of any unity of knowledge, and the teachers and administrators within universities began to cast about for some ways of gaining an overview, some ways of restoring, or at least minimally preserving the intellectual development of humankind as a common heritage in which each of us shares and has a stake. The two main avenues of attempt were an introduction of so-called interdisciplinary courses, as well as programs of study based on reading “great books”. Both approaches had their merits and limited success, but neither cut to the heart of the matter.

The Ad Hoc or Improvisational Character of Interdisciplinary Teaching

Interdisciplinary programs are designed to put together two or more specialists in the same classroom, offering students the dialectic of professors making sense first to one another and then, hopefully, also to the students from within specialized perspectives, while also accommodating themselves to the other perspective of specialization represented by their colleague(s) in the given classroom. Thus, twentieth-century interdisciplinary programs proved invariably to be personality-dependent, gerrymandered affairs, more or less valuable depending upon the talents of the professors involved, but “interdisciplinary” in no more than a *de facto* fashion rather than intrinsically interdisciplinary.

A Recrudescence of Scholasticism: The “Great Books” Approach

The “great books” approach fared no better as learning was determined as based on opinions of “authorities”, back to the tradition of the Latin scholastic universities, even if a plurality of sources was replacing the centrality of Aristotle. Since the “great books”, which have shaped the modern world within which the university today exists, come from a variety of specialists, from Chaucer and Shakespeare among the humanists to Newton and Einstein among the scientists, a great-book-based education indeed broadened

students’ minds and opened them to an understanding apparently beyond specialization. Yet, this approach in the end tended to feed into the split between what C. P. Snow characterized as the two cultures: sciences on one side, rooted in specializations aimed to interpret the book of nature, and humanities on the other side, rooted in broad reading interpreting the books written by men. Again “interdisciplinarity” was achieved more *de facto* than *de jure*. Neither the interdisciplinary nor the “great books” approach achieved in principle a unification of the two cultures.

Enter Semiotics

This point of impasse is the entry point for the doctrine of signs, the “one undivided science” which, as Peirce points out (1908: CP 8.342; c.1897: CP 2.227), does “not depend upon new special observations”, yet directly addresses that upon which all special observations and common observations alike depend, namely, the action of signs, semiosis. STEM education – education in science, technology, engineering, and mathematics – contrasts with liberal arts education as yet a further extension of C. P. Snow’s two cultures. But an individual, student or faculty, who comes to understand the standpoint and perspective that semiotics engenders transcends precisely this division.

At Indiana University, when Thomas A. Sebeok became Director of the Research Center for Language Studies in the early 1970s, among his first official actions was to change the name to the Research Center for Language and Semiotic Studies, and everyone expected him to launch an MA and PhD program in semiotics. He did not. Instead, he introduced what he called a “Certificate in Semiotics”, which students could acquire only after, or in conjunction with, graduate study in an established discipline, be it linguistics, anthropology, biology, English, physics, sociology, or whatever. His argument was that semiotics is not so much a discipline in its own right as it is a *field* including all the disciplines, inasmuch as “all thought is in signs”. As a

consequence, Sebeok considered that semiotics as an area of study within the academy ought not to be treated as one more specialization but rather needs to be seen as that which makes specialization in the first place possible, because it establishes the experiential ground from which (first in sensation and then also in conception) the whole of human knowledge springs! Thus, someone on their way to mastering a given subject matter – physics, chemistry, literature, and sociology – would discover on turning to semiotics that their chosen specialization already depends upon (albeit is not reducible to) the action of signs as revealing and distinguishing the very subject matter which is the object studied by the specialization.

Hence, students of semiotics are made to realize that in seeing signs at work within a given academic discipline, they are seeing something that is true of all specialized disciplines, because true of the whole of human knowledge, namely, that underlying all else in awareness and in the background always is *the action of signs*, thanks to which it becomes possible to know objects in the first place, let alone differences between objects which define different disciplines as fragmented areas of specialization.

Conclusion

Semiotics is postmodern in a double sense. It shows the way beyond the epistemology of modern philosophy and, at the same time, enables us to see the *unity* of human understanding beneath and within development of specializations essential to the establishment of modern science. It “investigates what all the other disciplines seem to take for granted” (Taylor 2008, p. 6). Semiotics, as knowledge that results from thematic study of sign action, is not only interdisciplinary and transdisciplinary (cf. Nicolescu 2002) but also *predisciplinary* in providing that common ground of animal awareness out of which humans as semiotic animals come to realize within the biosphere a unique ethical responsibility that includes education in semiotics.

Play: Aesthetics and Ambiguity of Play in Early Childhood Education

Beth Ferholt¹ and Monica Nilsson²

¹Brooklyn College, City University of New York, New York, NY, USA

²Jönköping University, Jönköping, Sweden

Introduction

Play has been the central component of most curricula for young children throughout the last century. Friedrich Froebel is considered by most to be the father of the modern, Western preschool and he held play to be the child's natural mode of expression. The adults' role in Froebel's kindergarten was to stimulate children's play through the provision of specific forms of environments and toys. This approach is in concert with contemporary Western European and American biological, psychoanalytic, cognitive-developmental, and cross-cultural psychological theories of play, in which one finds assertions that children's play is fundamentally different from adult activities and that adult knowledge, experience, or developmental stage is a teleology for children's play. See, for instance, the work of Groos, A. Freud, Klein, Erikson, Winnicott, and Piaget, although these are just a handful of the theorists who make this claim.

The ideal of modern Western childhood, with its emphasis on the innocence and malleability of children (Aries 1962), has combined with various social conditions to promote two categories of curricula for young children in regards to play: one in which children's play is directed toward adult-determined developmental goals and one in which children's play is protected from adult interference (so called "free play"). These two categories of curricula appear to be equally powerless in response to the current crisis, in which "academic" subject matter learning is becoming the focus of the curriculum, in place of play, in many early childhood classrooms internationally (Brooker and Woodhead 2013). Article 31 of the United

Nation's Committee on the Rights of the Child states that all children have the right to play. Recently, the United Nations Committee on the Rights of the Child (UNCRC) reminded State parties of this right and warned that children's time for play is often reduced. They write: "For many children in both rich and poor countries, child labor, domestic work or *educational increasing demands* serve to reduce the time available for the enjoyment of these rights" (UNCRC's General Comment No. 17, 2013, emphasis added). However, these two categories of curricula remain uncontested by any third alternative.

Aesthetics and Ambiguity of Play in Early Childhood Education

Gunilla Lindqvist's (1995) work traces this limitation of curricula for young children back to the dichotomy between imagination and realistic thinking, and her response is her exploration of the "common denominator" of play and aesthetic forms, which she calls the "aesthetics of play" (Lindqvist 1995). Lindqvist is one of the few play scholars who have focused on the relationship between play and art. Lindqvist's study of the aesthetics of play is based in Vygotsky's theories of play, imagination, and creativity (1978, 1987, 2004) and also in Vygotsky's (1971) psychology of art. Vygotsky's (1978) rebuttal to theories of play that position imagination and realistic thinking in opposition to one another was first published in 1933 and was hailed as overcoming the naturalistic and psychoanalytic theories of children's play that preceded it (Elkonin 2005). (One can use the terms imagination and fantasy as synonyms, but the term imagination is preferred, as the term fantasy has connotations of being "not true" which imagination does not have.)

Vygotsky (1987) highlights the importance of understanding imagination as an aspect of the process of creating and experiencing reality that defines our species rather than as something "other" than reality. He elaborates upon his claim that "(i)magination is an integral aspect of realistic thinking" (1987, p. 349), thus:

No accurate cognition of reality is possible without a certain element of imagination, a certain flight from the immediate, concrete, solitary impressions in which this reality is presented in the elementary acts of consciousness. The processes of invention or artistic creativity demand a substantial participation by both realistic thinking and imagination. The two act as a unity. (1987, p. 349)

As Cole and Pelaprat (2011) explain, human conscious experience is a process that requires not just our phylogenetically constrained abilities and our culturally organized experience but also our active reconciliation or “filling in,” our imagining, as we try to make sense of our world.

Vygotsky describes four basic ways that fantasy is associated with reality in the creative process: (1) Anything that one’s imagination creates is always based on elements from reality – from one’s past experiences. (2) Experience is also based in imagination, for instance, through imagining/remembering of one’s own or someone else’s experiences, through stories or through other means. (3) Emotions that arise in reality affect imagination, but imagination also affects emotions. (4) Fantasy becomes reality when imagination is crystallized in a material form which is returned to reality as a new and active force that has the potential to change reality: “(T)o combine elements to produce a structure, to combine the old in new way, . . . is the basis of creativity” (2004, p. 12).

Imagination and creativity are therefore both necessary for thinking, human growth and development, and the process that is the interrelation of the two is a trait of all people, including young children. This second point can be seen especially clearly in play, claims Vygotsky, as he argues that play is imagination embodied in the material world. A child’s play is not a reproduction of what she has experienced nor is it unrelated to these experiences. Instead a child’s play is a creative revision of what she has experienced.

Lindqvist (1995) designed the *creative pedagogy of play* to foster and study the aesthetics of play. Within this pedagogy children’s play is understood to be an early form of the artistic and scientific endeavors of adulthood and, therefore, to produce new and intrinsically valuable insights

that can be of value to adults and children alike. This pedagogy features *playworlds*, which are adult-child joint play activities in which children and teachers jointly create, enter, and exit fantasy worlds. Children contribute their play expertise and adults contribute their experience with art and science. A playworld often takes its starting point in a text, such as a children’s book, poem, or story.

Playworlds are created and studied in a variety of forms and for a variety of reasons, internationally, for instance, in Japan, Finland, the United States, and Serbia, as well as in Lindqvist’s home country, Sweden (i.e., Marjanovic-Shane et al. 2011). However, Lindqvist’s (1995) study of playworlds led her to conclude that there are two aesthetical forms of play. One is connected to music, poetry, and rhythmic movement. This form takes its starting point in the young child’s poetic and rhythmic relationship to objects and language. The second form is connected to literary forms and originates from the basic pattern in folktales. This form can be found in children’s play and stories from the age of three but also in children’s literature. The plot dominates in this esthetical form of play. These two esthetical forms can each constitute a basis for creating a playworld, which in turn supports these two esthetical forms.

These conclusions of Lindqvist’s (1995) concerning the aesthetics of play in curricula for young children can be further developed through theories of aesthetics and early childhood pedagogies that focus on aesthetics. Early childhood pedagogies that focus on play tend to be less useful in developing Lindqvist’s conclusions because they remain firmly based in play theory that does not acknowledge Vygotsky’s challenge to the separation of fantasy and reality and does not value play for its intrinsic qualities. As Brian Sutton-Smith (1997) writes: “. . .extrinsic academic, social, moral, physical, and cognitive play functions, with a progress-oriented thrust, have been the major focus of most child play scientists . . .” (1997, p. 50). It takes an outsider to the field, such as Gadamer (1960), to argue that play ontology is linked to experiencing,

understanding, and *bildung* and that play thus has a value in itself.

Wartofsky (1976) argues that “(h)uman beings become human in coming to know themselves as human” and that the creation and appreciation of art, what he calls “the very activity or praxis of art,” is “humanizing praxis” because it “is a praxis which comes to know itself, i.e., which takes *itself* as its own object” such that “this very activity is a fundamental mode of human self-knowledge” (1976, p. 357). Wartofsky continues thus:

“(A)rt represents its own process of coming into being and insofar, exemplifies and objectifies the distinctively human capacity of creation. It is in the self-recognition of this creative capacity that human beings come to know themselves as human, in the specific sense that they come to know themselves as creators or as artists”. (1976, p. 357)

If one understands art in Wartofsky’s terms, then one can ask if the esthetics of play consist of coming to know oneself as human. Others have used the work of Mikhail Bakhtin to consider play as humanizing, although this work is not based in the study of aesthetics, such as Wartofsky’s study of aesthetics within the field of philosophy, but in interdisciplinary stances, such as Stetsenko’s (2015) “transformative activist stance.” Marjanovic-Shane and White write: “As an act-deed (postupok), play is considered as a way of relating to others as well as a means of co-creating and representing subjectivities” (2014, p. 119). Working from both Bakhtin and Vygotsky’s positions, Stetsenko and Ho argue that in play “children sort out the difficult challenge of becoming unique, self-determined, and free persons within the communal world shared and co-created with others” (2015, p. 221).

The pedagogical approach of the preschools of Reggio Emilia, Italy, known internationally as the *pedagogy of listening*, focuses on aesthetics understood as a process of empathy that relates the self to things and things to each other. Exploration is the central component of the pedagogy of listening, and within this approach play is often regarded as an expression of a traditional Fröbel – inspired preschool didactics that are based on a vision of the child as “nature” (Dahlberg and Lenz Taguchi 1994). However,

insights from the pedagogy of listening into the nature of aesthetics in relation to exploration can help to deepen an understanding of the aesthetics of play.

Within the pedagogy of listening, children are considered to be culture and knowledge creators rather than just reproducers of knowledge. Children are understood to be developing theories and hypotheses about the world that should be considered to be equally possible to those of adults. Key components of this process of exploration are the environment and materials, which are thought of as a “third teacher” who supports children and teachers in formulating problems rather than searching for correct answers.

The pedagogy of listening employs a studio or *atelier*, which is regarded as a place of exploration, invention, and experimentation, and an *atelierista*, an educator with an arts background. *The hundred languages* is a term within the pedagogy of listening that describes the many ways children explore, make and test hypotheses, and express themselves, i.e., through dance, music, gesture, the visual arts, etc. The atelier and atelierista are both resources that exist to support processes of exploration and listening through these 100 languages.

Central to this process of listening is *documentation*, as exploration is not based on pre-defined goals but is instead developed from the children’s interests, questions, and engagement. When documentation is reflected upon, it becomes *pedagogical documentation*. Pedagogical documentation is used to guide a project based on what teachers perceive to be children’s meaning-making processes.

A founding atelierista of the pedagogy of listening, Veia Vecchi, writes the following of the “esthetic dimension” of this pedagogy:

Perhaps first and foremost it is a process of empathy relating the Self to things and things to each other. It is like a slim thread or aspiration to quality that makes us choose one word over another, the same for colour or shade, a certain piece of music, a mathematical formula or the taste of a food. It is an attitude of care and attention for the things we do, a desire for meaning: it is curiosity and wonder; it is the opposite of indifference and carelessness, of conformity, of absence of participation and feeling. (2010, p. 5)

Hutt et al. characterize the difference between play and exploration succinctly. They write: “Implicit in the behaviors we termed ‘exploration’ was the query: What does this *object* do? whilst implicit in the behaviors we termed ‘play’ was the query: What can *I* do with this object?” (1989, p. 11). The pedagogy of listening shows exploration in which art is a tool in the activity of exploration. The creative pedagogy of play shows play in which art (aesthetical form) is the activity. Both of these pedagogies have been developed in great part by teachers of young children, and these teachers continue to be engaged in problematizing the differences and similarities between play and exploration.

If, just as science and art are two key forms of adult creativity, exploration and play are two key forms of early childhood creativity, it may be that art as experience (Dewey 1934) in early childhood, which both of these pedagogies point to, is the necessary area of focus in an ongoing study of the relationship between play and aesthetics. The question of how one might best study the aesthetic experience of play may be most fruitfully addressed not only through theories produced within the academy but also through knowledge generated within early childhood pedagogies themselves, whose curricula stand to be shaped by a better understanding of the aesthetics of play.

Currently, learning is emerging internationally as the primary focus of preschools, at the expense of play (see the United Nation’s Committee on the Rights of the Child’s *General Comment No. 17*, 2013). Arguments in support of play remaining the primary focus of preschools have proliferated and have tended to disregard one of the few things that a survey of the diverse literature on play can claim with any certainty: Play is ambiguous (Sutton-Smith 1997). The resulting proliferation of studies that focus on play in curricula for young children as a knowable entity with knowable outcomes has both moved the field further from the preschool and further into the academy and also stifled some of the most promising and relevant branches of study of play in curricula for young children, such as the study of the esthetics of play.

Policy Imperative in Early Childhood Education and Care

Frances Press
Charles Sturt University, Bathurst, Australia

Explanatory Notes

Significant variations across national contexts in key terminology for this entry necessitate the inclusion of explanatory notes. The age range for *early childhood* is from birth to 8 years. The term *early childhood education and care* is used to refer to formal education and care services provided for young children in the years before compulsory schooling and in the early years of school. These services may or may not be part of State education systems. This definition encompasses the range of prior to school education and care services available to children including preschool, kindergarten, nursery school, and child care.

Introduction

Policy imperatives frame and shape the implementation of early childhood education and care

systems in particular ways and are bound by social understandings of childhood, children, and the role of the family. Since the spread of formal early childhood education with the nineteenth-century kindergarten movement, there have been significant shifts in how early childhood education and care is understood and provided through policy interventions in many, mainly minority world, countries. It is a domain, often uneasily posited, at the intersection of multiple policy spheres, including education, welfare, and workforce. Since the turn of the second millennium, policy for early childhood education has been subject to considerable scrutiny internationally through the international flow of research and the influence of world policy institutions (e.g., the OECD and World Bank). This scrutiny has been driven by multiple factors including the challenges of disadvantage and inequality, changes in demography, changes in how the institutions of early childhood education are constituted and understood, and considerations of the enactment of children's rights.

Policy and Policy Imperatives

Policy is designed to steer practices toward desired futures. Formal policy documents articulate objectives and frequently seek to mandate or guide how these objectives are to be achieved. Importantly, policy encompasses more than text and is manifest through how texts are translated into practice, as well as choices and silences about preferred courses of action (Press and Mitchell 2013). The term “policy imperative” is used to describe and capture the stated objectives driving policy choices, the framing of the problem to be addressed through policy, and the underlying (and often unarticulated) beliefs and values underpinning policy.

Early childhood education and care systems vary significantly across national contexts in their purpose as well as in how they are organized. These variations have been explained in various ways. In an examination of the marked differences in policy approaches to child care in France and the United States, White (2009) argues that the

ideas underpinning policy choices, specifically the interaction of “norms, frames, and programmatic ideas” are key to explaining how different systems emerge. Thus policy solutions are shaped when policy actors put forward the “right” programmatic ideas using the “right” policy frames that resonate with extant norms to convince policy decision-makers. Rigby et al. (2007) argue that policy design choice, for instance, government investment in public child care or reliance upon the market, shapes not only what the system looks like but also how the policy problem is understood. Most policy scholars agree that policy regimes leave institutional legacies that are highly influential in determining the general direction of future policy.

Policy imperatives provide another way of understanding variations in the nature of early childhood education and care systems and enable an understanding of these variations within, as well as across national contexts. Attention to the policy imperatives at play is particularly useful for understanding early childhood education and care systems because this sector sits at the intersection of multiple policy domains in a way that is distinct from that of education systems for older children and adults.

Following the emergence of formal early childhood education with the nineteenth-century kindergarten movement, policy for early childhood education has been shaped by objectives related to welfare, women’s equality, educational achievement, and the workforce needs of the economy. It has also had to negotiate competing views about the role of the family and the State in relation to responsibilities for the development and well-being of young children. More recently, the ratification of the *United Nations Convention on the Rights of the Child (UNCRC)* in 1989 has lent momentum to advocacy for early childhood education and care policy to be based on a commitment to children’s rights. Each broad policy domain shapes early childhood education and care systems in distinct, and at times, competing ways. How (and whether) children’s rights and interests are conceptualized and enacted within each policy framing is contested.

The Family or the State: Where Does Responsibility for Children’s Early Education Rest?

Children’s right to education is enshrined in Article 28 of the *United Nations Convention of the Rights of the Child*. This article states that, in particular, primary education should be “compulsory and available free to all.” Although a number of global policy institutions, such as the Organisation for Economic Cooperation and Development (OECD) and the World Education Forum (WEF), promote universal access to early childhood education (OECD 2001, 2006, 2012, WEF 2015), this exhortation does not enjoy the same degree of unanimity as children’s access to school education. In part this is because the desirability of early childhood education and care for infants and very young children is strongly contested. Such contestation arises from competing discourses of motherhood, conflicting understandings of the conditions considered necessary to children’s healthy development, concerns regarding young children’s vulnerability, and competing views about the nature and extent of State intervention in care and education. In an essay canvassing Western philosophical constructions of childhood in early childhood education, Davis (2010, p. 289) writes that the education of very young children “(m)ore than any other stage in child development...foregrounds the relations of private to public, family to community, maternal sustenance to civic welfare.”

At the end of the nineteenth century, many kindergarten advocates emphasized the responsibility of mothers for children under 2 or 3 years of age by refusing the youngest children access to kindergartens. This position was reinforced later in the twentieth century by Bowlby’s maternal deprivation theory that emphasized exclusive maternal care for the first 3 years of life. Thus, for much of the previous century, the assumed family norm informing early childhood education and care policy was of one parent in the workforce (usually the father) and one parent at home (usually the mother) responsible for children and the domestic sphere. As a result, early childhood education and care in many minority world

nations focused on older children in the years before school and paid scant attention to younger children and infants, except in cases where the family was deemed unable to provide appropriate levels of care. In addition, although some governments' policies strove for universal access to early childhood education for older children, the policies of other governments sought only to provide access as a compensatory measure for children facing risks to their development.

Feminism and Women's Participation in Paid Labor

In the latter third of the twentieth century, feminism has been instrumental in driving significant shifts in early childhood policy, particularly in relation to the expansion of childcare provision. The availability of child care enables mothers with young children to engage in paid labor and to participate in the public sphere. It thus becomes a strategy to support women's equality.

As women's participation in paid labor has become a norm in many nations, economies have become reliant on women's contribution. Hence government policies to support child care are often now framed as key labor force strategies.

Welfare

Early childhood education and care policy objectives concerned with welfare are usually concerned with outcomes related to children. In more recent years, however, such policy has also sought to achieve welfare objectives concerned with parents.

The kindergarten movement evident in many minority world nations at the end of the nineteenth century was associated with philanthropic interventions on behalf of children living in poverty and children who were often poorly nourished and living in cramped and unsanitary conditions. Similarly, in the first few decades of the twentieth century, the nursery movement emerged to provide for the babies and very young children of mothers who worked from necessity, because they were widowed, deserted, or otherwise unable to

rely upon their husbands for support. These were interventions targeted to specific groups of children deemed to have particular needs because of the failure of the family or the State to provide adequately for their healthy development. Nursery care in particular was often described in terms of being an unfortunate necessity.

In more recent decades, a number of highly influential longitudinal studies (e.g., the Effective Provision of Preschool Education study 2004) have affirmed the positive impact of high-quality early childhood education and care for children who face risks to their healthy development and/or who are at risk of school failure. In his review of longitudinal studies, Nobel Prize-winning economist James Heckman (2006) concluded that early childhood education and care was the most cost-effective intervention for children facing disadvantage.

Another version of early childhood education and care as a policy response to welfare emanates from changes to family formation, in particular, increasing numbers of single-parent households (predominantly female headed). Child care enables women to maintain employment, post-childbirth and regardless of family composition, and thus reduces the likelihood of children being raised in poverty. Hence, acting as a buffer against poverty, child care mitigates the risks to children's development that poverty may pose.

Rights and Citizenship

The widespread ratification of the *United Nations Convention on the Rights of the Child (UNCRC)* at the turn of the 1990s has generated increasing attention to the rights of young children. Rights considerations not only concern the entitlement rights of children to particular services such as education, they also focus upon how rights might be manifest *within* services.

Article 3 of the *Convention* states that the best interests of the child should be a primary consideration in all actions concerning children. Thus, attention to the daily experiences of children within services (rather than anticipated outcomes from attendance) and how children's citizenship is

played out within early childhood education is also an important objective.

The Impacts of Policy Imperatives

Because early childhood education and care intersects diverse policy domains (e.g., education, women's equality, welfare, and labor), the policy imperative becomes critically important. Each policy imperative comes with a tendency to privilege particular aspects of early childhood education and care. Thus the imperative is highly influential in determining which children and families have access to early childhood education and care services, what the service system looks like, as well as the content and the nature of children's experiences within such settings. Additionally, the multiple and sometimes competing imperatives at play can result in policy incoherence within nation states as well as helping to explain differences across nation states (Fig. 1).

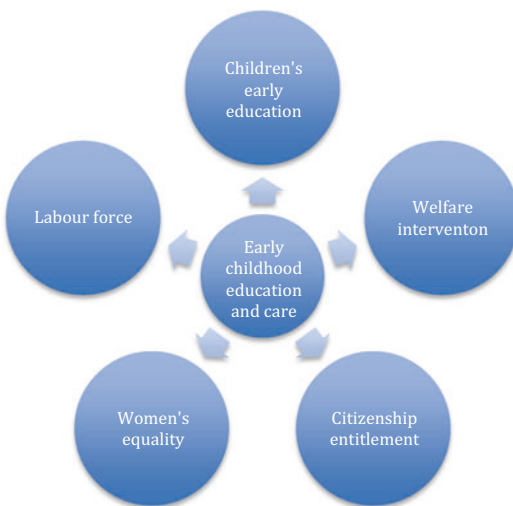

The following section canvasses the tendencies toward particular policy outcomes associated with each policy imperative. This is followed by a short discussion of the policy problem this poses for the development of early childhood education and care systems.

When the primary policy imperative for the provision of early childhood education and care is to enable women's paid employment, it is positioned as an adjunct to workforce participation (either as an emancipatory measure or as an economic measure). In this case, the policy tendency is to prioritize outcomes of childcare accessibility and affordability. That is, policy focuses on supply – ensuring that there are sufficient numbers of child care places to meet demand and containing the cost to families. Child care is often made available for children from a young age.

When the primary policy imperative for the provision of early childhood education and care is related to welfare objectives, the policy tendency is to target the provision of services to particular individuals, groups, or localities. Eligibility for government-supported provision is determined typically through the application of assessment criteria and might include economic or social indices, or health, ability, or welfare assessments.

When the primary policy imperative for the provision of early childhood education and care is related to educational outcomes, provision may be universal or targeted. In universal systems, provision is often (though not always) limited to 1 or 2 years before school entry. As educational discourses strengthen in early childhood education and care, early childhood policy analysts point to the risk of the “schoolification” of curriculum in early childhood education and care. That is, creating early childhood curricula that more closely resemble those of schools and the loss of play-based pedagogies that have traditionally distinguished curriculum for very young children.

When the primary policy imperative for the provision of early childhood education and care is within a discourse of children's rights and citizenship, the policy tendency is to attend to the experiences of children within such programs and to nurture children's values and dispositions for democratic life. So, for instance, the OECD report *Starting Strong II* recommends that early childhood education and care systems “support broad learning, participation and democracy” (p. 218)

Policy Imperative in Early Childhood Education and Care, Fig. 1 Policy domains intersecting early childhood education and care

and safeguard communal, interactive, experiential, and social contexts for children's early learning.

The Policy Problem Policy Imperatives Pose

Policy interest in children's early care and education is exemplified by the OECD's production of four *Starting Strong* reports – international policy reviews of early childhood education and care (2001, 2006, 2012, 2015) in addition to the *Babies and Bosses* (2007) report which canvassed issues of childcare provision as part of reviewing work and family policies. *Starting Strong I* adopted the term “early childhood education and care” to denote the inseparability of children's care and education. The need to adopt such a term in itself is indicative of the policy problem posed by the impact of diverse policy imperatives.

In many nations, policy for children's early education and care has been developed in a piecemeal manner as different policy imperatives give rise to different responses. Significantly, policy rationales for the provision of early childhood education and care may be driven by objectives unrelated to children, such as supporting parents' (read “mothers”) participation in the paid workforce. Even in cases where such rationales are primarily focused on children, there are tensions between whether the resulting service system is primarily a welfare intervention, an educational intervention linked, for instance, to ideas of school readiness or an environment constructed around conceptions of children's democratic practice and citizenship. Many other implications arise from the various policy imperatives at work in relation to early childhood education and care, including who should work in such services, how services are to be provided, from what age children have access, and the nature of early childhood curricula.

Nations' extant norms – including conceptualizations of children and childhood, the positioning of the family and the State, the perceived role of women and mothers in particular, and the emphases placed on governments and markets in the

provision of services – interact with the various policy imperatives at play in early childhood education and care, to shape early childhood education and care in particular ways.

Political Aspects of Assessment

Harry Torrance

Manchester Metropolitan University,
Manchester, UK

How a society selects, classifies, distributes, transmits and evaluates the educational knowledge it considers to be public, reflects both the distribution of power and the principles of social control (Bernstein 1971, p. 47);

You get what you assess; you don't get what you don't assess; you should build assessment towards what you want...to teach... (Resnick and Resnick 1992, p. 59).

Introduction

The above quotations demonstrate that politics, and political choices, infuse and permeate every aspect of assessment design and use. Everything that a society values cannot be taught in school, choices about curriculum content and teaching methods have to be made. In turn, everything that is taught cannot be assessed; again, choices have to be made, samples have to be constructed (via test items of various kinds). Thus what is assessed represents, and in practice comes to be regarded, as the most important elements of educational experience and curriculum content. This is sometimes known as the “backwash” effect, whereby what is assessed narrows and drives the curriculum in particular directions. However, Bernstein's argument goes beyond this. It is not that assessment inadvertently impacts on the curriculum and students' educational experiences, but rather the selections that are made about what to assess very specifically reflect what the most powerful in society value – and it is those values which influence and pervade the school curriculum. In advanced economies, this is academic knowledge and, to a lesser extent, specific skills and capabilities. This insight can be used to analyze the political implications of assessment (“evaluation” in Bernstein's terms) in relation to social control – who gets to learn what and with what consequences. As the old aphorism has it,

“knowledge is power” and control of access to knowledge is a powerful tool for the control of populations. However, this insight can also be used to drive the curriculum and schooling in particular directions. Thus Resnick and Resnick (1992) take the same broad insight and, in a sense, turn it on its head – if assessment is going to influence the curriculum and educational experiences so profoundly, then let's use it positively, to best effect, and not simply accept the taken-for-granted values of the powerful. Build better assessments, and you will lead education in the direction you want it to develop. Either way, the political implications of assessment are significant – influencing what is taught, how it is taught, by whom, and to whom.

Perhaps because so much development and analysis is undertaken in the relatively closed worlds of psychometric research and test agencies, assessment is often thought of as a largely technical aspect of educational systems. Assessment is designed and used to measure the capabilities and achievements of students and report on these to the students themselves, teachers, parents, employers, university admissions officers, and other users of test and examinations results. Here the argument is that assessment simply reflects what is taught and learned, it does not determine it. That examination results may carry very significant consequences for students is not often regarded as a political issue per se, though the uneven distribution of results across cohorts and social groups (for example, by social class, gender, and race) may raise political concerns about economic efficiency and social mobility. Rather, assessment is seen as a politically neutral way of measuring achievement and distributing social and economic life chances – distributing life chances on academic merit.

More recently, test results have begun to be used to evaluate schools, teachers, and even whole school systems through national and international testing regimes such as National Curriculum Assessment (NCA) in England, No Child Left Behind (NCLB) in the USA, National Assessment Plan Literacy And Numeracy

(NAPLAN) in Australia, the National Certificate of Educational Achievement (NCEA) in New Zealand, and international comparative test organizations such as the Programme for International Student Assessment (PISA, run by the Organisation for Economic Cooperation and Development, OECD). Even here however, with tests carrying potentially severe consequences for schools and teachers, the tests themselves are largely regarded as technical and neutral mechanisms for identifying the outcomes of education. Test results may feed into political decision-making, but tests and testing are not thought of as political in and of themselves; rather it is argued that they provide information for decision-making (OECD 2013). It can also be argued that test results focus attention on the outcomes of education, on the quality of what is produced, rather than the inputs, with this being especially important in developing countries (Pritchett et al. 2013). But taking a small number of outcomes measures (usually tests in language, maths, and possibly science) as indicative of the quality of an education system as a whole risks the corruption of the indicator as schools and teachers focus on teaching to the test (“you get what you assess”). Thus as test scores go up, educational quality may not necessarily be improved; it may even go down, as teaching to the test narrows the curriculum and the educational experience of students, even very successful students (and perhaps especially the very successful students). There is extensive evidence of this happening in the USA and UK (Torrance 2011). It is a trade-off that may be worth accepting in the short term in developing countries where the baseline quality of educational provision is still low, but not in advanced economies where schools must produce much more than a limited range of test scores. Furthermore, the distribution of life chances to individuals and the distributing or withholding of resources to and from particular schools and teachers are inherently political activities. For example, national testing and international comparisons routinely now involve redirecting public funding to successful schools and withdrawing it from unsuccessful schools through restructuring plans and even closure of so-called failing schools. However, it could

equally well be argued that comparatively unsuccessful schools, working in difficult circumstances, require *more* resource rather than less.

Historically, perhaps for a period of a hundred years or more from the 1860s to the 1960s, assessment was used to categorize, select, and certificate minorities of students: to identify and direct small numbers of the supposedly “feeble minded” to special institutional provision and to select small numbers of students for elite education and subsequently to certificate their academic achievements. Education was a scarce good, access to educational opportunities were limited, and educational assessment was largely concerned with selecting individuals for those limited opportunities: for access to an elite secondary education and access to university. In turn, grades and certificates were awarded to individuals at the end of particular courses of study, as they progressed through the education system. So the focus of assessment was on identifying individual achievement and particularly on selecting and certifying individuals. In so doing, this process functioned to identify and legitimate on grounds of educational merit, the identification of the next cohort of suitably qualified and socialized personnel for economic and social leadership roles in society. Selection and certification was done *by* relatively small elite groups, *of* relatively small elite groups, *for* relatively small elite groups and was underpinned by reference to the idea that innate intellectual ability was distributed along a normal distribution curve within a population (Sutherland 1984). Thus assessment developed as a political *technology of exclusion*, with school leaving examinations in particular, constituting a key mediation point in the articulation of schooling with the economy. The selection, tracking and progression of students through the education system, and the certification of their achievements, or lack of them, have functioned very directly to prepare, filter, and allocate groups of students into vocational and academic tracks and to identify particular individuals for specific roles and employment opportunities.

More recently, the focus and purpose of assessment has changed. The intellectual field and policy context now assumes that all, or at least the

overwhelming majority, of the population can and should be educated to the highest level possible. The focus is now on education for all and the development of a fit-for-purpose assessment system *as a system*, i.e., as part of an integrated approach to national human resource development. The imperative now is to treat education as an economic investment, both on the part of the individual student and on the part of government. How and why these changes have occurred could be the subject of a much longer chapter. Suffice to say that we now live in a world of intense global economic competition and mass movements of capital and labor. Unskilled mass production and employment opportunities have virtually vanished from developed economies, and the emphasis now is on education for the so-called knowledge economy and as a form of investment in human capital. Governments now need to develop assessment mechanisms which harvest and utilize the capabilities of the majority of their populations, rather than dispense with them, and thus assessment is now developing as a *technology of inclusion*. It is expected to accurately identify and report the individual educational achievement of the vast majority of the student population; in turn, such measures are also expected to accurately evaluate the effectiveness of individual schools (and sometimes teachers), while parallel international measures compare, contrast, and evaluate the quality and effectiveness of whole national systems of education.

Furthermore, the field of assessment studies has itself expanded and become much more sophisticated, exploring the relationships between assessment, teaching, and learning. Assessment is now expected to support and underpin the process of learning, not just measure the outcomes of learning. So, again, the expectations for the field are vastly more ambitious than was once the case and the political implications are multiplied as assessment comes to pervade every aspect of the teaching-learning process via formative approaches to assessment and not just through a generalized control of the curriculum. While the development of a more inclusive system may appear to be a more benign use of assessment, it remains a political use and, moreover, such inclusion attributes success and failure, and devolves responsibility for them,

very much down to the efforts of the individual student, teacher, and indeed parent (via their support for their children's learning), rather than locating success and failure at the level of institutional processes and selection procedures, as was the case previously (Torrance 2011, 2015).

So, assessment intersects with every aspect of an educational system and indeed of a social system more generally: at the level of the individual student and teacher and their various experiences (positive or negative) of the assessment process, at the level of the school or similar educational institution and how it is organized and held to account, and at the level of the educational and social system with respect to what knowledge is endorsed and which people are legitimately accredited for future economic and social leadership. Assessment controls the curriculum and, in turn, the work of teachers, and the educational experiences of students more generally; it allocates life chances and opportunities (or the lack of them) to individuals and in turn legitimates the idea of social and economic stratification on grounds of measured achievement and academic merit, and it renders diverse school systems commensurate and comparable with each other via international test programs (Lingard et al. 2013).

It might be argued that we need some mechanism to identify achievement, to mediate social and economic competition for scarce opportunities such as senior technical, administrative, and managerial positions, and indeed to allocate such opportunities to those best equipped to succeed and thereby benefit society as well as the individuals themselves. But much empirical evidence and theoretical analysis suggests that assessment processes and outcomes reproduce social and economic inequalities by reflecting the culture and values of the already successful, rather than identifying capability and achievement irrespective of social background (Bourdieu and Passeron 1977; Cassen and Kingdon 2007). This is also the implication of Bernstein's argument concerning the distribution of power – already powerful social groups control the content and procedures by which “merit” is defined. Not surprisingly it reflects their own accomplishments and behaviors. More recently, it has been suggested that

the development of new technologies and globalized competition is rendering even the traditional success of the “educated middle classes” vulnerable to obsolescence as many middle management and administrative tasks become ensconced in computer programs rather than the roles of employed individuals (Lauder et al. 2012). However, while such developments may threaten traditional definitions of social and economic success, they do not challenge the political role of assessment. Quite the reverse, they will intensify the political role of assessment in further rendering individuals responsible for determining their own futures (Torrance 2015).

Having said this however, it is also important to recognize that assessment is engaged in voluntarily and is not simply imposed on students and teachers in some arbitrary or conspiratorial fashion, though some specific versions of assessment are indeed imposed on school systems by government. Assessment in general is a ubiquitous feature of modern education systems precisely because different educational actors have an interest in developing and working with assessment. Examiners and test developers produce assessments to sell into an educational market (and an increasingly international and globalized market at that, selling tests is a multimillion dollar industry); teachers use assessment for purposes of motivating and controlling students in the classroom; and students submit to assessment because of the potential social and economic benefits that success can bring. Here we see both the political economy and the micropolitics of tests and testing at work – with test agency profits and people’s individual careers and career opportunities being very specifically promoted or inhibited by particular approaches to and uses of assessment.

So, the political aspects of assessment turn on our interpretation of some key questions and revolve around the role they play in controlling the overall trajectory and productivity of education systems. Does assessment merely measure what has been learned, or control what is to be learned, and how it is to be taught? Does assessment merely manage entry to the labor market and select and certificate the best equipped for the job or does it legitimate such selection by reference to academic

merit while masking the role that power and culture play in reproducing social and economic inequality? Do international testing programs such as PISA merely provide useful comparative evidence for national educational decision-making or do they deflect attention from the political nature of the interventions planned and the resource allocation choices that are then made, with assessment effectively substituting for policy and creating the policy problem it purports to address? Moreover, do international testing programs render national systems commensurate, comparable, and hence open to private commercial exploitation as it becomes easier and more profitable to sell the same test and textbook to 15 or 20 countries rather than just into one national system?

How we answer these questions will determine our position on the political aspects of assessment. Our answers will reflect, at least in part, our position within an education system, within the policy/practice nexus, and effectively turn around whether or not we can envisage more valid and equitable approaches to assessment, certification, and selection being developed. There is no shortage of advocates for other approaches to assessment – approaches which would involve a far greater range of educational outcomes being pursued, including the development of practical skills and abilities and the application rather than just the recall of knowledge. These could be pursued by developing more practical assessments of “authentic” tasks undertaken in situ and reported through various forms of “profiles” or “records of achievement” compiled over time by students themselves (Torrance 1995). Reviewing such approaches is beyond the remit of this entry, except to say that developing such approaches would still reflect the political aspects of assessment, but involve different political choices being made and different political and economic goals being pursued.

Political Economy of Charter Schools

Shawgi Tell
Nazareth College of Rochester, Rochester,
NY, USA

Synonyms

[Neoliberalism](#); [Profit](#); [Rights](#); [School choice](#)

Introduction

In order to understand charter schools and to avoid many of the confusions inherent in the charter

school debate, it is helpful to view charter schools from the perspective of political economy. Perhaps the main reason there are so many misunderstandings surrounding charter schools is because there is no reliance on political economy to make sense of them. The fact that we live in a culture that is anti-inquiry, anti-discussion, and averse to scientific renderings of phenomena contributes to this state of affairs. The dominant forces in society, such as Wall Street, big business, and their political and media representatives, have a direct interest in promoting mystification and incoherence about many critical issues. This keeps people disoriented and vulnerable to ideas and agendas that are not in their interest. Today, nearly every issue is spun to the point that no one knows what to believe any more. Maximum confusion is widespread. This incoherence and disinformation invariably harms the public interest and blocks the path of progress; it does not serve the majority.

Political economy provides us with rigorous conceptual tools which empower us to place any phenomenon, including charter schools, on a sound objective analytical footing. From the perspective of political economy, questions such as “are there any good charter schools?” or “how can we improve charter schools?” are superfluous. If anything, such questions are a frank admission that there are many lousy charter schools out there but somehow the concept and practice of charter schools is acceptable. Statements such as “charter schools are so diverse that it is undesirable to make generalizations about them” or “charter schools had noble, progressive, grass-roots origins” are also erroneous or misplaced. Such questions and statements miss the mark altogether and expose the absence of a rigorous approach based on political economy.

From the standpoint of political economy, the main question is: what is the relationship between charter schools and the laws governing the production and exchange of the material means of life? That is, to understand the nature of charter schools, when they emerged, why they emerged at a specific time, and who they really serve, we must examine the way production and exchange of the means to reproduce existence takes place in a particular society at a particular time. Without

rooting phenomena in the material production of life, we risk taking an ahistorical and decontextualized approach to phenomena.

To this end, this entry defines political economy and describes the political economy of charter schools. Special attention is paid to the law of the falling rate of profit and neoliberalism as they relate to charter schools. This entry also outlines an alternative to charter schools and existing production and exchange relations. Such an alternative is a human-centered society that provides human rights, including the right to education, with a guarantee; it is the negation of the present state of affairs. Rights belong to humans by virtue of their being and for no other reason whatsoever; they cannot be given or taken away and must be guaranteed from birth to death.

Political Economy

Engels (1877) states that “Political economy, in the widest sense, is the science of the laws governing the production and exchange of the material means of subsistence in human society” (p. 104). Political economy examines how humans produce and exchange what they need to live, including the relations they enter into with each other in the course of this production and exchange. This production and exchange of products is the basis of every society because there can be no life, history, or development without the production of the means of existence. Engels goes on to clarify that while production and exchange “constantly determine and influence each other,” they are different functions because “Production may occur without exchange, but exchange – being necessarily an exchange of products – cannot occur without production” (p. 104). Not all societies have produced products for the purpose of exchange because not all societies have had a well-developed social division of labor and a system of private ownership. Such societies are a very recent phenomenon, historically speaking, and emerge and grow in relation to the development of the forces of production. Furthermore, because production and exchange often vary from country to country and from generation

to generation, “Political economy is therefore essentially a historical science” (p. 104). No mode of production lasts forever. Everything contains its own negation and is in a constant process of *becoming* (Malott and Ford 2015).

Under capitalism, the highest development of commodity production, products are produced mainly for exchange and profit, not for meeting social needs. If something is not profitable, it will not be produced, regardless of whether society needs it or not. A commodity is anything that can be bought and sold. Under advanced commodity production, society coordinates products and exchange through the market, through the so-called invisible hand, what Marx called the law of value, which is why chaos, anarchy, and violence are ever present. Slumps and crises are endemic to such an unplanned economic system because conscious human organization of the economy is continually negated by the old capitalist relations and ideas. Production and consumption cannot be harmonized when the socialized economy is separated into privately owned competing parts. The result is perpetual crisis.

Every commodity has a use value and exchange value, which means that every commodity is simultaneously an object of utility and a bearer of value. The substance of this exchange value, abstract human labor, was discovered by Marx. Undifferentiated human labor, labor stripped of its particular useful form (e.g., weaving, baking, plowing), forms the essential content of value. “[A] commodity,” writes Carchedi (2011), “contains value, crystallised human labour in the abstract” (p. 5). In this view, all labor can be reduced to the expenditure of human brains, muscles, nerves, and limbs. No matter what it is, nothing can be produced without human energy. This capacity, as opposed to the useful forms it takes, imparts to products their value. Unlike use value, which is tangible and readily perceived, value is not something one can touch or readily observe. It can be grasped only through the power of abstraction. More than anything else, value represents the way production and exchange are organized in a particular society; it is fundamentally a *social* relation. Or, as Carchedi (2011) puts it, “Value cannot be observed, only labour can” (p. 8).

Under capitalism, workers do not own the means of production; they lack the wherewithal to provide for their own existence and livelihood, which means that they must sell their ability to work to the capitalist, who *legally* owns the means of production. Capital (dead labor) expands only by exploiting workers (living labor), which is why workers and capitalists have opposing interests. In this setup, workers, who are the source of all value, are alienated from both the production process and the products of their labor; they have no control over the world they themselves create. From a capital-centered perspective, workers are a derogatory cost of production, a burden, and a liability. This view conceals the fact that it is owners of capital who are unproductive, superfluous, and a drain on the economy and society. It is actually the capitalist who is a liability and has no right to be (Malott and Ford 2015).

The magnitude of value is determined by the average work time required to produce something useful. It does not matter what is being produced, whether it is bread, cars, or houses – all are the products of the same common social substance: human labor power. While the use value of a commodity stems from the specific type of work one is engaged in (e.g., baking bread, manufacturing cars, building houses), its value (or exchange value) stems from the average labor time it takes to produce it. Thus, something that takes on average 10 h to produce possesses more value than something that takes on average 7 h to produce. As productivity increases, the value of a commodity falls because it can be produced faster.

Law of the Falling Rate of Profit

Building on the work of his predecessors, Marx showed that under capitalism, competition and the real threat of extinction pressure major owners of capital to constantly improve the forces of production and productivity so as to stay ahead of others and maximize profits. Regardless of their personal values and intentions, any capitalist who becomes complacent about these inescapable pressures quickly finds themselves out of the game. This is why what a capitalist believes or

intends is irrelevant; the logic of capital is decisive. You live and die by the market whether you like it or not (of course, if you are too big to fail, then you are too big to jail, and you will get an enormous financial handout from the government). New technologies, machinery, and techniques must be introduced on a continual basis in order to stay ahead. The alternative is to fall by the wayside.

However, this drive to outcompete others and seize more surplus value invariably causes the rate of profit to decline in the long run. In *The historical transience of capital*, Maito (2014) shows that since the mid-to-late 1800s, despite periods of boom and bust, the rate of profit has steadily declined in 14 major countries (including Germany, the USA, Japan, the United Kingdom, and China). The data reveal a long-term tendency to economic breakdown, showing that capitalism is not capable of infinite development. Uninterrupted extended reproduction is impossible under advanced commodity production and private ownership of the means of production. For more than a century, the torturous business cycle has ruined the lives of millions at home and abroad. Naturally, official political economy claims that anarchy and crisis are natural and inevitable and that there is no alternative to this destructive state of affairs.

Roberts (2009) explains that “when the organic composition of capital rises (i.e., the amount of capital invested in plant, machinery and equipment relative to wages and benefits to the workforce), then the rate of profit for the capitalists will eventually fall” (p. 55). As more is invested in machinery and technology (constant capital), and less on wages and salaries (variable capital), the more the rate of profit declines. Machinery cannot add value to products, it simply *transfers* value. Labor is the only source of profit. Only labor can add value to products. Surplus value has no other source. And since profit equals unpaid labor, the aim of the capitalist is to convert paid labor into unpaid labor. Accordingly, if variable capital (i.e., living labor, the only source of value) is continually diminished while constant capital is continually increased, then the rate of profit (which differs from the *mass* of profit) is bound to decline.

While capitalists use many destructive ways to counter this inevitable decline in the rate of return on investments (e.g., intensifying worker exploitation, layoffs, monopolizing markets, going to war, tearing up contracts, mergers, bankruptcies, militarizing the economy, establishing State-organized pay-the-rich schemes, eliminating social programs, increasing debt, and intensifying antisocial public opinion), they cannot overcome the law itself; it is inescapable and affects the economy as a whole.

Today there are few, if any, profitable investment opportunities for major owners of capital; everything is tapped out; markets are saturated. Especially after the Great Recession of 2008, which has now turned into a long depression, all major investments have declined or stopped. The world's major economies (including India and China) are either anemic or slowing down. Stagnation is widespread. Unimpressive economic forecasts are continually revised downward, while representatives of the financial oligarchy go so far as to openly declare that we may never see the weak economic growth that preceded the Great Recession.

Capitalists are simply not investing. Traditional or typical sources of profit have largely disappeared. Instead, major owners of capital are relying increasingly on what Henry Giroux calls *casino capitalism*, or financial parasitism, to satisfy their unlimited greed. This is where the focus of the economy shifts from value creation to (real and fictitious) value appropriation. For capitalists, determining how to *redistribute* real and fictitious wealth increasingly replaces the actual *creation* of new wealth. The so-called real economy declines, while manipulation of newly created toxic and exotic fictitious financial instruments, along with trillions of dollars in *quantitative easing*, thrives. This retrogressive trend has only intensified in the neoliberal period and shows no signs of letting up.

Neoliberalism

Neo means *new* while *liberalism* refers to the economic doctrine of laissez-faire capitalism, the so-called free market. Neoliberalism refers to the

free market in a new form. Neoliberalism is capitalism under new and different conditions, conditions which differ markedly from previous eras. And because neoliberalism is global, we may use the expression neoliberal globalization to refer to the imperialist character of globalization.

Neoliberalism is the latest iteration of capitalism; the form capitalism has taken in major economies since the late 1970s. It is a concerted attempt by the ruling circles to reverse the falling rate of profit, which takes sharp downturns at specific points in time, in this case starting around 1980. Its main components include privatization, deregulation, repression, and abdication of government responsibility for the well-being of the people. It takes the form of phony austerity programs around the world, with Greece serving as the most vivid recent example of neoliberal pillaging.

Neoliberalism entails the elimination of many social programs and social welfare state arrangements brought into being, mainly through the struggles of millions of workers, during the first and middle parts of the twentieth century. It reverses many of humanity's achievements. It continually imposes cuts in wages, salaries, benefits, pensions, unemployment insurance programs, and more, increasing insecurity and misery for millions. Parks, libraries, sanitation and administrative services, utilities, roads, water, prisons, schools, healthcare – all are being privatized at a faster rate under neoliberalism in order to reverse falling profitability. Inequality, debt, unemployment, underemployment, and poverty have reached new levels under the neoliberal antisocial offensive. None of these assaults on workers, the middle strata, the public interest, and the society could have been achieved without the increased involvement of the State on behalf of major owners of capital. Public authority and public right have essentially disappeared in the neoliberal period.

Charter Schools

Charter schools, now numbering about 6,500, are first and foremost a political-economic project

that emerged squarely in the context of neoliberalism. They did not emerge before the onset of neoliberalism and have nothing to do with education reform. In fact, charter schools appeared less than ten years after the publication of the infamous 1983 *A Nation at Risk Report*, which called for the broad neoliberal restructuring of American education.

For major owners of capital, charter schools, also known as *contract* schools, represent a main way to transfer public funds, assets, and authority to the private sector so as to counter falling profitability. When a student enrolls in a charter school, public per-pupil funds, mostly State and federal, but sometimes local funds too, flow from the public school to the charter school. Annually, this drains billions of dollars from public schools, especially chronically underfunded, segregated, urban public school systems attended mostly by poor and low-income minority students. Venture philanthropists (e.g., Bill Gates), seedy lawyers and real estate developers, hedge fund managers, movie and sports celebrities, and millionaires of other stripes have all jumped on the charter school bandwagon in the context of a failing economy in order to get a piece of the nearly one-trillion-dollar public education budget. Hundreds of millions more in public funds come from the federal Charter Schools Program launched in 1994.

Currently, 44% of all charter school students in the USA are enrolled in a school owned and operated by an education management organization (EMO) (Miron and Gulosino 2013). The real figure is likely higher. EMOs are essentially privatized for-profit organizations. However, it does not matter if we are talking about for-profit or nonprofit charter schools though because both engage in for-profit arrangements and both embrace the free market and competition (winning and losing). Their contractual nature makes this possible. Contract schools stand *outside* long-standing governance arrangements in American public education and make privatization and marketization possible by operationalizing the public-to-private transfer of wealth and authority. Oman (2011) notes that a “Contract is the quintessential legal institution of a market economy” (p. 1). Contracts codify and

legitimize exchange relations under advanced commodity production.

The core error with this approach is that education is not a commodity. Education is not a business. It cannot be bought and sold like beef jerky or chewing tobacco. Schools cannot be opened and closed like a shoe store. Students, parents, and teachers are not consumers or products. Education is a basic human responsibility that a modern society must guarantee so that society moves forward. To subject education to the chaos, anarchy, and violence of the free market is irresponsible and profoundly counterproductive. It ensures constant instability and upheaval – hardly good conditions for teaching and learning. This is why teacher, student, and principal turnover rates are very high in charter schools (Miron and Applegate 2007; Stuit and Smith 2009). It is also why 88% of charter schools are not unionized (National Alliance for Public Charter Schools 2010) and many, if not most, practice selective enrollment patterns that contribute to an already segregated school system (Rotberg 2014) and skewed results on curriculum-narrowing high-stakes standardized tests produced by a handful of for-profit companies. For extensive information on unethical and illegal activities in charter schools across the country, see *Charter School Scandals* at <http://charterschoolscandals.blogspot.com>. For their part, Baker (2012), Green and Mead (2004), Karp (2012), Lubienski and Lubienski (2014), Saltman (2010), and others have shown why charter schools are not public schools.

