preserve their unique identity and heritage, a monumental effort was particularly led by *Reinaldo J. Decoud Larrosa* in the 1940s, along with the ongoing current-day extraordinary efforts by Professor Almidio Aquino. Called *Proyecto Kuatiañe’e* (Language Notebooks Project), housed in the Institute of Guaraní Linguistics in Asunción, the central mission of this project is to preserve the written form of the Guaraní.

Proyecto (Project) Kuatiañe’e

As it had been, Paraguay did not have measured uniform standards for those children attending aboriginal schools. At best, these schools may have outdated texts for some children; at worst, there are no books available. Though not lacking in effort, standards are essentially determined with what the individual teacher brings to the

classroom with whatever material she can garner.

However, and needless to say, the lack of a combination of integral common standards and limited resources is a recipe for a limited education experience, negatively impacting opportunity and student preparedness for possibly attending the university and/or to meaningfully participate in a postmodern world.

In response to that reality, *Proyecto Kuatiañe'e* has been a concrete, proactive educational endeavor that has significantly served to help maintain and affirm the cultural identity of the Guaraní and to provide a more meaningful curriculum in the schools. Particularly in the case of the Ava, Ache, and Mbya tribes, *Proyecto Kuatiañe'e* has published 68 books in their respective languages, in addition to dictionaries, grammar books, and cassette tapes, all of which are designed to be used in the schools.

Much less children's literature in the conventional sense, the publishing of this material is significant because prior to that accomplishment there were no books available for the Ava, Ache, and Mbya Guaraní children in which their unique cultures and languages were celebrated. Indeed, these books are now used in various schools in the Paraguayan countryside in order that Guaraní youngsters may read, learn, celebrate, and be affirmed by the significant contribution of their own people, the Ava Guaraní.

The books contain and preserve stories told by the elders, some of who have already passed away. The narrations in the respective books were transcribed through numerous conversations that cover an array of topics and themes related to the Ava, Ache, and Mbya Guaraní customs and culture. Topics such as theology, religious rites, cosmogony, the mystery of life and death, anthropology, tribal customs and traditions were the general themes of conversations.

The teachers who are typically Guaraní themselves attend a series of workshops to receive intensive training in both deductive and inductive methodologies so that they can use the *Proyecto Kuatiañe'e* books most effectively. For example, and coming more from an inductive methodology, a teacher may engage students in a discussion

about their reality and background experience as it relates to family, customs, and traditions. Then, making connections to their background knowledge with tribal customs and traditions highlighted in a respective text, the teacher may engage the student in a reading exercise, writing lesson, or a cultural awareness project.

Not only is the above process constructivist in nature, but it also embraces a pedagogical practice that Freire (1990) characterizes as a problem-posing approach. That is, the teacher views the individual student as a unique individual who is given the opportunity to share their wisdom, experience, and creative power in the classroom. Thus, a dialogue will occur between student and teacher, and a partnership unfolds between the two. As Freire (1990) points out, "Yet only through communication can human life hold meaning. The teacher's thinking is authenticated only by the authenticity of the students' thinking" (p. 63–64). Consequently, student and teacher are working together through dialogue, reflection, and engaged inquiry, fostering a process described as *conscientização* (conscientization) whereby participants begin to better understand their reality and move toward a more critical reading of the world.

In addition, because the children live in poverty, the teachers are sensitive to their learning readiness and must also contend with having anywhere between 30 and 45 children in each classroom. With only a light breakfast for sustenance, children walk to school, which begins at 7 a.m., and depending on government funding, they only receive a cup of milk around 10 a.m. to help sustain them until 12:00 noon when school is over. After school, the children walk back home for lunch, a siesta, and then help on the family farm. And despite what seems like insurmountable odds, the impact of *Proyecto Kuatiane'e* is having a reverberating effect.

Significant Impact: Two Official Languages

With hard work and commitment, this project is having a significant impact in perpetuating the rich Guaraní culture and language; indeed,

requests for their books and materials are constant in elementary schools. In fact, the project has also published material for Guaraní group in Brazil's Mato Grosso do Sul.

In the final analysis, *Proyecto Kuatiañe'e* is powerfully contributing to preserve and promote an aboriginal culture and language that is intimately tied to the identity of Paraguay. Indeed, in 1992 both the Guaraní and Spanish languages constitutionally became the two official languages of Paraguay.

While other Latin American countries have worked on efforts in promoting bilingualism, Paraguay is currently the only country on the continent in which it is law that an indigenous language, Guaraní, and Spanish are the languages of commerce, the languages inculcated in the schools, and the languages of the "educated." Given the colonial past, which started in 1492 when Christopher Columbus began a legacy of "renaming," this Paraguayan reality is historic.

In Closing

Pope Francis' trip to Latin America in July 2015 was critically significant and the theme was clear: an emphasis on the poor, the denouncement of colonialism and its reverberating effects, and the lifting up and preservation up of all those who have been historically marginalized. Indeed, endeavors such as *Proyecto Kuatiañe'e* have clearly lifted up and have been one which has worked to celebrate diversity in preserving a language and a culture.

Literacies and Identity

Donna E. Alvermann

Introduction

Conceptualized within sociocultural theory, literacies are social practices (Gee 2015; Street 1993) and thus implicated in how people negotiate their identities as readers and writers. For instance, coming to view oneself as a literate person in a certain kind of social group (e.g., a *Harry Potter* book club) is dependent on being recognized by others in that group as a person who is like them – one who has read all of J.K. Rowling's fantasy series, perhaps written some fan fiction about Harry and other characters in the series, blogged a critique of the *Harry Potter* films, and so on. Lacking such recognition does not mean that a person is disinterested in other fantasy novels, but rather is simply outside an affinity group that calls itself the *Harry Potter* book club. Yet, within certain school contexts, so-called disaffected readers are often labeled as struggling or having a disability that is in need of remedial instruction. Over time, accepting a label that others have constructed for them, these students may indeed lag behind their peers in most or all of the subject areas. On the other hand, resisting or pushing against such labeling is a means of negotiating one's own subjectivity or personal interpretation of the kind of literate being one is (or is not).

This negotiation process involves constructing ways of being – interacting valuing, believing, reading, writing, speaking, listening, and performing – that will sustain one's membership in a particular group as long as it is mutually satisfying and beneficial. The difficulties associated with the process can range from minimal to a

magnitude that effectively closes down opportunities to identify as being the kinds of readers and writers that individuals envision for themselves.

A closer look at some openings for making the negotiation process less stressful is the underlying theme for this entry. It begins with a definition of *literacies* and *identity* in relation to a methodology for rereading and rewriting one's identity using artifactual literacies. Next is a section on how social media websites serve to encourage projecting one's literate identity into various sites' activities. A concluding section focuses on the role of identity in negotiating the literacies and literate practices among Latin@ youth in an area of the United States increasingly referred to as the New South.

Rereading and Rewriting One's Identity

Until late in the twentieth century, literacy was spoken of in the singular and generally assumed in education circles to be schooled literacy. A mature reader and writer in the context of schooled literacy could comprehend, compose, and discuss printed texts such as the canonical works in English literature, the scientific findings from laboratory experiments, the histories of various countries, and the word problems associated with a mathematics curriculum. Being successful in schooled literacy equated to demonstrating that one had achieved mastery of particular texts and their associated tasks (e.g., passing a standardized test or end-of-course test that assessed a reader's ability to compare and contrast the results of World War I and II). Learning to read the subtexts of both narrative and informational texts was a way to make visible the ideas that authors might have consciously or unconsciously concealed. With few exceptions as a pedagogical process, schooled literacy required teachers to organize class time, materials, and work experiences as though they were separate from everyday reading and writing.

This more limited approach to literacy learning and teaching has gradually given way to the twenty-first century concept of multiliteracies, which acknowledge the social, economic, and

political aspects of reading and writing, as well as the relations of power that are inevitably bound up in identity formation within literacy practices (Cole and Pullen 2010; Cope and Kalantzis 2000). A broader definition of what counts as a literate being has arguably made the negotiation of one's identity a less stressful process for some, but not all. On the other hand, in contemporary society it is common for spoken and written texts to engage readers and writers in situations that are both cognitively and socioculturally demanding. When added to that mix a growing number of multimodal literacies (e.g., still and moving images, sounds, icons, and living performances) discussed elsewhere in this volume, it is little wonder that some people are experiencing relatively more (rather than less) stress in negotiating their identities.

Identity as defined in this entry is a theoretical concept, which while socially constructed (Moje and Luke 2009) is not immune to an individual's pushing back or resisting a particular construction when it conflicts with that person's lived experiences (Hagood 2002). Though once thought to be a stable entity, the most current use of the term indexes multiple and diverse enactments of identities across an individual's lifespan. Thus, being recognized as having a particular identity in a certain kind of discourse community or affinity group does not commit that person to staying within the confines of the group. Rather, as Gee (2015) has argued, a person's identities are fluid in that they change over time in different contexts and for different purposes. In his words, such changes are best when nuanced and not forced for the very reason that "We can harm people just as badly by seeking to fix their identities, even if only to support them, as we do in demeaning their identities in an attempt to diminish them" (p. 248).

A methodology informed by artifactual literacies (Pahl and Rowsell 2014) is one that aims to neither fix nor demean people's identities, especially when the newcomers' ways of knowing and valuing are reflective of what they cherished in the former homeland. Developed from Street's (1995) insights into people's situated meaning making, a methodology of artifactual literacies values

cultural objects that are passed down from one generation to the next. Within this particular approach, artifacts are defined as material objects that embody certain oral language and literacy practices associated with an object's use.

So, for example, a worn suitcase in which a grandmother had carried her postcard collection as a young woman, while moving with her family from one military base to the next, might count as a treasured artifact – one that conceivably could mediate the stress of taking on new identities in an adopted land. Typically of limited monetary worth, artifacts nevertheless carry with them priceless memories of stories told that are part of one's earlier identity. Artifacts need not be old or even passed down among family members to be counted as such; for instance, a digital device consulted on the morning of 9/11 in New York City would likely have cultural value and be viewed as an identity-marker like few other objects in a person's possessions.

Teachers who incorporate artifactual literacies in their planning and instructional routines can serve as a bridge between home and school for children and youth who are learning a second language. There is evidence that L2 learners who make use of valued objects to construct storied worlds rich in literacy experiences that apply as much to their home lives as to their school lives have less difficulty transitioning to formal writing instruction later on. Similarly, it has been shown that when L2 reading and writing instruction takes into account broader community issues, the methodology of artifactual literacies makes the teaching of critical literacy both feasible and effective.

In the broader scheme of things, games are considered cultural artifacts. They have the potential to reveal how shared literacies and identity formation can both ease and raise stress levels among differently motivated and gendered groups. As demonstrated in Thorn's (2013) video of James Gee discussing the 13 learning principles that evolved from his playing video games with his young son, it is evident that "games are very good at creating identity" (n.p.). They can also motivate learners to engage in problem solving that has literacy-related offshoots. To play Minecraft well, one must stay

alert to the value of creating, collaborating, and communicating fully within a community. The sociability index is high – so much so, in fact, that both critics and supporters of Minecraft hint at the possibility of its being a forerunner of what social networking will become in the near future.

Projecting One's Literate Identity in Social Media

Just as Gee (2008) explained projected identity vis-à-vis gamers situating themselves inside simulation-type games through their avatars, so, too, he argues players reveal something about their empathetic selves through their choices of avatar types. To Gee's way of thinking, "Good game design gives an emotional charge to the thinking, problem solving, and learning it recruits. This is sometimes done partly in terms of players' attachment to the identities of their avatars – characters they come to care about" (p. 35). Emotional ties are also a potential outcome of participating in social media. Experiencing a sense of social connectedness while engaging collectively in social media such as Facebook, Twitter, Google+, Medium, and Reddit, among a host of other social networking sites, affords a feeling of belonging as well as an opportunity for projecting one's own literate identity into the mix.

Some social networking venues are designed for specific communities such as LinkedIn (the business community) and Research Gate and Academia (the scholarly community), which enable free sharing of articles and chapters among researchers from an array of disciplines. Specialized online networking sites benefit those whose literacy practices may vary along a continuum from experts to novices. The former attract primarily audiences with high-interest drives, while audiences in the latter group potentially gain from examples the experts provide.

Networking occurs through social media sites devoted to curating and categorizing content of various sorts: images (Pinterest, Tumblr, and Instagram), music (Spotify, Last.fm), videos (YouTube, Vimeo), news (Reddit), and question posing and answering (Quora). Subscribing to one

or more of these social media sites is an invitation for locating affinity groups with which to affiliate or at least identify as having common interests and supports. Subscriptions also provide a steady flow of information that is scaffolding for comprehending more in-depth reporting, which in turn can lead to perceptions of improved self-worth and lessened stress.

Medium.com is a social media site quite unlike other online networking outlets or blogging sites. Medium bills itself as a new way for readers and writers to interact. On its website, a writer's narrative becomes grist for a reader's creative verve and subsequent interpretive moves, such as highlighting words or short phrases in the original narrative. These alterations can influence other readers' interpretations of the story, or even the way authors come to think about what they have written. Readers' responses to a narrative that an author has initially posted on medium build upon each other and can grow an original idea in different and unforeseen ways. This reciprocal process readily lends itself to attracting appreciative audience members who are steeped in their own literacy practices that both shape and are shaped by the digital footprints of others.

Crowdsourcing (Snapwire, Zooniverse) and crowdfunding (GoFundMe, Kickstarter) are participatory online activities that call for volunteers to accomplish goals which at one time, prior to the internet's mediating effect, would have been the domain of more conventionally run businesses, institutions, and organizations. While volunteers can and do contribute monetarily to their favorite projects, they more typically donate their time and expertise to providing services that others need. In return, the crowdsourcers gain experience, self-esteem, and social recognition among their peers – all conditions under which a lessened stress load might be expected in negotiating one's literate identities

Exploring the Role of Identity in Negotiating Literacies

As the previous sections of this encyclopedia entry have shown, literacies and one's identities

are fluid constructs. “Just as the meaning of “tomorrow” becomes “today” every 24 h,” so also do our multiple literacies and identities undergo negotiation (though arguably not every 24 h). An overview of this negotiated process is part of a chapter by Alvermann and Rubinstein-Ávila (*in press*) titled *Latin@s’ Literacy Practices and Identities in the New South*. Their chapter focuses on Latino/a youths’ arrival and settling in over the past decade in a region dubbed the New South – an area roughly consisting of North Carolina, Tennessee, and States in the Deep South (Mississippi, Alabama, Georgia, and South Caroline).

These youths, some of whom have been labeled “undocumented” in some areas of the New South, are re-identifying or re-inventing themselves as student activists. For example, they are using information communication technologies (ICTs) in ways that push against their present exclusion from enrolling in some of the New South’s major public research universities. They are also being mentored by groups of local teachers in some rather complex literacy practices.

For example, Mr. Hicks, an experienced 11th-grade English teacher, helped his students, many of whom were Latin@s from what he described as either undocumented or mixed-status immigration families, to navigate constantly changing State and national policies on immigration (Johnson et al. 2014). Specifically, he taught them to use online social media sites for finding and distributing information on how to apply to colleges and secure financial aid outside the New South. In doing so, the students became increasingly adept at engaging with an array of ICTs, including the use of digital storytelling to create pamphlets that were then distributed to the media on State capital grounds and before small groups of legislators.

In sum, whether through rereading and rewriting one’s identity or projecting it in heavily networked social media sites, the negotiation process is similar. It is one of continually shaping and being shaped by literacies in search of identities, or vice versa. Like a glue stick, the process rolls on and over multiple literacies, assembling them here as related, elsewhere as unrelated, and in

between as literate practices lying in wait for the next turn in the road.

Literacies, An Introduction

Sandra Schamroth Abrams¹, Bill Cope² and Mary Kalantzis²

¹Department. of Curriculum and Instruction, St. John's University, Queens, NY, USA

²University of Illinois at Urbana-Champaign, Champaign, IL, USA

Synonyms

Contextualized learning; Meaning making

Introduction

Literacy, as a singular noun, has come to represent traditional understandings of reading and writing alphabetic text. Though this definition continues to help educators and policy makers standardize and determine quantifiable literacy rates and levels, there are other components to meaning making, including but not limited to a variety of other modes (visual, spatial, object-oriented, embodied, aural, and oral), and the pragmatics of context, experience, and history. These additions to, and sometimes substitutes for, alphabetic literacy not only extend what it means to be literate but also impact the ways students take up alphabetic literacy. When students enter a classroom, they bring with them a host of home, school, and community experiences that inform their understanding of academic material, social interaction, and cultural norms.

Twenty years ago, the New London Group (1996) took issue with conventional literacy pedagogy, explaining that it “has been a carefully restricted project – restricted to formalized, monolingual, monocultural, and rule-governed forms of

language” (p. 61). Street (1999) also emphasized how literacy is an “‘autonomous’ variable, somehow divorced from social and ideological contexts that give it meaning” (p. 55). The focus turned to social, cultural, and multimodal representations of meaning and participatory practices, all subsumed under the expansive term, literacies.

With a broadened notion of literacy, critical questions began to emerge, such as, “How do we ensure that differences of culture, language, and gender are not barriers to educational success? And what are the implications of these differences for literacy pedagogy?” (The New London Group 1996, p. 61). An understanding of shifting and complex dimensions of literacies also created an awareness of historical, economic, and technological differences, and there has been a greater emphasis on understanding the nuances of literacies and individuality in learning approaches and experiences.

Despite these philosophical shifts and organizational policies (e.g., NCTE, ILA, AERA) that honor an expanded understanding of meaning making and advocate for closing socioeconomic and linguistic gaps in education, current formal assessments and discussions of literacy rates continue to hinge in the Anglophone world on mastery of reading and writing English. As a result, even when schools recognize the importance of literacies, reading and writing alphabetic text in English continue to be privileged in most classroom settings.

The *Encyclopedia of Educational Philosophy and Theory* entries that specifically attend to literacies, therefore, have two overarching purposes: (1) They represent a range of interpretations and applications of literacy and literacies. Though not exhaustive due to space constraints, the scope and foci of the entries reveal a conceptual evolution, as they call attention to the multiplicity of perception and the nuances of meaning making. (2) They offer readers a variety of lenses to consider when addressing meaning making and pedagogy in light of the ever-changing and porous nature of digital landscapes. In other words, as current and new technologies permeate and transform social and cultural norms, so, too, do understandings of literacies and pedagogy evolve. As such, across the entries readers can explore how various interpretations may inform one another and/or

transform traditional, alphabetical, and standardizing notions of literacy.

A Specific Focus on Literacies

The entries that specifically focus on literacies include foundational concepts, such as multiliteracies, multimodalities, and identities that inform all the other entries. Bill Cope and Mary Kalantzis trace the history of multiliteracies and present a pedagogy of multiliteracies that hinges on reflective, flexible, and contextualized practices that are rooted in the knowledge processes: *experiencing*, *conceptualizing*, *analyzing*, and *applying*. Dane Di Cesare and Jennifer Rowsell provide an overview of multimodal literacies, examining ways modes have been conceptualized to work in different variations and combinations to engender and/or represent texture, culture, intensity, and individuality. Donna Alvermann's discussion of literacies and identities underscores the fluid nature of identities and the ways they can be manifested through and negotiated with technological resources and multiple and multimodal literacy practices.

Just as multiliteracies, multimodalities and identities address interrelated facets of meaning making, so, too, do the entries on new media literacies, videogaming and literacies, and digital literacies present insights into proficiency and interaction in light of new technologies. Justin Olmanson and Zoe Falls identify how new media literacies involve investigatory practices that reveal new information and support collaborative, social learning. Sandra Schamroth Abrams addresses how videogaming literacies involve social, participatory, and fluid practices that span digital and non-digital spaces. Examining socio-technical change in his entry on digital literacy, Christopher Walsh attends to participatory and operational understandings of the term, "digital literacies," and underscores the need to intentionally grapple with "the ethical dimension of digital literacies and how they are fostered (or not) in educational institutions."

With a focus on contextualized meaning making and the need to refine (or perhaps redefine

terminology), the authors of the Academic Literacies, Biliteracy, Transliteracies, and New Literacies entries offer readers a range of perspectives to consider as they contemplate current and future scholarship. Jon-Philip Imbrenda and Michael W. Smith examine three theoretical and pedagogical underpinnings of academic literacies that focus on learning mediated by the individual, the text, and the context. Eurydice Bauer and Soria Colomer's discussion of biliteracy highlights a shift away from single-language-based activities. The authors contend that biliteracy "represents what students are able to do with print across their languages, while recognizing that both of the students' languages are always present even when reading in one of their linguistic codes." Here again, a sociocultural framework and attention to context and the lived experience continue to remain at the fore. Amy Stornaiuolo, Anna Smith, and Nathan Philips present a discussion of transliteracies, which recognizes movement and individuality in meaning making and also offers a language and inquiry process for studying complex interactions among people and things. Finally, in their entry on New Literacies, Chuck Kinzer and Donald Leu offer language to characterize literacies research. More specifically, they suggest that "lower-case new literacies" signify the various studies that examine meaning making through a range of perspectives, methods, and contexts, thereby reconceptualizing the term in light of technological changes. Looking more broadly, the authors also acknowledge how the cumulative and consistent findings across these studies help to generate a larger conversation about New Literacies.

Implications and Applications

The entries addressing literacies represent a range of understandings, but there is a commonality among them. Though some may have a focus on alphabetic interpretations of literacy grounded in applied linguistics, there is an overall acknowledgment of meaning making as highly variable and shaped by a wide range of social and cultural communicative experiences. There is an

expressed need for education to be responsive to participatory practices, contextualized learning, and multimodal representations of meaning making. How students view themselves in relation to the texts they use and to the world in which they live and how students represent themselves in and across digital and non-digital spaces are all central concerns today for an overall domain called “literacies.”

Introduction

The figure of the innocent, pure child permeates the discourse about children and childhoods, family, child-rearing, and education in Western modernity. It is closely linked with questions of religion, nature, and sexuality. At the same time, the discourse is polyphonic and contradictory. In what respect “innocence” or “purity” has been ascribed to children, and what has been meant by “nature,” has varied over the centuries, as

have the child-rearing ideals and educational concepts and practices associated with this.

The article shows how ideas of the innocent, pure child, influential for the history of education, changed from the eighteenth to the twentieth century. They are linked with the concepts of nature, which developed more scientific foundations over the nineteenth and twentieth centuries. Moreover, the idea of the innocent, pure, natural child is associated with a normative discourse about motherhood and the mother-child relationship. This also had consequences for educational professions dedicated to the care of small children. The sacralization of children and mothers and the hope of redemption through education are based on the long-term secularization and temporalization of redemptive expectations.

Christian and Religious Traditions and their Transformation in the Eighteenth Century

Evocations of innocence and purity, which are linked with sacralization, refer time and again to the biblical narrative of the birth of Christ, to the baby Jesus and the Holy Family. Visual representations, the iconography of the baby Jesus, the Holy Family, and the Madonna and Child, are elements of this discourse. They supply the references, symbols, and codes of a powerful pictorial tradition, simultaneously invoking and causing emotions. A passage in the Bible frequently cited in the history of Western education, child-rearing, and childhood is Matthew 18:2: “Unless you change and become like little children, you will never enter the kingdom of heaven.” In modernity, however, these visual and textual references are increasingly transferred to secular contexts and the field of education.

In the Middle Ages and the early modern period of Western Europe, interaction with children was strongly shaped by religious practices, e.g., around birth, baptism, or death (Orme 2001). In these periods, and especially in early modern Pietism, the idea of original sin was important for concepts of education and child-rearing. For example, original sin legitimated pedagogical

measures to break the child’s will. It was only in the eighteenth century that long-term secularization gradually attenuated the close connection with religion, and the preoccupation with children’s spiritual salvation. Most notably, in another long-term process, belief in the idea of original sin declined. With this decline, “children were transformed from being corrupt and innately evil to being angels, messengers from God to a tired adult world. They also came to be seen to a greater degree as endowed with a capacity for development and growth the motor for which was more Nature than God” (Cunningham 2005, p. 59).

It was Jean-Jacques Rousseau who subtly challenged the idea of original sin with the first sentence of his novel of education, *Emile* (1762). He begins with the words: “Everything is good as it leaves the hands of the Author of things; everything degenerates in the hands of man. [...] He wants nothing as nature made it, not even man; for him, man must be trained like a school horse” (Rousseau 1979, p. 37). On the one hand, these sentences open up the discursive path for the sacralization and romanticization of the child; on the other hand, *Emile* contrasts nature with culture or civilization. Culture or civilization, Rousseau argues, stifles human nature (ibid.). In his work, nature – in relation to child-rearing and education – has multiple dimensions. Firstly, there is “nature within us,” secondly, nature is expected to play an educative role, and thirdly, “nature itself” is meant to be the goal of education or child-rearing. “Natural man is entirely for himself. He is numerical unity, the absolute whole” (ibid., p. 39). Natural man is contrasted with civil man: deformed, broken, enslaved, miseducated, dependent, and alienated from himself. In this perspective, the child embodies natural man in his natural state; the main agent of education is supposed to be nature, and the desired result is natural man in the state of society.

For Rousseau, the ideal human is not a small child, but a prepubescent boy of about 10–12. “But when I represent to myself a child between 10 and 12, vigorous and well-formed for his age, he does not cause the birth of a single idea in me which is not pleasant either for the present or for the future. I see him bubbling, lively, animated,

without gnawing cares, without long and painful foresight, whole in his present being and enjoying a fullness of life [. . .]. His figure, his bearing, his countenance proclaim assurance and contentment; health shines from his face; his firm steps give him an air of vigor; his complexion [. . .] has no effeminate softness; the air and the sun have already put on it the honorable imprint of his sex. [. . .]. His eyes, which are not yet animated by the fire of sentiment, at least have all their native serenity; long sorrows have not darkened them; unending tears have not lined his cheeks. See in his movements, quick but sure, the vivacity of his age, the firmness of independence, and the experience of much exercise. His aspect is open and free but not insolent or vain. His face, which has not been glued to books, does not fall towards his stomach; there is no need to say to him, "Lift your head." Neither shame nor fear ever caused him to lower it" (ibid., pp. 158–159).

The (male) child is happy, at one with himself, and not yet driven by sexual desire, which constitutes another element of his innocence. This view links human history with individual development and educational with social utopia. The child embodies natural man in the state of society, the noble savage, and at the same time becomes the symbol and cipher for criticisms of society and of education or child-rearing. This is also incorporated into the above-quoted passage: "His face, which has not been glued to books" (ibid.). Thus, the arguments and passages cited contain all the elements that are presented in ever new variations in the critical writings of twentieth-century progressive educationalists. This includes a regime of the body, an emphasis on fresh air, sunshine and exercise, and the ideal of asceticism. The exemplary child's body is described precisely, in terms of figure, movement, face, skin, cheeks, posture of the head, gaze, and feelings. An idea central for many currents of progressive education in the twentieth century, that of removing the child from the city and raising him far away in the countryside, in nature, is already present in *Emile*.

The binary nature-culture opposition, central to Rousseau's work, is a characteristic of

modernity, emerging in the early eighteenth century; until the seventeenth century, "nature" had still been "a more open category," imagined as changeable and flexible (Plamper 2012, p. 16, author's translation). Hobbes conceived "nature" as the condition before the state, and John Locke and Rousseau saw it as preceding society. "Nature" was also associated with the contrast between primitive (natural) and civilized (cultured) nations, as well as with the unchangeable, inner aspects of the human body. And finally, flora and fauna were declared to be part of nature (the environment). Both "nature as body" and "nature as environment" came to be seen as something unchangeable, "a legitimating authority that preceded religion," which eventually – in the process of secularization – became absolute. "Nature was poured into a rock-hard *fundamentum absolutum*, became the new ultimate certainty" (ibid., p. 15, author's translation).

In the nineteenth century, this dichotomy intensified; Francis Galton's eugenics and the natural sciences gave it a new emphasis (ibid., p. 17), which also shaped the history of education and child-rearing. "Nature," though conceived in quite different ways, provided the model and legitimation for educational practice.

The representation of children and educational principles in Rousseau's *Emile* shows all of the above-mentioned elements of naturalization. The child embodies man's condition before socialization, but also symbolizes ancient man (as a primitive or natural people); nature is innate and simply has to develop, and an upbringing or education in nature is conducive to this. In addition, the talk of the child's nature is closely linked with constructions of gender. According to Rousseau, women never lose their similarity to children, they remain "big children" (Rousseau 1979, p. 211.). The nature versus culture dichotomy emerging in the eighteenth century is equally influential for concepts of childhood, child-rearing, and education and for the gender discourses of the nineteenth and twentieth centuries. Women are responsible for raising and educating small children, to whom they are seen as similar in being (see for example Friedrich Fröbel).

The Innocent Child of Romanticism and the Vulnerable Child in the Nineteenth Century

The Romantic concept of childhood is distinguished by naturalness and proximity to nature, innocence, and sanctity, in other words, a sacralization or mythification of the child. It emerged after 1800, especially in Germany, but also in England, and is expressed in concise, exemplary form by the Protestant theologian and teacher Friedrich Schleiermacher: every child appears as a “revelation of the divine” (Schleiermacher 1989, p. 18, author’s translation), and “every mother is a Mary” (ibid., p. 35). The Romantic concept of childhood is based on challenging the concept of original sin and on the organological notion that all predispositions are already present in embryo in the child and then develop in the process of growing up. The older notion of the child as a *tabula rasa*, a blank slate (still held by Locke), is now replaced by an organological concept of nature. Childhood is declared to be an autonomous phase in life, containing its own meaning and purpose. The Romantic child’s proximity to nature is defined in three respects: children are not yet deformed by society and are therefore natural; they are closer to flora and fauna, as expressed in the visual imagery of Romanticism; and lastly, they have a particular closeness to ancient times, to primitive peoples and “savages.” The latter is explained by way of the parallel between individual development and the development of humanity and owes much to Johann Gottfried Herder’s philosophy of history. The innocence of the Romantic child relates to the absence of original sin and to the child’s whole, unspoiled state, which has not yet been deformed by society (Baader 2016), and which is the focus of longing. Childhood thus becomes the utopian blueprint for a different, better society. Overall, Romanticism produced a concept of childhood that described children as “foreigners” and “others” in relation to the modern world.

“Romanticism embedded in the European and American mind a sense of the importance of childhood, a belief that childhood should be happy, and a hope that the qualities of childhood, if they could

be preserved in adulthood, might help redeem the adult world. In becoming more child-oriented in this way, society had radically changed its ideas on the relationship between childhood and religion” (Cunningham 2005, p. 72). Cunningham notes: “Romanticism, then, was much more influential as a body of ideas than as an active force in day-to-day child-rearing within the middle-class home” (ibid., p. 72).

Nonetheless, the Romantic complex of ideas was directly transposed into pedagogical concepts by Fröbel, with his invention of the kindergarten in the 1840s. This was spread worldwide by the German emigrants of 1848. Fröbel himself acquired the status of an educational hero with these “traveling ideas,” particularly in the USA, where he is read as a precursor to John Dewey (Baader 2004). Fröbel’s Romanticism-inspired pedagogy aimed mainly at creating a protective space in which children’s strengths could develop with as little hindrance as possible. This argument was also the basis for the idea of the kindergarten. Kindergarten is, according to Fröbel, “paradise given back” to the children, intended to give them a “happy childhood.” The key to the educational theory of the kindergarten was childish play, which was meant to encourage the child to self-directed or autonomous activity. The high value ascribed to child’s play as a genuine form of childish expression is partly justified by (natural) religion (Baader 2016). Gardening was also an important element, allowing children to spend time in and become familiar with nature. According to Fröbel, who established the occupation of *Kindergärtnerin* (nursery teacher), women were predestined for childcare and the rearing and education of small children. Fröbel was already using the term “motherhood as a vocation” in the text *Mutter- und Koselieder* in 1844. The phase following early childhood, however, “human education” (*Menschenziehung*, also the title of Fröbel’s work of 1826), was the task of male teachers.

Romantic notions of the innocent child, in need of protection, are also the basis for the idea of the vulnerable child. This is increasingly invoked in the last third of the nineteenth century, in the context of the implementation of child protection rules

and the concept of the best interest of the child. Charitable organizations and the international women's movement helped to establish these between 1880 and 1914. The right to compulsory schooling was also cited in these arguments. Internationally, England took the leading role in child protection. "The romantics had helped to fix in the British mind an idea of what childhood should be" (Cunningham 2005, p. 146). The child in need of protection became a key element of childhood and educational theory. "Childhood is constituted as essentially "vulnerable" in much Western discourse, acting almost as a master identity for children [...]. Children are constituted as essentially vulnerable beings who can only survive and develop successfully if intensely nurtured and protected by adults" (Christensen 1999, p. 3).

Nature- and Child-centered Education in Progressive Education in the Twentieth Century

Progressive educational theories of childhood around 1900 referred frequently to Rousseau, Fröbel, and Romanticism. They are by no means uniform, however, but are as heterogeneous as the international progressive education movement itself. While Romanticism referenced philosophical concepts and forms of natural religion, progressive educational approaches invoked science as well. A representative example is the work of the Swedish progressive educationalist Ellen Key, *The Century of the Child* (1900), arguably the bible of child-centered and nature-centered education. Key invokes Rousseau and Fröbel, but also Friedrich Nietzsche, Charles Darwin, and Galton, the founder of eugenics. She also refers to the international field of childhood studies, which was emerging around 1900. For German empirical childhood studies around 1900, the categories of innocence, naturalness, and individuality were central and thus coincided with the Romantic concept of childhood.

Like the Romantics, Key talks of children as "holy" and emphasizes their autonomy and will-power (Key 1909, p. 44). She famously refers to the child as a majesty, whom adults should serve (ibid., p. 181). Key's child-centered approach

includes eugenic elements, as the child has "a right to choose his parents" (ibid., p. 1). This means that eugenic aspects play a role in conception and that parents should not be alcoholics or mentally handicapped; this should be monitored by community leaders. After this "responsible parenthood," the child should ideally be taught by its mother, based on its individual abilities. A child that has been perfected in such a way is expected to contribute to the "higher development of humanity," as proposed by Nietzsche. According to Key, threats or dangers emanate from the institution of school, the Christian religion, the doctrine of original sin, and the Christian idea of sinfulness. Key speaks of "soul murder in the schools" (ibid., p. 203). She evokes the figure of the child as a "victim" of restrictive pedagogical institutions. The child as "victim" reappears in the work of Maria Montessori, who also saw eugenics as an option and made reference to Key. Both these educators associate the image of the child, suffering from the wrong pedagogical institutions, with the image of the suffering Christ. In a lecture from 1928, Montessori describes every birth of a child as the death and resurrection of Christ.

Key contrasts the strong child, strengthened, vitalized, and activated by the right education, with the vulnerable child as victim: a victim of the institution of school, especially of Christian religious teaching (Baader 2016). Children should spend time not at school, but in nature, exercising and strengthening their bodies. Key argues that they should not only be physically active, but engage in autonomous artistic and creative activities. Above all, however, they should show strong emotions. Key takes the Romantic concept of childhood and adds eugenics, evolutionary theory, social Darwinism, Nietzscheanism, and *Lebensphilosophie* (Baader 2016). Science is an important point of reference here.

The progressive educational concept of child-centered, nature-centered education is reflected in pedagogical practice in forms of physical training, as in the cult of the body within youth movements, and in progressive educational *Landerziehungsheime* (country education homes, i.e., boarding schools) such as the German Odenwaldschule, founded in 1910. The

Odenwaldschule was supposed to correspond to Key's ideas of a "school of the future." The spectrum of practices in the *Landerziehungsheime* includes physical training and toughening up, and the cult of nudity. In the Odenwaldschule, where numerous cases of sexualized violence occurred in the 1970s and 1980s, talk of "child-centeredness" was part of a context of concealment used to protect the institution. In the early twentieth-century youth movement, linked with the *Landerziehungsheim* movement, the ideal of innocence and purity is explicitly related to dealings with sexuality. "Stay pure and become mature" was the motto. The idea of "purity" also has connotations of nationalism and racial hygiene in the youth movement.

In the progressive education, youth and *Lebensreform* movements at the beginning of the twentieth century, the invocation of child-centeredness, proximity to nature, innocence, and purity simultaneously served purposes of nation building. An example is the progressive education compendium *Das Buch vom Kind* (1907), which included contributions from international authors. Progressive educationalists hoped that a "new education," clothing suitable for nature, fresh air, light, exercise, and outdoor lessons would lead to "national renewal." There is a strong focus here on the body of the child. The founding of the Bund für Schulreform in 1908 popularized the terms *vom Kinde aus* (child-centered) and *kindgemäß* (child-appropriate), though these were mainly used to criticize religious education in schools, which was seen as inappropriate for children.

In the eighteenth and nineteenth centuries, the idea of childish innocence included the belief in children's asexuality. This was fundamentally challenged in 1905 by Sigmund Freud, with his *Three Essays on the Theory of Sexuality*, but continued to be part of pedagogical concepts into the 1960s and beyond. The educational critique of the late 1960s, linked with transnational protest movements in the context of 1968, makes child sexuality a focus of its pedagogical concepts. Its "bible" was *Summerhill*, the progressive educational work of Alexander Neill about his alternative school. Here it was expected that liberated sexuality and the questioning of children's sexual

innocence would contribute to "redemption through education" and a freer society. Even in 1960, Neill linked the demand for liberated sexuality with criticism of the doctrine of original sin. At the same time, he claimed that his school was "the only school in England that treats children in a way that Jesus would have approved of." "You talk about salvation. We live salvation," declared Neill (1969, p. 374).

Even now, the idea of children's innocence and purity has not disappeared from perceptions of children, child-related iconography, and pedagogical concepts. In modernity, the discourse of the innocent, pure child is simultaneously accompanied by a counter-discourse about the neglected and sexually promiscuous child. Today "child-centeredness" and "child-appropriateness" are central to early childhood education and are mainly justified in terms of educational psychology.

Lyotard and Philosophy of Education

Michael A. Peters
University of Waikato, Hamilton, New Zealand

Jean-François Lyotard is considered by most commentators, justly or not, as the non-Marxist philosopher of “the postmodern condition” (sometimes referred to as “postmodernity”). His

The Postmodern Condition: A Report on Knowledge (1984), originally published in Paris in 1979, became an instant *cause célèbre*. The book crystallized in an original interpretation a study of the status and development of knowledge, science, and technology in advanced capitalist societies. *The Postmodern Condition* was important for a number of reasons. It developed a philosophical interpretation of the changing state of knowledge, science, and education in the most highly developed societies, reviewing and synthesizing research on contemporary science within the broader context of the sociology of postindustrial society and studies of postmodern culture. Lyotard brought together for the first time diverse threads and previously separate literatures in an analysis which many commentators and critics believed to signal an epochal break not only with the so-called modern era but also with various traditionally “modern” ways of viewing the world.

The Postmodern Condition as a single work, considered on its own merits, is reason enough for educational philosophers and theorists to devote time and effort to understanding and analyzing Lyotard’s major working hypothesis: “that the status of knowledge is altered as societies enter what is known as the postindustrial age and cultures enter what is known as the postmodern age” (1984, p. 3). He uses the term “postmodern condition” to describe the state of knowledge and the problem of its legitimation in the most highly developed societies. In this he follows sociologists and critics who have used the term to designate the state of Western culture “following the transformations which, since the end of the nineteenth century, have altered the game rules for science, literature and the arts” (Lyotard 1984, p. 3). Lyotard places these transformations within the context of the crisis of narratives, especially those Enlightenment metanarratives concerning meaning, truth, and emancipation which have been used to legitimate both the rules of knowledge of the sciences and the foundations of modern institutions.

By “transformations” Lyotard is referring to the effects of the new technologies since the 1950s and their combined impact on the two

principal functions of knowledge – research and the transmission of learning. Significantly, he maintains, the leading sciences and technologies have all been based on language-related developments – theories of linguistics, cybernetics, informatics, computer languages, telematics, and theories of algebra – and their miniaturization and commercialization. In this context, Lyotard argues that the status of knowledge is permanently altered: its availability as an international commodity becomes the basis for national and commercial advantage within the global economy; its computerized uses in the military are the basis for enhanced State security and international monitoring. Knowledge, as he acknowledges, has already become the principal force of production, changing the composition of the workforce in developed countries. The commercialization of knowledge and its new forms of media circulation, he suggests, will raise new ethico-legal problems between the nation-State and the information-rich multinationals, as well as widen the gap between the so-called developed and third worlds.

Here is a critical account theorizing the status of knowledge and education in the postmodern condition which focuses upon the most highly developed societies. It constitutes a seminal contribution and important point of departure to what has become known – in part due to Lyotard's work – as the modernity/postmodernity debate, a debate which has involved many of the most prominent contemporary philosophers and social theorists (see Peters 1996).

It is a book which directly addresses the concerns of education, perhaps, more so than any other single “poststructuralist” text. It does so in a way which bears on the future status and role of education and knowledge in what has proved to be a prophetic analysis. Many of the features of Lyotard's analysis of the “postmodern condition” – an analysis over 15 years old – now appear to be accepted aspects of our experiences in Western societies.

And yet Lyotard's *The Postmodern Condition* should not be allowed to overshadow or obscure his other works or their significance for educational theory. Lyotard has written in the order of

20 books and many scholarly articles, spanning a range of philosophical fields, themes, styles, and topics. Nor should the focus on one text, however intellectually fashionable, obscure the emphasis on Lyotard's ongoing political and pedagogical engagement in a career spanning more than four decades.

Jean-François Lyotard was born in 1924 at Versailles, and he taught philosophy in secondary schools from 1949 to 1959. He taught at universities in Nanterre and Vincennes. Later he secured a post as professor of philosophy at the University of Paris VIII (Saint-Denis) which he held until his retirement in 1989. He was also a professor of philosophy at the Collège International de Philosophie in Paris and professor of French and Italian at the University of California at Irvine.

Lyotard had been an active member of the radical Marxist group *Socialisme ou barbarie* for some 10 years from 1954 to 1964. Thereafter he joined another radical group, *Pouvoir ouvrier*, only to leave 2 years later. These 12 years represent the years of his active political involvement. From 1955 onward, while a member of *Socialisme ou barbarie*, Lyotard was assigned responsibility for the Algerian section. His accounts of the anti-imperialist struggle in Algeria, as Bill Readings (1993, p. xiii) argues, “provide a useful empirical corrective to charges that poststructuralism is an evasion of politics, or that Lyotard's account of the postmodern condition is a blissful ignorance of the postcolonial question.” After 1966 Lyotard discontinued his active political affiliation with any radical Marxist group, and, indeed, this break, autobiographically speaking, represents intellectually, on the one hand, a break with Marxism and, on the other, a turn to philosophy.

Lyotard's break with Marxism and his turn to philosophy has to be seen against the background of French intellectual life and, in particular, the struggle in the late 1950s and early 1960s against both humanism in all its forms and Marxism. Structuralism, based upon the work in linguistics by Ferdinand de Saussure, Roman Jakobson, and many others, first found a home in a form of cultural anthropology pursued by Claude Lévi-Strauss and developed also in the disciplines of

history (early Michel Foucault), semiotics (Roland Barthes), psychoanalysis (Jacques Lacan), and Marxism (Louis Althusser). Structuralism, at least as it was understood by Foucault, constituted, above all, a reaction against the phenomenological (existential or humanist) subject which had dominated French philosophy in the postwar period. Poststructuralism was inspired by a return to Nietzsche's writings and captured Gilles Deleuze's (1962) influential *Nietzsche et la Philosophie*.

The place of Lyotard's political writings in the corpus of his work is a complex question. Lyotard has remarked that *The Postmodern Condition*, in the eyes of his critics, has occluded his other works; that it was marked by a certain sociology and epistemology rather than philosophy; and that the philosophical basis of *The Postmodern Condition* is to be found in *Le Différend* (1988a). While one can name the specific genres that constitute Lyotard's writings – the philosophical, the epistemological, genres of criticism, linguistics, narrative, intellectual autobiography, and aesthetics – politics, as he says, is more complex than a genre, combining “discursive genres (but also phrase-regimes) which are totally heterogeneous” (Lyotard 1988b, p. 299).

Lyotard (1988b), in an interview with Willem van Reijen and Dick Veerman, suggests that “the essential philosophical task will be to refuse [...] the complete aestheticization of the political” (ibid.) which he maintains is characteristic of modern politics. By “aestheticization” Lyotard means an active fashioning or shaping of the community or polity according to the idea of reason. Lyotard in his *Political Writings*, then, addresses the crisis of “the end of the political,” that is, “of all attempts to moralize politics which were incarnated in Marxism” (Lyotard 1988b, p. 300). This means, as *Readings* (1993, p. xviii) suggests, that Lyotard's political writings are characterized by a “resistance to modern universalism” by an argument against what may be called the “politics of redemption.” What we are presented within Lyotard's work, as an alternative, is a politics of resistance, a form of writing which offers resistance to established modes of thought and accepted opinion. The same form of writing

also registers an ongoing internal struggle or resistance, characterized by the difference between early and later modes of thinking and, crucially, by Lyotard's difference with Marxism itself.

Dick Veerman (1988, p. 271) asserts that Lyotard's philosophical writings are divided into two main periods. The doctoral thesis *Discours, figure* (1971) opens the first period. *Économie libidinale* (1974) closes it. In the intervening period, Lyotard published *Dérive à partir de Marx et Freud* and *Des Dispositifs* (Lyotard 1973a, b), two collections of essays written between 1963 and 1973. From 1975 onward, we can speak of the second period. Among its most important articles and books, I count the following: *Instructions pad'ennes* (1977), *Au juste* (1979; conversations with Jean-Loup Thebaud), *The Postmodern Condition* (1979), “Answering the Question: What is Postmodernism?” (1982), “Judicieux dans le différend” (1982, published 1985), *Le Différend* (1983), *L'Enthousiasme: la critique kantienne de l'histoire* (1986), “Grundlagenkrise” (1986), “Sensus communis” (1987), “L'Intérêt du sublime” (1987), and *Que peindre?* (1987).

We can add to the first period *La Phénoménologie*, published in 1954 and translated into English in 1991, and we can add substantially to the second period: *Peregrinations: Law, Form, Event* (1988c), *Heidegger and “the Jews”* (1990), *The Inhuman: Reflections on Time* (1991), *The Postmodern Explained to Children: Correspondence 1982–1985* (1992), *Political Writings* (1993a), *Lessons of Darkness* (1993b), and *Lessons on the Analytic of the Sublime: Kant's Critique of Judgement* (1994a).

Already in his early works, *Discours, figure* and *Économie libidinale*, Lyotard signaled a conscious shift away from the doctrinaire praxis philosophy which characterized the non-PCF Marxism tradition of *Socialisme ou barbarie*. The former work attempts to develop a metaphysics of truth without negation; the latter attempts to substitute Freud's economy of libidinal energy (and the notion of primary process) for Marxist political economy. In this situation there is no truth arrived at through dialectics: the supposed ethical and social truths of Marxism, based upon

an appeal to a historical ideal, are no better than the falsehoods it wants to overcome. Lyotard (1974) criticizes the underlying notion of the dialectic. He simply does not believe that a political, philosophical, or artistic position is to be abandoned because it is “sublated.” It is not true, according to Lyotard, that the experience of a position means its inevitable exhaustion and necessary development into another position where it is both conserved and suppressed. Veerman (1988, p. 272) suggests that the upshot of Lyotard’s metaphysics in his first period is simply that: “we cannot take one political stand rather than another, since the correct one cannot be decided.”

Lyotard’s difference with Marxism and specifically with *Socialisme ou barbarie* and Pierre Souyri, in particular, is recounted in “A Memorial of Marxism: For Pierre Souyri.” He describes how, in the language of radical Marxism, dialectical logic had become a simple idiom and how “the machinery for overcoming alterity by negating and conserving it” for him had broken down, precipitating a “relapse” into the logic of identity. He writes of his own intellectual biography of the time:

And what if, after all, the philosopher asked himself, there wasn’t any Self at all in experience to synthesize contradictorily the moments and thus to achieve knowledge and realization of itself? What if history and thought did not need this synthesis; what if the paradoxes had to remain paradoxes, and if the equivocacy of these universals which are also particulars, must not be sublated? What if Marxism itself were in its turn one of those particular universals which it was not even a question of going beyond — an assumption that is still too dialectical — but which it was at the very least a question of refuting in its claim to absolute universality, all the while according it a value in its own order? But what then, in what order, and what is an order? These questions frightened me in themselves because of the formidable theoretical tasks they promised, and also because they seemed to condemn anyone who gave himself over to them to the abandonment of any militant practice for an indeterminate time. (1988c, p. 50)

What was at stake for Lyotard after 12 years of a commitment to radical Marxism was whether Marxism could “still understand and transform the new direction taken by the world after the

end of the Second World War” (ibid., p. 49). Capitalism had succeeded in surviving the crisis of the 1930s. The proletariat had not seized the opportunity to overturn the old order. On the contrary, modern capitalism, once its market and production capacities had been restored, had set up new relations of exploitation and taken on new forms. Lyotard lists the following new realities confronting Marxism: “the reorganisation of capitalism into bureaucratic or State monopolistic capitalism; the role of the modern State in the so-called mixed economy; the dynamics of the new ruling strata (bureaucratic or technocratic) within the bourgeoisie; the impact of the new techniques on work conditions and on the mentality of workers and employees; the effects of economic growth on daily life and culture; the appearance of new demands by workers and the possibility of conflicts between the base and the apparatus in worker organisations” (ibid., p. 66).

Lyotard was at the University of Nanterre during the events of May 1968, and his political activism centered on the struggle against the modernizing tendency — new selection methods and changed conditions to the baccalaureate examination — of Fouchet’s reforms, which comprised the demand for democratization and, in doing so, severely underestimated the student’s desire for genuine participation. Themes that were to surface later in Lyotard’s *The Postmodern Condition* find their source here: in critique of a class monopolization of knowledge and the mercantilization of knowledge and education, in an attack on the “hierarchical magisterial relation” of pedagogy, in the refusal of a kind of education under capitalism which merely socially reproduces students to fulfill the technical demands of the system, and in the expression of a moral ideal embodied in non-dialectical forms of dialogue as the ethical precondition for pedagogy.

Lyotard acknowledges his debt to Marx and yet remains within the ambit of a commodification thesis (albeit as a representational system) as one of the main processes of rationalization which guides the development of the system as a whole: the Marxian analysis of commodity fetish as it applies to knowledge and education. He recognizes the way in which the logic of

performance, aimed at maximizing the overall efficiency of the system, generates socioeconomic contradictions, but he parts company with Marxists on the possibility of emancipation or of salvation expected to arise automatically from these contradictions. He jettisons what Readings (1993, p. xxiv) calls the “politics of redemption” based upon “the Marxist desire to identify alienation as a reversible ideological distortion” in order to rethink politics and resistance in “minoritarian” terms, which forgoes an authoritative reading of events based on determinate judgments, to respect the difference and “to think justice in relation to conflict and difference” that admit of no resolution. “Our role as thinkers” in the situation of postmodernity, Lyotard (1993d, p. 27) suggests, “is to deepen what language there is, to critique the shallow notion of information, to reveal an irremediable opacity within language itself.” The issue for Lyotard is one of understanding and providing a critique of capitalist forms of the insinuation of will into reason and the way this is manifest primarily in language.

It is a theme that leads directly to the legitimization of knowledge and education. If the Enlightenment idealist and humanist metanarratives have become bankrupt and the State and Corporation must abandon or renounce them, where can legitimacy reside? Lyotard, in his critique of capitalism, suggests that the State has found its only credible goal in power. Science and education are to be legitimated, in de facto terms, through the principle of performativity, that is, through the logic of maximization of the system’s performance, which becomes self-legitimizing in Luhmann’s sense.

It is this account which has proved so potent in prophesying and analyzing the changes to economic and social policy which have taken place in the Western world with the ascendancy of the so-called new right. Education, not so long ago regarded as a universal welfare right under a social democratic model, has been recast as a leading subsector of the economy and one of the main enterprises of the future “postindustrial” economy. Lyotard’s (1984) *The Postmodern Condition* provides an understanding and critique of the neoliberal marketization of education in terms of

the systemic, self-regulatory nature of global capitalism. His concern is that critical theory, based upon the traditional critique of political economy, has been used as a way of reprogramming the system. Lyotard claims that critical theory has lost its theoretical standing and been reduced to a utopia. In Lyotard’s terms critical theory, especially in the hands of Habermas, is still committed to the universal categories of reason and the subject – albeit the minimal intersubjective subject of communication – based upon the paradigm of mutual understanding. These universal categories, established through the principle of consensus, do not respect the difference. Where Habermas adheres to an ideal of transparent communication, Lyotard investigates the difference inherent in language.

In the Preface to the English translation of Lyotard’s (1984) *The Postmodern Condition*, Frederic Jameson notes how Lyotard’s text was, among other things, “also a thinly veiled polemic against Jürgen Habermas’ concept of a ‘legitimation crisis’ and vision of a ‘noise-free’ transparent, fully communicational society” (Jameson 1984, p. vii). Jameson is alluding to the way in which Lyotard’s *The Postmodern Condition* is, above all, a critique of Enlightenment metanarratives or grand *récits*. Lyotard wants to question the dogmatic basis of these metanarratives and their “terroristic” and violent nature, which, in asserting certain “truths” from the perspective of an authorized discourse, does so only by silencing or excluding statements from another.

Lyotard, in a now often quoted passage, uses the term “modern”:

to designate any science that legitimates itself with reference to a metadiscourse . . . making an explicit appeal to some grand narrative, such as the dialectics of the Spirit, the hermeneutics of meaning, the emancipation of the rational or working subject, or the creation of wealth. (Lyotard 1984, p. xxiii)

In contrast, he defines “postmodern” elliptically as “incredulity toward metanarratives” by which he means to point to “the obsolescence of the metanarrative apparatus of legitimation” to which corresponds “the crisis of metaphysical philosophy and of the university institution. . .”

Lyotard, Hope on the Dark Side

 KU Leuven, Leuven, Belgium

Introduction

Education is, in many ways, premised on hope (Bloch 2000/1918; for a more recent treatment, see Papastephanou 2009). Hope for the future;

hope for the next generation. This accounts in part for our willingness to continue to invest in shared practices, even in the face of pressure, disappointment, and pessimism. Our investment in educational practices today is governed by a sense of an uncertain, precarious future, which requires flexibility, mobility, and maximally efficient and effective use of resources. In postmodernity, the grand narratives of modernity – of progress, freedom, and emancipation that drove the development of the nation-State and its institutions – are no longer credible. Lyotard's notion of performativity, elaborated in *The Postmodern Condition: A Report on Knowledge* (1984/1979), captured the logic of what replaced them.

Lyotard's work often informs critical accounts of education that express pessimism in the face of managerialism, accountability, and economization according to which it is governed today. The notion of performativity “has dominated educational discourse on Lyotard” (Ford 2015, p. 89), and the concept remains highly influential in theorizing the way neoliberalism shapes contemporary education, and higher education in particular, today. But the narrow understanding of performativity (see Munday 2014 for one account of how the term is misconstrued) limits our understanding not only of our current context but also of the pertinence of Lyotard's thought for educational philosophy and theory. There are “several key concepts in his *oeuvre* that have import for but remain largely underdeveloped or absent in the field [of philosophy of education]” (Ford 2015, p. 89).

Nevertheless, within educational philosophy, numerous scholars have sought to show the deeper significance of Lyotard's thought. This chapter provides an overview of recent scholarship and draws out, not an optimism to counter the pessimistic accounts, but a sense of the hope that derives from the aesthetics and politics of Lyotard's understanding of experience, thought, and language. To paraphrase Bearn, Lyotard's philosophy is not “the reassuring black of a glorious tragedy,” as it is not nostalgic (Bearn 2013, p. 232), nor does it celebrate our postmodern condition; performativity is itself a grand narrative, albeit a “hollowed out one” (Munday 2014,

p. 324). Instead, “Lyotard's philosophy is painted a melancholic grey” (Bearn 2013, p. 232).

Knowledge, Performativity, and What Remains

Lyotard was commissioned to write *The Postmodern Condition: A Report on Knowledge* by the Conseil des Universités of the government of Quebec as a report on the status of knowledge in developed societies. Its important and prescient philosophical and empirical insights into the commodification of knowledge and the implications of this relate to his broader philosophy of language, politics, and ethics. In the opening section, Lyotard outlines the post-war shift toward computerization and the effects of technological development on scientific knowledge. He equates the effects of “the proliferation of information-processing machines” on learning with those of “advancements in human circulation (transportation systems) and later, in the circulation of sounds and visual images (the media)” (Lyotard 1984, p. 4): “The nature of knowledge cannot survive unchanged. . . It can fit into the new channels and become operational, only if learning is translated into quantities of information” (ibid.). That which cannot be translated in to a particular, hegemonic language will be abandoned, silenced, and have no value. In education today, the predominance of market logic, the concern with outputs and metrics, and the “what works” agenda, for example, all testify to the prescience of Lyotard's account. Hence, the notion of performativity – “the optimization of the global relationship between input and output” (p. 11) – remains particularly influential in accounting for this.

Lyotard's diagnosis of the specific character of postmodernity requires him to show how it is different from modernity. There is not only the material shift from manual labor to automatization and computerization but also the shift in the status of knowledge itself and the truths according to which societal development is understood. The modern period was characterized, on Lyotard's account, by the legitimation provided by what are termed meta-discourses (Nuyen 2013, p. 98).

These comprised “universal rules and principles to which we can appeal to resolve a dispute that may arise between the ‘small discourses,’ or language games (*petits récits*) in which different people are engaged” (Nuyen 2013, p. 97). In the production of scientific knowledge, for example, disputes between two conceptual frameworks could be resolved by appeal to a universal principle, the meaning of which was shared. Today, this practice of legitimation fails. The postmodern condition is characterized by an incredulity toward metanarratives: “there are no universal rules or principles” we can appeal to, “only language games, or small discourses, each defined by its own set of rules” (ibid.). Due to his examination of the delegitimation of the grand narratives of modernity, Lyotard is often taken as an exponent of “the relativism and performativity that the Enlightenment makes room for” (Munday 2014, p. 323). But although he assents to the plurality enabled by the demise of grand narratives, Lyotard does not celebrate what replaced them (ibid.). Lyotard’s concern with language, ethics, and justice is in part a response to the nihilism that ensues from the loss of universal, shared values, and principles.

Without a meta-discourse by means to legitimate one position over another, and thus to resolve conflict, there are only separate language games or small discourses (or *petits récits*). Thus, Lyotard points to something that (literally) escapes our attention: the *différend*. To acknowledge this is a matter of justice. The *différend* occurs when someone, or a group, “is divested of the means to argue and becomes for that reason a victim” (Lyotard 1988, p. 9). It refers to what cannot be testified to, represented, in the existing discourse; a new criterion is needed, otherwise it is subsumed within the existing discourse, excluded, or silenced (Crome and Williams 2006). In a conflict, reaching consensus is not necessarily desirable: “To apply the rules internal to one discourse in the case of a conflict is not to resolve it: it is to allow that discourse to dominate others that are in conflict with it, or to allow it, as Lyotard puts it, to ‘totalize the field’” (Nuyen 2013, p. 98). As Lyotard’s opening to *The Postmodern Condition* shows, the need for knowledge

to be translated into the hegemonic system risks the abandonment of other, untranslatable forms of knowledge or thought. To acknowledge the *différend* is to acknowledge what is not represented by the dominant discourse and thus to resist the totalization of performativity.

Here, Lyotard seems to offer a way to counter performativity; his invocation of silencing and excluding, and his attention to the *différend*, finds support in the politics of emancipation and related liberatory pedagogies. His notions of the *différend* and *petits récits* have been taken up in educational research concerned with narrative, voice, and social justice (see, e.g., Griffiths 2003). The concern with representation of the *différend*, through pedagogies and research practices that give voice to it, seeks to reclaim a space dominated by a particular language game or discourse. Lyotard’s notion of the *différend* deepens the notion of justice further, however, to point to the forgetting that is effected by our drive to represent. To try to represent the *différend* risks the forgetting of forgetting: this does not acknowledge that something always escapes representation. Furthermore, the very naming of something, as in the politics of representation – giving voice to some “thing,” a specifically named, subordinated group, e.g., in terms of race, gender, sexuality, and religion (see, e.g., Lyotard 1997) – does violence to the other by this imposition. A similar point can be made regarding promotion of the ideals of autonomy and authenticity, as counter to totalizing narratives. The way that Lyotard “reveals the limitations and problems” of such ideals is less well understood than those ideas that can be more easily assimilated into progressivism. Although these ideals “seemed to offer the best hope of resistance against the encroachments of performativity. . . they are partly complicit with its harms” (Standish 2013, p. 160; see also Hodgson 2009, 2016). To give voice, as seen in life history and narrative research, represents those excluded from the dominant discourse and thus seeks to include them in it. But, it risks not hearing the *différend* itself. Attention to the *différend* is not concerned with inclusion in the form of consensus or representation. Rather Lyotard emphasizes dissensus, that which remains

beyond linguistic representation. We move then from the pessimism of accounts of the totalizing force of performativity to a hope (albeit an uncomfortable one), not of emancipation but of ethics and respect: living “together in difference, but not indifferently, in respect for the irreducibly distinct other” (Smeyers and Masschelein 2013, p. 143).

Lyotard’s attention to the *différend* draws less on the Marxist politics of his early career and more on Kant’s *Critique of Judgment*; in particular he draws on the notion of reflective judgment, which Kant contrasts with determinative judgment:

According to Kant, we make determinative judgments when we fit our experience under an existing conceptual structure, thus determining it. In contrast, we are called upon to make reflective judgments when we cannot subsume our experience under any pre-given conceptual frame, and we instead have to look for a way of conceptualizing that experience, thereby inventing the criteria by which to judge something. (Crome and Williams 2006, p. 10)

This resistance to the assimilation of experience and thought into existing frameworks offers a richer sense of the import of Lyotard’s thought for education today. Lyotard identifies that, in spite of the ways in which education is subject to the input–output logic of maximal efficiency and effectiveness, science – or the production of knowledge more generally – “does not develop in an efficient, orderly way. It proceeds as a search for instabilities that develops in a highly unpredictable way, and thus resists incorporation within a framework that wants to invest in what it predicts it can put to profitable use” (Crome and Williams 2006, p. 10). To elaborate further on the specific politics of justice in Lyotard’s thought, we turn to his understanding of language.

Language Games, Discourses, and Registers

Lyotard uses Wittgenstein’s notion of language games as his “method” in *The Postmodern Condition* and to elaborate his notion of the *différend*. Hence, he has drawn the attention of

Wittgensteinian scholars of education (see, e.g., Peters 2006). Some argue that Lyotard’s discussion of language games misconstrues what Wittgenstein intended, however (see, e.g., Burbules 2013). Whereas Wittgenstein’s concern is with ordinary language, Lyotard’s use of the term reflects his concern with power, exclusion, and injustice. His attention to language, and to the ability of a language to silence another, reflects connections between his work and that of Nietzsche, Foucault, and Deleuze. Thus, his language games may be better expressed as discourses (in the Foucauldian sense) or phrase regimes (Lyotard 1993).

In Lyotard’s characterization of language games and the social bond in terms of the “agonistics of language,” his emphasis on difference and incommensurability leads to the accusation that he – and those who have taken up his ideas – exoticizes otherness (McLaren 1994). But to identify the undesirability of consensus for politics is one thing; to suggest its impossibility is quite another. The emphasis on incompatibility or incommensurability between discourses in Lyotard’s concept of language, society, and communication is based on a “certain view of language connected with a certain politics” (Smeyers and Masschelein 2013, p. 145). Lyotard seeks not consensus, but rather dissensus or paralogy, that is, as support for the legitimacy of small narratives (p. 144). Thus, rather than radical incommensurability suggesting the impossibility of community, instead the concern is with how to “live together in difference, but not indifferently, in respect for the irreducibly distinct other” (p. 143). In response to the demise of grand narratives, Lyotard seeks not to restore “a moral point of view but, as Ophir has it (1997, p. 201), for the recovery of moral response-ability” (Smeyers and Masschelein 2013, p. 143).

Respect for otherness and the maintenance of the distinctiveness of the other may still leave us at a political and ethical impasse. As we saw with reference to Kant’s determinative judgment, the concern with silencing repudiates attempts to name, as “naming is an act of appropriation and ultimately an act of violence” (p. 145). In response, Smeyers and Masschelein write:

“While we can agree that any and all structures of meaning may be deconstructed or reshaped, it is difficult to accept that we should view conceptual structure as hopelessly unjust and terroristic in itself” (p. 146). The “prioritization of difference” and the emphasis on individual uniqueness this entails, which “opens us all to commodification,” remain problematic given Lyotard’s concern with justice (*ibid.*). Nevertheless, Lyotard’s concern with representation, and its resistance, raises important questions for educational theory. This is elaborated in the next section.

Re-presentation: Meaning and Event

Lyotard’s concern with aesthetics (see, e.g., Lyotard 1971) enables a more nuanced account of incommensurability in line with his notion of the *différend*:

What Lyotard offers. . . in his later work especially, is an ethical turn toward aesthetics in judgment with a special emphasis on the significance of the sublime. This is the place of hope that cannot be articulated nor shown by the protocols of reason, of hope that can be felt. It is thus that he avoids an easy optimism – from what has gone before – without succumbing to pessimism or nihilism. It is by way of Wittgenstein and Kant that hope is restored. (Dhillon and Standish 2013, p. 6)

His account of performativity can be seen not only to express a pessimism about what had happened to the status of knowledge and research in the computerized age but also to “shake the mistaken faith that is placed in consensus as if this this were the paradigm of scientific thought” (Dhillon and Standish 2013, p. 4). Lyotard writes: “What all intellectual disciplines and institutions presuppose is that not everything has been said, written down or recorded, that words already heard or pronounced are not the last words” (Lyotard 1991, pp. 90–91). This presupposition leads not only to the desire to record, to codify the world and experience as knowledge, but also to the hope that new thought always remains possible.

The questions Lyotard raises over representation pose a challenge to educational theory, and its presupposition that a representation of what is desirable is a necessary starting point:

But what is left out of the picture is the fact that the coherence of our representations (or phrases) makes us forget the groundlessness or emptiness from which the event irrupts. Acting and thinking are identified with the realization or accomplishment of representation. Lyotard wants to sensitize us to this identification, and this amounts to a fundamental repudiation of educational theory and practice, understood as governed by representations and rules without remainder. (p. 148)

In the face of the crisis of representation – the loss of grand narratives according to which we can judge and the realization that our knowledge and judgments are groundless – Lyotard seeks a different point of departure for critique: situated in ethical experience, outwith the order of representation and language, and sensitive to “the moment in which the injustice [the representation] happens. Being educated here means being able to lend one’s ear to this non-representability” (p. 148). This non-representability, as a source of resistance to the inhumanity of “the system,” rests on Lyotard’s distinction between “the *quod*, the meaning of something as an event,” such as the uttering of a phrase, and “the *quid*, the meaning of something as such,” i.e., as a concept (p. 149). The event precedes language:

That something happens always ‘precedes’, as it were, the question about the what of what happens. More precisely, the question itself precedes. As ‘that something happens’ is the question about the *event*, ‘next’ it asks about the *event* that has taken place. The *event* comes as a question mark ‘before’ it presents itself as a question. (Lyotard 1998, p. 94)

Once the event is realized, it is neutralized, forgotten. This forgetting is unavoidable. But we must not forget this forgetting: this is where the act of injustice lies. Instead, we must remain sensitive to indeterminacy, to that which escapes representation:

For Lyotard it is not less than this that characterizes the educated human being: the person inhabited by a discomfort, by disquietude, restlessness that makes him or her think. The educated person is a distressed human being; the agony of the event marks genuine thinking. The indeterminate, not-thought, ‘hurts’ because one feels good in what has already been thought (Lyotard 1998, pp. 31–32). (Smeyers and Masschelein 2013, p. 150)

Education, on this view, exists not in evidence, outputs, and satisfaction, but in discomfort.

Conclusion: Hope on the Dark Side

The resonance between Lyotard and Wittgenstein is perhaps found not in Lyotard's explicit adoption of the notion of language games, but rather in his writing on aesthetics, politics, and on childhood, in which Smeyers and Masschelein find the real import of his work for educational philosophy. Dhillon and Standish state that it is in relation to Wittgenstein and Kant that hope is restored. This is not, as we have seen, in a utopian sense, but in acknowledgement of the painfully felt existence of what cannot be expressed, what escapes representation, and our ethical obligation to acknowledge this.

We have seen how the predominant reading of Lyotard within educational theory itself illustrates the very risks of injustice that he draws attention to. In the notion of the *différend*, it is Wittgenstein's sense of the groundlessness of our practices and the heterogeneity of meaning that provides the starting point – and so the restoration of hope – from which he restates the possibility of thinking and of education. This entails not only attention to our practices of knowledge production in research or to our ordinary language but also to the event that precedes it, as a permanent attention to the inhuman, that which is not yet said and which may not be sayable.

M

Mach and Science Teaching

Michael R. Matthews
School of Education, University of New South
Wales, Sydney, Australia

Synonyms

[Enlightenment](#); [History and philosophy of science](#)

Ernst Mach (1838–1916) was a major contributor to the European Enlightenment tradition, and one of the great philosopher-scientists of the late-nineteenth and early twentieth centuries. He had immediate and continuing influence in European and more generally international physics, philosophy, biology, physiology, psychology, economics, sociology, and much else, including mathematics, art and literature (Blackmore 1972; Blackmore et al. 2001; Bradley 1971; Cohen and Seeger 1970). The first of Mach's five hundred publications – a paper on “electrical discharge and induction,” the subject of his physics PhD – appeared in 1859, the year of Darwin's *The Origin of Species*. His many papers and books appeared up to and after his death in 1916, the publication year of Einstein's *Relativity: The Special and General Theory*. Among his last papers was a 1918 study on “Some Sketches in Comparative Animal and Human Psychology.”

Mach was a major contributor to a revolutionary period of science.

This entry will focus on Mach's less well-known contributions to the theory and practice of science education (Siemsen 2014). It takes up a task announced 100 years ago in a 1916 obituary for Mach written by Alois Höfler (1853–1922) the Austrian philosopher-physicist-pedagogue and friend of Mach who succeeded the latter as coeditor of Mach's science education journal *Zeitschrift für den physikalischen und chemischen Unterricht* (*Journal of Instruction in Physics and Chemistry*):

It is Mach the *educationalist* whom we must here bring to the attention of our readers, particularly the younger ones, and not as someone who has passed on, but as a man whose seed is destined to put down ever further roots in physics teaching, and, with that, in all teaching about real things, and to fructify the whole spirit of this teaching.

It is unfortunate that Mach's contribution to education has been largely ignored in the Anglo-American world because current trends in the practice and theory of science education are in many respects repeating Mach's century-old arguments concerning the purposes and aims of science teaching, the nature of understanding, and the best ways to promote learning. An indicator of this neglect is that Mach's name does not appear in the Index of the popular and scholarly *A History of Ideas in Science Education* (DeBoer 1991).

Mach and the Enlightenment Tradition

All the Enlightenment philosophers were engaged with the promotion of education, both formal (schools, colleges) and informal (societies, journals, newspapers). Such engagement was a defining feature of the movement: If you were not interested in education you could not seriously be interested in the advancement of culture and society. Hence the following appear in all histories of education: John Locke (1632–1704), Baruch Spinoza (1632–1677), Voltaire (1694–1778), Jean D’Alembert (1717–1783), Denis Diderot (1713–1784), Nicolas de Condorcet (1743–1794), Benjamin Franklin (1706–1790), Joseph Priestley (1733–1804), Thomas Jefferson (1743–1826), and Immanuel Kant (1724–1804), to pick out some of the more recognizable names (Parry 2007).

Mach, who aligned with this Enlightenment tradition, was characteristically deeply involved with nineteenth-century Austrian education. He published numerous school and college textbooks, he cofounded the first ever research journal for science education, he taught what might have been the first ever university teacher-education courses, he addressed a multitude of teachers’ meetings, he had ongoing engagements with the reform and restructuring of Austrian high school education especially on breaking the stranglehold that Classics at the expense of Science had on university admission, he contributed to adult and workers education, he contributed to newspapers, he wrote detailed research studies on learning and concept development and linked this research to teaching methods, and as a member of the Upper House of the Austrian parliament (the House of Peers) he made numerous speeches and interventions on education policy. In brief, Mach made important contributions to both the *theory* and the *practice* of education. Although primarily a research physicist and philosopher, his contribution to education put him among the foremost of the Enlightenment-inspired educators.

Among major scientists of his time, and indeed through to the present day, Mach was noteworthy as one of the few who had deep and sustained educational interests and engagements. Another such was Thomas Henry Huxley (1825–1895),

the English polymath, champion of Darwin’s evolutionary theory – “Darwin’s Bulldog,” and educator (Huxley 1893/1964). Despite considerable overlap in the lifespans of Mach and Huxley, and both being champions of Darwin, enthusiasts for the Enlightenment project and energetic education reformers who devoted great energy to the spread of science education and its promotion in workers’ education – it seems that neither was aware of each other’s work. Nevertheless, Huxley can reasonably be labeled “Machian” in both his larger educational theory and his pedagogical directives.

Philosophy in Science Teaching

For Mach, the teaching of science, or any discipline at all, went hand-in-hand with teaching the philosophy of the discipline. For a student to understand the discipline and its claims, they had to appreciate the methodology, epistemology, ontology, and related ethics and goals of the discipline; know how it came to make its claims and how these claims were substantiated; to appreciate the role of internal and external factors in the process of substantiation. And acquiring such philosophical understanding of a discipline meant attending to its history. And this held whether the discipline was science, mathematics, economics, psychology, history, theology, or anything else. An example of Mach’s “philosophy of the discipline” concern is:

I led [during doctoral examinations in Vienna, 1895–1898] candidates into a conversation on general, and even the most general, questions of their special field. I recommended to philologists that they study the writings of philosophers of speech, to historians cultural history and prehistory, and mathematicians and natural scientists normally Mill and Jevons. It often became evident that the candidates did not know the philosophical writings of their own special fields. They were usually very thankful for my suggestions about future study. (Blackmore 1972, p. 139)

For Mach, philosophy was in the weft and warp of science (and indeed of all subjects being taught). Philosophical reflection did not have to be imported into science teaching, it was there in the

textbook, laboratory, and classroom; it just needed to be recognized and taken up.

This is true of all of science, but is especially obvious in Newtonian theory, a staple of all science classrooms (Hanson 1965). Mach had the greatest respect for the genius of Newton, for his “intellectual greatness” (Mach 1893/1974, p. 304), and excused his failure to deeply appraise the foundations of his “system of the world” because: “He that has to acquire a new point of view naturally cannot possess it so securely from the beginning as they that receive it unlaboriously from him” (Mach 1893/1974, pp. 304–305). But Mach says that after 200 years the situation is different and Newton might well have expected those following him to more closely attend to, scrutinize, and philosophize about the foundations of the system they were “unlaboriously” receiving.

This is not just a task for philosophers, Mach saw that the task can begin in science classrooms whenever the Newtonian system (or Einsteinian, Darwinian, Mendelian) is taught. But this rarely happens. Herbert Goldstein, in his popular *Classical Mechanics* book, lays out the standard procedure:

Basic to any presentation of mechanics are a number of fundamental physical concepts, such as space, time, simultaneity, mass, and force. . . . For the most part, however, these concepts will not be analysed critically here; rather, they will be assumed as undefined terms whose meanings are familiar to the reader. (Goldstein 1950/1980, in Assis and Zylbersztajn 2010, p. 143)

Mach might say “familiar, but not understood”; and further would note the missed opportunity to encourage students to put their toe in the philosophical water. The opportunity for basic philosophical engagement is everywhere in science, but is everywhere put off – “later, later, later” – at best this deferment goes on to postgraduate years, but often not even then.

Science teachers have endless opportunity to do this. Whenever “attraction at a distance,” “magnetic fields,” “electron shells,” “inertial mass,” “atomic models” are mentioned, aspects of the phenomenalist/realist debate can be introduced. And so much else of what Mach values as

philosophy, and that is so much a part of science – good experimental design, logical thinking, justified connection of evidence to conclusions, values – warrants attention by teachers.

Philipp Frank and Machian Science Teaching

Mach’s view on the place of philosophy in science education is clearly seen in the writings and teaching of Philipp Frank, the Viennese physicist who studied in Mach’s department, who often expressed his great debt to Mach, and who was a founding member of the “Mach Circle” in Vienna. Frank can be taken as an elaborator of Machian educational ideals (Frank 1950). Mach knew that science developed in conjunction with philosophy, both influenced by it and in turn influencing it; all his historical studies illuminated this connection (d’Espagnat 2006; Weinert 2005). Frank was more explicit about its educational consequences, saying:

Equally, students of science and philosophy should learn exactly what were the issues between Descartes and Newton, and between Newton and Leibnitz. From these disputes has arisen what we now call the classical physics of the nineteenth century, which until today has been the basis of the training in science to get into colleges of engineering or liberal arts. To grasp these issues would help them to understand our present science as a dynamic living being. (Frank 1950, pp. 279–280)

Mach believed that such broad, philosophically-informed teaching enables students to appreciate the engagement of science with philosophical systems, religion, and political ideology. Frank believed the same:

There is no better way to understand the philosophic basis of political and religious creeds than by their connection with science . . . the influence of political and religious trends on the choice of these symbols [metaphysics of science] should by no means be minimized, as is often done in presentation of the philosophy of science. (Frank 1950, p. 281)

Nearly 50 years ago Israel Scheffler outlined the contribution that philosophy can make to education (Matthews 1997), and did so in terms that echoed much of what Mach had written:

I have outlined four main efforts through which philosophies-of might contribute to education: (1) the analytic description of forms of thought represented by teaching subjects; (2) the evaluation and criticism of such forms of thought; (3) the analysis of specific materials so as to systematize and exhibit them as exemplifications of forms of thought; and (4) the interpretation of particular exemplifications in terms accessible to the novice. (Scheffler 1973, p. 40)

Comparable arguments were stated in a 1981 review of the place of philosophy of science in British science-teacher education:

This more philosophical background which is being advocated for teachers would, it is believed, enable them to handle their science teaching in a more informed and versatile manner and to be in a more effective position to help their pupils build up the coherent picture of science – appropriate to age and ability – which is so often lacking. (Manuel 1981, p. 771)

Teaching the Nature of Science

In recent decades there has been a good deal of writing and research on the contribution of history and philosophy of science (HPS) to science teaching (Matthews 2014, 2015). One part of this contribution has been the recognition of the connection of science to other academic and cultural fields. This is constantly pointed to in Mach's historical works. One part of the contribution of HPS to teachers' and educators' understanding is to connect topics within particular scientific disciplines; to connect the disciplines of science with each other; to connect the sciences generally with other disciplines such as mathematics, philosophy, literature, psychology, history, technology, economics, and theology; and finally, to display the interconnections between science and components of culture – the arts, ethics, religion, politics. All of this is obvious in Mach's work and is developed in more detail by Frank and others contributors to the Machian tradition.

At the same time there has been a concerted effort by researchers and curriculum writers to include Nature of Science (NOS) into science programs (Hodson 2014). One problem has been that because HPS is so little taught in graduate

education programs, this NOS research frequently underestimates the complexity of the HPS issues and debates, and presents a too simplified account of the issues. One especially deleterious effect of this underestimation, the more so when it becomes hubris, is the presenting of deeply controversial issues in HPS as settled, and so producing numbered lists that purport to capture the nature of science, and going on to have such lists taught catechism-like in school classes and teacher-education programs. The learning of such lists benefits no one, except when they appear in national and provincial curricula and become required learning for high-stakes exams.

Matthews (1998) argues why teachers should have modest goals when teaching about the nature of science; while Matthews (2011) details the benefits of moving educational discussion from nature of science to features of science. The latter formulation invites discussion and elaboration of multiple features of science in the way that NOS terminology, and associated assessment, does not.

History and Philosophy in Teacher Training

A serious impediment to raising the level of HPS discussion and understanding in both science education research and teacher-education programs is the crushing pressure to publish that is exerted on newly appointed faculty. Successful doctoral students might well say, as Mach's students did, that: "They were . . . very thankful for my suggestions about future study" [of HPS], but upon their first appointment they have to immediately set about meeting tenure-review publication commitments; none of which include wide reading so as to become acquainted with, let alone master, the history and epistemology of their discipline. This task takes years. Indeed on the contrary, taking time out to even begin the task means not getting tenure because the required number of publications have not appeared. Such publications, by definition are going to be juvenile, and contribute little, if anything, to the discipline. Better for young teachers, and far better for their students, that their time be spent doing what Mach suggested. But of course

this is not done and the whole sad problem of the HPS-uninformed leading the HPS-needed continues in science education.

Conclusion

Mach's Enlightenment-informed approach to education, characterized by social reformism, personal knowledge growth, experiential learning, and liberal curricula can be championed without commitment to his phenomenalism. The last was the core of all his scientific and philosophical work, yet his theory of education and his pedagogical style can survive without it. Being a realist is no bar to being a Machian in education. But thoughtful realism does require coming to terms with Mach's own phenomenalist arguments that he so comprehensively advanced.

Unfortunately there is little opportunity in any country's science teacher-education programs, or even graduate education programs, to learn from the life, work, and writings of Mach. The history and philosophy of science is not a part of these programs and neither is the history of science education. With both HPS and history of education missing, Mach does not appear in preservice or graduate education programs that are dominated by other supposedly more practical concerns. But in education, as in science, there is nothing so practical as a good theory, and Mach provides one. And his theory can in-principle be elaborated, revised, and criticized. It is an orientation to education and pedagogy that rewards engagement.

Making Educated Girls in the Global South: Insights from Educational Anthropology

Karishma Desai

Teachers College, Columbia University, New York, NY, USA

Introduction

The education of girls and women has been heralded as a panacea for community and national change in global discourses. Commonsense understandings suggest that changing the human capital potential of girls will inform the economic and moral progress of a nation. As such, girls' education has been centered in reaching international development goals such as the Millennium Development Goals (MDGs) and, more recently, Sustainable Development Goals (SDGs), and through campaigns like *Let Girls Learn* and *Girl Effect*, governments are pressured to make policy changes to increase the number of girls in school. Certainly, the discourses of international development campaigns and policies hold aspirations for what educated girls and women should be like, and as such, girls become objects of reform. These aspirations are articulated through formal and informal educational sites and interface with local constructs of gender and perceptions of femininity. This encyclopedia entry traces the cultural production of educated girls in diverse locations in the global South. I specifically focus on the global South, inclusive of regions in the Southern hemisphere – Africa, Asia, and Latin America – and marked by the political economic legacies of colonization and international development. The entry prioritizes this region because the geopolitical power dynamics of these global conditions have implications for how gender

difference has been constructed and are produced in educational spaces.