The Way Forward

There can be no progress so long as the government serves major owners of capital and tramples on people’s rights. The government must restrict monopoly right and take up its responsibility to provide human rights, including the right to education, with a guarantee. Choice in education means removing government responsibility for education and subjecting it to the violence of the free market in the name of providing opportunities to poor and low-income minority students. It is the opposite of what is needed.

As part of a modern nation-building project, the government must fully fund a high-quality public education system open to all. It must also provide the rights to food, shelter, clothing, healthcare, pensions, and work with a guarantee. Rights belong to humans by virtue of their being and for no other reason whatsoever. Rights are not privileges. They cannot be given or taken away and are not based on competition, contracts, ability, wealth, race, sex, language, religion, or national origin. Human needs are not negotiable and cannot be reduced to a matter of policy.

In order for education, healthcare, work, and more to be guaranteed for all, the people must have control over the socialized economy. So long as the socialized economy remains in the hands of the top one percent, uneven development, instability, slumps, crises, chaos, and anarchy will increase. Millions will suffer unnecessarily and things will continue to go from bad to worse. This is why the fight for political empowerment is paramount. The right of the people to govern and decide their own affairs, including economic affairs, is critical. Workers and all progressive forces must deprive owners of capital of their ability to deprive everyone else of their rights.

Workers themselves must decide what is produced and consumed, as well as when and where it is produced and consumed. All the main sectors of the economy must be controlled by the people. Private interests that seek to distort and extort the economy cannot be tolerated. The economy must be oriented to increase the material and cultural well-being of all instead of serving the narrow private interests of a tiny ruling elite. The contradictions between socialized production and private ownership, mental and manual labor, and use value and exchange value must all be overcome so as to develop society and the economy in an all-sided, conscious, and planned manner. Anarchy in production and exchange is inconsistent with modern requirements.

Only under such conditions will education be fully funded, high quality, and open to all. With people in control of their livelihoods and destiny, no longer will there be a need for charter schools and other school-choice schemes that purport to

serve students and society but really enrich a handful of capitalists. The problem is not one of money because there is an overabundance of resources in society. The issue is: *who decides?* The financial oligarchy is unwilling and unable to use the social product to serve the public interest and advance society. It is fully committed to the neoliberal agenda. Only the working class and people can provide a new direction for society, an alternative to the existing society and the outmoded system it is based on.

Populism

Manuel Anselmi
University of Perugia, Perugia, Italy

Introduction

Analyzing educational phenomena means understanding factors which are not merely pedagogical but above all social. This is especially true for the Latin American context, where some social and

power structures strongly influence educational activity as, for example, populism, which before being a political reality is a social phenomenon interwoven in the fabric of the population. Aspects of the populist mentality which affect institutional education programming are reproduced through educational devices. Thus there exists a deep correlation between education and populism: to understand the first, we must not neglect to study the second.

Populism is a political phenomenon which has returned to affect many political and social contexts of the globe in the last few decades after a season in which it had seemed relegated to only a few areas like Latin America. By populism we mean a power relationship based upon a direct rapport between a charismatic leader and the people (Canovan 1981). On the basis of popular consensus, it offers itself as an alternative to a constituted power (establishment) and develops a political discourse based upon a rigid juxtaposition between us and them. Contemporary scientific debate on populism is focused on some crucial aspects such as its definition and its relationship with democracy: the new form of media populism.

The first scientific studies on this theme occurred in the period between the two wars. They were prevalently historical in character and took as their subject of interest the first forms of American populism from the second half of the nineteenth century and the Russian populisms (*narodniki*) occurring slightly later. Successively the conclusion of the fascist experience in Italy contributed to a further scientific research on the subject. For all that it is impossible to sustain that fascism and populism are the same thing, even so on an analytic level they do have a lot in common, such as the mobilization of the masses and the presence of a charismatic leader. The great difference is that fascism availed itself of a strong and strategic ideology, while populisms have always made recourse to tactical and composite ideological forms.

For a good part of the second half of the twentieth century, this term referred to extra European experiences for the most part or at least countries outside of the group of the more advanced western

democracies. Populism particularly seemed to be a prerogative of Latin American governments where the charismatic relationship between the leader and people took on a patriarchal connotation. In this sense the case of Argentinean Peronism had an almost paradigmatic function.

With the end of the 1990s in the period following the collapse of the Soviet Bloc, we see new forms of populism, which have been defined neo-populisms to distinguish them from previous populisms. Not only at the margins of the more advanced societies, but even in more consolidated democracies, we witness the birth of very robust forms of populism. This is the case of the populisms of the European right, such as Haider in Austria and Bossi and Berlusconi in Italy, or also the case of Latin American populisms, personified by leaders such as Chávez, Evo Morales, and Correa, who represented the so-called Latin American “left turn” in the first decade of the new millennium. Today we can count populist entities in many countries in many areas of the world: from Russia to Thailand, to Turkey, to Spain, and to Latin America. In Italy we have a populist political context with several political forces in competition with one another structured on the basis of this characteristic: Berlusconi, the Northern League, the Five Star Movement, and the current premier Renzi.

On the level of populism analysis, we have different orientations of study. Margaret Canovan, for example, provides a first classification of populisms, which still has great value today. Canovan declares repeatedly the need for a systematic study in sociological terms of populism so that “Populism becomes a sociological category rather an historical one” (Canovan 1981, p. 299). Canovan identifies two macro-categories: the first one which she defines agrarian populisms, the American People Party, and Russian populism is part of this category; the second one, which she calls political populism, is formed by the populist dictatorship, populist democracy, reactionary populism, and politicians’ populism.

By agrarian populisms Canovan means both the farmers’ radicalism in the USA and the peasant movements of Eastern Europe, particularly Russian populism. The first is represented by

those protest movements on the part of agricultural producers, who, in the second half of the 1800s, repeatedly launched protest actions with the purpose of claiming economic autonomy when it came to deciding the prices of their products. The objective of this movement was to detach itself from its subordinate position with respect to the federal monopolists who, owning the means of distribution of the products, profited outrageously to the detriment of the producers. From the very first protest actions, these producers showed themselves to be an extended community of resistance, and within a few years, they came to found the People's Party with an effective rhetoric based on the formula of "plain people." Canovan stresses that it was not just a socioeconomic phenomenon based on the claims of agricultural producers, but rather a sociopolitical phenomenon of revolt against the dominant plutocratic elite and national politicians, which for the first time in the history of the USA were able to express a form of "radical democracy" (Canovan 1981, p. 58).

The case of *narodnichestvo*, Russian populism, is profoundly different. If American populism is something that arises from within society and from the deepest needs of economic and political representation of the social base, Russian populism is instead the result of an elaboration made by an intellectual elite. It was a populism of the intelligentsia that was proposed to the rural social classes, whose doctrine was aimed to hypostatize and glorify the rural lifestyle in anti-modern protosocialist terms and on the basis of a sentiment of rediscovery of Slavic roots. American populism arose from the people as a form of self-awareness in the wake of a rebellion; Russian populism took its moves from young intellectuals who, abandoning bourgeois and metropolitan life to stay near the peasants, often rediscovered their orthodox and patriotic roots. In this case, in fact, there was the elaboration of an ideology which contributed more than a little to the development of the struggle against tsarist autocracy, often resulting in acts of terrorism. The end of this movement was decreed by the establishment of the Bolshevik regime.

Political populisms are such because their focus is political rather than agrarian. It is conceivable, however, that there may be cases in which an agrarian populism is also political or that a political populism may contain elements of agrarian populism. In political populism, elements such as the urban dimension, the presence of charismatic leadership, and/or structured political parties are preeminent.

The first kind of political populism which Canovan presents is the "populist dictatorship," and to illustrate she indicates two paradigmatic examples: the Argentinean Juan Domingo Perón (1895–1974) and the American Huey P. Long (1893–1935). In both cases, Canovan underlines the special condition of widespread social uprooting of citizens as the condition that creates possibility of populism: a widespread individual disorientation that acts as a lever to the rhetoric of redemption proposed by the leader and which permits a positive outlet for social resentment. They are phenomena of collaboration between classes, hardly ascribable to a single ideological logic, but highly anti-elitist and characterized by an extraordinary mass mobilization through means of a leader's just as extraordinary charismatic ability. This kind of populism has an effect of weakening democratic institutions and favoring the personalization of the political dimension. Precisely because of this dynamic of mass consensus, these populisms have more things in common with fascism and Nazism.

Populist democracy is the second type of political populism. With this expression are meant all the forms of populism which strive for a considerable increase of political participation and a government of the people. Populist democracy is therefore a radical democracy where the aspects of the representation of the people and the mediation between the governing classes are reduced to the minimum. All the movements that require greater direct democracy in clear opposition with representative democracy and its dysfunctions are part of this subtype. Canovan includes the case of McCarthyism in this area of analysis. Studied by Shils in his famous book *The Torment of Secrecy* (Shils 1956) as a populist social reaction in a political context of democratic elitism, it was the

spread of a popular mentality which simplified the terms of political issues, coming to assume highly uncivil and violent positions. In contrast, Switzerland is a case of concrete, or perhaps it would be better to say institutionalized populist democracy. Government procedures established by the Swiss constitution are, in fact, a rare example of accomplished radical democracy. The people have the possibility to intervene in many crucial questions of political life through referendums and participative forms. The reason for this political regime, which may be considered unique, is the peculiarity of the process of formation of the Swiss State. Unlike other States which were created through a top-down process, Switzerland came into being through a bottom-up evolution of a federal kind among the different cantons. Canovan also presents what may be the extremes of populist democracy, which have often been pointed out by neo-elitist critics: the risk, for example, of a tyranny of the majority in which minorities are not adequately represented; the tendency of public opinion to influence government policy in a non-objective and distorted way, based on the oversimplification and over-dramatization of issues; or the loss of authority and legitimacy of the elected government due to a social logic of exaltation of the popular point of view, but also a loss of authority and prestige of office on the basis of an absolute egalitarianism.

Reactionary populism is characterized by an antiprogressive, nationalist, and often xenophobic and traditionalist ideological content. The return to the people is conceived as a return to roots and a refusal of every element of progress. In this form of populism, the contrast is therefore between a popular base that is identified in its retrograde and reactionary cultural forms against the elites and their progressive and cosmopolitan culture. Therefore this kind of populism is often in sharp disagreement with intellectuals and all forms of avant-garde art. Canovan identifies a typical example in the politician George Wallace, governor of Alabama famous for his positions in favor of the defense of racial segregation of blacks.

Politicians' populism is the last one of the political populisms according to Canovan's classification. More than anything else, it is a political

style expressed through their actions and political practices. The "catch-all people's parties" and all those organizations that are found in the democratic dimension without necessarily desiring a radical structural change, but find strength in direct popular consensus, belong to this subgroup. The concrete political forms where it is possible to find this populist style range from what is called anti-politics to personalist parties to radical coalitions. Canovan gives the example of Jimmy Carter for the USA, who defined himself personally as a populist or the Partido de la Revolución Mexicana PRI. The structural characteristic of politicians' populism is the tactical nature of populism, which consists of using popular appeal as a means of renewing consensus and social legitimacy to realign from time to time political action with the requirements of the context. In this case, the paradoxical nature of the concept of "people" is evident more than ever: if, on the one hand, it is ambiguous, vague, and undefined; on the other hand, at the social level, precisely because of this vagueness, it allows forms of political inclusion, even only momentary and limited, which renew politicians' power.

Canovan's latest studies focused precisely on the people as an abstract political concept, but also as a widespread social representation conditioning the citizens' actions. Populism is set in a wider horizon of problems which goes back to the nature of the western State, so that it is impossible to understand populism as a feature of contemporary democracies unless you reconstruct genealogically the progressive centrality of the people and of popular sovereignty in constitutional forms, in political culture, and in political theory. The people are thus a widespread social concept among the citizenship which not only legitimize political authority but also have the possibility of changing it, according to what Canovan calls sovereign people in reserve.

It is possible to catalogue the principle theories on populism in at least three different approaches as Gidron and Bonikowsky have clarified: populism as a political ideology, populism as a political style, and populism as strategy.

The theories that consider populism an ideology hark back to the concept of "thin-centered"

ideology elaborated by Michael Freeden. According to these authors, populism is in fact a subtle and limited ideology, typical of the new postmodern context and after the end of the great twentieth-century ideologies. The most significant representative of this theoretical orientation is Cas Mudde (Mudde 2007). Mudde explains that populism is a set of ideas on politics and on society which is structured on a macro opposition of *us* against *them*, where *us* is the people while *them* coincides with the elite. Populism is thus always an anti-elitist ideology in a context where the elite coincides with the power establishment. This aspect of juxtaposition between an *us* and a *them* follows an *ingroup-outgroup* logic highlighted by Teun Van Dijk (1998), where every ideology develops a discursive logic of social representations according to which everything that belongs to the sphere of *us* is inclusive, positive, and enhancing, while everything belonging to the sphere of *them* is excluding, negative, and diminishing. Applying this logic to populism presupposes the first sphere being associated with the people, while the second belongs to the elite enemy of the people and to all which opposes the people.

The second approach conceives populism as a form of discourse. The most significant exponents are Laclau and Panizza (Laclau 2005; Panizza 2013). These scholars essentially interpret populism as a means of protesting and engaging in politics on the basis of a communicative style geared toward the claim of a majority of society against the dominating elites. Especially Laclau's writings have permitted a relative revaluation of populist forces. Keeping especially in mind the Latin American cases of progressive matrix populism of the first decade of the present millennium, Laclau has explained how populism may be the political discourse interpreted by the excluded part of society in a subordinate context with respect to the elite. Thanks to the populist discourse, a new democratizing perspective is possible in a context where democracy is merely formal and oligarchic tendencies prevail.

The third type of approach considers populism as a strategy and thus essentially a form of social political mobilization and organization (Weyland

1996; Jansen 2011). Concentrating our attention on the social dynamics which underlie the populist phenomenon, these bring to light aspects such as social mobilization, social polarization, the institutional crisis which precedes the populist ascent, and the role of leadership in regard to all this.

The increase of populisms in the last decades on a global scale has not only been a matter of quantity but also a matter of quality. Today in fact we can find numerous types of new populisms and new labels. We speak in fact of media populism to indicate those forms of populism which are based on forms of social consensus through the media, one example was the case of Berlusconi in Italy and his use of television to impose a political domination, or we speak of web populism to indicate specifically strategies of consensus which use the Internet; we also speak of ethno-populism to define that type of populism based on a strong ethnic connotation of the people in question, as in the case of Evo Morales's movement in Bolivia (De la Torre 2007).

In addition to political populism, other forms of populism exist such as penal populism. This type of populism regards the forms of pressuring and alteration of the justice system by politics. Penal populism is not necessarily tied to a charismatic figure or leader, but it is made up of a series of procedures and situations. Amplifying and distorting the risk of criminality during electoral campaigns, failing to make recourse to statistical data, or making criminal trials glamorous and hyping them up, altering their perception by public opinion, and pressuring the judges are some examples.

Beyond the complexity due to the multiple forms of populism, this phenomenon poses a profound problem with regard to the concept of democracy. Populism may be considered either pathology of the forms of political representation that emerges when the classical mechanisms of mediation in representative governments enter into crisis. However it may also be seen as an intrinsic form of democracy because it is profoundly tied to popular sovereignty, one of the cornerstones of modern democracies. The people's rallying cry in such a strong and absolute

way typical of populist forces may even be perceived as an excess of democracy. Certainly the action of criticism of the establishment fostered by populism is a form of delegitimization of the established order and of the preexisting symbolic social scene; thus populist action constitutes a possibility of social change of the forms of citizenship and of democratic participation in a more direct and vertical direction.

Postcolonialism, Development, and Education

Dip Kapoor

University of Alberta, Edmonton, AB, Canada

Introduction

This entry considers the colonial contexts of development, including development as neocolonialism in the postindependence period, followed by a consideration of the role(s) of education designed for development and the attendant academic or literary postcolonial critiques of postwar development and education. Often neglected in academic postcolonial scholarship, anti-/decolonial postcolonialism emergent from the works of scholar activists and indigenous and land-based sovereignty politics and related conceptions and practices of development and education in the postcolony are also given due consideration.

Colonial Developmental Contexts and Civilizing Missions

The French Enlightenment political philosopher Antoine-Nicolas de Condorcet in his book, *Outlines of a Historical View of the Progress of the Human Mind*, proffered the following questions: Will all nations one day attain that state of civilization which the most enlightened, the freest, and the least burdened by prejudices, such as the French and the Anglo-American, have attained already? Will the vast gulf that separates these people from the slavery of nations under the rule of monarchs, from the barbarism of African tribes, and from the ignorance of savages little by little disappear? According to Condorcet, these immense countries, to arrive at civilization, appeared only to wait till Europeans furnished them with the means, at which point they would instantly become friends and disciples. David Hume, the Scottish philosopher and ostensible founder of modern political science, writing in

1754, suspected that Negros and in general all the other species of men were naturally inferior to the Whites, i.e., there never was, according to Hume, a civilized nation of any other complexion than White nor even any individual eminent either in action or speculation. Civilizational and racial deficits were translated into knowledge and educational inferiority prompting the British anti-slavery activist Thomas Macaulay to pontificate that even a single shelf of European literature was worth all the books of India and Arabia. He subsequently suggested the liquidation of indigenous culture through the linguistic colonization (by English) of the Indian educational system in the early nineteenth century.

The self-proclaimed civilizing responsibility and alleged racial superiority referenced by these Europeans were notably predicated upon various expressions of colonial developmental violence including slavery, genocide, unbridled exploitation of natural resources and labor, and oft irreversible restructuring of local political economies toward capital, a unique distinction of modern European colonial (racialized) capitalist development (Quijano 2000; Rodney 1972). These emasculations are variously documented in colonial critiques forwarded by the likes of Eduardo Galeano (*Open Veins of Latin America*), Walter Rodney (*How Europe Underdeveloped Africa*), Hamza Alavi (*Capitalism and Colonial Production: South Asia*), Syed Hussein Alatas (*Myth of the Lazy Native: Malaya*) and Pramoedya Ananta Toer (*The Buru Quartet: Indonesia*), Dadabhai Naoroji (*Poverty and Un-British Rule in India*), and Frantz Fanon (*Wretched of the Earth: Africa*).

Eduardo Galeano (1973), with reference to the sixteenth-century Spanish silver extraction from the Potosi mines of Bolivia, noted that if one took all the silver mined from this hill, it could build a bridge from Potosi to Spain, while another bridge could also be built from Potosi to Spain with the bones of the Inca slaves who died in these mines (eight million Incas are estimated to have died during Spanish silver extraction). Belgian colonialism is estimated to have resulted in the deaths of ten million Congolese killed in the pursuit of rubber and ivory wherein native refusal to tap rubber for the colonialists often meant losing a

hand or a life. The eighteenth–nineteenth-century exploits of the British East India Company in Bengal, the richest State at the time, included the introduction of English landlordism, the tripling of land taxes, the dispossession of some 20 million small holders including forced conversions to growing opium for export to China (see Opium Wars), the eventual destruction of the local textile industry, and the subsequent famine-related deaths of a third of the population (ten million people), prompting then governor-general William Bentinck to comment that the bones of cotton weavers were bleaching the plains of India and that such misery could hardly be found in the history of commerce.

Frantz Fanon concluded that “Europe is literally the creation of the Third World. . . an opulence that has been fuelled by the sweat and the dead bodies of Negroes, Arabs, Indians and the yellow races” (1963, p. 76), while Mohandas Gandhi, when asked by a journalist what he thought of Western civilization, is rumoured to have replied with cynicism that it would be a very good idea.

Postwar Development and Education

A century and a half later since Condorcet and Hume and shortly after the Second World War, as the colonized worlds achieved statehood and official independence from their colonial occupiers, this racialized civilizing mission of the European powers became the ideological foundation of the postcolonial colonial modern development mission (Duffield and Hewitt 2013; Levy and Young 2011) echoed in the Point Four Program (or Fair Deal aimed at spreading the promise of science, technology, and industrialization) promulgated by President Harry S. Truman of the USA, for the “Third World”: a spatiotemporal-political pejorative, if not fallacy, drawn from nineteenth-century French economic demographer Alfred Sauvy’s use of the term referring to the marginal Third Estate or *Tiers Monde* in France. An emergent neocolonialism (see Kwame Nkrumah) soon defined the continued exploitation of the “officially independent” colonies in the continued interests of Euro-American

capitalist development. Over two-thirds of the world's people from Africa, Asia, Latin American, and the Caribbean were consigned to the dustbin of history as backward, traditional, deficient, and once again in need of Euro-American aid, tutelage, and beneficence (via the Development Project; see Philip McMichael) in all matters of being but primarily in relation to the economic and ostensibly to address poverty through international state-capital-centered Euro-American modernization (Escobar 1995; Rist 2002/2014).

The subsequent installation of Bretton Woods institutions (e.g., IMF and World Bank) controlled by the imperial powers (e.g., voting rights according to capital shares) in the context of the Cold War together provided the institutional architecture for what has been dubbed as the Marshall Plan for the "Third World." Contemporary United Nations expressions of this project include the Millennium Development Goals or MDGs (2000–2015) and the recent Sustainable Development Goals or SDGs. Both sets of goals include focuses around education and literacy, while the World Bank continues to be the dominant funder and global developer of these educational initiatives. Development theorists and theory (Peet and Hartwick 1999) play an integral part in informing these institutions and goals and in addressing the perennial project of Kipling's White Man's Burden, potentially ensuring that neocolonialism continues to transform the capitalist modern West from a geo-temporal entity to a psychological category wherein it seems "the West is now everywhere, within the West and outside, in structures and in minds" (Nandy 1983, p. xi).

For development economists (dominant for the first two postwar decades), whether liberal, classical Marxists or neo-Marxists (see Dependency Theory and World Systems Theory critiques of capitalist modernization and the "development of underdevelopment theory" – influential from the 1960s to the early 1980s in Latin America), decolonization was a matter of adopting industrial development predicated on scientific rationality and the inescapable tide of technological advance along capitalist (or its Keynesian welfare variants) or socialist political-economic revolutionary historical trajectories.

In the *Theory of Economic Progress* written in 1944, C. S. Ayres proclaimed the inevitability of industrial life and values while claiming that the irrational values of prescientific and preindustrial (tribal) cultures were doomed. Sociological theories of modernization, including psychosocial and behavioral theories proposing traditional–modern binaries, imposed disempowering and homogenizing deficit constructions on traditional societies and peoples (Third World), which were colonially productive if not tautological. Sociologists Alex Inkeles and David Smith compared (evaluated) Ahmadullah (rural/traditional man) to Nuril (urban/modern man) in Bangladesh. The American psychologist David McClelland set out to demonstrate need achievement scores (low- and high-achievement countries) and differentials warranting achievement motivation training interventions (education) to stimulate economic development in the "Third World."

These initial theoretical foundations of the macro development project were also instructive for theorizing education and international development (McCowan and Unterhalter 2015). In keeping with the modernizing Zeitgeist, neoliberal capitalist development necessitated an education which trained and enhanced worker's skills for economic growth and productivity while measuring educational worth in terms of returns on educational investment (Human Capital Theory). Neo-Marxist theories encouraged a revolutionary critical education (toward socialism) which addressed economic exploitation and the reproduction of inequality (including de-linking from First World dependency) inevitably linked to capitalist modernizations. Micro-perspectives on (alternative) development based on radical democratic and humanist traditions stimulated various forms of local/community and individual empowerment schemes through participatory learning and action for local development predicated on transforming consciousness and the development of a just society (see ► Freire, Paulo (1921–1997)); and liberal egalitarianism emphasized educational opportunity to equip all individuals for full participation in a democratic society and a humanized capitalist economy addressing basic needs, human rights, human development (all capacities),

gender, the environment and citizenship, and good governance, i.e., an education which assumed and reproduced liberal (reformed) market colonialism and imperialism. This was, by some accounts, a product of both the Communist threat during the Cold War and as part of an exercise in the management of discontent associated with poverty and inequality caused by market-led development, if not the rising tide of expectations stimulated by consumer capitalism.

The *World Education Crisis* signaled by Philip Coombs in the early 1970s put mass modern (capitalist) education (and education equals schooling and associated nonformal interventions) on the development map, eventually prompting the World Conferences on Education for All (e.g., Jomtien, Thailand in 1990) and related MDG and SDG inclusions insisting on the global expansion of modern schooling as a self-evident good, i.e., professing an educational ideology (education cures all) while maintaining a deafening silence around the question of educational neocolonialism(s) and cultural imperialism being reproduced via EFA in the postcolonial era (an alleged historical rupture from the colonial period as per this dominant rhetoric).

Literary (Academic) Postcolonialism, Development, and Education: Discursive and Representational Interventions

Addressing postcolonialism and development, Christine Sylvester suggests that one field begins where the other refuses to look. While both fields are preoccupied with the “colonies” and North–South relations, there are predictably significant (debatable) points of tension and difference (McEwan 2009, p. 2) including:

1. Applicability, where development knowledge (economics) invites translation into practice (mainly macro solutions/interventions), while academic postcolonialism (literature) mainly concerns itself with critiquing colonial discourse and representations;
2. Theoretical objectives, where development is concerned with modernist transformation

based on universal concepts and plans, while academic postcolonialism seeks to question and undo “development” as a Eurocentric invention masquerading as universalist; and

3. Methodologically, where development is selectively ahistorical (e.g., colonial silence), macro, and measurement focused, while academic postcolonialism is preoccupied with the (colonial) historical, micro-experiential (difference/context) and culture, representation, identity, and discourse.

The academic (literary) postcolonial scholarship of Edward Said pertaining to *Orientalism* and *othering*; Homi Bhabha and the unintentional subversive potential of *hybridity* and *mimicry*; Gayatri Spivak and the question of *subalternity*, *representation*, and *articulation*; and Dipesh Chakrabarty’s discursive attempts to unseat Europe as the sovereign theoretical subject, i.e., *Provincializing Europe* to disrupt intellectual dependency and recognize other knowledge(s) (see Raewyn Connell’s *Southern Theory*) have provided the basis for postcolonial critical engagements with the Development (Theory) Project on these and other counts (McEwan 2009), including in relation to dominant conceptions of education for development.

Postcolonial education (in relation to grand narratives pertaining to development and beyond) (McCowan and Unterhalter 2015) deconstructs dominant conceptions of development, related “othering,” and caricaturing through binaries (e.g., traditional–modern) and dominant representations and prescriptions while stimulating critical educational pedagogies (pursuing decolonization of the mind) which, for example, globalize curricula based on comparative-solidarity and selective inclusions of marginalized knowledge(s), if not complete lobotomies as in the case of languages (see *Ngugi wa Thiong’o*); emphasizes critique and a pedagogy of ethics and hope to encourage empathy (not detachment) as opposed to compassion-based approaches in vogue in development education; and questions academic development tourism and field research by academics while suggesting a need for self-reflexivity (unlearning of privilege, acknowledging complicity, learning

to learn from below, etc.) in these cross border/cultural engagements (McEwan 2009). Decolonizing education, research, and knowledge production in the interests of epistemic and cognitive justice and pluralizing the quest for universals and global citizenship are some primary concerns of an academic postcolonial education and development engagement.

According to Chandra Mohanty (see *Feminism Without Borders*), however, while discursive categories are clearly central sites of contestation, they must be grounded in and informed by the material politics of everyday life, especially the daily life struggles for survival of those written out of history. That said, as another body of critical colonial theorizing suggests, academic contestations over discourse/knowledge and education/development (mental decolonization) not only need to be informed by but also need to actively engage in/with the material politics of everyday life and these struggles for survival.

Anti-/Decolonial Postcolonialisms, Development, and Education: Indigenous, Peasant, and Land-Based Sovereignty Politics

While “development studies” rarely listens to the subaltern, the academic and literary postcolonialism of the comfortable classes tends not to be concerned with material politics or with, according to Christine Sylvester, whether the subaltern is eating.

Anticolonial (revolutionary nationalisms and place-based movements), anti-capitalist, indigenous sovereignty (decolonial), and modified socialist politics worked out in and through concrete social struggles offer other colonial critiques, conceptions, and practices of development and education that register historical and continuing material projects generally overlooked by academic and literary postcolonialists and developmentalists alike. These formulations are informed by an engaged-activist intelligentsia of the likes of Frantz Fanon, Walter Rodney, Amílcar Cabral, Ranajit Guha, and Jose Mariátegui, to name a few possibilities while also germinating

from various social struggles in semirural indigenous and small/landless peasant regions and contexts of the postcolony (e.g., Zapatista Army of National Liberation or EZLN movement in Chiapas, Mexico; Landless Workers Movement or MST in Brazil). Colonialism, after all, meaning to cultivate, inhabit, and guard as derived from *colere* in Latin, was and continues to be about land as is also evident in the current land-grab practices of richer States and agribusiness in economically exploitable regions (“Third World”) akin to the empty land hypotheses or the legal basis (doctrine of discovery) for the same during the colonial Age of Discovery.

Sharing a concern for material exploitation with Marxist scholarship and revolutionary politics, Euro-American development and education are variously critiqued, bypassed, resisted, or radically reconstructed in different contexts of the “postcolony” through anticolonial and anti-proletarian material (developmental) struggle over land (dispossession) and labor (servitude). Unlike developmental and educational modernizations predicated on capitalist or Marxist (and in-between) incorporations into the historical pathway of Europe and America, many indigenous scholars anticolonial revolutionary critics proposed conceptions and relations with land as central to political economies and cultures. This enabled a land-based anti- or decolonial politics which jettisoned incorporations into the colonial imperatives of capital (i.e., privatization imperatives of land and agro-industrial colonizations of rural spaces and bodies) and Marxism (i.e., prognostications of inevitability around capitalist dispossession of land and exploitation of labor and revolutionary class struggle thereof from within and against capital and toward modern industrial socialism).

Karl Marx dismissed rurality and peasants as counterrevolutionary in sociopolitical terms, while the idea of revolution was appropriated by the Marxist class-based project. Anticolonial revolutionary activists and intelligentsia affirm the political and revolutionary possibility of the indigenous and the peasantry as anticolonial revolutionaries informed by a land-based sovereignty. According to Zapatista Subcomandante

Insurgente Marcos (2001) of the EZLN in Chiapas, Mexico, the problem is that they want to take our land so that our feet have nothing to stand on. In the Algerian context, Frantz Fanon (1963) notes that for the colonized “land is the most meaningful” as it is “the land which must provide bread and, naturally dignity” but all the colonized “has ever seen on his land is that he can be arrested, beaten, and starved with impunity” (p. 9). He affirms that in “colonial countries only the peasantry is revolutionary. It has nothing to lose and everything to gain” and that “colonialism only loosens its hold when the knife is at its throat” given that it is incapable of reasoning; as a “naked violence” (p. 23). Some Marxist historians and activists in the Indian and South Asian context similarly addressed a peasant and tribal subaltern (sacral) politics in an attempt to write histories from below and register subaltern agency/history and organization in/from a potentially autonomous (from elite nationalist or imperial) political domain (Guha 1982), expressed today as a politics of sovereignty in some rural struggles addressing development dispossession (Harvey 2003) in the “postcolony.”

In theoretical, materialist, and political terms and as a continued critique of economic exploitation, anti-decolonial postcolonial developmentalists have suggested that Marxist imperatives break down in colonial contexts as colonial political-economic structures actually thwarted (halted or disrupted) class formation that accompanies (from a Marxist perspective) the development of market production and therefore the prospects for class-based revolution/politics.

This denial of the historical process of development (colonization stopped indigenous history) of national productive forces, a violent colonial usurpation, called for a revolution that did not change history (Marxism) but restored it by linking a colonial future to the precolonial past, not as nostalgia but as a renewed continuity (Cabral 1979; Marcos 2001; Mariátegui 1996). Speaking in relation to the contexts of Cape Verde and Guinea, Amílcar Cabral calls for a counterforce to restore the history of the colonized, one that takes back the land from the Portuguese colonialists who have taken the land in

order to “halt our history for us to remain tied to the history of Portugal as if we were a wagon on their train” (Cabral 1979, p. 32). The basis for common ground and political-economic unity subsequently had less to do with class (which was not significantly introduced as suggested) than it did with a unity of/around territory; taking back the land for those who have lived in the same place and ensuring that its production is for their own use, i.e., are the economic activities on a given land supporting its inhabitants?

According to this proposition, the relationship between a land and (indigenous) population is seen as the key to historical development as opposed to the history of class struggle and development and education (for development) as modern industrial civilizational progress. In so doing, the likes of Cabral and Marcos, if not Fanon and Guha, variously affirm and restore the historical agency (and history) of peasant and indigenous collectives denied under Marxist historical prognostications singularly tied to the class struggle in relation to capital and the European historical journey (hence the charge of Eurocentrism) and a case in point pertaining to the *Local Histories/Global Designs* proposition (see Walter Dignolo).

Indigenous development socialisms (Mariátegui 1996), for example, are put forward on material and political (and not just normative and utopian) grounds while pointing to the superior productivity of pre-Incan communalism based on *ayllu* (community) and practices like *minga* (collective labor) when compared to the Spanish colonial capital-feudal *criollo* estates and *haciendas* while acknowledging the political significance of myth as motivation and inspiration (what subalternists in Asia refer to as a fundamentally religious subaltern politics) for strong collective bonds to account for Peru and Latin America’s varied indigenous political experience from Europe and the individualistic and isolated French peasant, prompting Marx’s pejorative analogy comparing them to a sack of potatoes (disunited and politically impotent). The strong links between community and land (basis of political struggle) make communal modes of production for local needs politically feasible, if not desirable even on normative, spiritual, and historical grounds as stressed in an indigenous sovereignty

politics of decolonization (Marcos 2001; Meyer and Alvarado 2010; Sankaran 2008).

Education as formal schooling by the neocolonial developmentalist state (and private interests) under these localized conceptions of development and sovereignty based on historical and collective modes and ways of being linked to land as place, territory, and history is a space of colonial contestation against domination. Parallel if not entirely different spaces of education are often put forward in these contexts of struggle. In illustration, Raul Zibechi points to three examples of “education born in the basement of our societies” (borrowing a Zapatista phrase) “by those without” referring to Indians and peasants in (1) a school created by a community/*ayllu* (e.g., Warisata, Bolivia), (2) the “dislocated school” in a movement (e.g., Landless Workers Movement or MST, Brazil), and (3) the Andean and Zapatista schools encouraging the art of learning (e.g., *Kichwas* weaving) (Meyer and Alvarado 2010, pp. 317–328).

With their respective contextual and political variations, a similar anti-/decolonial sovereignty-related land-based developmental politics and education are informing myriad and current food sovereignty struggles (see Food First, GRAIN, War on Want or Journal of Peasant Studies), anti-development dispossession (e.g., by mining and agribusiness land grabs) movements, and indigenous and small/landless peasant politics in numerous locations of the “postcolony” (see The Via Campesina indigenous and small/landless peasant “postcolony” network organization).

These anti-/decolonial postcolonial activisms and associated demands for sovereignty based on the notion of land held in common and *comunalidad* (Meyer and Alvarado 2010) (also see *Ubuntu* and African Socialism) contradict Lockean liberal conceptions of land as private property and modern capitalist developmental claims based on superior productivity for profit and the related deployment of *terra nullius*. Postcolonial engaged-activist theories and material movement practices continue to register a contemporary relevance, however unspectacular under the terms of a modern colonial capitalist Zeitgeist,

if not a continued developmental and educational relevance derived from a material and cultural history pre-dating the Enlightenment and the coloniality of Euro-American power, development, and an education for development.

Postmodernism and Education: Relevance of Deleuzian and Guattarian Perspective for Education

Pieter-Jan Decoster
KA Koekelberg, Brussel, Belgium

Introduction

This entry will elaborate on the philosophy of Gilles Deleuze, both alone and in collaboration with Félix Guattari. In the first section, their philosophy will be regarded as a tool of analysis in relation to Western society. Deleuze's concept of *Control Societies* will be introduced to discuss what the French philosopher Jean-François Lyotard conceives as the postmodern condition.

Additionally the first section will point out what the task of philosophy could consist of from a Deleuzian and Guattarian point of view. In an age of professional training, they argue that doing philosophy requires a *pedagogy of the concept* (Deleuze and Guattari 1994[1991], p. 12). In the second section, their philosophy will not be regarded only as a tool of analysis but as way of living and thinking in relation to the present. Their stance toward philosophy will be illustrated by discussing how nonphilosophical aspects of life – such as cinema, literature, science, and art – are incorporated in their work. In the third and final section, the relevance of philosophy as conceived in the first two parts will be discussed in relation to education.

From Disciplinary Societies Toward Control Societies

In *The Postmodern Condition: A Report on Knowledge* (1984[1979]), Lyotard shows that in the history of Western societies, there is a movement from a modern relationship with knowledge and truth toward a postmodern relationship. From the Enlightenment period onward and until the Second World War, knowledge predominantly received its legitimization in relation to the truth and subjective ideals recognized by a Western, rational society. Lyotard discusses Humboldt's nineteenth-century idea of *Bildung* to exemplify how a modern relationship with knowledge translates itself into a general edification of the subject (Lyotard 1984, p. 33). However, from the 1950s onward, there is a delegitimation of this relationship with knowledge. In the contemporary, post-industrial society, and postmodern culture, the grand narratives of the *Aufklärung* have lost their credibility in favor of the principle of performativity, which translates itself into an almost exclusive obsession with efficiency and effectivity (Lyotard 1984, p. 37, 47–53). Lyotard's famous report on knowledge thus shows that the business model can be considered as the blueprint for contemporary postmodern society.

In *Postscript on Control Societies* (1995 [1990]), Deleuze takes a similar stance. Deleuze

speaks of a transformation from Michel Foucault's *disciplinary societies* toward *control societies*:

[Disciplinary societies] initiate the organization of vast spaces of enclosure. The individual never ceases passing from one closed environment to another, each having its own laws: first, the family, then the school ('you are no longer in your family'); then the barracks ('you are no longer at school'); then the factory; from time to time the hospital; possibly the prison, the preeminent instance of the enclosed environment.

(Deleuze 1995, p. 177)

Disciplinary institutions like the family, the school, the military, the hospital, and the prison literally confine the individual to a specific place, with specific rules to follow. Lyotard's analysis of modern education which edifies the subject through *Bildung* can be situated within such a disciplinary institution. These institutions, in Foucauldian terms, *enclosed* the subject from the eighteenth century onward and thrived in the first half of the twentieth century.

Like Lyotard, Deleuze recognizes World War II as a fundamental turning point, after which there is an acceleration of new forces which push the old institutions of the disciplinary societies into a crisis. Reform after reform is being announced, "but everybody knows that these institutions are finished, whatever the length of their expiration periods" (Deleuze 1995, p. 178). The model of the corporation or business has replaced the model of the factory in every segment of society, including the field of education. In the disciplinary society, you always restarted from zero; "you went from school to barracks, from barracks to factory" (Deleuze 1995, p. 179). The individual belonged to the masses, which were governed in the different enclosed environments like schools, factories, and prisons. In control societies, however, the business model dominates all these environments, and "you never really finish anything" (Deleuze 1995, p. 179). For Deleuze and Guattari, Kafka's novel *The Trial* is very important because it shows a society constantly shifting between discipline and control. *The Trial* stands in between discipline and control, illustrating both modern and postmodern strategies. The novel is about "apparent acquittal (between two confinements) in disciplinary societies, and *endless*

postponement in (constantly changing) control societies" (Deleuze 1995, p. 179).

Nowadays, Western societies are already deeply transformed into control societies. With the business model at its core, it creates rivalry and competition between individuals. Philosophy, Deleuze and Guattari argue, has not remained unaffected by "the general movement that replaced Critique with sales promotion" (Deleuze and Guattari 1994, p. 10). This is in line with Lyotard's analysis, who argues that in the postmodern society, knowledge has received a specific role it functions as an economic resource. In *What is philosophy?* Deleuze and Guattari describe an age of commercial professional training, where companies claim to be the friend of creativity and *the concept*, the core of philosophy, which has been shamefully picked up by information services and engineering. For now the question will be addressed how Deleuze and Guattari conceive philosophy should respond to this state of affairs. In the third section of this entry, the relevance of this point of view will be discussed in relation to education.

Only a *pedagogy of the concept* can prevent us from this "disaster for thought" (Deleuze and Guattari 1994, p. 12). However, philosophy should not be conceived as the post-Kantian task of creating a universal encyclopedia. In *A thousand plateaus* (1987[1980]) and in relation to their well-known concept of *the rhizome*, they clearly distance themselves from the position of the all-knowing philosopher king. In this sense, Deleuze and Guattari do not argue for a return toward a relationship with knowledge which characterized the modern, disciplinary society. Deleuze and Guattari do not see philosophy fundamentally as a tool of analysis. In fact, doing philosophy implies going beyond the inclination of the analyzed and compartmentalized and dividing structure, to live and think differently. Therefore a pedagogy of the concept should be conceived as an act which releases the subject from identities, in favor of a movement in thought, this way releasing the possibility of thought. However, the pitfall is that today doing philosophy is reduced to superficial, ready-made texts or activities. It is not difficult to use the concepts of Deleuze and Guattari to talk

about brainstorming, the fragmentation of life, the connections that are possible, the networks, etc. Therefore the second section of this entry will elaborate what a pedagogy of the concept nowadays could consist of. What does it mean, from the perspective of Deleuze and Guattari, to create concepts and avoid both analytic, dogmatic intellectualism on the one hand, and commercial, superfluous communication on the other?

The Relevance of Nonphilosophy for Doing Philosophy

In *What is philosophy?* the post-Kantian focus on a *universal encyclopedia of the concept* is contrasted with a *pedagogy of the concept*. Doing philosophy is not about having a just idea but about just having an idea, which consists of researching, time and again, under what conditions, a new concept can be created. This can be exemplified by studying how Deleuze and Guattari interpret the importance of non-philosophy for what doing philosophy is about. Consider how they create a way of thinking in relation to the concept of “the rhizome” in *A thousand plateau* (1987). To think rhizomatically, and more in general, to do philosophy by creating concepts, involves considering how a thought or an event always can be approached through multiple ways. A rhizome is a stem of a plant, from which a new plant can arise at any time. Bulbs, tubers, rats, burrows, potatoes, and couch grass, however, are also examples of the rhizome. Deleuze and Guattari interpret Kafka’s literature as rhizomatic. *The Trial*, for example, grows from bureaucracy and systems of justice. Deleuze and Guattari use this concept as a force to react against a way of thinking deeply rooted in Western reality. To describe this Western way of thinking, they use the image of the tree or the root which “endlessly develops the law of the One that becomes two, then of the two that become four . . .” (Deleuze and Guattari 1987, p. 5). Deleuze and Guattari describe accounting and bureaucracy as trees or roots but also psychoanalysis and linguistics such as Chomsky’s grammaticality (Deleuze and Guattari 1987, p. 7).

In contrast to this, “to be rhizomorphous is to produce stems and filaments that seem to be roots, or better yet connect with them by penetrating the trunk, but put them to strange new uses” (Deleuze and Guattari 1987, p. 15). The pitfall consists of interpreting the rhizome as a metaphor. As the Dutch philosopher Henk Oosterling argues, for Deleuze and Guattari, the world should not be interpreted *like* a rhizome. The metaphor suggests that a clearly identifiable reality exists, which the rhizome would then represent (Oosterling 2012, p. 188). In contrast, to write and to think *is* rhizomatic and results in a continuous becoming (Oosterling 2012, p. 191). “That about which is being written and how it is said are not juxtaposed as substance and form, but interweave, as content and expression” (Oosterling 2012, p. 197, my translation). Deleuze and Guattari are aiming at the possibility of a different kind of thought, and the nonphilosophy they use, such as literature, mathematics, painting, cinema, or concepts such as the rhizome, is to be interpreted as metonymic for this possibility.

A clear example of the relevance of non-philosophy for doing philosophy is Deleuze’s cinema theory in *Cinema 1* (1986[1983]) and *Cinema 2* (1989[1985]). Deleuze does not use cinematic images to strengthen a particular point of view but rather researches what the implications are when the mind thinks “cinematographically.” For Deleuze, cinema always shows the world; watching cinema is a way of being connected to the world. It shows aspects of the world “in the process of being formed or dissolving through the movement of lines and points taken at any-distant-whatevers of their course” (Deleuze 1986, p. 6). “Cinema” comes from the Greek word “kinetic,” meaning “a motion.” As an art form, it has the potential to offer an experience of the world in which thinking does not think any more through a given method or a “presupposed image of thought which determines our goals and our methods when we try to think” (Deleuze 2004[1968], p. xv). Cinema is a practice of images and signs, created by great directors who think through moving images and create compositions of “images and of signs, that is, a pre-verbal intelligible content” (Deleuze 1986, p. ix). Deleuze conceived cinema as an

automaton. What is important is that in line with Walter Benjamin, he believed that the task at hand is not to tame cinema but precisely to allow it to be an automaton and to render it spiritual. Deleuze conceptualizes his spiritual automaton as always consisting of two contradicting states of mind which nevertheless coincide. Cinematic movement and time influence the spectator who is conscious and unconscious, active but also passive, critical yet at the same time surrendering completely to the experience. Or as the French film director Robert Bresson puts it, cinema allows the spectator not to see what one is already thinking, but to think about what one sees (Bresson 1975).

Heidegger said: 'Man can think in the sense that he possesses the possibility to do so. This possibility alone, however, is no guarantee to us that we are capable of thinking.' It is this capacity, this power, and not the simple logical possibility, that cinema claims to give us in communicating the shock. It is as if cinema were telling us: with me, with the movement-image, you can't escape the shock which arouses the thinker in you. (Deleuze 1989, p. 156)

Accordingly, in Deleuze's work, both alone and in collaboration with Guattari, instead of a set of principles or a clearly delineated methodology, it seems rather that a philosophical attitude or *ethos* is coming to the fore. In fact, doing philosophy seems to imply an *ethos as methodology*. Deleuze and Guattari introduce the question what philosophy is by referring to a "moment of quiet restlessness, at midnight, when there is no longer anything to ask" (Deleuze and Guattari 1994, p. 1). Furthermore, "the friend who appears in philosophy no longer stands for an extrinsic persona, an example or empirical circumstance, but rather for a presence that is intrinsic to thought, a condition of possibility of thought itself, a living category, a transcendental lived reality" (Deleuze and Guattari 1994, p. 3).

The Significance of Deleuze and Guattari for Education

The first and second sections of this entry accentuated two different ways of looking at Deleuze and Guattari's work. In the first section, it was

exemplified that their philosophy can be used as a tool of analysis in relation to (aspects of) Western societies. In what follows, this way of thinking will be discussed in relation to the current state of affairs in education. As we saw in the first section, Deleuze's *Postscript on control societies* clearly refers to a cultural and economic shift where old institutions are crumbling down in favor of new societal forms of organization. As a consequence, knowledge and learning and education are legitimated differently as well. Vis-a-vis the economic productivity of society, knowledge has become a primary resource. In a postmodern society, individuals select the knowledge they need "à la carte" in their specific contexts (Lyotard 1984, p. 49). This way, however, learning is not perceived as merely learning facts or insights as opposed to the modern idea of *Bildung*, in which learning was directly related to shaping a personality. Indeed, it cannot be compared to the modern idea of edification anymore. However, it does have a purpose as we can relate it to the business model Deleuze mentions or the performativity principle of Lyotard. Concretely this entails that when relating to knowledge, the individual is constantly preparing him or herself for the job market. Learning today does not simply imply that time and again, as long as one lives, one merely has the capacity to access information. Rather, it is "the capacity to actualize the relevant data for solving a problem "here and now" and to organize that data into an efficient strategy" (Lyotard 1984, p. 51).

In the light of both Deleuze's and Lyotard's hypotheses, the language of the UNESCO World Report clearly shows what learning is about nowadays:

The 'learning' model has spread far beyond the world of education, into every cranny of economic and social life. It is now increasingly accepted that any organization, profitmaking or not, needs to strengthen its educational, 'learning' side; and here it is important to note that the rise of this pattern coincides with that of innovation generally, in all areas of human activity. (UNESCO World Report 2005, p. 57)

This quote is indicative that the way education is perceived nowadays, indeed, is transforming

from education as a means to edify the subject toward a focus on learning based on a business paradigm the way Deleuze conceived it:

[S]chool is being replaced by *continuing education* and exams by continuous assessment. It's the surest way of turning education into a business. (Deleuze 1995, p. 179)

Factories formed individuals into a body of men for the joint convenience of a management that could monitor each component in this mass, and trade unions that could mobilize mass resistance; but businesses are constantly introducing an inexorable rivalry presented as healthy competition, a wonderful motivation that sets individuals against one another and sets itself up in each of them, dividing each within himself. (Deleuze 1995, p. 179)

In this quote, we read an important reference to the individual, which should be taken into account when thinking about how in education nowadays the emphasis lies on individual, student-centered learning. The individual is not enclosed anymore like in the disciplinary society but rather exposed to perpetual rivalry which “sets itself up in each of them, dividing each within himself.” According to this model of the corporation, “*perpetual training* tends to replace the school, and continuous control to replace the examination” (Deleuze 1995, p. 179). If the factory and its workers are metonymic for the economic life in the disciplinary society, the business corporation and its employers are metonymic for the conditions in which we find ourselves today. Education, instead of shaping a character toward adulthood, would then organize the training of each individual to become an active participant of society and to relate to knowledge predominantly, if not solely, from an economical perspective.

This brings us to the relevance of what doing philosophy consists of as described in the second section of this entry. The significance of Deleuze and Guattari could imply that at least to some extent their method of doing philosophy is used to put education in a different perspective. So apart from using Deleuze and Guattari's work as a tool of analysis to contemplate on the current meaning of knowledge and learning, the significance of their philosophy could also consist of a more fundamental experimentation with the concepts and events related to learning as it is conceived in a

postmodern society. In other words, from a particular philosophical ethos, which is central in the work of Deleuze and Guattari, the control societies' perspective on learning is not accepted and applied anymore, but interrupted or short-circuited, so that the activity of learning becomes a question again. Education then consists of creating a movement in thought and disturbing conventions, rules, dogmatic thought and commercial, and superfluous communication.

Poststructuralism and Education

Michael A. Peters

University of Waikato, Hamilton, New Zealand

Introduction

Poststructuralism has its origins in European formalism and has strong affinities and continuities with its predecessor paradigm “structuralism” as well as some critical theoretical differences. Both movements have had a strong impact and continuing on educational philosophy and theory especially in relation to questions of the text, criticism, reading, writing and the philosophy of the subject. The twin movements have exercised deep influence in most sub-fields of education. As a movement of thought it has impacted widely in education – not only philosophy but also in policy, feminist thought and postcolonial studies. This chapter charts some of the most significant of poststructuralist developments and their impacts in education. It comments on its emergence and traces its affinities and differences.

Poststructuralism will be resisted in the domain of educational theory and research for some time to come not only for the reason that this domain, at least in the mainstream, is inherently conservative, being largely State or federally funded, and still strongly imbued with the positivist ethos it inherited during its historical development and professionalization as a legitimate field of study but also because poststructuralism – if we can both risk and indulge a singularization – at the broadest level carries with its philosophical reaction to the scientific pretensions of structuralism, a

critique of the very Enlightenment norms that “education research” today prides itself on “truth,” “objectivity,” and “progress.” Poststructuralism as a contemporary philosophical movement offers a range of theories (of the text), critiques (of institutions), new concepts, and forms of analysis (of power) which are relevant and significant for the study of education, but also it offers a range of writings explicitly devoted to education.

Poststructuralism is a difficult term to define. It has often been confused with its kinship term, postmodernism, and, indeed, some critics have argued that the latter term, through patterns of established usage, has come to subsume poststructuralism. We can distinguish between the two terms by recognizing the difference between their theoretical objects of study. Poststructuralism takes as its theoretical object “structuralism,” whereas postmodernism takes as its theoretical object “modernism.” Poststructuralism can be characterized as a mode of thinking, a style of philosophizing, and a kind of writing, yet the term should not be used to convey a sense of homogeneity, singularity, and unity. The very term “poststructuralism” is not uncontested. Mark Poster (1989, p. 6) remarks that the term poststructuralism is American in origin and that “poststructuralist theory” names a uniquely American practice, which is based upon an assimilation of the work of a diverse range of theorists. More generally, we might say that the term is a label used in English-speaking academic communities to describe a distinctively *philosophical* response to the structuralism characterizing the works of Claude Lévi-Strauss (anthropology), Louis Althusser (Marxism), Jacques Lacan (psychoanalysis), and Roland Barthes (literature) (see Gadet 1989). Manfred Frank (1988), a contemporary German philosopher, for his part prefers the term “neo-structuralism” emphasizing a continuity with “structuralism,” as does John Sturrock (1986, p. 137), who focusing upon Jacques Derrida *the* “Post-Structuralist” – indeed, “the weightiest and most acute critic Structuralism has had” – discusses the “post” in “post-Structuralism” in terms of “coming after and of seeking to extend Structuralism in its rightful

direction.” He continues: “Post-Structuralism is a critique of Structuralism conducted from within: that is, it turns certain of Structuralism’s arguments against itself and points to certain fundamental inconsistencies in their method which Structuralists have ignored” (ibid.). Richard Harland (1987), by contrast, coins the term “superstructuralism” as a single umbrella based on an underlying framework of assumptions common to “Structuralists, Poststructuralists, (European) Semioticians, Althusserian Marxists, Lacanians, Foucauldians, et al” (Harland 1993, pp. ix–x). All of these locutions “post-structuralism,” “neo-structuralism,” and “super-structuralism” entertain as central the movement’s historical, institutional, and theoretical *proximity* to “structuralism.” Yet post-structuralism cannot be simply reduced to a set of shared assumptions, a method, a theory, or even a school. It is best referred to as a *movement of thought*—a complex skein of thought—embodying different forms of critical practice. It is decidedly interdisciplinary and has many different but related strands.