I draw on insights from educational anthropologists about the processes of the cultural production of educated persons (Levinson et al. 1996) to consider the production of educated girls. Cultural production is a “theoretical construct, which allows us to portray and interpret the way people actively confront the ideological and material conditions presented by schooling” (Levinson and Holland 1996, p. 15). This entry asks: How have educational ethnographers considered the construction of educated women and girls? How have scholars remarked upon the construction of gendered aspirations, of becoming good mothers, responsible and law-abiding citizens, and modern urban women in diverse contexts? And what do these studies reveal about the limits of becoming educated women? Paying attention to some of the ways in which young women experience marginality in diverse contexts, their lived experiences and affective investments, this entry interrogates the production of educated women. Bartlett and Holland (2002) contend that the “educated person reflects a culturally specific definition of desirable, valued forms of training, skills, and knowledges which may or may not coincide with formal schooling” (p. 14). Further, the cultural production of an educated person has moral overtures and if becoming educated is the equivalent of becoming a “decent and honorable person,” others are considered “intellectually and even morally inferior” (p. 15). As Stambach (2000) and Vavrus (2003) have noted, paying attention to gender in the production of educated persons raises a specific set of questions: what are the performances of morality and respectability that women are expected to aspire towards? If to begin to seem and feel educated, marginalized persons have to counter symbolic violence and construct new social relations (Bartlett 2007, 2010), what aspirational locations are available for women?

Cultural Production

Educational anthropologists drew upon critical theories of reproduction, social reproduction,

and developments in anthropology where culture was resituated not as noun, a static body of knowledge transmitted from one generation to the next, but rather as verb (Street 1993), involving shifting processes of meaning making. Using cultural production as a lens, educational spaces, school-based and otherwise, can be viewed as sites of subject formation occurring through the production and consumption of cultural forms. While dominant discourses that are directed towards building modern nation States and are well-alive in schools, in their edited volume, Levinson et al. (1996) maintain that individuals within schools, teachers and students alike, often occupy the space of school in creative ways where practices and understandings are generated that engage and transform “aspirations, household relations, local knowledges and structures of knowledges” (p. 15). They are not necessarily subjected to dominant discourses schools often carry. For instance, contends that while schools seek to modernize indigenous populations in Ecuador, certain Huaoroni communities resist these State’s attempts. Believing that State schools deskill their children, Huaoroni hold onto their activity-based cultural knowledge. This is their version of the “educated person.” To extend this point, educational anthropologists argue that all cultural and social contexts form frameworks of what it means and how one becomes a fully “knowledgeable” person in that context, endowed with maximum cultural capital (Levinson et al. 1996, p. 21). And as such, the idea of an educated person refers to a culturally specific “definition of desirable, valued forms of training, skills, and knowledges which may or may not coincide with formal schooling” (Bartlett and Holland 2002, p. 14). Anthropologists argue that school is often a site of struggle amongst the value of school knowledges and knowledges from other sites, noting that the “educated person” is produced through/within these uncertainties.

Learning Respectability and Morality

Contemporary schools remain sites where gendered norms of morality and respectability are

taught. The intended and formal curriculum inscribes such gendered ideals. In her ethnography of gender-based in the Mount Kilimanjaro region in Tanzania, anthropologist Amy Stambach (2000) observes how girls are schooled in home economics; the curriculum portrays the mother–child relationship as the core of the African family. The formal curriculum features standards of proper hygiene, bodily care, housecraft, and mothering. Stambach (2000) describes how the syllabus section called General Housecraft combines lessons titled “Good Manner” and “Good Grooming.” The section aims to build the moral character of girls by teaching them that their “attire and manners are indications of their personal worth: by being on time, following instructions, and always appearing neat and clean, girls will embody the social values commensurate with their education” (Stambach 2000, p. 5).

Schools teach girls moral lessons through the formal curriculum as well as the informal and unintended curriculum. In her study of al-Khatwa School, a single sex school in Jordan, anthropologist Fida Adely (2012) focuses on the informal, everyday curriculum in which educators and peers teach gender lessons on what it means shape oneself into a respectable woman in Jordan. Teachers are positioned as moral guides and regulate proper Islamic behavior for young women, albeit differentially. She explains how school is seen as an extension of family, where teachers were entrusted with the upbringing or *tarbiyya* of young women, according to a set of generally shared moral values. For instance, modesty is one particular moral value for young women that was instilled and reinscribed in everyday practices. This attention to modesty was connected to concerns about marriage and, relatedly, respectability. Sex segregation and disciplining students’ attire were two ways of regulation. Furthermore, a girl’s respectability was both monitored and constructed in school as her social status was intertwined with being an “educated person.” Adely argues that respectability was tracked, as particular forms of education such as science and medicine held greater social value than others.

At the same time, these ethnographers illustrate how girls subvert and engage these efforts to

educate them into moral subjects. Adely, for instance, explains that gender segregation did not prevent girls from talking or calling boys and finding time to see them. Girls discussed romance in school when they were away from parental surveillance. Girls differently negotiated their Muslim identity and challenged teacher and textbook interpretations of Islam regarding women's work, conduct, and dress.

In many cases, schools are often perceived to be sites where local ideas of morality are undermined. Therefore, in contexts where localized desires for respectable femininity contrast perceptions of morality etched through schooling, families choose to prevent girls from attending school. Rather, desired femininities are taught and learned through local educative practices. As Naji (2012) illustrates in her study of formal education in Sirwa, a geographically marginal Berber region of southern Morocco, families prefer that girls learn weaving as opposed to schooling. Her study details how girls and young women in the Sirwa come to desire the norm assigned to their sex and become recognized as legitimate members of "female" groups through their participation in weaving and domestic activities. She demonstrates how the education of young women in weaving shapes and marks them as moral subjects. In this context, being a skilled weaver and being a moral woman are conflated. The pedagogical techniques used by mothers and elder sisters in teaching weaving incorporate techniques of humiliation, coercion, and peripheral participation. Craft production implies a work on the body and mind, inherent in mastering the craft. Imposed discipline becomes internalized as women craft a moral and valorized self. And as such, Naji suggests that weaving works on the girl producing an educated girl is morally astute.

As these ethnographers demonstrate, girls are taught to become moral subjects through formal and informal education. At times, school spaces coincide with locally desired values for female morality. In other instances, families choose to teach towards respectability through local educative sites over schooling.

Learning Entrepreneurial Skills and Economic Independence

There are two dominant subjectivities of neoliberalism – the entrepreneur and the consumer or the knowledge producer and the knowledge consumer – according to Nikolas Rose (1999) and Stephen Ball (2008). Rose (1999) details the self-made ideal entrepreneurial citizen in which, "politics must actively intervene in order to create the organizational and subjective conditions for entrepreneurship" (p. 144). This entrepreneurial subject-citizen must develop a will to take initiative, to be motivated, and to realize their potential and their inner drive. Accordingly, moral worth is attributed to responsible individuals who are able to take up the mechanisms of self and familial care and management in arenas that were initially the State's responsibility and demonstrate high levels of productivity. A problem of the entrepreneurial subject-citizen is that it positions the subject-citizen as responsible and able despite constraints of material poverty, a condition intensified by neoliberal policies.

Recent empirical studies on the Nike Foundation's Girl Effect phenomenon (Moeller 2013; Hayhurst 2013) attend the way in which entrepreneurial citizenship is gendered. For instance, Kathryn Moeller's (2013) invaluable multi-sited study on the Girl Effect apparatus investigates how the Nike Foundation's investments represent increased corporate interest in education generally and girls' education more specifically. She describes how adolescent girls become researchable, disembodied objectified data, and how this expert data is used to create universal indicators – age of marriage, pregnancy, and secondary school completion – to manage the young women as subjects and prove the Girl Effect. This assessment enables the foundation to gauge the extent to which the "asset-levels" of adolescent girls have improved. Thus, the Brazilian NGO funded by the foundation is pressed to demonstrate the efficacy of Girl Effect – they recruit for the right type of sexually regulated girls, teach "entrepreneurial" skills, and channel them into

insecure, low-wage employment in telecommunication centers, supermarkets, and bus companies – thereby, illustrating how a nation gains by regulating the productivity and reproductivity of adolescent girls. This “intimate relationship between heterosexuality and economics enables the production of the returns – real or imagined – Girl Effect purportedly creates on multiple spatial scales from the girl to the nation to the world” (Moeller 2013, p. 4).

Drawing on Foucauldian-inspired critiques of neoliberal governmentality, Lyndsay Hayhurst (2013) investigates relationships among non-governmental organizations delivering sport-based girl empowerment programs in the global North with the girls they target in eastern Uganda. She illustrates how these relationships “result in a widespread flurry of entrepreneurial activities for both NGOs and girls in order to help them survive (and eventually thrive) in the current neoliberal order” (p. 298). SGD programs seek to foster self-reliance through social entrepreneurship by training young women to become martial arts instructors, allowing them to earn income, teaching them how to avoid gender-based violence, and encouraging them to take responsibility for their own health and well-being. Hayhurst suggests that through the martial arts program, young women build an “economically vigorous body that is employable and/or fundable” (p. 304). Hayhurst views neoliberal governmentality as hegemonic force, yet illustrates how social entrepreneurship provides avenues for girls to become economically self-sufficient.

Similarly, examining the effects of schooling as a new phenomenon in the Maasai region of Kenya, particularly for girls, Heather Switzer’s (2010) research on Maasai schoolgirls in Kenya provides insights on how education promotes fantasies of independence. Switzer underscores, “what they see and desire is the primary requirement of neoliberal development and the signature aspiration for the neoliberal subject: participation in the wage economy” (p. 148). Employment is seen as the main vehicle for autonomy, and independence emerges as a dominant theme across her interviews with schoolgirls. Hence, in the Maasai

girl’s move from *entito* (girl in Maa) to schoolgirl, she breaks the “bonds of tradition” to pursue her own autonomous dreams and take an independent place as a producer and consumer in the future developed world. Switzer’s findings suggest that the girl-child is re-signified as the schoolgirl through engagement with an individualizing process that positions her as a future producer; the Maasai girls in Switzer’s study aspire to be future producers as they consume new subjective positions.

Learning Proper Consumption

In addition, the ideal neoliberal subject is a consumer, who consumes appropriately. Comaraff and Comaraff (2000) discuss how access to consumer goods and the “freedom to choose” was considered a fundamental political right in the West by the mid-twentieth century. The market is not solely imagined as a space in which subjects are expected to produce, but the subject also has the right and responsibility to consume. Rose suggests, “citizenship is realized through acts of ‘free’ but responsibilized choice in a variety of private, corporate, and quasi-public practices from working to shopping” (p. xxxiii). As part of fashioning citizen-subjects who have autonomy, self-reliance, willingness to learn, and motivation among children and youth in particular, technologies of the self or subjectivity are mobilized through education.

Youth studies scholars have examined how consumer citizenship shapes youth culture (see Lukose 2009). Anoop Nayak and Mary Jane Kehily (2013) call for a specific attention to global femininities and consumption considering the positioning of young women as ideal neoliberal subjects (Harris 2004; McRobbie 2002) and note that cultural flows of particular global femininities such as consumer citizenship converge with local practices offering points of connection and dissonance and providing access to new subject positions. Globalization influences the content, commodities, and ideas that are consumed and the processes by which consumption happens.

Several youth studies scholars attend to the ways in which the consumption of global media produces new femininities (Vidmar-Horvat 2005). For instance, in study of gender and personhood in new South Africa, she illustrates that while motherhood was once regarded as the epitome of femininity, the status given to motherhood declined with the onset of global media. Global media such as soap operas provided young women with new forms of cultural capital, and they were able to imagine “gender relations beyond the narrow choices their mothers proscribed,” (p. 358) which resulted in the provision of new possibilities as well as new constraints. Femininities promoted within educational spaces further crystallize aforementioned neoliberal femininities as illustrated by Ritty Lukose (2009). In her study of a low-caste college in Kerala, Lukose illustrates how young women develop gendered subjectivities through consumer citizen discourses “where globalized patterns of consumption becomes an axis of cultural belonging with implications for how women participate and become citizens” (p. 57).

Conclusion

Anthropologists of education attending to the construction of girlhood unsettle the normalized human capital logic that investment in girls education will further the economic development of their nations. Rather, through careful investigation into how girlhood is culturally produced in educative spaces, ethnographers illustrate how the construction of gendered norms occurs through global norms of morality and citizenship that uphold the discursive logic. Through schools and nongovernmental organization (NGO) programs, young women in the global South interface these global norms around gendered citizenship in neoliberal times. They engage, negotiate, and contest these ideals of girlhood with localized aspirations for future women. This review of ethnographic research emphasizes that the intersection of geopolitical conditions and situated study are needed to best understand the discursive conditions that provide new possibilities and new

constraints in producing educated women and girls in different sites across the global South.

Mālie Conceptualizing: A New Philosophy of Tongan Education

Linitā Manu'atu

Api Fakakoloa Educational Services, Loto'Ofa
WhatuManawa Educational Services, Mt Roskill,
Auckland, New Zealand

Introduction

The terminology, *mālie*, is an indigenous word in Tongan language and culture, one of the many languages and cultures identified in the South Pacific. *Mālie* means good, pleasing, pleasant, interesting, advantageous, helpful, splendid, fine, commendable, admirable, or very satisfactory (Churchward 1953). An initial study of *mālie* in the academy by Manu'atu in 2000 has paved a way of decolonizing the thinking of Tongan people to draw upon their concepts, values, and beliefs in their own Tongan language for ideas to deepen their thinking about their education, pedagogies, and philosophies. Furthermore, the study has opened up an entry from Tongan peoples' wisdoms to talking knowledge and philosophy with people of different languages and cultures in the world. This intellectual work is exciting and challenging, and the conceptualizing of *mālie* is working in progress.

Conceptualizing Mālie from a Tongan Perspective

Mālie can be talked about as a spirit (a philosophy) that enlivens the hearts of people and permeates and enriches their whole world – the social, cultural, economic, political, and physical. As a spirit, *mālie* can be experienced in the heart. In Tongan culture, the heart and the mind are both acknowledged as separate but are intimately and deeply related; both are enablers of knowing and learning to take place, that is, learning the deep knowledge and wisdoms and knowing all kinds of scientific knowledge. When a person experiences this kind of learning and knowing, it is referred to as *mālie* to the person's heart, mind, and body. The happiness and joy of good learning and knowing is spoken about as *mālie*! In this way, learning and knowing are not rote or technical; rather, the spirit of the person is alive and energized (growing in wisdom), and the mind is active in thinking, be it critical or reflective, or soars in imagination.

When a person is willing to learn and know, his or her mind is open, and the person can learn and know almost anything. For example, *loto lelei* (a good heart) is equated with *atamai lelei* (a good/brilliant mind), and a person who is both *loto lelei* and *atamai lelei* is willing to learn, learns well, and will experience good learning that seeks to know and understand.

Other examples that talk about the intimate relationship of the *loto* (heart) and the *atamai* (mind) include *loto poto* (being wise) being equated with *atamai fakapotopoto* (being prudent, sensible, tactful, shrewd, cautious, also economical, sagacious, and thrifty), *loto matala* (open heart) being equated with *atamai puke me'a* and *atamai vave* (comprehending and quick at grasping), and *loto toka'i* (deeply respectful and reverent in the heart) being often equated with *atamai loloto* and *fakakaukau loloto* (in-depth thinking and seeking for depth) Churchward (1959).

The idea of *mālie*, conceptualized from a Tongan perspective, embraces a philosophy of practice, energy, and transformation (Manu'atu 2000a). As a concept, it draws upon Tongan language that provides insights into the cultural

meanings that Tongan people construct to make sense of the relationships they form with people and with the world(s).

The Use of *Mālie* in Tongan Language and Culture

There is no great deal of literature on the notion of *mālie*, but there are unquantifiable lived experiences and stories that are *mālie* and are about *mālie* in activities known to be performed by people – performing arts, thinking, sports, music, arts, storytelling, fishing, gardening, planting, navigation, traditional healing, medicine, church services, and wedding ceremonies, among others. This is not saying that Tongan people's life purposes are hinged on singing and dancing in order to experience *mālie* nor an implication that *faiva* (performing arts) is the only space where *mālie* can be experienced. The point that is made here is that as a cultural way of being and doing, *mālie* is pursued and experienced in *faiva* and in the wholeness of living (Manu'atu 2000a).

The vocabulary created by and derived from the word *mālie* provides insights into the worldview that underpin Tongan language (Manu'atu 2000a, 2014). In grammatical terms, *mālie* is a verb, a noun, an adverb, and an adjective (Churchward 1959). The grammatical feature of the Tongan language is theorized to reflect a language that is underpinned by a worldview that is not rigid; rather, it is about movement. The movement is signified by the verb-based structure of the language, and the verbs are interpreted here as relationships that people create when forming their worldview and knowledge (Manu'atu 2000a).

Mālie can be added (like a suffix) to verbs and/or nouns to enhance or deepen the meaning of the word (Churchward 1953). The words represent concepts of various forms of social relations that can be experienced in a range of contexts. Their meanings and use are significant to show how a philosophy of *mālie* contributes to understanding the cultural milieu and social relations that are emphasized by Tongan people.

Each of these terms (Churchward 1953, 1959) can be discussed, critiqued, and analyzed philosophically.

alomālie (fine beautiful day, a good day for sailing)

auhamālie (totally annihilated)

faingamālie (*fai*, a verb which means to do; *fainga*, a noun which means to do; *faingamālie*, an opportunity to do something with good intention)

*fie**mālie* (*fie* means desiring, *fie**mālie* means in total comfort since the desires are fulfilled)

hangamālie (*hanga* means to face a direction, *hangamālie* means totally focus)

langimālie (*langi* refers to the face of the king; *langimālie* means being healthy, a beautiful, bright face)

laumālie (*lau* means talk, the language spoken; *laumālie* means the language spoken is good since they come from the heart, spiritual)

lavengamālie (*lave* means a slight touch; *lavenga* means being touched on; *lavengamālie* means touch on the heart, connect with the heart, well connected)

maaumālie (*maau* means tidy, *maaumālie* means very well organized)

mahu'ingamālie (*mahu'inga* means important, valuable; *mahu'ingamālie* means deeply meaningful)

mālie'ia (experiencing *mālie*, delighted, to be so pleased)

ta'imālie (to be so blessed)

tokamālie (*toka* refers to the king's disposition, *tokamālie* means peaceful, calm)

tu'umālie (*tu'u* refers to stance, standpoint; *tu'umālie* means prosperity, richness, affluent, wealth)

With these meanings, *mālie* is about the spiritual; it expresses wholism. In quest of philosophical ideas to inform the education of Tongan people and Pacific peoples at large, there is urgency to seek for spiritual wisdoms to guide the heart and mind of the collective and the individual (Manu'atu 2000a, 2014, 2016). *Mālie* is an example of spiritual wisdom in Tongan language and culture.

Mālie in Kātoanga Faiva: Festival of Tongan Performing Arts

In Tongan *faiva* (performing arts) and, in particular, *faiva lakalaka* (Tongan traditional dance), the notions of *mālie* and *māfana* as central concepts are culturally constructed, and they articulate “success.” *Mālie* in *faiva lakalaka* is defined here as a process that produces meaningful connections between *ta’anga* (the context in Tongan language and cultural practices), *hiva* (singing), *haka* (the bodily movements), the psyche and spirit of the *punake* (the poet, also artist), the performers, and the audience, all of which energize and uplift people (Manu’atu 2000a). The expression *tau-e-langi* (literally means reaching the sky) is a reference to the moments and duration of *mālie* people experience. *Mālie* is energy, and upon experiencing it, the hearts and souls of the performers and audience are uplifted to utmost fulfillment. *Mālie* can transform the psyche, emotions, and movements of the body. Members of the audience often get up and dance to show that they cannot contain the movement of *mālie* and *māfana* through them.

[Note that *māfana* is an entry in the encyclopedia. A full discussion of *māfana* can be obtained from that specific entry. Suffice to say that *māfana* and *mālie* are experienced together in *faiva*, Tongan performing arts. *Māfana* is used here to mean warm spirit and energy that is moving through the heart].

Success and achievement as considered within the frame of *mālie* secures relationships between and within everyone who is brought together by the performance. The individual achievement is not an issue here; rather, the “interconnectedness” that is experienced and practiced by the collective is what counts. A person’s “achievement” within the performing group is not denied; rather the persons and the group as a whole are considered together as co-producers of *mālie* and *māfana*. With an audience who can relate and understand the performance, they too can experience the *mālie* and *māfana*. It is known to have happened that some *faiva* have been performed where neither the performers nor the audience have experienced a sense of *mālie*, and both the performers

and audience have recognized this condition. In the event, the *haka* (actions), *hiva* (singing), and *ta’anga* (lyrics) fail to produce the meanings and understandings that move the spirit of the performers. When this happens, usually the performers may demonstrate skills in movements of the *haka*, but the *ta’anga* (poetry) fails to represent the artistic knowledge and skills of creating metaphorical language and meanings. The *ta’anga* in this sense is described to be *pāpafua* (flat) and *hualela* (straightforward and shallow) and does not produce *mālie* and *māfana*. In this way, the *faiva* is fragmented and the performance is one of meaningless techniques. There is no comparison between a performance where performers act with understandings and those where the performers have little or no comprehension of the art. *Mālie* cannot be produced if the performers denied the understanding of the concepts and the connections they have with the art of performance. The mimicking of the *hiva* and *haka* by the performers only reinforces an image of superficiality.

In *faiva lakalaka*, a *ta’anga*, stories are told from a particular standpoint within a framework that is metaphorical, cultural, and political, all in pursuance of *mālie*. As an aim, *faiva lakalaka* is created to produce *mālie* in the art of *ta’anga*, *hiva*, and *haka*. In the hierarchical society of Tonga, *faiva* (as a production of *mālie*) was an activity created by the *punake* (poet, also artist) and performed by the people and some members of the *hou’eiki* (royal family and nobles of the realm) with pleasure called *fakahoifua*.

When a *faiva* is performed and *mālie* is not experienced, then the performance and the audience tend to consider it as just another (unfulfilling) task that has been done. Usually people say that they are glad, it’s all over! The performance is quickly forgotten, and people are usually despised for the poor and uninspiring experience they had produced. A *faiva* that is *mālie* is a success story, and it lives on in the memory of the people. Its greatness is not just talked about, but it becomes a point of reference to the group where their identity is reconfirmed and their social status is reaffirmed. *Mālie* provides a different

philosophy in Tongan language and culture, and upon it success and achievement can be viewed differently.

Mālie: A Philosophy Underpinning Good Pedagogy for Tongan Students and Learners

Pedagogical ideas can be drawn from conceptualizing social relations in real-life linguistic and cultural contexts. The Kātoanga Faiva is one useful source of good pedagogy to draw upon for ideas. In the discussion of Tongan Kātoanga Faiva and its usefulness as a pedagogical site (Manu'atu 2000b), the *mālie* in *faiva*, *hiva*, *haka*, and *ta'anga* is considered useful in theorizing pedagogical practices (Manu'atu 2000a). Good pedagogy is central to successful learning of academic and nonacademic subjects. That is, the pedagogical ideas that are sensitive and appropriate for the students can be drawn from the conceptualization of *mālie*. In doing so, pedagogical approaches can be synthesized from understandings of values and meanings of relationships from a Tongan perspective (Manu'atu 2000a, b). The best pedagogical approaches also mean paying attention to how they promote, hinder, or transform situations to produce successful and worthwhile learning.

Mahu'ingamālie: Mālie in Education for Tongan Students

The word *mahu'ingamālie* is a verb that is translated in the dictionary as “perfectly clear to the mind, stronger than *mahino*” (Churchward 1959, p. 318). The word *mahino* as a verb means to understand. A possible addition which is proposed here is an interpretation of why *mahu'ingamālie* is stronger than *mahino*. A view that is proposed here is that *mahu'ingamālie* is an experience of *mālie* that a person arrives at when she/he makes sense of the meanings as well as the connections between the context, meanings, and the relationships people create himself/herself and with others (Manu'atu 2000a). Hence,

mahu'ingamālie is not just understanding something (*mahino*), but the person also creates connection(s) with the context of what she/he understands. In a way, the understanding is more in-depth and more meaningful.

As a notion, *mahu'ingamālie* is key to an understanding of “achievement” from a Tongan perspective. What is proposed here is that “achievement” from a Tongan perspective is framed around the philosophy of *mālie*. Ability, skills, knowledge, and possibilities are considered in the philosophy of *mālie* as aspects of the relationships that are valued and formed when *mālie* is pursued and achieved. So *mālie* as a process can be considered as relationships that are created within a person in relation to other persons and the collective. A person who perceives the world in a fragmented and mechanistic worldview, for example, may not “connect” with the philosophy of *mālie* easily. However, *mālie* is useful to explain why a Tongan perspective of “achievement” at school can be considered in theorizing about teaching Tongan students in order for the process of learning to be uplifting. In doing so, the achievement of students can also be raised since the learning (ako and education) in their wider sense of use is about processes in which people engage meaningfully in order to draw upon themselves to transcend, to achieve, to engage possibilities in the world, to enjoy, to transform, to inform, to share, to strive, to know, and to understand.

So the achievement that is promoted by the examinations in schools can be theorized from the frame of *mālie* to be the attainment of “connecting with” the concepts or whatever is taught. It means that the students can make sense of the ideas by understanding the contexts of the ideas and their relationships with them. When the students are taught from such a standpoint, then their learning is *mahu'ingamālie*. Hence, they can question, discuss, and develop their interests in learning, and they become *māfana* to learn (wanting to learn more). The notion of *mahu'ingamālie* has pedagogical implications for the education of Tongan students. The value of learning, what is learned, and how it is learned is captured by the notion of *mahu'ingamālie*.

Human beings come to experience *mālie* when they understand something clearly and deeply, and then they further their own learning by contributing to the learning process of others. Further, they can discuss, talk, question and answer, and create knowledge in many ways.

When students do not make sense of what is taught, that is, when they are not connected to the concepts and the contexts in which the subject taught is created, then there is little or no understanding of what is going on. There is no experience of the *mālie* of learning, of coming to know.

What these *mālie* words reflect is the centrality of *mālie* and *māfana* to Tongan people's experiences and living (Manu'atu 2000a). Insights into Tongan values, ways of doing, spirituality, and health provide ideas about pedagogical practices which frame learning as valuing, connecting with, and becoming in the process of understanding. The idea here is to conceptualize *mālie* and *māfana* as key concepts in the critical discussion of Tongan educational experience, expectations, and achievement. In other words, an understanding of *mālie* and *māfana* enables educators to critically reflect on the current pedagogy of Tongan students, question what constitute "good pedagogy" for them, and then act upon the new understandings to transform educational practices toward Tongan students (Manu'atu 2016).

Management

► Managerialism and Education

Managerialism and Education

Patrick Fitzsimons

Independent Researcher, Auckland, New Zealand

Synonyms

Efficiency; Governmentality; Markets; Management; Power; Privatization

One of the features of contemporary Western society is the tendency under neoliberal philosophy to define social, economic, and political issues, as problems to be resolved through management. Under neoliberalism, there is also a generalized governmental concern to promote efficiency in what were previously non-governmental spheres – i.e., in self-constitution – and that includes redefining the cultural as the economic. During recent decades, these developments have been associated with the introduction of managerialism as a new mode of governance under the restructured public sectors of many Western societies. The restructuring has involved the reform of education in which there has been a significant shift away from an emphasis on *administration* and *policy* to an emphasis on *management*. This form of managerialism is known as *new public management* (NPM) and has been very influential in the United Kingdom, Australia,

The original version of this entry was revised: An erratum can be found at https://doi.org/10.1007/978-981-287-588-4_900

Canada, and New Zealand. It has been used both as the legitimating basis and instrumental means for redesigning State educational bureaucracies, educational institutions, and even the public policy process.

Under NPM, there is an elaboration of explicit standards and measures of performance in quantitative terms that set specific targets for personnel, an emphasis on economic rewards and sanctions, and a reconstruction of accountability relationships. It promotes a reduction in scope for ministerial discretion in the administration of government agencies; it separates the funding agencies from providers of services as well as separating advisory, delivery, and regulatory functions. NPM introduces accrual accounting, capital charging, and a distinction between the State's ownership and purchasing interests. There has been a decentralization of management control toward what is often referred to as the doctrine of self-management. In the interests of so-called productive efficiency then, the provision of educational services has been made contestable; and, in the interests of so-called allocative efficiency, State education has been marketized and privatized.

Interpretations of Managerialism

NPM is underpinned by a tradition of managerialism that can be located within an account of the development of capitalism. Historically, the ownership of capitalist enterprise was separated from its operational function, which was the stimulus for the employment of a professional managerial hierarchy in the organization. The modern business enterprise can be located in this broad institutional context and can be linked specifically with two chronological phases in the development of the capitalist economic system. These two phases are referred to as liberal and State-regulated capitalism, respectively. It was during the development of State-regulated capitalism that managerialism in its current forms came to the fore. Davis (1997, p. 305), who argues that in its latest mode managerialism has "refashioned the world in its image and captures for itself the modern state," reinforces this. In terms of the modern

corporation, managerialism signifies the shift from the owner to the professional manager to legitimate the control of individuals, societies, and their organizations in the interests of capital.

Managerialism has been characterized in a variety of ways. Enteman (1993), for example, describes managerialism as an international ideology on which rests the economic, social, and political order of advanced industrialized societies and from which arises the impoverished notion that societies are equivalent to the sum of the transactions made by the managements of organizations. In this view, social institutions are primarily a function of the practices of management. For Drucker (1974, p. 19), "management has as its first dimension an economic dimension." Davis (1997, p. 305) claims that managerialism has swept aside "an idyllic older bureaucratic world . . . reducing every relation to a mere money exchange." Managerialism has also been characterized as a "set of beliefs and practices, (that) will prove an effective solvent for . . . economic and social ills" (Pollitt 1990, p. 1).

In addition to its technical function, management is . . . an elite social grouping which acts as an economic resource and maintains the associated system of authority. (Child 1969, p. 13)

Managerialism has also been explained as a form of instrumental reasoning where, in the interests of efficiency, value does not inhere in the activity itself. Weber's notion of the "iron cage" of bureaucratic rationality explains the oppressive potential of a society that is increasingly governed by its logic of instrumental reason. He predicted that the modern bureaucratic State would require the extension of means-end reasoning into more and more areas of social life. In this respect Pusey (1991, p. 22) observes that "there can be no quarrel with the notion of efficiency as such. The inherent problem lies instead at another level – with the criteria that define what count as costs and benefits; with the loss of social intelligence; and with the number and range of potentially constructive discourses that have been suppressed." Drucker (1994, p. 193) asserts that "post-capitalist society requires a unifying force . . . a common and shared commitment to values,

onto a common concept of excellence.” In this new rational economic order, social decisions are defined within managerialism, and, consequently, policy, politics, democracy, and ethics disappear. On these accounts, managerialism is emerging as a unifying force in the wake of the predicted breakdown of Fordist notions of production. Taken together, these representations of managerialism imply a transcendent theory that Lyotard (1984) calls a meta-narrative.

It is significant that throughout these accounts, managerialism has remained implicit as a mode of governance, preferring instead to account for itself explicitly as a mode of domination. An alternative characterization of managerialism is as a form of what Michel Foucault (1991) has termed *governmentality*. In this sense, managerialism is a regime of governmentalizing practices rather than a meta-narrative where it is presented as a politically neutral technology under its rhetoric of economic neutrality. Employing governmentality to explain managerialism is different from employing theories of State and is legitimate, because, according to Foucault (Gordon 1991, p. 8), the perceived internal constraints of governmentalizing practices are just as capable as principles of legitimation of carrying normative meaning and content. Foucault sees that the State has no essential properties but is, rather, a function of changes in the practices of the government. Governmentality has a central concern with the legitimate foundations of political sovereignty and political obedience.

This explanation of the new managerialism as a form of governmentality includes, but is not limited to, traditional accounts of managerialism as domination. In addition to the corporatist characterizations of managerialism as the prerogative of managers, governmentality suggests a genealogy of practices about how individuals also implicate themselves in their own governance. In other words, as a form of governmental rationality, managerialism is a form of disciplinary knowledge. Although Pusey may well be correct about suppression of the “other” by economic rationalism, following Foucault, it could be argued that managerialism as a moral technology is not only *constituted by* but also *produces* certain effects on

discourses. These productive effects are ignored in orthodox accounts of managerialism as domination. To the extent that accounts of managerialism employ imposition, they are inadequate because, at the expense of agency, they present a skewed picture of managerialism as domination. Even in nominally democratic societies, explanations of domination as a totality are not rational, and, therefore, agency is implied. Since agency implies a sense of self-governance, a more adequate explanation of managerialism as governance, then, would include what Foucault (1988) calls technologies of self. Although NPM includes corporatist management practices, under democracy, this combination must also be explained in conjunction with a genealogy of the ways in which individuals implicate themselves in their own governance. Self-governance as a form of governmentality occurs at the intersection of technologies of domination and technologies of self. In this mode, agency and domination can both be accounted for. Since this account is a new formulation of managerialism, it might be better termed as the “new managerialism.”

The new managerialism explains public services not as production functions or firms, but as governance structures. What is at stake is not so much the ethos and practice of management as the culture and structure of governance. Here governance means the culture and structure of the relationship between what Weber called legitimate domination and the self-constitution of those who are subject to it. What Weber meant by legitimate domination was justified by an authority structure, which was, in turn, legitimated by legal-rational authority. But governance through the new managerialism is not dependent for its legitimation on Weber’s notion of legal-rational authority, but more on a form of rationality that depends upon efficiency in the market. Although this new managerialism still draws on models of corporate managerialism as well as accounts of NPM, it is also imbued with the practices of self in everyday life. What is new here is recognition of the technologies of self that individuals employ to implicate themselves in their own governance.

Against this account, it could be argued that much of this change is rhetorical rather than

substantive and that educators will simply clothe their actions in new rhetoric while continuing their traditional practices. But rhetoric also has its own discursive force in that it encourages people to define the world differently; as language changes, so too does practice, and vice versa. Language itself could even be construed as a social practice. Education is also a product of the effects of social practices, and its institutional actors are neither solely creatures of neither language nor agents independent of the historical practices in which they engage. Rather, both language and social practices constitute them. While this view displaces the individual as the central actor or agent of social change, it does not dismiss agency altogether. The question it raises is to what extent the individual is free from the coercion of managerialism; that is, to what extent can the individual recapture the center as the originator of thought or action? Paradoxically, managerialism assumes an autonomous, individualistic, transparent, and self-interested, rational individual at its core that is admonished to “take responsibility,” to be “self-motivated,” and so on. Far from assuming a stable autonomous individual, managerialism has not yet demarcated the senses in which an individual might exist as a social actor. Managerialism then leaves us wondering about the “who” that is engaging in its required performances. If the problem is essentially a struggle about practices as well as language, what people say and do within institutions actually matters. Under the previous democratic governance of institutions, the dominant opinion was for the redistribution of educational opportunities and sought to remedy the exclusiveness of education. These same people are now implicated in managerialism. In the interests of “better” education, they (albeit grudgingly) write mission statements, implement strategic plans, design appraisal forms, and measure efficiencies. The result is that the governance of education is transformed under the new managerialism.

Resistance to managerialism as a form of domination is sometimes recommended as something that will enhance autonomy. But because managerialism sees itself as the antidote to chaos, irrationality, disorder, and incompleteness, there are no spaces within such a social order in

which autonomy can be contested legitimately. Managerial definitions of quality, efficiency, improved productivity, or self-management construct a particular version of autonomy. Those who do not desire these managerial constructs of autonomy are simply defined as absurd, as under managerialism, these notions appear as self-evidently “good.” Even the presentation of resistance itself indicates an engagement already within the definitions provided by managerialism.

A Way Forward?

Managerialism – at least as the orthodox account of domination would have it – is a totalizing technology that subsumes education to its discourse through what appears to be legitimate practices (including the language of efficiency and quality, etc.). To find ways of increasing space for living, rather than living within managerial definitions of autonomy, a critique is required that will not simply fall into the trap of resistance within the definitions supplied by managerialist discourse. A way forward for research is outlined in brief below.

Since power is masked as legitimate authority under orthodox accounts of managerialism, an analysis of power is called for if the new managerialism is to be understood. A form of power that could be analyzed is that which Foucault (1978) calls bio-power, which presents us with a form of bipolar technology that generates political counter demands. It provides at the very least the possibility of a “strategic reversibility of power relations” (Foucault 1982, p. 221). That would provide a technology for contesting managerialism. Further analyses could be introduced from a poststructuralist perspective in which there is now a rethinking of possibilities for education that illustrates meanings as shifting, receding, fractured, incomplete, dispersed, and deferred. There is also a Nietzschean approach to a critique of managerialism under which the value of these practices is to be evaluated on the basis of their contribution to survival and health (as metaphors for life) rather than on their contribution to abstract notions of truth and rationality.

For Nietzsche, certain redundant metaphors for the philosophical tradition of “self as truth” have carried over into the present as historical remnants in the form of reified practices. The particular practices in question within the new managerialism are those predicated upon its underpinning assumption of its autonomous, individualistic, transparent, and self-interested, rational individual.

These types of analyses of notions such as power, life, domination, meaning, rationality, and truth suggest research into the worth of a project that revalues the actual value of the new managerialism as the governance of education.

Mapping the Terrain of Political Theory in Education

Jeff Stickney

University of Toronto, Toronto, Canada

Foundations of Political Theory in Education

The domain of political theory in education is too vast to cover in one pass; an Educational Research Information Center (ERIC) scan turns up over 8000 articles related to this topic, showing that educationists often address diverse political issues, using an array of political theories and philosophies at our disposal. Borrowing the theme from the next *Philosophy of Education Society* Annual Meeting (Toronto, 2016) lends focus. Hannah Arendt’s highly influential work, *Between Past and Future. Eight Exercises in Political Thought*, characterized late twentieth century political theory as a subject drawing vital energy from current conflicts and courageous thinking, conducted within a “critically awakening” historical discourse that “pushes from behind and constrains from ahead” (1977, p. 7). A quick scan of the educational philosophy literature grabbing attention today reveals this kind of urgency and commitment – motivated by pressing contemporary issues such as the legacy of colonialism (racism and hegemony) and the spectre of globalization and neoliberalism (audit societies obsessed with risk management) – spanning ancient origins and anticipating future opportunities for liberation. Unable to annotate and reference current publications here, several illustrative

examples set the stage: tracing origins of contemporary conversations in philosophy of educational back to political discourses still lighting our path from the distant past.

In Masschelein and Simons' recent open-source book, *In Defence of the School: a Public Issue*, the ancient Greek concept of *skolē* – as “disinterested” or “pure pursuit of learning” – is revitalized for a modern, tech-savvy audience. Their work culminates in an “Allegory of the school” that recalls Plato’s landmark metaphysical journey to enlightenment in the “Allegory of the cave” (1991, Bk 7). Conversations today about “cosmopolitanism” (see Marianna Papastephanou, Sharon Todd, and David Hansen) – searching for possible salvation from internecine conflicts over our many differences – reach back to Diogenes the Cynic, the first cosmopolite: banished from his city for his critical “truth-saying” (*parrhesia*; see Foucault 2001). Following Foucault’s later movement into the investigation of “arts of the self” and *governmentality* – while building upon his earlier genealogies of bio-power and *games of truth* – many philosophers have addressed the role of pastoral and panoptic supervision, disciplinary power, and dividing practices within governmental structures in education (see Stephan Ball, Jenifer Gore, James Marshall, Tina Besley, Michael A. Peters, and Mark Olssen). The recently emergent school around Rancière’s political philosophy engage in a critique of our fall from Greek democracy, seeking to replace monolithic hierarchies with greater conditions of equality: learning together within “circles of our need” instead of inculcation by the “explicative order” (Rancière 1991, 2006; see Gert Biesta, Sharon Todd, Claudia Reutenberg Jan Masschelein and Martin Simons). Anticonsumerism literature in education (see Trevor Norris) draws on Arendt’s exposition of the public versus private domains of social life, celebrating the *polis* as a place for freedom from the necessities of life in contrast to the marketplace (*agora*). Critiques of corporatism in schools and colleges see the trend as closing spaces for freedom, opened through the liberal tradition of learning, having instead vested interests in reproducing citizens with corporate allegiances. In each of these representative cases, philosophers of

education carry out a dialogue *between past and future* political issues and theories.

In the space allotted I try to map some of the avenues by which this classically inspired discourse emerges onto the present scene. Limiting my survey to Western literature, there is a rich tradition of addressing education within the context of philosophizing on ideal forms of the State. Plato’s *Republic* (1991), defining justice in the soul by first examining its role in the State, sets out a “synopsis” (Bk7) of his curriculum: beginning with gymnastic and music, flowing into arithmetic (based on rhythm) and geometry, pondering the heavens, and then culminating in the study of ethics and politics. The method of educating youth follows the progression described earlier in the “Allegory of the Cave” – the circuit from terrestrial abode to the sun, and the duty to return to the common realm of cave dwellers needing political guidance from enlightened philosophers willing to risk reprisal for their heresy. Such wide-spanning, magnanimous education prepares learners for philosophical contemplation “of things human and divine” (Plato 1991, Bk 6).

During the seventeenth to eighteenth century, enlightenment, philosophers sought to “light the cave,” so to speak, through improved forms of education, but they did so by drawing on Plato’s model. Social contract theorists John Locke (1968) and Jean-Jacque Rousseau (1979) followed in this tradition: Locke’s syllabus is founded on dance and proceeds toward mathematics and science before the humanities, and Rousseau’s *Emile* learns about terrestrial and astronomical science through first-hand exposure to nature, growing beans, and gazing at stars, but culminates in world travel to learn the customs of different people: knowledge useful in commerce and governance.

Aristotle significantly contributed to our inherited framework for discussing politics and education, distinguishing three forms of knowledge: technical, practical, and scientific. Though acknowledging value in thought going into crafting artifacts (*technai*) according to predetermined ends (a *telos*), Aristotle’s tripartite system praises more highly practical wisdom (*phronesis*) and good judgment (*metis*) useful in

politics, and bestows even higher esteem on rational attainment of scientific knowledge (*episteme*) – what he views as the goal or end (*telos*) toward which human flourishing strives. Aristotle explains in the *Nichomachean Ethics* (1962, Bk.1, §3,1094b13–27) that we do not demand the same precision or degree of certainty in ethics and politics as we do in math or science. The axiological scheme has endured, valuing maths and sciences over the humanities, and both over vocational studies. Coupled with this epistemological divide is the political division between free men, entitled to an education along with citizenship (as a birthright), and slaves and women who were denied both. Aristotle's *Politics* (1941) opens with a fallacious, circular argument from nature, suggesting slaves are “slavish by nature” or else they would have freed themselves. Although Plato's *Republic* included women in education (1991, Bk5), after the example of Pythagoras, Jane Rolland Martin offers an insightful critique. Questioning how progressive this move was, she notes that education has always been regarded as part of the reproductive sphere of society. For Plato to say women were eligible to be guardians was like saying they can just as easily as men apply to be tennis players, when in practice they are more likely to have been systematically excluded from preparatory activities like throwing balls, necessary to gaining admittance to this function in society. Following Mary Wollstonecraft (1995), Martin also critiques Rousseau's *Emile* for its disappointing conclusion: the education of Sophie in purely domestic matters, as caregiver for Emile. John Locke and Immanuel Kant also excluded women from the rational pursuit of knowledge, based on a false taxonomy deeply embedded in societies. Wollstonecraft put this division to the test with her experimental girl's school, showing nurture to be the cause rather than nature.

From this classical foundation in Plato and Aristotle we get the notion that “studies suitable to free men” are liberating in that they take us out of the mundane realm of the common people (*hoi polloi*), having no purpose other than the pursuit of pure knowledge. In the Roman (Stoic) system of education, we see this translated into *artes*

ludicrae (technical studies), the *pueriles* (preparatory studies), and *artes liberales* – the complete “circuit of studies” (Lt., *curriculum*; Gk. *encyclopaidieia*) that “rounds” out the pupil and prepares “him” (sic) for philosophical study and leadership. The Stoics referred to these liberal arts as being among the things that “equip” one toward life in accordance with nature, bringing reason into alignment with logic, or as “scaffolding” that builds a character base for pursuing philosophy, politics, and right livelihood.

Digression into this distant past may seem antiquarian, but historical perspective is needed to understand the legacy that political reformers inherited when setting out to build national education systems in the modern era, starting with Germany in the early nineteenth century and culminating in public education movements in France and finally Great Britain and the colonies. Drawing on Michel Foucault, in philosophy of education Ian Hunter and more recently Michael McGarry have conducted genealogical studies of this kind of nineteenth century national education reform movement in Australia and Canada. Immanuel Kant's *Pedagogy* (1904) is an eighteenth century precursor to this movement, seeing in education the means to progressively up-build national character (*bildung*) in step-like fashion (cf. Buchner, “The Philosophical Basis of Kant's Educational Theory,” in: Kant 1904, pp. 29–43). In the form of a philosophical antinomy, Kant acknowledged the paradox of using authority and restraint to generate autonomous and rational citizens.

One of the greatest problems in education is, How can subjection to lawful constraint be combined with the ability to make use of one's freedom? For constraint is necessary. How shall I cultivate freedom under conditions of compulsion? I ought to accustom my pupil to tolerate a restraint upon his freedom, and at the same time lead him to make good use of his freedom. (Kant 1904, §29, p. 131)

Adam Smith also took an interest in public education, seeing moral guidance and math and literacy training of workers as the base of a market-regulated economic system that requires decent, industrious, and frugal citizens. John White has refreshed this conversation (see also

Ken Howe) about balancing “Smithian efficiency with democracy” with respect to educational philosophy in the context of twenty-first century capitalism.

Liberal-Analytic Philosophy of Education

In the early 1970s through the early 1990s there was a movement in academia that took as its point of departure David Hume’s “fork”: the distinction between the contingent (a posteriori) knowledge we obtain through experimentation and synthesis, and the necessary (a priori) knowledge obtained by analyzing the relations among words or numbers (Hume 1910). For many professors working in the humanities it seemed fitting that if the subject matter could not possibly have the rigor of the experimental sciences, it could at least rise to the analytic task of sharpening the tools in use by examining the core concepts of the field. In education this meant “topologies of the teaching concept” (see Thomas Green), mapping our terms like “learning” and trying to find in ordinary language the path to better practice.

The sense in which this was a “liberal” enterprise is twofold (see Michael Oakeshott 1989): the movement tended to be coupled with Kant’s moral stance on rational autonomy and John Rawls’s (1971) efforts to achieve distributive justice in the domain of education as a social-contractual institution (applicable to disability studies); following the civil rights movement, the student rebellions on campus (May 1969) and anti-Vietnam War protests, this included not only equal access to public forms of education but sweeping questions about authoritarianism in education (see Richard S. Peters). Who decides the curriculum, and what is the role of modern liberal arts in fashioning the citizenry to be, not just subjects embossed with national character (after the model of the USSR and France) but critical thinkers with autonomous, rational capabilities to determine their own ends. Lawrence Kohlberg’s attempt to redefine (after Kant and Piaget) stages of moral reasoning, moving away from relativistic, doctrinaire, or nationalistic forms of character

education, has similar motivations: both philosophically and as a reaction to the totalitarian nightmares of World War II. The democratic schools movement (see Clark Power) and “just community” concept emanate from this source.

Paul Hirst took up the task of redefining the liberal arts in terms of his own reading of the later Wittgenstein, drawing Richard Pring’s critical response that again we are focusing value on liberal over vocational studies. The second sense in which they sought to renew the liberal arts was by refreshing the teaching concept, as the rational pursuit of engaging students in assessing – through public tests appropriate to each *form of knowledge* or discipline – the quality of evidence and veracity of truth claims instead of holding views unshakably, as sanctioned orthodoxy. Taxonomies were developed to distinguish teaching – qua “teaching” as a concept we adhere to, value and judge as members of both a language and democratic community – from its concept-cousins, some of which bear family resemblances: training, advertising, conditioning, proselytizing, indoctrinating, etc. A vast body of literature was devoted to what amounted to a veritable cold war on nonrational means of teaching, coincidently at a time that followed upon fears of the domino theory (Korea, Vietnam) and that coincided with an dangerous arms race between the superpowers: USA, Russia, and China.

Hegelian Progeny

One of the other fountainheads of political philosophy in education is George William Friedrich Hegel’s *Phenomenology of Spirit* (1931; cf. 1996): principally the section entitled “On Lordship and Bondage.” Unlike Aristotle, the salve is said to be suffering false consciousness as a condition of his or her servitude: but so too is the master gripped by false consciousness arising from an artificial position of dominion. In order for the master to be freed, the slave must first free himself. The most powerful deployment in education comes through Paulo Freire (1970, 1998). As educational advocate for disempowered workers he strives to help them first articulate and then renegotiate the social conditions

reproducing their servitude, leading to liberation on the level of what Marxists would refer to as the “material conditions” of their lives. Black feminist writer, bell hooks (sic) followed Freire in this tradition of emancipatory educational theory.

The Italian Communist Antonio Gramsci is another prominent thinker inspired by Hegel and Marx. Gramsci (2000) counsels workers to educate their children in the knowledge obtained by the ruling elites, sensing that class warfare is waged on the level of one’s dialect and vocabulary. Pierre Bourdieu (et al. 1965) followed in this tradition (see C. W. Mills on the *Power Elite*) with his critique of higher education as the means of bestowing upon the ruling elites the verbal armature and cultural capital to maintain their hegemony. Boles and Gintis conducted a sweeping survey of class privilege in American education, pointing to the capitalist economic system as the root of inequities and therefore the target of their radical critique.

Other appropriations of the Hegelian master–slave dialectic, as it has become known, come through in feminist critiques of male privilege and systemic inequities, as in de Beauvoir’s appropriation (see James Marshall). Critical theorists in educational theory – notably Henry Giroux, Michael Apple, and Peter McLaren – have taken the lead in bringing this spirit of radical critique to bear on globalized forms of neoliberal education reform and its politically conservative tendency to reproduce social stratification under the guise of providing choice, challenging its contradictory impulse to stifle academic debate, and diversity while speaking about principles of transparency and inclusion. The critical tradition in educational philosophy begins with Socrates, but manifests in populist literature with Ivan Illich and Neil Postman (among others). Infused with a Hegelian/Marxist critique of all forms of “false consciousness,” its educational aim is emancipation.

Conclusion

What these different conversations share is vital concern for the educational formation of citizens,

calling attention to the positive and negative dispositions we produce through our governing practices and policies. Kristján Kristjánsson for instance draws on Aristotle’s virtue ethic in his advocacy of “character education,” which Judith Suissa criticizes for not being political enough. One of the most powerful movements along these lines was Dewey’s progressive movement, combatting the scholastic tradition but also the antidemocratic tendency of an education system that abandons its connections to utility and self-directed inquiry (1966). Dewey’s pragmatist angle drew heavily on Rousseau and Hegel (see James Garrison), finding in arts education (Dewey 1934) the kind of hands-on, cosmopolitan answer to the deep divides between powers in World War II. Reinterpreting Dewey, Martin seeks to redefine education for democracy along nonsexist lines, and those in solidarity with Richard Rorty (1989) into critiques of fundamentalist, Orwellian flights from democracy. The hope is that this “map” helps the reader somewhat in tracing the intricate paths, without distorting the dendrite, canyon landscape by imposing external order from on high.

Marcuse and Critical Education

Dustin Garlitz

Department of Philosophy, University of South Florida, Tampa, FL, USA

[Critical education](#); [Critical pedagogy](#); [Critical theory](#); [Marcuse](#), [Herbert](#)

Introduction

Herbert Marcuse (1898–1979) was a twentieth century philosopher and critical theorist with a strong commitment to progressive education and pedagogy. He was one of the leading members of the Frankfurt School and its Institute for Social

Research of critical theorists from Germany and, as an émigré scholar, became a leading figure of the New Left of the 1960s and 1970s. Along with Theodor W. Adorno, Max Horkheimer, Erich Fromm, Leo Löwenthal, Franz Neumann, Friedrich Pollock, and others, Marcuse and the Frankfurt School proposed the task of a critical theory of society, one in which education was grounded in culture, in the tradition of *Bildung* (education as culture) in German intellectual thought. As such, Marcuse incorporated the theme of education in his critical works during the portion of his academic career coming after the Second World War, and the theme itself became a major programmatic statement of the New Left, as well as part of movements of progressive reform in German intellectual and cultural thought. This entry examines his formative years, his intellectual development, and his contributions to a critical theory of education.

Marcuse's Formative Years and Intellectual Development

Prior to the rise of Nazism, totalitarianism, and authoritarianism in Germany, Marcuse was one of the Jewish students of philosopher Martin Heidegger at the University of Freiburg, and with the rise of the right wing, conservative thought associated with Nazism in Germany during the 1930s, Marcuse and other Heidegger's Jewish students, such as Hannah Arendt, Karl Löwith, and Hans Jonas, became disillusioned with Heideggerian phenomenology, at which time Marcuse turned to the Hegelian-Marxist socio-philosophical frameworks most apparent in the critical theory of the Frankfurt School and its Institute for Social Research. Marcuse's philosophy doctoral dissertation in Germany was published as *Hegel's Ontology and Theory of Historicity*, to which he turned back with an engagement after experimenting with Heideggerian Marxism early in his academic career. Accordingly, education for Marcuse was a social discourse, one that was grounded in the Hegelian notions of history and historicity and their worldly powers, pursuits that were eternal in the spiritual, Hegelian lifeworld sense of the term *Geist*.

In addition to education, Marcuse and other Frankfurt School's critical theorists attempted to synthesize Hegelian-Marxist dialectics with the works of major figures in continental philosophy such as Friedrich Nietzsche and also drew inspiration from the Neo-Kantian human sciences (*Geisteswissenschaften*) and cultural sciences (*Kulturwissenschaften*) or the emergent social sciences – those that were all distinct from the natural sciences (*Naturwissenschaften*) – as well as from the philosophy of life (*Lebensphilosophie*)/philosophers of life (*Lebensphilosophers*) Wilhelm Dilthey and Georg Simmel, the latter who were Kantian and Neo-Kantian scholars, respectively. Accordingly, these intellectual pursuits represented Marcuse's distinct approach to the humanities, which Frankfurt School scholars such as critical theorist and philosopher of education Douglas Kellner stresses as an approach to the humanities that broached the themes of emancipatory education and predatory culture (Kellner et al. 2009). In Marcuse's intellectual thought, Freudian psychoanalysis was especially pervasive, and he would go on to author *Eros and Civilization: A Philosophical Inquiry into Freud* (Marcuse 1966), which became a foundational text of the New Left during the 1960s and 1970s and which focused on the Freudian psychoanalytic theories of repression and liberation. Marcuse's best known work was *One-Dimensional Man: Studies in the Ideology of Advanced Industrial Society* (Marcuse 1991), in which he proposed his canonical Frankfurt School critical theory of society most prominently. In addition to education, politics, culture, and ethics, other value theory areas that Marcuse focused on in his scholarship included art and esthetics, which led him to author the book *The Aesthetic Dimension*. His work has been taught in sociology departments at many colleges and universities, namely, in courses in contemporary social theory, as his works such as *Reason and Revolution: Hegel and the Rise of Social Theory* (Marcuse 1960) have been especially prominent at theoretical intersections of philosophy and sociology. In political science courses, he is also studied, namely, his works such as *Revolt and Counterrevolution* and other important texts of the New Left.

Marcuse's Work on/in Education

Marcuse taught courses in many different areas at Brandeis University in Waltham, Massachusetts, during the American portion of his academic career, including courses on philosophy, history (history of ideas), social science, and politics. He was a faculty member there from 1954 to 1964. He published a controversial essay in 1965 titled "Repressive Tolerance" that was dedicated to his students there at Brandeis. In Hegel's social and philosophical thought, Marcuse was interested in the notion of negation, which was a central principle of logic and dialectics, which he attempted to expand upon in his scholarly work while in residency at Brandeis. Marcuse also taught at Harvard University and Columbia University. Accordingly, Marcuse's American career in higher education saw him start teaching at Columbia, then moving to Harvard, briefly before settling at Brandeis in a permanent faculty appointment, and finally moving one more time in his academic career to a permanent faculty appointment at the aforementioned University of California at San Diego on the West Coast. The Frankfurt School's critical theorists in America had a storied history of engagement with the West Coast and its culture, with Adorno and Horkheimer spending time in Los Angeles, living in the Pacific Palisades section where so many other émigré German scholars lived during the Second World War (such as Bertolt Brecht, Arnold Schoenberg, Thomas Mann, and Franz Kafka), and writing *Dialectic of Enlightenment*, with its component chapter that theorized of the Culture Industry, while they were staying there in 1944.

Among his most prominent appearances and speaking engagements at institutions of higher education in the portion of his American academic career coming after the Second World War, Marcuse gave a renowned lecture on education at Brooklyn College in New York City in 1968. He then gave another noted lecture on higher education and politics in Berkeley, California, during 1975. In his lecture at Brooklyn College, he argued that the idea of general education was a very recent concept. Moreover, he found that education was not general even at the time of reform

that he was giving his lecture (Kellner et al. 2009). These beliefs of Marcuse fell back on the aforementioned distinct approach of his in the humanities, one that resonated with and was grounded in the interdisciplinary pursuits of the human, cultural, and social sciences in the history of German intellectual thought.

While teaching at Brandeis as an émigré scholar in the United States, Marcuse became one of the well-known scholars at the university's renowned and progressive History of Ideas program. After Brandeis, he moved to, and started teaching at, the aforementioned University of California at San Diego (DeVitis 1974; Reitz 2009, 2015). Marcuse began teaching at the University of California at San Diego in 1965 and was a professor emeritus there through the time of his death in 1979. He was one of the most controversial professors there with his distinct philosophy of critical education, and in 1968 the board of Regents in the University of California System attempted to persuade the central administration at San Diego not to renew his faculty appointment, a move which was unsuccessful. His best known course at San Diego was titled "Theories of Society," and among the most well-known students from San Diego was Angela Davis, who earned an MA under his direction. Marcuse's family is still involved in higher education in America, including with education in the University of California System, as his grandson Harold is a well-respected professor of history (modern German history) at the University of California at Santa Barbara, while his son Peter still is a professor emeritus of urban planning at Columbia University in New York City, the latter academic institution being where Marcuse the Frankfurt School critical theorist originally started teaching at in the United States as an émigré scholar during the Second World War. Throughout his academic career at, and affiliation with, the Frankfurt School's Institute for Social Research, Marcuse worked with scholars in many different fields of the humanities and social sciences, such as the fields of history and planning that his son and grandson are involved with today as university professors, respectively, as these endeavors characterized part of the Frankfurt School's distinct

approach to education that was interdisciplinary, and at times, multidisciplinary.

Marcuse's Influence on a Critical Philosophy of Education

Among critical theory and the philosophy of education, there have been growing amounts of secondary literature on Marcuse concerning radical and revolutionary thought in the context of critical pedagogy. Marcuse was in fact a critical philosopher of education and pedagogy and sought to transform these endeavors through nonviolent revolutionary praxis. He wrote extensively on revolution from a nonviolent perspective, as much of his critical work in this area focused on the dangers inherent in violence, and approached the topic through the lens of Hegelian-Marxist social thought. Accordingly, Marcuse engaged in social critique of traditional and educational institutions and practices. He was not the only member of the Frankfurt School of critical theorists (the Institute for Social Research) to provide such a social critique of conventional education, as this project informed a component part of the overall project of the Frankfurt School's proposal of a critical theory of society, and was carried on in European and American progressive thought by its next generation of scholars such as Jürgen Habermas in his discourse ethics. As such, Marcuse's radical and revolutionary social thought and critique of education have been examined in recent continental philosophy with the frameworks and methodologies of post-colonialism, critical race theory (including radical black thought), and critical philosophies of gender, sexuality, and disability. Various commentators have presented Marcuse's critical social thought in the context of other leading figures in continental philosophy's frameworks and methodologies relevant to philosophy of education, such as that of Martin Heidegger and phenomenology (as studied by philosophical commentators such as Richard Wolin, Andrew Feenberg, and Fred Dallmayr), in the pairing of the phenomenology of Freiburg and the critical theory of Frankfurt with the goal of achieving a critical

ontology, one that takes into account culture and education as *Bildung* in the traditional German philosophical sense. In works of Feenberg especially, who was a graduate student of Marcuse's from San Diego, the philosophy of education in these figures' thought has also been linked to their distinct philosophy of technology. Douglas Kellner has sought convergences in Marcuse's critical educational philosophy and that of the French poststructuralism of Jacques Lacan, as endeavors such as theoretical psychoanalysis were important in contemporary continental philosophical figures' work. Marcuse also had students in philosophy who went on to become major figures in progressive thought and educational reform in their own right, such as the aforementioned Angela Davis.

Themes employed by commentators in recent scholarship on Marcuse, critical education, and radical pedagogy have included these endeavors' relationship with neoliberalism, free market capitalism, and other forms of what has been interpreted and labeled by Marcuse scholars as predatory culture/economics and finance. As such, connections have been made with that of the critical theory of Michel Foucault and his work on neoliberalism in his Collège de France Lectures (published as *The Birth of Biopolitics*). Also with Marcuse's student Angela Davis, connections have been made in his radical pedagogy with critical race theory (as employed in African-American Studies) and critical feminist theory (as employed in Women's and Gender Studies). In addition to critical philosophies of race, gender, and sexuality, Marcuse's radical pedagogy has also been applied to disability studies, as well as to other marginalized groups in contemporary society, including its relationship to citizenship, the commonwealth, and utopia.

Accordingly, part of Marcuse and the Frankfurt School's critical theory of society involved the notion of praxis, more specifically, radical praxis in the context of the utopian nation-State. Marcuse's work in these areas was borrowed from his elder Frankfurt School affiliate Ernst Bloch and his work *The Spirit of Utopia*. This aspect of Marcuse's intellectual thought has been focused on the context of critical pedagogy by

commentators such as Peter McLaren, Douglas Kellner, and, in some cases, Henry Giroux and Paul Gilroy. And the strengths as well as the dangers implicit in such theories of radical praxis and utopia were examined in Marcuse's original intellectual thought with case studies of Soviet Marxism and other totalitarian and authoritarian social movements. As such, these studies have been extended and expanded in philosophy of education scholarship to give theoretical explanations to reschooling and notions of violence and nonviolence (including gun control), as well as those concerned with reschooling and educational reform/policy. Connections have also been made in social theory with Marcuse's theory of education and that of Émile Durkheim and John Dewey. Accordingly, Marcuse, as is/was the case with his Frankfurt School colleagues, offered a distinct social critique of the societal institution of education, in addition to their cultural critique which, as aforementioned, approached education as *Bildung*. As such, these theories of Marcuse's have been applied to the sociology of education (in studies that incorporate the Neo-Kantianism of Max Weber's *Verstehen* thesis in the German social sciences, as well as that of Ferdinand Tönnies notions of *Gemeinschaft* and *Gesellschaft*).

Marcuse's radical thought has been applied to avant-garde pedagogies and institutional critique, such as unschooling and unlearning, and finds itself employed in the area of contemporary cultural studies in that manner (Kellner 1998–2014; Kellner et al. 2008). And in the portion of Marcuse's distinct approach to pedagogy and education that has been developed in the context of Black Radical thought, philosophers of race and cultural critics such as Cornel West have acknowledged indebtedness to his work. Marcuse's critical theory of education was influenced by Marxian themes such as reification and false consciousness. Other Marxian themes such as commodification were employed at times, in his development of radical pedagogy among schooling, reschooling, and the reforming of educational institutions. As such, Marxian notions of alienated labor played a role in educational reform for Marcuse. Especially the case with Marcuse and the Frankfurt School was the influence of young

Marx's *Economic and Philosophic Manuscripts of 1844* (the so-called Paris manuscripts), once they were rediscovered in Germany, which examined these themes (especially commodification). A significant portion of Marcuse's work on *Bildung* and education came after the rediscovery of such manuscripts in Germany. Within the Frankfurt School and its scholars of critical theory, Marcuse was influenced by affiliate Walter Benjamin's reading of Hegel's philosophy of history, philosophy of literature, and philosophy of art. Also influential was Theodor W. Adorno and Max Horkheimer's theory of the Culture Industry from their work *Dialectic of Enlightenment*, Horkheimer's lectures published as *Between Social Science and Philosophy*, his essay "Traditional and Critical Theory" (which was republished in his volume of essays titled *Critical Theory*), as well as his work *Eclipse of Reason*. Other Frankfurt School members whom were also influential in Marcuse's radical thought and pedagogy included Erich Fromm and his social psychology and psychoanalysis from works such as *The Art of Loving*, *The Escape from Freedom*, and *The Sane Society*. Additionally, Adorno's critique of Heidegger's ideology of German existentialism and phenomenology was especially influential, as explicated in works such as the polemic *The Jargon of Authenticity* and the metaphysical treatise *Negative Dialectics*. Marcuse's volume *Negations* was especially relevant to Adorno's *Negative Dialectics*, and both wrote extensively on esthetics from a Hegelian point of view, as published in Marcuse's *The Aesthetic Dimension* and Adorno's *Aesthetic Theory*.

Conclusion: Marcuse's Continental Philosophy and Critical Pedagogy

In contemporary German philosophical thought, the hermeneutics of Hans-Georg Gadamer revisited themes originally investigated in Marcuse's critical theory, such as *Bildung* as education and culture, and the notion of the esthetic dimension (which Gadamer, in turn, had hoped to transcend in his project of a philosophical hermeneutics in published works of his

such as *Truth and Method*). As such, Marcuse and Gadamer's rival methodologies in German continental philosophical thought (once again, the critical theory of Frankfurt versus the hermeneutics of Freiburg and Heidelberg) were both indebted to Hegelian readings of the philosophy of history, which again has been synthesized in recent commentators' works as a critical ontology and critical hermeneutics, the former by the likes of the aforementioned Dallmayr and Feenberg and the latter by Habermas' student from the Frankfurt School's Institute for Social Research Hans-Herbert Kögler. In Marcuse's lectures at American universities, especially relevant was Fromm's social approach to Freudian psychoanalysis, which also reappeared in his work *Eros and Civilization* (Marcuse 1966) and *Five Lectures* (Marcuse 1970). In addition to trying to synthesize Marx and Freud in his work (in an effort to expand upon Freudo-Marxism), Marcuse attempted to synthesize Hegel and Marx (in attempt to expand upon Hegelian-Marxism) in the canonical Frankfurt School sense, as well as Marx and Nietzsche, in turn focusing on in many cases what has today been labeled in continental philosophy as the "hermeneutics of suspicion" in the works of Marx, Nietzsche, and Freud. As such, Marcuse's critical social thought from the Frankfurt School has historically been a major intellectual and theoretical inspiration in the development of critical pedagogy, alongside works by the likes of Paulo Freire and his *Pedagogy of the Oppressed*. This academic area that Marcuse helped lay the foundations in a historical and theoretical manner represents a lacuna in contemporary continental philosophy scholarship and has served as an intellectual inspiration to other marginalized and historically underrepresented approaches to philosophy.

Marketization of European Higher Education Through Policy

Alexandra Waluszewski
Department of Economic History, Uppsala
University, Uppsala, Sweden

Synonyms

[Academic capitalism](#); [Innovation policy](#); [Research policy](#)

Introduction

Until the last decades of the twentieth century, “higher education” and “innovation policy” were two publicly financed areas with few organized governmental policy connections. The so-called science and innovation policy regime (Elzinga 2004) that began in the 1990s marked a shift that encouraged a “forced marriage” between these domains. This section focuses on the theoretical background of the marketization of higher education and research and the newly identified double role of the university as provider of two distinct products: research results that can be commercialized and transformed into innovations, on the one hand, *and* of undergraduate and graduate students trained to be useful in business, industry, and society, on the other. The section concludes with a summary of the consequences of marketization for higher education and research.

From Indirect to Direct Utilization of Higher Education and Research

Until the 1980s, higher education and research were in general excluded from direct policy interventions aimed at driving innovation, industrial renewal, and economic growth in Anglo-Saxon countries. Although business and industry interacted with academia to varying degrees in the past, the general approach from governmental policy was to treat higher education and research

as a public good that should be sheltered from direct involvement by economic actors. Governmental policy concerning technological and industrial advances was mainly dealt with through industrial interaction and based on the identification of problems and opportunities related to specific technological areas and businesses. The most powerful instrument then utilized was arguably the public procurement, both military and civil, of technological solutions that did not yet exist but which the commercial and institutional organizations involved were obliged to deliver. The emergence of new technologies and related commercial goods and services in fields such as communication technology, nuclear power, and defense technology benefitted from more or less direct but always substantial State engagement (Mirowski 2011; Rider et al. 2013; Håkansson et al. 2009).

The role of higher education and research was acknowledged by scholars in different disciplines engaged in process-oriented studies of societal and industrial renewal, and it was usually identified as being mainly indirect and thus difficult either to predict or to chart retrospectively. First, when academic knowledge is mediated by people through their education and their research experience, who contributes what, when, and where tend to become hidden. Second, when academic knowledge is mediated through materialized research advances, its utilization in economic and/or social contexts most often occurs indirectly, through gradual adaptations and combinations with established social and material structures and processes in public as well as commercial settings. Third-hand conceptions of scientific advances, as Basalla (1988) notes, can and do serve technology well.

Neoliberal thinking, often spurred by US cold war think tanks, had no particular influence on higher education policy until the 1980s. It was during this period that new ideas about the relationship among academic research and economic actors took hold (Mirowski 2011; Slaughter and Leslie 1997). The aim of the 1990s' science and innovation policy regime was to create a more efficient utilization of public investments in higher education and research through the

establishment of a direct relationship to business and industry. With the OECD as a main exponent, and with EU policy as an early adopter, a new doctrine came to dominate policy discourse about higher education and research, namely, its role as a critical but underutilized source of innovation. The remedy, according to this model, was comprehensive utilization, to be achieved through policy orchestration. New structures to bridge the gap between higher education and the "market" had to be established, including support to educational and research areas identified as important knowledge providers to the latter. The policy was then that the aim of science is first and foremost to make a socioeconomic contribution (Nowotny et al. 2001).

Forces Behind the Changing Relationship Between Higher Education and the Market

Neoliberal policy paved the way for increased governmental reliance on "market forces" to spur industrial and societal renewal. The understanding of the structure and function of the business and industry expected to transform research advances to innovation was markedly guided by conventional market models. The economic landscape was assumed to have the characteristics of a "market," that is, populated by competing companies which, independently from other economic actors *and* from historical and contemporary social and material investments, are free to make decisions about what commercialized goods to exchange. The great obstacle to overcome was identified as the interface between academic research and the market. Academic research advances were considered "sticky information," that is, difficult for the market to access. Thus, policy makers saw the need for a supporting organizational structure of information transfer from the public to the private. The basic idea was that *if* academic knowledge advances corresponding to certain needs were commercialized, the actors of the market would absorb it and transform it into equivalent products and services. Hence, the interface between commercialized research advances

and established social, financial, and material structures would be free from friction and interference (Rider et al. 2013; Håkansson et al. 2009).

The most common approach to policy with respect to innovation and growth is the so-called national innovation system (Lundvall 1988), which actually originated as a critique of neoclassic market thinking; in European policy interpretation, however, it was adopted as a complement to it. A national innovation system is identified in all the factors behind the development, diffusion, and use of innovations, with higher education and research as a basic ingredient. The ability to supply society with relevantly educated and trained people, *and* with knowledge advances that can be commercialized, is seen here as critical for the level of innovation, renewal, and growth for a nation or region. The fact that a nation investing in higher education and research still can have a relatively low proportion of “research-intensive” innovations is described as a “knowledge paradox,” the implicit assumption being that commercialization should follow immediately, both temporally and spatially, from research, and further, that it is possible to identify and quantify innovation by reference to evidence such as patent data. While the national innovation system model underscores the importance of an active user setting for the transformation of research advances into innovations, European policy acknowledges other components: “knowledge production,” “transfer,” and “reduction of hindrances for market forces.” Thus, in line with neoliberal economic thinking, the role of the market forces and the need for related “system components” is seen here as the way to overcome the “knowledge paradox” (Rider et al. 2013; Håkansson et al. 2009).

The adoption of the national innovation system model in European policy entailed that higher education and research came to be considered a central “system component,” which at its best can supply the market and society with both economic and social innovations, leading to solutions corresponding to societal challenges such as environmental and climate threats, as well as yielding traditional benefits such as employment opportunities, economic growth, and improved quality of

life in general. The advice from the OECD *and* the EU was that barriers and regulations restricting interaction between universities and private companies and corporations should be removed and that private-public collaborative arrangements should instead be facilitated. Consequently, an important policy task became to limit all hindrances to interaction between academia and economic actors. This ambition was realized by many means; universities were provided with an extensive transfer system, including judicial arrangements and ownership regulations; quantitative indicators were developed to help assess the functioning of the “innovation system”; individual member States and regions were advised about how to strengthen their general innovation systems, including their economic and social institutions. The core of the advice concerned how higher education and research, in their role as producer of system components, can be stimulated to correspond to the needs of the market and society (Slaughter and Leslie 1997; Mirowski 2011).

The neoliberal thinking about the role of markets also affected European higher education through a number of other direct structural changes. One of the most relevant bits of EU legislation, based on market assumptions, was decisive in making the traditional divide between higher education policy and innovation policy obsolete. When direct national involvement in industry came to be seen as disrupting market forces, the primary means left at the disposal of national governments wishing to maximize the utility of higher education and research was to identify social and economic challenges in advance to be “solved” by universities. Market models were also the underpinnings of “new public management” (NPM) as a way to increase efficiency in publicly financed institutions and agencies, leading to the assessment of educational results, research advances, and knowledge transfer in terms of quantifiable units of measurement.

Market-inspired research and innovation policy, uniting the aims of higher education, research, business development, and innovation, was also reinforced by globalization. At the end of the twenty-first century, technological and

organizational development had given rise to increased commercial specialization; companies utilized external expertise and outsourced many specialized activities. In contrast to neoliberal assumptions about a market populated by independent economic actors, the economic landscape instead faced increasing dependencies across company borders. Furthermore, legal changes made it possible to transfer capital and ownership across juridical borders. Together, these changes fostered an increasing number of visible and invisible alliances, partnerships, and business relationships, stretching across corporate, organizational, and national borders. The organizational changes also included the outsourcing of the most expensive and uncertain part of research and development to publicly financed universities and research institutes (Mirowski 2011; Slaughter and Leslie 1997; Håkansson et al. 2009).

The phenomenon of what has been called “academic capitalism” (Slaughter and Leslie 1997, pp. 8–9) that was the result of political economy, more specifically, policy-driven changes in higher education and research, conjoined with an economic climate that encouraged business and industry to outsource their research expenses to publicly financed research organizations (Mirowski 2011; Håkansson et al. 2009). Mirowski and Sent (2008) stress that what has occurred is not merely an adoption of market thinking in the steering of higher education and research but also, and more importantly, a blurring of the borders between publicly financed knowledge production, a public good, and economic interests (private goods). Global economic actors became an integrated part of publicly financed research and education.

Consequences for Higher Education and Research

If the economic landscape had the characteristics of a “market” as depicted in conventional market thinking, the knowledge advances transferred from the public to the private sector would not have had to be adapted to existing social and material structures; the economic actors would

have been able to decide which commercialized knowledge, corresponding to what needs, to acquire and utilize in new products and services, independently from investments in place. Given a global economy characterized by systemic interdependencies, however, for a new advance in research to add value, it has to be adapted to social and material investments in place. If a direct utilization of research for innovation is going to be achieved, the adaptations must take place during the research process and not, as traditionally, after the fact. This in turn entails that any significant interaction between higher education and the economic landscape has to blur the border among publicly and privately financed activities. The same is true for educational programs. If the students educated are going to be directly useful for different kinds of stakeholders, the content of the programs will have to be adapted to the established activities and the needs of the latter.

The consequences of uniting higher education policy and innovation policy are complex and far reaching. The more advances in knowledge are identified with direct contributions to the innovation system, the more faculty and institutions have to adapt to corresponding commercial and public user interests. This development, in turn, entails also that *certain* research and educational fields will be deemed more useful for innovation than others and will consequently be targeted for funding, from both governmental and private sources (Slaughter and Leslie 1997). The areas of research and education that can benefit from the “1990s research and innovation policy” are those that can adapt to the notion of knowledge as functional components in an innovation system. Research and education that is thought to supply relevant advances and competencies and thus yield added value to social and material investments in place will be allocated resources that will be taken from less productive fields. Both education and research will have to adapt to business and industry as customers; the research advances and education provided will have to correspond to the commercial and societal activities to which they are to add value. Naturally, the knowledge transfer units established at universities to encourage and increase the

commercialization of research advances based on *expectations* of what they can contribute within the “innovation system” will also benefit from current policy.

Resources for research and education programs lacking a simple fit into this system, that is, those engaged in knowledge development and practices, the outcome of which is difficult or nearly impossible to blueprint, will dwindle, as they are increasingly funneled into the innovation system. Basic research, whose potential benefits cannot be predicted or assured in advance, falls outside a system constructed to deliver components for immediate use in business, industry, and society. Thus, change in the relationship between higher education and society is dramatic: the ideal of the university as an autonomous servant of public goods has been replaced with that of a supplier of commercial goods and services on a global market. It is too early to say what the long-term consequences of the disappearance of forms of knowledge irreducible to economic transactions and immediate social utility are.

Marx and Philosophy of Education

Nigel Tubbs

Faculty of Education, University of Winchester,
Hampshire, UK

In many ways it is easier to write about the application of Marx’s work within education than it is to write about any strictly defined “educational” import of Marx’s own writing. Regarding the former, *Marxism* has had a dramatic and powerful influence over all aspects of education, not only in the West but across the world. The Soviet Union as was and the Republic of China are two examples of how Marx’s critique of bourgeois economies and social relations were transformed, in different ways, into general programmes of compulsory “State” education which aimed at advancing new forms of social relations and new societies. Also, many poorer parts of the world have used Marxism as an educational tool either to promote revolutionary change or to maintain it.

Of significance in the West has been the Marxism of Brazilian educator Paulo Freire. His book *Pedagogy of the Oppressed* (1972)

continues to be an example of how Marxist revolutionary politics can be worked into educational theory and practice. This kind of education has become known as critical (sometimes dialogical) pedagogy, and it involves teachers using classrooms for a critique of bourgeois ideology or the worldviews of the oppressors. The views of the oppressed themselves, the students, are given a voice and a legitimacy. They are not suppressed by a dominant teacher who tells them “how it is” and “what they must do.” Instead teachers and students seek to challenge traditional models of their relationship, working through together, in a mutual dialogue, how the world is and naming it according to these suppressed interpretations. For Freire this *praxis* is revolutionary because the ideas, language, and concepts of the oppressed will threaten and potentially overcome the bourgeois relations of domination, both in education and in the wider society. At its root, this critical education aims to undermine bourgeois ideology and to transform undemocratic forms of society into free and democratic socialist societies. This kind of critical pedagogy has enjoyed a vitality in the West, particularly in North America, although there are other strains, most notably in Europe from the critical theory of Horkheimer, Adorno, and Habermas. A particular tension in this strain of critical pedagogy, given its origins, is that it concentrates very heavily on the ideological and other obstacles which block revolutionary change, offering a somewhat negative and pessimistic diagnosis. Habermas alone is held to be one critical theorist who maintains a more optimistic vision (see, for example, his two volume book, *The Theory of Communicative Action* 1989, 1991, and R.E. Young’s *A Critical Theory of Education: Habermas and our Children’s Future* 1989).

Another way in which Marxism was applied to education in the West was as a theoretical perspective with its own concepts and frameworks by which the theory and practice of education in capitalist societies could be understood. Marxist perspectives of this kind were prevalent in philosophy, sociology, politics, and economics. What they had in common was a critique of all aspects of Western educational provision, seeing such provision as another superstructural element

which reproduced but never challenged the existing order of inequality and exploitation. Speaking sociologically for a moment, education was identified as one of the key bourgeois institutions – Althusser (1984) remarked that with the decline of the Church it was now the *key* institution – by which the bourgeoisie were able to ensure their continued ownership of the means of production. The values which schools passed on to their students, the attitudes they inculcated, the behavior and respect for authority they demanded, and even the time keeping and regular work practices they imposed were seen as both a preparation of the next generation of laborers for an uncritical and docile acceptance of the relations of production and an ideological reproduction of modern bourgeois social relations as “natural.” Each element of the curriculum was identified as playing its part here. For example, physical education extolled competition among human beings as a true representation of human nature and rewarded those who were successful in overcoming the challenge of their rivals; history sought to ensure a new generation who viewed world events from the perspective of the imperialist masters and not from that of those forced into slavery; home economics gave the impression that housework was the “natural” domain of women. Marxist feminists developed arguments about this patriarchal aspect of the way schools serve as ideological tools of the bourgeoisie.

Marxism as a critical perspective in the social sciences was perhaps at its weakest in two areas. First, many argued that its thesis about the structural features of ideology – that ideology was built into the system and would corrupt all attempts to overthrow it – was overdeterministic. It seemed to suggest that human beings were somewhat helpless in the face of those structures and particularly helpless against the power of capital not only to abstract all objects into commodities but also in a similar way all relations between people. The failure of the working class in most European countries to mount a revolutionary challenge was explained in this way. Second, and contradicting this view, others suggested that a Marxist critique which could see through the process of commodification and its consequent

effects on day to day perception of reality had already in some senses overcome these ideological distortions, and that therefore the production of a different kind of consciousness, one which was potentially revolutionary, was still possible. These two opposing positions have, for us, an educational relationship. If ideology has totally triumphed, then its critique may no longer be possible, reduced to mere repetition of objectified (*bourgeois*) social relations. If ideology can be overcome, then those who say so find themselves in a dominating, more “educated” position than those who remain “unenlightened.” As with any such vanguard, they could be charged with legitimizing a hierarchy of knowledge and a legitimation and of a kind of “intellectual tyranny” whereby they were able to justify themselves as able to make decisions on behalf of those who did not yet understand the world “correctly.”

Viewed in this way Marxism has an educational dilemma at its very core. This comes into view when education is understood not as the accumulation of facts and knowledge – what might be called mere abstract or empirical education – but rather as the experience of the oppositions and contradictions which empirical education generates. This latter can be called a “philosophical” education (after Hegel). As such, the dilemma of authority and legitimation which lies at the heart of Marxist theory and practice is, for us, an educational experience born out of what is called the “dialectic of enlightenment.” In Marxism, “enlightened” theory dominates practice and practice generates experiences of failure and repetition which return us again to (enlightening) theory. This aporia has always been Marxism’s own dialectic of enlightenment. (For details of this see Horkheimer and Adorno’s *Dialectic of Enlightenment* 1979). However, Marxism has been slow to theorize this dialectic of enlightenment in Marx’s own work. I will return to this below, but in short the dialectic of enlightenment in Marx is repeated as the “culture” which is Marxism. That Marxism has consistently failed to recognize itself as a culture explains its repeated failure to explore the nature of modern experience and more significantly how we *learn* from such experiences. Using Hegel’s definition of culture,

Marxism has not understood itself, its “subjectivity,” as a representation of its predetermined relation to universality by and within bourgeois social relations. This failure to learn about itself as representation constitutes an *educational* failure.