As a French and predominately Parisian affair, first-generation poststructuralism is inseparable from the immediate intellectual milieu which prevailed in postwar France, a history dominated by diverse intellectual forces: the legacy of Alexander Kojève’s and Jean Hyppolite’s “existentialist” interpretations of Hegel’s *Phenomenology of Mind*, Heidegger’s phenomenology of Being and Jean-Paul Sartre’s existentialism, Jacques Lacan’s rediscovery and structuralist “reading” of Freud, the omnipresence of Georges Bataille and Maurice Blanchot, Gaston Bachelard’s radical epistemology and Georges Canguilhem’s studies of science, and, perhaps, most importantly, the French reception of Nietzsche. It is also inseparable from the structuralist tradition of linguistics based upon the work of Ferdinand de Saussure and Roman Jakobson and the structuralist interpretations of Claude Lévi-Strauss, Roland Barthes, Louis Althusser, and (early) Michel Foucault. Poststructuralism, considered in terms of contemporary cultural history, can be understood as belonging to the broad movement of European

formalism, with explicit historical links to both formalist and futurist linguistics and poetics and the European avant-garde.

Decisive for the emergence of post-structuralism was, undoubtedly, the rediscovery of Friedrich Nietzsche’s writings and Martin Heidegger’s (1991) interpretation of them by a group of French thinkers, along with the structuralist readings of both Freud and Marx. Where Marx was seen to play out the theme of power in his work, and Freud gave a conceptual priority to the notion of desire, Nietzsche was read as a philosopher who did not prioritize or subordinate the one concept over the other. His philosophy offered a way forward that combined both power and desire (see Schrift 1995; Peters 1998).

The American reception of deconstruction and the influential formulation of “poststructuralism” in the English-speaking world quickly became institutionalized from the point at which Derrida delivered his essay “Structure, Sign and Play in the Discourse of the Human Sciences” to the International Colloquium on Critical Languages and the Sciences of Man at Johns Hopkins University in October 1966. Richard Macksey and Eugenio Donato (1970, p. x) described the conference as “the first time in the United States that structuralist thought had been considered as a cross-disciplinary phenomenon.” Even before the conclusion of the conference, there were clear signs that the ruling transdisciplinary paradigm of structuralism had been superseded, yet only a paragraph in Macksey’s “Concluding Remarks” signaled the importance of Derrida’s “radical reappraisals of our [structuralist] assumptions” (p. 320).

The “decentering” of structure, of the transcendental signified, and of the *sovereign* subject, Derrida suggests — naming his sources of inspiration — can be found in the Nietzschean critique of metaphysics and, especially, of the concepts of being and truth, in the Freudian critique of self-presence, as he says, “the critique of consciousness, of the subject, of self-identity and of self-proximity or self-possession” (Ibid., 280), and, more radically, in the Heideggerian destruction of metaphysics, “of the determination of Being as presence” (ibid.). In the body of the

essay, Derrida considers the theme of “decentering” in relation to Lévi-Strauss’ ethnology and concludes by distinguishing two interpretations of structure. One, Hegelian in origin and exemplified in Lévi-Strauss’ work, he argues, “dreams of deciphering a truth or an origin which escapes play and the order of the sign” and seeks the “inspiration of a new humanism.” The other, “which is no longer turned toward the origin, affirms play and tries to pass beyond man and humanism” (Derrida 1978, p. 292).

Gilles Deleuze’s (1983, orig. 1962) *Nietzsche and Philosophy*, which interpreted Nietzsche’s philosophy as an attack upon the Hegelian dialectic, helped to create the conditions for an accent upon pure difference – a “philosophy of difference” – that emphasized difference not only as a constant in linguistic and symbolic systems but also as a necessary element in the process of creating social and cultural identity (see Schrift 1995; Peters 1996, 1998).

In its first generation, poststructuralism is exemplified in the work and writing of Jacques Derrida, Michel Foucault, Julia Kristeva, Jean-François Lyotard, Gilles Deleuze, Luce Irigaray, Jean Baudrillard, and many others. Historically, its early formation and institutional development can be charted in Philippe Sollers’ highly influential journal *Tel Quel*, and there are strong connections with literary figures such as Maurice Blanchot and Roland Barthes. In addition to work which engages directly with specific philosophers, poststructuralist thinkers have developed distinctive forms of analysis (grammatology, deconstruction, archeology, genealogy, semanalysis) and often developed these forms as critiques of specific institutions (family, State, prison, clinic, school, factory, armed forces, university, even philosophy itself) and theorizations of a range of different media (“reading,” “writing,” teaching, television, the visual arts, the plastic arts, film, and forms of electronic communication).

The influence of the first-generation poststructuralists has been immense: inside France it has led to exciting developments at the forefront of feminist research, psychoanalysis, literary theory, anthropology, sociology, and history. It has also led to important cross-fertilizations and

interpenetrations among the disciplines and to intellectual advances in newly configured fields such as film theory, media studies, queer theory, postcolonial studies, and Afro-American and Hellenistic studies. Outside France and especially in the American academy, the influence of poststructuralism has been strongly felt in literary studies (e.g., Jonathan Culler, Shoshana Felman, Vincent Leitch) and is strongly evident in the work of the Harvard literary school (e.g., Paul de Man, Hillis Miller). Within the Western academy, more generally it has influenced the traditional disciplines of sociology (e.g., Zygmunt Bauman, Barry Smart), philosophy (e.g., Cornel West, Paul Patton, Hubert Dreyfus), politics (e.g., Colin Gordon, William Connolly, Barry Hindess), anthropology (e.g., James Clifford, Paul Rabinow), history (e.g., Hayden White, Mark Poster, Dominick LaCapra), geography (e.g., Edward Soja, David Harvey), as well as the newly emergent fields of feminist and gender studies (e.g., Judith Butler, Chris Weedon), postcolonial studies (e.g., Edward Said, Gayatri Spivak, Homi Bhabha), and cultural studies (e.g., Stuart Hall, Simon During).

In part the significance of poststructuralism for educational philosophy and theory lies in the fact that it can be construed as a philosophical reaction against a *scientistic* social science. The theoretical development of French structuralism during the late 1950s and 1960s led to the institutionalization of a transdisciplinary “mega-paradigm” which helped to integrate the humanities and the social sciences but did so in an overly optimistic and *scientistic* conception of the social sciences. Its claim to the status of a “mega-paradigm” was based around the centrality of language and its scientific analysis in human social and cultural life, considered as self-reflexive signifying or semiotic systems or subsystems. It was, in this sense, part of the broader “linguistic turn” taken by Western philosophy. The tradition of structuralist linguistics had its origins in the late nineteenth-century European formalism and under the combined influence of Ferdinand de Saussure (1959) and Roman Jakobson (e.g., 1973) developed into the dominant research program in linguistics. In the hands of Claude Lévi-Strauss, A.J. Greimas, Roland Barthes, Louis

Althusser, Jacques Lacan, Michel Foucault, and many others, it made its way into anthropology, literary criticism, psychoanalysis, Marxism, history, esthetic theory, and studies of popular culture, developing into a powerful overarching framework for the semiotic and linguistic analysis of society, economy, and culture, considered as a series of functionally interrelated sign systems.

Poststructuralism, then, can be interpreted as a specifically *philosophical* response to the alleged scientific status of structuralism – to its status as a mega-paradigm for the social sciences – and as a movement which, under the inspiration of Friedrich Nietzsche, Martin Heidegger, and others, sought to decenter the “structures,” systematicity, and scientific status of structuralism, to critique its underlying metaphysics, and to extend it to a number of different directions while at the same time preserving central elements of structuralism’s critique of the humanist subject.

Its main theoretical tendencies and innovations can be summarized in terms of its *affinities* and *differences* with structuralism:

Affinities

- (i) The critique of Renaissance humanist philosophy and the rational, autonomous, self-transparent subject of humanist thought. A shared suspicion of phenomenology’s and existentialism’s privileging of human consciousness as autonomous, directly accessible, and as the sole basis of historical interpretation, understanding, and action.
- (ii) A general theoretical understanding of language and culture in terms of linguistic and symbolic systems, where the interrelations of constituent elements are regarded as more important than the elements considered in isolation from one another. Both structuralism and poststructuralism take up the Saussurean belief – and innovative methodologies based upon its insights – that linguistic signs act reflexively rather than referentially.
- (iii) A general belief in the Unconscious and in hidden structures or sociohistorical forces that, to a large extent, constrain and govern our behavior. Much of the innovation of structuralism and poststructuralism is directly indebted to Freud’s study of the Unconscious and his clinical investigations which undermined the prevalent philosophical view of the pure rationality and self-transparency of the subject, substituting a greater complexity that called into question traditional distinctions of reason/unreason (madness).
- (iv) A shared intellectual inheritance and tradition based upon Saussure, Jakobson, the Russian formalists, Freud, and Marx, among other thinkers. This shared intellectual history is like a complex skein that has many strands. We might call it European formalism, beginning in prerevolutionary Russia, in Geneva, and in Jena, with simultaneous and overlapping developments in linguistics, poetics, art, science, and literature.

Differences

- (v) The reintroduction of history. Where structuralism sought to efface history through synchronic analyses of structures, poststructuralism brings about a renewed interest in a *critical* history through a reemphasis on diachronic analyses; on the mutation, transformation, and discontinuity of structures; and on serialization, repetition, “archeology,” and, perhaps most importantly, what Foucault, following Nietzsche, calls genealogy. Genealogical narratives are seen to replace ontology, or to express the same thought in a different way, questions of ontology become historized.
- (vi) The challenge to scientism in the human sciences, an anti-foundationalism in epistemology, and a new emphasis upon perspectivism in interpretation. Poststructuralism challenges the rationalism and realism that structuralism continues from positivism, with its promethium faith in scientific method, in progress, and in the capacity of the structuralist approach to discern and identify universal structures of all cultures and the human mind.
- (vii) The rediscovery of Nietzsche and Heidegger’s interpretation of Nietzsche as the “last metaphysician.” Nietzsche’s work

provides a new way to theorize and conceive the discursive operation of power and desire in the constitution and self-overcoming of human subjects. Heidegger in his two-volume *Nietzsche* first published in 1961 focuses upon *The Will to Power* – a work assembled from notes and first published posthumously by his sister – and interprets Nietzsche as the last metaphysician. Derrida, in particular, takes issue with Heidegger’s “reductive” interpretation and translates Heidegger’s “destruction” of the history of Western metaphysics as “deconstruction.”

- (viii) A critical philosophy of technology. Much of the history of poststructuralism can be written as a series of innovative theoretical developments of or about Heidegger’s notion of technology. Heidegger’s philosophy of technology is related to his critique of the history of Western metaphysics and the disclosure of being. The essence of technology is a *poiesis* or “bringing forth” which is grounded in disclosure (*aletheia*). He suggests that the essence of modern technology shows itself in what he calls *enframing* and reveals itself as “standing reserve,” a concept that refers to resources that are stored in the anticipation of consumption. As such modern technology names the final stage in the history of metaphysics (nihilism) and the way in which being is disclosed in this particular epoch: a stockpiling in principle completely knowable and devoted entirely for human use. He suggests that the essence of technology is nothing technological; it is rather a system (*Gestell*), an all-embracing view of technology, described as a mode of human existence that focuses upon the way machinic technology can alter our mode of being, distorting our actions and aspirations. Heidegger is careful not to pose as an optimist or pessimist. He sees his own work as preparation for a new beginning that will enable one to rescue oneself from nihilism and allow the resolute individual to achieve an authenticity.
- (ix) A deepening of democracy and a political critique of Enlightenment values. Poststructuralism criticizes the ways that modern liberal democracies construct political identity on the basis of a series of binary oppositions (e.g., we/them, citizen/noncitizen, responsible/irresponsible, legitimate/illegitimate) which has the effect of excluding or “othering” some groups of people. Western countries grant rights to citizens – rights are dependent upon citizenship – and regard noncitizens, that is, immigrants, those seeking asylum, and refugees, as “aliens.” Some strands of poststructuralist thought are interested in examining how these boundaries are socially constructed and how they are maintained and policed. In particular, the deconstruction of political hierarchies of value comprising binary oppositions and philosophies of difference is seen as highly significant for current debates on multiculturalism and feminism and as issuing from the poststructuralist critique of representation and consensus.
- (x) Foucault’s later work based on the notion of “governmentality” has initiated a substantial body of contemporary work in political philosophy which deals directly with political reason. Foucault coins the term “governmentality” in an analysis of liberalism and neoliberalism, viewing the former as origination in a doctrine concerning the critique of state reason. Foucault uses the term “governmentality” to mean the art of government and to signal the emergence of a distinctive type of rule that became the basis for modern liberal politics. He maintains that the “art of government” emerges in the sixteenth century, motivated by diverse questions: the government of oneself (personal conduct), the government of souls (pastoral doctrine), and the government of children (pedagogy). It is around the same time that “economy” is introduced into political practice as part of the governmentalization of the State. What is distinctive of

Foucault's approach is that he is interested in the question of *how* power is exercised, and, implicitly, he is providing a critique of contemporary tendencies to overvalue problems of the State, reducing it to a unity or singularity based upon a certain functionality. Both Foucault and Derrida, returning to Kant's cosmopolitical writings, have addressed themselves of the prospect for global governance, and Derrida has talked about both deepening democracy and – entertaining developments of new technologies – a “democracy to come.”

- (xi) Philosophies of difference. If there is one element that distinguishes poststructuralism, it is the notion of *difference* which various thinkers use, develop, and apply in different ways. The notion of difference comes from Nietzsche, from Saussure, and from Heidegger. Gilles Deleuze (1983, orig, 1962), in *Nietzsche and Philosophy*, interprets Nietzsche's philosophy according to the principle of difference and advances this interpretation as an attack upon the Hegelian dialectic. Derrida's notion of difference can be traced back to at least two sources: Saussure's insight that linguistic systems are constituted through difference and Heidegger's notion of difference. It took nearly a decade, from the first mention of the notion of difference (in 1959) to its development as *différance*. *Différance*, as Derrida (1981, pp. 8–9) remarks, as both the common root of all the positional concepts marking our language and the condition for all signification, refers not only to the “movement that consists in deferring by means of delay, delegation, reprieve, referral, detour, postponement, reserving” but also and finally to “the unfolding of difference,” of the onto-ontological difference, which Heidegger named as the difference between Being and beings. As such *différance* is seen as plotting the linguistic limits of the subject. Lyotard (1988), by contrast, invents the concept of the *différend* which

he suggests establishes the very condition for the existence of discourse: “that a universal rule of judgment between heterogeneous genre is lacking in general” (p. xi), or again, “there is no genre whose hegemony over others would be just” (p. 158). A *différend*, as Lyotard (1988) defines it, “is a case of conflict, between (at least) two parties, that cannot be equitably resolved for lack of a rule of judgment applicable to both arguments” (p. xi). Poststructuralist notions of difference, pointing to an anti-essentialism, have been subsequently developed in relation to gender and ethnicity: the American feminist philosopher, Iris Marion Young (1991), writes of *Justice and the Politics of Difference*, and the Afro-American philosopher, Cornel West (1992), speaks of “*The New Cultural Politics of Difference*.”

- (xii) Suspicion of metanarratives. Lyotard's definition of the “postmodern condition” characterizes a feature of poststructuralism that we can call the suspicion of transcendental arguments and viewpoints, combined with the rejection of canonical descriptions and final vocabularies. In particular, “suspicion toward metanarratives” refers to the question of legitimation with reference to the *modern* age in which various grand narratives have been advanced as a legitimation of State power. There is no synthesizing or neutral master discourse that can reproduce the speculative unity of knowledge or adjudicate between competing views, claims, or discourses. The “linguistic turn” of twentieth-century philosophy and social sciences does not warrant the assumption of a metalinguistic neutrality or foundational epistemological privilege.
- (xiii) The diagnosis of “power/knowledge” and the exposure of technologies of domination based upon Foucault's analytics of power. For Foucault, power is productive; it is dispersed throughout the social system, and it is intimately related to knowledge. It is productive because it is not only repressive but also creates new knowledge

(which may also liberate). It is dispersed rather than located in any one center, like the State, and it is part of the constellation “power/knowledge” which means that knowledge, in the sense of discursive practices, is generated through the exercise of power in the control of the body. Foucault develops this thesis through his genealogical study of the development of modern institutions like the prison and the school and the corresponding emergence of the social sciences that helped devised new methods of social control.

- (xiv) The politics of the global knowledge/information society/economy. Poststructuralism provides intellectual resources to philosophers of education for unpicking the ruling assumptions currently used to construct the dominant neoliberal paradigm of globalization as a global economy/society allegedly based upon a conception of knowledge and “free trade.” The new production of knowledge and the global knowledge economy, together with classical assumptions of rationality, individuality, and self-interest, are important construction sites for knowledge deconstruction and critique. They are also conceptual sites for alternative conceptions.

Introduction

Postcolonial theory coincides with radical disruptions to colonial systems of thought brought about by civil rights movements in the '60s in France and other Western nations. In the wake of the

Shoah and liberation struggles in ex-colonial nations, French poststructuralists began a systematic critique of Western metaphysics of being and its attendant modernist operation. Poststructuralists use various means and methods to destabilize the assumed primacy of modern structures of language, knowledge, governance, ethics, and patriarchal social relations to unveil the hidden aims and catastrophic ends of Western ontological projects assuming a mythical superiority of European man over other beings (Derrida 1974). For Lévinas (1969), in particular, the ethno-superior subject and totalizing logics underpinning Western ontologies of being greatly inform devastating genocidal and colonial projects leading to the finite extermination of the unique existence of others before, during, and after the Second World War.

Given its emergence in a time of ultimate colonial failure, Robert J. Young argues that poststructuralist theory is already postcolonial. For Young (1990) poststructuralism arises directly from sustained philosophical examination of the modernist imperatives of European ontologies of the human and the nature of human being. According to Young deconstruction is primarily of the “concept, the authority, and assumed primacy of, the category of ‘the West’” (19). The poststructural reveal of colonial ontology in the Western episteme, in turn, generates a postcolonial vocabulary, framework of geopolitical and historical analyses, and set of constructs that challenge, contest, and “rethink the premises, assumptions and protocols of its centrist imperial culture” (Young 2001, p. 414).

Poststructuralism informs the most influential postcolonial theorists of our time, most notably, Edward Said, Homi K. Bhabha, and Gayatri Chakravorty Spivak. In its close association with poststructuralism, postcolonial scholarship is routinely accused of being apolitical. If aligned with the politics of anticolonial and/or decolonizing projects, leading postcolonial theorists are careful to resist a reformulation of oppositional, reductive, ideological, or identarian logics that repeat the narcissistic and self-preserving violence of being underpinning the white mythology of Western metaphysics (Derrida 1974; Bhabha 1994). As

with poststructuralism, postcolonialism is an enactment of thought that excavates, deconstructs, and represents modernist forms of knowledge, history, and social organization, but with explicit reference to a colonial frame and context. Acknowledging their debt to the decolonizing movements, Homi K. Bhabha (1994) suggests that postcolonialism examines blurred, broken, and antagonist social ties produced from violent histories of colonial oppression and their aftermath. For Bhabha, fractured social bonds bind contemporary and global geopolitical relations into a historical knot that is difficult but necessary to untangle. In this regard, postcolonialism bears the reparative impulse of poststructuralism to imagine, create, and enact just modes of thinking and being in the world with others. Postcolonial theorizing seeks to supplement, recuperate, narrate, and renew a wounded humanity from the more violating imperatives, actions, and events cast in the name of the human and humanism.

Key Postcolonial Thinkers in Education

Widely viewed as inaugurating the field, Edward Said's seminal work *Orientalism* is the first full-length study of its kind to examine the representation of the “Eastern Other” in Western metaphysical thought and the humanist tradition. If widely critiqued for creating an “other” monolith of the human, Said's work is remarkable for its detailed, Foucauldian excavation of figures of foreignness as depicted in literary and colonial accounts. In contrast to Said's macro-historicizing project, in the *Location of Culture*, Homi Bhabha invents strategies of critique to investigate the micro-political dimensions of colonial operation. Leaning on an eclectic array of poststructural and anticolonial theories, Bhabha argues that colonial structures find their basis in fantastic self-other relations and formulates a psychosocial lens to bring nuance to philosophical and social investigations of colonial processes. In her groundbreaking article, “Can the Subaltern Speak,” Gayatri Spivak emphasizes the gendered quality of colonial relations, and the complex role of sexually exploited, disappeared, and forgotten women in

colonialism's patronizing schematic. Using deconstruction, Spivak (1988) organizes the unrepresentable qualities of subjectivity of the "other" using the Gramscian conception of subaltern. Subaltern stands in for the unrecognizable and abject (female) body subject to the devastating effects of patriarchal and sexual violence ricocheting off the uneven male colonial contest over family, language, politics, law, culture, education, and resources. Spivak relocates the logics and enactments of patriarchal struggles for social control over territory, rule, and resources in the bodies of women caught in between warring factions of colonial and "native" patriarchal governance.

The poststructural destabilization of canons and institutions of Western knowledge continues to present a series of challenges, aporias, and generative opportunities for postcolonial theorists. Postcolonial scholars conceptually lean on and forge departures from modernist projects of enlightenment, history, and humanism informing modernism's metaphysics of being. The more notable of poststructuralist constructs taken up by postcolonial theories involve the qualification and renewal of ideas of the "other," the human, difference, differend, discourse, subjectivity, narration, representation, and justice in diverse colonial contexts. Through various philosophical and literary methods, postcolonial scholars experiment with, supplement, and/or contest the operation of Western knowledge; culture with "other," hybrid, and indigenous aesthetics; social forms; cultural productions; and critical theories of humanity. Invented constructs such as subaltern, native informant, hybridity, worlding, and the third space, seek to account for a persistently deformed construction of the colonized subject in philosophical thought, colonial records, and contemporary cultural productions of "others" in a globalizing world.

Education and Postcolonial Theory

Immense is the range of postcolonial scholarship and inquiry within and across academic

disciplines. Postcolonial thought is inherently interdisciplinary and transgresses the fields of philosophy, history, geography, anthropology, social science, economics, political science, literature, cultural studies, education, and the helping professions. Still, postcolonial orientations and methods of analysis have yet to significantly infiltrate mainstream forms of compulsory, public education systems across the world that continues to build upon colonial foundations and theories of knowledge, literacy, and learning. As John Willinsky (2000) demonstrates, public schooling in nations worldwide remains stubbornly tethered to educational processes of subject formation in the European mold of the human as upheld by the Commonwealth or ex-colonial State. For example, the impact of colonial English education is felt in global times; to receive an exemplary education is to acquire an education in English. Consequently English is the global language of commerce and trade, academic knowledge, technology, cosmopolitanism, and culture.

Postcolonial scholars look to *education* as enabler, producer, and liberator of human subjectivity from Western aesthetics, logics, operations, discourses, institutions, and the insidious reach of global capitalism. Said's (1978) work contributes an understanding of the role of knowledge production in the making and remaking of societies and worlds. For Said, knowledge, and thus education, is not ethno-culturally neutral or empirically unmotivated. Said's historicizing critique investigates the colonizing operation of the educational enterprise in advancing Western forms of knowledge above and at the expense of others. For Said, true knowledge of the world lies somewhere in an unrelenting archeological excavation of human histories. Bhabha (1994) identifies knowledge archived in colonial encounter as a third space of possibility for a world reeling from colonial pasts. Returning to the colonial archive, Bhabha reconstructs pedagogical strategies of resistance used by colonial subjects, including mimicry, misrecognition, and revolt, against colonial role. He locates human agency in the symbolic capacity of human beings to imagine and produce different social organizations from forms

of resistance to multiple and continually morphing forms of colonial violence and control. Spivak (1993) has theorized education as *pharmakon*, as both a medicine and poison that enable and injure subject formation by particular means, for colonizing and liberating ends. Education, Spivak suggests, remains an important site of postcolonial inquiry and intervention into the ontological meanings and epistemological productions of being and not being human. As with the “post” in structuralism and modernism, Spivak insists that postcolonial studies are not simply what comes before and after colonialism but what is retrievable from within its enabling and enduring anthropomorphic, patriarchal, and ethnocentric violence continuing to form human thought, organization, and existence.

Poststructuralism and the (Post)colonial Roots of Modern Education

Across the world, in ex-colonial, settler colonial, and colonial nation states, public schooling continues to impart, import, and exalt Western ontological and epistemological molds and logics. Poststructuralism does offer educational scholars theoretical tools and methods for interrogating these continuities but without specific reference to a historical or political context. Consequently, poststructural critiques of modernity are often unhinged from enduring material, geopolitical, and educational consequences for indigenous and formerly enslaved and colonized communities. In his book, *Out of Africa*, Pal Ahluwalia argues that poststructuralism carries a foreclosed debt to the particular and localized (post)colonial contexts giving rise to poststructuralism’s incredible movement of thought. Ahluwalia further suggests that poststructuralism arises from an unnamed postcolonial recognition of the violence of modernism’s colonizing logic, one that has yet to be fully mined by scholars working with these frames. For example, obscuring lines between French poststructuralism and its Algerian (post)colonial roots mute the violent historical and political context driving its movement while

sidelining the ontological and epistemological contribution of formerly colonized nations to poststructural thought. Colonial legacies of violence and antagonism can be directly indicted in the contemporary production of postcolonial tensions arising between French citizens, French-Algerian citizens, and Algerian migrants seeking refuge in “multicultural” France. Excavating historical and political context to the legacies of colonialism framing new social and political formations of global life, postcolonial theorists labor to supplement, return, and challenge the primacy of all forms of Western thought (including poststructural) “to disrupt the cultural hegemony of the West, challenging imperialism in its various guises” (including multiculturalism) (Ahluwalia 2010, p. 3). Although linked, the ontological and epistemological “posts” guiding poststructuralism, post-humanism, and post-colonialism are “out of joint,” and, yet, this disjointedness is also a strength, giving rise to generative points of dialogue, debate, and departure for those working across these frameworks.

Educational systems and scholarship also suffer from a foreclosure of education’s colonial roots. A glaring lack of inquiry into colonial foundations of “universal” public schooling advances the study, enactment, and global circulation of Western forms of education (Rizvi 2007). Colonial logics inform categories of difference, normative models of human development, and ideas of national citizenship in public schools across the globe. Through the provision of English and French and the centering of Euro-colonial curricula, public schools in ex-colonial nations continue to be beholden to Western colonial logics, curriculum, and practices of education. Specters of colonial logics justify State-sponsored forms of forced, residential, and segregated schooling structure and inform unequal relations between students and students and teachers while advancing dominant misrepresentations of communities historically marginalized in and by school.

Postcolonial scholars are committed to an examination of the ongoing and persistent role of empire in the contemporary practice of education. These scholars engage with the traumatic

implication of colonial pasts in the present treatment of students from communities affected by injurious school experiences. As with poststructural scholars, postcolonial scholars are concerned with the status of subjectivity and the human in the organization of categories of difference-stratifying school. They contextualize these categories in legacies of slave and/or colonial institutions and demonstrate the influence of colonial pasts for perpetuating material, linguistic, and social inequities in the classroom. Postcolonial scholars also stage reconstructions of race and other defaced social categories as an instrument of colonial technology of subject formation symbolically and materially delivered to children in the earliest experiences in school. They insist on postcolonial frameworks to support teacher training as a responsive education with communities impacted by violent histories of colonization.

Postcolonial scholars in education are uniquely positioned to articulate challenges associated with working inside and against the colonial logic underpinning educational systems in ex-colonial nations and threatening to universalize “new” visions of supposedly “global” and “best” educational practices. They view the constructing and enacting of particular forms of humanness as and in active psychosocial forms of praxis delivered through tacit and insidious colonial educational technologies. They share the poststructural concern with and interrogation of the status of human in education through postcolonial inquiries that persistently question the tight Western, ontological hold and normative value of the human in the formation of children through schooling. Postcolonial approaches to education not only include an excavation of the role and activities of Western “normal school” in colonial projects; they generate and lift up forms of schooling that run counter, alter, or resist those put forth by Western proponents of modern education.

Despite criticism against the largely discursive and intellectualized take-up of postcolonial theory in the Western academy, in many ways the full social and pedagogical potential of postcolonial thought is yet to be realized. Postcolonial theory threatens the colonial foundations of mandatory

public education, an institution of subject formation and social organization that has yet to be shaken. Under global capitalism, ex-colonial nations continue to cling to colonial educational systems to gain economic, political, and material advancement on the world stage. As human rights-based movements of education are tied to Western forms of education, initiatives put forward by the UN such as “Education for All” are also tethered to colonial foundations and Western ontological molds of the human. The global acceptance of Western forms of universal access to public schooling can make education impervious to postcolonial analyses.

Still, postcolonial theory is powerful in rethinking the possibilities of education for new forms of subjectivity, knowledge, and social organization and institution in this century. Indeed, as Fazal Rizvi (2007) suggests, education in a global age necessitates a postcolonial approach as from the minute of the child’s entry into the world she is subject to an immense complex of colonizing forces, discourses, and histories that abstractly condition her being. As globalization rearticulates national boundaries and claims to citizenship, it is critical that educators of the twenty-first century adopt a postcolonial lens. Global movements of people, knowledge, and ideas generate new forms of social connectivity, organization, and belonging informed and driven by a postcolonial past. New manifestations of these histories continue to affect the lived, multilingual, and cultural realities of migrant, immigrant, refugee, and diasporic populations and inform the educational experiences, curricular knowledge, and social organization of students in schools. Without a postcolonial lens, rapidly globalizing forms of Western education risk re-entrenching gross geopolitical and economic inequities and bitter antagonisms between ex-colonial and newly formed and failing nations. Vanessa Andreotti (2011) further argues that, as an actionable form of social praxis, postcolonial theory alerts us to the dangers of foreclosing new and old colonial imperatives underlying any educational enterprise seeking to humanize the child by particular means and/or for certain ends.

Postcolonial approaches to education seek to interrupt normative, “scientific,” and Western frames of educational research and scholarship. Postcolonial constructs pose serious questions to educational and social science researchers utilizing taken-for-granted and/or universalized social categories that form their understanding of unique bodies and complex learning processes of students in the classroom. Postcolonial scholars in education argue that Western theories of development, literacy, and knowledge offer partial, partisan, and thus distorted versions of how each child grows, learns, and participates in social life. When acknowledged that mandatory schooling and modern education are complicit with particular colonial aims of the adult, community, or society, educational scholarship is faced with the demand to rethink some of its most cherished and exalted conceptions of the child, language, care, knowledge, experience, pedagogy, human participation, and education. Postcolonial scholarship in education identifies competing epistemologies, representations of knowledge, and the pedagogical relation as the symbolic and social means by which human beings might relearn a humanity injured but not overdetermined by colonial pasts.

At its most radical, postcolonial theory makes an ethical and pedagogical commitment to creating a freedom seeking and just education for newcomers in an old and globalizing world. Postcolonial histories of oppression and mass violence behoove the adult community to consider and take care with the ontological molds, epistemological virtues, and institutions of human becoming to which the child is necessarily and violently subject. Postcolonial educators challenge the adult community with the demand of supporting the symbolic, experiential, and existential entry of the child in social forms, events, and organizations that acknowledge each child’s whole existence, participation, and potential in particular and shared worlds. Postcolonial scholars in education acknowledge the pedagogical relation as critical to the renewal of violently broken social bonds structuring possible futures of a globally shared human community. Postcolonial education as human praxis might form a

global community that can bear learning from the excesses of empire’s terrible history to think, speak, write, teach, and live with greater intention with all beings sharing an existence, presence, time, and place in a dynamic world.

Poto

Sione Tu'itahi

Health Promotion Forum of New Zealand,
Auckland, New Zealand

Central to the theory and practice of Tongan education is the notion of *poto*, the ultimate outcome of learning, from a Tongan perspective. So what is *poto*? This entry describes *poto* and explores its many forms and uses in education and other fields within a Tongan context. The Tongan knowledge system, *tala-e-fonua*, is discussed to explicate further the notion of *poto*.

Poto means wise, discerning, intelligent, and clever (Schneider 1977; Rabone 1845). Churchward (1959) refers to *poto* as “to be clever, skilful; to understand what to do and be able to do it.” In her study of Tongan education, Helu-Thaman (2001) identified three basic educational ideas: *ako*, *'ilo*, and *poto*. She elaborates:

Ako is used to denote learning as well as searching, and in the early part of the nineteenth century it was also used to mean teaching. Later when schools were introduced, the term *faiako* (making learning) was used to refer to a school teacher. *'Ilo* denotes knowing, knowledge and information and implies learning and/or searching. *Poto* refers to one who is wise or learned and is used to describe a state of being or mind, and implies the use of *'ilo* for the benefit of the group and wider society. (Helu-Thaman 2001, p. 53)

As indicated by the definitions above, *poto* has at least two major dimensions. The first one is the spiritual intelligence or the wisdom of the spirit. For example, when a learned person makes a wise decision for the betterment of the community, she or he is referred to as a *tokotaha poto*/wise person. The second element is the cognitive intelligence. For instance, a very knowledgeable person is referred to as *tokotaha poto*/knowledgeable or skilful person. The former is associated more with the *loto*/heart, whereas the latter is more concomitant with the *'atamai*/mind.

To understand *poto* in the Tongan educational context and at its spiritual level, the concept of *loto* is further explored. *Loto* has a range of

meanings that are closely related. *Loto* denotes the heart, soul, will, inner being, core, and depth. *Tokotaha lotopoto* is a term used to describe a person who makes wise decisions, based on the promptings of his heart and spirit, for the betterment of the community. A person who is courageous is called *lotolahi* or *lototo'a*/brave heart, while a coward is called *lotosi'i*/fainthearted or *lotofa'i*/vanquished heart. A loving person is referred to as *loto'ofa*, whereas a heart full of envy is called *lotokovi*. On an abstract level, the concept of *loto* means interior such as *lotofale*/interior of a house. When reduplicated, it means depth as in *moana loloto*/deep ocean. In all these examples, *loto* means the interior, the heart, and the essence.

To gain a fuller comprehension of the cognitive and intellectual element of *poto*, the concept of *'atamai*/mind is further explored. While it usually means the mind, the term *'atamai* literally means to reflect or to project forward. It is made up of two morphemes, *'ata*/reflection and *mai*/to make something come to the fore. *'Ata* means reflection as seen in terms such as *mafoa-'a e-ata* (the breaking of dawn), *'ata*/reflection in a mirror, and *tauata* and *ataata* – the emergence of ideas in one's mind or thinking. *Mai* means to bring forth.

A metaphor that is used to describe the *'atamai*/cognitive intelligence is *mata*. *Mata* has a number of meanings that include eyes, face, representative, surface, point, green, and unripe (Schneider 1977; Rabone 1845). The term *matapoto* is often used to describe a person who is intelligent and quick to observe potentials and convert them to advantages and opportunities.

At the social level, *mata* not only means the eyes or face of human beings, but it also stands as a symbol for the character of the individual. A person who loves and cares, for instance, is referred to as *tokotaha mata'ofa*/loving face, while an uncaring person is regarded as *mata'ita'e'ofa*/unloving face. A person who cares for the well-being of her extended family and community is known as *matakāinga*/extended-family caring face. In the field of strategic leadership, a visionary and forward-thinking leader is known as *matalōloa*/long-distance vision.

Exploring connections between *mata/mind* and *loto/heart* can reveal the systemic coherence between them and their product of *poto* as cognitive intelligence and *poto* as spiritual intelligence. At the abstract level, *mata* means outside, exterior, or surface, whereas *loto* is interior/depth. In human and education terms, *mata* symbolizes the mind, while *loto* stands for the heart. Additionally, from a spiritual dimension, *mata* symbolizes the material, whereas *loto* refers to the spiritual. Furthermore, from a Tongan educational perspective, the ongoing interaction between *mata/mind* and *loto/heart* is central to the learning and development of a person. Whereas *mata* refers to cognition and knowing, *loto* is the spiritual center and driving force of *poto/wisdom* and has a central role in a person's decision-making, such as translating knowledge into practical and positive outcomes.

To motivate a Tongan person to learn or act, the *loto/heart* or spirit is the key. This is best illustrated by the old Tongan maxim of “*Tonga mo'unga ki he loto*”/the mountain of Tonga is the heart. When the Tongan's heart is motivated and moved, it will demonstrate qualities such as *lototo'a/courage* and *lotolahi/determination*, and that person is self-driven to achieve goals at high standards.

Lotopoto literally means wise heart. It refers not only to being intelligent and knowledgeable, but, more importantly, to using intelligence and knowledge under all conditions for the right purpose. Also, it points to a depth of wisdom that has intellectual and spiritual dimensions. Further, it indicates that a person who is *lotopoto* is one that acts wisely for the collective well-being rather for his personal gain and individual advancement only.

Through the social construction of *matapoto* and *lotopoto*, it can be suggested that the use of *'ilo/knowledge* for the benefit of society – a hallmark of being *poto* – is largely an outcome of educating the *loto/heart* rather than the mind only. In other words, central to the notion of Tongan education is a clear and dynamic coherence between teaching the mind and educating the heart. While *matapoto* focuses on acquiring knowledge and skills, *lotopoto* is more about

embedding Tongan core values and principles such as *fe'ofa'aki/love one another*, *fetokoni'aki/reciprocity*, *faitotonu/integrity*, and *fakapotopoto/wise, prudent, and judicious*. Therefore, Tongan education is about educating both the mind and heart, and its purpose is to attain *poto* in both spheres. Additionally, *lotopoto* is of greater significance to Tongan education because knowledge is not only sought, but is also put to good use, thus completing the educational process and its purpose. This Tongan philosophy of education – the gaining of knowledge and translating it into action for the betterment of society and for the collective good – is aptly captured in the hymn number 510 of the Free Wesleyan Church of Tonga. The hymn was composed in the early days of Christianity in Tonga, a period when Tongan education and thinking were dominant:

Loto mo e 'atamai/Heart and mind
ko Ho pule'anga ia/Thine kingdom
Fokotu'u taloni ai/Establish therein Thy throne
Tala ai ho fatongia/Therewith Thine dominion
defined

Poto as wisdom can be seen in other Tongan contexts. For example, *fuopotopoto/the poto shape* is the Tongan term for the circle. This use of *poto* means that the shape of the circle represents balance, whole, and complete. In other words, *fuopotopoto* is the shape of wisdom because it represents being inclusive, equal, and fair to all parties. In traditional Tongan horticulture, the mature and best quality *'ufi (yam)* for seedlings is called *'ufi poto* or wise yam. As a third example, made up of a reduplication of *poto*, the term *fakapotopoto* not only means wise and intelligent but also refers to being frugal, prudent, and judicious. In *fakapotopoto*, it can be observed that the intelligence of the mind and the wisdom of the heart are combined. A clever person with little experience who embarks on a project and makes mistakes along the way is referred to as *ko e potopoto-'a-niu-mui* (clever but inexperienced person). When analyzed in greater details, *fakapotopoto* has four major dimensions: *taki fakapotopoto* (strategic or wise and prudent leadership), *pule fakapotopoto* (effective/wise and prudent management), *ngāue fakapotopoto* (right/wise and prudent application of knowledge,

skills, and experience), and *anga fakapotopoto* (wise application of ethical or spiritual principles).

As one of many applications in the Tongan knowledge system of *tala-e-fonua* (wisdom and knowledge of the land or indigenous knowledge system), the *fakapotopoto* leadership model is not only valuable for understanding the past but, more importantly, can be useful in navigating the present and future (Durie 2004; Tu'itahi 2009). A brief examination of *fonua* can provide more understanding of *poto* and its many meanings and uses such as *matapoto*, *lotopoto*, and *fakapotopoto*.

Simply put, *fonua* means people and the land. More deeply, it is a socio-ecological philosophy that espouses and reflects the natural reality of humanity being one and in unity with the rest of the ecology. This interconnected and interdependent relationship is evident in the material and spiritual dimensions of Tongan life. For instance, in the human life cycle, four significant abodes of the human being are all referred to as *fonua*. The baby is nurtured in the *fonua*/womb of the mother. Meanwhile, the mother is nourished by the physical *fonua*/environment. Similarly, the baby is embraced and sustained by the physical *fonua* once it is born into it. The ceremony of burying the umbilical cord of the baby into the land symbolically, physically, and spiritually ties the human being with the *fonua*. When a human being passes on from this natural *fonua*, her physical remains are returned to her *fonualoto*/land within the land, or grave, while her *laumālie*/spirit continues its journey to the *fonua ta'engata*/eternal *fonua* or life hereafter (Māhina 1992; Tu'itahi 2009).

In essence, Tongans, other Pacific peoples, and other indigenous peoples for that matter have evolved their history of existence and their knowledge systems largely from the symbiotic relationship with Mother Nature (Māhina 1992; Tu'itahi 2009). Further, they have evolved a value system that underpins their harmonious and sustainable relationship with the ecology and with each other as fellow human beings. Through stories, song and dance, and other such cultural activities, Tongans preserve their history which is woven with the ecology. Exploring *fonua/whenua* from a

health perspective, Durie (2004) notes this symbiotic relationship. He writes:

All indigenous peoples have a tradition of unity with the environment and the tradition is reflected in song, custom, subsistence, approaches to healing, birthing, and the rituals associated with death. The relationship between people and the environment therefore forms an important foundation for the organisation of indigenous knowledge, the categorisation of life experiences, and the shaping of attitudes and patterns of thinking. Because human identity is regarded as an extension of the environment, there is an element of inseparability between people and the natural world. The individual is a part of all creation and the idea that the world or creation exists for the purpose of human domination and exploitation is absent from indigenous world-views. (Durie 2004, p. 4)

As Durie observes above, much of indigenous knowledge is derived from the relationship of indigenous peoples and their environment. The concepts of *poto*, *matapoto*, *lotopoto*, *fakapotopoto*, and Tongan *ako*/education and learning, as briefly discussed in this entry, are examples of that process. Māhina (1992) points out that *tala-e-fonua*/oral history, once regarded as mere prehistorical myths and legends, is, in fact, history. But because it is coded in Tongan cultural devices such as *heliaki*/symbolism, understanding *tala-e-fonua* can be challenging. Tu'itahi (2009) maintains that in addition to being Tongan history, *tala-e-fonua* is also the Tongan knowledge system. *Tala-e-fonua* refers not only to the distinct but related domains of knowledge in the system, but it also refers to the methodological frameworks and processes through which Tongans over the ages have employed to search and try to understand their natural and social realities.

While there is no scope in this entry to explore them thoroughly, it should be noted that there are at least two other Tongan terms that are related to *loto* in terms of describing the faculties and functions of the heart and the behavior of a person. These two terms are *ongo*/emotion, intuition, and feelings and *anga*/behavior, character, attitude, and attributes. *Ongo ki he loto* is an expression used to describe how one feels something deeply in one's heart. *Ongo tonu* means that a person's intuition is correct or right.

Language is a human invention, a social construct that is influenced and shaped by the capacity of the human spirit, mind, and body, as well as the social and natural environment. In light of this perspective, it is insightful and instructive to explore the phonemic and morphemic characteristics of these three terms – *poto*, *loto*, and *ongo*.

Firstly, they are of similar phonetical sound, especially the “o” sound. This suggests that the “o” sound in Tongan phonetics is often used to form words and meanings that describe the inner realities – physical and metaphysical – of the human being. It can be added that the same linguistic process/practice appears to be applied in other areas of Tongan milieu, such as the terms *toto*, blood; *loloto* or deep; *moto*, the inner essence of a flower that manifests in a bud that is ready to bloom; and *longo* and *longonoa* which mean silence, implying that the physical, mental, and spiritual faculty of the human being is looking inward rather than outward. Other set of examples of how the “o” sound is instrumental for forming words that depict the mental, spiritual, and emotional state are *nonga*/peaceful state of being, *noa*/state of tranquility, *fakanonoa*/state of inner solitude and sojourn, and *faka’o’onoa*/state of solitary meditative reflection as in the case of an accomplished *punake*/composer-choreographer-musician seeking inspiration. In all these terms, it can be observed that the phonemic and morphemic elements of the “o” sound and letter are present.

Similarly, the words for the mind and other such mental faculties are constructed phonetically and morphemically with the “a” vowel and sound, as seen in the following words: *tau ata*/dawn, ‘*ata*/reflection, ‘*atamai*/mind, *mata*/face, and *anga*/behavior.

In attempting to describe *poto*, this entry explored and established that *poto* is a central concept in Tongan educational philosophy, drawing the conclusion that *poto* refers to a well-trained ‘*atamai*/mind with practical skills and a wise, educated *loto*/heart. *Poto* is not only about knowing and doing with the mind and body, but is also about discerning with the heart the right thing to do and do it the right way for the right reasons, such as utilizing knowledge for the common good. *Poto* is about practical knowledge and

ethical application of knowledge with wisdom. *Poto* is not only cognitive intelligence, but, more importantly, emotional and spiritual intelligence. Additionally, this entry suggests that translating *poto* into action for the betterment of society is of greater significance than being knowledgeable without practical application.

Putting into the broader perspective, *poto* as a Tongan educational construct was derived from and will continue to develop within the context of *tala-e-fonua*, the Indigenous Tongan knowledge system, that is based on the symbiotic and dynamic relationship between human beings and their environment. *Tala-e-fonua* is underpinned by the principle that humanity and its environment are one and inseparable. In other words, humanity is part of the whole ecology as illustrated by the meaning of the Tongan socio-ecological concept: *fonua*/land and people are one.

Introduction

Praxis is the central concept which Paulo Freire adopts to capture the dialectical relationship between consciousness and the world, reflected in the pedagogical approach for which he became famous. The concept of *praxis* dates back to the time of the ancient Greeks and as far back as Aristotle. It connects with Socrates' dictum, captured by Plato in the *Apologia*, that the unexamined life is a life not worth living. This entails reflection on the process of living – an intellectual function. This is connected with Gramsci's later notion that all human beings are intellectuals but not all carry out the function of intellectuals. The reference here is to the thinking and reflecting processes that accompany most activities and that one should help nurture with political change in mind.

Praxis continued to be adopted in subsequent writings in social theory. It entails action-reflection-transformative action. It gained revolutionary prominence in Marxist thought and action. Gramsci rendered *Praxis* the central concept of his philosophy – “The Philosophy of Praxis” – in keeping with the Marxist tradition and Marx himself: “revolutionizing practice” (Marx and Engels 1978, p. 144) entailing reflection on action to change the world. This is captured in Marx's 11th and final Thesis on Feuerbach where he states: “The philosophers have only *interpreted* the world, in various ways, the point, however, is to *change* it.” (Marx and Engels 1978, p. 145).

Marx's early notion of praxis centered on the world of practical activity and everyday life. Later in *Capital*, it took on a decidedly

production-oriented turn, in that the area of labor activity is given the greatest prominence as the focus of critical reflection for revolutionary action. Paulo Freire, to whom this section is dedicated, drew on Marx in his conception of *praxis*, the central concept in his pedagogical politics: the “pedagogy of praxis.” In *Pedagogy of the Oppressed*, Freire writes:

But human activity consists of action and reflection: it is praxis, it is transformation of the world. (Freire 1970, 1993, p. 125)

Reflection, Theory, and Transformation

There is a transformative edge to Freire’s interpretation of praxis which involves theory which is regarded as a codification of reflection on and rumination with regard to experience and therefore the world of action (Freire 1970, 1993). This renders problematic common phrases such as “from theory to praxis” – theory is embedded in praxis. Praxis is geared to transforming the world, that is to say, one intervenes in history to contribute towards its development. Put differently, education based on “praxis” is one that allows people to act on their material surroundings and reflect upon them with a view to transforming them.

The process (action-reflection-transformative action) involved is *dialectical* and not sequential as the late Paula Allman (1999), one of the key exponents of Marxian concepts in Freire and Gramsci, emphasized time and time again.

For Freire, action on its own, isolated from reflection, is tantamount to mindless activism. Reflection, divorced from action, constitutes empty theorizing.

Praxis lies at the heart of different situations in Freire’s writings. One recurring aspect of his use of the concept is that of standing aside, either voluntarily or through forced circumstances, to take a critical look at things which are familiar. Frank Youngman (1986) aptly puts it thus: “... education must help people in the process of objectifying the world, critically understanding it, and acting to change it.” (p. 171). This serves as a definition of the term *praxis*.

Contradiction of Opposites

While gaining this critical distance, with a social justice intention, the people involved would be contributing to “negating the negation.” (Allman 1999) They would be negating the process of thwarting the subaltern, the oppressed, and disenfranchised in their process of becoming, becoming more, in this case becoming “more fully human,” a notion that exposed Freire to criticism, from a postmodernist and related perspectives, of essentializing the human condition. In denying the necessary conditions for this humanization to occur, one would be dehumanizing oneself while, at the same time, dehumanizing others. By the same token, in gaining further “humanization,” the oppressed humanize the oppressor. All this is related to solving the contradiction of opposites between oppressors and oppressed. This is genuine revolutionary activity, one which is intended to resolve the contradiction rather than maintain it by simply replacing the personnel involved, the oppressed replacing the oppressor by acting on the internalized image of the latter, activating the “oppressor consciousness” –wanting to be like the oppressor. Praxis can play an important role in solving this contradiction.

Pedagogy of Praxis

Paulo Freire’s pedagogical approach, developed in the North-East of Brazil, and especially in Angicos, can take us some way in this regard. It is an education based on praxis. It is in fact the “Pedagogy of Praxis,” something which somehow echoes, though not deliberately, Gramsci’s “Pedagogy of Praxis.” It is a pedagogy which has “critical distancing” at its core. What is often problematically referred to, in Latin America, as the “Metodo Paulo Freire” is said to capture this sense of critical distancing. What is important, however, for one’s appreciation of Freire’s approach, is the philosophy at the heart of it, rather than the “method” itself. As with all pedagogical approaches, the one advocated and exemplified by

Freire is bound by context. In fact, Freire time and time again argued that one should not refer to his approach as a “method.” What happened in say Angicos cannot be transferred elsewhere cargo style. Putting it differently, and echoing Freire’s words, the experiment cannot be transplanted but must be reinvented. This having been said, a recapitulation of the Freire approach at Angicos brings to light the basic features of an education based on praxis. Quite instructive here is Dennis Goulet’s succinct account of this approach, in his preface to the English version of Freire’s very early writings.

Generative Words and Themes

There was a preliminary phase since any community education project entails one’s getting to know the community involved, the people’s speech patterns, aspirations, preoccupations, and what captures their imagination, among other things. Every community has its own characteristics. Educators were to spend time in the community, probably as part of a team involving target learners themselves who became coresearchers and coeducators in the project, just as the educators became colearners. The collective work involved searching for “generative words” with a focus on their “syllabic richness” and intimate connection to the people’s quotidian experience (Goulet 1973, p. 11). The next stage involved codifying the material gathered into different forms of cultural products, including dramatic representations, photos, drawings, etc. This was meant to enable people, who form part of this culture, to gain critical distance from things that are familiar to them, “extraordinarily re-experiencing the ordinary” as Ira Shor puts it in his *Critical Teaching in Everyday Life*. The ensuing discussion, prompted by “hinge themes,” introduced by the official educator, involved a process of decodification. The group members were helped to recognize the situation as the one in which they live. They were helped to hopefully begin to view it in a different, more critical light, unveiling, in the process, the underlying contradictions of this reality. They were then involved in developing alternative futures, a new codification

through which they intervene in the history-making process affecting their own community and possibly larger ones (Goulet 1973, p. 11).

There are some important points to consider regarding the use of *Praxis* by Freire especially through this pedagogical approach. The borrowing from Marx is there for all to see. It is the people’s material surroundings, and the social relations to which these give rise, that lie at the heart of the raising of their critical consciousness. In *The German Ideology*, Marx and Engels posited:

Consciousness is, therefore, from the very beginning a social product, and remains so as long as men [*sic.*] exist at all. (Marx and Engels 1978, p. 158)

Praxis constitutes the means of understanding the social relationships involved and identifying the possibilities of such awareness for the struggle to generate a climate for radical social change. The point of departure, for Freire, is human beings “in the ‘here and now’.” (Freire 1970, 1993, p. 85).

Conscientização

Secondly, this pedagogical approach involves *conscientização* (Roberts 2000), a concept that is closely linked to that of *praxis*. *Conscientização* has its prominent place in Latin American social thought, including radical religious thinking. Freire acknowledges that it had been employed by Brazilian radicals in the 1960s and identifies Dom Helder Camara, then Bishop of Recife, as the person who helped popularize it. Freire later stopped adopting the term because of its loose usage, devoid of any sense of praxis (Freire 1993, p. 110). He later began to reuse it describing it as the process “of the coming of consciousness” (Freire 1993, p. 110).

Third, there is a connection between praxis, *conscientização*, and literacy. However, the kind of literacy involved is one that transcends that of simply functional literacy. The latter kind of literacy, though sufficiently political in the sense that it allowed subaltern groups, in Brazil at the time, the right to vote, did not allow for praxis. Functional literacy of that type would involve a mechanical

process of learning – devoid of the political act of reflection. It was divorced from the context for radical social change. The kind of politicizing literacy Freire introduced, a literacy-entailing praxis, was called “critical literacy.” The quest for critical literacy, that is, to read and write the word and the world, applies to both the conventionally illiterate and conventionally literate alike. One can read the word but not necessarily read the world while doing so. Others have argued, going beyond Freire, that critical literacy also involves reading and *writing* the world and its construction through various media in a process of critical literacy. The terms critical literacy, *conscientização*, and praxis therefore become inextricably intertwined. Critical literacy, involving praxis, is the process whereby one reads the word and the world with a view, in the revolutionary praxis sense, to transforming it. Parallels with the work of Italian critical educator, don Lorenzo Milani, have been made in this context.

Authentic Dialogue and the Collective Dimension of Learning

Fourth, the process throughout is based on authentic dialogue. The educator, while not being on an equal footing because of his/her authority as educator and in the subject matter being investigated, an authority that, however, does not degenerate into authoritarianism, would be disposed to *relearn* what she or he knows through interaction with the learners. The latter, while learning, also teach, through the insights, often based on their own cultural background experience, they bring to bear on the object of coinvestigation. Freire wrote, in this regard, of “teacher-student” and “students-teachers” (Freire 1970, 1993, p. 80).

Liberatory education is fundamentally a situation where the teacher and the students *both* have to be learners, *both* have to be cognitive subjects, in spite of their being different. This for me is the first test of liberating education, for teachers and students both to be critical agents in the act of knowing. (Freire, in Shor and Freire 1987, p. 33)

Fifth, what emerges from this process is an affirmation of the collective dimension of learning.

There is the recognition here that revolutionary transformation of the world implies a collective, and not a single, effort. Revolutionary praxis is *collective* in nature. Freire argued that one engages in the task of social-justice-oriented transformation in concert with others (Freire 1970, 1993, pp. 85–86). Taking a purely individualistic approach to becoming “human” is mistaken in that it can entail denying others possibilities for reaching the same state. It would entail the dehumanizing process of “having more” (pp. 85–86), all part and parcel of “having” rather than “being.”

Different Contexts for Praxis

The process of *praxis* in his early and most celebrated works, namely, *Pedagogy of the Oppressed* and *Cultural Action for Freedom*, centered around political and communal life in general. In later work, however, when confronted by impoverished communities such as those of Guinea Bissau, then just liberated from Portuguese colonialism, his formulations around *praxis* took on a slant that echoes *Capital* Vol. 1. It also echoes Karl Marx’s advocacy of a “polytechnic education” in the “Geneva Resolution of 1866.” The site of reflection for Freire, in this specific African context, was the world of economic production. Freire argued extensively and prescriptively (at odds with his general philosophy), in Letter 11, that there should be no dichotomy between productive labor and education (Freire 1978).

He even went so far as to argue that educational institutions should not be “distinguished, essentially, from the factory or from the productive activity in the agricultural field” (p. 105), thus echoing Mao, Nyerere (the school-*shamba* as a site for “self-reliance” education), and others who wrote from a “Third World” perspective in this context. This position, which provoked severe criticism, posits a version of praxis characterized by reflection on the world of production. It somehow echoes Ernesto “Che” Guevara’s belief that “praxis (critical, creative, human life-activity) can radically transform men and women into different kinds of being through labor” (von Vacano 2013, p. 484).

Exile as Praxis

Finally, reference was made earlier to Freire's different uses of *Praxis* for an understanding of different situations. Reflecting on his experience of exile in "talking books" with people who were banished externally (Antonio Faundez) or "exiled" internally (imprisoned in Brazil – Frei Betto), Freire even used *praxis* to define these moments. These situations allowed Freire and the two coauthors in question the chance to gain critical distance from the context they knew. They were cut off from action in countries (Chile under Allende, Brazil before the 1964 coup) where a potential social transformation was halted by repressive military takeovers. Freire makes statements to this effect in the 1989 book with Faundez, translated into English as *Learning to Question*, and also in the hitherto nontranslated into English exchange with Ricardo Kotscho and Frei Betto (Carlos Alberto Libanio Cristo). This exchange appears under the book title *Essa Escola Chamada Vida* (The School called Life).

The period of exile constituted a profoundly pedagogical experience for Freire. The same applied to Betto who engaged in drama and other projects within the Brazilian cells; he was twice imprisoned (Betto was a student leader during the military dictatorship period). Conversations with other exiles or prisoners of conscience, or otherwise, served as a form of praxis since they had the potential to generate the knowledge, emotional responses, and reinvigoration necessary to seek to transform Brazilian society once the stressful situation was to come to an end. This was to occur with the *abertura* (opening) in the early 1980s and the promise of democracy, a very fragile democracy at first (Freire was at first skeptical of returning from exile and was persuaded to do so by such friends as Cardinal Paulo Evaristo Arns).

Relearning Changed Context of Origin

For Freire, however, praxis of this type entailed further dialogue and learning on return to the country from which he was banished. He had to

"relearn Brazil" since the context in which he was born and bred had changed considerably throughout the 16-year period of exile. Otherwise, the implication would be that, as a hero welcomed home, he ran the risk of being another agent of "cultural invasion," generating imported ideas which cannot be transplanted in the new, albeit home, context. Engaging in praxis involved constant reflection and relearning on the world of action. In Freire's case, this must have culminated in his having sufficiently relearned Brazil to the extent that he acquired the confidence to assume the post of Education Secretary in the Municipal PT government of São Paulo, when invited to do so by Mayor Erundina. There he reintroduced "praxis" in a manner that allowed the concept to lie at the heart of the "popular public schools" he helped develop, targeted at such children as the "*menino/a* popular" (popular child). He encouraged the "school community" to develop curricula on the basis of "thematic complexes" that arose from investigations of the surrounding environment.

Conclusion

It would be fair to state, by way of conclusion, that Freire's earlier and broader conceptualization of *praxis* is the most enduring interpretation of this term in critical education circles. Ira Shor, Antonia Darder, Henry Giroux, Peter Roberts, Paula Allman, and Peter McLaren frequently use it. The concept also lies at the heart of the radical liberation theology movement in Latin America that inspired and is inspired by Freire. Leonardo and Clodovis Boff described faith as a "liberating praxis," the term Freire himself uses in *Pedagogy of the Oppressed*.

There are those who distinguish between "praxis" or, in some cases, "intellectual praxis" and "revolutionary praxis." The former is said to constitute a case where people might change but the structure of oppression is left intact. This has been a standard critique of Freire. Conscientisation does not necessarily lead to transformation. It might simply lead to adopting an attitude based on critical awareness but this

does not bring about change. Revolutionary praxis entails building on one's continuous critical engagement and awareness to act on the world, possibly even through militant action and violence (as with guerilla warfare in Latin America and elsewhere) to bring about change. One does not preclude the other. Praxis, involving conscientisation, can help create the climate for revolutionary change. In Gramsci's words, every revolution is preceded by an "intense labor of criticism." Otherwise, the material change involved would be simply a top-down development rather than an ongoing revolutionary democratic one; hence the "prefigurative" educational work. Freire's pedagogy of praxis serves this prefigurative work well. As Gramsci postulated, revolutions of different kind, sudden or of very long duration, the latter involving the gradual renegotiation and transformation of relations of hegemony, require a long process of educational and cultural work. The "pedagogy/philosophy of praxis," in the Freirean and Gramscian sense, can potentially play a decisive role in this process.

Primary School Curriculum to Foster Thinking About Mathematics

Marie-France Daniel
Département de kinésiologie, Université de
Montréal, Montréal, QC, Canada

Introduction

Since the Fall of 1993, at the Centre Interdisciplinaire de Recherche sur l'Apprentissage et le Développement en Éducation (CIRADE) of

the Université du Québec at Montréal (UQAM), two mathematicians (Louise Lafortune and Richard Pallascio) and two philosophers (Marie-France Daniel and Pierre Sykes) have collaborated to design and develop a research project involving philosophy, mathematics, and sciences. Previous observations in the classroom had led the researchers to realize that, within the school curriculum, children like some subject matters and dislike others. Most of them usually succeed in arts, physical education, and language arts but many have difficulties in succeeding in mathematics. Why? On the one hand, as Matthew Lipman advocate and colleagues, the school curricula are not sufficiently “meaningful” for children (1980). On the other hand, some studies in the field of mathematics suggest that there are myths and prejudices about mathematics in primary schools and that the school system is partly responsible for this. Indeed, the school system does not invite children to express emotions in class about mathematics nor does it favor creativity. It does not allow dialogue among peers about mathematical concepts and problems nor the construction of mathematical knowledge by the students themselves (Lafortune 1992).

For quite some time, myths and prejudices about teaching and learning mathematics have taken root. Some of these myths and prejudices are as follows: students have to toil and suffer to learn mathematics; every mathematical problem has only one correct answer; there exists one right way to solve a mathematical problem; inherent objectives of teaching and learning mathematics are found in speed and accuracy with computational skills; speed and accuracy are more readily achieved with competition than cooperation; there is no place for discussion in mathematics; logical and rational thinking are the main skills to foster in mathematics – not creativity and intuition; mathematics is very difficult and can be better understood by a few talented students; men and boys are more inclined to succeed in mathematics than women and girls, for males are rational and females are more intuitive and sensitive (Davidson 1980; Lafortune 1990).

Throughout history there have also been myths and prejudices about philosophy. Let us remember that in Plato’s *Republic*, philosophy was a discipline reserved for a male elite, the rest of the community not being wise enough to deal appropriately with this double edge weapon (Book V). In the following 2000 years, philosophical thinking and philosophical discussions have often not been an expression of liberation which reveals the self, but a means of domination by language which shows to those who do not correspond to certain models, that they have good reasons to feel guilt, shame, and fear. In this way, philosophy like mathematics has been a means of domination of certain individuals over others, often of men over women and children. Even today, at the end of the twentieth century, philosophy is mostly restricted to higher education (college and university).

Some of the myths and prejudices which concern philosophy are: philosophy deals only with abstract concepts; philosophy uses particular idioms; philosophy is far from daily concerns; philosophy is dialectic and involves only logical and rational thinking; philosophy excludes intuition and feelings; philosophy always includes debates with effective rhetoric; philosophy is for those who possess mature thinking; and philosophy is not for children (Daniel 1996).

In the face of all these myths and prejudices about mathematics and philosophy, the question arises as to whether there is anything university researchers and curricula designers can do about how students perceive and experience mathematics. We believe there is: based on a different way of thinking about mathematics, as well as a new way of doing philosophy, we seek to invite primary school students to participate in philosophico-mathematical communities of inquiry that will help them tame mathematics, understand better, like them better, and have more pleasure in doing mathematics. In the following pages, we will present the philosophical foundations and epistemological principles inherent to the philosophico-mathematical curriculum we are designing and using in class. We will also

include some excerpts of the material so far written. Finally, we will present some qualitative results of experimentations held in three different primary schools.

The Philosophical Foundations and the Epistemological Principles Inherent to the Philosophico-Mathematical Curriculum

We know that all educative activities, including mathematics, are processes which involve the aptitude to learn as well as the aptitude to teach. Children construct their ideas and attitudes towards mathematics and other subject matters by the means of ideas and attitudes that have been taught to them. This leads us to question various aspects of teaching and learning and to distinguish their roles in the process of apprenticeship.

To Teach Versus to Learn: A Conceptual Distinction

In the constructivist and pragmatist points of view, to learn has to be differentiated from to teach. According to Latin etymology, to teach comes from “*insignere*” (to signal, to let others know) and to learn comes from “*apprehendere*” (to take with). The first term implies that the teachers are the subjects of the educative act, while the second implies that the students themselves are the subjects of the educative act.

To teach carries an ambiguous status: it is situated at the frontier of education and instruction (education being understood as an act from inside and instruction as having an outside cause). In the classroom, teaching is too often related to transmitting, which presupposes that students’ role consist in receiving, memorizing, and understanding rather than creating, inferring, and evaluating (see Gilford in Paré 1977).

To learn might also be ambiguous. In daily language, to learn might be used in its transitive form, and it then involves a subjective act (to gain knowledge of something or acquire skill in some art and to become transformed by it). When used

in its intransitive form, it involves an objective act (to become informed of, or about something by someone). Nevertheless, the Latin etymology of the verb “to learn” (*apprehendere*) reveals its essence, that is, to take with, to assimilate, to become able, to transform the self. Thus, to learn implies a voluntary and conscious act by a person to take the risk to get involved in the development of his or her capabilities (to do, to feel, to think, and to be) in order to improve his or her comprehension of data, of self, of others, and of life.

If to teach and to learn refer to two different aspects of education, we nevertheless believe that these two concepts are not conflicting because, in the classroom context, these concepts are complementary in nature. In the apprenticeship of mathematics for instance, we believe that there must be a part of teaching as well as a part of learning. Yet, we believe that learning has a predominant role to play.

The First Basic Principle of Learning: Learning Is a Process Based on the Reconstruction of Knowledge by the Self

What are the fundamental principles of significant learning? Pragmatists such as John Dewey would answer that a person learns through doubt and uncertainty. As Dewey points out, uncertainty brings about a process of discovery and learning (1916/1983, 1967). Ernest Bayles (1980), recapturing the Deweyan vision of learning, talks about the process of formulation of insights by the self as well as logical organization by the self. Constructivists for their part state that the learning process starts with the self-appropriation of knowledge and with the construction of problems and their possible solutions by the students themselves (Bednarz and Garnier 1989; St-Onge 1992). Following the pragmatist and constructivist perspectives and inspired by the pedagogy of Lipman et al. (1980), we have come to believe, concerning the learning of mathematics, that the teachers’ role should focus on getting children involved in an active process of reconstruction of knowledge rather than giving a problem to students and ask them for the right answer. Indeed, to educate in mathematics should not merely

involve enticing children to give final answers to problems. To educate in mathematics should privilege guidance of children involved in the process of mathematical inquiry (transformation, readjustment, reconstruction, and improvement) (Daniel 1996).

Some traditional pedagogists could ask: “What is there to inquire about by students in mathematics?” We answer that in this model, each step of the problem-solving process could lead to an inquiry or to a construction: construction of the problems inherent to the mathematics problem; construction of the meaning of concepts inherent to a given problem; construction of the possible solutions to a problem; construction of the possibility of transferring the solutions to a problem to other problems and to various life experiences; and construction of one’s strength and character.

The regular application of this pedagogy should have a positive impact on children’s motivation in doing mathematics and also on children’s self-development, because construction by the self can foster, in time, self-development (Davidson 1980; Sharp 1992). Indeed, to learn mathematics does not only mean to acquire knowledge and skills in mathematics but to learn how to improve one’s ways of thinking, feeling, acting, and being (Vincent, quoted by Brossard and Marsolais 1992). This is confirmed by more and more researchers that show that learning mathematics is strongly related to attitudes and emotions (among others: Lafortune 1992). Other researchers are trying to find ways to help teachers foster students’ metacognition (Lafortune and St-Pierre 1994).

Many mathematics teachers and program designers contend, when it comes to teaching mathematics to students, that the teacher must privilege the cognitive aspects of learning rather than the affective or social dimensions (Baruk 1994). We believe that such pedagogical and epistemological points of view lead to the persistence of many myths and prejudices about mathematics in primary school classrooms. Some of these myths and prejudices may be related to comments made by primary school children on mathematics: mathematics is useless in daily life; mathematics

has no relationships with the rest of the curriculum; to succeed in mathematics, one has to find “tricks” and to think fast; mathematics is boring and hard; to succeed in mathematics, one has to be brilliant; the students who succeed well in mathematics are boring; students are not allowed to make mistakes in mathematics; it is a waste of time to try to understand mathematics; girls have to study more than boys to succeed in mathematics; and mathematics teachers know everything (Lafortune 1993).

In the face of such comments on mathematics, we believe it is about time to act towards changing attitudes towards mathematics and suggest the application of new pedagogical models in teaching mathematics. The model we have come to privilege is a constructive model (or some may say an inquiry model).

The Second Basic Principle of Learning: The Intrinsic Motivation to Get Involved

The second principle of significant learning in mathematics is called intrinsic motivation and is referred to in every book by John Dewey on education. For Dewey (1967), there exist two kinds of interests in an activity. The first kind is an interest that is generated by a person towards an activity (intrinsic) and is conducive to having the person succeed in the activity. The second kind of interest stems from an interest proposed by another person towards an activity (extrinsic) and is less conducive to success in the activity. With regard to the intrinsic interest and motivation to learn mathematics, Dewey states (1967) that as soon as studies in mathematics are dissociated from personal interest and their social utility, that is, when mathematics are presented as a mass of technical relationships and formulas, they become abstract and vain for students. It is only when children become intrinsically interested and conscious of mathematics as a means of solving daily problems (as opposed to ends in themselves) that they enjoy playing with numbers, symbols, and formulas. Dewey recognizes the pedagogical and epistemological necessity to take into account the experience of students along with the role played by the self. He recognizes the affective aspect of learning.

Jean Piaget (1962) also lets us recognize the importance of personal interest in learning, by supporting the point of view that students who are interested in learning and are positively encouraged in the classroom, will have more enthusiasm to study and will learn more easily. He states that, for more than half of students, weakness in mathematics is due to affective blocks. Piaget contends that affectivity intervenes in the structures of intelligence, as a source of knowledge and of original cognitive acts (see also Daniel 1992c).

For Mumme and Shepherd (1990), effective communication about mathematics enhances students' comprehension and empowers them as learners. In this sense, and considering the importance of "reflexive dialogue" in class, we believe that each and every student should have the opportunity, within the mathematics class, to share with the rest of the group, elements of his or her constructions regarding various problems. Indeed, there is no need for students to make efforts to answer the teacher's questions if there exists only one good answer and if everyone in the classroom has previously been asked to memorize it (Dewey 1916/1983). Children will be motivated to make efforts to solve mathematical problems, only if they know that their answers can make a difference and be useful to their peers (Bayles 1980; Daniel 1992c). (One can also read: Lefebvre-Pinard 1989; Gilly 1989; Bauersfeld 1980; Blaye 1989a,b).

In order to respect the second principle of learning and foster students' interest in quality dialogue, the novels we are writing are philosophico-mathematical. The stories revolve around open-ended mathematical concepts and problems (such as truth, proof, success, the infinity, figure versus shape) which call for discussion among children. We assume that if children realize that they have the right to propose different answers to such concepts and problems, they will quickly learn to enjoy doing mathematics. They will dissolve affective blocks towards mathematics and replace them by self-confidence and real interest and eventually produce better results in mathematics.

Also, it is fundamental that children come to realize that talent and success in mathematics do not proceed from innate dispositions but rather from making good judgments. And children cannot succeed in making good mathematical judgments unless they continually practice making judgments (Lipman 1991; St-Onge 1992).

It follows then, that children should have the opportunity to communicate and to work with each other in order to understand mathematical problems; that they should have the opportunity to identify the possible solutions to a problem and attempt to submit these solutions to concrete tests. It is through such dynamics that students will become responsible for their learning, that they will realize that they can learn according to their motivation to make efforts at participating to the elaboration of their own instruments of mathematical thinking (Daniel 1992b; Daniel and Lebuis 1993).

The Role of Philosophy in the Development of Mathematical Learning

Usually, students view mathematics as a demanding discipline, where only one right answer is correct (McKnight et al. 1987). Discussions in mathematics class often lack the diversity of thought and originality we strive to develop (English 1993). If learning as involvement of the whole self means anything in learning mathematics, we should privilege the development of reasoning, conceptualization, translating, and researching in the mathematics class.

This brings us to the role of philosophy within the process of learning mathematics. First, let us specify what kind of philosophy is involved here. It is not the philosophy studied in traditional academic settings but rather a practice of philosophy, a "doing" of philosophy which refers to Socrates' maïeutic (Lipman 1988). Doing philosophy to learn about mathematics involves the creation of a philosophico-mathematical community of inquiry where children practice at thinking about mathematics in an autonomous, critical, and creative fashion.

This community of inquiry is a locus where children can search for the meaning of philosophico-mathematical concepts; a locus where they can share their results with their peers in order to construct thinking about mathematics and contribute to their learning of different ways to deal with mathematics.

Conceptualizing

Most children in primary schools use and understand a limited form of language and address concepts in a limited fashion. For instance, if they often talk about truth, they rarely question mathematical truth; if they often ask for proof, they seldom ask for mathematical demonstration; if they often compare the number of stars to the infinite, they rarely talk about infinite numbers; if they often use the word number, they have difficulties understanding the distinction between number and numeral; if they know what a cube is, they do not know the difference between the shape of a cube and its sketch, and so on. This is to say that mathematical language is formed of particular words whose meanings do not always correspond to those in daily language. We agree with Stella Baruk ([Xerox copy](#)) that we should not eliminate these words from students' books but, rather, help children understand the different meanings of these words, according to the different contexts they are used in. In this regard, Baruk wrote a dictionary of mathematics ([1992](#)) to guide students in their search for meanings. We believe that a good way to stimulate this search is to form a philosophico-mathematical community of inquiry in class where students are invited to clarify, together, the meaning of the mathematical words and concepts they are using very often without understanding them well. The community of inquiry enables students to practice at conceptualizing and at relating concepts to their different meanings, while at the same time, to practice at developing language skills through communication with peers.

Training in concept-formation skills is meaningful for primary school students whenever it uses, as a starting point, the concepts usually used and understood by children in their daily language ([Austin 1962](#)). Our philosophico-

mathematical curriculum adopts this starting point by proposing to children stories that depict daily situations. These stories address concepts such as truth, proof, infinite, too much, not enough, part of, and set the stage for children to talk about concepts in a community of inquiry. We believe that if children start to work with concepts that are meaningful to them, they will be interested and motivated to go further in their intellectual exploration and become authentic explorers in philosophico-mathematical language. As Lipman asserts ([1991](#)), if students work with concepts, they observe similarities and differences between two or more concepts, clarify ambiguities inherent to these concepts, establish and formulate relationships between them, explore their implications, and imagine new contexts they might be applied to. In other words, in working with philosophico-mathematical concepts, children learn to think for themselves in the language of mathematics.

To think for oneself in the languages of the different subject matters involves critical and creative thinking, for autonomous thinking implies that a person is able to reflect impartially and objectively about others' discourse – as well as her's or his' (critical). It also implies that a person is able to enrich this same discourse with fresh knowledge, new relationships, and pertinent concepts (creative).

The fostering of critical mathematical thinking could have children realize they are not thinking by themselves when they are merely repeating a series of exercises. It could also have children become less prone to naive scientific creeds and less gullible in the face of pseudoscientific authority claiming discourses of absolute truth. They could be less inclined to forget that most scientific discourses reflect hypotheses which have to be criticized, revised, and modified (one can look at: [Bednarz et al. 1992](#)). The fostering of creative mathematical thinking may help children create new useful concepts to better understand a theory; to discover a formerly unnoticed relation between two elements; to construct useful ordering; to organize the parts of a whole in a different fashion; and so on. According to David Tall ([1991](#)), some of the fundamental ingredients of

mathematical creativity are relational understanding, intuition, imagination, and inspiration. In short, because the fostering of concept-formation skills concerns philosophico-mathematical concepts, it represents more than a mere development of intellectual abilities. It is a global and fundamental education, which encourages students to think critically and creatively about mathematics and which gives them the possibility to articulate the expression of their opinions and contentions concerning personal as well as social or moral problems.

Reasoning

Reasoning and conceptualizing are strongly inter-related. Reasoning is the capacity of organizing different ideas into coherent systems often by means of human language. To do mathematics does not merely mean to get acquainted with the procedures of calculation (Baruk 1994). To do mathematics is a way to imagine the world, to deal with reality, and to reason about problems which are meaningful. When children, within a philosophical community of inquiry about mathematics, sit down and search together for the meanings of a mathematical problem, they develop their reasoning skills because, in order to succeed in their discursive activity, they have to extend the knowledge they already have (in regard with mathematics or with personal experience) through reasoning (Daniel 1994). When students search for meaning, they have to go through different proficiencies in such areas as classification, definition, question-formulation, giving examples and counter-examples, constructing and criticizing analogies, comparing, contrasting, and so on (Lipman 1991) – all proficiencies which are related to the development of reasoning.

Translating or Generalizing

To do philosophy about mathematics also involves and fosters translation skills. This is a high value skill, for to translate means to deal with human language. And as the reality of language is characterized by diversity and plurality, to translate means to deal with ambiguity. As with ambiguity, so with relationships. Actually, the most

basic element of translation skills is found in relationships – in mathematics as well as in other disciplines. As Luis Radford (1992) states, a mathematics problem is never set down in vacuo: it always means a relationship to something. In this sense, to translate implies to establish meaningful relationships between one problem and another, between one solution and another, between one context and another, and between one language and another.

Moreover, we are convinced that mathematical knowledge remains useless for students, unless they are able to transfer it to daily experience in order to improve its quality. Indeed, just as translating skills are fostered through philosophico-mathematical discussion, children will be able to construct their knowledge in other disciplines, to construct their vision of the world, and to construct their own self. In this context, mathematics becomes a way of thinking and a means of communication.

As Michel St-Onge notices (1992), if the teachers first explain to children the solution to problems and then give them exercises related to the solution, children will never exercise translation skills and, consequently, when a real problem occurs, they will not know how to resolve it. Philosophico-mathematical discussions in the classroom exercise translation skills, for it gives students the opportunity to observe, test, construct, and revise mathematical relationships. In this sense, translation is not only an intellectual act but a global behavior: it recognizes the existence of a plurality of modes of reaching truth as well as the necessity to submit any truth to examination.

Inquiring

The last set of cognitive skills do not merely involve the articulation of questions but, also and mainly, the inquiring attitude which implies activities such as: observing, doubting, questioning, seeking reasons, and searching for meaning (Daniel 1992a).

Very young children like to explore and always ask “Why?” But when they grow up they tend to look for clear-cut answers. They tend to put limitations to their inquiry by accepting (receiving) ready-made answers. And schools participate to this process by stressing the importance of clear-

cut answers in addition to the accumulation and memorization of information. As Pallascio contends (1992), average teachers of mathematics will rarely put themselves in a situation of inquiry. If they do, they tend to avoid sharing the difficulties they encounter in inquiry with their students. They tend to hide the process of inquiry and only show the final term (see also Daniel 1992b). Parallel to, it is rare that teachers propose to their students, real mathematical problems whose solutions are really unknown, a problem which is meaningful to students and which allows them to inquire, to invent, and to reconstruct (see also St-Onge 1992). Of course, stored knowledge is indispensable to question the results of research, to continue the exploration, and to inquiry in general (Tall 1991). Yet, to be fully educated in mathematics means to remain thirsty for new ideas and new questioning through the inquiry process.

In the philosophico-mathematical curriculum we are developing, students have to identify causes and effects, parts and wholes, means and ends, and means and consequences just as they have to suggest hypothesis, to formulate problems, to find solutions, and so on. All these mental acts maintain and foster the inquiry attitude.

Summary

In working with a philosophico-mathematical curriculum, primary school students should train in the four varieties of cognitive skills (reasoning skills, concept-formation skills, translation skills, and inquiry skills). They should learn to communicate within a community of inquiry, develop affective and social skills, and eliminate, to one degree or another, some of the myths and prejudices related to mathematics.

The Philosophico-Mathematical Curriculum

The curriculum we are designing includes a philosophico-mathematical novel and a teacher's manual, in keeping with the tradition of *Philosophy for Children*. The novel depicts children's daily life experiences in relation to philosophico-

mathematical concepts and problems. The manual is essentially composed of discussion plans about mathematical concepts and myths, philosophico-mathematical exercises, and mathematical activities. This material will be used in mathematics classes from fourth to sixth grade. The main objective of the curriculum is to foster philosophical discussions among children with regard to mathematical concepts, problems, myths, and prejudices.

Main Ideas

Some of the philosophico-mathematical ideas included in the material are:

- Can a room be a cube or does it only look like a cube?
- Do teachers know everything about geometry?
- Mathematics are useless, boring, difficult, and call for too much work.
- What is a problem?
- The fear of failing.
- Usefulness and uselessness.
- Too much and not enough.
- Abstract versus concrete.
- Is beauty in arts equivalent to beauty in mathematics?
- The necessity of proof and demonstration.
- Can animals think mathematically?
- Is geometry part of mathematics?
- Those who are good in mathematics rarely understand those who have difficulties in it.
- Where does success come from?
- The role of the community of inquiry in the finding of a solution to a problem of mathematics.
- Relationships.
- To guess and to reason.
- To believe.
- To understand mathematical operations and to memorize them.
- The role of intuition in mathematics.
- How can mathematics be useful in the resolution of daily problems?
- Infinite and indefinite.
- Does zero equal nothing?
- Rules, respect of the rules, exceptions to the rules.

- Does truth exist? Does mathematical truth exist?
- Do mathematics exist as an absolute, in the universe, or do they have to be created by human beings to exist?
- Far from; near of.
- Are mathematics a universal language?
- Number and numeral.
- To be a genius in mathematics.

Following the methodology of Philosophy for Children, students read one chapter of the novel by taking turns reading one sentence each. Then they are invited to ask meaningful questions brought about by reading the novel. Discussions on these questions take place within a philosophico-mathematical community of inquiry.

Extracts from the Novel

Matilde enters her bedroom and slams the door behind her. She takes off her shoes, puts her packsack in a corner and throws herself onto her bed. Ah! How GOOD she feels!

Matilde enjoys her bedroom. It is a very small green room, with a square floor.

- Hum! it almost looks like a cube! Isabelle taught us something about the cube this morning, in the geometry class. What was she saying, exactly?

Isabelle's words come gradually to Matilde's mind. While she looks vaguely around her, Matilde wonders:

- Can a room really be a cube or can it only look like a cube? Isabelle told us that it was not possible to see, on earth, a PERFECT cube. This surprises me!

Matilde tries to think about this problem, but she is tired. She gets bogged down in her
(continued)

ideas; she becomes impatient and, finally, says to herself:

- Tomorrow, I will ask Isabelle to clarify this for me. After all, SHE is the teacher! She probably knows everything about geometry.

Matilde's thoughts fly away, released from their mathematical problem. She starts to daydream about her new boyfriend, Mathieu:

- Ah! Mathieu, what a guy!

Everything is now calm and pleasant in Mathilde's room when, suddenly, she sees a big red sphere passing in front of her. Her heart still beating, she recognizes her brother entering her bedroom and who has just thrown his basketball against the wall. What a pest!

- I have a problem, Matilde.
- Really? Well, me too David, and it's YOU!
- No, please, listen to me. I really have a problem. I believe I've failed, once more, a mathematics exam this afternoon.
- Why do you say that, David?
- Because this is what I think, that's all!
- You said: "I BELIEVE I've failed, once more, a mathematics exam." What makes you believe you've failed? Is it your fear to fail or a prediction of failure? Maybe it is something else altogether.
- I don't really know. It is merely an impression.
- But, David, do you at least have good reasons to believe what you say? It is not because you have failed some tests last year, that you will fail them all this year.
- I know, but I hate mathematics!

(continued)

- David, you always repeat to yourself: “I am not good in mathematics; students who are not good in mathematics fail their tests, so I will fail my tests.” With this negative attitude, it is not surprising that you have failures.
- Mathematics are useless. The only thing they really do is provoke stress. And mathematics are so boring; they are difficult and call for too much work at home. I prefer to play ball or to draw. I am excellent in drawing!

After a moment of silence, David adds:

- And that is what I am going to do. I will draw my “Frustrations” in my room. This will be useful.
- Hi! Mathieu. Are you here for David?
- Yeah. Isn’t he ready yet?
- No. He has to clean his room before leaving. Did you have a good time at your party last weekend?
- It was not bad, answers Mathieu. You should have come with your brother! he adds, blushing.
- What do you think? I heard you when you said you were embarrassed to invite me because I’m a “brain” in mathematics.
- It’s not true! You’re all making this up.
- I heard you perfectly well Mathieu! And if I heard you, it’s true.
- Tell me, what is truth anyway? I think it’s just a word that doesn’t mean anything. Truth doesn’t exist.
- How can you say such a thing Mathieu? There are many things that are true and on which we rely every day.
- Like what? Give me an example.
- Well like “The earth is round.” Or “the earth revolves around the sun.”
- But Matilde, don’t you know that a few hundred years ago, everyone believed that the earth was flat?

(continued)

- So?
- So what tells you we won’t believe the earth is oval, a few hundred years from now?
- What’s your point Mathieu?
- What I’m trying to tell you is that what you say is true, that is, “The earth is round” may not be true. In the Middle Ages, the people saying “The earth is flat” were not saying something true.
- Matilde, you’re saying the same thing as I am ! You’re saying that something can be true for certain people and false for others. Like me, you’re saying that truth doesn’t exist.
- I’ll give you another example. Let me think. Here we are: $2 + 2 = 4$. This is always true and everyone agrees about it.
- I’m not so sure Matilde that 2 and 2 have always been equal to 4 or will always be equal to 4.
- You’re kidding!
- No I’m not. Close your eyes and imagine for a moment, that we’re in year 2897.
- O.K. Go on.
- Picture it: strange beings are dressed differently and even look quite different when compared to us.
- What else?
- Keep thinking about these strange beings and try to get into their thoughts, now. Aren’t they different from ours?
- Yes, probably.
- Continue your voyage in their brain, Matilde. Wouldn’t you say their way of calculating is also different from ours?
- Maybe, I don’t know.
- Well, I’m sure it is, Matilde. These beings are so different from us that they must have the need to invent a new way of calculating for them to evolve. I think that it’s quite probable that in year 2897, $2 + 2$ will equal 1 0 0 or something.

(continued)

- I think mathematics are truths that can't change.
- Why? What makes you say that?
- I can't explain it to you, but I know it. I think mathematics exist regardless of what we may think of them.
- I don't get it, Matilde.
- Well, I think that mathematics are truths that already exist in the universe and that humans just need to discover them.
- I think quite the opposite: mathematicians have invented mathematics and since they are human beings, they can make mistakes or change their minds. So for me, there is no mathematical truth.

At this point, David, who was listening in, asks:

- Tell me Mathieu, how and why would humans invent something like mathematics?
- To progress! replies Mathieu.
- Nah, says David. I think that mathematics exist in the universe the same way the stars out there exist. It's the astronomer's or the mathematician's job to discover them.

At this point, Matilde's and David's mother comes in the kitchen intrigued by the conversation she was overhearing from the living-room.

Looking at Matilde and David she says:

- Let's say that mathematics already exist in the universe. Would that mean that mathematicians have never created or invented a mathematics formula? To me that would be impossible.

Before Matilde and David could react, she turned to Mathieu:

- Let's say that mathematics exist in the minds of humans, would that mean that a
- (continued)*

baby would, at birth, possess the ability to calculate? Wouldn't it be strange?

Mathieu was surprised by his friends' mother's question and since he's shy, he chooses to run off:

- I'm sorry Mam, but we have to go. It's already late. Right David?

Back in her room, Matilde whispers:

- I still wonder if truth exists.

Some Reactions from an Experimentation in Three Classrooms

Since February 1994, a qualitative experimentation of the philosophico-mathematical material is carried out in classrooms of three different primary schools. After each class, teachers have to fill out an evaluation form (concerning the novel, the manual, and the discussion). Moreover, each discussion is recorded on audio tape. To this date, we cannot provide an analysis of the discussions. Nevertheless, based on the evaluation forms filled by teachers, we can share the following comments:

- The students are glad to see that David does not like mathematics.
- The students find the novel more interesting and easier to read than what they trained on in Philosophy for Children.
- Children are very helpful in suggesting ways to make discussions more interesting.
- There is a high participation of children to discussions, although relating discussion contents to mathematics is not always fun for some of them. Sometimes they do not want to hear about mathematics.
- Exercises and activities proposed by the manual are useful.
- Sometimes, it is difficult to establish a direct link between the topic of the discussion

proposed by the students and the choice of exercise or activity proposed in the manual. Sometimes, the teachers mention, we are left to adapt or invent, on the spot, an exercise or an activity clearly related to the discussion. It is difficult to succeed at this.

- We should get into more practical activities related to mathematics to help us talk about them.

Conclusion

We believe that to design and apply a curriculum which would foster the philosophical dialogue about mathematics is a significant way to start to tame and to like to learn mathematics. Indeed, we believe that if children do not like mathematics it is because they hardly see their relationship to the daily world or to their own personal problems. A philosophical curriculum has the power to help children establish this relationship, for it is:

1. A tool adapted to children, which talks to them in their own language and about their own difficulties and interests in regard with mathematics
2. A tool that can foster thinking about mathematics, because philosophy contains universal concepts which can be dealt with by children as well as by adults

Private and Public in European Higher Education

Introduction

The dichotomy public/private has become increasingly crucial in higher education. More precisely, there is a growing pressure to make higher education more private and less public. In many countries, this is also currently the dominant trend.

This aim to increase the level of privatization must be understood in light of the traditional perception of higher education as a public good. The original idea of the university as in terms of universality, i.e., as a community of teachers or students, bears similarities with the notion of higher education as a public good, something held in common to which all contribute and from which all profit. In the Middle Ages, universities formed a trans local community, a network of seats of learning, sanctioned by the Catholic Church. Higher education thus enjoyed a certain degree of independence from local authorities. With the rise of nation states, religious authorities lost most of their power over higher education. From the seventeenth century, and especially from the nineteenth century and onwards, universities became important pillars in the process of nation building and were crucial, not only for forming a national State bureaucracy but also for supplying national literary canons and national histories. Higher education as a private good is of a more recent date, having arisen in conjunction with the expansion of capitalism as an economic system and invoking such concepts as markets, supply and demand, commodities, and profits. The fervor for higher education as a private good has

Principles of Beauty

► [Issues in the Aesthetics of Educational Administration](#)

accelerated greatly during the last three to four decades and is related to the rise of the global knowledge economy. In this new economy, higher education and research are perceived as crucial assets and a necessary infrastructure for national economies and businesses to be competitive on a global market.

There are a number of processes that aim at supporting and increasing the private dimensions of higher education. At a policy level, the general introduction of neoliberal policy from the late 1970s and early 1980s has had large impact on higher education. This includes a movement toward the privatization of higher education, increasing the number of private institutions and strengthening their position, and augmenting the private funding of higher education, mainly by introducing or raising tuition fees. The latter has become more urgent since the costs for higher education has increased rapidly with the second phase of the massification of higher education (Verger and Charle 2012).

The privatization wave is also closely related to the internationalization of higher education. The influx of international students has increased steadily, and foreign students today account for a substantial section of the enrollments in a number of the most prominent host countries, including the USA, the UK, Australia, Germany, and France. An important vehicle here is the inclusion of higher education in the General Agreement on Trade in Services (GATS) by the World Trade Organization (WTO), which includes cross-border supply (provision of a service at a distance, distance learning, e-learning, etc.), consumption abroad (studies in other countries), commercial presence (branch campuses set up in other countries), and the presence of natural persons (staff teaching abroad) (Robertson et al. 2002). In some countries, such as Denmark and Sweden, international students from outside the EES area are charged full cover tuitions fees, while European and domestic students pay no fees at all. In the UK, the limit of 3000 £ for tuitions fees does not apply to non-European students, making it more profitable to recruit these full fee paying international students rather than other categories of students. A similar development has occurred in

research, where decreased public direct funding and increased private and external funding have created a higher education system that can be described as academic capitalism (Slaughter and Leslie 1997).

Yet another aspect of privatization is the introduction of new public management (NPM) in higher education. In very general terms, this means that management and steering models from the private sector have been implemented in the (traditionally) public sector, including higher education. This implies a focus on accountability, efficiency, transparency, decentralization, and deregulation. It is clear that the market model is presupposed.

Three Dimensions of the Private/Public Divide

The public/private divide of higher education is, of course, manifold and complex (see also Marginson 2007). At least three basic dimensions can be identified. A first dimension relates to the *funding* of higher education. Should it be funded by public or private means? The funding can also be mixed and could differ between student categories, such as national or international students. The *control* of higher education forms a second dimension. Control includes different levels, from the supranational to the national, the regional down to the local, including the individual higher education institutions. The State often functions as the controlling stakeholder but can subsidize a system of higher education including privately controlled seats of learning. A third and more diffuse dimension relates to the *organization* of higher education, which can be more or less inspired by private corporate models and market-driven principles. The three dimensions can go hand in hand. A higher education system with a substantial share of private funding might also have a large private institutional sector and a high degree of market-oriented offerings. Naturally, even other combinations are possible. In the following, European countries will be analyzed according to the three different dimensions.

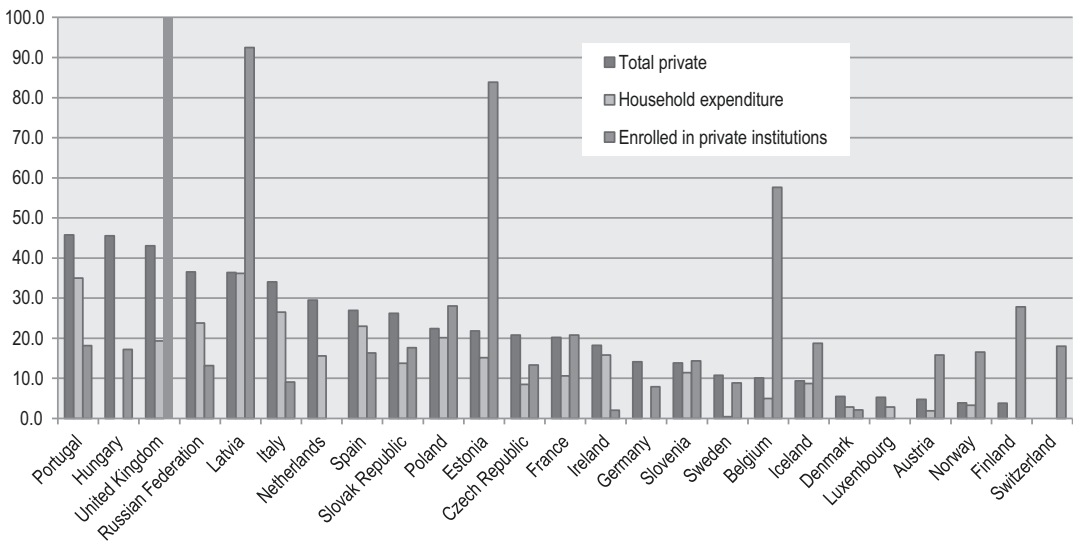

A Differentiated Public/Private National Landscape in Europe

Starting with the *financial* dimension, European countries differ greatly regarding the extent to which higher education is financed by public means or by private resources. According to figures from OECD for 2012 (see Diagram 1 below), it is clear that, in a European context, public funding dominates, and it is the most crucial source of financing in all countries. There are, however, important differences. Three countries reached over 40% private funding (Portugal, Hungary, and the United Kingdom), and an additional three countries (Russian Federation, Latvia, and Italy) exceed 30%. These can be contrasted to those with 10% and below – implying almost complete public funding – including the five Nordic countries, as well as Austria, Belgium, and Luxembourg. Thus, there seems to be a geographical pattern in the privatization of funding. Eastern, Mediterranean countries, and the UK are more dependent upon private funding, while Central, Western, and Northern European countries tend to be more publicly funded.

From a global perspective, the level of private funding of higher education in Europe stands out as low. Both non-European Anglo-Saxon

countries, such as the USA (62%), Australia (55%), and New Zealand (48%), and Asian countries, such as Japan (66%) and Korea (71%), have higher levels of private funding than the most extreme cases in Europe. It should also be noticed that the UK constitutes an exception in the European context. The OECD data for the UK in 2012 is lower than for the years 2007–2011, when the country had levels of approximately 70%, which is of the same magnitude as the non-European countries mentioned above.

A further differentiation of private funding can be made. Within the category of private sources, household expenditure dominates. There is, however, no clear connection to the level of private funding. Among the countries with a high degree of overall private funding, some, such as Italy, Portugal, and Latvia, have a large proportion of household funding, while the UK and the Netherlands have lower levels of household funding. At the other end of the spectrum, where the total private funding constitutes a low share, the relative weight of the household funding also differs greatly. Within the Nordic countries, household funding stands for almost all the private funding in Iceland and in Norway but is nonexistent in Finland and very low in Sweden.

Private and Public in European Higher Education, Diagram 1 Higher education in European countries 2012. Total private expenditure, household expenditure and rate of students enrolled in private institutions (Source: OECD 2015)

The second dimension, the *control* of higher education, based on student enrollment rates in private institutions, adds to the complexity (see Diagram 1 above). The UK and Latvia, two countries with the highest level of private funding, have 100% and 92% of the students studying at private institutions, whereas the four other countries with the highest level of private funding, Portugal, Hungary, the Russian Federation, and Italy, have only between 9% and 18% of their students in private institutions. Belgium, with 58% of the students in private institutions, has a low level of private funding (10%). There is also a set of countries with a very low level of private funding and relatively high rates of students in private institutions (Iceland, Finland, and Norway).

The evidence thus suggests that there are at least six typical combinations of private funding/private enrollment: high/high (the UK), high/low (Italy), medium-high/high (Estonia), medium-high/low (Ireland), low/high (Finland), and low/low (Denmark). The conclusion to be drawn is that funding and control are two separate dimensions of the public/private relationship in higher education in Europe. In non-European countries, there tends to be a stronger link between a high level of private funding, large share of household expenditure, and a large private sector in these countries in comparison to the European countries. Once again, the European countries stand out as less privatized and with greater variation.

Internal National Differentiations

In addition, there is often a differentiation of public and private enrollment within each national context. In most countries, shorter programs with a focus on practical, technical, or occupational skills for direct entry into the labor market (so-called type B higher education in the OECD statistics) have a larger share of students enrolled in private institutions than largely theoretical programs designed to provide sufficient qualifications for entry into advanced research programs and professions with high skill requirements (type A higher education). For 2012, the national

average for first category was 37% compared to 25% for the latter (OECD 2015).

Also, the typical pattern is that educational institutions primarily oriented towards the private sector, such as business schools or technical colleges, are more often private. In France, for instance, the vast majority of the business schools are private, as compared with 30% of the engineering schools. In Sweden, a country with a low level of privatization in higher education, only three institutions are private: one business school, one technical university, and one regional university college with an international business school.

When analyzing the more precise positions of the institutions within a global field of higher education, European countries differ from the USA, where private institutions dominate the upper echelons. While 22 among the 39 US universities ranked top-hundred by the *Times Higher Education World University Rankings* 2015–2016 are private, the vast majority of European universities in this exclusive group are public. The figures for the Shanghai ranking (*Academic Ranking of World Universities* 2015) are similar: 22 out of 51 US universities among the 100 highest ranked are private, as compared to handful out of 34 European universities. The private dominance in the American context becomes even more obvious when only the top-20 universities are considered: 11 out of 16 are private in the Shanghai ranking, and 12 out of 14 are private in the Times Higher Education ranking.

There is one area of European higher education where private institutions are competitive with public ones: business schools. While the American business schools are often part of larger universities, the European business schools are often institutions in their own right and frequently privately controlled. This is true for the leading French business schools, INSEAD, École des hautes études commerciales de Paris (HEC), and École Supérieure des Sciences Économiques et Commerciales (ESSEC), the leading European school, according to *Financial Times* ranking, the London School of Economics, the highest ranked Italian business school, Bocconi, and the most prestigious Swedish institution, the Stockholm School of Economics.

Increasing Privatization and Expansion

The increase in privatization of higher education should be understood in different contexts. First, it is related to the expansion of higher education, which generally came in two phases. The first occurred after the Second World War and the booming economies of the 1950s and 1960s, when higher education in many countries, in the terminology of Martin Trow (1974), was transformed from elite systems to systems of mass higher education. In the second phase, which stretches from the 1990s and onward, many Western countries entered a system of universal access. Especially this second phase of expansion has been associated with increasing demands for more private financing of higher education. In the OECD's *Education at a Glance*, for instance, it is stated that "More people are participating in a wider range of educational programs offered by increasing numbers of providers than ever before. As a result, the question of who should support an individual's efforts to acquire more education – governments or the individuals

themselves – is becoming increasingly important" (2015, p. 238).

The last 15 years (1998–2012, see Diagram 2 below) also indicate a general growth of private funding in higher education in European countries. Some countries have increased very radically. Portugal has raised its share of private funding from 8% to 46%; Hungary from 23 to 46; the Netherlands from 13 to 29, and the UK from 37 to 70 (in 2011, falling back to 43 in 2012). Many countries have seen moderate expansion: Germany from 8% to 14%; France from 15 to 20; Poland from 17 to 22; and Finland from 3 to 4. Only four countries have negative figures: Spain, Ireland, Belgium, and Norway.

But the link between expansion and privatization is not direct. While the expansion poses questions concerning how to fund higher education, different solutions can be considered. It is possible, for instance, to increase enrollment without raising the funding at the same rate, creating an erosion of resources. Expansion can also occur by the exportation of students. Due to underinvestment in Mediterranean countries such as Greece,

Private and Public in European Higher Education, Diagram 2 Higher education in some European countries. Total private expenditure, 1998–2012 (Source: OECD: *Education at a Glance*, 2000–2015)

Italy, and Spain, many young people from have enrolled in higher education abroad.

Shifting Organizational Patterns

In order to fully comprehend the privatization of higher education, the third dimension relating to the *organization* of higher learning, which can be more or less inspired by private corporate models and market-driven principles, has to be taken into account. Here, profound changes in systems of higher education have occurred which cannot be captured by the statistics referred to above. Many of these changes are orchestrated by supranational organizations (Laval and Weber 2002).

One obvious and far-reaching such transformation is the implementation of the Bologna process in European higher education. The crucial aims of the process are to enhance mobility and employability. This implies the creation of an international market of higher education where it is possible to transfer from one national system to another facilitated by two pillars of the process, the standardization of the educational system in three cycles and the standardization of the credit system. The stress on employability shifts the focus of the higher education system from the cultivation of academic knowledge to the production of manpower for the labor markets.

Yet another crucial change is the introduction of new modes of management in higher education, often referred to as new public management. Guided by principles such as accountability, transparency, efficiency, and decentralization, the goal has been to transform public rule-based bureaucracies to private company-like administrations. A precondition is the market model. Administrative units compete on a market and are compared with each other according to key elements. The model for public administration is transparency, so that clients and customers (students, patients, etc.) can make informed choices. Since funding is often tied to these choices, the system works in the direction of steering funding towards the most efficient and goal-fulfilling units. The issue of how to measure quality, and how and to what

extent it is tied to efficiency, has been a matter of some controversy (Rider and Waluszewski 2015).

Another issue related to the influence of private business models is the deterioration of collegial decision-making and increased concentration of power to management in chain of command structures. This also implies increasing power of external stakeholders in boards of higher education institutions. While these processes are often portrayed as enhancing the autonomy of higher education institutions, by decentralizing central decisions on funding distribution, employment structures, working conditions, etc., from the national level to the local level, a substantial reregulation is occurring. It is far from obvious that this leads to increased autonomy of the professionals, the teachers and the researchers, who seems better protected by national regulation than local feudalism.

Conclusion

Since the 1980s, a general shifting of power relations between public and private dimensions of higher education in Europe has occurred, where the latter has gained momentum at the cost of the former. There has been an increase in funding stemming from private sources, including households, enrollment in private institutions has increased, and organizational models originating from companies and private business have become more widespread in higher education.

If the development is seen in light of Burton Clark's famous tri-polar structure of the coordination of higher education (1983), it is not only the case that many countries have glided from the State-dominated pole towards the market pole, but also that there has been a movement from the professional pole towards the market one, implying that privatization implies loss of professional power.

Punishment

James D. Marshall
The University of Auckland, Auckland,
New Zealand

The Justifications of Punishment

Analytic philosophy tends to separate the two main philosophical questions concerning punishment – those of meaning and justification. They tend to be separated and treated almost

independently of one another. In this section we will follow this assumption. There are several traditional but opposed justifications of punishment, but, it will be argued*, none fit easily with the punishment of children (Marshall 1984). Here we will look at these traditional justifications, irrespective of whether or not they apply to children.

The *retributive* theory can be traced at least to the Old Testament adage of “an eye for an eye and a tooth for a tooth.” As the term “retributive” suggests, this involves a demand that punishment involves a paying back by the offender for his *offense*, and this notion of retribution is part of the justification of punishment. If the payment demanded by the Old Testament adage appears harsh and vindictive, the *payment* demanded by modern retributivists may not need to be as strong as that demanded by that adage. But, as the theory’s detractors often adduce, it is a “paying” back and is not concerned about the future behavior of the offender. In modern times, however, the recipient of any retribution has shifted from the victim to the State, though recent discussions on crime and punishment have centered on the plight of the victims of crime and how they personally are to be recompensed. Retribution then is *backward* looking, to the offense, and not forward looking and does little for the victim.

It is almost as if there is a moral accounts book, in which good and evil are entered on each side of the book in credit and debit pages. To keep the moral accounts balanced, the amount of evil brought into the world by a crime can only be alleviated by some credit of good, i.e., retribution or paying back by the offender. The moral accounts book must be kept balanced.

In less stern terms, we can see the retributive theory as holding that offenders need punishment and that justice is served on this account. Some retributivists however hold a stronger position that punishment is intrinsically good, i.e., that it is a good in itself and therefore in need of no further justification.