Marxism in this sense both represents and misrepresents Marx. In many ways the somewhat crude models of revolutionary consciousness or *praxis* which underpin the intervention of Marxists in the educational process stem from Marx’s own problems in working through the relation between the theory and practice, particularly in regard to subjectivity. To understand this, it is necessary first to rehearse in broad terms Marx’s theory of economic determinism. One brief summary on these ideas is found in his 1859 *Preface to a Contribution to the Critique of Political Economy*. There he explains that how people come together in society to meet their needs for food, shelter, warmth, etc. is determined by the resources which are available to them at the time. We do not decide from scratch each time how to do this. On the contrary we inherit all of the achievements (or otherwise) of previous generations. Marx says,

... in the social production of their existence, men inevitably enter into definite relations, which are independent of their will, namely relations of production appropriate to a given stage in the development of their material forces of production. The totality of these relations of production constitute the economic structure of society (1975, p. 425).

At the time Marx was writing, the material forces of production were those left by the industrial revolution, including machinery and factories. The relations of production are determined by these forces of production in that factories demand laborers to work the machines and demand capitalists to own both them and the products that are manufactured. The next step in the argument is that this totality of relations, capitalist and proletarian, appears “natural” and becomes the (economic) base “on which arises a legal and political superstructure and to which correspond definite forms of legal consciousness” (1975, p. 425). In other words, the predetermination of the world as it appears to us according to particular material circumstances and levels of

development is hidden from us. What we see we take as natural and do all our theorizing and philosophizing from this (mistaken) starting point, including our views about the law, about equality, and most significantly about “human nature.” Thus Marx is able to conclude that

The mode of production of material life conditions the general process of social, political and intellectual life. It is not the consciousness of men that determines their existence, but their social existence that determines their consciousness (1975, p. 425).

For Marx two things are of crucial importance here. First, the link between doing and thinking, or between the production of objects from nature and the production of ideas about nature, is already established. The species activity of mankind, as Marx calls it, is already a unity of theory and practice. Only under particular conditions does this unity appear to be irreparably severed, most notably those accompanying capitalist relations of production. Thus, and second, when mankind sees through these conditions it comes into conflict with the current relations of production. It sees that private property in particular and the separation of labor power from materialist activity are “fetters” which now prevent a different mode of production of material life. “Then begins an era of social revolution” (1975, p. 425–426) or of a conflict between a species alienated from itself and the bourgeois relations of production which predetermine that alienation. Putting these two aspects together, the proletariat is now setting itself “only such tasks as it is able to solve” (1975, p. 426) for it contains within itself both the development of new forms of material production and new forms of social, political, and intellectual life. In taking this step, in realizing mankind’s nature as truly “social” (or communal) Marx believes that “the prehistory of human society accordingly closes with this social formation” (1975, p. 426).

In employing notions of “seeing through” and “overcoming” Marx’s theory of social revolution can be said to involve notions of “education” or “enlightenment.” As Kant had suggested in the previous century, enlightenment is man’s release from dependence upon another. For Marx there is no doubt that revolution meant a release for the

proletariat from their bondage to a class of owners who represented (and enjoyed) the alienated labor of the workers. In addition one could say that the proletariat, in developing their own class consciousness and seeing through the illusions of bourgeois ideology, enlightened themselves regarding their own nature or *species activity*. But it would be wrong I think to see this (as Habermas has done in his *Philosophical Discourse of Modernity* 1987) solely as an enlightenment based on the philosophy of the rational subject. Marx has no theory of subjectivity precisely because of the difficulties posed by the dialectic of enlightenment within which subjectivity both is and is not its own identity. In Marx’s favor, as he makes clear in *On the Jewish Question*, the idea of the free citizen/subject is itself ideological and one which will be overcome when the political is redefined under new social relations. Exactly what that will look like Marx famously never tells us.

The lack of a theory of subjectivity protects Marx from slipping into bourgeois “natural law” theory but it also inadvertently protects him from realizing the actual significance for “subjectivity” of the dialectic of enlightenment in which subjectivity is both thought and not thought. Marx’s philosophical education is in this sense one sided. It has been hard for the modern consciousness which lives in the illusion of modern subjectivity to find its own voice or expression in Marx’s work. The imperative which subjectivity finds in Marx is to overcome all illusory (bourgeois) representations of itself. The reasons that it has been unable to do so have occupied many twentieth century critical theorists who asked why modern subjectivity was returned again and again to itself in its attempts to change social relations. Yet there is just such an analysis of return in Marx with regard to capital. It is well known that the theory of commodity fetishism reveals how commodities enjoy the social relationships with others that really should belong to human beings. That social relationship, Marx argues in the *Grundrisse* (1973), we carry around in our pockets as money. What is significant here is that when money, our social power, is risked or circulated in the market, the loss of its social nature returns

as capital. If the structure of Marx's analysis of this economy of risk, circulation, and return is interpreted in a Hegelian way then the nature of this return is the philosophical (and spiritual) significance of the dialectic of enlightenment. It is the culture, the self-representation, of the bourgeois subject who is learning about and from the experience of its own illusory status as a person. In such a reading, the "culture" of commodities is return in the form of capital as the culture of reified subjectivity is return in the form of (speculative) experience. One social theorist to have forcefully argued this case is Gillian Rose. She ends her book *Hegel Contra Sociology* by stating that

... to expound capitalism as a culture is thus not to abandon the classical Marxist interests in political economy and in revolutionary practice. On the contrary, a presentation of the contradictory relations between capital and culture is the only way to link the analysis of the economy to comprehension of the conditions for revolutionary practice (1981, p. 220).

In his ambivalence towards subjectivity Marx left open the space for this cultural and educational reading. But much of the Marxism after Marx became the culture which dare not speak its name, refusing or suppressing its own actuality as a culture, and thereby refusing its difficult and contradictory relation to the universal which was and remains its goal. Marx and Marxism without culture and education cannot learn about its own part in reinforcing the forms of bourgeois theorizing and law which it sought to overcome. But as Rose concludes: "this critique of Marxism itself yields the project of a critical Marxism" (1981, p. 220), a project which is avowedly educational.

Marxism and Disability Studies

Laura Jaffee

[Materialist disability studies](#); [Political economy of disablement](#), [The](#)

Introduction

Disability studies, a discipline that critically examines the meaning and implications of the social construction of dis/ability, provides a useful framework through which to understand the systemic oppression of disabled students, the construction of disability/ability in education, and disability-based oppression more broadly. Disability studies scholars and disability rights activists have long rejected the medical model of disability, which treats disability as an individual deficiency that necessitates medical intervention to "fix." A disability studies perspective, on the other hand, understands disability as socially produced. Disablement is situated within social, political, and economic structures that ascribe its meaning within a particular place at a given historical moment. This framework illuminates how

disability has been forged as an identity by those who share experiences of disability-based oppression or ableism. This entry specifically highlights disability studies scholars' engagements with Marxist theory. A historical materialist perspective highlights that ableism is not just a product of prejudicial attitudes that can be ameliorated through liberal rights-based legislation but is, primarily, the product of a mode of production under which one's value is determined by their exploitability within the wage labor system. Marxist analyses of ableism crucially expose that ending the systemic oppression of disabled people demands dismantling capitalism. As critical disability theories are increasingly taken up by educational theorists and philosophers, it is worth expounding how disability studies analyses that draw from Marxist theory shed light on the ongoing oppression of disabled people within the contemporary landscape of education. After reviewing Marxist analyses of disablement proffered by disability studies scholars, this entry concludes with a discussion of the ideas of educational theorists and critical pedagogues who engage disability studies and highlight the possibility education holds for challenging ableist capitalism.

Materialist Disability Studies

The dominant medical or individual approach to disability views disabled people's exclusion from the labor force as a natural and inevitable consequence of an innate biological deficiency. A disability studies approach rejects this medicalized conception of disability as an individual misfortune and instead understands disability, most broadly, as socially constructed. US-based disability studies scholarship has tended to place greater emphasis on disability identity and to highlight policy issues that reproduce structural ableism, at times at the expense of in-depth class analysis. While early US-based disability studies scholarship did highlight the material conditions of disabled people's oppression, disablement was seldom situated as principally a product of the social relations of production. Much early

disability studies work, which was heavily influenced by disabled activists' struggles, was understandably so directed at specific policy and legislative change precisely because of the degree to which the experience of disability oppression is entwined with bureaucratic governmental systems and programs. The strides made by activists in the disability rights movement on these fronts are vital. Some disability studies scholars, however, particularly those from the United Kingdom, have long advocated materialist analyses of disablement (Meekosha 2004). Marxist-influenced theorizations are distinct in that they view disablement primarily as a political and economic phenomenon and thus understand the construction of disability as principally rooted in the social relations of production (Russell and Malhotra 2002; Russell 2001). This framework recognizes that the dominant logic of disability is indispensable in justifying compulsory unemployment and regulating the labor supply under the capitalist mode of production (Russell 2001).

Disability studies scholar Michael Oliver proffered a Marxist analysis of disablement early on in the discipline's development (Oliver 1992). Critiquing the field's overemphasis on normalization or normalizing disability, Oliver (1999) wrote:

Normalization theory offers disabled people the opportunity to be given valued social roles in an unequal society which values some roles more than others. Materialist social theory offers disabled people the opportunity to transform their own lives and in so doing transform the society in which they live into one in which all roles are valued. (p. 172)

Oliver emphasizes that dominant ideas about normalcy, while relevant, are better understood as ideologies employed to justify the economic conditions of late capitalism. He thus critiqued analyses of the ideological justifications for disability-based inequality that neglected to root its structural basis in a capitalist system.

The work of Oliver and others makes clear that despite the focus on disability identity and normalcy within much disability studies scholarship, Marxist strands – which foreground material conditions and political and economic structures – have long been present within both disability scholarship and activism. The Union of

Physically Impaired Against Segregation, an early network of disabled activists in the United Kingdom whose ideas gave rise to the social model of disability and fueled the disability rights movement, was inspired by Marxism and early on rejected liberal and reformist campaigns (Shakespeare 2010). Disability studies scholars who foreground materialist analyses have attributed the shortcomings of liberal rights-based legislation, like the Americans with Disabilities Act (ADA), to a failure to recognize disability-based oppression as intrinsic to capitalism (Russell 2001, 2002). In light of the now evident insufficiency of liberal rights-based legislation for dismantling ableism, disability studies scholars are increasingly incorporating analyses of the political economy to explicate how the mode of production disables and devalues those whose labor power is or is perceived to be less exploitable within capitalism (Russell 2002).

It is worth clarifying, in light of commonly waged accusations of reductionism in Marxist theory, that materialist disability studies scholars recognize that disabled people have been marginalized under other economic systems. However, these scholars have compellingly argued that the dominant ideologies around disability that underlie ableism in its contemporary manifestation are principally rooted in the exploitative economic system (Gleeson 1997). In other words, the constant need for capital circulation and accumulation provides the material basis for contemporary manifestations of disability oppression. Many have thus argued that capitalism is far more disabling than prior social forms. Disability studies scholars have specifically pointed to the fact that in contemporary society ability is defined, in large part, in relation to one's exploitability as a worker for the sake of capital accumulation. For example, such analyses highlight how the shift to industrial capitalism and the attendant emphasis on standardization, rationalization, and mechanization produced a new class of disabled people now excluded from the labor force. Disability is thus defined synchronously with the shifting labor needs of capitalist production. At the same time, with this shift conceptions of human value became increasingly tied to economic

productivity and efficiency (Russell 2001; Goodley 2013). Eugenic ideology and the heightened emphasis on normalization and ranking thus emerged concomitantly to legitimize the new status quo and pathologize the newly disabled class (Russell and Malhotra 2002).

Brendan Gleeson (1997), a Marxist geographer and one of a handful of geographers to incorporate a disability studies perspective, describes the social history of capitalism as "a sociospatial dialectic of commodification and spatial change which progressively disabled" the labor power of bodies deemed unfit (p. 195). Both Gleeson and Oliver analyzed institutionalization and the move to deinstitutionalize from a Marxist perspective, highlighting the shifting social relations of production under which deinstitutionalization gained traction. Gleeson and Kearns (2001), for example, situate the shift away from institutions and toward vaguely defined "community care" within the context of the widespread neoliberal restructuring of States. They argue that the deinstitutionalization movement was largely co-opted by late capitalist or neoliberal governments seeking to cut social welfare spending by contracting out services to private care providers.

While disabled people have been systematically excluded from participation in the economic system under capitalism, the commodification of disability, at the same time, has opened up new markets for the expansion of capital through the further pathologization of disabled people. This has been well documented by disability studies scholars who outline the proliferation of diagnoses and categorizations that increasingly medicalize innumerable manifestations of human variation. The proliferation of the "special" industry and the marketing of apparently any activity disabled people engage in as "therapy," for instance, evidence the way in which capital has expanded into the human body and rendered it a highly profitable marketplace. The endless array of new diagnostic categories and concomitant overmedication of students, through which the pharmaceutical industry has accumulated mass profits, can be similarly read through a Marxist disability studies optic (Wiener et al. 2009).

In addition to rendering a new class of people disabled through shifting demands under Fordist and post-Fordist production, many have noted that disability is materially created through the working and broader environmental conditions of late capitalism and imperialism. Among countless other examples, this is evidenced by heightened rates of respiratory conditions among poor Black students and the mass disablement of people globally through imperialist wars. Materialist analyses thus call attention to the way in which capitalism creates disability through exploitative labor conditions and the colonial and imperial practices that sustain it.

While foregrounding critiques of the capitalist mode of production, some materialist disability scholars have urged that Marxist formulations that ignore critical disability analyses are inadequate for developing and enacting liberatory theories and politics around disability. As Abberley (1997) argues, for example, for many disabled people, an analysis “linking impairment to capitalism as a very symptom of its inhumanity and irrationality, is of little use” (p. 29). Indeed, some have disconcertingly argued for a socialist economic system by endorsing socialism as a path toward eradicating disability. Moreover, while the Marxist dictum “from each according to his abilities, to each according to his need” has been suggested to hold liberatory potential for disabled people (Russell 2001), others have argued that while removing the material basis for oppression, this framework upholds a normative disability/impairment binary whereby impairment is still only legible as a biological deficiency within an individual and, thus, fails to challenge taken-for-granted perceptions of disability/ability (Goodley 2013). Abberley notes that “for impaired people to be adequately provided for in the system of distribution, but excluded from the system of production, that is, on a superior form of welfare, would be unsatisfactory, since we would still be in the essentially peripheral relationship to society we occupy today” (p. 32). While rejecting the subordination of use value to exchange value under capitalism, Abberley asserts the importance of labor and of being central in the production of social life. Implicit in his analysis is the notion that

having one’s labor recognized as socially valuable is crucial for self-development and identity formation. Indeed, access to work and accessible workplaces has been a central demand of disabled activists. Certain bodies, though – most evidently those of severely intellectually disabled people – will always be beyond the purview of recognized labor power within the capitalist mode of production. Building off this idea, Marxist disability studies scholars have highlighted the necessity of developing an alternative understanding of labor that allows for the social recognition and attribution of value to disabled peoples’ supposedly “nonproductive” labor power (Mitchell and Snyder 2010). Marxism alone thus fails to challenge a hegemonic conception of ability – perpetuated through schooling practices and policies – and disability studies scholars and activists offer critical insight to this end.

Materialist Disability Studies in Education

Educational theorists and philosophers are increasingly taking up a disability studies framework, and the development of the fledgling field of disability studies in education is particularly promising. For disability studies to retain its transformative potential and build upon and transform critical educational theory, it is crucial that Marxist analyses of disablement be foregrounded. The capitalist ideology of productivism is central to the experience of disablement; dominant norms of who is “able” and accompanying conceptions of certain bodies as disabled and burdensome are inextricable from the social relations of production. Analyses of ableism thus offer a particularly stringent critique of capitalism. Given the way in which dominant ideologies around disability/ability are produced and reproduced through schooling, materialist disability studies offer a critical alternative to educational practices and policies that uphold oppressive ideologies through the continued segregation and marginalization of disabled students. The heightened extension of market and productivist ideology into institutionalized education with the rise of neoliberal

reforms, moreover, renders the development of educational theory and philosophy from a disability studies perspective particularly urgent. A Marxist analysis of disability in education also calls attention to the creation and construction of disablement under capitalism by considering how the uneven distribution of particular disabilities – such as the vastly disproportionate number of Black students labeled with emotional/behavioral disorders – impacts students' ability to learn while in school.

Some liberal theorizations of disability justice appeal to an idea of the able-disabled highlighting disabled people's normative abilities to advocate for accommodations that allow them greater participation in the workforce. By appealing to hegemonic notions of ability, though, this argument further entrenches a conception of human worth tied to economic productivity. This framework will always and inevitably be disabling for those whose labor power is not legible as such within the system of capital. Theorists linking disability studies to education have thus emphasized the need to prioritize use value in order to render legible the labor of many disabled people. Erevelles (2000) writes:

Alternatively, if, within another set of social relations, the laboring body is not commodified but is instead associated with the production of use-value, then in this case it would indeed be possible to explore the usefulness of the disabled body in more creative ways, since usefulness is no longer predicated on generating profits but is, instead, associated with meeting perhaps more affective and other non-monetary human needs. (p. 41)

Erevelles crucially highlights the need for an expanded notion of use that allows for the recognition of the intangible and unquantifiable use value of disabled bodies.

Disability injustices enacted by neoliberal education reforms – such as the heightened segregation of disabled students consequent of charter schools and the implementation of high-stakes tests scored on a so-called normal curve rooted in eugenic science – are usefully read through a materialist disability studies optic. Such an analysis suggests that inclusive education practices, for example, while a necessary and crucial reform for

challenging dominant logics of disability, is wholly insufficient if, in advocating such practices, we fail to ask what exactly it is that disabled students are to be included *in*. That is to say, if schools are understood as ideological State apparatuses that reproduce the social relations of production and if the mode of production is inherently disabling for those whose bodies it renders insufficiently exploitable, inclusion in a fundamentally disabling system can never amount to a liberatory disability politics. In it of themselves, such practices amount to including disabled students in a State apparatus that serves to reproduce the conditions of their disablement. Critical pedagogies that account for the way in which disablement is structurally produced are imperative in combatting this. Such pedagogies ought to not only dismantle dominant logics of disability that devalue particular bodies and ways of thinking and feeling but, moreover, create space for the collective development of alternative systems of value (Erevelles 2000; Goodley 2007). Within an alternative economic system, under which the laboring body is not commodified, more creative ways of valuing people can emerge (Erevelles 2000; Russell and Malhotra 2002). One's usefulness would no longer be predicated on their ability to allow the accumulation of capital, but, rather, usefulness could be thought of in terms of one's ability to fulfill affective or other intangible human needs. By incorporating such pedagogies, educational spaces can become sites for imagining and enacting alternatives to capitalism and the disabling system of value intrinsic to it.

Conclusion

Ableism operates in particularly stark relation to the political economy in that disability/ability is defined and constructed in direct relation to one's capacity to produce under the capitalist mode of production. While some social movements have sought to refute assumptions about particular groups' labor power – for example, debunking racist or sexist assumptions about people's capacity to labor productively – for many disabled people, the inadequacy of this tactic is evident. The disabling perception of their bodies as less

economically productive is indisputable within the presently configured capitalist economy. This has perhaps contributed to resistance to recognizing ableism as a system of oppression. Because ability is defined in direct relation to one's capacity to enable the accumulation of capital and prejudicial attitudes are a by-product of the social relations of production, it is clear that liberation from ableism is not possible within a capitalist economy. A materialist disability studies perspective renders evident that efforts which neglect to address the structural roots of disability oppression in the capitalist mode of production will always and inevitably fall short. A disability optic also expands Marxist analyses by challenging hegemonic conceptions of ability. Marxist-oriented disability studies scholars compellingly argue that capitalism is absolutely incommensurable with liberation from ableism and, further, offer critical analyses that deepen the political project and possibility of Marxist thought.

Marxism and Student Movements

Sandra X. Delgado and Michelle Gautreaux
The University of British Columbia, Vancouver,
BC, Canada

Introduction

Students and student movements have played crucial roles in political, cultural, and social transformations since the beginnings of the university (Altbach 1966, 1989; Boren 2001; DeGroot 1998; Lipset and Altbach 1966, 1969; Barker 2008a). Students are characterized for being a heterogeneous group who represent a diverse, pluralistic, and contradictory range of ideologies, grievances, and political commitments. Student movements are as diverse as students are; historically, student movements have not always been progressive or radical in their aims. For example, during the revolutions of Paris 1848 and Russia 1917–1919, students sided with the reactionary bourgeoisie (Barker 2008a). On the other hand, in the student movements of the 1960s and early 1970s in the United States, or Latin American movements in the 1950s and 1960s, student movements played a more revolutionary role (Barker 2008a; Spector 2013). Although the

topic of this entry focuses on the relationship between Marxism and student movements, it is important to point out that student movements have also had (and continue to have) close ties with a range of political philosophies, such as anarchism, feminism, liberalism, conservatism, among others. In short, diversity and heterogeneity of interests and political commitments among students have been the most fundamental markings of student organizing and political action (Gill and DeFronzo 2009).

The relationship between Marxism and student political activism has been marked by complexity and debate. Often student collective action has been disregarded as “bourgeois” or “petit-bourgeois” demands (“Student Movement” n.d.). Student movements have also been framed as simply the politics of a “generational gap,” where student activism has been interpreted as alienated youth rebelling against older generations. On a similar note, student activism has also been downplayed as a youth quest for meaning, at times even a quest for overly idealistic “impossible” ends or pursuits. However, students’ contributions to revolutionary struggles and their roles as organizers and leaders have been recognized (i.e., the Chinese revolution in the 1940s, the Cuban revolution in 1950s, and the Civil Rights movement in the United States in the 1960s, among others). It is also important to recognize that student organizations have also been deeply influenced by Marxism. For example, many members of student movements, either individually or collectively, have been actively involved in the communist or socialist parties in their respective countries (i.e., Zengakuren in Japan, FECH in Chile, among others).

Student organizing is confronted with particular challenges that other types of collective action may not face in the same way. For instance, student political organizations and movements are challenged by the limited time span of student life; once a student finishes his/her studies, he/she is no longer considered to be a student and his/her participation in student political action may be restricted. Student participation in collective action is also restricted by the structure of the academic calendar; periods in between terms are

moments when there is a decreased level of student political demonstrations. Similarly, canceling or suspending classes for extended periods of time is a tactic that university administrations have employed to deter student mobilization on campuses, which often results in an important number of the student body returning or staying at home instead of being politically and academically active on campus. These factors historically have posed important challenges for student mobilizing and have influenced the structure that student movements and organizations have adopted for securing student leadership, guaranteeing recruitment of new students, and assuring continuation of their political action.

Although aspects of student life, like its clearly demarcated temporality and the structure of academic calendars, pose a constant challenge for student movements, there are other aspects that open possibilities for student social mobilization and boost their potential. For example, the arrangement of academic schedules for full-time students allows student activists easier access to possible members who may have time, availability, and interest in being part of the collective action. In comparison with workers or peasants movements, students have less restrictions to organize direct actions and mobilize their peers. Students can protest and gather groups of support, stage walk outs, and sit-ins, using their free time easier than workers, who face different forms of repression. These aspects, however, remain continuously contested and negotiated as neoliberal reforms and capitalist dynamics transform universities and high schools.

Historically, the scope of student movements has been diverse. Some movements have pursued changes beyond the university, school, or academic boundaries, as many students, either individually or collectively, have contributed to revolutionary causes closely tied with communist or workers’ parties and movements to overthrow capitalism, more broadly. Students, both individually and collectively, have had (and continue to have) ongoing relationships with political parties, organizations, and movements of the left in a variety of ways. Students’ experiences in student movements and organizations are formative and

often serve as a path to students' involvement in leftist politics. A number of students, although not necessarily the majority, have also been organizers, leaders, intellectuals, and members of political parties and movements of the left (Boren 2001; Altbach 1989; Lipset cited in Altbach 1966). It is important to note that the relationships between student movements, student organizations, and political or social movements on the left are mutually beneficial. Students who are actively involved in political parties and movements of the left influence, organize, and incite students to collectively mobilize when political unrest arises on campuses. Thus, political organizations and parties have been indispensable for student movements and organizing.

It is also common to find examples of student movements whose agenda has addressed only specific aspects of education reforms (i.e., budget cuts, tuition hikes, privatization, among others) or reforms at institutional levels but has not articulated a critique of capitalism as a whole. The student movement in Quebec in 2012 is an example of such a movement. From a Marxist standpoint, Students have the potential to become revolutionary subjects when they politically integrate their struggles and activism into broader movements from below to overthrow capitalism (For example, the movement in Paris in 1968 articulated a critique of capitalism as a whole). Therefore, student movements that focus on particular self-contained issues have a limited scope and reduced potential and, thus, their possibility for revolutionary transformation would also be restricted.

The reasons to explain current student unrest are extremely diverse. Student movements reflect the contradictions of capitalism. As Lenin and Trotsky argued, students serve as voices for larger systematic injustices present in capitalist societies as they are "the sensitive barometer" (Trotsky 1910) of social unrest. An analysis of student movements grounded within a Marxist framework does not interpret them as separate or isolated movements but rather as part of a larger context of social struggles. As Barker (2008a) argues:

...student movements do not develop in isolation from wider social conflicts... they may possess their own specific dynamics, as a product of their

particular social composition and the situations of their emergence. But they are anything but immune to larger tendencies of development, to which they make their own contribution. (p. 46)

Framing and analyzing student struggles in the context of the contradictions and injustices of a capitalist society allows us to see how they are connected to other areas of social life that are also sources of social unrest and struggle, such as justice, health, the environment, among others. The last two decades have seen the emergence of mass movements against the effects of global neoliberal capitalism on the transnational level. These "social movements from below," which take place in various geographic locations and challenge or resist diverse aspects of global capitalism, are understood not as isolated occurrences but rather as part of a "historic wave" of movements, or, in other words, a "complex 'movement of movements'" (Cox and Nilsen 2014, pp. 2–3). Current movements resisting corporate education reform (from K-12 schools and including universities) are part of this wave of transnational movements.

Marxism and the Critical Pedagogy of Collective Action

Marxism is a contested, pluralistic, and constantly developing political philosophy. In the field of social movement studies, Marxism is being revitalized as a body of theory crafted for and by social movements (Nilsen 2009). Marxism is reengaged as a theory of collective agency and social change that is deeply relevant to activists' struggles and is helpful in carrying movements forward (Nilsen 2009; Cox and Nilsen 2014; Barker et al. 2013, among others). In the field of education, a similar revitalization is taking place, where recent efforts have been made to reunite critical pedagogy with its Marxists roots (i.e., Malott and Ford 2015; McLaren 2000).

Marxism as a philosophy of praxis is deeply connected with social action because it is through collective social action that human beings are involved in a process of self and social transformation. When social groups form, in their process

of forming or *coming to be*, they also transform themselves. Humans, understood both as individual and social beings, develop "... their own selves, their own skills and their own powers through the very process of their collective self-organization (...) Changing society means transforming human beings and their social relations" (Barker 2008b, pp. 8–9).

From a Marxist praxis, collective social action can be understood as inherently pedagogical, since knowledge is produced in collective action. This process is ultimately a pedagogical matter, as pedagogy is understood as going beyond being a repertoire of practices and methodologies. The pedagogy of collective social action not only "enable[s] the creation of collective readings of the world" (Motta and Cole 2013, 2014, p. 193) but it is also an essential element of the recreation and transformation of possible futures through the experience of "coming into being" (Malott and Ford 2015).

A Marxist critical pedagogy is grounded in the unification between theory and practice. As Freire (1970), Hall (1978), and others have argued, humans act upon theories, reflect upon the very action, and engage in this process continually as we organize and struggle to transform the world. On a similar note, Paula Allman (2001) reminds us of Marx and Engels' words when she states that "our consciousness develops from our active engagement with other people, nature and the objects or processes we produce. In other words, it develops from the sensuous experiencing of reality from within the social relations in which we exist." (Marx and Engels, 1846 cited in Allman, 2001, p.165).

Within social movements, political organizations, and diverse types of social struggles, a Marxist critical pedagogy enables the development of a critical reflective consciousness that makes the connection between issues movements face and political economy and acts to disrupt and displace capitalism (Choudry 2015). In other words, a critical pedagogy grounded in Marxism provides a theoretical foundation upon which movements are able to understand the forces of capitalist exploitation and oppression in society, envision themselves and the movement

transcending them, and set out, from the present moment to act upon that vision, creating themselves and the movement anew, engaging in a process of creating new social relations (Freire 1970; Allman 2007; Malott and Ford 2015).

In the context of student movements, it is through participation in social action that students, although for a small glimpse in time, can experience ways of engaging with one another that may challenge and even temporarily transcend everyday capitalist social relations. Through the material experience of these alternative social relations and renewed possibilities of engaging with others, students' consciousness is transformed. This reiterates the central notion of praxis, but it also illustrates the intimate connection between critical pedagogy and social movements.

Current Movements in the Context of Neoliberal Capitalism and Education Reform

A Marxist educational analysis understands corporate education reforms as the reorganization of education by transnational capital to serve the interests of the capitalist class (Hill 2006; Ross and Gibson 2007). The privatization and commodification of education is part of the global capitalist project to further entrench and advance capitalist values and ideas through schools and universities to maintain the power of capital over labor. Schools and universities are constituted as instructional spaces where the principles of market efficiency, competition, and "consumer choice" are taught, learned, and internalized by teachers and students. A Marxist critical analysis places the capital-labor relation, and the exploitation and oppression it produces, in the center of its critique of neoliberal capitalism and the privatization of education (Malott and Ford 2015). The effects of neoliberal education reform on teachers and students include punitive accountability measures, standardized tests, national standardized curriculum focusing on skill development and employment, and the overall defunding of public education, including universities, among others.

At the core of the most recent student uprisings is the struggle against neoliberal education reforms that refocus the purpose of education as ensuring “human capital” in the workforce and advance the privatization of education. Many of these recent movements have been successful in articulating convincing political agendas and reaching public support. Among those student movements gathering mass mobilization and public support are those that have taken place in countries as diverse as the United Kingdom, Canada, Holland, Australia, Mexico, Chile, Colombia, and South Africa, to name just a few. As an example, one of the most well-known recent movements is the Chilean student movement of 2011, the biggest movement in Chile since 1973. At the time of the movement, Chile had one of the most expensive post-secondary education systems in the world (Larrabure and Torchia 2011). This movement demanded free education for all Chileans and an end to profit in education. In early 2015, the Bachelet administration in Chile passed legislation which will eliminate tuition fees, selective enrolment, and profit making in all elementary and secondary educational institutions receiving public money (Achtenburg 2015). Various students, some of them politically organized but many not, played an important part in the coming to be of this movement. The FECH among many other student organizations present in Chilean universities are continuing to lead this movement (Achtenburg 2015) as the battle for free public education that serves the public interest has yet to be achieved with this most recent law.

It is important to mention that many student organizations and factions within today’s student movements maintain ongoing ties with revolutionary movements, radical left political organizations, and communist parties in their countries (i.e., the Federación Estudiantil Chilena (FECH), the Mesa Amplia Nacional Estudiantil (MANE) in Colombia, CLASSE in Quebec, among many others). As we mentioned in the beginning of this entry, student organizations, and more so in the case of student movements, are characterized for being heterogeneous and diverse, as students from all ranges

of political, organizational, and social commitments, tendencies, and beliefs assemble and mobilize even among movements and organizations who openly identify with leftist or revolutionary politics.

On the other hand, many student movements do not use Marxist language, or articulate a critique to capitalism *per se*, and their participants may not necessarily identify as Marxists or communist. However, as social movement scholars Barker et al. (2013) state, “There is, in short, ‘a system’ against which so many of today’s protests are pitched, even if they are not articulated solely, or even at all, in the language of ‘class’ ” (p. 2). In other words, from a Marxist approach to student movements and social movements more broadly, there is an interest in questioning, understanding, and articulating how *all* movements link together and what potentials they have to learn and join efforts. Historically, in Marxism there has been an effort to sustain encounters and dialogues with various cross-class movements (i.e., feminist movements, indigenous movements, Black and Latino movements, among many others). As Marxism continues to engage with various social movements and attempts to make a strong connection between class-based workers movements and other social movements, it is important to inquire and explore what social struggles and student movements all have in common and how they can all gain strength from each other, and realize their potential to become revolutionary together.

To conclude, as we have articulated, students do not have the potential alone to overthrow capital. Nonetheless, through the process of organizing, students transform themselves and their material reality. This means as a social group, students can come to develop a critical consciousness of educational and social inequity within capitalism. It is in this process where there is the possibility (and necessity) for continued dialogues and encounters between workers movements, communist parties, Marxist organizations, and student movements to develop paths of individual and social transformation that can be realized through the collective praxis of becoming communist.

Marxism, Critical Realism, and Education

Grant Banfield

Flinders University, Adelaide, SA, Australia

Synonyms

Emergentist naturalism; Social radicalism

Introduction

Marxist educational theory takes a significant but bedeviled place in the history of educational thought and practice. Like Marxism more broadly, it has ridden the contours of history while having been confounded by its own internal (but historically contingent) conceptual tensions. This is due,

in part, to the sheer breadth and incompleteness of Marx's work which has meant be bequeathed future Marxists and radical educators a living project. Marxism and Marxist educational theory are, and can only be, open to ongoing interpretation and epistemological scrutiny.

It is in the service of a living Marxism that critical realism, as developed by British philosopher Roy Bhaskar (1944–2014), lays claim to be of value to radical theory and practice (Brown et al. 2002). While the term critical realism is known among professional philosophers to refer to various species of “realist” approaches to philosophical inquiry, it is only Bhaskarian critical realism that is discussed here. Unlike other critical realisms, Bhaskar's work has been rigorously applied to Marxist praxis (Brown et al. 2002). The intellectual origins of Bhaskarian critical realism have Marxist roots. Not only are Bhaskar's own Marxist and socialist sympathies well documented but also the common emancipatory impulses expressed in both the critical realist and Marxist projects are widely recognized (Banfield 2015, pp. 1–13; Brown et al. 2002). Furthermore, as a philosophy of science, critical realism is understood by its advocates to be well placed to engage in theoretical ground clearing for scientific practice. Its application to a diversity of fields such as ecology, economics, law, religion, management, and organizational studies is well documented. Similarly, critical realism has been employed to address educational problems in their substance (Sarah 2011; Shipway 2010) and theory (Scott and Bhaskar 2015).

While explorations of the intersections of Marxism and critical realism along with education and critical realism are well developed, considerations of Marxism, critical realism, and education are at their infancy. To date, only one significant study brings the three together. The direction of this entry will be toward that work. Because of the limits of space, this will be pursued via a charting of the conceptual development of critical realism while noting its synergies with Marx and Marxism. This itself is not a simple task as Bhaskar's work is extensive. It is common among critical realists to divide his work into early and latter phases. Bhaskar's latter work – transcendental

dialectical critical realism – remains contentious among many critical realists. It is a matter of debate within the field whether it completes Bhaskar's philosophical system or turns upon itself. For this reason, only the early critical realism will be considered in what follows.

Critical Realism and Marxism

It is frequently noted by Marxist critical realists that we find in Marx (and particularly in his latter scientific works such as *Capital*) the early formulations of critical realism (Ehbar, in Brown et al. 2002, pp. 43–56, 2002). Indeed, Bhaskar has described Marx as the first critical realist with critical realism providing “the missing methodological fulcrum of Marx's work” (1989, p. 178). Bhaskar saw his relationship to Marx and Marxism as critical, productive, and clearing “the ground for the unfinished business of Marxism” (Bhaskar and Hartwig 2010, p. 140).

Critical realism had its beginnings with the release in 1975 of Bhaskar's *A Realist Theory of Science* (with subsequent editions: 1978, 1997, and 2008). It elaborated a transcendental realist (TR) philosophy for the natural sciences. In a move similar to Marx setting Hegel's philosophical idealism to place it on a materialist footing, Bhaskar took Kant's transcendental idealism to establish a transcendental realism. He saw the importance of his move against Kant as a challenge to the positivist (i.e., the empirical realist) dissolution of any distinction between philosophy and science. For Bhaskar, the acceptance of Kantianism in the philosophy of science had led to failures in understanding actual scientific practice and in grasping its emancipatory impulse. Taking a transcendental path, Bhaskar did not seek to impose a “master method” on science. Rather, as Marx did in *Capital*, he proceeded from concrete existence (i.e., actual scientific practice) and asked what conditions make it possible.

TR can be considered the conceptual starting point of Bhaskar's philosophical system that would offer (i) a practice-aware philosophy of science and (ii) a vindication of the primacy of

ontology over epistemology. The former claims that to understand science is to grasp it in its practice. In this respect, philosophy cannot replace science. Rather, it can only play a conceptual ground-clearing role that Bhaskar, in borrowing from John Locke (1632–1704), referred to as “underlaboring.” The latter establishes that the natural world does not consist in causal laws but in causality itself. For Bhaskar, science is the ontological search for causality. This was a double move against Kantian idealism and Humean empiricism. Contra idealism, Bhaskar demonstrated that causal laws are about things that exist independent of and, in their objectivity, can be fallibly known. By delineating ontology from epistemology, Bhaskar sought to show that the reality of things consists in their natures which not only determine the ways humans can interact with them but also provide the essential conditions for knowledge of them. Against empiricism, Bhaskar showed that, for science to be possible (and necessary), the natural world had to be structured and differentiated. Consistent with Marx’s realist distinction between essence and appearance or content and form, the objects of science are not actual events and directly observable phenomena but underlying mechanisms consisting in structured and differentiated relations of “vertical” determinacy and “horizontal” co-determinacy. What appears and what is experienced or perceived are only partial and superficial representations of a more deeply stratified reality.

Bhaskarian stratification signifies ontological strata as distinct but emergently real. In other words, the properties of higher order strata are non-predictable forms of the properties of lower, or more basic, strata. As such, relations between strata are taken as emergent. Empirical reality and associated phenomena cannot be accounted for by simply referring to laws governing more basic strata. In this way, emergentist depth realism is seen by critical realists to provide an essentialist conception of ontology (that avoids essentialism and reductionism) while offering scope for spontaneity and uniqueness. TR points to the ontological boldness of scientific practice where causality is understood to rest in the natural necessities of

things existing independent of mind, direct observation, and explanation. It began Bhaskar’s project of illuminating the realist impulse – the “methodological fulcrum” – in Marx’s scientific method.

The extension of TR to the social sciences came with the 1979 release of *The Possibility of Naturalism* (with subsequent editions: 1989 and 1998). It articulated what is now known as “critical naturalism” (CN): a philosophical exploration of the social sciences that takes seriously the possibility that social objects could be studied in the same way as natural ones. Underpinning Bhaskar’s CN is an emergentist depth materialism that describes natural relations as necessary conditions for societal relations and human agency. *The Possibility of Naturalism* set out to resolve the tension between positivist (hyper-naturalist) and hermeneutic (anti-naturalist) tendencies plaguing the history of social science. Bhaskar’s resolution was to unify the natural and social sciences in a transcendental realist method but distinguish them according to the nature of the objects of inquiry. Here we see methodological flesh given to the scientific naturalist bones Marx points to in his *Economic and Philosophic Manuscripts*: “History itself is a *real* part of *natural history* and nature’s becoming man.”

Fleshing out his CN for the social sciences, Bhaskar presented Durkheimian structuralism and Weberian interpretivism as paradigm cases of hyper-naturalism and anti-naturalism. With the former tending to structural determinism and the latter to agential voluntarism, both were seen as inadequate for scientific practice. Likewise, to conflate mechanisms of structure and agency was unsatisfactory. Captured in his transformational model of social activity (TMSA), Bhaskar stressed that while society and individuals are mutually dependent, they are also ontologically and analytically distinguishable. CN takes social forms as temporally preexisting human action.

The most productive work in the area of structure-agency relation since Bhaskar has been that of British sociologist Margaret Archer. Her morphogenetic approach – most thoroughly developed in her 1995 work *Realist Social Theory* – emphasizes, and further develops, the

relation as a temporally structured analytic dualism. The analytical separation of structures and agents represents an important limit to Bhaskar's naturalism. It establishes CN as a qualified anti-positivist naturalism distinguishing it from deterministic and reductive forms (to which the "economistic" Marx is often accused of contributing). Just as the social and natural worlds are ontologically distinct in virtue of the former comprising the reasoned action of human beings, so is the case for social structures and agents. Unlike social structures, the power of human agents is understood to include physically structured capacities as well as the ability to act on reasons. Bhaskar's qualified naturalism, endorsed and developed by Archer, takes reasons as causes.

As an extension of Bhaskar's TR critique of Humean empiricism where causality rests in regular succession of events, critical realists argue for a capacity-driven and generatively emergent view of causality. But critical realists do not see positing reasons as causes as falling to anti-naturalism. In contrast to the hermeneutic tradition where nature is presented as an externality to the world of human affairs, critical realism sees the social ontologically grounded in the natural. Mentalistic capacities essential to the making of the social world such as consciousness, awareness of interests, and the formation of reasons are emergent material powers that are only possible because of, for example, neurophysiological structures. To Bhaskar (1989) mind is emergent from matter. He claims to capture this in his theory of "synchronic emergent powers materialism" (SEPM) and to lay the conceptual groundwork for arguing that to advance a separate science for the natural world cedes too much to positivism. Advocates see critical realism offering a scientific base for the elaboration of a radical humanism and the explanation of education as a capacity-building force for human emancipation (Banfield 2015; Sarah 2011).

Identifying human agency and the causal power of reasons as representing a critical limit to naturalism indicated for Bhaskar that the subject matter of the social sciences included not just social phenomena and structures but also belief about them. If an emancipatory science were

possible, it had to include deep critique and causally real explanations of human consciousness. Bhaskar's theory of explanatory critique is most comprehensively outlined in his 1986 publication, *Scientific Realism and Human Emancipation*. It offered a direct challenge to the positivist insistence on a sharp distinction between facts and values. Rejecting Hume's law that "ought" statements cannot be derived from "is" statements, Bhaskar argued that when social science comes to a human-limiting evaluation of structures, phenomena or beliefs rectifying action ought to follow. Explanatory critique entailed taking an ethical naturalist path. Bhaskar also identified a fact-value split in the hermeneutic sociology of Weber. He argued that Weber was misled by his neo-Kantian anti-naturalism to insist upon not just a shallow ontology for social science but also a value expulsion to advance "objectivity."