The *deterrent* theory (sometimes referred to as a utilitarian theory) is the major alternative to retribution as a justification for punishment. Its strengths are to be found in the differences

which it has from retributive theories. While admitting that punishment is essentially an evil, the deterrent theory claims that it is justified because its purpose is to deter the offender, and others, from committing the same or similar offenses in the future. Thus it is *forward* looking and in opposition to the retributive theory which is backward looking. In its forward-looking aspect, it is concerned with the behavior of the offender and with changing that behavior in the future. This is deterrence's strength in my view. At first sight then, this forward-looking aspect may have some attraction for a search for the justification of punishing children.

There are a number of problems associated with the deterrent theory (see, e.g., Acton 1963). First a deterrent theory of justification may also justify the punishment of innocent people so that others might be deterred. Here the objection might be that it is only the guilty who can be punished and that the innocent should not be punished. If this is part of the definition of punishment*, then it would appear that the infliction of pain should be described in some other way, as murder say, or as some other form of unlawful killing. Hence the "punishment" of the innocent cannot be justified as punishment because it is not punishment at all.

But perhaps it is the threat of punishment which deters and not merely punishment per se. First, there is a presupposition that people want to, or are likely to, or are disposed to do *X*. But for many people, the thought, desire, and any plan to do *X* just do not arise. *X* is not the sort of thing in which they engage. Second, in the notion of deterrence, there is an implied threat – if you do *X*, then *Y* will follow. Furthermore the deterrent theory is concerned not just with past offenders but with all people; for the punishment of one offender is meant to be a deterrent to others in that there is a threat for all others which accompanies the actual punishment of a particular offender. But why do we wish or need to threaten people in this manner, at all, especially for those to whom the thought of *X*-ing does not occur? Why do we treat the offender (who may be truly contrite and determined to change his/her ways) and the innocent others in this manner?

Sometimes punishment is said to be justified because it *reforms* people, but usually this putative justification of punishment receives short shrift in the philosophical literature; reform is reform and punishment is punishment. In other words the concepts of punishment and reform are claimed to be logically distinct. Reform implies a serious straying from the path and the need to be redirected, or to redirect oneself considerably. But at first sight this justification of punishment has its attractions.

But if it is meant to be a general justification for punishment, the way in which the legal institution of punishment works, especially in prisons, is hardly conducive to reform. Furthermore reform, as a justification, does not seem to work very well. In order to justify punishment because it reforms, there would need to be greater success with punishment as a reform than seems to be the case in actual fact.

Usually then reform receives short shrift as a justification for punishment. It would be nice if punishment did reform but it doesn't. At best reform is a contingent bonus. Philosophically, reform is reform and is not identical with punishment.

Finally, A. C. Ewing (1929) talks about an educative function of punishment. He argues that punishment helps "din the words in," i.e., that if the rational explanations of why something involves a crime or an intolerable state of affairs are accompanied by some form of punishment, then this may assist in the explanations being understood or accepted. But as Ewing's examples seem to involve the young and their moral education, this account will be discussed elsewhere (consult other section on punishment).

The Legal Model of Punishment

In this section I discuss the legal model of punishment, sometimes known as the Flew-Benn-Hart model after three of its proponents. However there are conceptual problems in the Flew-Benn-Hart model which make its application to children problematic (Marshall 1972, 1975), and the traditional justifications of punishment do not seem to

apply to children either (Marshall 1984). Why there are problems over the meaning of “punishment” and its justification in the case of children will be discussed in another section.

In Anglo-American philosophy of education, the analytic approach dominated for nearly two decades from the early 1960s. The account of punishment offered by philosopher of education R. S. Peters in *Ethics and Education* (1966) is analytic, follows the Flew-Benn-Hart model, and has been accepted, essentially, by a substantial number of analytic philosophers of education. It results however in a number of philosophical paradoxes for talk of the punishment of children. These are caused by taking from general philosophy analytic models of the meaning and justification of punishment in legal and adult cases and applying them to young people. Peters’ work is used to illustrate this general analytic position on punishment, because it is readily available, and has set an important general framework for discussion and debate on the meaning of “punishment” and its legitimization in philosophy of education.

Those philosophers who have been interested in punishment have tended to concentrate upon two major questions, concerned with *meaning* and *justification*. The following questions have almost come to dominate philosophical literature: “what is the meaning of ‘punishment’?” and “how is punishment to be justified?” The selection of papers edited by H. B. Acton in his important collection, *The Philosophy of Punishment* (1963), illustrates this point well. Our concern here is with the first question.

The Anglo-American philosophical literature generally concerns itself with a particular model of punishment. This (legal) model is presented, e.g., by H. L. A. Hart in *Punishment and Responsibility* (1968), as an answer to these questions of meaning and justification. As Hart’s work draws upon earlier work of Antony Flew and Stanley Benn, the model is sometimes referred to as the Flew-Benn-Hart model of punishment. And as it was essentially to be adopted by R. S. Peters in his enormously influential writings on philosophy of education (1966), it might also be referred to here as the Flew-Benn-Hart-Peters model of punishment.

Hart (1968) says that he is merely drawing upon “recent admirable work scattered through . . . philosophical journals.” That Hart specifically added the qualifier “English” to his list of journals need not be of too much concern. If this does represent a certain insularity or philosophical myopia, Hart was probably correct at that time that there was little need to go beyond this literature in English-speaking philosophy (see, in particular, the edited collection by Acton). However, it should be added that he is also writing from within an established legal tradition and with more than merely an analytic methodology as he relates his approach to that of Locke’s discussion of property.

Drawing upon Flew (1954) and Benn (1958), he says that he will define the standard case of the concept of punishment as containing five *necessary* elements or conditions for the correct application of the concept “punishment.” Hart argued that (1968, p. 4 f.):

1. It must involve pain or other consequences normally considered unpleasant.
2. It must be for an offense against legal rules.
3. It must be of an actual or supposed offender for his offense.
4. It must be intentionally administered by human beings other than the offender.
5. It must be imposed and administered by an authority constituted by a legal system against which the offense is committed.

Hart then drew a distinction between standard cases and *substandard* or *secondary* cases. For the accolade of standard to be applied, all five conditions listed above had to be met. Substandard cases were illustrated by the following *cases*, or possibilities: pain or consequences for breaching other than legal rules – here he gives as specific examples, the family and the school; by other than authoritative officials; and unpleasantness or pain imposed deliberately by authorities but upon non-offenders. Hence the paradox for educators over the meaning of “punishment” for how can we talk meaningfully, in more than a substandard sense of the term “punishment” and more than metaphorically, about the punishment of children?

If we accept Hart's position, then the use of "punishment" in relation to young people in home or school is a substandard case of the use of the concept.

This standard account is to be found, essentially, in R. S. Peters' *Ethics and Education* (1966). Peters also adopts Hart's fourfold division of meaningful questions about punishment. These are said to be (Hart 1968, p. 4) questions of *definition*, *justification*, and *distribution*, with the latter divided into questions of *who* should be punished, i.e., *entitlement*, and the *form* and *severity*. Peters, however, sees the first two questions only as being philosophical questions, with the remaining two being the province of jurists and administrators. In effect then, in Peter's account, we have a philosophical division of labor, with the efforts of philosophers directed at the first two questions about punishment – definition and justification – and the relegation of the last two questions to the status of administrative, juridical, or, in Peters' case, educational questions. If Peters' particular account of punishment did not meet with universal approval (see, e.g., Wilson 1971; John Wilson 1977), nevertheless, the model sets the form of the debates that ensued in philosophy of education.

Queer Theory

William F. Pinar
University of British Columbia, Vancouver, BC,
Canada

Queer theory originated during the 1980s AIDS crisis and functioned first as a socially and politically mobilizing phrase to fight intensifying homophobia as well as government and medical inaction regarding the disease (Jagose 1996,

pp. 93–94). For Leo Bersani (1995, p. 72), “queer” incorporated “the inextricability of the sexual and the political.” The very concept of “queer,” then, has embedded within it, as Ann Cvetkovich (2003, p. 174) notes, “histories of suffering and resistance,” including the “crucial presence of lesbian activists, so many of whom came to ACT UP with previous political experience and contributed organizing skills.” The theorizing of “queer” has for some threatened to erase that founding lesbian presence, replacing women with a generic abstraction (“queer”), despite the fact “many” of the most prominent queer theorists were “undoubtedly feminist”: queer theory itself was “an interdisciplinary formation . . . developed out of – and continues to be understandable in terms of – feminist knowledges” (Jagose 1996, p. 119).

The publication of Eve Kosofsky Sedgwick’s (1985) *Between Men* may have initiated queer theory as an intellectual discipline, but by the early 1990s, this specialized academic field had become, Annamarie Jagose (1996, p. 109) concludes, a “movement,” even as it was being criticized as white, middle-class, and capitalistic, too attentive to whatever was *au courant* (Jagose 1996, pp. 114–115), even “elitist” and “inaccessible” (Jagose 1996, p. 110). That critique has been repeated, most recently and perhaps most emphatically, by James Penney (2014, p. 1), who has endorsed “a critical return to Marxism and psychoanalysis (Freud and Lacan),” by means of which he advocates “abandon[ing] the exhausted

project of sexuality's politicization." The theorist often credited with inaugurating the phrase "queer theory" – Teresa de Lauretis – famously abandoned it on the grounds that it had been co-opted (Jagose 1996, p. 127). "[N]ormalizing the queer," Judith Butler (1994, p. 21) acknowledged, would be "a sad finish."

Despite demands for its dismantling, contemporary queer theory suggests to Jen Gilbert (2014, p. xxii) "that the study of queerness, at least, pulls people into networks of belonging." So queer theory continues, even intensifies, both in terms of the temperature of its internal debates but its reach as well, now including (as well as informed by) *race* and *education* while referencing *psychoanalysis* as both thematic and methodology. Race, education, and psychoanalysis in queer theory – and its future – are the topics discussed in this entry.

Race

For some, the concept of "queer" had "race" incorporated within it from the outset, if negatively. In "the [homophobic] popular imagination," Richard Dyer (1997, p. 216) recalls, "uncontrolled African heterosexual appetite" combined with "white sexual decadence" to produce the "disease, death, and danger." Homophobia, then, and perhaps not only in the United States, has been informed not only by racism but by misogyny too, since (straight) men loathe detecting in men they demand to see in women (Hocquenghem 1978). Constructed as analogous to an ethnic minority – that is, as a distinct and identifiable population, rather than as a radical potentiality for all – "queer" demands recognition and equal rights within the existing social system (Jagose 1996, p. 61; Warner 1993, p. xxvi). Ironically, given the analogy to a race-based politics, the ethnic model's subject was often "white" (Jagose 1996, p. 62). Despite bell hooks (1994, p. 128) crediting of "feminist and/or queer theory" as enabling "a broader context for discussions of black body politics," Phillip Brian Harper (2005, p. 110) condemned "queer studies [as] unacceptably Euro-American in orientation."

To alter that orientation, E. Patrick Johnson (2005, p. 125) replaced "queer" with "quare" from the African American vernacular in a project of "recapitulation and recuperation" (2005, p. 127). Marlon B. Ross (2005, p. 176) embedded "racial ideology as integral to the invention of homosexual identity," a move inverted by Stokes (2001, p. 188), who insisted that "whiteness" is "itself queer." Black queer studies represented, Walcott (2005, p. 98) explained, "both the edge and the cutting edge of a reinvigorated black studies project" (see also Mercer 1994). Allied with black queer studies was Michael Awkward's (1995, p. 48) theorization of a "black male feminism," "heterosexual" in this theorist's self-positioning (Awkward 1995, p. 56). Is, Gayatri Chakravorty Spivak (2003, p. 34) asked, "heteronormativity contained within the 'queer'?" These binaries blur in psychoanalytic treatments of gender and sexuality.

Psychoanalysis

On "Planet Queer" (Watney 1996, p. 24) – now relocated online (Bryson 2004) – sexuality is separated from gender, itself, Judith Butler (2004, p. 54) emphasized, "internally unstable . . . transgendered lives are evidence of the breakdown of any lines of causal determinism between sexuality and gender." Not only theorizations of that relationship have been informed by psychoanalysis, so have the relationships among gender studies (Silverman 1992), race (Lane 1998), and education (Britzman 1998; Taubman 2011). Psychoanalysis also informs the most recent rejection of queer theory (Penney 2014).

Queer theory has also rejected psychoanalysis. David Halperin (2009, p. 8) asserts that "sexual subjectivity 'requires' neither psychology or psychoanalysis," as it is "shaped by originary social experiences of rejection and shame, and bristling with impulses to transgression." Halperin (2009, p. 78) asserts that "abjection . . . describes a dynamic social process constitutive of the subjectivity of gay men and other inferiorized groups." Focused on Genet, Halperin (2009, p. 84), underscores its potential: "Humiliation turns into

defiance.” Such “reversals” are, he acknowledges, “miraculous,” especially so, one would add, given that, in Halperin’s view, they occur without “agency,” at least as this term is typically defined (2009, p. 85). Indeed, with its “transformative power” (2009, p. 88), “abjection is not the problem . . . but the solution” (2009, p. 87). “For groups constituted by historical injury,” Love (2007, p. 1) acknowledges, “the challenge is to engage with the past without being destroyed by it.”

Halperin – whose scholarship (see Halperin 1990) is canonical – is almost alone in his repudiation of psychoanalysis in queer theory. Queer theory’s “temporal turn” (Dinshaw 2012, p. 34) is informed by psychoanalytic preoccupations with injury, trauma, and reparation. “Queer history has been an education in absence,” Love (2007, p. 52) reminds, as “the queer past is even more remote, more deeply marked by power’s claw,” claiming that the queer “community [is] not as constituted by a shared set of identity traits, but rather as emerging from a shared experience of social violence” (2007, p. 51). In queer theory, the “quest for history” becomes, Cvetkovich (2003, p. 268) suggests, a “psychic need rather than a science.” Is education also a “psychic need rather than a science”?

Education

Queer theory informs the study and practice of education (see Britzman 1998). The relationship between education and queer theory is, however, an ambivalent one, Gilbert (2014, p. xix) explains, as “sexuality is . . . the source of curiosity . . . so central to learning . . . [but it] also threatens the aims of education,” namely “mastery” and “knowledge” (2014, p. xxiii), themselves defenses, she offers, against “the helplessness that learning introduces.” Such psychoanalytic insight follows others, including Madeleine R. Grumet’s (1988) analysis of women’s complicity in curriculum for patriarchy.

“There can be no education without the charge of sexuality,” Gilbert (2014, p. x) appreciates, as “love, curiosity, and aggression fuel our

engagements with knowledge.” She (2014, p. x) adds: “And yet education – its practices, procedures, rules, structures, and relations – can be undone by the wildness of sexuality.” Gilbert asserts that “sex education is larger than information, affirmation, or prohibition,” as it inevitably addresses “the most intimate aspects of life – love, loss, vulnerability, power, friendship, aggression” (2014, p. 28). Sex education, she emphasizes, “is necessarily entangled in the youth’s efforts to construct a self, find love outside the family, and enjoy a newly adult body” (2014, p. 28). Gilbert concludes with a “manifesto” for a queer sex education (see 2014, pp. 96–100).

Education is embedded in racial sexual politics and psychic life, a psychoanalytic insight that remains obscure, Kobena Mercer (1994, p. 122) appreciates, given humanity’s “stubborn resistance to the recognition of unconscious fantasy as a structuring principle of our social, emotional, and political life.” Given the “existential complexity” of the “lived” experience of “real existing racialized subjects,” Cameron McCarthy (2014, p. 42) and his colleagues conclude, “our research imaginations on race are in sore need of rebooting.” So, perhaps, are our research imaginations on education and queer theory.

Is Its Future Past?

Queer theory represents both a rupture and a “continuity” of “previous gay liberationist and lesbian feminist models” (Jagose 1996, p. 5), liberationist models that began, by one account, among World War II veterans (Bérubé 1990). Queer theory’s history is, however, located centuries earlier (Halperin 1990). Matt Brim (2014, p. 52) cautions that “neither . . . ‘gay’ and ‘queer’ . . . is always accurate [:] the supposed trajectory from the first to the second employs a potentially dangerous teleology of progress and liberation.” Gilbert (2014, p. xvi) acknowledges that “LGBTQ is a fragile construction . . . freighted by a false sense of political unity.” That fragility may provide a point of continuity, as queer theory has claimed to be an antisocial

theory (Bersani 1995), a claim also clear in Edelman's (2004, p. 3) assertion of "resistance" to "the social."

It had been Bersani (1995, p. 32) who cautioned that social recognition and political inclusion could be annihilating; he worried that "gays have been de-gayng themselves in the very process of making themselves visible." Moreover, "once we agreed to be seen," Bersani (1995, p. 12) continued, "we also agree to being policed," a sequence confirmed by contemporary and not only queer concerns over surveillance, security, and privacy in the age of the Internet. In an age of terrorism, others – perhaps most prominently Puar (2007) – assert that queer has been incorporated within nationalist, imperialist, xenophobic, and capitalist complicities, the last allegation made before (see, for instance, Case 2000, p. 31).

Is There a Future for Queer Theory? While Racialization Continues

Including the incorporation of non-North American and mix-raced theorizations of sexual orientation, spatiality, and temporality (see, for instance, Ahmed 2006, pp. 24, 66), the first phase of identity politics may be coming to a close, and not only due to the expansion of the extant "heterosexual" order that gay marriage, the legalized adoption of children, and social inclusion accomplishes. Determined to "wrest sexuality discourse from its various minoritarianisms," Penney aligns the queer with what he terms "a genuinely universal emancipatory struggle beyond the reach of capitalism's complicity with the continuing proliferation and deconstruction of sexual and gender identities" (2014, pp. 1–2; see also Cohen 2005). Pronouncing "queer studies and queer theory are intellectual dead discourses" (2014, p. 3) – "*All the valuable points queer theory has made about human sexuality were previously made by Freud and developed in (aspects of) the psychoanalytic tradition*" (2014, p. 5) – Penney asserts "the strong, if not absolute, determination of sexual identities by economically structured social relations" (2014, p. 4). Can socialism replace sexuality?

That is an old question, and not only theoretically. Almost 50 years ago, Pier Paolo Pasolini proclaimed that homosexual liberation would achieve its own annihilation as, at the same time, he condemned the student rebellions of 1968 as bourgeois violence against the sons of the poor (e.g., the police), asserting – despite his expulsion from the Italian Communist Party – the primacy of the economic, however mediated this domain is, he insisted (after Gramsci) by culture, desire, and religion. Like contemporary queer theorists Heather Love and Carolyn Dinshaw, Pasolini pined for the past; for him too "feeling backward" (Love 2007, p. 4) represented a political protest against the enforced futurism of compulsory capitalism. As Angelo Restivo (2002, pp. 149–150) points out, Pasolini shared with Marcuse a deep distress over how capitalism substituted "lifestyle" for the historicity of "lived experience," thereby making morally mandatory – Pasolini insisted – that "homosexuality remain an alterity." Restivo (2002, p. 150) concludes: "Pasolini remains central to any theorization of 'queerness'."

Does remaining an alterity mean refusing marriage, declining to raise children, disrespecting heterosexist identities? Does it mean the intellectual evacuation of a desolate present wherein queer theory can be imagined *sans* "anti-normativity"? Can the past be reactivated as a psychoanalytic practice in the educational service of working through the present to a future we cannot foresee? Is the future of queer theory in its past?

Quest for Heroes

Rebekka Horlacher
University of Zurich, Zurich, Switzerland

Synonyms

Cult figures; Faith in numbers; Major thinkers;
Role model; Seminal authors

Introduction

The educational science is replete with references, in diverse contexts, to the “great names” and “great figures” of the discipline, and the works

of these luminaries are often dubbed “classics.” These individuals and their writings are an important part of the educational curriculum. They are assigned special significance for having achieved a certain measure of universal validity; their concepts are highly regarded as particularly instructive and inspiring. This entry examines the function of these “classics.” It argues that the quest for heroes is not merely characteristic of a particular historical epoch and not just focused on “great figures” and their ideas but part of the educational discourse.

The Classical Authors: An Overview

Regardless of the specific topic being addressed, authors in education journals like to cite the “great names” in their field, even when this reference lacks specific applicability. In this way, such references often appear to be a form of *name-dropping* to legitimize one’s position or argument. Accordingly, such references to the luminaries of the discipline should not necessarily be understood as an attempt to arrive at objective truth based on the contributions to understanding made by past luminaries, but rather as a mere pedestal on which the author showcases his or her own theoretical or normative preconceptions. The persons accepted into the pantheon of “major thinkers” vary across time and space and are especially contingent on linguistic contexts. Academics in American or British education, for example, considers different authors to be seminal than their French or German counterparts. Furthermore, the established pantheon of classical authors may remain relatively constant within a particular language over time. It is not typical for a classic to be supplanted by another from one day to the next, and, in fact, the loss of seminal status is a relatively rare phenomenon. By contrast, it is much easier to be inducted into the pantheon of classics when new themes, new perspectives, or new questions come along with the need for new heroes. The present *Encyclopedia* clearly has a “classics section,” populated by the names of Gilles Deleuze, John Dewey, Paulo Freire, Martin Heidegger, Friedrich Nietzsche, and Ludwig

Wittgenstein, who have been honored in their own exclusive section. However, the selection leans heavily on the British tradition of analytic philosophy, revealing that the construction of the classics – contrary to the intentions of those who seek to grant them special status – does not truly represent something timeless, but always relates to preferences and interests.

Thus, while one can identify marked differences between traditions based on linguistic contexts, there are some common names that enjoy validity beyond linguistic boundaries. For example, the Genevan philosopher Jean Jacques Rousseau (1712–1778) is included among the classics everywhere and his writings serve as a springboard for diverse educational themes. In the German-speaking world, he is termed the “inventor” of childhood, while in the English-speaking context, his educational writings are read more in the context of citizenship or civic education. Meanwhile, the French language discourse emphasizes his concept of the original state of nature. The situation is similar in the case of Johann Heinrich Pestalozzi (1746–1827), who was also Swiss and is often cited in connection with schooling, teaching, and the education of the poor. Depending on the country in questions, we find that Pestalozzi is remembered in dramatically different ways. In America, Pestalozzi’s name is linked to the notion of the object lesson, an aspect also discussed in German language discourse, but always eclipsed by Pestalozzi’s role as a seminal author in social education. French discourse, in turn, sees his work as a teacher and organizer of schools as an attempt to put Rousseau’s ideas into practice.

There is also a collective canon of pre-eighteenth-century classics that does not vary substantially among the various language domains. Examples of classic figures from this period include the Church Father Augustine (354–430), the Czech educator Jan Amos Comenius (1592–1670), and the English philosopher John Locke (1632–1704). However, during the nineteenth century, the various pathways of the classics begin to separate, and starting from this period, increasing emphasis was placed on heroes native to a given country or language. The

German-speaking world claims as its classic figure the educational policy-maker and “inventor” of the theory of *Bildung* Wilhelm von Humboldt (1767–1835), the theologian and founder of hermeneutics Friedrich Schleiermacher (1768–1834), the founder of the scientific theory of education Johann Friedrich Herbart (1776–1841), the early childhood educator Friedrich Fröbel (1782–1852), and the early fighter for the professionalization of the teaching profession Friedrich Adolph Wilhelm Diesterweg (1790–1866). Among these figures, Herbart and Fröbel gained entry into the English language canon by way of Herbartianism and the Fröbel movement. The English-speaking “great men” of education include the sociologist Herbert Spencer (1820–1903) and the liberal economist John Stuart Mill (1806–1873), but in the German world, they remain mostly marginal figures. The French sociologist Émile Durkheim (1858–1917) is scarcely considered worthy of mention in the German-speaking world, quite the opposite of his seminal position in the French context but in keeping with his position in English language discourse. The early twentieth century also brought forth figures who are canonized as classic figures in a multilingual context, such as John Dewey (1859–1952), Rudolf Steiner (1861–1925), and Maria Montessori (1870–1952), but among them, Dewey represents a relatively newly recognized phenomenon in the German-speaking world. Until the end of the twentieth century, Dewey was about as well known or unknown in the German world as Herbert Spencer or John Stuart Mill, and the pragmatism associated with his name was considered – at least in the first half of the twentieth century – as anathema.

Thus, beyond any particular national or linguistic context, there has clearly been general interest in the construction of classics, but there is no universal principle for the attribution of this function to particular individuals, since this choice is largely dependent on each specific historical context (Horlacher 2014). This entry takes an epistemological perspective on the classics of education, examining the significance and function of those heroic figures whose appearance was

closely linked to the teacher education in the nineteenth century. The primary aim of constructing major thinkers was to provide prospective educators with models. This understanding of the role of the classics and the notion of the history of education associated with it may have changed in recent decades, but at heart, the quest for heroes has not been fundamentally called into question.

Schooling and Teacher Education as Part of the Nation-Building Process and as a Site for the Emergence of Classic Figures

In the eighteenth century, a widespread belief developed in the power of education to resolve current and future social problems (Smeyers and Depaepe 2008). As a result, teachers were no longer viewed as “mere” schoolmasters – that is, just another set of skilled individuals who transmitted particular knowledge or skills – but, instead, were now elevated into moral role models with a broad educational mission. This new functional attribution gave teachers a prominent role in questions of moral orientation, which was previously the exclusive domain of the preacher or the church. This new understanding of the profession meant that the education of future teachers could no longer be limited to introducing them to methodology and didactics through handbooks and procedural manuals; instead, teacher education would have to draw upon broader wellsprings of knowledge. To this end, new teacher training institutions had to be established.

A curriculum for educating teachers developed, linked to various forms of privately organized, nongovernment-certified training programs, and the topical area “history of education” was an important part of this curriculum (Goodson 1988, p. 41). Thus, the history of education including the notion of the classics not only became a matter of interest within education, but because of the public function of teachers, it also became part of the process of nation building. Government-organized and government-financed public schools were seen as the appropriate

instrument for effectively transforming inhabitants into citizens (Tröhler et al. 2011). Such a transformation of the citizen was essential for the success of the “nation-state,” a key organizing concept in Europe in the wake of the Napoleonic wars. It was (and still is) impossible to imagine schools without teachers, and for this reason, the training of teachers meant to embody the desired goal of educating citizens became the object of greater attention.

The belief in role models, which became a major element in the process of professionalizing the educator, was closely linked in the German-speaking world with the concept of *Bildung*, which had developed and became instrumentalized in the field of education around 1800. It was a term that incorporated religious, aesthetic, literary, and ethical concepts (Horlacher 2016). *Bildung* connoted concepts and theories in the teacher education that transcended methodology and didactics, addressing elements of the “personality” and role model function of teachers as well as their national pedagogic, societal, and moral role as educators of the citizenry. *Bildung* thus became part of a type of teacher training that looked beyond the inculcation of traditional educational methods and content. The changed nature of teacher education is demonstrated vividly by the various “histories of education” that arose.

These “histories of education” typically included a description of the national education system, but in large part consisted of biographical descriptions of exemplary educators who were to serve future teachers as role models and moral paradigms. In this respect, the histories drew formally on the medieval tradition of the lives of the saints. The “founder” of this genre was the German geologist Karl Georg von Raumer (1783–1865), who published his *History of Education* in four volumes between 1843 and 1854 based on lectures he had delivered at the universities of Halle and Erlangen. In the foreword to the first volume, he justified the need for such a publication from his personal experiences as a teacher. For Raumer, what mattered most in writing such a “history” was the “ideal of *Bildung*” as well as knowledge about the ways a particular society educated its children imparted its own

educational ideal during a particular epoch. It was also important to introduce the “great educator personalities,” and Raumer made particular use of the biographies of practicing teachers to show how ideas could be implemented in practice. Raumer did not hesitate to take a clear stance on educational practices and candidly railed against the kind of “objective presentation” of the lives and works of these figures that might be pursued by a historian. As Raumer states in the preface to the first volume of his *History*, an objective history would not serve the true goals of his historiography because such objectivity would fail to provide any moral orientation.

Despite its rejection of objectivity, this type of historical writing placed Raumer in the mainstream of the dominant tradition of nineteenth-century European historicism (Beiser 2011). The central focus was on the “great ideas” of the “great men,” who were seen as the crucial actors responsible for “influencing” the course of history (by which they essentially meant political history). It should come as little surprise, then, that the study of history was also regarded as ideal preparation for government service; for here as well, learning from history and learning from role models formed an ideal foundation for training competent civil servants.

This concept was appealing to Raumer – and, along with him, for a number of other authors of “histories of education” or “classics of education,” as they were later called – because by engaging with their histories and learning about the “great educators,” future teachers could confirm and strengthen their moral beliefs. From an international perspective, during the same period, the German States, and especially Prussia, had assumed a pioneering role in developing a professionalized system of teacher training and were respected as such by other nations (Geitz et al. 1995). Not surprisingly, the German model of the “history of education” was also adopted in various other national settings, albeit with adaptations to include those figures from each nation (Rohstock, and Tröhler 2014).

Over the course of the twentieth century, academic historians began to question the personality-centered notion of historiography

and tended to examine the course of history using a structural or social- and cultural-historical approach, as in the Annales School. In the context of discourse history and the linguistic turn, they virtually expelled the subject from historiography, but nevertheless, the figure of the role model remained a dominant mode of thought in the world of education (McCulloch 2011). This is illustrated by educators such as Maria Montessori, John Dewey, Jane Addams, and Paulo Freire, whose works and lives achieved virtually heroic status. These educators had founded their own “schools,” and drawn “pilgrimages” to their workplaces, and their works continue to be cited, although it often remains unclear whether they are merely cited and mined for citations or are actually being read, contextualized, and historicized. Thus, the twentieth century created its own pantheon of new heroic figures of education, and they were not toppled by the theoretical discourse of historiography. Particularly among professional groups engaged in teaching, these figures continued to play an important role just as they had before.

The End of Heroes?

The growing strength of the discipline of psychology during the twentieth century and the associated increase in the influence of empirical educational research dominated by psychology challenged the traditional role of the “history of education” as part of teacher training. The idea of providing normative guidance through role models found itself competing with new scientific discoveries about learning and behavior from controlled experiments in the laboratory or classroom, which were accompanied by the promise to make schools and instruction “better.” The educational profession’s involvement with moral role models receded into the background under this pressure. However, even though the “history of education” became ever more marginalized in the teacher training curriculum, beliefs related to this subject remained alive in educational theory and practice. The theoretical frames of reference in empirical education research are typically based on concepts drawn from

psychology, and these concepts, in turn, often incorporate notions of educational reform without explicitly formulating this connection or its historical contingency. These unquestioned, positively connoted ideals include “child-centered” education, “individualization,” and “self-activation,” along with “happiness” and “participation”; their proponents see no need to contextualize them, since they are postulated as emerging from an ahistorical, psychologically determined nature of the child (Glover, and Ronning 1987).

Against this backdrop, we should also mention the turn to numbers and statistics and, thus, to a putative objectivity, which can be characterized as a search for new heroes to meet the needs of the twenty-first century. Although the generators of numbers and statistics may often regard them as provisional or tentative, offering only limited explanatory power, this has not prevented the public, policy-makers, or even scientists from interpreting them as facts and to a certain extent as the “truth” (Porter 1995). This trend has permeated educational policy debates on how best to run school systems, accompanied by a growing emphasis on evaluation and performance measurements along with faith in the persuasive power of international comparative studies. The findings of these studies were presented in the form of rankings, thereby suggesting that quality or output not only can be quantified but also used internationally to place countries in a certain rank order and that this rank order actually reflected an empirical reality. Concern about whether your country has risen or fell in the rankings of the newest PISA study or whether the position of your university has improved in international rankings now preoccupies a large sector of the public. The magnitude of the public response to the publication of various rankings reveals that despite all political and scientific cautions to the contrary, people have faith in the numbers and statistics associated with them.

Even if the belief in numbers and statistics has not been quite as widespread in the world of teacher training or in certain sectors of the educational sciences as it is in educational policy-making, numbers and statistics have largely taken the place of the educational heroes from the “history of education,” at least in the

curriculum, and have become a kind of “fetish” of the twenty-first century. To some extent, they are also used to promote the normative claims of educational theory and practice, as educators seek clearer guidance and instruction for solving societal problems. Psychological theories come with a certain promise to make teaching and learning “better” or more “effective” and thereby lead to greater happiness.

However, these theories are of limited use to provide normative guidance for individual action in practice. Even in the twenty-first century, meeting this need is left to the roster of luminaries in the “history of education,” and as a result, this canon of figures has become ever wider and more short-lived, if more colorful than it was back in the nineteenth century. In keeping with their reception in the nineteenth century, these heroes are not read as historic figures in their own contexts, but rather as the embodiments of particular educational articles of faith. These articles of faith are regarded as given and not to be questioned by historical research. The question whether educational theory and educational practice can continue to grow and develop despite this restriction or if, instead, the quest for heroes will merely end up presenting the same articles of faith in new packaging can only be answered historically and comparatively. However, the persistence of the educational classics does seem to indicate the limitations of any attempt to squelch the quest for heroes. Heroes are simply too tempting as normative objects of identification within a complex moral and moralizing practice.

Synonyms

Catchword; Emotive expression; Motto; Persuasive language; Saying; Statement

Introduction

The notion of education is “inclusive and imprecise” (Tröhler 2011, p. 1). This circumstance owes less to fuzzy thinking or lack of curiosity than to the phenomenon referred to itself. Learning as well as education involve *invisible* processes. Yet that which cannot be sensed immediately must be structured metaphorically if it is to be understood clearly (Lakoff and Johnson 1980). That said, metaphors still lack a good reputation in the sciences. Even so, they serve as paraphrased usage, as figures of speech in which pictures dominate and terms seldom find use or are lacking entirely. While metaphors have been ascribed an important function since Greek and Roman Antiquity, mainly in poetry and politics or rhetoric, modern theories no longer see metaphors serving a mere ornamental or persuasive function. They are viewed instead as basic elements in order to *recognize* or *understand* phenomena. From this standpoint, science free of metaphors is rather an illusion, and metaphorical theories function as theories of recognition and understanding (Blumenberg 1998).

Slogans – Discourse Battle Cries

Israel Scheffler believed that distinctions within the language of education (see the work of the same name published in 1960) occur clearly between (i) definitions, (ii) educational slogans, and (iii) educational metaphors. From a contemporary standpoint inspired by lingual criticism, it can surely be disputed whether these distinctions can be stringently maintained. Slogans are hardly imaginable without use of metaphors. Such turns of phrase have often spun off slogans and possess an implicitly normative character. Meanwhile, hardly anyone within the realm of education (but conscious at the same time of the historic, social, and political meaning of language and speech) can believe in the idea of definitions that are free of metaphors and slogans.

Naturally the word “slogan” is also a metaphor (see below) as is “education.” Slogans are usually typified by short and punchy sayings or colorful

phrases that persuade or convince people – especially in politics and advertising. So why cannot the notion of education be defined clearly in this way with a well-chosen batch of precise words? One reason, as already mentioned, lies in its all-embracing nature: The notion “includes moral or character education as well as school, continuing, or vocational education and focuses on the subject of education, the child, the pupil, the student, the future citizen, on the stakeholders, parents, the family, or the school” (Tröhler 2011, p. 1). Learning and education are so central to human societies (and especially to modern ones) that they not only touch upon almost all aspects of life but also all citizens who in one function or another have more or less clear (usually normative) notions about learning and education.

This is in no sense an exclusive situation. *All* terms central to society are open to dispute (e.g., identity, morality, justice, civil society, love, responsibility)! The meaning, omnipresence, and normativity of these so-called constructions lead to struggles over power and dominance in discussion: Who can or should define what one ought to understand specifically by education, school, school reform, or lifelong learning? And what consequences result from it? Those who dominate discussion also partially determine how the world should be viewed and which actions and viewpoints are appropriate and legitimate within a historic and sociocultural context. It is usually ignored that one is situated in the realm of the *invisible* and the *imaginary* figures. “Discourses,” according to Ian Parker, “allow us to see things that are not ‘really’ there, (. . .) once an object has been elaborated in a discourse, it is difficult *not* to refer to it as if it were real” (Parker 1992, p. 5).

In this situation, educational slogans gain the greatest social importance. The word “slogan” is traced back to the battle cry of the Scottish clans – thus to rallying calls (of Scottish-Gaelic *sluagh-ghairm*, whereby *sluagh* refers to “army” or “folk” and *ghairm* to “cry”). The expression was replaced by *slogorne* in the sixteenth century, and since the eighteenth century, it has been used in a figurative sense but also metaphorically.

Practical Relevance and Lack of Semantic Precision

There are literally hundreds of educational slogans; a few well-known ones and some less known are mentioned:

“Education is a better safeguard of liberty than a standing army,” “Education is bitter, but the fruit is sweet,” “Education is learning what you didn’t even know you didn’t know,” “Knowledge is power,” “Education is power,” “Education’s purpose is to replace an empty mind with an open one,” “If you think education is expensive, try ignorance,” “Let us reform our schools, and we shall find little need of reform in our prisons,” “No child left behind,” “Without books our kids would be crooks,” “Education is an arsenal, not a horizon,” “Education is what’s left over when all one’s school learning has been forgotten,” “Experience is what you get when you didn’t get what you wanted,” “Lead people, manage things,” “Pedagogy from the child’s point of view,” “Help me to do it myself,” “Just say no,” “Head, heart, hand,” “Learning by doing,” “The child’s right to its own death,” “The child’s right to today,” “Where *Id* was, there *Ego* shall be,” “Pick up the children wherever they are,” “Relationship instead of education,” “From materials to skills,” “From teaching to learning.”

Many of these slogans generate agreement, yet this consensus is often merely broad and shallow. Slogans have “no standard form, and they make no claim either to facilitate discourse or to explain the meanings of terms” (Scheffler 1960, p. 36). The problem with educational slogans, Scheffler already opined at the time, was literal usage (Scheffler 1960, pp. 36–37). Many slogans transform themselves into pedagogical mottos this way. Nonetheless, criticism of slogans’ literal sense naturally does not mean that the slogan or the content implied by it must be rejected, since “one commits no logical error in accepting these criticisms and at the same time applauding the emphasis of the slogan” (p. 41).

The practical relevance of educational slogans lies in attributing an “essentially contested concept.” Essentially contested concepts are “evaluative” because they imply value-judgements. As Garver (1978) emphasized, discussion of an important issue creates various ways to handle the variety of meanings of the key terms in an argument, particularly (i) dogmatic, (ii) skeptical,

and (iii) eclectic ones. These means of dealing are all problematical, since they tend to ontologize the content of a discourse and to omit linguistically and socially critical aspects when analyzing the discussion.

It is only dogmatic to allow but *one* viewpoint or interpretation. It is skeptical (in an exaggerated sense) to dismiss a claim of validity for *all* viewpoints, while it is eclectic and may seem somewhat naïve to view *each* interpretation as containing a *similar degree* of truth of *similar value*. Such positions are all scientifically untenable in the final analysis.

Slogans and Loaded Language

However you want to look at it, educational slogans remain as meaningful as they are problematic: “(…) there is no reason to believe that slogans will be eradicated” (Hare 1986, p. 72). The problematic part is the (conscious) manipulation: “If a slogan exaggerates for effect, there is a danger that other ideas may be ignored or unduly neglected” (p. 72). Nevertheless, one has to admit that even in education there “are certain important goals in education which cannot be adequately captured in terms of specific behaviors” (Hare 1986, p. 82). This insight does not release the educational scholar from using appropriate language. “We should continue to make our objectives as precise as we can, since there is no virtue in being vague” (p. 83). There are many linguistic modes in which educational slogans become problematic and make discourse more cloudy than clarifying: exaggeration, oversimplification, black-and-white thinking, moralization, and emotional argument are important features to steer discourses from the issue at hand. All these modes, as well as others, may be classified as *loaded* with *emotive* language, for they intend to produce specific emotional responses in the audience or reader (Macagno and Walton 2014).

Single words can be “loaded” when they have an evaluative meaning in addition to their descriptive meaning. Often cited are examples such as “beast” (= loaded) instead of “animal” or “weed” (= loaded) instead of plant (=unloaded) to

provide insight. It is admittedly more difficult to recognize that (depending on the context) use of the term “intrinsic motivation” can be classified as loaded language. On one hand, loaded language is not necessarily always manipulative, for it may function solely as expressive language. On the other hand, educational language is full of persuasive terms, off-the-cuff consensus-building “good” words and equally off-the-cuff “bad” words that prompt loathing. These help to transform the vocabularies, the interpretation patterns, and the pedagogical practice itself. Regardless of how we rate such transformations, it can be postulated that developing a repertoire of pedagogical vocabularies belongs to pedagogical education. Sensitivity to moral imagery that reflects a look at their “blind spots” and conveys a focused interest in strategically important figure-background maneuvers within pedagogy’s politically correct and politically incorrect arena for discussion.

Pedagogical language seems somewhat pseudoreligious. It must be understood to a limited degree as an expression of a secularized religion (and theology) (see Osterwalder et al. 2003). How otherwise could one understand the pedagogically meaningful commitment to remain constantly active in combating wickedness, injustice, and misery? Only on this religious basis (without which modern morality is hardly imaginable) can one come to the specific contents, purposes, or goals of completely independent evaluation. This applies either through the voice of God now secularized in the categorical imperative or through another overriding moral principle. Accordingly, “be active” should be good in principle, but “be passive” would almost always be bad; “be committed” or “be involved” would be good in principle, but “be uncommitted” would be bad; “be openly transformative” would always be good, but “remain conservative” rather poor; “change” good, but “stagnation” poor.

An Example: The Admired Term “Active Learning”

The contemporary pedagogical discussion is full of activism rhetoric: *Active learning is good. Open*

learning is also good; the same applies to communal learning, holistic learning, self-regulated learning, and sustainable learning. The combination of these learning forms approximates a magic formula of pedagogical persuasion practice. The example of *active learning* alone tells us what we need to know. Pedagogues as well as education scholars explain this by saying that we should be *actively involved in learning ourselves* (voluntarily if possible and/or out of personal involvement as well as understanding and responsibility).

Helmut Heid (2002, p. 103) sneers with reason over such talk and cites relevant authors (educational psychologists whose names should not be of interest here) according to which: “Children (...) are productive with the greatest probability when they are active in their own learning process,” or they know that “the learning person stands at the center of the learning process,” or according to which learning “without one’s own involvement is not imaginable,” or who also know that “successful learning assumes the active involvement of the learner.”

Heid compares such statements with the following: “Successful drinking presumes that the drinker is involved in his drinking.” (ibid.) So what do we know when we know that we reject learning processes “unanimously” (?) “as an individual” (?), “involuntarily” (?), “uninvolved” (?), and “senselessly”? The presumption suggests that it is not a whole lot. Perhaps a politically correct pedagogy has hardly anything to say in the realm of *educational content* without persuasion adjectives such as “active,” “open,” “communal,” “integral,” “innovative,” “constructive,” “constructivistic,” etc. It obtains its power of suggestion from neglecting the counterparts of contrasted terminology (active-passive, open-closed, communal-individual, integral-fragmented). The contrasts (simply suggested and thus defamatory but not examined) were also quickly revealed to show how lacking this seemingly pedagogical presentation is in substance. Nonetheless, it is effective political rhetoric and that *is* substantial. It is good to be active, committed, and involved – in any case always in the moral and pedagogic realm. Yet the questions *in which direction* the morally demanded

activism, interventionism, and transformation leads us (or should lead us), which goals they actually pursue, and which side effects they could trigger interest amazingly little and are obviously also secondary.

The Good Words and the Bad Words

One used to be on safe ground in democratic and scientific discussions by adopting the viewpoint that socially important concepts are controversial. Think of the term “democracy” itself – or of “rights,” “justice,” “love,” “society,” “the good life,” “moral duty,” as well as “education” and “training.” There is reason for the assumption that:

- It could be important that this dispute continues in democratic settings.
- It sometimes has to do with living with civility with dissent (i.e., nonviolently) and not necessarily forcing a consensual “yes.”
- “Controversial” does not mean “spongy” or “subjective”; in a nutshell, it means we can argue in a coherent manner.

Unfortunately, though, the implied argument represents a quickly formulated *de facto* justification for spongy subjectivism and hence fruitful ground for persuasion and defamation as well.

Thus many pedagogical discourses live from the Manichean division between “good” and “bad” words (as well as corresponding images and marginal connotations). Among the “bad words” are surely “authority,” “obedience,” “power,” “discipline,” “punishment,” “*ex cathedra* teaching” – in part perhaps “virtue” as well and sometimes also “performance,” “exercise,” and (for many pedagogues) even “education,” “good” education is no “typical” education, “good” teachers are not “typical” teachers (cf. Schirlbauer 1996, p. 71). The defamatory words must be adapted by more or less refined terminology avoidance strategies, that is, unless they perform useful services to describe their opponents’ pedagogical thinking or actions. Yet their own positions can be summed up this way: If a teaching concept cannot be renounced, it will be

presented in a vocabulary that hushes up the asymmetry and role complementarity of the teacher relationship. Teachers in many situations become “facilitators of learning,” “accompanists for learning procedures,” and “designers of learning arrangements.” Pupils become “customers,” while parent–child relationships are seen primarily as “partnerships” and “friendships.” And naturally “subordinates” are called “collaborators.” Such labeling of defamed “old” people involved suggesting symmetry between them goes along with promises and hopes that usually cannot be fulfilled or must be disappointed. The pedagogical phenomena lying behind this lose their basic structure by only permitting the “good” words now. These phenomena are rather presented more subtly in their imperative form.

Thus the effort to overcome the so-called pedagogical antinomy between compulsion and freedom – the contradiction of all modern autonomy pedagogy – regularly leads into pedagogical kitsch or pedagogical ideology. At least it leads to use of a “monistic” metaphor (which can be considered the common characteristic of kitsch and ideology). Kant’s famous question on pedagogical antinomy (“How do I cultivate freedom by compelling it?”) cannot be answered free of trouble or contradiction in either the specific education situation or the general theoretical setting – at least not without setting delicate weights. “Overcoming” the contradiction will become possible by:

- One-sided use of metaphors (e.g., using the growth metaphor)
- Emotionalizing the vocabulary (use of persuasive terms) linked with
- Hypertropical distinctions between “good” and “bad” pedagogical actors

Slogans and Persuasion Terms

Persuasive definitions are definitions that are not apt to determine, isolate, or clarify (which would be their task) but rather strive to “convince” by use of emotionally loaded words. In this way they can produce clarity in a more or less direct and polemical manner. This means it involves efforts to

manipulate and direct the outlooks and feelings of those addressed in a certain way. Persuasive definitions really come into play in educational slogans through use of “good” and “bad” words. The clearer the emotional load of the words (in either a positive or negative sense), the more the pedagogical heart will be moved or repulsed. It will also make it more difficult to recognize the strategic use of language. Instead it probably means to stand in especially close accord with the moral reality and the truth. The fact that slogans and persuasive definitions often appear inconspicuously belongs to their variability, strength, and the issue involved. “True slogans, (...), those that have the greatest effect and constitute the greatest danger, are not necessarily the most striking, by any means; true slogans are those that succeed best by concealing their real nature” (Reboul 1979, p. 296). For example, if alternative and private schools are defined by this approach, the slogans stress that they (apparently in contrast to others, notably public schools) “respect the pupils’ personalities at center stage.” If the least possible “extrinsic” motive is promoted but “intrinsic” motives are intensified and satisfied or if schools are understood as “embryonic societies,” children are merely described as “different,” etc., it involves pedagogical slogans in the best case. On one hand, these often receive a high rate of agreement. On the other hand, though, it means nothing at all by definition other than that they possess persuasive power by pseudodefinition.

Transformations of Vocabularies

Important transformations of vocabularies have marked pedagogical thinking during recent decades and hence changed the outlook on pedagogical reality. Educational slogans have played a central role in these processes. Changing vocabularies means changing interpretation patterns, and this in turns means weighing things differently. That is also an invitation to act and react differently, among other things. Some pedagogically important transformations of vocabulary appear to be:

- Transforming the language of virtue into the language of skills (e.g., from wanting to knowing)
- Transforming the language of morality into the language of psychology (e.g., from punishment to therapy)
- Transforming the language of politics into the language of economics (e.g., from citizen to customer)
- Transforming the language of action (the subjects) into the language of behavior (of the behaving creature with needs)

Pedagogical training includes sensitivity to linguistics and language nuances of pedagogical science and interpretation. On one hand, it involves developing a repertoire of pedagogical vocabulary that can denominate practice in the field more diversely rather than giving them clear and narrow meanings. On the other hand, it concerns development of a sensorium that differentiates between pedagogical and lay usage, the “blind spots” and focus areas in both sectors, their strategic figure-background maneuvering between political correctness and incorrectness. This (normative) view is equivalent to the statement about pedagogical training: On one hand, understanding of differing moral principles and their varying slogans. On the other hand, it develops motivation for an appropriate language to describe pedagogical phenomena.

Questions on the Global Indigenous

Carl Mika

University of Waikato, Hamilton, New Zealand

Introduction

The term “indigenous,” an instantly global one, has undoubtedly been incredibly helpful in mobilizing political change. But some more subtle, and nevertheless important, colonizing aspects about the term can be discerned, including its natural tendency to normalize diverse groups. This critique of the term rests in the possibility that global discourses can threaten to be homogenizing if their users are not careful. They may be used tactically and in that sense are merely useful shorthand for a much more complex set of circumstances that simply cannot be accounted for individually; however, the term “indigenous” is also extended to other phenomena, such as “knowledge” and then by implication “science,” and so its reach moves beyond just its own sphere.

What may be at stake here are tensions between individual indigenous people and their innate differences between each other on the one hand and the grander pronouncements that arise in literature about indigenous belief systems and politics on the other. The task of becoming familiar with the hegemony of such globalizing discourses and understanding their potential benefits is a transformatively educational one, insofar as there are both global and local literatures and lived realities to engage with.

Homogenizing Discourses and Indigenous Peoples

Distinct indigenous peoples often have a particular aversion to those labels that group their particular groups together. In New Zealand, for instance, the group that is commonly known as “Maori” today had no name for themselves prior to colonization. This fact led notable Maori academic John Rangihau (1992) to identify that:

These feelings . . . for me are my Tuhoetanga rather than my Maoritanga. My being Maori is absolutely dependent on my history as a Tuhoie person as against being a Maori person. It seems to me there is no such thing as Maoritanga because Maoritanga is an all-inclusive term which embraces all Maori How can I share with the history of Ngati Porou, of Te Arawa, of Waikato I have a faint suspicion that Maoritanga is a term coined by the Pakeha to bring the tribes together. (p. 190)

It is important to note that, despite its convenience, a rigid definition would be problematic given the diversity of the populations who consider themselves indigenous. An equally significant factor is the notion that labeling and defining indigeneity is a predominantly Western idea in its essence. According to both Battiste and HENDERSON (2000) and CORNTASSEL (2003), to define indigeneity is a project that does not entirely coincide with indigenous thought. Rangihau's point is more than just political (although this aspect is important); he is moreover concerned with the consequences of homogenizing languages and terms for the inherent differences of tribal selves. This idea harks back to various traditional beliefs around safeguarding against normalizing and

maintaining difference (Mika and Stewart 2015). A global concept of “indigenous” is hence ontologically problematic as it seeks, from an indigenous metaphysical perspective, to disregard the vibrancy of the links that each individual has to his or her own unique land.

But there are certainly political implications at play here, and they stem in the first instance from issues of defining what indigenous means. Cornassel (2003) writes of the global debate that exists around defining who is indigenous and discusses challenges that range from the notion of peoples’ unlimited self-identification as indigenous to strict standards and requirements to prove one’s indigeneity. However according to Taiaiake and Cornassel (2005):

Indigenous peoples are just that: Indigenous to the lands they inhabit, in contrast to and in contention with [European and other empire-centered] colonial societies. . . . The struggle to survive as distinct peoples on foundations constituted in their unique heritages, attachments to their homelands, and natural ways of life is what is shared by all Indigenous peoples, as well as the fact that their existence is in large part lived as determined acts of survival against colonising states’ efforts to eradicate them culturally, politically and physically. (p. 597)

Subsequently, organizations such as the United Nations and many other indigenous organizations have outlined characteristics rather than a fixed definition to help describe indigenous groups of people. According to organizations such as the Secretariat of the Permanent Forum on Indigenous Issues (2004), for instance, a few of the key indicators of indigenous groups of people include self-identification, strong connections to their geographical locations, distinct language, culture, practices, and beliefs.

Another key point that makes defining indigenous people problematic is the degree of non-indigenous contact, through integration, colonization, or assimilation that may have been visited on indigenous people. While the huge detriment that indigenous peoples continue to suffer may not necessarily muddy the clarity they have of themselves as “indigenous,” it can nevertheless undermine key facets of their existence. To be able to understand why such a deterioration is occurring in historically robust communities, one

must explore the contribution of colonization to this weakening of the indigenous well-being. The majority of global indigenous communities have experienced some form of integration, assimilation, colonization, or genocide. It is well known that the impact of systematic dispossession of many indigenous peoples from their lands, identities, languages, and cultures has been devastating. Lawson-Te Aho (2013) discusses the intergenerational trauma from this process of dispossession that exists and continues to affect many indigenous groups. In Aotearoa/New Zealand, high youth suicide statistics are linked to the historical trauma from the colonization of the indigenous peoples of the land. She suggests that, to positively influence the historical trauma and the rising suicide statistics in Aotearoa/New Zealand (and potentially other indigenous communities), there must be a redress, a reframing, and a reconstruction of past intergenerational trauma.

Indigenous Knowledge: A Normalizing Phenomenon?

Due to the fraught notion of “indigenous,” it is perhaps no surprise that any derivative of it, such as *indigenous knowledge*, would pose similar difficulties. Again, the issue is not straightforward because it is politically convenient, in the face of colonization, to be able to group vastly different knowledge systems (which may nevertheless share a very like-minded metaphysics); yet, it is also critically important that users of the acronym “IK” retain awareness that those differences do exist. In the New Zealand context, because of a loss of knowledge or at least its gradual withdrawal, Maori have attempted to reclaim their own knowledge alongside politicizing the process. In other words, the reclamation of knowledge is not simply a process of learning what has thus far been hidden; it just as importantly engages with what is presumed not to be Maori knowledge. In more global terms, this can be accounted for by the fact that indigenous knowledge, in the same way as indigenous people themselves, has been hugely undermined. This loss of

indigenous knowledge is a contributing factor that has led to confusion of indigenous identity and dilution of the indigenous cultures.

The impact of colonization to indigenous identity and well-being around the world has only highlighted the interruption and corruption of indigenous knowledge. Indigenous ways of being and knowing are intricately connected to indigenous identity, spiritual knowledge, and education for the well-being of indigenous peoples. Consequently, because of this close relationship of indigenous knowledge to identity, it is important to also clarify the meaning of indigenous knowledge. In relation to this conundrum, Battiste and Henderson (2000) assert that there is no standardized definition of indigenous knowledge because it is intimately connected to its group and hence cannot be moved away from in order to be strictly labeled. Much like the issues of defining indigenous people, it would seem that similar challenges arise with defining indigenous knowledge. Semali and Kincheloe (1999), however, attempt a definition and explain it as being, among other things, localized. A comprehensive explanation was recorded in 1994 by Special Rapporteur Erica-Irene A. Daes in her study titled "Protection of the Heritage of the Indigenous Peoples"; she defines indigenous knowledge as "a complete knowledge system with its own concepts of epistemology, philosophy, and scientific and logic validity" (as cited in Lawson and Bertucci 1996, p. 770). She further determines that the various ceremonies, protocols, initiations, trainings, and practices contained within the specific geological location are vital to interpreting and teaching that very knowledge system. Transmitting and maintaining such knowledge systems, it appears, are a responsibility of the indigenous individuals and communities; further, individuals must refer to the transmission practices that are peculiar to their own language in order to ensure that the integrity of that language's specific and profound meanings is retained.

A currently audible debate is the one that engages with whether indigenous knowledges should be known as "science." It is controversial because it deals immediately with a treasured

discourse of the West. Some recriminations against the term "science" itself can be made as it is so tightly bound up with Western thought; on that basis, it could be considered inappropriate to equate with indigenous knowledge, which tends to keep the world in one piece rather than break it down into its individual components. In that argument, treating indigenous knowledge to the values of science is harmful to the former; additionally, the converse may be true too, to the extent that the pure meaning of science is detracted from when equated with another episteme. This latter point tends to be less relevant to indigenous peoples than the former, because of the indigenous focus on the importance of their own knowledges; however, the two are related inasmuch as they both indicate a deterioration of knowledge, and the phenomenon of knowledge itself is valorized by indigenous peoples. When looked at from that perspective, the deletion of science – however subtle – through the imprint of indigenous knowledge may be more of an issue for indigenous peoples than at first thought.

Indigenous scholarship is, it may be anticipated, divided on this topic, with a somewhat greater measure evidently voting in favor of the equivalence of indigenous knowledge and science. To be sure, there is some credibility to be gained for indigenous knowledge by describing it as science. Many indigenous scholars have thus recommended the broadening of science to include indigenous knowledge, to legitimize and validate this knowledge within dominant science discourses. In this viewpoint, indigenous knowledge can correspond with another term and its concept without sustaining any harm. The arguments here are as much pragmatic as they are theoretical, with scholars maintaining that indigenous communities can accrue a great deal of benefit through calling their knowledge "science." These communities can have access to research funds and medical trials, and they can open their debates up so that their premises are equivalent to those of scientists. In the New Zealand context, Maori have been somewhat undecided; in the Waitangi Tribunal claim that dealt with ownership of cultural and intellectual property, for instance, research was commissioned that cast a wide net

over the issue and that highlighted various views on the topic, resulting in diverse thinking on the area.

In the context of our discussion, though, a problem emerges that a further homogeneity occurs when the two are equated with each other. Not only would local groups of people have been brought under a governing umbrella of “indigenous” but their unique knowledge systems are now understood under the vast but constricting discourse of “science.” There is the risk of a continuing loss of knowledge with the label of “science”; even more insidiously, however, the term “knowledge” may potentially have already achieved this outcome because not all indigenous peoples had a term for conceptualizing the world in terms of the epistemic certainty that the word “knowledge” asks for. If “knowledge” is meant as a more expansive discourse than certainty, then it may not be an issue but rarely is it thought of as a different phenomenon than one of clarity and precision and in that vein it is homogenizing. Moreover, one term for the multifaceted ways that indigenous peoples have of interacting with the world could be an undesirable one, with its tendency to group intuition, experience, spiritual responses to the world, and collective understandings of entities, under the one, potentially restrictive, term.

Decolonization and the Process of Transformation: Understanding the Local, Treating with the Global

Various scholars aim to regain and protect vestiges of traditional knowledge and thinking, others are more intent on analyzing Western coloniality, but they are both essentially counter-colonial approaches. Retaining the local while choosing to engage with the global is one of the most pressing issues facing indigenous peoples, and in all cases – whether assuming a traditionalist voice or a counter-colonial one (or, indeed, both) – indigenous writers on indigeneity are acutely aware of the hegemonic forces at work that militate against the preservation of traditional

and counter-colonial thinking. Writing on decolonization occurs frequently and is broad in nature. Quite fortuitously, the critique that is to govern whether one should utilize the discourse of indigeneity will itself come from both global and local sources. There now exists a good deal of indigenous literature that directly warns against the consequences of being normalized or globalized, but there is equally much that encourages the indigenous self to look beyond tribal territories.

Indigenous authors, in their quest to regain authentic or appropriate indigenous existence, are quick to describe the hegemonic discourses that are firmly entrenched within institutions and other colonial aspects such as media, education, and government. Some authors, such as Deloria (2001), discuss the potential for a global indigenous metaphysics while leaving room for individual differences between the groups. His remarks here comprise a political concern, as they attempt to activate philosophy so that it is relevant in an everyday sense. But local indigenous groups, as Deloria seems to suggest, can be ontologically as well as politically transformed through uses of terms, and “indigenous” is certainly no exception. It is also a transformative act to familiarize oneself with the various theories that deal with the area. Some of these theories, it must be noted, may come from nonindigenous theorists. Deloria’s remarks also urge the indigenous reader to keep at the forefront his or her teachings from their elders (and, we might add here, the younger generations). For him, metaphysics is an institutionally relevant study that lies at the basis of indigenous peoples’ knowledge and oppression generally, but any unmonitored temptation to adopt it at the expense of each group’s discrete knowledge is tempered. There is a learning process at work here that emphasizes the development of skills among each indigenous citizen to assess, among other things, the consequences of accepting the notion of “indigenous” and its various offshoots. The decision to adopt the term, its qualification with “knowledge” and so on, would most likely be a collective one, falling to each indigenous group rather than foisted on it by the individual indigenous person.

Conclusion

The term “indigenous” and its derivatives, such as “indigenous knowledge,” are primarily meant to refer to the politics of diverse groups’ unique lives. It is an extremely controversial label, and so it should come as no surprise that it is tracked with a certain transformative process. This formative nature consists in a schooling up on the literature and the demands and needs of each indigenous group; it also refers to a constraint in rushing to deem a cause to be universal. Indigenous groups risk much by adopting it either in its own right or as a qualifier for other phenomena such as knowledge, but there is also a great deal to be gained – particularly in a political sense – in its use.

Rancière and Education

Charles Bingham
Simon Fraser University, Burnaby, Canada

Jacques Rancière (b. 1940) has been prominent among Anglo cultural theorists since the late

1990s. Bringing disparate strands of critique together – aesthetics, politics, literature, and importantly, education – Rancière has since the early 2000s also become influential among educational theorists. Rancière studied philosophy under his mentor, the structuralist/Marxist Louis Althusser, at the École Normal Supérieure in Paris. After publishing *Lire le Capital* with Althusser, however, Rancière turned to denounce Althusser with the publication of *Althusser’s Lesson* (Althusser 1996; Rancière 1974). This latter work reflects on the milieu of student uprisings in 1968 Paris and rejects the pretense of a theorist who guides the masses. In 1999, he joined the philosophy department at the Centre Universitaire de Vincennes, subsequently the University of Paris. He retired from there in 2000, professor emeritus.

Rancière’s work spans the topics of literature, politics, aesthetics, and, significantly, education. It can be said that among the major continental theorists of the post-structuralist, post-Marxist era, Rancière is the first to open up the literary/political/aesthetic trinity with an extensive educational component. Thus, one need not translate his theory *into* education; rather, one can grapple in the mother tongue with the work of a superb theorist who also theorizes education. Rancière’s major works include the following. *The Philosopher and His Poor*, wherein he argues that Western philosophy has, since Plato, defined itself as at odds with laborers (2003). *The Nights of Labour* documents workers’ manifestations in the context

of coming to voice, rather than in the context of following some sort of theoretical orthodoxy (1991b). *The Politics of Aesthetics* describes the aesthetic dimension to reconfiguring human sensibility in order to bring about political acts (2004) and, importantly, Rancière's book on education, *The Ignorant Schoolmaster*, which chronicles the pedagogical adventure, and the educational theory, of Joseph Jacotot (1991a).

In *The Ignorant Schoolmaster*, published in 1987 and translated into English in 1991, Rancière uses the historical figure of the nineteenth-century schoolmaster, Joseph Jacotot, to theorize education and its relation to truth, emancipation, and equality. In this work, the story is told of Jacotot, an exiled French schoolteacher who discovered in 1818 an unconventional teaching platform that spread across Europe. Many considered Jacotot's deviation from instructional norms, as his radically egalitarian pedagogy, dangerous to the social fabric. Jacotot, knowing no Flemish, found himself teaching students whose language he didn't know. Finding success with this "ignorant" method, Jacotot went on to formulate a philosophy of "universal education," the foundation of which was both a linguistic radicality and an epistemological break. "Universal education" was founded on (1) the arbitrariness of language and (2) the separation of will from intelligence.

Jacotot's was a philosophy of "intellectual emancipation" finding great currency among a wide set of educators. As Jacotot professed, one need not teach that which one knows, and one should refrain from knowing what one teaches. Indeed, one must *not* teach what one knows. When one teaches what one knows, there is a "particular inequality that normal pedagogical logic operates" (Bingham and Biesta, p. 4). However, when one teaches that which is unknown to the teacher, "the teacher is first of all a person who speaks to another, who tells stories and returns the authority of knowledge to the poetic condition of all spoken interaction" (Bingham and Biesta, 6). Such a pedagogy would enable even illiterate parents to teach their children how to read and write. It should be noted that *The Ignorant Schoolmaster* is written with a vacillating voice that blurs

the boundaries between Rancière's thought, on the one hand, and the subject matter of Jacotot's teachings and philosophy, on the other. Educational scholars as well as general cultural theorists tend to treat the work as a statement of Rancière's theoretical perspective in spite of this vacillating voice.

Before outlining some of Rancière's major educational contributions, attention to key Rancièrian concepts – ones that inform his overall oeuvre – is warranted. Rancière is an extremely consistent thinker, with the exception, perhaps, of his turnaround with regard to Althusser's thought. Thus, each of Rancière's key concepts serves to elucidate various elements even in works where these concepts are not specifically mentioned. "Police" is Rancière's name for the management of human modes of life, society, and human passions. Rancièrian policing has nothing to do with human beings who are employed by the State, but rather the ordering of what gets to count as discourse and purposeful action. Rancière's "police," writes Eric Méchoulan, "as power practices and social life styles, builds inequalities, but such a construction has to appear natural" (4). The "distribution of the sensible" is a phrase of Rancière's that further clarifies the police order. This distribution "refers to the implicit law governing the sensible order that parcels out places and forms of participation in a common world. . . [it] produces a system of self-evident fact of perception based on the set horizons and modalities of what is visible and audible as well as what can be said, thought, made, or done" (Rancière 2004, p. 85). Whereas the distribution of the sensible offers up modalities of perception, the police order represents an organization of bodies based upon this distribution.

As Rancière writes,

This is what a distribution of the sensible means: a relation between occupations and equipment, between being in a specific space and time, performing specific activities, and being endowed with capacities of seeing, saying, and doing that "fit" those activities. (Rockhill and Whatts, p. 275).

"Dissensus" is Rancière's term for the creation of a fissure within the distribution of the sensible and within the police order. A critical artistic

work, for example, can lead to dissensus when it produces a new perception of the world and creates a commitment to its transformation. “Dissensus,” writes Rancière, “is the demonstration (*manifestation*) of a gap in the sensible itself. . . [It] makes visible that which had no reason to be seen; it places one world in another. . .” (2010, p. 38). Dissensus consists of three parts: the production of sensory inconsistencies, the development of an awareness of these inconsistencies, and then a mobilization of individuals based on these inconsistencies. Central to both Rancière’s educational theory and his political understanding of the police and dissensus is his notion of “subjectification.” “Subjectification” “. . . is the process by which a political subject extracts itself from the dominant categories of identification and classification. By treating a wrong and attempting to implement equality, political subjectification creates a common locus of dispute over those who have no part in the established order” (Rancière 2004, p. 92). Subjectification is the coming into subjectivity of one who has participated in dissensus.

Rancière’s “presumption of equality” and the “arbitrariness of language” are themes of Rancière’s work that have special resonances with education. With regard to the presumption of equality, it is not that all people *are* equal. That is, Rancière does not offer some philosophical, psychological, or political justification for the sameness of all people. Nor does the presumption of equality mean that all people need to be allotted resources in a similar fashion. Thus, the presumption of equality is not an ontological or political claim. It is rather a subjunctive claim, one that sets up a presupposition by which subjects might formulate language and actions by which they participate in politics and prove, through verification, that equality is a fact. The presumption of equality provides a means for a verification of equality. And as Rancière notes,

A verification of equality is an operation which grabs hold of the knot that ties equality to inequality. It handles the knot so as to tip the balance, to enforce the presupposition of equality tied up with the presupposition of inequality and increase its power. (Rockhill and Watts, p. 280).

In constructing an intervention on language, Rancière follows what has become an inevitable path in French theory after the “linguistic turn” (Rorty). Namely, it now seems incumbent on French theorists to offer a unique commentary on, or a usage of, language theory. While Rancière has refused the notion that his work has a theoretical anchor in language theory, he has stated that his thinking grew when, after studying Joseph Jacotot, “I became more sensitive to the fact that words are never definitions of things or states of things but are like weapons exchanged in combat, in dialogue” (Boustinduy). Thus, language is arbitrary. There are no words that are more privileged than others to tell a given story. The philosopher’s words are not any more important than the joiner’s. The sociologist’s words are no more important than the poet’s. The teacher’s words are not any more important than the student’s.

All of the above concepts are discernible, if not explicitly mentioned, in Rancière’s major educational work, *The Ignorant Schoolmaster*. However, this educational work also brings various of its own themes to the fore. Each of these themes constitutes a major educational contribution by a theorist whose work has a uniquely educational dimension.

Rancière Among Educational Theorists

Jacques Rancière, with the publication of *The Ignorant Schoolmaster*, positioned himself as an unprecedented educational theorist. He established an iconoclastic approach to education through his recuperation of Joseph Jacotot. Rancière’s work can be seen in contrast to three prevalent educational perspectives that dominated the twentieth century into the beginning of the twenty-first century. Education has commonly been described in one of three ways. These ways roughly correspond to the traditional, progressive, and critical models of education. As a traditional project, education is conceived as a platform for disseminating a common set of learnings. These learnings will, in turn, enable citizens to share a common language for use in the public sphere. Such learnings may or may not derive from the

experiences of the students since traditional education is not concerned with the private lives that students have had in the past, but with the common knowledge that needs to be fostered so that they can speak with others in the public sphere.

Progressive education shares the same liberalist tendencies of traditional theory, but progressives are more concerned about the bridge to be constructed between private experience and public life. So while the progressive orientation shares the desire to create a common body of knowledge that will enable citizens to communicate in the public sphere, progressives insist that a common body of knowledge can only be understood from the particular experience of each particular person. Thus, one must link private experience to public discourse. Critical education, in turn, considers traditional and progressive models to be lacking. For criticalists, education itself is identified as a tool that has been used by various oppressive interests to foster inequality. Education must be changed so that it no longer serves hegemony. Education must be refashioned so that it no longer impedes democracy, emancipation, and enlightenment.

In contrast to these three views, Rancière offers a divergent alternative. First, Rancière's recuperation of Jacotot is at odds with the traditional figure of a knowledgeable teacher whose role it is to disseminate his or her knowledge. Instead, Rancière's teacher is "ignorant," willingly unknowledgeable about subject matter. Further – and here is where numerous readers of Rancière go astray – Rancière's account has little to do with progressive pedagogy. As Rancière puts it, "The distinction between 'stultification' and 'emancipation' is not a distinction between methods of instruction. It is not a distinction between traditional or authoritarian methods, on one hand, and new or active methods on the other: stultification can and does happen in all kinds of active and modern ways" (Bingham and Biesta, p. 6). And finally, Rancière's contribution is not to be confused with the work of unveiling carried out by critical pedagogy. Rancière is explicitly critical of Pierre Bourdieu's theory of reproduction, "a discourse deriving its authority from the presumed naivete or ignorance of its objects of

study" (Rancière 1991a, xi). Insofar as criticalist education is largely indebted to such notions of reproduction, and to programs by which educators might combat reproduction, Rancière's pedagogical logic is different still from critical pedagogy.

In contrast, Rancière offers an assault on the very notion of educational epistemology. While other paradigms have worked within such an epistemology, Rancière claims that any schooled epistemology is a matter of inequality. He wants to break with "the particular inequality that normal pedagogical logic orchestrates. . ." where instruction normally serves to "split the intellect in two, to consign to the everyday life of students the procedures by which their minds have heretofore learned everything they know" (Bingham and Biesta, p. 4). Rancière insists that knowledge of the teacher must not correspond with knowledge of the student. Instead, the will of the teacher must be matched to the will of the student without their knowledges being commensurated. It is the commensuration of knowledges that leads to knowledge comparisons and student stultification. Only through a de-tethering of knowledge-knowledge comparison can intellectual emancipation obtain.

Having briefly outlined Rancière's key contributions and the distinction between his work and the work of other educational theories, two distinct themes of Rancière's educational work will be detailed: educational emancipation and educational truth. At least since Immanuel Kant's essays 'What is Enlightenment?' and 'On Education,' emancipation has been construed as an Enlightenment goal of education. Schools have been construed as places fostering "man's release from his self-incurred tutelage" and a release from "man's inability to make use of his understanding without the direction of another" (Kant 1992, p. 90). The Enlightenment project of the school has been an effort to bring students to a place of autonomy and rational thinking. However, Rancière's work demonstrates that this Enlightenment project of emancipation is problematic. Emancipation, so construed, is "something that is *done to* somebody" (Bingham and Biesta, p. 30). So while emancipation "is oriented towards equality, independence and freedom, it actually installs

dependency at the very heart of the ‘act’ of emancipation” (Bingham and Biesta, p. 31).

In contrast, Rancière proposes a form of emancipation that is done actively. Rancière notes that “nobody escapes from the social minority save by their own efforts” (2007, p. 48). This form is proposed both in politics and in education. In politics, Rancière documents the emancipation of French workers *by* French workers, “who, in the nineteenth century, created newspapers or associations, wrote poems, or joined utopian groups were claiming the status of fully speaking and thinking beings” (Rancière 2003, p. 219). This sort of political emancipation does not happen with the help of others; it happens at the hands of French workers themselves. Likewise in education, the students of Jacotot do not achieve intellectual emancipation with the help of someone else. Rather, they read, speak, and write French through repetition and verification *on their own*. Intellectual emancipation in education is thus a practice wherein explication no longer takes place. It is a practice where students take up a position as speakers, speakers who have as much right to make sense of the world as any other person, any other explicator who might pretend that students are somehow not equal to the task.

Another significant contribution is Rancière’s educational conception of truth. Once again, Rancière departs from traditional, progressive, and critical models. Each of these dominant models partakes in an Enlightenment orientation toward truth. Each considers truth to be a desirable, attainable goal, one that can be arrived by perfecting the insight of humans through the enlightening process of education. For these dominant models, education is a vehicle by which one arrives at truth. Rancière demonstrates that this Enlightenment model of truth is shored up by the notion that truth needs to be explained in schools. Thus, the Enlightenment model of truth – embraced by dominant educational theory – actually reinforces the notion that education should be explanatory.

Rancière uses language theory and anti-explanatory pedagogy in tandem to posit an educational alternative to Enlightenment truth. That is to say, Rancière demonstrates how truth takes on a

new role when Jacotot’s universal teaching and Jacotot’s thesis on arbitrary language are combined. With regard to language, truth, and Jacotot’s pedagogy, Rancière writes:

Truth is not told. It is whole, and language fragments it; it is necessary, and languages are arbitrary. It was this thesis on the arbitrariness of languages – even more than the proclamation of universal teaching – that made Jacotot’s teaching scandalous. (1991a, p. 60)

Rancière uses Jacotot’s example to demonstrate the fact that truth does not depend on the particular language of a particular expert. No one has a monopoly on explicating truth because truth is not amenable to explication. Whereas explanatory pedagogy assumes that language can be a vehicle toward truth, Rancière reminds us that such a perspective depends on a rather simple, language-as-clear-window paradigm.

Significantly, Rancière demonstrates that the school has become a symbol for the Enlightenment orientation toward truth. The school, as an institution, is posited as a place where people speak with words that are more knowledgeable than the words spoken outside of school. Those knowledgeable words, in turn, are supposed to bring students to truth. This model informs schools, and it also informs society at large. Rancière argues that we now have a “society pedagogicized,” where society itself takes cues from the school as to the availability of truth. Truth is, in general, assumed to be attainable through language because in an era of compulsory schooling, each person learns – in school, early on – that truth can be explained through language in a classroom. Thus, when Rancière and Jacotot insist on the arbitrariness of language, he insists that the school is not a primary place for attaining truth because the language of the teacher is no more privileged than the language of any other person.

Jacques Rancière remains a prolific philosopher. His writings will continue to inform educational philosophy because the themes he raises in the areas of philosophy, social theory, aesthetics, politics, literature, and education remain consistent. His new writings will no doubt to inform his older ones, and his educational import will continue to grow as a result.

Rancière on Radical Equality and Adult Education

Juha Suoranta

University of Tampere, Tampere, Finland

Universal teaching is above all the universal verification of the similarity of what all the emancipated can do, all those who have decided to think of themselves as people just like everyone else. (Rancière 1991, p. 41)

Synonyms

Democratic education; Dialogical education; Pedagogy of the oppressed

Introduction: Free and Chained

The philosophical strands of adult education are many but in the following I divide them in two. In this division there is “a philosophy of the order” which has usually been “a tamed philosophy.” The tamed philosophers have felt content in the lap of power in examining usually politically neutral and innocuous questions including such themes as active citizenship, which has shown the possibilities of the philosophy of the order: “be active but only within given limits and with given forms.” The philosophy of the order serves the police (police order); it is a philosophy without philosophy. On the other hand, there is “a living philosophy of adult education”: it has been susceptible to the “nonphilosophical” social effects representing an organic – “sparking” or “flaming” – philosophy.

In the following I read Rancière’s work through two traditions of thought: those of living philosophy and critical pedagogy, both of which are anchored to social action and revolutionary practice and to such political thinking as anarchism, syndicalism, communalism, and Marxism. Learning is defined in these critical traditions of education above all as a political, critically reflective action (cf. Brookfield 1995), a change in meaning perspectives (Mezirow 1995), or a revolutionary praxis (Freire 2005). In terms of learning, revolution can be defined using Ian Parker’s (2007, p. 148) words as “an opportunity for discovering new ways of living, of bringing to the fore aspects of human creativity and hope that are usually suppressed.” Along these lines, the social criticism and promotion of the political change are central features of radical education besides critical research and reflecting teaching (see also Lawson 1996, p. 142).

Living philosophy of adult education is not restricted only to big leaders or to trendsetters and to their effects, which have been conveyed, but refers to the ordinary people’s existence as bodily and experiential beings reflecting their active being in the world: this may be forgotten in an apparently learned but often unlearned academic name-dropping of the philosophy of the order. The living philosophy of adult education

is based on an ontological fact, which states that “there is only one human species and only one nature related to the flesh and skeleton, and to the bones and skin as long as at least a modest breath moves the beings. The truth about the human being is her own living body” (Onfray 2004, p. 34). On the other hand, the living philosophy of education (or a philosophy of the first person) respects peoples’ experiences, their own voice, and points of view. This means that all their experiences, including thinking and feeling, willing and loving, and believing and hoping, are taken seriously as starting points for the rigor critical analysis of the current condition. But as Billington (2003, pp. 318–319) reminds us, it is often forgotten especially in the Western philosophy of education. (In the middle of the 1990s, K. H. Lawson (1996, p. 144) estimated that philosophies of adult education have usually had only a marginal position in the research area. However, the situation has improved during the early years of the new millennia at least (see Elias and Merriam 2005, p. 5). These remarks must apply to the academic philosophy of the adult education only because the living philosophy of the adult education has had tremendous effects in the adult world for ages. As Finnish Professor of Adult Education Kari E. Nurmi (2002) once stated, the history of adult education consists of both occidental and oriental thinkers and founders of various traditions from Aristotle to Plato and from Socrates to Democritus, Gautama Siddhartha, and Kung Fu-Tse. These founding figures have provided inspiration to later-day thinkers such as Nikolai F. S. Grundtvig, Kurt Lewin, Jane Addams, Frederick Taylor, and Antonio Gramsci; these and many others have justified, though from different ideological standpoints, the practices of adult learning needed in the overall development of the society. In addition to the ones that have been mentioned, other names could be presented from Martin Buber and Malcolm Knowles to Paulo Freire as the central players of the field of adult education theory. Furthermore, many others also could be named: Desmond Tutu, Malcolm X, Jesus, Martin Luther King, Che Guevara, Mother Teresa, etc. (see also Willis 2007).)

The traditions of the living philosophy and critical pedagogy offer a ground to study French

philosopher Jacques Rancière’s idea of a radical equality. In his book entitled *The Ignorant Schoolmaster* (1991) (originally published in French as *Le Maître Ignorant* in 1987), he presents his critique of critical educational theory leading to emancipatory learning, and aiming at radically equal society, Rancière has radicalized the educational thinking of the Enlightenment with a claim that equality is a foundation both for the democratic politics and democratic education and not their objective or ideal end result. He also has examined such educational culture which is based on self-learning (or self-education) without external authorities. According to this rationale, *one can teach what one does not know*. This obscure thought Rancière has adopted from the private thinker Joseph Jacotot who lived in France and the Netherlands in the years 1770–1830 developing what was then called as “universal” or “panecastic” teaching method. This idea of teaching what one does not know serves as a cornerstone of Rancière’s suggestion of radical equality.

The philosophical foundations of “universal,” or more appropriately, an emancipatory method, are in close resemblance to the ideas criticizing both liberal democracies and State-based schooling systems as watered forms of equality. Rancière instead emphasizes the ordinary people’s possibilities to function as social subjects and maintains the significance of self-learning to reach humanity through radical equality. In this respect, his thinking is useful in reflecting the functions of the individual in the history of civilization, the roles of expertise in society, the meaning of politics and democracy, and the preconditions for the economic, political, and social change. In addition Rancière’s thinking is of special interest to those concerned in the relation between forms of education in terms of transformative and revolutionary change in an equal society.

Who’s Jacques Rancière?

Jacques Rancière (born in 1940) was a star pupil of philosopher Louis Althusser during the first

half of the 1960s in Ecole Normal Supérieure in rue d'Ulm, Paris. But in the end of the decade, he made a sharp intellectual distinction with his teacher accusing Althusserians of their structuralism, which, as Rancière claims, tends to serve the power elite only (Hewlett 2007, p. 84). According to Rancière's critique, Althusser underestimated the significance of the individual in the political and social change, collapsed to the elitism in trying to make a difference between scientific and other conceptualizations of Marxism and in claiming that the educational process is based on absolute inequality of knowledge and ignorance (ibid., p. 93).

Although it is hard to pigeonhole Rancière's intellectual work, it is fair to say that it is connected to the rich and turbulent traditions of French Marxism, existentialism, phenomenology, and hermeneutics (Dillon 2005, p. 430; Hewlett 2007). In his academic career, Rancière served in the University VIII of Paris in 1969–2000, his last 10 years as Professor of Aesthetics and Politics of actions. He got his own political education as part of the long 1960s and as a consequence of the events in Paris in May 1968. The communists' groups departed and Rancière ended up in the party fraction (*Gauche Prolétarienne*) whose members emphasized revolutionary action instead of theory in the times of political uprising. Among the members were Jean-Paul Sartre and Michel Foucault who tried to get rid of the Leninist-type vanguardism and to abolish the division between intellectuals and workers and intellectual and manual labor. Their ultimate objective was students', intellectuals', and workers' alliance and a united battlefield against conservatism and reformist politics (Reid 1989, pp. xvi–xvii).

There is at least three distinct periods in Rancière's work. After the influence of Althusser, he first concentrated on historical studies and then devoted himself to social and political philosophy. The political philosophy has later been connected to the philosophic analysis of aesthetics and the media. These research subjects are motivated by the interest in the questions of social and political control and their relation to the concept of emancipation. Rancière believes it is not a philosopher's task to give voice to the silent and

oppressed but to add her own voice into other voices: more than to interpret and write a theory, a philosopher's duty is to hear and listen. And this way a philosopher helps voices to echo and adds power of the silenced (ibid., p. 137; Hewlett 2007).

As Jean-Philippe Deranty (ibid., p. 136) puts it, "Rancière was out of place in the 70s, when Althusser's brand of Marxism was the official dogma of French intelligentsia. He was out of place in the 80s, when the utopian moment was weeded out of political philosophy. He is out of place today with his neo-Hegelian aesthetics and his reading of literature focused on proletarian emancipation." Initially, Rancière had been impressed from Marx but later distanced himself from Marx's core ideas; he is an existentialist but has given up the concept of the self-assertion, a postmodern theoretician who judges the language philosophy of Jean-Jacques Lyotard, a student of the social order who reacts critically to Michel Foucault's definition of power, a sociologist and historian interested in the misery of the world but critical toward Pierre Bourdieu's interpretations of the theme, a theorist of the confession rejecting the concept of understanding, and an expert on Gilles Deleuze whose political thinking is however geared around the notion of the subject (Deranty 2003, p. 136).

First and foremost, Rancière is a theorist of political philosophy and equality to whom the central question seems to be "the absent presence of the equality." To him no social order neither guarantees nor creates equality; it cannot be required either. According to Rancière, equality is an origin for political and other action, not the other way around, since equality is always practiced and verified in social practices (Dillon 2005, pp. 430–431). This way it is possible to understand Rancière's interest in educational processes and teaching methods as democratic exercise of power. The school is an establishing "transmission force" of the individuals and the political system in the modern societies. Its definitiveness is concealed in its ability to appear in the disguise of democracy (Rancière 1995, p. 52). The school presents itself as the level honoring form of democracy, although it serves capitalism as a

diploma mill and an examination automat. It has been celebrated as the ultimate apparatus of equality with its meritocratic possibilities, but for Rancière this does not meet the demands of the radical equality. (On meritocracy and its history of ideologies (see Goldthorpe 1997); problems and critique of such concepts as potential capability and talent often used in the meritocratic language (see Sennett 2007, pp. 99–122).)

Critique of the System Logic of Education and Radical Equality

The equality of social and educational possibilities has often been considered as the general objectives in the theory of the critical theory and critical pedagogy (see McLaren and Kincheloe 2007). These objectives have been striven for with different welfare political means such as progressive taxation, universal health care, social security, publicly funded schools, and so on. “One of the real achievements of modern society is to remove the opposition between *mass* and *mental*. Educational institutions have improved standards of numeracy and literacy on a scale which the Victorians could not have imagined,” writes sociologist Richard Sennett (2007, p. 85). Even though the social mobility has risen steadily, the sociologists of education have however noticed that the objective of the social and educational equality has been achieved only partly even in the wealthy West.

A vast array of analysis of the educational inequality has been presented; probably the best known among them is sociologist Pierre Bourdieu’s theory of reproduction. It states that the production and reproduction of social relations takes place in the area of formal and informal education; especially, it is the core function of the schooling system. According to the theory of reproduction, the education maintains the existing social order and individual differences. Even with new political correction movements, it has not been possible to remove different learning obstacles and to weed educational or other so-called disadvantages. One should keep in mind that these anomalies – unequal opportunities, dropping out

phenomenon, and disadvantages of various sorts – are qualities of capitalism and its schooling system; in other words, they are social issues, not individual problems (as C. W. Mills once taught us). Furthermore, the social and educational problems caused by the global supply of labor (“race to the bottom” as capitalism looks for labor wherever labor is cheapest), by automation, and by the management of aging have arisen in modern societies; together they have caused what have been labeled as “the fear of uselessness” (Sennett 2007, pp. 86–103). Massive school and social bureaucracy and respective “governmentality” have been founded to take care of the social ill, guaranteeing political consensus and taming dissidence.

However, in Rancière’s view of radical inequality, these analyses presented by the benevolent educational sociologists and their suggestions for corrective actions in educational policy are wrong and inadequate in reaching radical equality. In the pursuit of radical equality, one must grasp the roots of the problem (“and the root of the human being is a human being itself,” as Marx maintained) without trusting too much to the fact that the system would carry out equality for all. In this instance, this “grasping the roots” means among other things theoretical work around the notions of equality and empirical work in the participating institutions of socialization. Radical equality is based on the announcement of everyone’s similarity and everyone’s ability to voluntary thinking. As Rancière (1991, p. 41) puts it: “Universal teaching is above all the universal verification of the similarity of what all the emancipated can do, all those who have decided to think of themselves as people just like everyone else.”

From the beginning of the 1970s, Rancière has criticized Bourdieu’s reproduction thesis and its application in educational policy making. In his opinion, Bourdieu has built an idea of the intellectual aristocracy, of “sociology kings,” who always know the people’s matters and their life situations better than themselves. In its determinism, Bourdieu’s sociology of education thus presents “the philosophy of the police order” serving the dominating power whose representatives do not even hear the ordinary people’s voice but

consider it as meaningless nonsense (Hewlett 2007, pp. 90, 91–97), but on the other hand, one can claim that Rancière has used Bourdieu as a stroll man in developing his own points of view. (For this reason, Rancière does not warm from liberal ideas or formal political theories emphasizing status quo because they are too context free and stress too much a dialogue without social status and differences in the level of education (see Hewlett 2007, pp. 96–97). The issues of equality, fairness, and freedom cannot be reduced to an equal ideal communication because ideal communication does not exist.)

According to the criticism, Bourdieu assumes that people are more or less ignorant; people from the working class will be excluded from the educational system just because they do not realize or are not aware of the real reasons for the exclusion. This ignorance, in turn, is a structural consequence of the apparently democratic capitalist system, which closes them out in the first place. In Bourdieu's thinking, the system stays erect because people do not realize its proper functions and because it reproduces its own existence by staying unrecognized again and again within its own processes (Ross 1991, pp. xi–xii). However, Rancière does not want to sign or accept this circle logic of reasoning but stresses that the matters are as they are, and remain unchanged, partly because of these so-called social facts. In other words, Rancière wants educational sociologist to be more than neutral observers and gatherers of social facts; they should not only explain but also change the world of education.

In other words, they should try to be more critical and abandon their God's eye view and technically detailed analysis legitimating their own expertise and leaving the real sufferings of the world untouched and intact. Furthermore, they should reject their will to power, or as Rancière (1995, p. 52) remarks, their lasting hunger to "win every round." Probably, this critical position against the fellow philosophers and sociologists dealing with educational issues is among the reasons why Rancière once got interested in Joseph Jacotot's "intellectual adventure" and his suggestion that humanity could be better off without State-governed schooling system. In Rancière's

thinking, the deschooled world without teachers, who always know better than their pupils, that is, the world in which teachers and pupils alike can learn together and every participant's contribution is important and valued, is something to reach for.

Rancière has also made his case against the reformist, social democratic left, and its views on educational equality and equal opportunities. The reformist left has used Bourdieu's notions in watering the possibilities of the radical equality and creating new educational reform after reform, building all sorts of helping systems for the marginalized and unfortunate and special education for the disabled. In the words of Rancière, the reformist system of apparent equal opportunities has only strengthened the "police order" of the society. At the same time, it has created conservative public pedagogy that retains social hierarchies between people and experts (such as a hierarchy between a sociologist-king, a teacher-servant, and a pupil-slave). Furthermore, educational reformers have established an educational system from above in which teachers are reduced to as mere technicians. This system has also been used to arrange population into unquestioned and conventional classes both in the society (social classes) and in the classrooms (by age). Rancière's fellow countryman and brother in radical philosophy Michel Onfray writes in a pointed way:

Even if the whole schooling system had been disguised to rags of educational sciences or any other enlightened teaching practices, its only task would still be what is called 'adapting to the society' so that it would not be named otherwise: bending, subjecting, spraining of the backbone, obeying or even skill of lying and sanctimoniousness. (Onfray 2004, p. 76)

Irrespective of the goodwill or strong mind of the individual teachers, the modern system of education has served State politics almost without exception. And even though the politics has had many aims and goals in the escorting of the history, it has usually "aimed at changing of the individual into the subject" (ibid., p. 38):

The monarchists have appealed to the king as the figure of divine right and the superterranean representative of the heavenly unity principle; the communists have inclined to calmed, harmonious, classless, warless, and consensual society; on a

resolutely monotheistic society body in short; the fascists have thought of the homogenized nation, of the militarized and healthy native country; the capitalists have been possessed by the law of the market, the mechanical control of the liberty of its money currents and its advantages. And among the positivists, scientists and certain sociologists there are eager helpers next to the orthodox and next to the dogmatists. (Ibid., p. 79)

Higher and Lower Intelligence

In the meritocratic society, a potential capability and the so-called talent has replaced the social advantages and possibilities given by the inherited place in the society. In the meritocracy, those who know (or those who have the opportunity to set the standards of knowing) considered as experts have needed those who don't know and the ignorant in reproducing and legitimating their own privileged expert positions. These structural processes of legitimation belong to what Rancière describes as the pedagogical myth. The pedagogical myth divides the world into two by supposing a socially constructed division of power, as well as a lower and higher intelligence. As Rancière (1991, p. 7) points out:

[The pedagogical myth] says that there is an inferior intelligence and a superior one. The former registers perceptions by change, retains them, interprets and repeats them empirically, within the closed circle of habit and need. This is the intelligence of the young child and the common man. The superior intelligence knows things by reason, proceeds by method, from the simple to the complex, from the part to the whole. It is this intelligence that allows the master to transmit his knowledge by adapting it to the intellectual capacities of the student and allows him to verify that the students has satisfactorily understood what he learned.

Rancière's main objective is not to criticize sociological theories of education such as Bourdieu's but to develop a political theory that could be used in reevaluating the concept of equality and build a theory of radical equality. In this effort he takes as his source insights presented by the philosophers of the Enlightenment who maintained that human beings are born equal irrespective of their estate, family, or other social backgrounds and instead stressed the

revolutionary power of education and self-education. As Immanuel Kant put it in his famous treatise on Enlightenment: lack of Enlightenment is not due to their lack of intellect, to think for themselves, but lack of courage (Kant 1784). His often-cited definition of Enlightenment is as follows:

Enlightenment is man's emergence from self imposed immaturity (Unmündigkeit) for which he himself was responsible. Immaturity and dependence are the inability to use one's own intellect without the direction of another. One is responsible for this immaturity and dependence, if its cause is not a lack of intelligence, but a lack of determination and courage to think without the direction of another. Sapere aude! Dare to know! is therefore the slogan of the Enlightenment. (Kant 1784)

However, Rancière formulates these theses of the Enlightenment anew with the help of Joseph Jacotot by dissociating emancipatory education off all kinds of system logic aiming at students' subjection and obedience.

The duty of Joseph Jacotot's disciples is thus simple: They must announce to everyone, in all places and all circumstances, the news, the practice. One can teach what one doesn't know. A poor and ignorant father can thus begin educating his children: something must be learned and all the rest related to it, on this principle: everyone is of equal intelligence. (Rancière 1991, p. 101)

The State cannot produce or allow this kind of progressive pedagogy because education in the employ of the system only expands the distance which it promised to destroy in the name of equality (Rancière 2004, p. 223). The following quotation captures the core default included in Rancière's concept of the radical equality:

Equality is a presupposition, an initial axiom – or it is nothing. And this egalitarian axiom subverts in the last instance the egalitarian order itself. It is in vain that the superior gives orders to his inferior if the inferior does not understand at least two things: first, the content of the order, and second, that he must obey. But for the inferior to understand this, he must already be the equal of the superior. (Ibid., p. 223; see also Dillon 2005, p. 433)

Rancière's concept of radical equality is practical in nature; it is the praxis – a mix of theory and practice – which verifies radical equality. Radical equality means the opening of all the imaginable

possibilities and opportunities to everyone. This requires the politics of critique and the politics of hope. They address the question of social reality as given and provide pile of new ideas. In this sense, the politics of radical equality share the same objectives as the arts: to organize the accepted pictures of the social reality anew and to struggle against the denial of recognition experienced by the controlled (Deranty 2003, p. 137). The politics promoting radical equality includes the announcement of messianic hope that overcomes politics by retaining “irreversible” and “excess” as fundamental principles of life-sustaining practices (Dillon 2005, pp. 433–444). Or, as the famous May 1968 graffiti put it: “Be realistic, demand the impossible!” (There are, of course, many forms and meanings of equality. But in the critical tradition of educational research, one should keep in mind that concepts do not fall from heaven but are always theoretically and ideologically laden, and so is the concept of equality. For sure it is a human invention; we, as human beings, have invented it in our natural languages and given it different meanings and definitions. Besides that “equality” can be seen from other angles: biologically, we are equal in terms of various nutritional, sexual, and other needs as well as qualities related to *Homo sapiens* species. Regardless of the results in developmental and differential psychology serving the needs of capitalism (see Parker 2007, pp. 49–53), we also share many psychological qualities. The same applies to the social realm, which, by definition, is a social construction; social reality is only partly given and partly based on own decision making in everyday practices and in political arenas.)

Emancipatory Method

And in these thoughts of the radical equality is a source for Joseph Jacotot’s emancipatory teaching method which Rancière studies in *The Ignorant Schoolmaster*. Emancipatory method is the method of teaching and learning, which “looks for the totality of human intelligence in each intellectual manifestation” (Rancière 1991, p. 39). It is assumed in the emancipatory teaching that

(1) everyone has similar intelligence, (2) everyone is able to teach herself, and (3) everything is in everything (“All the power of the language is in the totality of a book”) (ibid., p. 26).

Jacotot has probably adopted the idea of equal intelligence from the philosophers of Enlightenment even though already Descartes (2008) reminded of the matter at the beginning of his *Discours de la méthode* (1637) as follows:

Good sense is, of all things among men, the most equally distributed; for every one thinks himself so abundantly provided with it, that those even who are the most difficult to satisfy in everything else, do not usually desire a larger measure of this quality than they already possess . . . For myself, I have never fancied my mind to be in any respect more perfect than those of the generality; on the contrary, I have often wished that I were equal to some others in promptitude of thought, or in clearness and distinctness of imagination, or in fullness and readiness of memory. And besides these, I know of no other qualities that contribute to the perfection of the mind; for as to the reason or sense, inasmuch as it is that alone which constitutes us men, and distinguishes us from the brutes, I am disposed to believe that it is to be found complete in each individual; and on this point to adopt the common opinion of philosophers, who say that the difference of greater and less holds only among the accidents, and not among the forms or natures of individuals of the same species.

Jacotot was born in Dijon in 1770, and at the age of 19, in the year of the conquest of Bastille, he was nominated as Professor of Latin in his hometown. Later he was recruited to the army participating in the war against Belgium as a captain; after the counterrevolution, he fled to the Netherlands, returned to France in 1830, and died 10 years later. In the Netherlands, Jacotot was hired as the teacher of the French language in the University of Leuven. Teaching was difficult from the start for few of Jacotot’s students who spoke French; most of them knew only their native language, Dutch or Flemish. Despite the difficulty, students were interested in learning with Jacotot, so a way had to be found, the smallest common denominator that would help moving on. At that time in Brussels, a 24-volume didactic-utopian story entitled *Télémaque* by the author Fénelon was published as a bilingual version in French and Flemish. Jacotot

took these editions into use and through the interpreter asked students to start to translate the text. The task was to translate the text from French with the help of the Flemish language text and to know a French text eventually so well that it would be possible to read it aloud from beginning to end.

Thus, the students started the foreign language and learned gradually without the teacher, crossing their teacher's expectations. Why did the students take this task that at the outset seemed so difficult? Was it the mere fact that at the time in France pupils were expected to take their teacher's lessons more or less as doctrines? Was it perhaps against this background that Jacotot's students were allowed to study themselves and that they were trusted to study without their teacher's unquestioned authority? This would imply that Jacotot's teaching (without teaching) was a significant learning experience for the students.

At least to Jacotot himself the students' achievement was an epoch-making learning experience (a turning point experience). He experienced an intellectual awakening after having realized that the teacher did not have to know better than his pupils. The thought challenged a Platonic idea of the pedagogic relationship where there is an intellectual and moral distance between a teacher and the pupil even in a dialogical situation. From the point of view of emancipatory teaching and learning, this kind of a distance is as useless as is the evaluation of that distance (or the level of the understanding defined as a "talent," a "skill," or an "ability") between the teacher and his/her pupils. The will to learn is the most important thing. The will to learn precedes the intelligence: the intellect enters into the service of the will of learning; intelligence is in the service of the will to learn. This thought deviates radically from the modern pedagogic thinking where it is usually leaned on the ideology of equal opportunities and teacher's intellectual and administrative authority. Rancière states after Jacotot that "what an emancipated person can do is to be an emancipator: to give, not the key to knowledge but the consciousness what an intelligence can do when it considers itself equal to any other and considers any other equal to itself" (Rancière 1991, p. 39).

In every teacher, there is a small Socrates (a master explicator) leading the pupils in the right, given, or determined direction. This way students might learn many things (and to repeat their teacher's knowledge like parrots), but this pedagogy does not emancipate (Rancière 1991, p. 29). An ideology of the equal opportunities emphasized in the modern era doesn't tell anything about the intellect; it neither admits nor forbids it nor the will to learn. Emancipatory method instead is a method of the will. It states that it is possible to learn independently, without the seer, if one wants to learn. In turn the will to learn is promoted by a desire to know; a desire exceeds the situation and the demands set by the given social conditions.

Modern nation states have believed in schooling and they still do. Rancière is however susceptible to the grand narratives of education and modernization from which the school and education as we know it are paradigmatic examples. In Rancière's measures, the modern belief in the system training is not only deceiving but also an illusion in that it doesn't fulfill its promise as a bedrock of democracy. Modern schooling is directed from above and fastened on the goals appointed by the ideological State apparatus. There is no actual freedom inside the system, not to mention the promotion of radical equality. The grand narratives like education cover to their shades pedagogic and other such insights which are formed as part of ordinary people's activities and which can be of major significance when people strive toward the radical equality.

Therefore, Rancière has studied nineteenth-century working-class history in bringing up those small narratives, which have not been suitable for the elites' triumphal march of the history of the progress. The example of this is his book *Nights of Labor* which reports the ordinary people's writing hobbies in France in the first part of the 1800s (Rancière 1989). In this work Rancière's objective has been to bring out the ordinary people's voices and interpretations under the established history. "It is a statement both of the right of the ordinary person to be listened to and a celebration of the profound usefulness of learning from what the ordinary person

has to say, unmediated as far as possible by the intervention of the more powerful” (Hewlett 2007, p. 86). Emancipatory educators participate for their part for this “excavation work” of the historical and present forms of oppression especially in the spheres of informal learning in which their teaching can be radically frightening both to students and teachers (as well as the power elite) because it can emancipate them both (Dillon 2005, p. 444).

Some Applications of the Emancipatory Method

For Ranci re significant studying and learning take place as self-learning and collaborative learning organically in the natural environments, without outside authorities. The very same issues Ranci re has raised in the context of political philosophy have been widely discussed among the philosophers and theorists of radical adult education. Progressive educators (Counts, Dewey) have dealt with the question of democratic schooling and education whereas theorists in community education have developed the ideas of local educational practices and forms of working-class education (see Willis 2007). In these an attempt has been made to build a theory for a democratic society based on democratic educational activity. Alike insights have also been developed in a child-centered pedagogy (see Gadotti 1996, pp. 135–138). But above all, the liberating agenda of the living philosophy is connected to the spontaneous learning activities which restores adults’ self-autonomy in their voluntary study activity in the formal learning institutions, in social movements, in culture work and in art, in trade-union training, and in peer-to-peer learning as well as in ordinary peoples’ self-education. (One example of the free learning: Ranci re’s philosopher colleague Michel Onfray left his job as a teacher of philosophy in 2002, and Caen established a free folk university (L’Universit  Populaire de Caen; see <http://upc.michelonfray.fr/>) in the town near its home area on all the willing ones. The establishment of the free university was on the other hand a reaction to the universities against the philosophy of the order which had nested on the other hand political act):

Onfray founded the university as a reaction to the arrival of Jean-Marie Le Pen, the leader of the far-right National Front party, into the second round of the 2002 presidential elections against Jacques Chirac. The idea, he said, was to fight against that happening again by “promoting and publicizing intelligence,” and to try to “analyze and understand how the world functions in order to put forward alternative solutions to the contemporary negativity.” Open to anyone, with free tuition and requiring no registration, prior education, tests or other course work, the concept, like his books, is also spreading beyond his home. There are now five other Popular Universities in France and one in Belgium, all of which acknowledge Caen as their model. (Spurgeon 2006)

The son of a manual agricultural laborer and a cleaning woman, Onfray was a professor of philosophy for two decades, until he resigned from the national education system in 2002 to establish a tuition-free Universit  Populaire (People’s University) at Caen, at which Onfray and a handful of dedicated colleagues teach philosophy and other weighty subjects to working-class and ghetto youth who are not supposed to be interested in such intellectual refinements. Onfray has never forgotten his underclass origins, and his dedication to helping the young of the left-out classes is admirable and inspiring. The Universit  Populaire, which is open to all who cannot access the state university system, and on principle does not accept any money from the State – Onfray uses the profits from his books to help finance it – has had enormous success. (Ireland 2006)

In these traditions of the living philosophy, learning has linked organically to adults’ needs to theorize their educational realities and facilitated them to reflect their living conditions (see Elias and Merriam 2005, p. 6). At best in these learning processes, people create collaboratively the sense of solidarity and the consciousness of democracy. Thus, the democratization of educational situations does not stay halfway; actually, as Stephen Brookfield (1995, p. 136) has noted, democratic education only partially is as impossible as to be pregnant only partially. And as he further states:

Once you commit to working democratically, you have to take the leap of faith that says that people will make informed choices. And you must trust that if they don’t make the choices that you think in the short term are the best ones for them (like attending every class), in the long run, the experience of being in control will make them more responsible the next time they are able to exercise power. (Ibid., p. 137).

There are several educational theories and practices, which resemble Rancière's ideas. Among the most known, popular and obvious ones are Ivan Illich's (1971) idea of a deschooled and convivial society, Paulo Freire's (2005) critical educational theory of the oppressed, and Erich Fromm's (1990) ideas of the sane society. Or let us think of the Zapatista pedagogy in Chiapas Mexico. It is not another top-down educational model led by the State, but exemplifies dialogical and democratic principles of emancipatory education, especially those emphasizing localization of education and government by calling for "a move beyond solidarity to a consideration of the possibilities for linking multiple, heterogeneous struggles as well as for transformations between and within sectors and locales" (Bahl and Callahan 1998, p. 24). In the case of Zapatistas and their leader Subcomandante Marcos, the question has been how to change the world without taking power (Holloway 2005).

In the realm of the Internet, or the Wikiworld (Suoranta and Vadén 2008), collaborative, peer-to-peer practices are flourishing as social media. These communities of practices utilize people's "general intellect," common knowledge, and voluntary participation. Criteria of the emancipatory teaching and learning method will become fully operational after an open-access principle, and free software applications are combined with free and open studies and education in places like the Wikiversity in the Internet or free universities and other free learning associations. For in these evolving worlds of free studies, an interest is not in the "potential capability" or talent but in everyone's access to participate and learn equally, to take according to one's needs, and to give according to one's abilities. This way the promises of equal education are also redeemed as universal human rights. At best collaborative practices in the Internet present new forms of internationalism, common will, and the power of the people. If we want, we can! Rancière sheds light on his own idea as follows:

From my point of view, the Internet is similar to what writing was at a certain moment. It meant the circulation of words and knowledge which could be appropriated by anyone. It is not a question of

giving knowledge to everybody, it is a question of having words circulate in a free and desirable way, and I think that this is what's happening with the Internet. That is probably why some reactionary people are so angry with the Internet, saying it's horrible that people log on to the web and they can find everything they want, that it is against research and intelligence. I would say no, it is the way intelligence, equal intelligence, works. You wander randomly in a library the same way you surf randomly on the Internet. This is, from my point of view, what equality of intelligence means. (Lie and Rancière 2006)

Finally

Jacques Rancière's idea seems to be that education and learning are means to participate in politics or, more precisely, they are forms of political socialization; the way education is arranged has significant political and social consequences. Methods and forms of education can be used either for supporting of the system or for changing of it. In the modern nation States, overall political goals in social and economic policy set also the aims of education. Emancipatory education is not suitable for a training system of the modern State, but points to the possibility of a totally different social order and maybe also to necessity of the altogether different world.