Bhaskar founded his ethical naturalism on the assumption that truth is a general good. But he was careful to detail that this did not imply an automatic move from fact to value. The unpredictability of context-specific codetermining mechanisms negated this and demanded the need for empirical work: there are no unmediated moves from fact to value or from theory to practice. Social theory for Bhaskar offers a "conditioned critique": "an implication of [Marx's] historical materialism" whereby critique is "realistic – that is, self-reflexively scientific (descriptively and explanatorily adequate) – about its practical impact" (1986, p. 170). Here Bhaskar draws on Marx's famous distinction advanced in *Capital* Volume I between "criticism" and "critique" where the former "knows how to judge and condemn the present, but not how to comprehend it." Critique, for Marx and Bhaskar, demands depth explanation informed by an ethical naturalism that elevates social science beyond "technical rationality" ... [and offers] perhaps the only chance of a non-barbaric, i.e., civilized, survival for the human species (Bhaskar 1986, pp. 180–181).

The emancipatory project of critical realism was dialecticized in Bhaskar's *Dialectic – The Pulse of Freedom* (1993). Dialectical critical realism (DCR) is generally recognized among critical

realists to represent the final stage of “early critical realism.” The defining concept of DCR is “absence.” Building on the TR and CN – that are taken as the first moment of DCR – Bhaskar argued that stratification, nonlinear causality, and emergence were only possible because of the absence of specific causal powers. This was familiar to Marx. The opening chapters of *Capital* establish that the absencing of use values characterizes capitalist commodity exchange. Absences are real and are actualized in their effects. This stands in stark contrast to what Bhaskar referred to as “ontological monovalence” that holds to a strictly positive ontology and cannot account for either real absences or the need to absent social ills. Bhaskar further advanced the dialectization of critical realism by introducing the concepts of “totality” that invites a “break with our ordinary notions of identity, causality, space and time” (1993, p. 125) and “transformative practice” – or, in Marx’s terms, “revolutionizing practice.”

Bhaskar offers DCR as a philosophical critique of Hegel and Marx. Among Marxists, this has had a mixed reception. Some consider it to be broadly consistent with Marx offering rich underlaboring possibilities (Ehbar, in Roberts et al. 2002, pp. 43–56). Others see DCR as a move to far toward philosophical system building that negates its underlaboring capacity. Collier is one who warns that Marxists should be wary of system building: “what Marx has put asunder, let no Hegelian join” (in Roberts et al. 2002, p. 162).

Marxist Education and Critical Realism

Banfield’s *Critical Realism for Marxist Sociology of Education* (Banfield 2015) currently sits as the only in-depth exploration of critical realism and Marxist education praxis. It claims to offer a critical realist underlaboring of Marxist sociology of education for the purpose of establishing conceptual and methodological bases to inform “revolutionizing practice.” The broad brush of the project’s method situates what Bhaskar had identified as the persistent problems of social science – “naturalism” and

“structure agency” – as the “central problematics” of Marxist Sociology of Education. Banfield operationalizes these via three field-specific “animating moments”: significant texts that established and continue to resonate within Marxist Sociology of Education. These are M.F.D. Young’s 1971 hermeneutically inspired *Knowledge and Control*, Bowles and Gintis’ 1976 structural functionalist offering *Schooling in Capitalist America*, and Willis’ 1977 radical culturalist ethnography *Learning to Labour*.

In his consideration of naturalism, Banfield shows that historical materialism can be understood as a species of anti-positivist and non-reductive naturalism. He does this via a critical naturalist underlaboring of the “base-superstructure” model: a well-known expression of Marx’s naturalist inclinations that has long haunted Marxism and brought with it accusations of, for example, economic (i.e., class) reductionism, evolutionary determinism, and tendencies to positivist science. The underlaboring proceeds via Marx’s material dialectic drawing on Ollman’s (2003) respectful Marxist engagement with critical realism. Banfield argues that, properly understood, the base-superstructure model expresses an array of mechanisms stratified by kind and not, as conventionally understood, representing structured relations of concrete phenomena. A new depth naturalist tripartite model is offered consisting in dialectical abstractions of codeterminacy (“horizontal” historical contingency), determinacy (“vertical” natural necessity), and vantage point (ontological and epistemological “standpoints”). Bringing the new model to a critique of *Schooling in Capitalist America*, Banfield claims to show a significant limit to the animating moment’s radicalism residing in anti-naturalist structural functionalist inclinations.

Attending to the problem of structure and agency, Banfield draws on Margaret Archer’s morphogenetic approach to develop an interest conception of agency. Taking reasons to be causes, the roots of those reasons are argued to lay, in historical materialist terms, in objective class-based interests. As such, interests are shown to provide not only a bridgehead between structure and agency but also the basis of an ethical naturalism for revolutionary educational

practice. Banfield suggests that this was the theoretical intent of *Learning to Labour*. Willis pushed against the overly socialized and excessively agentized approaches of the other two animating moments. While Banfield identifies depth realist tendencies in *Learning to Labour*, he demonstrates that Willis ultimately falls to an ontological shyness – a retreat toward ontological monovalence – that compromises the explanatory power for which he was searching.

The point of Banfield's project is that the animating moments together with the problematics they contain still find expression in various forms in the field of Marxist Sociology of Education. In what he describes as his projects limited and modest underlaboring of the field, there is an invitation to both scrutinize and further develop the work. Firstly, at the level of theory, the project prompts both the necessity of its critique and the importance of exploring its extension to fields beyond Marxist Sociology of Education. Secondly, at the level of practice, the dialecticized base-superstructure model and interest-based approach to radical change are to be tested in research and pedagogical applications.

Massive Open Online Courses (MOOCs)

Jeremy Knox

University of Edinburgh, Edinburgh, Scotland, UK

Introduction

Massive open online courses (MOOCs) are one of the most high-profile education and technology developments in recent years and have attracted a wealth of responses from researchers, educators, social commentators, and the media. In order to approach a comprehensive understanding of what the MOOC is, as this entry will try to do, it is not only a technological and pedagogical timeline of developments that has to be established, but also an insight into the ways these prominent courses have been described and understood in public discourse. This entry will therefore comprise three sections: *early experimentations*, *mainstream platforms*, and *responses*. These sections will outline the key individuals and organizations involved and the dominant channels through which MOOCs have developed, diverged, and become established.

Following the acronym, MOOCs might be classified as courses that are designed for large numbers of participants ("massive"), free to access ("open"), delivered entirely over the web ("online"), and structured and assessed ("courses"). However, definitions which seek to cover all aspects of the many different forms of the MOOC are useful, but tend to be too general. The difficulties in providing a precise definition of MOOCs derive from the different initiatives and approaches that have made use of the term, but also the significant precedents in the field of

e-learning and distance education that often challenge the uniqueness and exceptionality of this prominent educational initiative. One key difference is how the “open” in the acronym MOOC tends to be understood, a point which will be elaborated below.

Multiple characterizations of the MOOC are flourishing. Nevertheless, while MOOCs have never been consistent and new forms continue to emerge, prominent definitions and designs have had significant effects on how these courses have been understood. Most pronounced has been the suggested distinction between two different types of MOOC: the “cMOOC” and the “xMOOC,” the former referring to more experimental courses designed with the proposed theory of “connectivism” (see Siemens 2005) and the latter used to denote the more mainstream platform-based offerings from organizations such as *Coursera*, *edX*, and *Udacity*. While useful however, this is a distinction largely circulated by proponents of connectivism who have been critical of more mainstream initiatives. Furthermore, the division has been criticized as overly simplistic in assuming particular kinds of pedagogy, and increasingly redundant as MOOCs develop (see Bayne and Ross 2014). Nevertheless, it is a distinction that has gained considerable authority and reveals some of the key ideas that shaped the design, development, and promotion of the MOOC.

Early Experimentations

The acronym “MOOC” was proposed in response to a course called *Connectivism and Connective Knowledge* offered in 2008 by George Siemens and Stephen Downes. Known as CCK08, this course is often considered the first MOOC, with the convenors frequently recognized as pioneers of the format. However, importantly, Siemens and Downes also credit prior influences in the work of David Wiley and Alec Couros, signaling just some of the broad range of preceding work in this area. CCK08 and other MOOCs in this early period were developed as testing grounds for the proposed learning theory of connectivism: a

specific articulation of networked learning that foregrounds the network as a central model for understanding how individuals and groups learn. Prominent examples of cMOOCs include *Online Learning for Today... and Tomorrow* (known as eduMOOC), *Personal Learning Environments, Networks and Knowledge* (PLENK10), *Change: Education, Learning and Technology* (Change11), *Learning Analytics and Knowledge* (LAK12), *Digital Storytelling* (DS106), and *MobiMOOC*.

These MOOCs emphasized a style of self-directed, student-led learning, which foregrounded collaborative practices and often sought to diminish the role of the teacher. Such an approach was realized through the use of the web and social media services, offering prospective students free admittance to course spaces, as well as providing the means for multiple channels of communication between participants. This approach encouraged and permitted considerable numbers of participants, often in the thousands. The processes involved in cMOOC social interaction were often emphasized over formal assessment and accreditation, with the underlying rationale for these courses being proposed as one of networking with participants, openly sharing activity, and working toward individually determined aims. As such, early MOOC approaches were often positioned as a challenge to the educational orthodoxies of didactic teaching, institutional inaccessibility, and the emphasis placed on formal and standardized assessment. However, cMOOCs, and the underlying claims of connectivism, have not been without critique, which has often questioned the extent to which such approaches depart from already established theories and practices in online education and networked learning. Furthermore, some cMOOCs have been critiqued for relying on already-motivated participants with prior experience of the methods of engagement.

The kinds of structures informed by this underlying approach to MOOC pedagogy are key to understanding the differences attributed to the cMOOC category. While not all of the courses claiming to be informed by connectivism are consistent, there is a tendency to utilize distributed

social networks and multiple online spaces, encouraging participants to make their own decisions about where to engage in course activity. Importantly, rather than predefining course structures or environments, the cMOOC approach has often been able to specify modes of student participation, such as “aggregate, remix, repurpose, and feed forward” defined in the Change11 MOOC (Downes and Siemens 2011). These methods for taking part can thus be enacted in different spaces and with different web technologies. A central idea among advocates of the early MOOCs has been the Personal Learning Network (PLN), defining a set of guidelines for self-directed interaction (Cormier 2010). However, despite an emphasis on distribution, cMOOCs activity has frequently tended to cluster around specific spaces, such as central websites for course announcements, blog aggregation systems, and popular social media services such as Twitter. Furthermore, while it is important to note these general structural tendencies, those courses identified as cMOOCs have varied considerably in terms of their emphasis on centralized or distributed spatial arrangements.

A fundamental ethos of the early MOOC structure has been the promotion of openly accessible materials, stemming from association with the wider open educational resources movement. Therefore, not only is course content usually hosted in the public domain, but the suggested processes by which students reproduce and distribute this content emphasize the cultures of “remixing” and sharing prevalent in open educational practices. This generation of student-created material augments and expands core course content, often producing large amounts of material compared to more centrally controlled structures. While this approach has often resulted in students being overwhelmed by the volume of information to engage with, advocates of the cMOOC style have emphasized individual, self-directed choice as a foundational mode of navigation through these courses, such that digesting everything is not necessary. This structure is founded on a pedagogic model that privileges the *process* of forming personalized links between sources of information, rather than access to the

course content itself. Thus, the “open” in this style of MOOC is generally understood in terms of a multifaceted practice, involving admittance to the course, but also the free sharing and adaptation of content.

Mainstream Platforms

Stanford University played a significant role in the “mainstreaming” of the MOOC, shifting the provider of these courses to elite institutions and attracting unprecedented numbers of students. In 2011, Stanford professors Sebastian Thrun and Peter Norvig offered a course entitled *Introduction to Artificial Intelligence*, which attracted 160,000 enrollees, far exceeding that of the earlier connectivist-informed courses. Significantly, the course centralized resources within a single webpage, provided video lectures as the primary content, and incorporated automated multiple-choice questions as a form of assessment. These features contrasted significantly with the cMOOC model and reflected a much more orthodox pedagogical approach, despite the novelty of the online format and the unprecedented and remarkable number of course enrollees. Following considerable media interest, the course led directly to the founding of *Udacity* in February 2012, a for-profit organization headed by Sebastian Thrun. Udacity offered MOOCs under their own branding rather than direct affiliation with any educational institution.

The other two principal US MOOC providers were soon to follow. *Coursera* launched in April 2012, founded by Stanford computer science professors Daphne Koller and Andrew Ng. A for-profit organization, Coursera, has announced venture capital funding from corporate financiers and partner institutions somewhere in the region of 85 million and emerged as the biggest player in the MOOC space. At the time of writing, Coursera is partnered with 127 institutions and offers 1,340 courses. The organization has also announced revenue of one million US dollars, deriving from their “Signature Track” service (outlined further below). May 2012 saw the formation of *edX*, a partnership between Harvard University and the

Massachusetts Institute of Technology, and a consolidation of the previous “HarvardX” and “MITx” projects launched by each of these institutions, respectively. Significantly, edX publicized their nonprofit status, being funded by the two institutions themselves, and announced their platform software as open source, a position intended to distance their organization from the for-profit initiatives of Coursera and Udacity. At the time of writing, edX has partnered with 80 institutions and offered over 500 courses.

In September 2013, a UK consortium coordinated and owned by the Open University launched the for-profit *FutureLearn* platform. A couple of years behind the earlier initiatives, FutureLearn was perceived as a UK response to the US dominance of mainstream MOOCs, seeking out high-ranking British institutions as partners. However, this initial approach appears to have changed, with the organization forming more international affiliations. At the time of writing, FutureLearn is partnered with 50 educational institutions, a significant number of which are international but not US based. It has also partnered with “specialist organizations” such as the British Library and the European Space Agency. FutureLearn has offered over 70 courses.

These mainstream MOOC organizations established the model of centralized platform software, and all of their course offerings largely conform to similar arrangements. This involves three principal features: course content, chiefly in the form of video lectures; automated assessment, usually manifest in multiple-choice quizzes or facilitated peer feedback and grading; and space for communication, typically threaded discussion fora. This model, emphasizing teacher instruction and formal assessment, has been underpinned by behaviorist approaches to pedagogy and thus differs significantly from the cMOOC approach. The core principle of the mainstream MOOCs has been to provide *access* to the prestigious content of elite universities, an approach not only evident in the marketing and corporate promotion of the organizations themselves but also in the design of the platform structure. Thus the “open” in the xMOOC tends to be understood primarily in terms of admittance to content. In this model, it

is the video lectures from established academics that are positioned as the focus and value of participating in the course, alongside the formal recognition participants receive for completing the required assessment tasks. This emphasis toward content and assessment reflects a more established educational model than the process- and participatory-focused approach of the cMOOC.

The typical platform-based MOOC is structured around a series of video lectures, embedded within the platform, and in most cases featuring the course instructor speaking to the camera, referring to slides, or writing on a visible surface. This is content usually produced by the institutions involved and frequently branded with institutional watermarks. While these video lectures are often made publically available on social media, the centralized production of content is a trend more characteristic of the mainstream MOOCs. Video lectures are frequently interspersed with multiple-choice quizzes, intended to provide formative assessment of the course content and which often need to be completed before the remaining sections of the video can be watched. This further demonstrates the behaviorist ideas that tend to underpin the design of the mainstream MOOC platforms, using participant responses to control the pace of delivery.

Formal assessment and recognition is the other key focus of the MOOC platform design. Accreditation has been a prominent topic of discussion surrounding the emergence of the high-profile platforms, and the lack of uptake in this area has tended to position MOOCs outside of the core provision of institutions. At present, Coursera and edX do not offer credit themselves, and only a small minority of partnering institutions have experimented with formal credit models. Instead of formal academic credit, the principal platform-based MOOC organizations offer bespoke certificates: for example, Coursera’s “statements of accomplishment” and edX’s “certificates of achievement.” Significantly, however, all of the mainstream MOOC platforms offer alternative documents of recognition, at a cost to those wishing to purchase them. Coursera, edX, and Udacity frame this process as one of identity verification such that the cost is attributed to the authentication

procedure and the supposed authenticity of the participant is highlighted on the certificate itself. Such “verified” certificates are promoted as a superior form of recognition, premised on the idea that the individual undertaking the assessment is the same person in receipt of the document. FutureLearn has adopted a slightly different strategy by framing their fee-incurring “statement of attainment” in terms of undertaking an examination. At present this involves attending an exam center in person, a service provided in association with Pearson VUE. These “paid certificate” models are currently the leading revenue generation strategy of the mainstream MOOC organizations.

Recent developments by the mainstream MOOC organizations include the combination and sequencing of multiple courses within particular disciplines. Termed “specializations” by Coursera, and “XSeries” by edX, these developments entitle participants to a supposedly superior form of certificate. Udacity have also announced a service termed “nanodegrees,” focused on the accumulation of micro-credits that build toward more comprehensive evidence of vocational skills. Another significant development has been the shift toward so-called “on-demand” courses, notable in many current Coursera MOOC offerings. This development has been to structure courses so that enrollment and participation can happen continuously, rather than being limited to specific and delimited periods. This shift has considerable implications for both the pedagogical strategy and student experience of the mainstream MOOCs, necessarily structuring in more automated and self-directed modes of engagement.

Also significant is the change of direction announced by Udacity in 2013, in which the organization stated that it was no longer seeking to provide a broad higher education curriculum and was focusing instead on vocational courses, specifically aimed at the technology industry. Frequently cited as a figurehead in the mainstream MOOC project, Thrun’s subsequent retreat from the earlier claims of widespread educational disruption was publicized widely and interpreted by many as a signal of the failure of the platform

model. However, this change of direction has led to Udacity developing more in the way of accreditation models, for example, the offering of a master’s degree in partnership with the Georgia Institute of Technology and AT&T. It is perhaps the more vocational trajectory undertaken by Udacity that has allowed such specific qualification pathways to be developed.

Responses

The divisions in development that have shaped the pedagogic design and structure of MOOCs continue to influence the ways universities, media organizations, governments, educators, and researchers understand the emergence of these high-profile educational offerings. Following the emergence of the MOOC platforms, many responses sought to declare a profound disruption of established educational models. Media interest is particularly notable here, propelling the MOOC, and also the wider e-learning and distance education field, into mainstream attention. This is a crucial part of the MOOC narrative, because it fueled public interest and contributed to a culture of hyperbole in which institutions and even governmental organizations were compelled to respond. Key terms among the zealous media reporting were *disruption*, *revolution*, and *innovation* (see, e.g., Adams 2012; Friedman 2013), powerful terms that framed the MOOC in terms of dramatic and devastating change for the educational sector. These responses were bolstered by prominent figures such as Clay Shirky, who propagated the analogy of the music industry, comparing the intervention of MOOCs in higher education to the disruption caused by the MP3 file format (Shirky 2012). This extremist narrative influenced more formal reports, such as *An Avalanche Is Coming*, published by the UK-based think tank the Institute for Public Policy and Research (Barber et al. 2013). The report maintains the idea that the current higher education system is malfunctioning, and that radical changes are required so that the transformative and emancipatory potentials of the MOOC can be widely adopted.

While these responses have tended to sensationalize the narrative in largely unproductive ways, later, more measured reactions also reveal important aspects of the MOOC narrative. In reply to the swirl of intense media interest, a concerted effort has been apparent to evaluate and classify the MOOC, often in ways that situate and relate recent developments to more established institutional practices and research fields. Sir John Daniel, a long-time advocate of open and distance education, exemplified this response, with the influential report *Making Sense of MOOCs: Musings in a Maze of Myth, Paradox and Possibility* (2012). Similar high-profile reports have sought to moderate the claims of imminent disruption with more sober accounts of funding issues, prospective business models, and institutional approaches to widening provision through MOOC offerings. Another prominent issue here has been retention rates in MOOCs, which research has shown to average at 10%, a figure frequently derided as incommensurate with acceptable institutional standards. However, retention figures have also provoked debates about what constitutes appropriate engagement with university provision, with many claiming that “dropouts” also demonstrate valuable interaction with higher education.

These responses represent the standardization and institutionalization processes that have shaped the broad project of the MOOC, principally by positioning and adjusting the terms of the debate around established higher education sector issues. Assimilation, rather than disruption, is therefore how the contemporary MOOC might be understood. Nevertheless, critical responses to this strategic integration remain, no less from those working in long-established fields of education technology, e-learning, and online and distance university provision, which has in many cases been overlooked in the rush to operationalize an institutional MOOC strategy. Martin Weller’s *The Battle for Open* situates this debate within a broader open education movement, highlighting the problems arising from mainstream interest in “openness” (2014). The benefits of unprecedented institutional and governmental uptake of online education, wrought through the promotion of the large platform

organizations, exist in tension with the pedagogical orthodoxies and market values now built into the MOOC brand.

Conclusion

MOOCs are one of the most prominent developments in education technology in recent years and have achieved extraordinary media, institutional, and governmental interest. MOOCs have a lesser-known history as the experimental course format for “connectivism,” an emerging theory which foregrounds the network as a model for learning. These courses were distributed over the web and emphasized a process of self-directed and personalized course engagement. MOOCs entered a more mainstream phase following developments at Stanford University and the forming of high-profile organizations *Coursera* and *edX* who formed partnerships with elite higher education institutions. These organizations centralized MOOCs within platform software and adopted video lectures as the primary form of course content. Responses to the MOOC are also central to understanding how these courses are understood. Media responses were often exaggerated, claiming the imminent collapse of the traditional university. However, while this often overlooked long-established work in distance education, online provision, and e-learning, media hyperbole had the effect of propelling open educational issues into the mainstream, bringing both advantages and disadvantages for the project of the MOOC.

Mathematics Education as a Matter of Achievement

Eva Jablonka

Department of Education and Psychology, Freie Universität Berlin, Berlin, Germany

Introduction

Achievement in school mathematics is defined in relation to the goals of mathematics education, which are stated in curriculum frameworks, debated in research, or assumed by educational policy actors. Assessment of performance creates both, criteria for what it means to be successful in mathematics and students who achieve below and above a minimum standard or at a range of levels. Achievement (here used synonymously with academic performance or attainment), as an outcome of assessments after conclusion of an instructional unit, is commonly expressed in the form of course grades or scores on school examinations and other achievement tests. In school mathematics it appears comparatively easy to create large achievement differences between individuals. Because mathematics education has a long-standing function as a “gatekeeper” for entering a range of professions and higher education, there is a comparatively high economic value attached

to good grades or test scores. In addition, in popular culture high achievement in mathematics is often associated with cleverness, which may increase its symbolic value.

In education policy, measurement and comparison of mathematics achievement at individual and institutional level is seen as important for comparability when certifying students' competencies, for differentiating the curricula for previously comparatively low or high achieving students (often categorized as "students at risk" or "gifted students," respectively), for use of student achievement data as a measure of the quality of educational provision and teacher accountability, and for supporting or evaluating curriculum reform.

The conceptualization of successful mathematics education as a matter of measurable gains in achievement at individual or institutional level does not only dominate policy discourse but has also been the focus of many research studies and large-scale surveys. In particular, in the context of cross-national comparative achievement tests conducted by supranational organizations, rankings of students' average achievement in mathematics are used in discourses about the importance of sustaining or increasing economic competitiveness of nation States. Aggregate achievement scores are then interpreted as an indicator of technological and economic growth. Because mathematics is not only perceived as a privileged competence for the labor force but also seen as important for citizenship, high average achievement with a comparatively small gap between low-achieving and average students is assumed to bring with it benefits beyond enhancing students' individual careers or satisfying labor market demands, such as those of civic participation and social cohesion.

A central argument to consider is that assessments of mathematics achievement, which aim at ordering individuals in terms of their performance, insinuate success or failure for various social groupings of students. The argument stresses the functioning of achievement tests in the (re)production of social positions, which is reflected in the aggregate mathematics

achievement scores for those groups. The constitutive effect of the very principles of test construction for (inadvertently) bringing about this effect needs to be acknowledged. Hence, from this perspective, test outcomes cannot be taken as objective descriptions of mathematics achievement, neither at individual nor at aggregate level. Further, international comparisons of aggregate measures of mathematics achievement, complemented by national analyses and evaluations, have attracted considerable media reportage and contributed to the use of national achievement data as a tool for justifying education policy decisions. Then, mathematics achievement outcomes are taken as an indicator of the quality of educational provision at national as well as school and classroom level. Achievement outcomes so assume a central function in the language used to describe mathematics education.

In line with these considerations, a discussion of measurement including a brief excursion into the origin of academic achievement tests is presented first. The next section examines mathematics education as a matter of achievement for students affiliated with various social groupings. The third section discusses mathematics education as a matter of achievement at national level and the associated establishment of student scores as a management tool. As these are all complex issues, their outline in a synoptic form here inevitably results in considerable simplification. Nevertheless, these are key elements in conceptualizing mathematics education as a matter of achievement.

Measuring Students' Mathematics Achievement

Achievement in school mathematics is measured by seemingly neutral tests that most often reflect only a limited range of intended outcomes of mathematics education and are constructed to maximize differences between individuals. Wiliam et al. (2004) point out that mathematics achievement tests *produce* and objectify the constructs they purport to measure. They also

demonstrate that the principles of test construction demand to exclude items that assess the common learning experiences of students across schools and can be solved by many, as these would not sufficiently discriminate between test-takers. The requirement of a test to disperse individuals' results along a continuum on a one-dimensional scale amounts to a construction that aims at producing frequencies of scores that approximate a normal (bell-shaped Gaussian) distribution. At the same time, such a distribution is also particularly attractive for the functioning of tests as an instrument for selection. The distributions of empirical data from achievement tests, however, exhibit a variety of shapes and forms.

A look at the origins of the construction principles for achievement measures helps in further illuminating their functioning. Based on a short outline of the history of tests in the USA, Levine (1976) shows that a focus on test-construction had significance for psychology as well as education in support of their aspiration to gain the status of a science. In psychometrics, measurement of cognitive ability or scholastic aptitude preceded that of academic achievement, which led to an initial transfer of rationales and methods used for the construction of standardized achievement tests. As one aim of the introduction of achievement tests, in addition to evaluating teaching efficiency, was to create comparability of educational assessments and substitute or complement school-based examinations, the norms for achievement are based on the age-grade system of school organization. This strategy affords essentialist interpretations of what children at a certain age should be able to achieve in a school subject to be considered "normal," i.e., to achieve scores around the center of an imagined Gaussian distribution. Further, as Levine points out, the construction of cognitive aptitude tests originally aimed at predictive validity for differentiating between academically successful students and those likely to struggle, in order to solve the problems arising from introducing compulsory school attendance. As a consequence, the "natural" criterion for the age-scale of aptitude tests reflected the background of successful middle class students who profited from the compulsory school law and the

curriculum and against which to measure the others who did not. Hence, these tests do not only order individual students but also social, economic, and cultural positions.

In general, the more mathematics achievement is described as a set of generic competences (such as problem solving or reasoning, in contrast to mastery of specific techniques and grasp of specific concepts), the more any test that aims at ordering individuals in terms of these constructs will resemble the construction principle of a generic cognitive aptitude test in regard to the rather unspecific knowledge base and the vagueness of an assumed set of shared experiences that could help the test-taker in solving the tasks. Indeed, the point has been made that the achievement tests used in the Organization of Economic Co-operation and Development's (OECD) Programme for International Student Assessment (PISA) resemble such a construction (Rindermann and Baumeister 2015). Consequently, the potential effects of distributing different test-results to different student categories can be anticipated. The outcomes of a range of tests are actually often used as evidence to show exactly this effect, with varying and competing interpretations for the causes.

Validation of tests tends to be dominated by technical considerations and production of complex statistical analysis. Concerns about validity of achievement tests are commonly conceptualized as pointing to deficits in test-construction that may be overcome by refinement and technological advancement in the future. Awareness of the bias of apparently neutral assessment instruments resulting from the principles of construction of achievement measures, including prevalent imaginations of unidimensionality and age-grade related normal-like distributions, tends to be absent in the public discussion.

Differentiating Achievement for Various Groups

As indicated above, at the level of various social groupings, differential achievement in mathematics has been shown to relate to students' social

class or socioeconomic status, ethnicity or race, linguistic background, cultural affiliation, immigrant status, and gender, with varying sizes of gaps and changes over time in different contexts. Valero and Meaney (2014) point out that which social grouping is of interest in research studies (and figures as independent variable) indicates the classifications used in a particular society for differentiating types of people from normality, based on expectations constituted by the dominant groups at different points in time. Besides a cross-national interest in gender, social class and race have been a particular focus in the USA (Secada 1992). In China, for example, Zhao et al. (2012) examined differentiation in relation to levels of economic development in five regions in rural and urban settings by modeling mathematics achievement data from primary schools in relation to parents' occupation and possession of household items taken to reflect wealth (such as a TV-set, refrigerator, washing machine, and computer). In Germany, since the inception of the OECD's PISA, the achievement data produced by the survey have been analyzed with attention to students from immigrant families.

As has been argued above, the constitutive effect of any particular selection of substance and format of mathematics tests for creating achievement differences needs to be acknowledged. Regarding gender differences, Wiliam (2003) discusses some of the complexities in constructing mathematics achievement tests. Some tests may contain more of the type of tasks that turn out to favor males, while others more that favor females. Depending on these choices, one group then may outperform the other "on average." A similar point concerns the (re)production of social class differences in mathematics achievement tests. As Cooper and Dunne (2000) have found, mathematics tasks in UK tests that contained elements from some everyday practices that looked familiar to students from working-class families, disadvantaged these students as they (mistakenly) drew too much on their experience from those practices. Similarly, the substance and form of conducting mathematics achievement tests in Australia has been shown to contribute to achievement disparities between particular

groups of Indigenous students and other students (Meaney and Evans 2013).

In contrast to curricula-based assessments of mathematics achievement, the OECD's PISA and the Programme for International Assessment of Adult Competencies (PIAAC) claim to provide competencies-based assessments that measure mathematical literacy or numeracy. Jablonka (2015) emphasizes that these tests expand the discourse about mathematics education through which aspects of achievement are articulated. Reports from these studies typically describe achievement in terms of levels and with a range of new attributes of test-takers for constructing hierarchies between students or adults, schools, regions or countries achieving at or below these levels.

Hence, apparently objective national or supranational achievement measures not only define what counts as "normally" expected mathematical performance but also create differential outcomes for various categories of students. They produce "truths" about low-achieving or mathematically illiterate and innumerate groups and causes for their potentially unsuccessful participation in a range of practices that exclude alternative explanations.

Monitoring National Achievement

International comparative mathematics achievement studies, such as the OECD's PISA and the Trends in International Mathematics and Science Study (TIMSS) by the International Association for the Evaluation of Educational Achievement (IEA), have attracted some critical response in regard to methodology, usefulness, purpose, and function from the outset. In response to the First International Mathematics Study (FIMS) conducted more than 50 years ago by the group that became the IEA, Freudenthal (1975) expressed concerns about the lack of attention to differences and similarities in curricula and the deficient collaboration between the IEA and mathematics educators. He also alerted to the dearth of criticism of the statistical methods used in the study and pointed out that attention to

details prevailed where principles should have been the target. While there have been methodological advances, these points still hold. In a profound critical review of the potentials and problems of international comparative mathematics achievement studies, Clarke (2003) *inter alia* points to their unintended effects. These include imposition of a global mathematics curriculum against which a system's performance will be judged and the disapproval of teaching practices that were never designed to achieve the goals implicated in it, as well as the appropriation of the agenda and dissemination by those countries or bodies responsible for the design and conduct of a study. As documented in the edited volume by Jahnke and Meyerhöfer (2007), both appears to have happened with regard to PISA. Despite these concerns, the expansion and cyclical repetition of international comparative mathematics achievement studies over the last decades has contributed to conceiving mathematics education as a matter of national achievement. While these studies also provide a wide range of potentially valuable data in addition to achievement scores, only relatively few analyses of disaggregated data have been published in mathematics education. For example, in their inspection of proceedings from two recent major conferences, Kanes et al. (2014) found that the outcomes of PISA are mostly cited uncritically as part of the rationale for the research.

In many contexts, the rankings of entire nations in descending order of the mean mathematics scores have consistently attracted wide attention from the media and politicians. In reports and commentaries, the achievement rank is articulated as a particular form of evidence about the state of mathematics teaching and learning, which forms the basis for public arguments and rationalization of political decisions about education. For instance, a recent report presents findings and figures from an analysis of measures of economic growth and scores on international mathematics and science tests, understood as the "collective cognitive skills" or "knowledge capital" of nations (OECD 2015, pp. 25–27). Achievement in mathematics, together with science in the form of aggregate student scores, then assumes a

central function. It is taken as a symptom of a nation's innovative capacity that leads to relative competitive advantage. On the other hand, data from PISA-2000 and TIMSS-1999 have also been used for articulating concerns about equality of opportunity.

Hence, scores from achievement tests are not only taken to indicate a particular level of mathematical skills and knowledge of individual students but also used for diagnosing improvement or decline in the quality of an education system and consequently for public accountability of the service provided.

Accountability by means of student test scores includes their use for evaluating teachers and schools. The idea of using student achievement data in core subjects for scrutinizing the quality of educational provision, however, was already propagated by forerunners of achievement testing in affiliation with scientific management and behaviorist psychology. Suggestions included the use of students' scores derived from standardized tests for particular skills (e.g., in arithmetic and algebra) as an index of teaching efficiency with the purpose of evaluating and comparing teachers; or the use of a generic "achievement quotient," a construction that claims to differentiate between a student's unitary capacity to learn and their actual achievement in particular school subjects. This distinction persists in discourses of "underachievement" in relation to "(academic) potential," in particular for groups of students whose participation in mathematics education and reaction to the curriculum is viewed as problematic. An early example of a test that was used to demonstrate the effectiveness of instruction and so counteract political assaults on US schools in the second decade of the twentieth century is a speed test in arithmetic developed by an educational psychologist who used it to demonstrate regular grade-by-grade increments in New York City (Levine 1976).

Measures of teaching quality derived from student achievement data have not only remained prominent in the USA but have also more recently been exported to other countries. One example is the use of value-added scores for rationalizing reward or remediation of teachers or for

evaluating the performance of schools. Jablonka and Bergsten (2016) argue that the OECD's comparative mathematics achievement studies provide a particular form of "scientific evidence" about mathematics education, which constitutes what counts as a basis for public arguments and political decisions. Governments recruit what looks like a purified expertise of education researchers who produce such evidence about students' mathematics achievement in order to demonstrate accountability and rationalize and legitimize political decisions. This evidence relies on the production of quantitative measurements for student learning. A conception of mathematics education as a matter of achievement in terms of measurable academic performance, however, restricts recognition of the diversity of teaching and learning practices and overshadows a broader debate of associated goals.

Mathematics Education as a Matter of Cognition

Bharath Sriraman¹ and Kyeonghwa Lee²

¹Department of Mathematical Sciences, The University of Montana, Missoula, MT, USA

²Seoul National University, Seoul, South Korea

Introduction

The word *cognition* is defined in most dictionaries as (1) process of knowing, (2) something that is known, (3) thinking, (4) perception, and (5) study of the mind. There are numerous other meanings

that can be found in the domains of psychology, biology, philosophy, sociology, linguistics, and phenomenology. However, for mathematics education the primary focus has been on psychology and secondarily on biology, philosophy, and sociology. Therefore, an exploration of mathematics education as a matter of cognition implies describing and analyzing the domain of mathematics education as evolving in its notion of cognition from its roots in psychology and moving onto domains that broaden the notion of “cognition” for mathematics education researchers. There are three objectives:

- (a) To determine a “starting point” (if any) for research on cognition in mathematics education.
- (b) To unfold the development of mathematics education as a field of research based on its interaction with psychology, particularly the role of operational definitions in research on cognition.
- (c) To describe the different schools of thought currently found in mathematics education as they relate to research in cognition.

Determining a Starting Point

A watershed moment for cognition research in mathematics education in the latter part of the twentieth century was the publication of the book *Critical Variables in Mathematics Education* (Begle 1979), which surveyed existent research in the field based on high standards of scientific inquiry. Inquiry defined at this point in time was empirical research based on paradigms in experimental psychology. This can be attributed to methodologies advocated by funding agencies in the USA in the post-Sputnik era (late 1950s and 60s) where the notion of certainty of results was transposed from the physical sciences (physics, chemistry, etc.) to mathematics education. As a consequence, early researchers in mathematics education adapted operational definitions from cognitive and experimental psychology into their work. One sees a preponderance of Aptitude-Treatment-Interaction (ATI's) studies in the time

period 1960–1985. At this point in time, study of cognition was concerned with the mental processes of perception, thinking, memory, and learning. Theories that were invoked to guide research or development activities at this time were borrowed from educational psychology such as: Benjamin Bloom's *taxonomy of educational objectives*, Robert Gagne's *behavioral objectives* and learning *hierarchies*, Jean Piaget's *stage theory*, David Ausubel's *advanced organizers and meaningful verbal learning* – and later Vygotsky's *socially mediated learning*, and finally Herbert Simon's *artificial intelligence* models for cognition (Lesh et al. 2014).

As a contrast to this Anglo-American view of the development of mathematics education as a matter of cognition, a different view is obtained from Europe. In the early part of the twentieth century, mathematicians like Felix Klein (1849–1925) became interested in the teaching and learning of school mathematics. In this era, one finds increasing interest in studying the psychological development of schoolchildren and its relationship to the principles of arithmetic. The *International Commission of Mathematics Instruction* (ICMI) was founded in 1908 with Felix Klein as the first president. One of the founding goals of ICMI was to publish mathematics education books accessible to both teachers and their students. First published in 1908 but still printed today is the book “*Elementarmathematik vom höheren Standpunkt*” (Elementary mathematics from an elevated viewpoint). It clearly illuminated Klein's paradigm of school mathematics: *scientific foundation of school mathematics* and *accessibility through elementarization*. The question is how did this process of elementarization of higher mathematics work? Klein borrowed from the psychological theories of that time which claimed it was important to (1) provide an access to students by concentrating on the core of a mathematical topic; (2) add views from neighboring fields; and (3) recognize and activate the students' previous knowledge or by changing the means of representation (Törner and Sriraman 2006).

Another view of the influence of educational psychology in general and cognition in particular

to the field of mathematics education is obtained in the *Handbook of Educational Psychology* (Alexander and Winne 2006). In the foundations section of this book, the beginnings of modern educational psychology are attributed to the writings of Johann Friedrich Herbart (1776–1841), the pragmatists William James (1842–1910), G. Stanley Hall (1844–1924), John Dewey (1859–1952), and finally Edward Lee Thorndike (1874–1949). This suggests that it is erroneous to attribute the birth of mathematics education in the experimental psychology and behaviorism of Thorndike or to Begle or to Klein. Indeed, it is the school of pragmatism that can be attributed as a starting point for cognition research as seen in the work of William James who unlike his student Thorndike was already aware of the dangers of over-simplifying the study of the human mind/behavior into operational and quantitatively measurable constructs (Berliner 2006). Pragmatism is viewed as a philosophical position and one that is congruent with the shift from aptitude-treatment-interaction studies that characterized mathematics education to qualitative inquiry that recognized human beings as cognizing subjects different from each other. The former strand of mathematics education was based on cognition viewed from a behaviorist viewpoint which resulted in psychometric studies (ATI's), whereas the latter embraced methods from the human (e.g., anthropology) and social sciences.

Operational Definitions in Mathematics Education as It Relates to Cognition

The notion of “operational” definitions formed an important basis for studies of mathematical cognition as seen in the extensive canon of work produced by Piaget, which influenced the field of mathematics education extensively. In the hard sciences like physics and chemistry, theoretical definitions arise as a result of repeatedly observing invariance in operations represented by physical measurement devices. In other words, operationalization means to “define something” in terms of “a process” that measures *it*. According to Dietrich (2004) in physics, terms

have to be defined operationally (in terms of theories) provided experimentation can back up notions occurring within the theories. Piaget applied this to the study of cognition in children by defining operations as “internalized actions,” which were derived directly from the subject’s physical actions as enacted in sensorimotor behavior. The focus of cognition in Piaget’s work stemmed from adapting biological theories of organization, development, and adaptation to study children’s understanding of number, quantity, space, time, causality, and relations of invariance. Piaget’s developmental theory consisted of sensorimotor, preoperational, concrete operational, and formal operational stages. One of Piaget’s claims was the posited link between mathematics and biology where cognition was characterized as a form of biological adaptation as one moved through the stages outlined in his stage model. Piaget in fact said that “the whole of mathematics be thought of in terms of creation of structures” (Beth and Piaget 1966, p. 70). These constructions are of course not physical ones but operations carried out in the conceptual and idealized world of the mathematician. The passage from sensorimotor actions to formal thinking, in Piaget’s account, is one of increasing abstraction and generalization. Piaget compared his operator structures of thinking to the structures espoused by the Bourbaki. The Bourbaki identified three fundamental structures on which mathematical knowledge rests. They are (1) algebraic structures; (2) structures of order; and (3) topological structures. Piaget claimed that there existed a correspondence between the mathematical structures of the Bourbaki and the operative structures of thought. In terms of Dietrich’s (2004) analysis, Piaget took the observed regularities in children’s cognition and attempted to describe them as phylogenetically evolved mental cognitive operators.