What is especially interesting in Rancière's thinking is its dialectical and partly antagonistic tone, how he stresses the necessity of resistance toward an existing order. This position is based on his conviction that the essence of politics is not consensus but dissensus, not agreement through ideal speech acts as in Habermas but disagreement. And this holds true in the basic level of language use, for as Rancière thinks the use of language defines one's position in different social hierarchies. To him, "Words are not simply words with inherent, context-free meaning, but are received very differently according to who is uttering them and where they are uttered" (Hewlett 2007, p. 97). But on the other hand, it gives a change to disagree and contest the predominant meanings and power positions. As Hewlett (2007, p. 99) reminds us, for Rancière "human beings are political, then, precisely

because they are literary, because the meanings of words are contested and struggled over in disputes between the powerful and the powerless, those who have to date determined the meaning of words and those who have not.”

Rancière is an important figure pertaining to the living and radical philosophy of education since he has tackled some of the elementary questions of education in his works, among them the following questions: In the relation of an individual and community and role of the individual in the human history, is the individual an object or a subject, a target or an agent? What are the significance of philosophy and educational sciences in terms of expert training and the legitimization of the given social order? What is the meaning of radical politics from the point of view of political control, equality, democratic processes, and social transformation? How can adults use their democratic rights in changing the world into better? Is there a place for equal educational processes in that change? What is the genesis or origin of the political and social change? Does education have any role in it?

Rancière himself sets an individual before a community or a system and criticizes “the philosophy of the order,” and social sciences, from supporting the expert power turned into a lapdog of economic and political elite. To him politics is ruptures, cracks, and disagreements in the world of business as usual and political trade-offs. True politics consist of the dissidence and revolutionary participation; it is the voice of the multitude, of the ordinary people. The equality promoted and supported by the reformist left is nothing more than eviscerated and lost equality compared to the radical equality in which the equality is an origin for the politics, not the goal or an end result of equal politics. The radicalism of the equality is a solution to the problems of the meritocratic system in the sense that it reminds of the possibility of such the world in which it is possible to learn according to one’s needs and to educate, to teach, and to give according to one’s abilities.

Where some theorists of critical education have answered negatively – or at least are doubtful – a question whether critical educational practices can be tools for changing the world (see

Holst 2002, pp. 78–79), Rancière answers the question affirmatively. And furthermore, the question has been wrong posed from his point of view since education, society, and politics are always inseparable; they are intertwined or woven into each other as far as human beings are literate. The question is only how they and their complex, ideological, and hegemonic relations are defined. For Rancière the emancipatory practice of education is the birthplace of radically equal society. It fulfills the following principles: *you can what you will and teach what you don’t know – learn what you want to learn!* In sum I am inclined to claim that not only is Rancière’s notion of radical equality a partial challenge to the Enlightenment’s principles of progress and emancipation, as Hewlett (2007, p. 94) thinks but more than that: it poses an extreme radicalization of the fundamentals of the Enlightenment. And therefore, Rancière’s notions on radical equality and education should belong to the key readings of all students of critical education.

Rankings and Mediatization of University

Mats Hyvönen

Department of Cultural Anthropology and Ethnology, Uppsala University, Uppsala, Sweden

Synonyms

Media Logic; Mediatization; Publicity; University Rankings

Introduction

While *rankings* and various kinds of assessments of universities or professional schools within certain fields have been around for quite some time, it was not until the beginning of the twenty-first century and the publishing of the Shanghai Jiao Tong *Academic Ranking of World Universities* (in 2003) and the *Times Higher Education World University Ranking* (in 2004) that rankings became global in the sense that they aimed to compare university performance around the world. These major initiatives were soon followed by many others, both private and public, with varying ambitions and scope. Within a short span of time, there was an increase in rankings at all levels: global, regional (such as the European Union), and national. By offering purportedly objective comparisons between the qualities of different higher education institutions worldwide,

rankings have had a major impact on the reshaping of the higher education landscape. They have also been integral to the transformations of what is now commonly perceived to be a global university sector or market (Drori et al. 2012). Consequently, university rankings are often viewed and theorized as symptoms or results of meta-processes such as globalization and commercialization. Global rankings seem inevitable in a globalized world, where knowledge is perceived as a vital commodity for individuals as well as nations in the global competition for jobs, innovation, and economic growth.

The surge in the use and impact of rankings fits well as an example of globalization and global governance models for higher education, but there is also research suggesting that they are prime examples of how *mediatization* shapes the institutional context of science, scholarship, and higher education. Accordingly, the emergence and proliferation of rankings can be seen, at least in part, as a result of the development of certain kinds of media products but also as typical products of a “media logic,” that is, the institutional and technological *modus operandi* of the media, including the ways in which media create and distribute material and symbolic resources. Even though there is no one authoritative definition of the concept, mediatization usually refers to a process where the media influence and intervene on the activity of other institutions, such as universities.

Mediatization

The term *mediatization* describes a process of social change in which media exert greater and greater influence and become ever more deeply integrated into different spheres of society (Asp 1986; Strömbäck 2008). In recent years, many scholars both within media studies and political sciences have found the concept of mediatization useful in thinking about, describing and analyzing how the mass media act as agents of change for other institutions (Schillemans 2012). Like other multifaceted and complex meta-processes such as

globalization, however, mediatization is not easily delimited or defined. It designates not so much a coherent theory as a theoretical perspective or frame of reference (Strömbäck and Esser 2014). There is, nonetheless, a broad consensus that mediatization can be defined, in the most general terms, as the rise and intensification of the influence of the media on the functioning of different sectors of society (Lundby 2009). What the concept of mediatization tries to capture is the multi-dimensional and intricate long-term correlation between media change and cultural change (Hepp et al. 2010). In other words, the concept of mediatization is used to describe a process of transformation, wherein the original logics of a field, institution, or organization give way to the specific logics of the media. Thus, through the process of mediatization, academic institutions and organizations become increasingly dependent on the media and, as a consequence, are increasingly guided by media logic. One example of this is that scientists, research groups, universities, and other academic institutions have to prioritize and allocate more resources to their media activities. In a “media society” or a “mediatized society,” the growing importance of the media in shaping public opinion, awareness, and perception has a considerable impact on the way institutions of research and higher education are understood, evaluated, and managed. Mediatization theory, however, studies not only how information about research and higher education is transmitted through media but also how media are integrated in the fundamental work of academic institutions. By way of its specific “logic,” the media create a dramaturgy building on simplification, polarization, intensification, personalization, visualization, and stereotypization (Asp 1986) – a dramaturgy that fits ill with the traditional academic precepts and values (cf. Rider et al., 2013). By publicizing central issues related to higher education in certain specific ways, such as the framing and presentation of policy debates, for example, the media not only inform but even shape the public understanding of the activities, practices, and results of research and higher education. Politicians and management, as well as the institutions and organizations involved, must then

adapt to the public image thus created, through changes in policies, regulations, and funding (Pallas and Wedlin 2013). Thus, through the process of mediatization, the media attain autonomy with respect to the institutions they mediate. “Mediatization,” then, designates this adaption of different social fields or systems, such as those of higher education and research, to these autonomous institutionalized rules for how media mediates. These rules, that is, institutionalized formats and forms of staging, are what the concept of “media logic” is all about (Altheide and Snow 1979).

Mediatization scholarship examines how, and the extent to which media communication is integrated in policy processes, organizational structures are modified and designed to accommodate this communication, and the execution of core tasks are imbued with media logic, as well as conceivable or likely outcomes of such accommodation and adaptation (cf. Fredriksson et al. 2015; Schillemans 2012). According to some scholars, the increasing power and autonomy of the media implies an increasing dependency in the institutions mediated, such as universities. The heightened autonomy of the first is won at the loss of autonomy of the second.

The concept of mediatization is most often used to analyze the relationship between politics and media. As we have seen, however, the concept is equally useful for understanding the relationship between higher education and media. Mediatization provides a framework for understanding why universities submit to the rankings, for instance, and why the latter have become so useful for policymakers and decision-makers on different levels in the global higher education sector.

Rankings as Example of the Mediatization of Universities

A common feature of university rankings, be they national, regional or global, is that they aim to grade higher education institutions according to various indicators or metrics. There has been much debate about the merits of ranking

methodology and whether they measure what they purport to measure. Research has suggested a number of problems with university rankings. One problem is that reputation, included as an indicator at least to some extent in most rankings, is of questionable validity. Further, rankings change their criteria and methodologies, making it difficult to make comparisons over time. A third issue has to do with the negative impacts of rankings: they assume a zero-sum game, since there can only be a certain number of top universities in a league table. That assumption in itself at the very outset characterizes the overwhelming majority of the world’s institutions of higher education as “non-excellent.”

Rankings have also been criticized for privileging established centers of research and higher learning in the industrialized West, by virtue of their heritage, wealth, and strong traditions of academic freedom and meritocracy (Altbach 2012). Another example of such privileging bias is the universal pressure to publish in English and on issues deemed worthy of publication in Western journals (Kang 2009). In order to become “world class,” according to the rankings, non-English-speaking countries must encourage publishing in predominately Anglophone journals. There has been considerable discussion of the deleterious consequences of this development; aside from domain loss within other languages, there is a risk that problems and issues of local or regional concern will not be addressed by scholarship at all (Lin 2009). Finally, the rankings have been criticized for the relative lack of importance attached to teaching. By focusing almost exclusively on research outputs in leading journals, rankings tend to favor institutions heavy on disciplines that attract the most funding and produce the most publications and citations (i.e., the STEM subjects, medicine, and pharmacology), since these determine the position reached in the rankings (Altbach 2012).

The scholarly debates over the value and meaning of the rankings have not stopped them from acquiring public and political popularity as a way to measure and compare the performance of entire universities across diverse social, political, economic, and cultural contexts. One explanation

for the popularity of rankings that has been suggested is the impact of the extensive media coverage of them. The results of the comparisons and the assessments of higher education institutions are almost always newsworthy, while many of the rankings themselves are products created or sponsored by media outlets. In their publicizing of the rankings, the media constitute their meaning. They have taken the assessment of quality outside of the jurisdiction of the universities themselves and placed it “within a wider comparative and international framework overseen by governments and supranational organizations” (Hazelkorn 2015). By making supposedly “objective” comparisons between different universities, and by the effective dissemination of the results in and through media, rankings have become a “quasi-funding instrument,” fusing national and international priorities and transforming a benchmarking tool into a strategic instrument (Hazelkorn 2009) for university managements as well as governments eager to increase national competitiveness in the global race for knowledge capital. As higher education becomes increasingly central to strategies for enhancing competitive advantage in what is called “the global knowledge economy,” it also becomes more adapted to its role as an instrument of economic development. Higher education and research are thus redirected toward wealth creation and economic competitiveness at the expense of other tasks. It is in this process and under these conditions that “knowledge becomes commodity” (Slaughter and Leslie 1997). Mediatization scholars would say that in a mediatized world, the media plays an essential part in the production, marketing, and distribution of this commodity on all levels.

Consequences of Mediatization for Public Education

Whether or not rankings really measure what they purport to measure is an important issue for the methodologies and quality of different rankings. Mediatization studies, however, are more concerned with the effects rankings might have

on the inner workings of higher education institutions. One way to do this is to think about what rankings might mean for the relationships between institutions of research and higher education and their societal environments.

The modern media society is characterized by an abundance of information and a scarcity of attention (Asp 1986). Hence, institutions and organizations, both public and private, are involved in a constant struggle to get people’s attention. Since rankings are, by way of the media dramaturgy, newsworthy, they direct attention to higher education and research as important sectors in society. But rankings do more than that: they also translate the internal moral and professional norms, values, and qualities in accordance with the media logic. The media formulate the internal qualities of research and higher education in ways that make them suited for public communication (Pallas and Wedlin 2013). In this way, the media not only publicize higher education and research but also make them “public” in more profound ways. From the internal perspective of research and higher education, this translation of the internal qualities according to media logic can have unintended and undesirable consequences. Since the media need to emphasize and elaborate specific aspects of organizations or events in order to make them comprehensible and relevant for a broader audience, the mediation of research tends toward oversimplification. This, in turn, in the public mind, is liable to sever the relation between universities, on the one hand, and traditional and established academic norms and values, on the other. In mediating popularized and simplified images of the very complex and diversified activities and operations at higher education institutions, the media produce images of what good research and higher education are or should be that render invisible what, from the point of view of university teaching, science and scholarship, are fundamental. The popularized and simplified images can only convey a very limited conception of what research and higher education is, what it does, and the possible ways it could contribute to the surrounding society since it is impossible to mediate the complexity and diversity that actually

exist at the tens of thousands of departments, research units, colleges, and universities throughout the world. Rankings, the prime example of this popularization and simplification, inevitably promote a conception of research and education that directs attention to certain disciplines and activities while largely ignoring others. The phenomenon of mediatization, here exemplified by rankings, makes universities dependent on the media for their recognition and legitimacy in the public sphere. In order to attract students and attract funding, for example, the universities must accommodate the expectations placed on them as a consequence of the public, which is mediated, version of what a university fundamentally is.

In contrast with the complex reality that they take themselves to be explaining, rankings are very simple and straightforward: they seem to provide an objective comparison and evaluation with respect to a limited number of discrete variables or indicators, across a broad range of diverse cultural, social, economic, and political contexts. The simplicity is itself a consequence of media logic, the aim of which is to produce a coherent and easily grasped image. Thus, “excellence” in teaching or research is whatever the rankings, that is, the framework for the mediation of universities, say it is. From the perspective of mediatization theory, the rankings can be said to produce “excellence” through their effects on regional and national policy, university management, and even the choices of the individual. The image produced in the rankings, disseminated through media and consumed by the public, become the basis for decision-making at all levels. The subsequent reorganizing of higher education institutions constitutes a shift from a traditional academic organization with collegial autonomy and control over curricula and research toward an organization in which every section is assessed in relation to the university’s ability to climb, that is, to appear more “excellent,” in the rankings. This devotion of attention and resources to branding weakens traditional academic structures, values, and concepts, which are usurped by the principles and practices of corporate management.

Real Recognize Real: Local Hip-Hop Cultures and Global Imbalances in the African Diaspora

Bryce Henson

The University of Illinois at Urbana-Champaign,
Urbana-Champaign, IL, USA

Hip-hop is revered as a global countercultural movement that disrupts dominant configurations of power and gives voice to traditionally marginalized peoples. Its origins illustrate how marginalized Black and Latina/o youth in the United States use technology and culture in contradictory fashions to illustrate the lived experiences of race and the structures of racism in the postindustrial city. This movement galvanized both minoritarian and arts communities in New York City. It is a poignant reminder of the impetus behind cultural studies: to illustrate how culture is inextricably linked to economic, political, and ideological power that impacts one's material conditions, life chances, lived experiences, and interactions with the State. Hip-hop's four core expressions of rapping, DJ'ing (disk jockeying), breakdancing, and graffiti have become rich sites of critical pedagogy where racialized groups are also producers of meaning, knowledge, and critique in contrast to dominant modes of power. While a movement that originated in the South Bronx in 1970s New York City, it quickly spread across the United States (US), and now around the globe.

Studies of youth and hip-hop culture are proliferating and producing cunning research. Furthermore, hip-hop culture has become a transnational community engaged by marginalized groups in order to critique their local conditions, global capitalism, and their stigmatized cultural representations in public discourses and mass media. While hip-hop is indeed becoming a more globalized phenomenon, it is not without its own power dynamics. This entry examines how hip-hop culture in the city of Salvador da Bahia illustrates the perils of globalizing cultural studies, namely that hip-hop too often traverses the dominant global flows and obscures the ways in which

non-Anglophone marginalized groups in the Global South engage hip-hop as well as globalization. Simply put, hip-hop culture must be contextualized in local historical dimensions to trouble the homogenization of transnational communities but also to work through and dialogue about internal differences.

Cultural Studies

Stuart Hall (1980) convincingly argues that cultural studies is not simply the study of cultural texts but how those texts are embedded into ideologies of representation, power, resistance, (counter)hegemony, and formations that are indicative of particular historical moments. Culture, in other words, is not detached from our lived experiences and material conditions. As a result, cultural studies, as an interdisciplinary field, extends the study of culture in two ways: the first, “to an ‘anthropological’ definition of culture – as cultural *practices*; second, the move to a more historical definition of cultural practices: questioning the anthropological meaning and interrogating its universality” (p. 27). Hall’s definition nuances how culture is practiced and performed in a group’s everyday lives and social rituals. This undoubtedly is specific to how a group makes meaning of culture and is shared among its members. This requires interaction by actors within a group and how they construct the social world in order to navigate it. This approach is buttressed by taking a historical approach that refuses a static notion of culture that is flat and timeless. Rather, it is a process that is contested, struggled, and continually being remade. Culture then is mediated by those who constitute a specific social formation, impacted by their historical moment, and how they are positioned with particular sets of social relations. Thus, culture is cultivated by particular arrangements of social, political, and ideological power.

Global Hip-Hop Culture and the African Diaspora

Hall’s definition is critical to nuancing the imbalances within the global hip-hop community.

Hip-hop culture is not simply the production and consumption of its four key elements: rapping, DJ’ing, breakdancing, and graffiti. Moving hip-hop culture within anthropological understandings of culture necessitates situating it within how hip-hop is lived, practiced, ritualized, communitarian, and meaningful. It also situates the historical changes within a given society as well as global relations. It is no coincidence that hip-hop in the US arose in the aftermath of the US Civil Rights movement of the 1960s. Despite these historical changes, the United States remodeled its ideology and social structures in order to sustain existing structures of economic and political power. This resulted in the deindustrialization of urban cities; shifting manufacturing jobs abroad; urban projects that displaced Black and Latina/o communities; and the increase in the service, telecommunications, and finance sectors. Put simply, the postindustrial city was the site where these political, economic, and ideological shifts occurred in the United States.

Hip-hop culture arose from those changes in the United States. US African Americans, Anglophone Afro-Caribbeans, and Caribbean Latina/os were put into similar socioeconomic positions despite vast differences in culture, history, and ethnoracial identities. These Afro-diasporic intimacies were also forged out of similar experiences that were the result of cuts in social services, increased policing, and urban displacement (Chang 2005). In these spaces of marginalization and silences, a bricolage of expressive cultures mediated through technology produced hip-hop culture to speak back against their lived experiences, material conditions, and cultural representations that were naturalized in ideology and social structure. Hip-hop culture illustrates the ways in which culture is continually remade and invented in a particular time and place that is embedded in a bricolage of social relations.

Advances in technology and telecommunications facilitate the extension of hip-hop culture around the globe. Today, youth around the world participate in hip-hop culture and have become part of a transnational community. This provides a lexicon of resistance, imagery of power from the margins, and a multicultural and multiethnic

identity that transcends and critiques the nation-state as well as forms of oppression in the modern world. At the same time, the emphasis on a global hip-hop culture has created a false universality that all oppressions or forms of marginalization are identical. This is not to elide the very real conditions and violence that people experience. Indeed, forms of oppression can often cut at right angles to each other, as Paul Gilroy (2000) has noted, that operate through interlocking systems of oppression. Rather, it is to make clear that oppressions operate through interlocking systems that are malleable but also rooted in specific socio-historical totalities. Globalization is not simply able to erase those convoluted residues of the past. They take on different arrangements, and a society is articulated in a variety of possibilities that create structures of dominance. Eliding the global dimensions of hip-hop culture only rearranges the organization of power and repositions particular groups in a marginal position, with the divide between the Anglophone and non-Anglophone worlds being but one example. It is thus imperative to nuance these tensions between the local and the global within the larger hip-hop community.

In addition, the conflation of hip-hop culture as a space of marginalization too often elides the role of race, specifically blackness. Anthropologist Marc Perry (2008) intervenes into the erasure of race and the African Diaspora in the globalization of hip-hop culture. He argues, “hip hop can be seen globally as an increasingly important conduit for just those kinds of transnational black identifications and emergent subjectivities that have historically constituted the African diaspora as a lived social formation” (p. 639). Even as hip-hop becomes a transnational, multicultural, and multi-ethnic community, it is still foundational in the contemporary moment for African-descended peoples across the globe to forge diasporic identities, cultures, and communities. Highlighting issues of race and Blackness within hip-hop cultures is important because it not only illustrates the uneven terrain that those terms traverse, exposing the imbalances that globalization

embeds in the African Diaspora. Local understandings of hip-hop culture may in fact contest the dominant discourse within global hip-hop itself. This is an issue of not only translation but also context. Literary scholar Brent Hayes Edwards and his notion of *décalage* to expose an unevenness in the African Diaspora that “resists translation into English; to signal that resistance and, moreover, to endorse the way that this terms marks a resistance to crossing over” (2003, p. 13). Edwards’ intervention here is useful to understanding how local hip-hop cultures expose imbalances and tensions within the global hip-hop community.

Local Understandings of Global Hip-Hop Culture

These tensions can be exemplified in a hip-hop workshop observed during the author’s ethnographic research on the Bahian hip-hop movement in 2014. What became apparent was that global hip-hop, as a culture and object of study, can easily elide local tensions and complexities in the Global South. Part of this can be attributed to language and geographical difference. However, this can also be attributed to glorifying commonalities while eschewing varied positionalities within transnational communities. These differences are part of regional tensions in a given nation as well as reproducing familiar tropes about the African Diaspora and global Black culture.

During this hip-hop workshop, a US African American female professor whose expertise is global hip-hop and the African Diaspora was brought to Salvador da Bahia. In addition to delivering a lecture at the local university, she was to give a workshop in one of the shantytowns on the periphery of the city. This particular shantytown is notable for multiple reasons. The first is this neighborhood had a cultural center that could hold events such as the workshop. Another significance is that few foreigners come to this cultural center and engage with locals. In fact, most tourists rarely leave the historic center of

Pelourinho or the beach neighborhoods of Barra and Rio Vermelho. To host a US African American female professor who specializes in global hip-hop and the African Diaspora is certainly rare and a special occasion for this community as well as the professor. Finally, two locally prominent Black male rappers live in this neighborhood. Thus, the neighborhood is associated with the local hip-hop culture.

One of the Black male rappers invited me to this event in order to observe how Bahian hip-hop is engaged and understood outside of Brazil. Observing an encounter of an US expert on global hip-hop culture and the African Diaspora in a city known as “Black Rome” exemplifies the tensions between the local and the global in hip-hop culture and the African Diaspora. This is by no means to deride the professor. She should be applauded for engaging with this community. As Brazil is not her geographical expertise, her presentation conjured represented tensions that frequently arise in hip-hop culture and the African Diaspora, both in study and as a community. Specifically, it made visible how global cultures are unbalanced due to the means of power over knowledge production and capitalism. This does not elide interlocking forms of oppression, such as race, class, gender, and sexuality, but rather illustrates how these are also impacted global relations that are discursively understood as the Global South, the Third World, or developing nations. While global cultures and transnational communities oft share striking similarities across context, one must not elide how local meanings of culture, community, and identity are historically constituted and locally specific.

Diasporic Temporalities

A particular tension of the African Diaspora with the modern world is the notion of temporality, the notion that Blacks are behind in progress and development. This does not preclude varying notions of time within the African Diaspora as well where some cultures are viewed as modern and others as premodern. Hip-hop culture is viewed as the modern incarnation of Afro-

diasporic cultures and situated in the most cosmopolitan and globalized cities. Put another way, hip-hop is modern Blackness and privileges global Anglophone cities. Rio de Janeiro and São Paulo, Brazil’s most cosmopolitan cities, are the locales associated with hip-hop culture but also modern Blackness (Sansone 2003). Thus, modern Blackness in Brazil is only recognized in the urban landscapes that are highly visible in globalization.

This elides the historical and global reverberations in Salvador da Bahia, an important colonial outpost and port city for the Atlantic slave trade. Salvador was the political and economic center of Brazil’s sugar plantations that were concentrated in the Northeast. After abolition, the South and Southeast were deliberately developed and industrialized to compete in the global economy (Skidmore 1993). Salvador and its majority Black population were deemed unfit in aiding these modernizing efforts. Important is the idea that Salvador’s Africanity inhibited its Black population from being equipped to participate in a free market and thus backwards. Within Brazil, Africanity is divided between a modernizing South and Southeast juxtaposed to a backwards and premodern Northeast.

Diasporic Recognition

These tensions were exposed in the workshop the author observed. In her informative workshop, the professor cogently illustrated the origins by which US hip-hop arose and how they sprouted across the United States and the globe. She linked these to African philosophies of culture, rhythm, and music. She noted that these roots have common cultural origins in Salvador. Her argument was that hip-hop is the cultural conduit for a transnational Afro-diasporic community. While she illustrated the input of African cultures into hip-hop, its output lost Salvador and produced São Paulo. Her examples of Brazilian hip-hop, namely Os Racionais MCs, were from the city of São Paulo. Hip-hop in São Paulo has done much to illustrate the literal and figurative racial violence against Blacks in Brazil. Yet, this reproduces the notion

that cities such as Rio de Janeiro and São Paulo are the only globally embedded cities in Brazil.

Salvador is silenced in these conversations about Black modernity. Its landscape and Afro-Bahian cultures are frequently drawn upon to learn about the past and African cultural roots. However, it is erased from contemporary Afro-diasporic cultures. This speaks to the “racialized feminization of Salvador” make (K.-K. Perry 2013, p. 42; see also Pinho 2008) where the city is the recipient of desire by outside forces that demarcate Blacks’ and especially Black women’s agency and voices. Yet, Salvador is also reproduced as effeminate by other localities in the diaspora. Hip-hop is certainly an example where Salvador is a reservoir of cultural influence for other Afro-diasporic groups, but little attention is given to Black Bahians’ concerns, desires, or novel forms of Black culture.

The community members at the workshop challenged these assumptions and informed the professor that there is a substantial hip-hop scene in Salvador and at the fore of the intersection of hip-hop culture and the African Diaspora. Bahian hip-hop was already drawing on their Afro-Bahian roots and doing innovative cultural work through their hip-hop cultural production. In other words, they did not need hip-hop to come to them via the United States or even São Paulo. They were already going to hip-hop. One youth presented local group Opanijé as an example. The trio of rappers formed Opanijé in 2005 and draw extensively on Candomblé, an Afro-Brazilian religion, in their sound, themes, and imagery in their music and videos. Notable political rappers, such as Mos Def, Talib Kweli, and Jurassic 5, also influence their work (Maca 2008). Opanijé also performed at a concert with Chuck D of Public Enemy. Opanijé not only demonstrates the presence of weaving the African Diaspora and hip-hop culture but also how they are engaging both beyond the borders of Brazil.

This encounter is more significant than recognizing Bahian hip-hop. It also speaks to the invisibility of Afro-diasporic cultural forms beyond Salvador’s historic center and various desires for premodern African culture associated with Afro-

Bahian culture. At stake is the gendering of Salvador as a passive space of molding, controlling, and desiring not only by the Brazilian nation but also by other Afro-diasporic groups. It elides those who are there and how they live and create knowledge in the modern world. The community members at the hip-hop workshop pressed back against the notion that hip-hop elsewhere must be brought to them in order to bring them into the contemporary moment as if they were provincial and stuck in a premodern past. Rather, they illustrate that they too are enmeshed in a global world, modernity, and hip-hop. They illustrate not only how globalization is being localized but also how local actors are engaging the global in ways not frequently recognized or that might disrupt global discourses of their locality.

Conclusion

This entry illustrates the tensions of transnational communities, global cultures, and the African Diaspora. In an age of ever increasing mediated and imaginary connections, globalization has not erased local differences or narratives. These local specificities are rooted in global *and* national forces. The latter has very real ideological and material consequences of how Blackness and Black bodies in particular locales are understood. As necessary as it is to understand how globalization is creating different arrangements of social relations, it is also necessary to contextualize the specificity of local actors and how they are using globalization in ways that are not highly visible. Engaging how the local reaches the global and the global engages the local provides a fruitful space for negotiating internal differences in transnational communities.

Reconsidering Aesthetics and Everyday Life

Cameron McCarthy

University of Illinois, Champaign, IL, USA

Why should the lamp or the house be an art object, but not our life? (Foucault 1991, p. 350)

Introduction

When considering the career of the treatment of the topic of aesthetics (defined, hereafter, as the operationalization and application of form, taste, self-stylization, and the creative imagination to the demands of contemporary life) in the educational field, one is struck by a striking bifurcation. Mainstream and liberal curriculum standard-bearers such as Eliot Eisner (1997, 2005) writing on the topic have gone down the path of more or less insulating aesthetics within self-enclosing disciplinary frames of reference emphasizing self-referentiality, connoisseurship, and the maverick-like qualities of artistic producers. This orientation might be called, after Pierre Bourdieu, the “charismatic approach” (1993, p. 76) in which the artist and the aesthetic object are judged by art-qua-art criteria shorn from the social environment. Aesthetic conversations within this paradigm brush off art objects from contaminating imbrication in the political world. The work of aesthetics in this sense is to transcend the turmoil of everyday life ennobling artistic producers and their creations and the elected audience of affinity who know how to properly consume artistic objects. Further custodial work is conducted to keep at bay those wayward producers, curators, etc., who engage in works of bad taste (as in a Mapplethorpe) or who exercise too strenuous social critique.

On the other side of this divide, neo-Marxists and cultural studies theorists of education have never really overcome the inherited terms that had been set for aesthetics within classical or

orthodox Marxism. On these terms proponents have tended to place aesthetics outside the realm of systematic consideration of the workings of society subordinating these practices to the economic and integrating the discussion of aesthetics within the superstructures. Here, then, aesthetics were understood to either slavishly contribute to the reproduction of economic relations (as scholars such as *Schooling in a Capitalist America*'s authors Samuel Bowles and Herbert Gintis had mapped out in their general formulation of the workings of education and culture in the social order) or had become part of the workings of spitball popular culture of resistance and rejection of the mental programs of schooling as cultural reproduction theorists such as Paul Willis (1981) had maintained.

Taking a different path in this entry, I wish to build upon critical, post-Marxist scholarship on education and society that has prompted a return, in recent years, to the scenario of aesthetics within contemporary society. Here, I am referring to the work of a multidisciplinary group of scholars writing from within a plurality of fields – education, anthropology, sociology, cultural geography, and history. I call attention to scholars such as Arjun Appadurai (2013) writing on the work of the imagination, Stuart Hall and Sarat Maharaj (2001) writing on the liberating eruption of aesthetics out of the institutional confines of the museum spilling over in carnal communion with everyday life, Saskia Sassen (2014) who foregrounds the work of aesthetic practices in the building of the new global city, and the work of Michel Foucault who has sought to decenter establishment aesthetics and its high priests calling attention to the banality of the work of art and the care of the self.

While neo-Marxist scholars of education writing on urban life have tended to place aesthetics on the boundaries of critical practices, treating aesthetics as a surplus set of practices that can only be made fully relevant when added on to a more concentrated attention to economy and politics, these post-Marxist theorists maintain that aesthetic practices now underwrite the fiber of everyday modern life. As Arjun Appadurai usefully points out in the *Modernity at Large* and *The*

Future as Cultural Fact, aesthetic practices are no longer to be simply understood as the practices exclusive to the artist – a maverick or charismatic citizen creating selective images about the past, present, and the future of human existence. But aesthetic practices are linked to the work of the imagination of ordinary people and connected even more earnestly to the work of capitalism and its organization and reorganization on a global scale. What Appadurai, Sassen, and others are pointing toward can be identified as a central energy in modern life associated with the production, reception, and circulation of representations and images and the diffusion of knowledge and information – the core of what Manuel Castells calls the new information paradigm where information is the key product and new driver of the capitalist order and where its organization and deployment contribute to reshaping contemporary social relations. It is within this paradigm that the manipulation of form, images, and style (not the ever mountainous climb of data but the transaction of aesthetics of existence) quite literally articulates the most aggressive possible marketing of signs, the radically active ascesis of self-caring, of how we look, of who we would want to look like, the house we would like to live in, and the places around the world we would like to visit. All of these practices are really seductions of style and persuasion that are now deeply commodified – whether in the domain of reality television, packaged tours, the sandboxes of console-supported video games, or the online virtual play worlds of the World of Warcraft.

In what follows, I want to extend these understandings in a very specific way by discussing the historical entanglement of aesthetic practices in the diffusion of modernization and developmentalism to the Third World. Second, I want to point as well to the deepening role of aesthetics in the organization of capitalism in the new millennium. Third, I close the essay with a brief discussion of the crisis of language that the aestheticization of everyday life has precipitated in neo-Marxist efforts to grasp the central dynamics of contemporary societies. The latter development has led to a depreciation of the value and insightfulness of neo-Marxist analysis in our time.

Let me now turn to a discussion of the historical context of the integration of aesthetics into commerce and the transfer of modernization principles through aesthetics to the Third World.

Aesthetics and Economic Production in Historical Relief

The long shadow of the integration of aesthetics and capitalist economics can be tracked back into the circumstances of the late-nineteenth-century industrialization, the generation of new markets for the ever-expanding range of capitalist goods and services, and the production of consumer durables. These “luxuries” of personal style were in their everyday utility, if not necessity, expanding middle-class consumption patterns to the working class. Within this set of developments, deepening patterns of aestheticization in advertising, the imbuelement of commercial products with sensuousity, flair, and feeling, and so forth generated a leveling effect in the processes of class representation and helped to transform agrarian and immigrant actors into the new acquisitive urban subjects. As Dean MacCannell would argue, the commodity world of capitalism derived value not simply from invested labor but from the symbolic register in which human actors attached stratified meaning to things, their shape and form, and their near magical power to signify beauty, self-worth, and importance. This symbolic energy in aesthetic forms would contribute to the generation of flow and fluidity within the representational furniture of the class order and contribute tremendous value-added dynamism binding ecumenical groups of social subjects to the unfolding capitalist order. The working class could now try on the uniforms of the upper classes, explore their ways of life through the glow and illumination of what TS Eliot in his poem *Portrait of A Lady* called “bric-a-brac,” and through consumer credit and loans acquire the imitation furniture, jewelry, and items of leisure that mirrored aristocratic existence. Aesthetic practices integrated into economic form were now performing the pedagogy of molding the new subjectivities of the modern age – less in collision with capital in the classical sense identified by Friedrich Engels in *The Condition of the*

Working Class in England but more in besotted communion with the spectacular array of consumer products capitalism had strewn in their wake. To be a true citizen in the modern society was to be a dedicated consumer.

Modernization’s Aesthetic Arrival to the Third World

This model of progress, proletarianized and internationalized by the middle of the twentieth century, would be taken full scale to the Global South, embodied in Coco Cola and Pepsi ads, the family size Coca Cola drink, the cultural translation performed by the films, musicals, popular songs, etc., that entered the Third World through cinema houses, radio, television and newspapers, comic books, and cartoons, and the lure of the new sleek-looking surfaces of consumer durables and household electronic appliances. Here, debt-driven consumption summarized the aspirations of the masses for something more than material want. These practices of borrowing today and paying tomorrow underlined a fueled working-class interest in comparative affluence – a desire to expand and materialize freedom by codifying taste and style and by integrating the aesthetic and leisure practices into their rigorously subordinated lives defined by industrial parks. These aestheticized aspects of material culture were themselves indices of a new aspirational momentum generated in the so-called preindustrial economies that were navigating the modernization paradigm propounded by Anglo-American policy intellectuals. The newly aestheticized material culture paralleled new imperialist policies of industrialization by invitation and the transfer of production processes of multinational capital to the Third World.

The modernization paradigm traveled instantaneously incubated in the spreading tentacles of electronic mediation embracing the most remote parts of the earth. Musicals such as *The King and I* and *The Sound of Music* and soap operas such as *Portia Faces Life* offered aesthetic solutions to the problems of necessity and want in the Third World. These popular cultural productions propagated ideas such as the inviolability of contract and the value equivalence involved in the process of exchange of labor power for wages. They

extended a shimmering imaginary plane of existence linking the metropolis to the periphery latent with needs and saturated with unfulfilled desires. These aesthetic works suggested that the Third World life, linked to tradition and agrarian organization and imagination, was flawed, oppressive, backward (a neo-Marxist claim as well!). This type of enlightenment narrative was propagated, for example, in highly popularized musicals such as the *The King and I*. Circulated through radio, television, and film, *The King and I* made popular the modernization dilemma of the old traditions of Siam (Thailand) versus the suppressed wish fulfillment of Siam's people, particularly their capacity for individual action and choice. *The King and I* ultimately set the capriciousness of the absolutist state against the visions of constitutional democracy. The way out of cultural miasma and backwardness to enlightenment was provided in the person of an English schoolteacher, Anna, who would carry out the work of cultural incorporation and translation. The cultural and philosophical forms of modernization – the right to private property, the capacity of the workers to sell their labor power, and the deification of Western democratic traditions – are all underscored in this musical in which a half-naked king, with Anna's help, must reconstitute his relations to his subjects and retool himself as a comprador agent of capitalism's expansion in Southeast Asia.

The aestheticization of the economic – capitalism with a human face – sold the Third World on the modernization theories of Western policy intellectuals such as Daniel Lerner, Harold Lasswell, and William W. Rostow. The “passing of traditional society,” as Lerner called it, involved that fearful asymmetry of contractual agreement to exploitation and excavation of the resources of the native and her land, along with state-enforced guarantee of the privileged status of the right to private property that multinationals and mercantile local elites so intensely craved. The development gap between the Third World and the First could be jumped by the expansion of the consumerist culture of possessive individualism and the wholesale adoption of the infrastructure of industrialized production by “overseas” territories. Just as new streets were being paved

for industrialization by invitation in the 1960s in Puerto Rico and Barbados – the sweet middle-class life of the *Brady Bunch* and later *The Partridge Family* presented itself through television as the embodiment of the one and only true heaven, as the buoyant end game in the struggle for happiness. Why couldn't a woman be more like a man (*My Fair Lady*)? Why couldn't we the Third World Siams be more like the enlightened West?

It was, in part, this developmentalist dream of plenitude and progress that delivered the “Pakis” and the “Jamaicans” to the land of the “Lads” in pursuit of the Holy Grail of the better life and the material rewards of capitalism – as Paul Willis had documented in the *Learning to Labor* (1981). As cultural theorists writing about education had barely noticed, the postindustrial phase in capitalism brought a new multicultural environment onto the terrain of metropolitan urban centers. By the 1980s a new aesthetics of everyday meaning of style marked the sartorial and leisure choices of urban youth in metropolitan centers. Whether it was the post-beatnik, yuppie culture in New York or punk and skin-headed flamboyance in London, a cultural turn to hybrid genres and world culture marked the identities of white working class indelibly. What was missing in the cultural studies account of these new cultural formations was the backstory of imperialism and colonialism. What cultural studies theorists of the Center for Contemporary Cultural Studies confronted in Birmingham in the ocular opposition of the immigrant other to the Lads in the *Learning to Labor* is this abridgment of a continuous line or movement of disembeddedness and transformation in an imaginative and spatial geography that extended the aspirations of the Jamaicans, the West Indians, the Pakis, the Indians, and the Bangladeshis from the periphery to beachheads in Brixton and Manchester. The full significance of what this movement would mean in the changing terms of globalization was indeed far more fully recognized in the popular films such as *The Full Monty* (1997), *Billy Elliot* (2000), and *This Is England* (2007). To understand these dynamics more clearly, we must now turn to a consideration of the role of aesthetics in everyday life.

Everyday Life

The role of aesthetics in everyday life has deepened in the last few decades with the rising importance of computerization and media-driven technologies. The work of aesthetics is not simply now embodied in the selling of messages and images but in the very construction of products and constituencies of affiliation in the new millennium. It is pivotally located in the convergence platforms that integrate the old media technologies of television, radio and newspapers, and comic strips into the new technologies of handheld machines (Jenkins 2008). All these affordances have enhanced that whole area of stylization of the self and the self-management of everyday life that Foucault discusses in his *History of Sexuality* volumes, and Baumann alerts us too in books such as *Liquid Modernity*. But the processes of aestheticization also reach deeper into the marketing and circulation of goods and services, the proliferation of labels, and the redirection of difference and diversity toward the new vending machines of choice. As the author of *No Logo*, Naomi Klein, insisted some years ago, it is the aesthetics of entrepreneurial identities and labels, logos, and brands that have displaced the manufacture of products as the heart and soul of what makes post-Fordist capitalism tick. Everywhere smart capital is running away from the materialization of dense product inventories, costly overheads, and static models of factory organization and opting instead for the cultivation of new bonds of consumer affiliation and labeling, relying on the faithful consumer to spawn markets by parading the labels of branded distinction in their natural habitats. It is precisely here in this new restructuring arrangement, too, that the critical separation of work from leisure – a division in the social and economic orders that Marxist scholarship held onto from Marx and Engels formulations through to Harry Braverman, Bowles and Gintis, and cultural studies theorists such as Willis – has collapsed as labor has become deftly integrated into leisure. There is a constant diffusion of value in leisure generated in the 24/7 interactive engagement of the twenty-first-century consumers in the full penumbra of digitally based inducements in video games, online fantasy

communities, online shopping, culture fashioning, and even I-reporting.

Leisure is work and work has shifted radically into all leisure spaces. The consumer's body and its extension by handheld machines, such as the mobile phone, have become the new interactive canvases of commodity fetishism. It is in this framework of cultural oversupply that the modern consumer tries on new identities and engages in practices of self-correction and self-modulation. Transnational corporations such as Starbucks and Nike now brand new ecumenical communities with their labels like so many tattoos on the social/global body. And so, ethnic, class, and gendered communities are now coalescing around practices of consumption and patterns of taste rather than around production relations or ancestry, or geography, or biology. The language of the new aesthetically branded world now registers the new ecumenical orders of feeling, affect, and taste. These ecumenical orders overlap with the traditional collectivities of class or race or gender, but in the most frenetic and unpredictable of ways. This buoyant aestheticism has generated a new cannibalism as the modern actor seeks refuge in ever more savage intensities and hybridities (MacCannell 2013).

The Aftermath of the New Aesthetics and the Impact on Radical Scholarship in Education

This shifting terrain of the aesthetics of existence articulated to identity, and affiliation has overtaken neo-Marxist scholarship in education by events. We live in an era in which old metaphors associated with Marxism – concepts such as “class,” “economy,” “state,” “production,” “reproduction,” “resistance,” “the labor/capital contradiction,” “reality” and “fiction,” “ideology” versus “truth,” and “materiality” and “immateriality” are being worn down by the transformations of the past decades in which the saturation of economic and political practices in aesthetic mediations has proceeded full pace (Bauman and Raud 2015). The framework of analysis that linked education to capitalist employers, to factories, to the nation-state, and so forth is no longer serviceable as the coordination of economic and

symbolic production is now rearticulated along multiple sites in a global process of marketing, branding, and outsourcing of the production of goods and services.

We have reached a stage in this millennium where the old “conflict” versus “consensus” metaphors do not seem to apply. Instead of models based on conflict and resistance, increasingly social groups are being defined by overwhelming patterns of transnational hybridities, new forms of association and affiliation that seem to flash on the surface of life rather than to plunge deeper down into some neo-Marxist substructure. Paul Willis’s nationally and geographically bounded Lads are now being replaced by Hisham Aidi’s banlieusard diasporic youth formulating their powerful musical critiques of the French State and their protests against living conditions of immigrants by melding electronically relayed African-American hip-hop with Sufism and new North African poetry (Aidi 2014).

All these developments are turning the old materialism versus idealism debate on its head. It is the frenetic application of forms of existence, forms of life, the dynamic circulation of and strategic deployment of style, and the application of social aesthetics that now govern political rationalities and corporate mobilization in our times. The new representational technologies are the new centers of public instruction providing the forum for the work of the imagination of the great masses of the people to order their pasts and present and plot their futures. They are creating instant traditions and nostalgias of the present in which our pasts are disembedded and separated out as abstract value into new semiotic systems and techniques of persuasions, new forms of ecumenical clothing that quote Che, Mao, Fidel, and Marx, and “revolution” in the banality of commodified life – the publicity of one brand of dishwashing liquid as having “revolutionary” effects is just one good example of the work of aesthetics in the brazen rearticulation of terms and traditions in the brave new world in which we live. Who now owns the terms that define the authentic traditions of radicalism that inform our works? Who now has final purchase on the terms

“resistance,” “revolution,” “democracy,” “participation,” and “empowerment?” The massive work of aesthetic and textual production is blooming in a crucible of opposites – socially extended projects producing the cultural citizen in the new international division of labor, in which the State may not be a first or the final referent.

Religion and Modern Educational Aspirations

Mette Buchardt

Department of Learning and Philosophy, Aalborg University, Copenhagen, Denmark

Introduction

Religion is – across national context – commonly said to have had a historically central role in educating and raising future generations in pre-modern times. In popular as well as in academic discourse, it has often been assumed that the non-West was and still is particularly marked and even controlled by religion up until today, and thus it is dubbed “premodern.” The West, including Western education, has in contrast been identified with modernity and thus secular rationality. Modernity in Europe and North America has been perceived as based on separation of religion from public matters, including separation of religion from modern schooling. Such views are related to the concept of secularization that up until the 1990s dominated Western educational and historical research, as well as religion studies, including voices critical toward secularization as a political project.

Since secularization as a research paradigm was increasingly found inadequate from especially the 1990s, historiographic educational research has challenged the narratives on modern

schooling and pointed to how religion has played a role in modern European and North American educational effort: How religion, especially in the form of Protestantism, has been used and transformed in the modern civilizing mission of schooling, in nation-building through schooling, and in the languages of education, and as such, circulated globally. The concepts of modern schooling that developed in Europe and North America from especially the mid-nineteenth century onward have been part of transforming and reinforcing religion globally from colonialism to present day politics of globalization.

The Question of Religion in Educational Discourse

Though it is common sense in the educational field that religion before modernity has played a central role in education, opinions differ when turning to a perspective of the present. In, for instance, Europe, among teachers, scholars, and teacher educators, as well as among politicians and other debating voices in the media, roughly two main positions can be detected. One position points to the fact that religion in the meaning of Christianity had such an important cultural impact that its role should be maintained since it provides the education systems with history, cultural background, and morality for the future citizens. The other position views religion as belonging to the past and views it as progress to leave religion in the past: The role of teaching future citizens morality and conduct today should, from this position, be sustained by what is seen as secular bodies of school knowledge such as philosophy of life, civics, etc.

Both approaches, though ideologically differently positioned, share a prescriptive aim, namely, to point out what role religion should play and thus which conclusions should be drawn in the education systems. The positions also rest on another common presupposition, namely, that religion has historically been fraught with morality and as such delivered the basis for the legislation and constitutions of States (“the law”), hence the foundation of present society. Religion is in

other words viewed as a form of morality in the meaning of guidelines for individuals as well as the moral basis for modern ideas of the political.

Seen from a historiographic point of view, such assumptions are somehow correct and yet not very precise. Though it is correct that in, for instance, Medieval Europe the church played a crucial role, it was just as much as a political, economic, and sometimes military force, and religion can thus not be confined to being a provider of morality. While the reformation in especially Northern and Central Europe led to new relations and divisions between State and church institutions, for instance, to several confessions and thus church institutions within the same State, it did not necessarily mean a division between church and State administration. In the Lutheran States in Scandinavia, parish priests on the contrary served as local administrative representatives of the State, and it was not least in this capacity that church and schools remained and became increasingly connected, namely, during the forming of the State education systems in the nineteenth century.

Viewing the role of religion – and religion in education – as confined to morality and a supplier of culture and cultural heritage is closely connected to modernity and to a political process of secularization in the meaning of division of church institutions from State institutions such as schools. This process began much earlier in republican States such as the USA than in, for instance, the European monarchies.

In light of this (ideological), positions as the abovementioned do, however, point to and exemplify central elements regarding how religion as a phenomenon has been perceived and made useful in the European and North American States throughout the nineteenth and twentieth centuries, meaning during the emergence of modern schooling and the founding of education as academic discipline and science. This period was also the formative period for modern State formation, where State crafting, especially from the early twentieth century, increasingly became based on functionalizing and optimizing the State body and its citizens by means of scientific results and methods. As part of this process, what today is

defined as religion became scientifically conceptualized and described.

The educational field has played a pivotal role for projects of science-based State crafting and as a central venue for the political project of secularization. Religion did not disappear from education. Rather it was transformed and spread out, for instance as a central part of what historian and educational theorist Daniel Tröhler calls *languages of education* (2011) and as part of the salvation project of modern schooling (e.g., Baader 2005; Popkewitz 2011). Furthermore, religion in education can be seen as a force in what Emilio Gentile (in relation to Italian fascism) has named *the sacralization of politics* (1996) and as related to what, e.g., Robert Bellah, inspired by, e.g., Rousseau's work on "The Social Contract," has conceptualized as civil religion (1967). Finally, education in the form of religion and religion in the form of education have been important parts of European colonial projects, a process which has been crucial on the one hand to how religion took the shape of a civilizing education mission, which also reflected back on the metropolitan terrain of empire and on the other hand for the whole basis of talking about religion as a phenomenon.

Christianity as Religion and Education

As an academic concept religion was originally a European creation, a provincial entity that got circulated globally not least through colonialism, for instance, through missions and migrations. Historian of European intellectual history Tomoko Masuzawa has pointed to how the concept of the so-called world religions should be understood as situated in the European project of claiming universalism and as closely connected to hierarchies of othering (2005). While the upcoming discipline of anthropology played a decisive role as knowledge producer during the British Empire, the German universities, for instance, became an important site for developing what today is known as Comparative Religion.

The emergence of comparative studies of religion was part of a general rise in exploring and

conquering "the Orient" through knowledge production in, for instance, the philological disciplines, which boomed during the nineteenth century. At the Northern European universities, a new range of academic disciplines centered on "culture" developed, an effort that included attempts to make academic knowledge about culture useful to society. In, for instance, Germany, liberal theologian scholars were among the late nineteenth- and early twentieth-century pioneers of studying religion as culture. A part of this scholarly effort was to make the new science-based knowledge on religion useful for the modern State. These so-called cultural Protestant theologians argued that academic knowledge about religion as culture could provide State and society with culture and thus bridge between a growing divide between Christianity and culture by means of academic knowledge. Many also involved in the Social Christian movement which sought to provide solutions to the so-called social question as an alternative to the rising labor movement: How to resolve the growing poverty in especially the urban setting – for instance, through education – without fundamentally changing the social divisions of society.

The new cultural disciplines were in other words utilized from the outset, and seeking to utilize new academic results in the education system and to involve in the educational sciences was part of this endeavor for many cultural protestant scholars of culture. A German example is the reform pedagogue and Jena-plan architect Peter Petersen, trained theologian under, e.g., the Danish-German-Swedish liberal theologian and pioneer of comparative religion Edvard Lehmann, who also involved in the question of education. In Sweden, comparative religion in the form of "history of religion" became integrated in the school curriculum for religious instruction in 1919 as one of the first examples of this in the world. Such reform did not implicate that all religions were seen as equally valuable for developing moral and culture as part of creating good citizens for the State; rather, Christianity was viewed as being the highest of cultural value, but also, for instance, "non-Christian" figures such as Zarathustra could be of value in State education (Buchardt 2015).

Another central site for globally distributing the concept of religion into social practice was missionary education (and the upcoming discipline of missionary studies which collected knowledge about religion as well as on for instance educational efforts in “the missionary fields”). The missions were confronted with what in the period was increasingly understood as differences in culture among populations under colonial rule, and missionary education thus in different ways became a central site of the “civilizing missions” that were able to handle difference.

Historian Pama Sengupta has in studies of Bengal during the British rule shown how colonial pedagogy cannot be understood as a Western secularization of the non-West: The “involvement of missionaries in the expansion of modern education ultimately reinforced, rather than weakened, the place of religion and religious identity in the development of Indian Modernity” (Sengupta 2011, p. 1). This contributed to setting the conditions under which Muslim and Hindu educational reformers operated and which ultimately “made education one of the primary ways in which Bengalis, whether Christian, Hindu, or Muslim, came to identify and ultimately divide themselves” (Ibid, p. 5).

Also “at home” – in the metropolitan terrain of the Empire – missionary practice impacted education and led to new practices concerning religion in schools. Historians of education Rob Freathy, Stephen Parker, and Jonathan Doney have shown how the late twentieth-century reform of religious education in domestic UK schools where a so-called world religion approach was adopted can be traced back to, for instance, the Edinburgh *World Missionary Conference* in 1910 and the ecumenical movement which developed from such international cooperation (see, e.g., Freathy et al. 2015).

Protestantism, Educational Reform, and the Global Languages of Education

The world religion approach to the teaching of religion in schools can be understood as part of the development of concepts for schooling, which could grasp the social and “cultural diversity”

among the populations to be schooled. The world religion concept utilized in schooling can simultaneously – in line with Masuzawa’s points – be viewed as tool for dividing and creating hierarchies of population through hierarchies of knowledge.

The same can be said concerning the cultural Protestant academic involvement in the aspirations of modernizing schooling and modernizing the State through schooling in Northern Europe, e.g., in Sweden and Germany in the early twentieth century, as well as with their Protestant equivalents across the Atlantic: Protestant reformers that involved in the so-called Social Gospel Movement in the USA. Historian of education and educational theorist Thomas S. Popkewitz has shown how Puritan narratives of salvation reappeared in American progressive education, intertwined with national exceptionalist ideas about the chosen people. In addition, this entangled with ideas on the moral disorder in the conditions as well as in the people of urban settings, a legacy from the Social Gospel Movement to which many of the educational reformers related during the early twentieth century (Popkewitz 2011, e.g., pp. 220ff, Tröhler 2011).