Piaget’s theory of cognitive development in children formed the cornerstone of numerous longitudinal studies in North America funded by the National Science Foundation. Based on Piaget’s body of foundational work, mathematics education researchers empirically validated models within, for example, the Rational Number Project (Lesh et al. 1988) that explained how proportional

reasoning develops in children that by and large cohere with Piaget's stage theory. Some of the findings from the last two decades also suggest that when Piaget's experiments are repeated with age appropriate materials, the stages proposed by him are not as discrete as they seem but more porous with the possibility of children being able to reason at a more advanced level given contextual play materials (Sriraman and English 2004). Zoltan Dienes' six stage theory of learning mathematics bears resemblance to that of Piaget with a somewhat different conceptualization of what "operational" means (Sriraman and Lesh 2007). If mathematics education researchers pointed to one topic area where they believe theory development to be strongest, they would point to the substantial work on mathematical cognition in the areas of (a) early number concepts or (b) early algebraic reasoning or (c) rational numbers and proportional reasoning (Lesh et al. 2014). Evidence of this theory development in learning is found in the literature related to Piaget-like cognitive structures (Steffe 1995); cognitively guided instruction which focuses on task variables; the focus on counting strategies; Vygotsky's socially mediated views of development; and focus on computer-based embodiments which are in some ways similar to those used Dienes (Sriraman and Lesh 2007).

Learning Theories in Mathematics Education

The problem of "learning" in mathematics education was reformulated as a problem of "mathematical cognition" and such a view became dominant in defining what the core of mathematics education was about. As a result, debates on different theories of learning reached a crescendo in the 1990s with mathematics education researchers arguing for and against constructivist theories of learning in which cognition was at the center, either individual or social. Radical constructivism as proposed by Ernest von Glasersfeld took an extreme view of human cognition best captured in the phrase "every person is an island" and meaning was an individual construction; whereas

social constructivism as proposed by Paul Ernest argued that conversation between people was the underlying building block in creation of meaning. Theorists like Paul Cobb and Heinrich Bauersfeld attempted to bridge radical and social constructivist theories by emphasizing the role of culture and language and classroom discourse. Other researchers who valued the emphasis on culture built on Vygotsky's cultural-historical psychology in what has become known as cultural-historical activity theory (see Radford's *Mathematics Education as a Matter of Joint Labor*). Finally, a theory of thinking was proposed by Anna Sfard which extended and synthesized the ideas of Vygotsky and Wittgenstein to propose commognition (cognition and communication) as a theoretical basis for analyzing discourse from the informant's point of view (see Morgan's *Mathematics Education as a Matter of Discourse*). A full treatment of these different theories is found in the *Theories of Mathematics Education* (Sriraman and English 2010). This book documents a shift beyond theory-borrowing toward theory-building in mathematics education, and that relevant theories in mathematics education now draw on far more than psychology.

Newer developments that address cognition in mathematics education are constantly occurring. Furinghetti and Radford (2002) traced the evolution of Haeckel's (1874) *law of recapitulation* from the point of view that parallelism is inherent in how mathematical ideas evolve and the cognitive growth of an individual (Piaget and Garcia 1989). In other words, the difficulties or reactions of those who encounter a mathematical problem can invariably be traced to the historical difficulties during the development of the underlying mathematical concepts. The final theoretical product (namely, the mathematical theorem or object) is the result of the historical interplay between phylogenetic and ontogenetic developments of mathematics, where phylogeny is recapitulated by ontogeny. Beth and Piaget's (1966) claim that there was a correspondence between the Bourbakian structures of mathematics, and operator structures of thought were conjectural at best. However, when analyzed from the perspective of Haeckel's law the correspondence can be

conceived of as Bourbakian ontogeny recapitulating individual mathematicians' phylogenetic contributions against the backdrop of history. Furinghetti and Radford (2002) argue that psychological constructs as well as the study and formation of intellectual mechanisms are not as tenable as the clearly dated and archived transformations of mathematics in its historical development. The use of Haeckel's recapitulation theory as a link between the psychological and historical domains offers better insights into the evolution of cognition as opposed to the one-to-one correspondence conjectured by Beth and Piaget (1966). It is important to note that Haeckel's law in its original form was rejected by the community of biologists but has been transformed numerous times by some over the last 100 years to better explain the relationship between phylogeny and ontogeny in different species. However, in mathematics education unlike biology, we are referring to psychological recapitulation.

In a similar vein, a neo-Lamarckian perspective of recapitulation is also available to mathematics education in any discussion of biological metaphors that capture mathematical cognition. Jean-Baptiste Lamarck's recapitulation cannot be applied or transposed directly to the study of didactical problems in mathematics education because it does not take into account the influence of experience (or more broadly culture). However, just as Lamarck proposed in vain to his peers in 1803, that hereditary characteristics may be influenced by culture, mathematics education increasingly takes into account how culture influences the mutation of historical ideas. The teaching and learning of mathematics bears strong evidence to this Lamarckian nature. Indeed, what took Fermat, Leibniz, and Newton collectively a hundred years to develop is taught and often digested by students in 1 year of university Calculus. Any higher level mathematics textbook is a cultural artifact which testifies to rapid accumulation and transmission of hundreds (if not thousands of years) of knowledge development. So, evolutionary epistemologists have now begun to accept the fact that for humans, cultural evolution in a manner of speaking is neo-Lamarckian (Callebaut 1987).

Conclusion

To summarize, different "starting points" for research on cognition in mathematics education are given and then traced by analyzing the role of operational definitions and theories of learning that were developed. The work of Piaget, Haeckel, and Lamarck are examined, particularly in the use of metaphors from biology to study and understand cognition from an individual to a collective historical perspective. Other readings of "cognition" in line with Vygotsky and communication and, more recently, neuroscience are alternative readings present in mathematics education. Neuroimaging studies are increasingly used to reveal individual learning differences and to design targeted interventions to remedy learning difficulties. Neuroscience also has revealed its diagnostic value in identifying children with dyscalculia and interventions to prevent long-term learning disabilities (Ansari and Lyons 2016).

Mathematics Education as a Matter of Curriculum

Peter Appelbaum¹ and Charoula Stathopoulou²

¹Arcadia University, Glenside, Philadelphia, PA, USA

²University of Thessaly, Volos, Greece

Introduction

A curriculum studies perspective on mathematics education acknowledges the broadest possible views of curriculum, including content and organization of school mathematics and the social

context in which mathematics is situated in and out of schools, as well as formal and informal processes of mathematical enculturation and acculturation. Beyond scope and sequence of mathematics skills and concepts, it is valuable to question basic assumptions and metaphors implicit in current practices and to generate alternatives. For example, instead of tweaking pedagogy to improve test results related to problem solving, this perspective explores alternatives – learners posing their own problems, categorizing problems or critiquing them instead of solving them, or judging the importance of a problem in terms of its implications (Brown 2001). Or, instead of identifying the best sequence of skill objectives, it creates opportunities for administrators and families to share their knowledge of the kinds of mathematical activities that learners experience in different life moments. It also considers how mathematics may perpetuate colonialist privileges and the erasure of indigenous mathematics. Curriculum studies pay particular attention to those dimensions absent from typical curriculum decision making, prioritizing issues of equity, access, and voice. Translating this priority into the various practices of mathematics education leads, for example, to several key questions:

- What (mathematical) knowledge is of most worth?
- Who gets to decide?
- How does the second question matter?

Curriculum Theory

Eisner (1985) described the explicit or officially stated curriculum, the implicit or hidden curriculum, and the null or excluded or neglected curriculum. A school curriculum might officially include topics in algebra, geometry, number theory, probability, and so on. The hidden or unintended curriculum without anyone intentionally making the effort might include an overwhelming message that girls or Roma children – or other marginal groups – are not natural learners of mathematics, or that

mathematics is a set of procedures to memorize, or that mathematics has no relationship to everyday life. The null or excluded curriculum might include the importance of learning mathematics for obtaining positions of power in society, the use of statistics to understand social policies, the application of mathematics to the solution of global crises such as the plight of refugees, the extreme weather conditions resulting from global warming, and so on. Research in this area is expanding and invites new projects. Appelbaum (1995, 2009) and Gutstein and Peterson (2005) describe changes in the use of community projects and interaction with audiences outside of school as initial efforts in this direction. Similarly, Larry Cuban (1995) differentiated among the official, taught, learned, and tested curricula, each of which might differ in myriad ways from the others. Jahnke and Meyerhöfer (2007) illustrate such differences through their analysis of international comparisons accomplished through PISA tests as generating a global industry of assessment products, need for analyses of results, materials and professional development programs tied to improving performance, etc. without evaluating the curriculum as intended or directly influencing classroom practices.

What is left out by the Eisner and Cuban categories? *Historical studies* provide genealogies of the assumptions about what is possible and what is appropriate for mathematics teaching and learning, in both enabling and constraining ways. *Political studies* interrogate the ways that mathematics education supports or challenges relations of power locally and globally. *Philosophical studies* untangle how mathematics education policy and practice perpetuate modernist assumptions and make it possible to redesign curriculum or pedagogy to be aligned with postmodern notions of power, knowledge, and practice. They also study the ways that mathematics curriculum continues to reestablish expectations and categories of understanding that legitimize only some forms of power and knowledge relationships. In particular, learners' experiences – mathematical or not – and how these experiences come to define for them what is (not) mathematical, what is (not) possible, and indeed what is, might be, could be,

should be, and is unlikely to ever be part of their world comes together in “landscapes of learning.” Such landscapes also include family, media, religious, and other community experiences that are part of the mathematics curriculum. For example, Leonard and Martin (2013) provide a critical historical perspective on the education of Black children in the USA. They show how notions of lack of ability are formed in multiple arrangements of policy, learning, ethnomathematics, student identity, and teacher preparation. They make visible “counter-narratives” about mathematically successful Black youth to advocate for a mathematics curriculum grounded in African-American culture and the “brilliance” of Black children.

Mathematics curriculum is further open to discursive analyses reflecting broad characteristics of human experience. As an *aesthetic text*, mathematics curriculum examines the landscapes of learning and the lifeworld connected to criteria of value, conceptions of morality and ethics, dispositions to explore or deny beauty and harmony, and so on. Curriculum as *theological text* looks for the ways that mathematics curriculum does, can, or might bear explicit, implicit, or null curriculum of religious ideas. For example, Rotman (1993) described interaction with infinity, and in particular, enculturation into an understanding of the number system, as perpetuating reliance on a divine power. On the other hand, Brown (2001) addressed the ways that school mathematics often subjects learners to a morality that denies rights and privileges of the individual. Curriculum as *institutional text* leads to a focus on the relationships between particular social institutions and the landscapes of learning mathematics that are associated with them, as well as the interactions among the various institutions in terms of mathematics. For example, it is possible to study or introduce practices based on the understanding of schools, churches, mosques, families, popular culture, social media, television, and street life. Each can be taken as a social institution with a concomitant mathematics curriculum, constraining and enabling various landscapes of learning mathematics. The particular ways that one institution enacts a mathematics curriculum, attempts to make one more like another, the

relative influence of various social institutions on the life trajectory of individuals, efforts to intervene in the interaction of some of these institutions, or struggles by constituencies to counteract the influence of one or more of these over the others, might become central to a curriculum studies perspective on mathematics education.

From Objectives to Complicated Conversation

Despite the possibilities mentioned above, mathematics education as a matter of curriculum remains largely undertheorized and marginalized in policy, research, and practice. Such scholarship contrasts with the dominant, ameliorative approach to designing mostly school programs based on models of curriculum *development* that ignore the potential of cultural and institutional resources for learning outside of school. In this way, dichotomies are maintained between formal and informal (mathematics) knowledge and furthermore between theory (designers, scholars) and practice (implementers, teachers), making it possible to privilege one end of a constructed dichotomy over the other. More specifically, however, the debasement of curriculum development to the efficient, backward sequencing of experiences has tended to ignore the important questions of how to go about deciding which knowledge is of most worth, who makes these decisions, and the implications of the null curriculum for learners and for society as a whole. It further constructs pervasive invisibility throughout the whole of mathematics education of the ramifications of such debasement, relegating issues of equity and diversity to notions of differentiated instruction, simplifying the curricula that unfold outside of schools as “funds of knowledge” brought into the school to be capitalized upon by a program of instruction, and characterizing aesthetic, political, and interdisciplinary mathematical activity as external to a neutral set of skills and concepts. The result is school programs that serve mostly as sorting tools amplifying inequality and disempowerment rather than as resources for meaning, pleasure, and entertainment, methods of

understanding and responding to community and global issues, opportunities for democratic empowerment, or tactics of resistance to oppression.

According to the commonsense rationale, experts first create a collection of objectives based on the needs of the content, the learners, and society. They then identify experiences that can help learners move toward the objectives using several clever techniques that experts have assembled. Then the design of the curriculum is carried out using themes and threads to create sequences of activities that efficiently intend to move students toward the objectives, along with plans for ongoing assessment of the program so that modifications can be made in process to maximize efficiency. In this process, important questions remain unasked: How do we choose which objectives? What is not included in the objectives? How does our creative and idiosyncratic choice of activity sequence matter? What if we based a program on something other than objectives that allows for taking advantage of serendipitous and spontaneous opportunities for learning? How can we effectively create forms of assessment that accurately communicate whether or not learners are progressing toward objectives? For that matter, how do we know that learners should and can progress toward objectives in such an efficient and universally applicable manner, let alone that learning mathematics happens, or always happens, in such short-term, efficient modules of experience?

One way in which the commonsense approach has been reconstructed *ex unguem leonum* as the entirety of mathematics curriculum is to posit (incorrectly, it turns out) that program planning really can address all issues of curriculum, not by faulting the process of starting with objectives but by expanding the possible sources of objectives. For example, different sets of educational philosophies have guided the construction and enlargement of objectives:

- *Humanist/consummatory*. Strongly and deliberately value-saturated in order to support self-integration and self-actualization. Curriculum provides personally satisfying consummatory

- experiences and emotional encounters. Education fosters autonomy and personal liberation.
- *Social reconstructionist*. Emphasis on the role of education and curriculum content within a larger social context, stressing social needs. Social reform and responsibility for the future of society are primary. Clearly based on social values and political positions, the school responds to its role as a bridge between what is and what might be; school is the process through which society changes itself.
 - *Technicist*. Curriculum is about the how, not about the what. Curriculum finds efficient means to a set of predefined, non-problematic ends. It is concerned with the communication of knowledge rather than its content.
 - *Academic rationalist*. Enables learners to acquire the accumulated tools for participation in Western cultural traditions and with providing access to the greatest ideas and objects humans have created. Curriculum emphasizes traditional disciplines. Curriculum aims to exemplify intellectual activity at its best.

Other categories have also been used for building objectives:

- *Training for work*. Gaining basic mathematical skills, habits, and attitudes necessary to function in the workplace and to adapt to changing work needs
- *Connecting to the canon*. Acquiring core mathematical knowledge, traditions, and values from the dominant culture's exemplary moral, intellectual, spiritual, and artistic resources as guidelines for living
- *Developing self and spirit*. Learning mathematics according to self-directed interests in order to nurture individual potential, creativity, and knowledge of the emotional and spiritual self
- *Constructing understanding*. Developing fluid, active, autonomous mathematical thinkers who know that they themselves can construct knowledge through their study of the environment and collaborative learning with others

- *Deliberating democracy*. Learning and experiencing deliberative skills, knowledge, beliefs, and values necessary for participating in and sustaining a democratic society with and through mathematics
- *Confronting the dominant order*. Examining and challenging oppressive social, political, and economic structures that limit self and others with and through mathematics curriculum and to develop mathematically informed beliefs and mathematical skills that support activism for the reconstruction of society
- *Making subjectivities*. Accepting cultural and ideological truths that make it easier to be manipulated by governing institutions and market forces

Tinkering with curriculum as merely a matter of expanded or clarified objectives leaves the fundamental questions unaddressed. In the process, these questions remain unarticulated for the field of mathematics education. Rather than apparent “solutions” to the complexity of this cultural-historical moment of transition and reconceptualization in mathematics education, trends within curriculum studies emphasize “deliberation” (Sack 2008) and “complicated conversations” (Bratton et al. 2005). This suggests frequent collaborative meetings of teachers, students, community members, and others to engage in important discussion, always ready to respond to the likely realization that some possible perspective on the learning experiences has been and should no longer be excluded (Gutiérrez 2012).

Even Mathematical Knowledge Is Now Questioned

Curriculum studies center interdisciplinary study of the *experience* of mathematics education in the unfolding processes of always becoming mathematical and always being subjected to mathematical aspects of culture, power, and equity. “Until we are able to see that *mathematics needs people* as much as *people need mathematics* [. . .], we risk tinkering with education in a way that fails to address power issues or true transformations in

society” (Gutiérrez 2012, p. 30). Because curriculum studies is not widespread, with few representative examples in research or practice, and because it is grounded in generative metaphors and critique, a common technique of curriculum is to create mind experiments of alternative practices and then to explore the implications of the contrast with commonsense practices. Building on the importance of deliberation and complex conversations, it is possible to imagine a school or other social institution organizing ongoing deliberation opportunities. All members of the community would be understood as mathematical learners – students, teachers, staff and administrators, business and policy representatives, etc. Guided by wisdom and traditions of indigenous elders, these groups would locate their conversations and the work of the institution in the history, present, and future of the place in which they come together.

The conversations and (mathematical) programs of the institution would be characterized by the analysis and critique of the relationships among perspectives, language, power, social groups, and social practices by the learners. A mathematics curriculum could in this way be organized around the exploration of how it became possible to think/be/feel/act the way people do with/because of/or in spite of mathematics. It could be possible to question the implications of the systems of belief about mathematics because of the mathematics known, and how such systems relate to power, social relationships, and the distribution of labor and resources. Mathematics education could in this way become at the same time something to resist and something that can be co-opted for social change, as in, for example, the struggles of the Landless Peoples’ Movement in Brazil (Knijnik 2002).

Furthermore, complicated conversations could be characterized by a form of global citizenship, a citizenship that honors the dignity of all human beings, always learners of mathematics. Because there is no universal recipe or approach that will serve all contexts, it is important to recognize that a “soft” global citizenship informed by multicultural approaches or minimal awareness of the importance of culture is appropriate to certain

contexts and can constitute a major step. But mathematics as a matter of curriculum cannot stop there: If educators are not “critically literate” to engage with assumptions and implications/limitations of their approaches, they run the risk of (indirectly and unintentionally) reproducing the systems of belief and practices that harm those they want to support. Skovsmose and Valero (2005) make a similar point when they demonstrate the possibility that a curriculum designed for a specific population addressing issues of equity might produce further forms of exclusion. Attention to the micro levels of power relations that turn global issues of ethics and oppression in normal teaching practices, however, can contribute importantly to the cultivation of such a sensitive literacy. And one key curriculum question that can no longer be pushed to the side is how very narrow, Western, “rational” conceptions of what mathematics “is” have continued to be wielded implicitly as tools of epistemicide, obliterating alternative epistemologies of number, size, quantity, possibility, shape, algorithmic problem solving, analogic representation, and other extended components of mathematical thinking and living.

Curriculum Provokes New Directions

Mathematics education as a matter of curriculum reveals the ethical and political aspects of mathematics education in three particular ways: (1) Null and hidden curricula, when ignored or left unexplored, are powerfully implicated in maintaining the status quo and its associated forms of inequity and oppression. On the other hand, specific search through questioning assumptions for what has been routinely acting as a null or hidden curriculum is a tactic of social and political change. (2) Mathematics curriculum reflects relative power relations on a global geopolitical scale. Some regions of the world rely on models of ideal mathematics programs from abroad, whether out of desire to emulate dominant cultures or forced to do so, by development institutions and international funding sources. The adoption of non-indigenous programs that ignore

different conditions and overlapping ideological targets has unforeseen consequences that are ripe for future research and related political action. (3) The expectation that school programs are the source of inspiration and questions for mathematics education research neglects the potentially more important scholarship of curriculum as *experience* in all of its forms. Schools, like all social institutions, primarily reflect their role as sites of contestation and social reproduction and in this way limit the possibilities for understanding education as the ongoing cultivation of mathematical sensibilities, subjectivities, desires, fears, hopes and dreams. Stepping away from school programs toward the ongoing co-development of mathematical enculturation, acculturation, social practices, and forms of knowledge, is the promise of the newly emerging subfield of mathematics education as a matter of curriculum.

Mathematics Education as a Matter of Discourse

Candia Morgan

University College London Institute of Education,
London, UK

Introduction

What does it mean to conceive of mathematics education as “a matter of discourse?” This question can be answered in several ways, varying according to theoretical understanding of the nature of discourse and according to the scope of what is taken to be mathematics education. At a basic level, discourse is sometimes defined as verbal interaction. Taking this definition, it is hard to dispute the claim that mathematics education *involves* discourse and there is substantial agreement among researchers and curriculum developers that verbal interaction has an important role to play in learning. In this entry, however, discourse is taken to involve not only use of language but also its functions within the social practices of mathematics education. These practices involve distinctive ways of seeing the world and acting in it, forms of identity and relationships among participants, and sets of values and expectations, all of which shape and are shaped by language use. The discursive component of a practice involves the distinctive patterns of

language and other forms of communication that participants use to construe their experience of the world. Considering mathematics education as a matter of discourse, therefore, entails studying the patterns of language use: the objects and actions that are spoken of, the relationships between them, and the values attached to them; the subject positions that are available and the ways these may be taken up or contested; and what kinds of things can be said and which participants in the discourse are able to say what.

The epistemological and ontological foundations of discursive approaches to mathematics education can be traced to various sources, including in particular to Wittgenstein's notion of language games, to Foucault's discursive formations, and to the tradition of ethnomethodology that underpins discursive psychology. However, a common fundamental principle is that the "meaning" of a word, utterance, or text is always constituted in social practice; interpretation of any text must therefore take into account the form of activity and the context in which it plays a part. Furthermore, use of language is itself constitutive, producing the phenomena we experience rather than reflecting some objective "reality" (though theorists differ as to the material basis of experience). Analysis of discourse thus entails analysis of the processes by which objects, ideas, and social actors come into being.

In an article reviewing the use of notions of discourse in mathematics education research, Ryve (2011) provides a useful overview of a range of theoretical perspectives on discourse, their disciplinary origins, epistemological assumptions, analytical focus, and methods of analysis. It is worth drawing attention to the distinction made by Gee (1996) between *discourse*, the language-in-use in particular instances of social interaction, and *Discourses*, the patterns of language use that mark membership of a particular social group or participation in a particular specialized practice. References here to, for example, "the discourse of mathematics" may be considered instances of a *Discourse*, while analysis of an extract of "classroom discourse" is an analysis of *discourse* (though this may also involve

identifying how one or more *Discourses* – of mathematics or psychology or everyday practices – are implicated in the discourse).

It should be noted that both linguistic and non-linguistic modes of communication function discursively. While linguistic communication is often seen as having priority because of its scope, flexibility, and power, other modes such as diagrams, algebraic notation, gesture, and the dynamic images of computer graphics also play important roles in the ways participants in mathematics education practices construe their experience.

Mathematics as a Matter of Discourse

One of the characteristics that distinguish mathematics from other forms of knowledge is the nature of mathematical objects. There is some dispute about whether objects such as *function*, *average*, or *derivative* have an independent existence, but it is clear that we cannot work with them or even think about them without using some form of communicative resource, whether words, visual images, or symbolic expressions. We cannot even have direct access to geometric objects such as *triangle* or *square*, but only to specific concrete (and approximate) representations or realizations of these ideal objects. This entails that doing mathematics is a discursive activity, involving the manipulation of discursive objects. Anna Sfard (2008) goes so far as to claim that mathematical thinking is a form of communication, whether with oneself or with others. From this perspective, there are no absolute mathematical "concepts" (of *function*, *average*, *derivative*) that are represented by linguistic, symbolic, or diagrammatic means. Rather, for any individual, the mathematical "concept" of, say, *function*, is constituted by the set of words, symbolic expressions, and other visual forms that the individual identifies with *function*, together with the relationships he or she forms between these various "realizations" of *function*.

Sfard argues that mathematical objects are entirely constructed by discursive means. One such discursive move is the naming and defining

of new objects. The growth of mathematics, however, is also characterized by the discursive move of “reification,” that is, the transformation of processes into objects. For example, the object *derivative* is a reified object that encapsulates the process of differentiating. The significance of this move is that the thus formed reified objects can have or can be assigned properties (*the derivative is positive for all values of x*), can be related to other objects (*the derivative of e^x with respect to x is e^x*), and can be manipulated or operated upon in order to construct further objects (*differentiating the derivative gives the second derivative*).

But considering mathematics as discourse involves more than just characterizing mathematical vocabulary and the other semiotic systems commonly used in mathematics. In the first place, the distinctive ways that language and other communication modes are used in mathematical contexts include specialized kinds of statements and forms of argumentation. These ways of speaking and writing in order to do and communicate mathematics constitute the mathematics *register* and have identifiable features at the level of words, statements, and whole texts (Pimm 1987). Sfard’s characterization of mathematical discourse includes *routines*, repeated patterns such as algorithmic methods or forms of proof, and *endorsed narratives*, statements or sequences of statements such as theorems that are subject to endorsement or rejection by “discourse-specific endorsement procedures” (2008, p. 134).

However, expanding the scope of the description of features of mathematical communication is not enough. Critically, it is necessary to ask how we know that a given example of spoken interaction or written text is mathematical and where “discourse-specific endorsement procedures” come from. A purely descriptive linguistic analysis will not allow us to answer these questions. On the one hand, many components of the mathematics register are also found in other spheres of activity, and many instances of communication in mathematical contexts mix aspects of the mathematics register with less specialized forms of language. On the other hand, there is a risk of

arguing in a circular fashion that we recognize a text as mathematical or we know the types of procedures necessary for endorsing a theorem because we know mathematics. It is at this point that the notion of discourse as the patterns of language use *within a social practice* becomes crucial. Mathematics is not an objective body of knowledge but a form of social practice – or, rather, a family of related practices including, for example, the scholarly mathematics of academia, various varieties of school mathematics, recreational mathematics, etc. It is through participation in these practices that agreement (and disagreement) is constructed about what counts as mathematics, what kinds of reasoning are accepted as legitimate forms of endorsement, and who is able to make and evaluate claims about mathematics.

Even within academia, mathematicians may be seen to engage in different forms of discourse (though some discourse theorists would call these *genres* within a single discourse of academic mathematics). In particular, Richards (1991) has distinguished between “Journal Math” – the discourse of academic research articles – and “Research Math” – the everyday discourse of doing mathematics and communicating about this with colleagues. A critical difference between these discourses is in the forms of reasoning used to endorse new statements. Research Math makes use of a “logic of discovery,” mapping out a path that may include inductive reasoning and guess work as well as deduction, hypotheses, uncertainty, false steps, and dead ends, a temporal and personal narrative of messy, nonlinear processes, while Journal Math overwhelmingly involves “reconstructed logic,” presenting only the product of the research activity: theorems and their proofs. The Journal Math discourse constructs a mathematical world in which mathematical knowledge is absolute, endorsed by well-structured logic and independent of human agency. The academic mathematicians who participate in both these discourses have to learn to move between them and to position themselves both as authors and as colleagues, as collaborators and often as teachers, drawing on different discursive resources as they do so.

From Mathematical Discourse to School Mathematics Discourse

Conceptualizing mathematics as discourse and mathematical thinking as communication leads to conceptualizing learning mathematics as learning to participate in mathematical discourse, using the specialized patterns of language that are recognized as mathematical. Yet, just as the practices of mathematician involve different sets of language patterns, the discourse of mathematics in school is also complex. Richards (1991) notes that "School Math" discourse shares with Journal Math a tendency toward reconstructed logic, obscuring the messy human origins of mathematical discovery and constructing a mathematical world of unquestionable absolute knowledge to be acquired and reproduced by students. But mathematics education consists of more than just mathematics.

Mathematics education can be conceived of as a network of practices, including those of teachers and students in mathematics classrooms but also practices of curriculum development, international assessment, educational research, etc. We are generally able to recognize texts from each of these practices; a classroom interaction or written homework task is clearly distinguishable from a curriculum document, conference presentation, or research article. Yet there are also relationships between them. The discourse of a mathematics classroom draws on features of discourses originating in other practices, though these are transformed in the course of moving from one practice into another. We are likely to find ways of speaking about mathematics that bear some *family resemblance* to those used in the academy, but the interactions between teachers and students are also likely to include relationships and ways of being that are related to those found in curriculum documents, in psychology, sociology, or education research as well as in everyday discourse.

Bernstein's (2000) notion of *recontextualization* offers a way of thinking about the interdiscursivity of school mathematics (the way school mathematics makes use of resources from multiple discourses). Mathematics is produced in

the academy, and, as it moves into the school context, it is transformed for a new, pedagogic purpose. This involves not only selection of what is to be taught but also changes in the functions of discursive elements and in the relationships between them. For example, factorizing an algebraic expression in school mathematics is often an end in itself, as part of an exercise in which students perform multiple similar yet logically discrete operations, aiming to develop and consolidate a skill. In contrast, in the practice of mathematicians, factorization is far more likely to be a single step in a series of different but logically connected operations, aiming toward solution of a problem or proof of a theorem. Moreover, in the school context, mathematical discourse is brought into relationships with discourses from other specialized fields and from the everyday practices that teachers and students bring from outside the classroom. For example, a teacher may justify her choice of a given task for her students by drawing on discourses of mathematics (the task involves an important piece of mathematics), of psychology (the task is designed to produce cognitive conflict), of curriculum and policy (the task will help students prepare for statutory tests), or of everyday practices (students will find the task fun).

Because schooling is a practice that aims not only to transmit academic knowledge but also to form students into particular kinds of social subjects, Bernstein argues that the discourse of the classroom consists of an *instructional discourse* (the recontextualized discourse of mathematics) that is always embedded within a *regulative discourse* that shapes the kinds of behaviors, identities, and relationships available to students and teachers. The kind of mathematical knowledge that students acquire is a function not only of the mathematical instructional discourse they encounter but also of the opportunities to acquire this that are afforded by the regulative discourse.

Discourse Analysis as a Means of Understanding Mathematics Education

As indicated above, mathematics education may be seen to involve a wide variety of practices both within the classroom and beyond

Mathematics Education as a Matter of Discourse, Table 1 Questions about mathematics classrooms – as a matter of discourse

Concerns of mathematics educators	Reformulated concerns from a discursive perspective
What mathematics do students learn?	What are the forms of mathematical communication that are established in classroom interaction?
How do students learn (or not learn) mathematics?	How do classroom interactions lead (or fail to lead) to the development of students' fluency in mathematical patterns of language use?
What problems do individuals and groups encounter in the classroom?	What are the discursive demands of the mathematics classroom, and how do these relate to the experiences, expectations, and discursive resources that students bring with them into the classroom?
What are the effects of a particular form of teaching or classroom organization?	How does this form of teaching or organization frame the opportunities for students to come to participate in mathematical forms of discourse, and how are students and teachers positioned as subjects?
What are the effects of use of a particular textbook, visual or material resource, or technological tool?	What kind of mathematics (objects and actions, forms of reasoning, values, etc.) may be construed through use of this resource, and what kind of participation may a student construe for herself/himself?

Mathematics Education as a Matter of Discourse, Table 2 Questions about implementation of mathematics curriculum reform – as a matter of discourse

Concerns of mathematics educators	Reformulated concerns from a discursive perspective
How do teachers implement a given reform?	What Discourses are implicated in the reform?
Why do reform efforts often result in different outcomes from those anticipated by the reformers?	How do these constitute mathematics, teaching and learning, and teachers and students? What Discourses do teachers draw on in their practice and when describing, explaining, and justifying their practice? To what extent are the ways these constitute mathematics, teaching, and learning consistent with the reform or in conflict with it?

M

it. Conceptualizing these practices as a matter of discourse provides a means of gaining new insights by focusing on the patterns of language use and reframing some of the traditional questions faced by the field of mathematics education in discursive terms.

At the level of the classroom, mathematics educators are concerned, for example, with what children learn and how they learn it, with the problems individual learners or members of particular social groups encounter, with the effects of various forms of teaching and classroom organization, and with the effects of use of textbooks, manipulatives, technologies, and other resources. Table 1 offers some possible reformulations of each of these concerns from a discursive perspective, beginning to “bridge the individual and the social” (Kieran et al. 2001), seeking to understand individual learning as part of a social practice.

Of course, “social” involves more than just interactions within the classroom. Shifting focus

toward the wider social practices within which classrooms are situated, further concerns of mathematics educators include movements to reform curricula, pedagogy, and assessment practices and the design, outcomes, and consequences of international testing. Table 2 suggests some ways of reformulating concerns about mathematics curriculum reform from a discursive perspective. While the questions in Table 1 were largely focused on *discourse*, shifting focus to wider practices demands attention to Discourses, whether the object of study is the implementation in the classroom or the nature of the reform itself.

Many researchers and educators who adopt a discursive perspective on mathematics education have a strong concern with issues of equity and identity (see Black et al. 2009; Herbel-Eisenmann et al. 2012), a concern that may be addressed through critical discourse analysis (Wodak and Meyer 2009). As social identities and relationships are constructed in discursive practices,

Mathematics Education as a Matter of Discourse,
Table 3 Questions about disadvantage in mathematics
education – as a matter of discourse

Concern of mathematics educators	Reformulated concerns from a discursive perspective
Why do students of color, from working-class families, learning in a second language, etc., achieve less success in school mathematics?	How do the discourses drawn on in educational practices position these students? How does the discourse of the school and the mathematics classroom relate to the values and ways of construing the world afforded by the everyday discourse in their homes and communities, including everyday discourse about aspects of mathematics?

studying and understanding how patterns of language use contribute to this construction provide opportunities to critique, challenge, and even transform practices that produce undesirable (from some point of view) identities or inequitable experiences and outcomes.

Across the world, students from socially disadvantaged groups achieve lower levels of attainment in mathematics and participate less in advanced mathematical studies. This is often explained in ways that locate responsibility for lower achievement with the individual students (they are less intelligent and less motivated and lack prerequisite skills, knowledge, or dispositions), their families and communities (which provide less support or the wrong kind of environment), or their teachers (who lack high expectations of their students or are under-qualified, prejudiced, and unable to communicate with or motivate these kinds of students effectively). Rather than considering these explanations as objective descriptions of students, families, and teachers (whether true or false), they can be considered as discursive constructions, construing the world in ways that serve to maintain the dominance and advantages of high-status social groups. Table 3 suggests how this perspective might redirect the focus of those concerned with disadvantage.

Concluding Reflection

To be consistent, conceiving of mathematics education as a matter of discourse must also entail conceiving of other work that takes a discursive perspective as examples of discursive actions. It has been argued that texts such as curricula, teacher guides, classroom interactions, or research articles create descriptions of the world by constructing particular sets of categories, relationships, and values rather than by objective representation of an external reality. Equally, it must be recognized that this entry does the same thing. Adopting a discursive perspective on mathematics and mathematics education does not make a truth claim about the world but enables particular forms of action in the world. Like any other theoretical perspective, it makes it possible to speak about mathematics and mathematics education in some ways and makes other ways of speaking impossible.

Mathematics Education as a Matter of Economy

Alexandre Pais

Faculty of Education, Manchester Metropolitan University, Manchester, UK

Synonyms

Credit system; Equity; Mathematics for all

Introduction

Economy is one of the modern sciences that relies on mathematics to develop its models and results. It is also one of the main pillars of the modern State. A solid grounding in mathematics is considered invaluable for understanding the complexities of real-world economic problems. The more professionals are equipped with mathematical knowledge, the better is the service they provide to the economic organization of societies. In the last four decades, however, mathematics education researchers have been calling attention to the importance of mathematically educating not only the future professionals who will use this science in their work but also *all* the students. It is assumed that people need mathematics in their daily lives to participate as actively engaged citizens. Mathematics is thus posited as a valuable

resource to the social and economic progress of society. As a result, mathematics education has become highly assessed through global instruments like TIMSS and PISA. The results of these international measurements not only determine curricular changes across the globe, but they function as a barometer for the economic wealth of a country. Countries that perform less well in these evaluations are perceived as being compromising their status in world economy (which is increasingly becoming a “knowledge economy”). This approach to mathematics education and economy rests on a liberal and unproblematic understanding of society, where knowledge is seen as neutral and economic progress as a goal in itself (Woodrow 2003).

Critical approaches to mathematics education have been problematizing these ideals of progress and neutrality. Mathematical knowledge might be important to the economic wealth of societies; however, the recognition that economy is a contentious field, with inequality and social injustice always lurking in the background, has led to research that criticizes the role mathematics has in establishing systems of knowledge and control that favor market-oriented economies. Their arguments rest on the importance for citizens to be mathematically informed about the way in which mathematics formats reality, in particular, the economic reality of the current world. Since most of the mathematics modeling our world is hidden behind complex formulae or technological hardware, students need to critically deconstruct the way in which mathematics formats reality, so that they can socially participate as informed citizens. In this way, the relation between economy and mathematics education is one that posits mathematics as an important knowledge both to enhance current economic models and to raise (critical) awareness of the inherent workings of these same models. The latter has been one of the aims of critical mathematics education, which advocates an exploration of real-life situations in school mathematics and highlights the importance of mathematical modeling for economy and policymaking (Ernest et al. 2016).

Another way to envisage the relation between mathematics education and economy concerns

not the education of students, but the influence that economic tenets have on school mathematics. Education has become an increasingly commodified social space. It is a commonplace in critical educational studies to assert how education has become merchandise and schools some kind of corporation. Studies on ethnomathematics, in particular, have been criticizing contemporary schooling for mimicking market-oriented rationales, turning people into components of a big machinery that aims at uniformity (D'Ambrosio 2003). Educational industries, from publishing houses producing textbooks to computer firms developing technology, see schools as a profitable market. Administrators and politicians use the metaphor of schools as companies to envision ways of managing education. Governments attribute primordial importance to results in high-stake tests as a means to do school evaluation and make grades and scores a matter of profit. The labor market and industries demand the production of the highly qualified people needed. All these are few examples of how education has become capitalized and thus progressively contaminated by the capitalistic structure of society. Implicitly in this view, there is the assumption that education is something originally pure based on humanistic ideas such as education being the place to learn the cultural heritage, to free people, to do formative assess (instead of summative assessment), etc. The "solution" for the problems of current education would be a decapitalization of education, a return to its original purity. The purpose is to keep the capitalist logic of production/consumption outside the educational enterprise.

This position is aligned with liberal-democratic approaches to economy and to education. It recognizes the unfairness of schooling and its tendency to reproduce inequality of all sorts (social, racial, economic, etc.). Yet, these are seen as empirical problems, which can be solved through the efforts of well-intended human beings engaged in the amelioration of their praxis. In the effort to create a meaningful mathematics education for all students, one that is not damaged by dubious economic interests, researchers need to think about schools as places of equality,

emancipation, and progress (e.g., Radford 2012), that is, as a place at odds with today's economic reality. This liberal approach to education has thus been criticized for positioning schools as something outside the remaining society, with its economic mechanisms and political frames (e.g., Pais 2012).

However, the characterization above does not exhaust the relationship between economy and education, nor is it the crucial aspect. The problem is that school itself, more than just being contaminated by some capitalistic ideas, is the crucial ideological State apparatus in the reproduction of a certain economic system, namely, *capitalism* (Althusser 1994). Education in its scholarized form has in its kernel the capitalist logic. From a strictly economic perspective, schools have been performing a crucial role, without which our current modes of living could not be possible. Schools guarantee a place where children could be deposited when their parents go to work. But it is not just a matter of "guarding" children. It is also a matter of sorting them, by means of stipulating who is capable of performing specific roles in society. Mathematics education research is fertile in research showing how mathematics is involved in processes of credibilization and social selection, in excluding groups of people considered to be disadvantaged, in providing a clear social mechanism of accountability, or in fostering the appropriation of behaviors and modes of thinking and acting that make every child governable (see Valero and Meaney 2014) for an account of the socioeconomic influences on mathematical achievement). Therefore, school performs three crucial economical functions in our societies: it guarantees a space where parents can put their children so that they can work; it keeps children away from production; and it sorts them.

It is against this background that education, and mathematics education in particular, can be conceived not as being contaminated by capitalism, nor a part of capitalism, but as sustaining the capitalist system itself, by assuring its reproduction. Education is not just a product (education as a piece of a profitable market) but a means of (ideological and material) reproduction. As such, as a matter of economy, instead of conceiving

mathematics education and economy as separate entities that influence each other, the role that current mathematics education plays *within* capitalist economics will be considered.

The Economy of Schooling

A mathematical object in a school is not the same as a mathematical object in the working sheet of a mathematician. What makes them different are the different worlds they inhabit. A student is first and foremost a student, frequenting a specific place called school, with particular rules and organization of labor. To assume that the inherent properties of mathematics are a sufficient source for students' engagement with mathematics is to neglect the place this school subject occupies within the economy of schooling. From the moment mathematics comes into school, it becomes part of an economy, where students are organized into classes and subjected to classification through criteria of evaluation. Certificates are the final prizes. With higher or lower pressure, this system is the fundamental organization of schools at all levels and all around the world (Baldino and Cabral 2013).

Within mathematics education research, Shlomo Vinner (1997) was the first to call attention to what he named the school's *credit system*. Contrary to the assumption that mathematics empowers people because it provides them with some kind of knowledge or competence, authors, following Vinner, have suggested that this empowerment has instead to be understood in the field of value (Pais 2014; Baldino and Cabral 2013; Lundin 2012). Mathematics allows students to accumulate credit in the school system that will allow them to continue studying and later to achieve a favorable position in the labor market. In this (economic) perspective, mathematics empowers people not so much because it provides them with some kind of knowledge or competence, but because it is posited as an economically valuable resource. Accepting this condition, Roberto Baldino and Tânia Cabral use the Marxian categories of use value, exchange value, and surplus value – the credentials which represent the

surplus products of learning – to show how in schools students learn, above all, to participate in and accept the conditions of production and seizure of surplus value. The value of the ones who fail is appropriated by the ones who pass as surplus value. As posed by Baldino and Cabral (2013, p. 11):

[I]n the social practices that occur at school, students, teachers and the administrative personnel participate in a process of transformation of students' labour power, initially simpler and less qualified, into a commodity of higher value, to be sold in the future for a higher salary, which is expected to pay off the investment of muscle and nerves of students as well as salaries of teachers and staff. In the process of qualification of their labour-power, students exert a double function: while actively engaged in the work of raising the quality of their labour-power, they function as labourers; while owners of the commodity in process of increasing quality, they function as capitalists.

Against this background, the problem of failure in school mathematics can be better understood if it is not posed as a problem affecting particular groups of students but as an endemic feature of current schooling, thus affecting *all* students. Failure is properly speaking a political and economic problem having to do with the way schools are structured as credit systems, where year after year teachers are asked to mark students with a grade that will determine their future possibilities. Failure in achieving a meaningful mathematics education is not a malfunction which could be solved through better research and a proper crew of well-educated teachers and of accurately designed tests. Rather, it is an endemic characteristic of capitalist schooling (Pais 2012).

The Economy of Students' Desire

Researchers have been recently connecting elements from political economy and psychoanalysis, informed by the work of Lacan and Žižek, to understand students' learning not in terms of the inherent properties of mathematics but in terms of the role this school subject plays within political economy (e.g., Pais 2015). What does it make a student desire mathematics? For many people

who come across school mathematics, engagement in this subject does not derive from a will to learn the subject itself, but from a will to satisfy some Other's demand (say, parents' demand for good grades, teachers' demand for learning, academic or professional demands, etc.). As Lacan repeatedly asserted, desire is the desire of the Other. That is, far from coming from some inner will, desire comes from raising the question: What does the Other want from me? Strictly speaking, it is the Other what causes our desire. The question about students' desire can be formulated thus: who is the Other who causes students' desire to learn mathematics? For sure, it is the dream of many mathematics educators to conceive mathematics itself as this Other: to believe that mathematics as an object has already in itself the properties that will trigger students' desire for learning. However, if we follow Lacanian theory, we are instigated to posit credit as the cause of students' desire. Mathematics, with its attributed qualities of power, utility, beauty, and the like, is the necessary ideology masking the real object of schools' credit system. This encourages us to take a certain critical distance toward the object mathematics, a distance enabling us to see mathematics not in itself but as being articulated in the field of the Other – capital. The crucial insight from Lacanian psychoanalysis is that the cause of students' desire is not articulated in terms of culture but in terms of economy.

The Disavowal of the Economy of Schooling in Mathematics Education Research

Apparently, there is no way of getting out of such an accreditation system, and mathematics education research ends up taking it for granted. The struggle against inequity is then elaborated in terms of what is called “identity politics,” concerning the emancipation of particular groups of people considered to be in disadvantage or by addressing issues of power. To struggle not only for a change of mathematics education in terms of what Marx called the *superstructure* – culture, politics, and discourse as emphasized by sociopolitical

perspectives – but also a change in the economy of schools seems to be out of reach. Indeed, by noticing that exclusion is something inherent to school, we realize that ending exclusion implies suppressing schooling as we know it. In the current myriad of world social organization, this does not seem possible. The problem of equity requires a fundamental economic and societal change, which we experience as impossible. The question is, thus, how can the community continue to develop research after acknowledging that exclusion is an endemic feature of current schooling?

At stake here is the role of ideology in providing a meaningful narrative to justify the unequal reality that constitutes the economy of schooling. Mathematics education research partakes in an ideology set on avoiding the necessity of failure within current schooling. A fantasy provides a rationale for failure. When confronted with the worldwide problem of failure in school mathematics and the societal demand for “mathematics for all,” research establishes an explanatory scheme within which an approach to the problem is proposed. Although the particular constellation of the ideological narrative changes from one research trend to another, the figure of “mathematics” functions as that which simultaneously thwarts the realization of the ideal goal of a universally meaningful mathematics and compels the articulation of an entire discourse concealing the necessity of failure (hence providing researchers a frame within which to develop their work).

Although an ideology, with few resemblances with the concrete circumstances of schooling, research has real effects (Lundin 2012). It creates an entire research industry, outlines school curricula, prescribes classroom work, and is the main informant for the constitution of international comparative assessment programs like PISA and TIMSS. Researchers often see these instruments as corrupting positive developments originated from research (Pais 2014). We have thus two opposite positions. On the one side, we have governments and international agencies privileging economic interests and suspicious political agendas in education, and, on the other side, we have researchers who are perceived as struggling against this educational reductionism. However,

could it be that these two positions are not opposite but part of the same whole, each one performing a complementary role?

From Knowledge to Economy

By positing the importance of school mathematics in terms of knowledge and competence, research provides an ideological screen against the role school mathematics plays within capitalist schooling. While presenting school mathematics as an important subject in terms of knowledge and competence – that is, in terms of what Marx called the use value – the other surreptitious functions of mathematics, its exchange value, can actually become operative. We can however conceive the importance of mathematics not in terms of mathematics itself, but in terms of the place that this subject occupies within a given structural arrangement, that is, to conceptualize the importance of mathematics not in terms of its inherent characteristics – problem solving, utility, beauty, cultural possibilities, etc. – but in terms of its attendant submissions to political as well as economic criteria and goals. In short, an economic approach to mathematics education invites us to posit mathematics as a crucial element in the accreditation system, instead of conceiving its importance in terms of a precious knowledge aimed to empower people and to enable societal development.

Mathematics Education as a Matter of Identity

Agency; Discourse; Identity; Identity-work; Positioning; Selfhood; Subject; Subjectivity

Introduction

“Mathematics education as a matter of identity” is an emergent field where selfhood and the mathematical subject are being theorized as the effect of

lived experiences in institutions such as family, school, media, or church. Identity and its associated term subjectivity are embryonic in varied theoretical and activist arenas ranging from socio-cultural psychology, psychoanalysis, cultural studies, poststructuralism, postcolonialism, new materialisms, or arts-based research. Emphasis on the “question of the subject” facilitates the problematizing of a “knowing self” as the effect of politics of difference, diversity, language, discourse, body, power, authority, agency, justice, and emancipation or as the product of affective politics connected to consumption habits and entertainment desires.

Up until today, “identity” persists the status of a ubiquitous concept in social sciences, resists clear-cut definitions, and subjects itself to critique. Despite being unsettled as a robust concept, mathematics education researchers embrace identity and/or subjectivity for analyzing, discussing, or interrogating how selfhood becomes inscribed through mathematical practices; how certain subject positions are constructed as normative, deficient, or marginal; and how a reconfiguration of mathematical subjectivity is potentially possible as part of cultural, discursive, material, corporeal, or affective renewals. Moreover, “mathematics education as a matter of identity” is key toward understanding the reciprocal relation among a burgeoning free-market economy, neoliberal governing, increased socioeconomic crisis, vulnerable environmental sustainability, loss of security and safety, forced migration, etc. and the risky process of fabricating (by means of mathematics) the rational, reasonable, and yet fragile, fragmented, or indebted subject.

Lines of Identity Research in Mathematics Education Practices

An explosive interest in discussing *mathematics education as a matter of identity* has been recently realized among researchers, educators, curriculum designers, and policymakers. The turn to *identity* signifies primarily a concern for the quality of life experienced by learners or teachers through a complex availability of discursive and material

mathematical practices. It also expresses an intent to capture, perform, or alter imageries of “who” is the mathematical subject. As such, identity research is geared toward the social, cultural, discursive, affective, ethical, and political underpinnings of mathematics education by being alert on how self and subject enact mathematical institutions (Martin 2006; Solomon 2009; Walshaw 2010; Chronaki 2009, 2013).

Most identity research marks a dissatisfaction with restrictive representations of the mathematical subject as the myth of the active, rational, autonomous, white, able, male, middle-class learner. It pursues to explore how marginalized or excluded subject positions are being constructed through racial, socioeconomic, ethnic, cultural, linguistic, or disability/ability discourses. It seeks not only to interpret or deconstruct normative mathematical subjectivities but also to reconfigure alternatives. At the same time, a focus on mathematical identity and subjectivity exemplifies (and sometimes disrupts) how imperialism, modernist thought, and neoliberal governing are being built on predominant ideologies of a certain, objective, predictable, measurable, and calculable selfhood. Equally, the turn to identity signals a discontent with conceptions of learner participation, access, and engagement as simply a matter of individual beliefs, attitudes, views, values, or of an enculturated, socialized, or self-regulated behavior. Instead, it gestures attentiveness to a more rigorous theorizing coupled with a deliberation toward problematizing equity, social justice, and emancipatory politics.

How is then identity being discussed and used in relation to mathematics education? Two distinct lines of thought, in contemporary social sciences, approach “identity theory” and “theories of the subject” from almost incongruent standpoints. On the one hand, “identity theory” with antecedents in structural perspectives of cultural or social psychology, sociocultural theory, and sociology strive toward a coherent language of “identity” clarifying relational mechanisms among social structures and subject positions. In this line, researchers in mathematics education exploit mostly sociocultural theory and search for

operational tools that discuss identity as a precursor to learning (Sfard and Prusak 2005), to design participatory learning activity (Cobb 2004), or to create sustainable communities of practice (Lerman 2012). On the other hand, “theories of the subject” bring together scholars from the broader field of cultural studies including critical psychology, psychoanalysis, gender and queer studies, discourse theory, poststructuralism, new materialisms, or postcolonial theories. They discuss identity politics in relation to subjectivity in the realm of contemporary changing times as a complicated matrix of fluid relations, bodies, and spaces forming loci of immense dynamism, resistance, and creation. By and large, researchers in mathematics education who identify with a “theory of the subject” line of inquiry focus on how mathematical subjectivities are being produced discursively or materially and explore disruptions or reconfigurations of normative identity.

In particular, psychoanalytic perspectives based on Freud and Lacan capture the subject as “split” or as “polymorphous perversity” denoting that gender, race, and ability are already instilled in us as part of our corporeal encounters with biological species. Foucault-based post-structuralism develops a view of the subject as the workplace of power, struggle, will, and resistance where the self becomes governed through education to identify with society as organized in fixed categories around rationalized discourses of truth and knowledge. Laclau and Mouffe advance a discursive post-Marxist position based on the Althusserian notion of the interpellated subject via ideological State apparatuses (such as family, school, media, religion, law) and Lacan’s theory of the split subject as fundamentally fragmented and constantly struggling toward becoming whole. This struggle to “whole,” although always imperfect and incomplete, is crucial for identity-work where individuals strive to articulate meaning via chains of equivalence/difference, myths, social imaginaries, and bodily action functioning as “surfaces of inscription.” Butler’s queer theory further problematizes the discursive limits between subject, body, and identity tied into materializations that produce ideal constructs of selfhood and discusses the politics of “troubling”

hegemonic identity. Deleuze and Guattari’s new materialism, allying with a Foucauldian analysis of the subject’s relation to discourses of power and truth but departing from a psychoanalytic view of an esoteric subject, conceives subjectivity as a continuous “being” and “becoming.” The subject is constituted in an extrovert process of affective encounters with the surfaces and rhizomes of a socio-material assemblage seeking mostly connections rather than predetermined identities as patterned structures of eternal or generalizable truths.

Reviewing the literature on identity research in mathematics education, Lisa Darragh (2016) points to a growing body of research with an increased peak in the last 5 years. A distinction is often made among two ways of conceiving identity, on the one hand, as “representing,” “acquiring,” or “appropriating” drawing on theories that frame learner qualities in socialization, culture, or biology and, on the other hand, as “performing,” “resisting,” or “troubling” predominant self-categories. Yet, the terrain might be more complicated as, despite urges for shared definitions of identity, a proliferation of terms such as narrative, enacted, leading, fragile, fragmented, or hybrid identity marks how researchers strive to capture aspects of a complex process of identity-work in which individuals struggle to perform norms or resist stereotypes. At the same time, there is a notable realization on how the concept of identity is more and more grounded in diverse and often conflicting theoretical frames without discussing their epistemological and ontological underpinnings making it more and more difficult to consider potential synergies. Methods are mostly drawn in qualitative studies (e.g., ethnographies, interviews, teaching experiments, genealogies of knowledge) focusing on the discursive analysis of moment-to-moment classroom talk, classroom episodes, workshop or leisure activity, narratives of student and teacher learning trajectories, career choices, and future aspirations as mathematics learners or educators.

Despite the absence of clear-cut definitions, one might appreciate a cartography of empirical outcomes produced by a growing research body designating how identities mediate learner

cultures, influence educators' pedagogic acts, and inform the choice and design of adequate materiality as spaces where mathematical subjectivities become performed or resisted. As such, "mathematics education as a matter of identity" can be discussed in relation to (a) learner identities including children and students in primary, secondary, and tertiary domains; (b) educator identities including preservice, novice, and teacher professional development; and (c) material identities including texts, textbooks, resources, technologies, media, and varied genres of pop culture. It is within these spaces where discourses of truth and power unfold around gender, race, ethnicity, social class, language, or body politics and fabricate (or not) the self as the subject of mathematics.

Learner Identities

The bulk of identity research in mathematics education concentrates on how young children and students in primary, secondary, or tertiary domains experience mathematics as part of continuous changing social, cultural, and linguistic contexts. In particular, researchers tend to focus on how learners fabricate themselves as mathematical subjects while they relate to genres of formal or informal mathematical activity; become involved in transitions from primary, to secondary, and to tertiary education; make choices for studying mathematics or opting out STEM careers, or, even, migrate across geographical territories due to socioeconomic or environmental crisis, war, and religious and political conflicts. Of major concern is how students adopt, appropriate, conform, reproduce, or resist normative mathematical subjectivities and how categories of race, gender, class, religion, or ethnicity influence learning, knowledge access, and engagement with mathematics. Identity is often seen as the "missing link" for exploring learning as the distance between actual and designated identities (Sfard and Prusak 2005). It becomes a lens to explore how normative mathematical identities become construed or constrained via learning design, curricula reforms, and innovation (Cobb 2004). It is as well the hybrid space for opening up

entries to "dialogicality" between West and subaltern positions of the mathematical subject (Chronaki 2009).

Learner identities tend to become affective spaces that govern a complex political work where traditional disciplinary dichotomies are entangled with curricular reform, innovative pedagogy, or educational policy. However, a number of issues need to be confronted. *First*, identity as a static, core self, or individual trait that contributes toward the construction of the "real" or "universal" mathematical learner has been problematized, and a figuration of the child as changing, growing, and always in flux is becoming endorsed. *Second*, there is an increased awareness of youth mathematical identity as constituted at the intersections of race, gender, social, linguistic, cultural, religious, and ethnic subject positions. And *third*, a configuration of learner identities in relation to youth and childhood spaces, mathematical agency, learning, and design for learning is progressively considered in the realm of sociomaterial, semiotic, and discursive practices of mathematical activity.

Educator Identities

Identity has equally been a construct for discussing how educators live through the changing sociopolitical dimensions of institutional teaching cultures as part of their initial education courses or in-service training, their encounter of pressing requirements to implement and mediate curricular reforms, and their responses to increased transcultural contexts of schooling. While some resort on how mathematics education practices work toward producing and reproducing certain teacher identities in the realm of regulatory strategies, cultural habitus, and reform demands, others emphasize how teachers resist, negotiate, transform, and, eventually, change identities as part of official policy requirements to implement curricular reforms or as the effect of market forces for innovative products or creative skills and capacities. They are based on the assumption that "traditional" and "reform" pedagogies are distinct worlds. "Traditional" is often implied as

restrictive or primitive, while “reform” mathematics as always developing new professional identity by encountering innovative tools, novel ways of constructing mathematics, or new governing strategies for designing, organizing, representing, testing, assessing, evaluating, and marketing.

Educator identity research focuses primarily on the interplay among “traditional” versus “reform” or “innovative,” “progressive,” and “creative” practices that circulate through varied regulatory strategies in which educators position themselves as they struggle to articulate meanings among hegemonic and marginal discourses. Teacher identity-work does not reveal a pre-existing fixed mathematical subjectivity but a complex discursive construction of self and subject at the thresholds of macro and micro educational levels. As Brown and McNamara (2005) argue that the potential reconfiguring of mathematical subjectivity of either novice student-teachers, who start anxious when they lack a solid background in mathematics, or expert teachers, who resist reform curricula implementation, lays primarily in making accessible creative experiences or sharing innovative mathematical activity with children and less within official regulatory frameworks for teacher training. Still, the recurring theme of mathematics teacher as autonomous subject, flexibly moving across territories of expertise, constantly changing and adapting, or always being the locus of thought, action, and ideology, needs further discussion. Some research interrogates how the neoliberal politics of a free-market economy exploits “educator identity” as the alibi for promoting particular products, skills, and competences that will turn into governing technologies of the self. Current demands for effective media or technology use and for responsive postures to social justice and cultural, religious, racial, gendered, and linguistic diversities in mathematics classrooms exemplify how identity becomes a crucial space toward governing teachers as agents for change. At the same time, teachers and educators fall into being identified as the “indebted” subject, unceasingly responsible for change, innovation, and creativity and, instantaneously, guilty of not being able to, finally, meet these goals.

Material Identities

Researchers have devoted attention on how socio-material and semiotic practices including a variety of texts such as textbooks, literary books, curricula resources, media, technologies, or popular culture genres represent, signify, or mediate certain mathematical identities and provide a textural basis for crafting mathematical subject positions. Walkerdine (1989) analyzed how textbooks employed in the UK have served to limit female agency with regard to mathematical knowledge. This has proved a lasting and consistent pattern throughout primary-school while becoming more grievous in secondary-school textbooks across nations up until today. Specifically, women and girls are still represented in textbooks as mostly passive and inferior to men or boys, frequently in need of help, support, or guidance, and, often, in positions that do not accord with serious mathematically rooted professions. On the contrary, masculine images in texts are comparatively more in demand for power and action identifying the genius, quick, and clever problem solver.

Gendered, racial, and class dichotomies prevail along with discursive constructions of ethnic identity not merely in textual representations of mathematical content and historical accounts of mathematicians and mathematics but also in the ways specific written speech acts and visual images of word problems address the reader into mathematical activity. Recently, Hottinger (2016) discusses gender reconstruction of mathematical subjectivity in the US context by means of a popular series of mathematics textbooks authored by glamorous actress and mathematician Danica McKellar who addresses middle-class adolescent girls (e.g., *Girls Get Curves*, *Kiss My Math*). Although her storied problems attempt to shift the masculine discourse of mathematical ability and to align mathematics with femininity, gendered representation is conflated with heterosexual identity and femininity norm is fixed around specific notions of sexuality (Raubel 2016). Such material identifying of mathematical subjectivity can be problematic since the textual narratives of “real-life” problems unfold around fixed categories of gender, sex, and sexuality but also social

class and neoliberal governing. Thus the process of mathematical activity ignores diversity across gender identity, sexual orientation, and ideology positioning.

Of significant importance is how learners, teachers, or spectators identify selfhood and configure mathematical subjectivity by conducting multiple narratives, storied problems, modeling, thematic contexts, and problem-based activity in textbooks or media. Findings indicate that mathematical content selection and representation is not only rarely in accordance to youth cultures but appears to limit motives for participation and intensities for successful participation. The tenacious presence of normative identities has also been documented in genres of stereotyping the presence of mathematics and mathematicians in popular culture texts such as movies, TV series, youth magazines, etc. Prevailing images of mathematics and mathematicians construct, by and large, negative or alienating relationships with audiences not appealing to the complexity of life (Moreau et al. 2010). In addition, normative mathematical subjectivity is configured not only as incompatible with femininity but also in close relation to constructions of West identity as superior. This is evident in how narratives of the mathematical hero in most representations, varying from textual historiographies to visual portraits in postage stamps, tell the story of mathematical knowledge growth as mainly a racial, gendered, and cultured achievement where the West as imperial power is revisited without being interrogated (Hottinger 2016). As such, the civic disposal of mathematical material identities in relation to mathematical activity is often trapped around particular norms that do not fit with contemporary struggles toward discursive shifts related to racialized, cultured, or gendered subjectivities and, thus, cannot identify with the public at large including educators and learners.

Concluding Remarks

“Mathematics education as a matter of identity” lures the question of “the subject” as crucially political. It serves to interrogate the relation

between subjectivity and identity politics and to problematize normative assumptions around categories such as women, age, ability, masculinity, sexuality, patriarchy, social class, West, or indigenous as consistent across regions and historical periods. A number of studies in mathematics education agree that stereotyped categories of identity persist in the cultural spheres of education. At the same time, there is a noted absence of research that sheds light on alternative identity-work that pursues reconfigurations of mathematical subjectivity. It is apparent that more attention is required in relation not only on how mathematical identity mediates the construction of specific subject positions as success or failure. It is equally important to think about how material, textual, and corporeal mathematical subjectivities can queer, trouble, or disrupt essentialist identities and can contribute into creating alternate spatial and embodied constellations of both representing and performing subjecthood.

- increasing awareness that to come to grips with the complexity of contemporary societal demands, mathematics education can no longer be fruitfully formulated either as an epistemological or as a psychological matter – not even as epistemological *and* psychological.
- Sociocultural theories developed in the fields of sociology and anthropology (from Émile Durkheim to Pierre Bourdieu and beyond) have provided new perspectives by which to consider mathematics education. In particular, sociocultural theories have provided mathematics educators with new possibilities to conceptualize the students, the teachers, and the school and to better understand the political, economic, social, and cultural dimensions that shape mathematics as a scientific discipline and mathematics education as a social-political-pedagogical project.
- Sociocultural theories differ categorically from the individualist idealist approaches to the mind and the rationalist epistemologies that have informed mathematics education since the early twentieth century. The individualist approaches to the mind understand the production of meaning and ideas as a mere subjective endeavor. Rationalist epistemologies understand it as an abstract, nonhistorical, a-cultural process. Sociocultural theories, by contrast, understand the production of human beings and the ideas and meanings that humans produce as embedded in the individuals' cultures. The common denominator of sociocultural theories is the claim that human beings are *consubstantial* with the culture in which they live their lives. In other words, cultures are not merely a constant source of stimuli to which humans adapt. On the contrary, the way in which human beings think, take action, feel, imagine, hope, and dream is deeply entangled in the historically constituted forms of thinking, sensing, feeling, and interacting that they find in their culture. To a great extent, differences between sociocultural theories appear according to the manner in which the aforementioned consubstantiality is understood and theoretically thematized—and so is the case of sociocultural approaches to mathematics education.
- Historically speaking, the differences between sociocultural theories did not appear all of a

Mathematics Education as a Matter of Labor

Luis Radford
Université Laurentienne, Sudbury, ON, Canada

Introduction

During the twentieth century, mathematics education was predominantly conceptualized either as the diffusion of mathematical contents or as the facilitation of the students' development of mathematical cognitive structures. In the first case, the emphasis was generally put on the organization of the mathematics curriculum and the efficient management of the learning environment. In the second case, the emphasis was often put on mental structures and the understanding of students' mathematical conceptualizations. In the first case, the underpinning theoretical orientation was essentially *epistemological*. In the second case, the theoretical orientation was *psychological*. Although the aforementioned conceptualizations of mathematics education have shown their merits, in the past few years, there has been an

sudden. Nor did they appear clearly formulated. They turned around the problem of the individual and the social, and the subjective and the objective. It is in this context that, in the works of Wilhelm von Humboldt, Ernst Cassirer, and Valentin Voloshinov (or Vološinov), language came to be considered the link between cultures and their individuals. Voloshinov (1973), for example, turned to the *word*. Noticing that the word is implicated in every act and contact between people, Voloshinov found in the word the ontological connection between the individuals. Drawing on this conception of the word, Voloshinov, as well as Bakhtin, came to see literature not just as one of the fields of aesthetic experience and cognition but the central field through which the other cultural fields are refracted. It is ultimately through language and literature that reality is produced and interpreted. The problem of the individual and the social, and the subjective and the objective, is resolved, in Voloshinov's account, in the dialectical tension between the relatively stable centripetal forms of culture (epitomized by the *novel*) and the centrifugal forms of resistance and novelty (epitomized in Bakhtin's idea of *carnival*).

Language-oriented sociocultural research (e.g., research based on Bakhtin's and Vygotsky's work) has had an important influence on current mathematics education. For instance, inspired by the work of Vygotsky (1987) and discursive psychology, Lerman (1996) has studied the role of language in the constitution of intersubjectivity. Barwell (2014) has turned to Voloshinov's and Bakhtin's work to understand mathematics classroom discourse, while Sfard (2008) has drawn on Vygotsky's ideas to develop an educational discursive approach to mathematics teaching and learning. This research area has recently led to questions of ideology, agency, gender, and power in the mathematics classroom (Radford 2009 and Barwell 2016).

In the following another sociocultural way of theorizing mathematics teaching and learning is described, where the primacy is not given to language but to human activity.

Mathematics Education as a Matter of Activity

To consider mathematics education – and in particular its teaching and learning – as a matter of *activity* means to place oneself within a different perspective from the one in which language, discourse, and literature appear as the ultimate field of aesthetic experience and cognition. To think of mathematics education as a matter of activity is not to dismiss the role of language in the processes of knowing and becoming but to assert the fundamental ontological and epistemological role of matter, body, movement, action, rhythm, passion, and sensation. To think of mathematics education as a matter of activity is an invitation to consider teaching and learning mathematics in accordance with the way in which teachers and students engage in classroom activity. It is an invitation to attend to the sensuous manners in which teachers and students bring mathematical ideas to the fore and produce mathematical meanings. Those sensuous manners include perceptual activity, gestures, kinesthetic actions, posture, language, and the use of artifacts, symbols, graphs, and diagrams (Radford 2009).

Behind the idea of mathematics education as a matter of activity rests a specific anthropological conception of the human. Humans, following Marx's (1998) Spinozist stance, are considered to be part of nature: they are *natural beings*. That humans are natural beings means that they are sensible beings, unavoidably *affected* by the other parts of nature. In this context, sensations and passions are conceptualized as ontological affirmations of the individual's nature as a natural being. One important consequence of this theoretical stance is that the individual's existence cannot be conceived of as a substantial entity, produced from within, as articulated by the humanist trend of the Enlightenment. The individual's existence is *relational* through and through. It appears to be profoundly linked to an ensemble of relationships with other parts of nature – including social relationships – and is based on culturally and historically constituted conditions of life. In this

line of thought, to be a natural being means also that, like other natural living beings, humans are *beings of need* who find their satisfaction in objects *outside* of themselves.

To meet their needs (needs of survival and also artistic, spiritual, intellectual, and other needs created by/in society), humans engage themselves actively in the world. They *produce*. What they produce to fulfill their needs occurs in a social process that is at the same time the process of the *individuals' inscription in the social world and the production of their own existence*. In dialectic materialism, the name of this process is *activity*. Sensuous, material activity is considered the ultimate field of aesthetic experience and cognition.

This conception of activity is very different from usual conceptions that understand activity as a series of actions performed by an individual in the attainment of his or her goal. In dialectical materialism, activity is something else. It is precisely the specific form in which the individuals *express* their life. “As individuals express their life, so they are. What they are, therefore, coincides with their production, both with *what* they produce and with *how* they produce” (Marx 1998, p. 37). Activity, in short, is a social form of joint endeavor that comprises self-expression, intellectual and social development, and aesthetic enjoyment. It is a process in a system of social relations that realizes the societal nature of human beings (Roth and Radford 2011).

In articulating a psychological approach based on the dialectic materialist idea of activity, Leont'ev (1978) suggested a basic structure of activity. An activity for him is characterized by its object and its motive. The object and motive of an activity are the engines that keep activity in motion. In practice, in the pursuit of the activity's object, individuals break down the object into a sequence of goals to which actions are associated. In the “Supplement” to his important 1978 book – a supplement dedicated to educational matters – Leont'ev discusses the conditions under which a certain theoretical learning content can be meaningfully perceived or attended to by the student. He contends that

in order that the perceived content be recognized, it is necessary that it occupy the structural place of a direct goal of action in the subject's activity, and thus that it appear in a corresponding relation to the motive of this activity. (Leont'ev 1978, p. 153)

It is hence through activity and the structural interconnection between motive, object, goals, and actions that the learning content becomes disclosed to the student's consciousness.

Activity theory, as this sociocultural approach has come to be known, has had an important impact on education in general and mathematics education in particular (see, e.g., Jaworski et al. 2012; Roth and Radford 2011). Yet, in focusing on the *procedural* aspect of activity, activity is reduced to its *operational* and *functional* dimension, eradicating from it the aesthetic and political dimensions of action and creation. The account of activity culminates, unfortunately, in a technological dull analysis of what was originally thought of as the sensible experience of human *life*.

The idea of mathematics education as a matter of joint labor is discussed below. The idea of joint labor seeks to restore to activity its most precious ontological force, namely, the dynamic locus where human existence creates and recreates itself against the backdrop of culture and history. Yet, with its utilitarian and consumerist orientation, contemporary mathematics classroom activity tends to produce and reproduce alienated students. It is argued that the search for non-alienating classroom activity requires a reconceptualization of the classroom's forms of human collaboration and its modes of knowledge production. The section ends with a view of classroom activity as joint labor, that is, a collective, critical endeavor of mutual and self-fulfillment, and a discussion of the communitarian ethic that supports it.

Mathematics Education as a Matter of Joint Labor

In dialectic materialism (see, e.g., Ilyenkov 1977), knowledge (mathematical, scientific, artistic,

legal, etc.) is considered to be constituted of forms of human action that have become historically and culturally synthesized. They are synthesized forms of action and reflection bearing, in sedimented ways, the political tensions and contradictions of human life. They are always in the process of continuous movement, constantly born and reborn, incessantly transformed in practice. Knowledge belongs to an immaterial sphere of culture that is intertwined with the material world of objects and human actions. This immaterial sphere of culture is part of what Marx (1998) called the nonorganic realm of nature and is also part of the conditions out of which human existence is crafted.

Instead of being conceptually neutral, knowledge already conveys a specific *ideology*. That is to say, unavoidably, knowledge allows one to always see the world in a *certain* way. The symbolic algebra of the Renaissance, for instance, conveys the theoretical stance of the instrumental reason of the Western sixteenth century and the social abstractions brought forward by the emerging mercantilist capitalism. And it is under the theoretical stance of practical reason and calculation that contemporary school mathematics conveys, through the curriculum and other institutional mechanisms, an instrumental and technical view of the world of objects and humans.

The instrumental and technical view of the world of objects and humans is produced and reproduced through a utilitarian orientation of classroom activity. This is what traditional (or direct) learning does. In it, mathematics appears as a disembodied realm of truths, and the students' work is reduced to passively receiving information, repeating and memorizing it (Freire 2004). The students cannot *express* themselves in the products of their learning. In traditional learning classroom activity is the expression, not of a fulfilling life but of an alienated one. The so-called reformed learning and its student-centered Piagetian pedagogy has sought to find in the student's work an escape to the technical view of the world of objects and humans. To do so, it has promoted an individualist and romantic pedagogy that emphasizes the

student's freedom and autonomy. In this pedagogy, the students are left to their own cogitations, interacting among themselves, yet moved by their own interest. In this approach, the students do express themselves but remain imprisoned within the confines of their subjective universe, living a one-sided existence in a chimerical taken-as-shared world, cut off from cultural and historical perspectives at large, and, hence, alienated from them. As a result, classroom activity is again the expression, not of a fulfilling life but of an alienated one (Radford 2016).

Mathematics education as a matter of joint labor is an attempt at restoring the idea of activity in general and classroom activity in particular as a non-alienating form of life. It is inscribed within an understanding of mathematics education as a political, societal, historical, and cultural endeavor. Such an endeavor aims at the dialectic creation of reflexive and ethical subjects who critically position themselves in historically and culturally constituted mathematical practices and ponder and deliberate on new possibilities of action and thinking. To avoid confusions with other meanings, and to emphasize the idea of activity as a historically produced aesthetic form of life where matter, body, movement, action, rhythm, passion, and sensation come to the fore, activity, in this approach, is termed *joint labor*.

The concept of joint labor, which plays a central role in the theory of objectification (Radford 2008), offers a reconceptualization of teaching and learning. In joint labor, the students are not reduced to a role as simple cognitive subjects. They do not appear as passive subjects receiving knowledge or as self-contained subjects constructing their own knowledge. In the same vein, teachers are not reduced to a role as technological and bureaucratic agents – guardians and implementers of the curriculum. They do not appear as possessors of knowledge who deliver or transmit knowledge to the students either directly or through scaffolding strategies. The concept of joint labor suggests an educational perspective in which to envision teaching and learning not as two separate activities but as a single and same activity: one where teachers and the students, although without doing the same

things, *engage together*, intellectually and emotionally, toward the production of a *common work*. *Common work* is the *sensuous appearance* of knowledge (e.g., the sensuous appearance of a covariational algebraic or statistical way of thinking through collective problem posing and solving and discussion and debate in the classroom). *Common work* is the bearer of dialectic tensions because of the emotional and conceptual contradictions of which it is made. Through it, knowledge appears sensuously in the classroom (through action, perception, symbols, artifacts, gestures, language), much in the same way and, with similar aesthetic force, that music appears aurally in a concert hall through the common work of the members of the orchestra.

The joint labor-bounded encounters with historically constituted mathematical knowledge materialized in the classroom *common work* are termed *processes of objectification*. Through these social, material, embodied, and semiotic processes, the students and teachers not only create and re-create knowledge but they also coproduce themselves as subjects in general and as subjects of education, in particular. More precisely, they produce subjectivities, that is to say, singular individuals in the making. This is why, from this perspective, processes of objectification are at the same time processes of *subjectification*.

The concept of joint labor resorts to (a) specific collective forms of classroom knowledge production and (b) definite modes of human collaboration that rest on critical community *ethics*. The ethical forms of human collaboration are driven by a general attitude toward the world and serve to configure the teachers' and students' *joint labor* in the classroom. These critical and community ethical forms blur the borders that separate the teachers from the students. Teachers and students labor *in concert as one*. The classroom appears as a public space of debates in which the students are encouraged to show openness toward others, responsibility, solidarity, care, and critical awareness. The classroom indeed appears as a space of encounters where teachers and students become *presences in the world* (Freire 2004). That is to say, the classroom appears as a space of encounters, dissidence, and subversion, where teachers

and students become individuals who are more than in the world – they are individuals with a vested interest in one another and in their joint enterprise; individuals who intervene, transform, dream, apprehend, suffer, and hope *together*.

Governmentality; Mathematics; Policy; Reform

Introduction

Mathematics is a subject that makes part of compulsory schooling, vocational education, and also a wide range of further higher studies. It is an area that became highly regulated by policies in the past and in the current functioning of massive education systems. Citizens' mathematical knowledge and competence are considered fundamental for the maintenance of modern forms of life. More recently, mathematical achievement is taken to be an important indicator of school success and, with it, individual and social progress. Thinking of mathematics education as a matter of policy posits pedagogical and educational processes related to mathematics in the terrain of biopolitical technologies for the governing of teachers, students, and school administrators (by the others and by themselves) and, in ultimate instance, populations. This means

conceiving of mathematics education in terms of *governmentality* (Foucault 2014).

The analytics of governmentality explores the practices of government in relation to the ways in which truth is produced in social, cultural, and political practices. Thus, it provides a way of thinking about how power is effected through educational policies that generate forms of reasoning and related taken-for-granted truths. Such truths set the limits for what counts as school mathematics, how to organize it, for which purpose, and with which effects of power for people engaging in/with it. When mathematics education is considered an issue of policy, the broad network of people and practices involved in relationships around the teaching and learning of mathematics in society enters in the double operation of governing populations and subjectivities. Educational policy has been long conceived as a political process that connects, on the one hand, the activity of an authoritative body generating consciously articulated rules and frames with expectations of certain behavior and, on the other hand, the activities of bringing these expectations into the life and practices of administrators, teachers, students, parents, etc. (Bascia et al. 2005).

From a perspective of governmentality, policies can be thought as a technology of power over a population that inscribes differentiation and ordering on groups of people, which Foucault called *biopolitics*. Such technology, exercised through biopower, is “considered as a kind of anatomo-politics of the human body and control of the population at large” (Besley and Peters 2007, p. 81). This form of government puts into action control mechanisms on the mathematics knowledge that will be taught and learned by teachers and children, on how it should be taught and learned, and on what should be achieved. But at the same time, policies set in operation technologies of the self that *subjectify* teachers, students, and parents alike, in conducting their conduct so that they freely surrender to the will of mathematical learning. In the doings of policy, individuals are positioned – by others and by themselves – as (un)able and (un)successful learners of mathematics. In other words, the processes of subjectivation work on the school subjects, conducting them in

specific directions in what concerns who they are/could be, the place they assign to mathematics and school mathematics in society, and, in the limit, what kind of society they desire to build. In this way, educational policies govern in the two ways pointed by Foucault.

The discussion of the meaning of mathematics education as a matter of policy is guided by the question of how mathematics education research conceptualizes and relates to the political desires of steering curricular organization and pedagogical practices in mathematics through either national or supranational educational policies. The first step in the discussion is a contextualization of the desire to regulate mathematics education through policy. Then, three identifiable conceptualizations of the effects of power produced by policies in and for mathematics education are examined.

The Will of Educational Policy in Mathematics

Even if there are people who have documented the existence of forms of instruction in mathematical topics in different times and places since Antiquity, the structured and planned inclusion of mathematical topics in programs of education is characteristic of the modern organization of education. Education as an effective tool for the making of desired citizens became a privileged area of government and with it an issue of State policy. The “educationalization” of social problems, as formulated by Tröhler, manifested among others in the desire of having political control over educational offers that would provide citizens with the knowledge, skills, and competences needed to address the problems and challenges of society. The increasing transfer of the management of education from religious orders to the State is part of its strengthening the political possibility of steering populations through the organization of curricula containing what people should know and be able to do.

With respect to mathematics, the inclusion of basic arithmetic and diverse forms of calculation was frequently argued as important knowledge

and skills to be learned in basic schooling. More advanced and varied forms of mathematics were part of the training in particular trades and colleges such as the military and its diverse forms of engineering during the second half of the nineteenth century. In many Western countries around the world, the beginning of the twentieth century brought the discussion of whether mathematics and science were needed areas of study for the making of the virtuous citizen in new industrializing societies. It is argued that such a view gained broad support and started being part of the ways of thinking about contemporary education in the post Second World War and the Cold War.

The conditions of the possibility of such view were the political, the economical, and, specially, the technological optimism of the Cold War epoch. The Sputnik launch in 1957 justified the strengthening of mathematical and scientific education for an ideological, military race and for the production of all kinds of technologies for changing social, economic, political, and cultural relations in Western societies. The international New Math movement was not only the result of the mobilization of mathematicians for the making of a new strong mathematics curriculum, it was also the articulation of economic interests represented in the OECD to support human capital development through education for economic growth. The emerging new international comparative studies of assessment started building measurements of school (mathematics) achievement and monitoring its development in different countries. All together, educational improvement was considered to be all too important and strategic to be left on the hands of educators. Experts and policy makers were necessary for steering the need of more and higher mathematics for all (Valero 2017).

New crises and social problems have triggered new political actions for the adjustment of education and, with it, mathematics education. In the configurations of the globalized neoliberal capitalism of the turn to the twenty-first century, mathematics curricula have not only been revised through several local and national policies and related reforms, they have also been the target of large-scale, evidence-based, supranational

interventions such as OECD's PISA. The promise of delivering solutions to education so that countries can enter the "highway of educational development" is a manifestation of the tight connection between the policies that govern school (mathematics) achievement and the making of the modern, worker-citizens desired in a current neoliberal world. Almost all aspects of education have become an object of policy and with this both populations and individuals are made objects of the calculations of power. So is the case in mathematics education.

Perspectives of Mathematics Education Policies

In research there has been a long-standing call for engaging with the study of how policies affect mathematics education and how research also can impact on policy and serve policy maker's needs for improving mathematics education (Hoyles and Ferrini-Mundy 2013). To the issue of how mathematics education research conceptualizes its connection to policy, there can be identified at least three understandings.

A *technical perspective* adopts the view that mathematics education research has the main goal of improving teaching and learning practices and that therefore it should have something of relevance to say to policy makers about the direction in which policies should direct school practices. At the same time, researchers are to be instrumental in the implementation of policies. Policy formulation and implementation at the level of the curriculum organization – the contents and pedagogies of school mathematics – are seen as the arena in which researchers, policy makers, and practitioners can join forces in fulfilling the desire of leading the new generations toward a better performance in mathematics that would result in the creation of a qualified labor force. Here the central point is the efficiency in devising evidence-based pedagogies and techniques that can show an increased learning of locally or nationally prescribed contents, for reaching students' desired, defined levels of achievement.

More often than not, researchers adopt the stated formulations in local, national, or supranational policies as statements of a desired, ideal state to reach. And from it build a comparative logic between the state of affairs in learning/teaching for learners and teachers in classrooms and schools and the assumed situation that would be desirable to reach according to policy. Research is about trying to close the gap between the often deficient state of affairs and the ideal. In the process, improved realizations of how to engineer practices emerge as results on how to increase implementability of policy.

There exist numerous examples of this conceptualization in a field that perceives itself in constant need of reform, given the systematic underachievement of the majority of students. Research programs investigating the details of mathematics education pedagogies, such as the French school of didactical situations and its related didactical engineering (Margolinas and Drijvers 2015), have fed into teacher education to make possible a support of improved teaching and thus learning. Such a view was implemented systematically in the creation of the *Instituts de Recherche sur L'enseignement des Mathématiques* (IREM) in France as a strategy for providing a new, research-based teacher education since the 1970s.