The Social Question inscribed ordering and classifying principles about modes of living that differentiated and divided the qualities encased as civic virtues of “the chosen people” from those different and casting out in other, unlivable spaces. [...] The very inclusive principles that ordered the sciences of education and pedagogical practices entailed inequality through the divisions that characterized and distinguished the qualities of individuality. (Popkewitz 2011, pp. 235–236)

Though there were crucial exchanges across the Atlantic, differences regarding confession and State formation, which also impacted the field of education, are important to note. While tracing the religious elements in the language system behind contemporary globally circulating educational discourse, Tröhler has pointed to distinctions between republicanism and the monarchies and between the languages of different Protestantisms. Calvinism and Puritanism were influential in republics such as Switzerland and the USA and Lutheranism in, for instance, imperial Germany (e.g., Tröhler 2011). An orientation

toward *Bildung* and thus “Geist” and “the culture sphere” in German pedagogy and toward “the social sphere” and the demands of the republic in American educational science, can thus not be understood independently of the different Protestant languages which fed into educational thought and modern educational aspirations.

This is also mirrored in the differences between the roads taken by German and Nordic Cultural Protestantism and the American Social Gospel Movement, despite similarities. Both movements were confession-wise quite open and comprehensive, but the Lutheran imprint was strong in the North European movements, whereas the Social Gospel Movement developed in an environment marked by reformed Calvinism, the latter with a strong tradition for communal and republican engagement (cp. Tröhler 2011).

The new liberal Protestantism in Northern Europe did also have its social wing, for instance, the German *Evangelisch-sozialer Kongress*, a social and political movement, active from the 1890s and into the 1920s, with the aim of dealing with social problems from a Protestant ethical point of view, featuring key figures such as the pastor and politician Friedrich Naumann who also engaged in educational questions. However, it was not least by transforming religion into culture and putting it to work for the State in formal education that liberal Protestantism and educational reforming intertwined in Germany and in the German-influenced Nordic States (Buchardt 2015).

Protestant languages also formed part of the German reform pedagogy, but as it has been explored by historian and educational theorist Maike Sophie Baader, the Christian elements mixed with inspiration from, for instance, Theosophy, modern Western occultism, and esotericism in what Baader calls *figures of thought* (Denkfiguren) such as “the child as holy” and “the teacher as pastor” (e.g., Baader 2005).

Religion and Education as Scholarly Object

Rather than seeing modern schooling and modern educational aspiration as secular, it might make

more sense to understand educational modernity in its European and North American shape as, in the words of historian of education Fritz Osterwalder, pedagogization of the public sphere which went hand in hand with a sacralization of pedagogy (Osterwalder 2006). The extent to which religion in modern pedagogized form has been part of a sacralization of State and politics and of making the civil religious has not yet been fully explored, but that religion has played a vital role in this process is beyond reasonable doubt.

It is, however, important to note that insofar as it makes sense to talk about sacralization of State and schooling, it is to be understood as the flipside of the coin in a process of increasing secularization in the meaning of institutional division of State and church, a process which in the Protestant-dominated States in Europe took place from the late eighteenth century onward. The status of religious instruction as a subject matter in schools was during this process a highly debated topic in, for instance, many European States, and still is today.

The question of religion in education historically can, however, not be confined to the question of religious education. Just as the intellectual history of religion in schooling is broader than religion as a subject matter, so is the institutional history, as, for instance, historian Daniel Lindmark has pointed out (Lindmark 2015). Naturally, the question of religion in schooling can also not be confined to Europe and North America. Nonetheless the global languages of education circulated through, e.g., supranational bodies can be said to draw extensively on what historian and educational theorist Bernadette Baker has conceptualized as Western world forming (Baker 2009). The same can be said of the very concept of religion, and thus – once again – about its pedagogically utilized modern forms.

Resurgence of Freirean Pedagogy in the New Media Age

Herner Saeverot

Bergen University College, Bergen, Norway

Introduction

In this contribution Paulo Freire's pedagogy is replaced, into a contemporary context. The contribution starts with a short description of the background that led Freire to see the need to develop a pedagogy. A retelling of Freire's meeting with poor farmers in Brazil in the 1950's will be outlined in brief terms. These farmers were oppressed primarily because they were illiterate; hence Freire saw the need to develop a pedagogy that was able to solve this problem. Secondly, this entry highlights the trend that current Western curricula and schools largely focus on developing students' reading skills. The problem Freire faced in the 1950's in Brazil is no longer an issue. However, other problems have occurred, i.e., problems which may be comparable to the illiteracy among Brazilian farmers in the 1950's. For example, images have become an important part of the everyday life. People express themselves through images, are socialized through images, etc. Images affect modern people, and they help to understand the world. But can the young generation read images adequately? The claim in this contribution is that the absence of images in many Western curricula increases the risk that children and young people become visual illiterates. This

leads to the third point of the entry, namely, that there is a certain need to return to Freire's pedagogy, as a kind of repetition.

Repetition will function as a kind of method in this entry. But what is a repetition? The Danish writer Søren Aabye Kierkegaard distinguished between two kinds of repetition. Firstly, there is a mechanical kind of repetition, where the copy is identical to the original. Kierkegaard talks about "the same sameness" (Kierkegaard 1983, p. 170). A direct transcription of a text can be an example of this kind of repetition. Secondly, Kierkegaard's authorship contains a repetition that can be described as "the unlike sameness" (ibid., p. 175). An example here might be a book which is translated into another language. Even though the two books are very alike, they are also different and unlike each other. This latter kind of repetition will be used for the following analysis, i.e., a kind of repetition that cannot avoid to add something new, even though it shows deep respect for that which is repeated.

Thus, the structure and design of the contribution look like this: It starts with a brief description of Freire's experiences and how they led him to develop a new kind of pedagogy. This history is then repeated, by replacing it into a contemporary context, i.e., a problem in today's media age that is both similar to and different from the problems that was highlighted by Freire. In the third section, there will be a brief description of some basic features in Freire's pedagogical perspectives, before these perspectives are repeated in the fourth and final section. As such, the basic features of Freire's pedagogy are preserved, while some new features are added to that pedagogy, making it possible to deal with one of the problems that the new media age is facing. Through the repetition of this specific history and pedagogy, there may be a need for the resurgence of Freirean pedagogy in the new media age.

History Repeated: From Linguistic Illiteracy to Visual Illiteracy

Brazil in the 1940s and 1950s: Illiteracy

From 1946 to 1954 Freire was Director of the Department of Education and Culture of the

Social Service in the Brazilian State of Pernambuco (Torres 2014). In this service, he began to develop methods to teach adult peasants to read and write. The reason for doing this was that these farmers were, according to Freire, oppressed as they could not read nor write. According to Freire, this illiteracy was not only the root of oppression but also the root of the strict authoritarian mentality and absence of democratic principles in Brazil. The authority was on the side of the landowners and governors, who could easily oppress the peasants because they could neither read nor write.

At this time, Brazil was considered to be a closed society, in which illiterates, but also others, were silenced (Freire 2005). The illiterates did not have the right to vote and they did not have a chance to express their views on matters affecting their own lives. Consequently, they were deprived of feelings of responsibility and solidarity towards their own country. At the same time they were oppressed, neglected, and silenced; almost forced to be like the ones who were in charge. As for Freire, this was typical features of a dehumanizing society.

However, from the 1960s, things started to happen in Brazil, i.e., the closed society was beginning to look like an open society (Torres 2014). This occurred primarily in the period when the leftist politician João Belchior Marques Goulart (1918–1976) was president, for the period 1961–1964. Although much remained in order to say that Brazil was an open society, Freire found several hallmarks of an open society where participation in decision-making and opportunities for critical attitudes were present. Not the least, there was room for radicalism, and from Freire's perspective, the radicals were the subjects of history, as opposed to the oppressed who were regarded as objects of history, as their lives were governed by others (McLaren 1999). Where the authoritarians construct their own "truth," which is then forced upon others, the radicals seek to solve problems together with others and not for others.

Freire wished to do something about this and he saw possible solutions through pedagogy. He therefore developed educational programs to teach peasants to read and, as a result of he being appointed director of the Department of Cultural Extension of Recife University in 1961,

these programs were spread throughout Brazil (Roberts 2000). Although these programs were developed in order to learn to read, the underlying goal was to create an open society, free from oppression. Thus, Freire had to side with the weak and oppressed, so as to create space for critical awareness, which in turn would lead to a more humanized society (Freire 2013).

The New Media Age: Visual Illiteracy

There is of course a great deal of differences between Brazil in Freire's time and the new media age. Where the former society was characterized by closedness and totalitarianism, the latter is characterized by openness and democracy. Even though one can ask if there are any similarities between the two societies and eras whatsoever, such a claim might be supported.

To begin with, images influence the lives of children and young people to a great extent; they look at images, take photos, share photos, and give comments to images much of the day. With smartphones they shoot an enormous number of images, which are shared on social media, almost in the same instant as they are taken. Many young people share thousands of images over a year. The figures are almost scarily high, and there is almost no limit when it comes to sharing photos. This openness is virtually the opposite of what Freire witnessed in Brazil in the 1950's, as this society was characterized by closedness, rather than openness.

Still, there are some similarities between the two societies. That has to do with a typical behavior of many young people of today, i.e., they seem to think less and less about how their images look. Moreover, many young people are not aware of the power that is exercised through digital media and that such an exercise of power may have a profound influence on their lives (Maar and Burda 2004). Take Facebook as an example. People on Facebook often have many "friends," often several hundred. With so many "friends," one will easily lose track of who all these people are. Besides, others outside the "circle of friends" may easily get access to what is published on Facebook. The point being that users of Facebook are vulnerable. Moreover, the age limit in social media is set for 13 years, but it is not illegal for

children under 13 to be on Facebook or Instagram. These young users are particularly vulnerable. For example, imagine that a 13-year-old girl posts a picture of herself on Facebook. It is a so-called selfie. Her face is clearly visible in the picture and she makes a kiss mouth. Her intentions are innocent, but the 13-year-old girl has probably not thought about the recipients, or, rather, she has just thought that her selfie will be received by friends and acquaintances. What she probably has not thought of is that such an image may easily lead associations to something more than an innocent kiss. An imprudence may lead to an inadvertent invitation.

Another example is retouched photos depicting people as "perfect," for example, a picture of a slim and pretty girl, without any defects. Documentary photos in the media may serve as yet another example, where important events are clipped off. In both examples, the image is lying, and those who do not see through this lie can easily be fooled into thinking that reality equals that which is described in the picture. In other words, this receiver is deceived and therefore oppressed by the image.

To learn to understand images to a greater extent is clearly an advantage, in order to being able to use them in a good way. Not least, curricula need to focus on training in visual understanding. Today's children and young people need to acquire basic skills in the language they use every day, all the time. The challenge is that aesthetic skills have low status in today's society. Several Western curricula overlook not only images but also dance, theater, music, handicrafts, etc. As long as the curricula primarily focus on numbers and text, they help to oppress the language of image which young people use on a daily basis. Instead, the society entrusts the education and understanding of such a big part of being a social being to the children themselves. It may turn out well, but in many cases it does not. Thus, there is good reason to ask whether the curricula increase the risk of visual illiteracy among many young people.

What, then, does visual illiteracy signify? In short, a visual illiterate is one who cannot read images (Boehm 2007). Certainly, almost all people understand, at least to a certain extent, images,

just as most people can perceive the spoken language and understand that a dog is an animal or a rose is a flower. But although most people can talk and listen and understand, the Western schools usually emphasize that children must go to school to learn to read, write, and interpret texts, while developing knowledge about the history of literature. This is not the case when it comes to images, at least not to a large extent. Rather, skills in reading, writing, and arithmetic is considered to be of importance. The problem is that schools largely relate to an abstract world and little to the everyday lives of the pupils. For example, many curricula put emphasis on different ways to master poetry and equations, but this is not part of the daily lives of most pupils. As previously stated, the communication of most children and young people involve images, yet they do not learn to either create or interpret images at school. Neither do the pupils receive sufficient knowledge of the history of image at school. Accordingly, children and young people do not learn to read images the way they can read texts. That is basically the reason why children and young people of the new media age run the risk of being visual illiterates, a phenomenon that to some extent is comparable to the illiteracy that characterized the Brazilian farmers in Freire's time. The point is that the consequence of being illiterate, whether it is visual or linguistic, is oppression.

The Pedagogy of Freire Repeated

A good step in the right direction, when it comes to solving the problem of visual illiteracy, is to emphasize images in the curriculum. However, that is not enough. There is also need for a good pedagogy, and it is here that Freire's pedagogy of the oppressed is relevant. Henceforth, this contribution shall therefore begin by making a brief account of his main pedagogical perspectives, before relocating his pedagogy in the new media age where image plays a huge role.

Freire's Pedagogy

One of the reasons why Freire saw the need to develop a new kind of pedagogy was that the

traditional pedagogy posed many problems (Roberts 2000). The biggest problem was that pedagogy maintained the unequal balance of power in the Brazilian society. Through pedagogy, some decided and controlled, while some were governed and oppressed. For example, the relationship between teacher and pupil were asymmetrical (Freire 2005). While the teacher emerged as an authority, the pupils appeared as passive and manipulable objects. In other words, the traditional pedagogy consisted mostly in mechanical instruction, where control rather than freedom was prominent. As the pupils are controlled and converted into objects, while being manipulated in the direction that the teachers have pointed out, this pedagogy reminds us of the landowners who oppressed peasants for the sake of being wealthy. We are left with a dehumanizing pedagogy, where pupils adapt that which already exists (Freire 2014). Instead of being critical, the pupils are socialized into certain patterns and ways of living, without regard to their own world. Such kind of pedagogy does not lead to change for a better and more humane society.

Yet Freire saw opportunities for freedom through pedagogy. In working for a more humane society, pedagogy should, amongst others, create space for a dialogue between the pupils and their own world (Freire 2005). The teaching ought to start with problems that affect the pupils directly. The objective of this pedagogy is to open for critical awareness, including criticism of dogmas and accepted truths. At the same time, the pupils must be allowed to be involved in decisions about their own lives. As such, it will be possible for those who have been oppressed to enter the political life, which may be a way to change the world (Freire 2014). Instead of relying on an authoritarian relationship between teacher and pupil, Freire imagined that this relationship should be governed by a dialectical and dialogical relationship. To break out of an authoritarian relationship is possible when both parties are helping to solve a common problem.

Not least, pedagogy should allow for both reflection and action (Freire 2005). Through reflection the pupils can reflect on their situation in the world, and through action they can

intervene in the world, and possibly change it and making it more humane. For Freire, it is also important that the relationship between reflection and action, which constitute praxis, is dialectical (*ibid.*). A pedagogy without action will for him be considered as weak and powerless. At best it will maintain the status quo. Nor will it be of great help if actions take place without reflection, according to Freire (2005). In such cases actions happen on impulse, without any goal or intention. Thus, one may easily end in activism that is based on strong ideology and irrationalism. So, when the actions are not based on reflections, they may be characterized by power and authority rather than freedom. For Freire, this is a form of illegitimate praxis. Legitimate praxis, on the other hand, involves a dialectical relationship between reflection and action. In such cases, change without oppression may happen.

Freire's pedagogy of the oppressed aims at awareness, where the pupils initially realize that they are oppressed. The pedagogy is thus creating a movement that goes from a naive and unreflecting consciousness to a critical and creative consciousness (Freire 2013). For Freire this is legitimate praxis, in which the participants appear as subjects. However, this will not occur by itself. Above all, teachers should take responsibility for this to happen, which means that they must make room for active participants who will fight against oppression, as opposed to socially adapted individuals.

Overall, Freire developed a problem-oriented pedagogy, where the pupils were considered as subjects of their own world. Besides, and this is important, Freire did not perceive his own pedagogy to be final. For him, pedagogy had to be created over and over again, by way of a dialectical relationship between teacher and pupil (Freire 2005). Thus, Freire's pedagogy is always moving and changing.

Freire's Pedagogy in the New Media Age: Image Is Praxis

This openness makes it possible to place Freire's pedagogy in the frame of today's new media age. In this way Freire's pedagogy is repeated. While sticking closely to his pedagogy, trying to

preserve the same, something new and different do emerge, through the repetition.

As a first step of such a repetition, one should notice that Freire was preoccupied with the word. For him, the word meant praxis (Freire 2005). That is to say that the word must be supported by reflection, which in turn leads to action. While words without action will lead to nothing other than pure verbalism, i.e., a form of illegitimate thinking, words without reflection restrict the actions, leading up to pure activism, which is considered by Freire to be a form of illegitimate action. The consequence of both of these limitations is that the word loses its power. When the word corresponds to praxis, where reflection and action are key elements, it can change and transform the world.

One way of repeating Freire's pedagogy is to suggest that image means praxis. A slightly repetition of Freire thus states that image without action will leave us with nothing other than the language of image, while image without reflection will limit the actions, as, for example, the image runs the risk of losing its power in making the actions more humane.

But how can pedagogy make use of reflection when it comes to image? In many ways. One way may consist in the teacher having a dialogue with the pupils about images. As stated above, Freire suggested that the problems should be related to the pupils own experiences, and a good pedagogical method can therefore be to start the dialogue and reflection with images that have a special meaning for the pupils. Actually, there is empirical evidence that such a pedagogical approach can awaken something existential in pupils, something which has not been fully promote to consciousness (Saeverot 2015, p. 105). Thus, pupils can, by way of image and teacher as interlocutor, reach something that is important in their lives. The indirect way through the image initiates a reflection of the pupil, while the dialogue puts words on something that has been "there," but without being totally clear. Since the pupils have a central role in the whole thing, the free will may feel less directed from the outside. This corresponds well to Freire's idea that pedagogy must not be authoritarian in any manner.

But how is it possible to connect actions to image, first and foremost humane actions? One answer to this question is that certain images can have an awakening effect. Through image the recipients can imagine, and almost feel, the pain of others, whereupon the conscience becomes involved. A good example of this is found in another research project (Saeverot, in progress), where one of the pupils chose to reflect upon the now famous documentary picture of the three-year-old Syrian boy who shortly before his death said: "I will tell God everything." The boy is painfully aware that he will soon die, and listening to the trace of his words may be the closest one can come to feel his pain. The pain must be felt, as reason already knows that the boy is suffering. The reason also knows that innocent people die in Syria daily. Therefore, it will probably not be as powerful just informing the pupils about this, without image. It may be compared to informing someone of something which he or she already knows. What Freire's pedagogy aims at is to eradicate indifference. And image has the power to do just that, as it goes directly to the recipients' feelings and reaches out to the conscience (Boehm 2007), which may pull the recipients out of paralysis and at the same time awaken the state of passion. Thus, image is praxis, which in turn can realize Freire's dream of an increasingly more humane society.

Revitalizing Islamic Ecological Ethics Through Education

Najma Mohamed

Stellenbosch University, Stellenbosch,
South Africa

Introduction

For a growing number of environmental thinkers, the social and ecological malaise afflicting people and the planet remains among the defining challenges of the twenty-first century and presents a spiritual and moral, rather than a technological, conundrum (Tucker and Grim 2001; Gottlieb 2003). Religious traditions, for many the world over, still offers "the primary form of cultural conversation outside the modern story of economic growth and technological fixes" (Oelschlager 1996, p. 47) and represent a way of imagining (and living) an ecological future.

Religious traditions present a range of world-views, metaphors, rituals, knowledge conceptions, educational approaches, and a lived spirituality – of relevance to the environment. By way of its demand for radical transformation, religion could also "become a powerful alternative to modernizing and a powerful help for ecologizing, provided that a connection can be established (or rather re-established) between religion and *Creation*" (Latour 2009, p. 464). Engagement with the environmental narratives of religion – or its ecotheology, produces both ethical and educational visions which respond to the ecological question.

The theocentric ecoethics of Islam presents an environmental imaginary based on the sovereignty of the Creator, the responsible trusteeship of humankind and the intrinsic value of creation. Drawing upon these ecoethics, Muslims across the world are actively voicing their concern for the environment and harnessing the educational landscape of Islam as one of the primary conduits for environmental action.

Ecological Ethics in Islam

Muslim scholars and practitioners, while approaching the environmental question from different angles, refer to the relationship between humans and the environment as an ethical one (Nasr 1996; Ouis 2003; Özdemir 2008; Llwellyn 2003). The Islamic view on nature is neither ecocentric nor anthropocentric, but is essentially theocentric (God-centered) and is drawn from “dissected parts of Islamic theology, law and ethics, in outline form” (Izzi Dien 2000, p. 81).

Concern for the environment is deeply rooted in all fields of Islamic teaching and culture (Foltz 2005). Theological concepts, such as *tawhīd* (unity), *khilāfah* (trusteeship), and *‘adl* (justice), have been drawn upon to illustrate the Islamic ecotheology. Islamic ecoethics generally involves the extension of these broad principles regarding the nature, meaning, and value of the world and its creatures to the human-environment relationship (Izzi Dien 2000; Khalid 2002; Ouis 2003). The ecoethical principles discussed below foreground the fundamental aspects of the environmental narrative of Islam.

Tawhīd is often put forward as the key principle underlying the ecoethic of Islam (Khalid 2002). According to Manzoor (1984), this principle is the sine qua non of the Islamic faith and asserts that God is the absolute source of all values and also the Owner and Originator of the universe. All discussions of ethical conduct in Islam proceed from this concept since an understanding of the principle of unity impresses upon the hearts of Muslims “what moral conduct or normal behaviour should consist of” (Irving 1979, p. 2) and affirms the interconnectedness of the natural

order, the creation of One God. Indeed, it is *the* principle which gives the religion of Islam its distinctive morphology and makes the ecoethic of Islam wholeheartedly theocentric. This principle, which centers upon the Oneness of the Creator, spells out clearly that the Owner, Creator, and Sustainer of the entire universe is Allah. This principle has profound implications for the relationship between humans and nature since it “liberates the human mind from the false sense of autonomy or dominion over the Earth’s natural resources” (Goolam 2003, p. 266).

Humans have been appointed as trustees on Earth, holding it in usufruct, answerable for the just and responsible discharge of this trusteeship in accordance with Divine Laws. Trusteeship or *khilāfah* is further shaped by the belief that humans, in their servanthood, are accountable for everything in their care. True *khilāfah* is thus not about dominion, mastery, or control over any part of creation, but is centered on responsible trusteeship, cherishing and carrying out the capabilities entrusted to human beings with humility and obedience to the laws of the Creator as expressed in His Books and in creation. This principle, as discussed by Muslim environmental scholars, portrays men and women as trustees or stewards, who are provided with bounties that should be enjoyed within limits (al-Hamid 1997; Izzi Dien 2000; Özdemir 2003). *Khilāfah* is located within the framework of Divine Sovereignty, encapsulated in *tawhīd* and requires humanity to care gratefully for the environment that belongs to Allah and serves His Will (Timm 1990).

Creation (*khalq*), a term used to refer to the natural world here, is a reflection of divinely arranged structure and order. The value of the natural world in Islam can be condensed into three primary functions: Firstly, all of creation has intrinsic value and is regarded as signs or *āyāt* of Allah, worshipping and glorifying Him, even though humankind cannot perceive this. Secondly, nature has an ecological value as an integral part of the whole ecosystem, created in measure and balance (*mīzān*) by Allah. And finally, nature has an instrumental value to humans who hold it in usufruct. The Qur’an states

that the natural world has been “subjected” (*taskhīr*) or “constrained” by Allah for human use, but this does not entail domination, exploitation, or control of nature, but rather use of the Earth’s natural resources within the ethical mandates of Islam. Lubis (1998) considers these three functions in a hierarchical fashion with the intrinsic value of nature, as *āyāt* of Allah, as the *raison d’être* for its protection and conservation. The view that nature possesses value solely for human use has also been challenged by both traditional and contemporary scholars, and the primary reason for conservation of the natural world is often put forward as the sanctity of creation (Bagader et al. 1994; Izzi Dien 2000; Özdemir 2003).

Fasād features prominently in the ecoIslamic discourse. Translated as destruction, corruption, or mischief, *fasād* is said to apply to the realm of the environment as it does to any other part of life. It is the result of transgressing the limits as ordained by God – including those limits in the natural world so cogently captured in recent scientific thinking on planetary boundaries (Rockström et al. 2009). *Fasād* results from humanity’s “unwary interference with the natural laws and environmental systems” and “[e]nvironmental pollution, which is tantamount to the disruption of natural balance, is the main form of corruption on the earth” (Ghoneim 2000). This interpretation, of *fasād* as environmental pollution and destruction, is prevalent among many Qur’anic commentators. The environmental crisis is thus framed primarily as a failure of human trusteeship, where nature becomes the index of how well a particular society has performed (Ouis 2003; Setia 2007).

Corruption prevails in the land and the sea because of all the evil that the hands of humanity have earned—so that He may cause them to taste something of that which they have done—so that they may return in penitence to God. (The Byzantines 30, p. 41)

Humankind is called, in the above verse, to desist from polluting and destroying the earth. They are encouraged, in the same chapter, to turn back from evil toward their “innate” goodness, or *fiṭrah*, the primordial nature of

humankind. *Fiṭrah*, the concept of original goodness and belief in One God, incorporates not only “passive receptivity to good and right action, but an active inclination and natural innate predisposition to know Allah, to submit to Him and to do right” (Mohamed 1996, p. 21).

So set thou thy face steadily and truly to the Faith: (establish) God’s handiwork according to the pattern [*fiṭrah*] on which He has made mankind: no change (let there be) in the work (wrought) by God: that is the standard religion: but most among mankind understand not. (The Byzantines 30, p. 30)

When living in her original state of *fiṭrah*, a human being becomes the perfect *khalīfah*, believing in and submitting to her Creator and His Laws (Mohamed 1996). What implications does *fiṭrah* have for environmental concern? *Fiṭrah* is considered to be the natural state of humankind which is one of being in harmony with nature. Muslim ecotheologians argue that what is required is a “return” to this natural way of living – embodied in the teachings of Islam. The notion of *fiṭrah* is therefore in sync with the call by environmentalists to live with an understanding of the interconnectedness of everything in nature (Ouis 2003) – in accordance with their deepest human nature which is beautiful, harmonious, and right (Khalid 2002; Chishti 2003).

Boasting an extensive and growing educational establishment, both traditional and modern institutions, are playing a vital role in the educational life of Muslims the world over, including education about and for the environment. Environmental education, which assists in the actualization of the ethical mandate of *khalīfah*, is now regarded as a central component of Islamic education since it equips Muslims with the knowledge required to fulfill a religious obligation, environmental care (Al-Naki 2004; Haddad 2006; Abu-Hola 2009).

Ecoethics and Pedagogy in Islam

Among the definitive purposes of the educational process in Islam is to facilitate the trusteeship of humankind, who are charged with living in accordance with Divine Laws and securing the

common good, justice, and welfare of creation, *maṣāliḥ al-khalq*. Knowledge, which will assist humankind in exercising this vicegerency, reflecting the highest ethical values, is therefore required. These ethical horizons incorporate both the human and nonhuman worlds.

The acquisition of knowledge, regarded as an obligation and an act of worship which garners reward, must also manifest itself in action (*ʿamāl ṣālihāt*). Wan Daud (1989, p. 74) defines *ʿamāl ṣālihāt* as “all those actions that emerge out of and in conformity to, the Islamic worldview” and include “ritual obligations and other religious duties as well as efforts of personal or social significance,” including environmental care and action. This action-oriented epistemology and life-affirming spirituality of Islam necessitates the importance of being *in* history, concerned with securing the well-being of all creation (Kazmi 2000; Ramadan 2009).

Muslim educationists face the task of developing reflective and critical engagement with all knowledge (*taʿlīm*); nurturing mindful individuals who undertake responsible action (*tarbiyyah*); and inculcating the spirit of social activism (*taʿdīb*) which epitomizes the action-oriented flavor of Islamic pedagogy. Several writers have identified these three terms as central to the educational process in Islam (Cook 1999; Hussain 2004; Waghid 2010). In the discussion below, these terms are conceptualized in relation to environmental education.

Taʿlīm is derived from the Arabic word *ʿilm* and encompasses several meanings including knowledge, learning, and intellection. As described in the Qurʾan, *ʿilm* delineates a broad spectrum of knowledge, revealed and non-revealed. The Qurʾan also uses a variety of terms to denote the various methods of knowing such as “listening (in the sense of understanding), observing, contemplating, reasoning, considering, reflecting” (Guessoum 2009, p. 64). Islamic thinker, Al-Farābī (d. 950), suggests that *taʿlīm* incorporates student-centered learning and is an interactive process that involves both the teacher and the student, in which the teacher facilitates the student’s journey toward knowing, comprehension, and conceptualization (Günther 2006).

Taʿlīm is thus conceptualized as “deliberative and reflective engagement” and entails socializing the learner into an inherited body of knowledge, revealed and non-revealed (Waghid 2010). However, it also requires, of necessity, the cultivation of critical thinking, independence, and courage as demonstrated in the prophetic pedagogy. The implications of *taʿlīm* in constructing the ecological narrative of Islam thus requires that Muslims reflect and deliberate upon the inherited body of knowledge, the ecoethical principles in the Qurʾan and Sunnah, the legal instruments and institutions oriented toward environmental care, and critically engage with ecological knowledge in constructing an ecoethic which responds to social and ecological injustices.

The second concept, *tarbiyyah*, is derived from the Arabic root *rabā* which means to make or let grow, to raise or rear up, or to educate and teach a child. The derivative term *tarbiyyah* is said to refer to pedagogy, instruction, and education. *Tarbiyyah*, in the educational sense, is frequently used in reference to “nurturing and caring for children” and teaching them not *about* Islam, but what it means to *be* Muslim – the beliefs, values, principles, rights, and responsibilities and attitudes which a Muslim should uphold (Tauhidi 2001). The importance of *tarbiyyah*, seen as the social and moral development of the Muslim personality, is echoed by Hussain (2007, p. 300) who regards the “quintessential goal of moral education the awakening and proper situating of the inner being within a person.” Waghid (2008) also assigns to *tarbiyyah* the meaning of responsible action. As it relates to the ecological knowledge of Islam, *tarbiyyah* thus extends the process of engaging with the ecoethic of Islam (*taʿlīm*) toward actualization of this ecoethic in practice.

The concept of *taʿdīb*, as elaborated by Al-Attas (1979), denotes the final and critical aspect of Islamic education – social activism, the vital link between knowledge (*ʿilm*) and good actions (*ʿamāl ṣālihāt*). This concept entrenches the transformative objectives of Islamic education. *Taʿdīb* is drawn from the concept of *ʿādab*, meaning “a custom or norm of conduct passed through generations” (Douglass and Shaikh 2004, p. 14). It also refers to the recognition and

acknowledgement of the right and proper place of all things and beings – manifest in the condition of justice (Al-Attas 1979). *Ta'dīb*, according to Al-Attas, entails not only having the knowledge of the right and proper place of all beings in the universe, its *fiṭrah* and *mīzān*, but to strive to be in harmony with the entire cosmos – to not only live in a state of justice but to be active and willing participants in achieving this state. Waghid (2010, p. 246) argues that *ta'dīb*, as social activism or good action, has “emancipatory interests in mind, which can be made possible through a just striving which takes into account [and assures] the rights of others,” human and nonhuman.

These concepts constitute the basic tenets of introducing the ecoethics of Islam in the educational process: reflective engagement with all ecological knowledge (*ta'lim*), the Words and Works of the Creator; cultivating the qualities required to undertake responsible environmental action (*tarbiyyah*); and effecting meaningful and positive change (*ta'dīb*) for the environment in one's self and in society.

The growing ecoIslamic movement is slowly moving toward reflecting the liberating ecotheology of Islam which affirms that environmental care is a religious obligation, an act of spiritual obedience, and requires action to right environmental aberrations. It is beginning to evince the holistic epistemology which requires critical engagement with *all* existing knowledge, revealed and non-revealed, to understand and formulate a response to the ecological question of our time. And while it displays greater success in highlighting the need for responsible environmental action (*tarbiyyah*), it needs to improve both the knowledge acquisition (*ta'lim*) and social activism (*ta'dīb*) components of the environmental learning process (Mohamed 2012) in Islam.

Conclusion

As the world faces mounting environmental challenges, developing a response which directs humankind toward just and responsible action is imperative. Islam plays a pivotal role in shaping the worldview of more than one billion people in

the world today. Its environmental narrative presents not only an understanding of the natural world – an ethic which promotes just, respectful, and responsible interaction between humans and nature – but an educational philosophy which could propel Muslims to harness the transformative force of their faith to right the environmental aberrations in society.

Rhizoanalysis as Educational Research

Diana Masny

Synonyms

Actual-Virtual; Affect; Assemblage; Becoming; Rhizomatic Research

Introduction

In 1976, a tiny book, entitled *The Rhizome*, written by G. Deleuze & F. Guattari was published in French. It was later integrated as the opening plateau in the book *Mille Plateaux* published in 1980. From a concept of the rhizome emerges a concept of rhizoanalysis, a nonmethod in conducting educational research. Rhizoanalysis proposes to be different relying on its ontological force, transcendental empiricism, created by Deleuze and Guattari. Its originality lies in a decentered subject (human and nonhuman). It appeals to creativity, innovation, and becoming.

In the last century, structuralism was a significant philosophical and linguistic movement embedded in transcendent empiricism. It is a binary system (e.g., good or bad; literate or illiterate) associated with linear representation. Representation limits experience to the world as it is known to individuals, not as a world that could be. Linear representation assumes a world built on foundational knowledge that is taken up (re-presented) and created through symbols. Representation is something that can be directly experienced. Representation also considers that there is an object present but that it also has another meaning. For example, a daffodil in February represents awareness of cancer month.

Closely associated with representation is interpretation. Interpretation involves getting at the meaning of what something or someone represents. A metaphor can be considered an example of interpretation. However, Deleuze's renunciation of metaphor flows from some of the most fundamental commitments upheld throughout his philosophy: his rejection of the representational image of thought, his pragmatism, and his long-standing interest in the mobility of philosophical concepts (Patton 2010, p. 21).

... concepts involve two other dimensions, percepts and affects. ... Percepts aren't perceptions, they're packets of sensations and relations that live on independently of whoever experiences them. Affects aren't feelings, they're becomings that spill over beyond whoever lives through them (thereby becoming someone else)... (Deleuze 1995, p. 137).

Ontology

Deleuze and Guattari rejected transcendent empiricism in favor of transcendental empiricism. A binary system is unable to account for instability in systems. Deleuze in challenging the concept of binary systems such as those promoted by structuralism, for example, transformed ways of working with unstable systems. Regardless, there will always be a slippage, a line of flight (*ligne de fuite*). In this way, Deleuze and Guattari argued for an open system that appealed to instability, creativity, and mutation; hence, the importance of becoming.

They maintain their stance on anti-representation and anti-interpretation in that something (knowledge, perception) cannot be directly experienced. Deleuze and Guattari (1987) refer to interpretation as an illness, interpretosis. There is no appeal to interpretation.

... Actually, there is no longer any need to interpret, but that is because the best interpretation, the weightiest and most radical one, is an eminently significant silence ... (Deleuze and Guattari 1987, p. 114).

In addition to antirepresentation and anti-interpretation, other features of transcendental empiricism are immanence and difference, and subject decentering. They would be part of an assemblage, a key concept for Deleuze and Guattari.

Immanence and Difference

In keeping with transcendental empiricism, experience is not an event ascribed to the autonomous thinking subject. Deleuze and Guattari favored experience conceived in terms of the virtual thought of an experience, that of immanence (virtual-actual interaction). Here is an example. Two colleagues are walking along a corridor at school. The smell of coffee disrupts the conversation. What might happen next? The clock on the wall says it is 4 o'clock. Whatever has been going on has been disrupted. The rupture brings on a virtual thought of what might happen. It is asignifying. Potentially it actualizes by picking up a coffee and an impromptu meeting with the school principal at the coffee shop, returning to

class to correct class assignments, and perhaps going home. Where the smell of coffee might lead is unpredictable and not predetermined, perhaps to another rupture. A virtual-actual interaction (immanenc) repeats; however, the repetition is never the same. Becoming and difference: what it is/was could be no longer. In becoming, it is different.

Assemblage and Decentered Subject

The subject is decentered in that the subject becomes part of an assemblage (*agencement*). What is an assemblage? How does it function? What does it produce? Experience, presented earlier, is not grounded in the individual. The subject is decentered and connected to other elements in an assemblage. The elements in an assemblage are constituted nonlinearly and nonhierarchically. The example of coffee describes an assemblage consisting of connectivity between elements of content (clock, coffee machine, daylight, bodies walking) and expression (collective assemblages of enunciation). Deleuze and Guattari maintain that language is social and not individual and utterances reflect a dominant social order (Masny 2014b). However, the deterritorializing process opens up possibilities for extending experience in an assemblage. Collective assemblages of enunciation are considered a way in which speaking is expressed socially (e.g., order words, a clock expressing time, obligations) that disrupt/deterritorialize and in the process reconfigure the assemblage differently based on a relationality of the elements through affect. In this particular example, immanence emerges in situ. In other words, the virtual-actual interaction is made possible in relation to the disruption (coffee smell) that activated and disrupted (deterritorialize) the elements of content and expression and reconfigured the assemblage.

Rhizome

While the problem of closed systems might have contributed to creating an ontological concept of transcendental empiricism, Deleuze and Guattari were confronted with the problem of arborescence (the syntactic tree structures proposed by

Chomsky) which might have been a catalyst in creating the concept of the rhizome and promoting the rhizome as a horizontal system of thought.

Characteristics of the rhizome include: connectivity (“any point to any other point”), heterogeneity (“regimes of signs and nonsign states”), multiplicity (“neither the one nor the multiple. . .”), asignifying rupture, mapping, and decalomania. Each will be briefly explored for they set the stage for a rhizoanalytic inquiry that problematizes a received (conventional) view of qualitative methods and methodologies.

A rhizome connects from one point to another. The connections are heterogeneous. An example is the wasp and the orchid, a connection of animal and plant. A rhizome is made of plateaus.

A rhizome is made of plateaus. A plateau refers to “any multiplicity connected to other multiplicities . . . to form or extend a rhizome” (Deleuze and Guattari 1987, p. 22). A rhizome has neither beginning nor end. Its shoots spring from the middle and grow horizontally in no predetermined way. A rhizome is composed of “dimensions or rather directions in motion” (idem p. 8). There are no points or positions in a rhizome, such as those found in a structure, tree, or [vertical] root. There are only lines: molar lines, molecular lines, and lines of flight. These lines “are merely localizable linkages between points and positions” (ibid.). For example, molar lines are rigid/fixed. When a molar line ruptures, it emits a line of flight/becoming. It is an asignifying rupture on a plane of consistency and virtual.

A rhizome maps its lines, a map produced and constructed, “detachable, connectable, reversible, modifiable”. It has multiple entryways and exits. Mapping involves “experimentation in contact with the real (idem p. 12)” while tracing involves reproduction of itself. However, according to Deleuze and Guattari, it is important to “plug tracing back into the map”:

The orchid deterritorializes by forming an image, a tracing of a wasp; but the wasp reterritorializes on that image. The wasp is nevertheless deterritorialized, becoming a piece in the orchid’s reproductive apparatus. But it reterritorializes the orchid by transporting its pollen. Wasp and orchid, as heterogeneous elements, form a rhizome. (idem p. 10)

The importance lies in a deterritorialization and reterritorialization to happen and reconfigure the assemblage (*agencement*). A rhizome with all its lines constitutes an assemblage. It consists of content and expression that de- and reterritorialize. The assemblage brings together various elements not pre-established but rather on a relation to each other through affect. While a received view may consider an assemblage, it does not focus on the relationality of affect of the elements in the assemblage and how relationships of affect create different becomings.

Rhizoanalysis

Relevance

In rhizoanalysis, ontology becomes a significant force guiding a research inquiry. Rhizoanalysis is a nonmethod. What is presented in this section becomes one way to do rhizoanalysis in keeping with Deleuzian ontology. Accordingly, rhizoanalysis constitutes a radical departure from what might be considered the received view of doing research, that is, postpositivist and humanist research paradigms (subject centering, representation, interpretation, etc.) that have been critiqued (Masny 2013; Mazzei and Jackson 2012; St. Pierre 2014).

Deleuze studied life through problematization. How does a problem come about and what has a problem produced in becoming? Problems stem from experiences in life. A problem invites experimentation. Furthermore, problematizing creates concepts. Concept creation is important as it provides new directions for thinking. In this entry, a problem arises from experiences of conducting empirical research in education. The problem is one of incommensurability. The autonomous thinking subject grounds experience, in other words, attempts to fix (pin down) and predict what research observations and interviews as data mean through representation and interpretation. In contrast, Deleuzian ontology engages in a decentered subject, antirepresentation and anti-interpretation, immanence and difference. Such a perspective of reality combined with the rhizome, itself an assemblage, de- and reterritorializes

empirical research and creates a new concept, rhizoanalysis.

What Is Rhizoanalysis?

There is no one-way to do rhizoanalysis (Dufresne 2002; Fox and Alldred 2015; Olsson 2009; Perry 2013; Waterhouse 2011; Sellars 2013). Regardless, its analytic orientation to research is based on Deleuzian ontology and the rhizome (multiplicity, connectivity, heterogeneity, rupture, and mapping). Moreover, in its movement of horizontal lines/shoots, a rhizome is nonhierarchical. In other words, every element (connection) is equally important. One element enters into a relation with another element. The relationality is one of affect, becoming in the process of mapping connections of lines: molar (rigid), molecular (supple), and lines of light.

Research Assemblage

There is immanence, a virtual actual interaction during which an aspect of the research assemblage disrupts (e.g. interacting bodies) deterritorializes/virtualizes becoming asignifying and actualizes as rhizoanalysis. When there is an unpredictable event (such as incommensurability), ruptures in conventional research happen and emit lines of flight. The direction of actualization cannot be predicted. Rhizoanalysis through a research assemblage creates new connections through becoming. What emerges is a different way of doing research until an imminent event engages once more in a virtual-action interaction. What was a particular form of doing research could be no longer. It is different. It is difference that allows for creation and invention to happen continuously (Dufresne 2006).

As stated earlier, rhizoanalysis is an assemblage and connected to a research assemblage. What emerges is a particular view of rhizoanalysis. In what follows are examples taken from a research project involving rhizoanalysis (Masny 2013, 2015). The research project focuses on acquiring multiple writing systems simultaneously in multilingual children. How does the process of acquisition happen and what does it produce in becoming? Accordingly, the research assemblage consists of content (the school, the classroom, computer, lighting, etc.)

and expression (collective assemblages of enunciation, order words). These nonhierarchical elements and their relationality to each other through affect contribute to de- and reterritorialize the research assemblage. The elements in the assemblage are not predetermined. In this entry, Cristelle, a 7-year-old girl in the research study effects and is effected through a relationality of affects of the elements of which Cristelle is one in the assemblage thereby becoming.

In this project there were filmed observations in class that became a springboard for interviews subsequently transcribed. The transcriptions do not undergo coding and are antirepresentational. In other words, the transcripts are not representations or a copy of the interview. Particular parts of the interview conceptualized as vignettes become the focus for analysis. The mind is not responsible for selecting vignettes even though the experience of connectivity takes place in the mind. Rather it is within a research assemblage, including observations that rhizomatic ruptures happen and with the power of affect flowing through a relationality of elements in the assemblage, vignettes emerge. Vignettes emerge based on the power of affect to flow through the assemblage and be affected by the assemblage. Vignettes deterritorialize and take off in unpredictable rhizomatic ways and reterritorialize creating new territories (e.g., video-vignettes, analytical vignettes, Masny 2015). Regarding analysis, the issue of data has been ongoing. Some researchers (St. Pierre 2014) critique what data do when connected to the received view of empirical research. In this entry, data have undergone deterritorialization and reterritorialized as palpation. Data in the received view are directly experienced. In rhizoanalysis, data have actualized as palpation that which cannot be directly experienced. Palpation (May 2005) will be explored further.

What follows is a research project that takes into account transcendental empiricism and the rhizome. Both govern rhizoanalysis and also promote the use of:

1. The infinitive invoking the prepersonal with the absence of subject and object; the infinitive speaks to events yet-to-come.

2. Indirect discourse decentering the subject.
3. A collective assemblages of enunciation (there is no first person pronoun) which speaks to the social nature of language, one in which reality is organized according to a dominant social order.
4. Problematization eliciting questions. Questions become responses to problems, “a useful way to suspend or resist this tendency to actualize-fix the virtual-problem as solutions-interpretations-recommendations” (Waterhouse, personal communication). Questions might elicit further problematization. As well, questions become a way to respond to data that cannot be directly experienced.

In an interview, Cristelle and the researcher were going over a riddle activity in class the previous day. She stated she did not enjoy the activity. She liked recess. She can play. She also liked drawing. When asked what activities she liked in class she answered that there was “none.” What happens then when asked to do activities in class she does not like? She replied that she “must do it.” The researcher inquired if she liked writing. She replied “no, it’s boring”, “everything is boring”.

With these vignettes, how do blocs of sensation flow through connecting relations that include Cristelle in the assemblage? The assemblage consists of content (Cristelle, the researcher, the video, the activities, the teacher, classmates, curriculum, the physical layout of the classroom, etc.), expression (collective assemblages of enunciation, order-words such as drawing after writing, curriculum), deterritorialization (becoming), and reterritorialization (new/different concept). The coming together of connecting relations in an assemblage is unpredictable, not pre-given, and formed at a particular moment in time and space. [A rhizomatic assemblage of connectivity, heterogeneity, multiplicity, decentering subject]

Cristelle stated that she must do the activities even though she does not like them. Is it the power of domination (*pouvoir*) through order words? Institutionalized power (*pouvoir*) in a rhizome consists of a molar (rigid) path that nevertheless ruptures and emits a line of flight. Is it a power of

becoming (puissance), an immanence (virtual – actual interaction), a potential for transforming and becoming? Herein lies perhaps the untimely of power and becoming. Do order-words constitute rigid institutionalized spaces (molar lines)? It appears that collective assemblages of enunciation and order-words such as planned curriculum that position recess and drawing relate to a power of domination (*pouvoir*). However, there is also the relation of elements in an assemblage that through the power of becoming (*puissance*), recess, and drawing become different (undergo transformation). What might happen? Questions emerge from a problem. In addition, questions might elicit further problematization. As well, questions become a way to respond to palpated data, data that cannot be directly experienced.

In the received view of qualitative research the problem stated at the beginning of a research project is followed by research questions. Questions are formulated with the aim of finding solutions. Taken-for-granted assumptions of research tools merit problematizing. In rhizoanalysis, conventional coding, problem, and research questions deterritorialize only to reterritorialize as problematization and questions formulated as responses in order to disengage from interpretation (interpretosis) and encourage concept creation. There is no appeal to interpretation, simply raw tellings. In other words, to interpret/explain is to judge.

From a rhizomatic perspective, representational data emit lines of flight, a becoming–problem that deterritorializes data, becoming other in response to what it is not, difference and palpating data. To palpate data and construct questions from data open to the problem of how data function and what data produce.

With rhizoanalysis, we are in the realm of the empirical, but not of the representational kind. Empirical representation of data relies on direct observable experience supplemented by rich and thick descriptions and member checks, and inviting interpretation through empathy (Masny 2014a). Representation and interpretation go hand in hand in conventional qualitative research. Through rhizoanalysis, representation and interpretation deterritorialize and reterritorialize as

antirepresentation and anti-interpretation. There is no direct experience of data. In other words, the research assemblage is not limited to what a researcher generates by way of interpretation based on the data before her/him. Immanence and difference extend experience of rhizoanalysis beyond what is to what might be.

Intermezzo

In education, there are many approaches to research. Rhizoanalysis is one that relates to an ontology proposed by Deleuze and Guattari (subject decentering, antirepresentation, anti-interpretation, immanence, etc.). Rhizoanalysis has its specificity, an opportunity to experiment with the unknown, the unpredictable, and the nongiven. Rhizoanalysis is able to respond to the instability that presents itself in the world.

This position stands in contrast to problems “given ready-made” that disappear in the responses or solutions (Deleuze 1997, p. 158). This is not Deleuze’s position. He has set about to problematize a situation emerging out of life’s experiences to create questions that open up discussions that might lead to further questions and discussions “in which there are many possible solutions each of which captures something, not everything, put before us by the problem” (May 2005, p. 83). As May (2005) suggests, Deleuze has put forward an ontology of problems. Perhaps it is an invitation to jettison ontology of problems as a driving force in rhizoanalysis for it can provide an interesting alternative to conventional subject-centered educational research.

Rodríguez, Simón

Maximiliano Duran

Universidade do Estado de Rio de Janeiro – FAPERJ, Rio de Janeiro, Brazil
Facultad de Filosofía y Letras, Universidad de Buenos Aires, Buenos Aires, Argentina

Introduction

Simón Rodríguez's writings are within the richest and most powerful in the Latin American nineteenth century. Over his entire written works, Rodríguez maintains an absolutely novel concept regarding popular education. Through this idea, the author denies the very identity principle of each educational institution of the time. The Latin American school in the mid-eighteenth century and early-nineteenth century consists of a diverse group of schooling institutions. Each one accepts within a determined kind of population according to certain identity criteria established by a caste system. In this context, different schools are created throughout the colony for the castes that comprise the Spanish Empire. Schools for rich white boys, for poor white boys, schools for girls according to their stratum and social place, schools for boys part of the natives' nobility, for the children of common natives that could not show nobility by birth, schools for mestizos, and schools for orphans (Gonzálbo Aizpurú 2005; Querejazu 2012). Admissions, as well as the contents taught in each one of them, were determined and oriented according to the identity of the school population for which they were conceived. Thus, we could say that the school environment is structured on the basis of a complex class

interaction system built over the principle of identity. Each one of these schools requires this principle as a condition for admission and accepting of a student. Thus, educational institutions ensure the preservation and replication of a determined social and political order typified by a division in hierarchies of the people that comprise it. This system did not experience significant variations during the early years of the republic and most of the nineteenth century. The idea of popular education coined by Rodríguez breaks with this schooling order as it entails the unfolding of a radical equalitarian principle, powerful and unknown until that moment. Rodríguez's *Popular Education* not only denies the identity principle held by the rest of the institutions, but it also affirms a completely different principle from which to open new paths to consider education for the people of America. Based on this concept, the author develops an educational project unprecedented in the continent. Rodríguez upholds an educational project that is equalitarian, welcoming, and irreverent. *Popular Education* regarding Rodríguez's work affirms equality as a starting point for each and every one of his students. According to this point of view, no student is worth more than the other. His schools have no distinctions regarding caste, creed, lineage, or sex. They are all equal. It is on this statement that the welcoming feature of popular education is based on. According to Rodríguez, every boy and girl in the city enters school without any identity requirements. Unlike traditional schools, which have strict admission criteria based on the students' identity, Rodríguez unconditionally opens his school to all children in the city. Finally, the irreverent feature of popular education lies precisely in the fact that, within it, respect is not based on fear, distinctions, or superiority of any kind. Given the equalitarian and welcoming features of popular education, no kind of subduing is allowed within.

Popular Education, the Philosophical Name of a Novelty

The Bolivian city of Chuquisaca was an area ruled and structured in hierarchies. The system of

division and classification of human beings based on an alleged racial composition was in full force in the early-nineteenth century. Its schools were a reflection of the city and the system. Rodríguez broke that order by creating and spreading an equalitarian principle implied in the inclusion, in the same classroom, of all children as equals.

"Education for all, because they are all citizens" (Rodríguez 1999, p. 284) is the representation of this statement which meant the dissolution of an unequal environment and the opening of another environment in Chuquisaca and Latin America. In *American Societies in 1828* he wrote on this matter. There, he states "... even if work is done to remove from peoples the idea they have on their fate, nothing can be accomplished unless they feel the effects of moving" (Rodríguez 1999, p. 271). From his point of view, equality and inequality of the people rest, ultimately, in the choices each person makes to that respect and their consequences. Thus, his "Education for all, because they all are citizens." Such statement assumes, unlike educational projects of the time, that citizenship, understood as a political concept that expresses equality among men and women, can be found in the very beginning of the schooling process. It is not a school that creates citizens, but one that affirms their opportunity. All children of the city, boys and girls, are citizens, are equal, and are therefore admitted to the new school.

Equality in Rodríguez's school is axiomatic in nature for it takes root and follows the logic derivative of its consequences. In other words, it is a constant claim from which a coherent practice emerges. It is a statemental dimension and not a program. For Rodríguez, equality is not something to be attained in the near future, but a part of the order of what is. It constitutes an appearance in an environment where inequality prevails and he upholds the abolition of that very environment along with the chance to create a new one.

Rodríguez's school, in its equalitarian claim, not only allows any and all to enter but provides time for studies to those who, until then, had to use it to work. Time off from social and work duties is offered in a radical and unconditional manner

there. Unlike other schools which offer free time to those who already have it by birth, money or gender, Rodríguez's school provides it for all based on the aforementioned principle of equality.

Such a gesture is unprecedented in Latin American education. So novel was the action taken in Chuquisaca that the common educational knowledge of the time was insufficient to name what took place. Authorities and local oligarchy employed terms such as "place of doom," "brothel," "whorehouse," "stunned Frenchman," "madman," "nun kidnapper," and "child corruptor" to talk about the school and the teacher. They never used educational concepts or any other knowledge related to the school.

Rodríguez was aware of the novelty that took place in Chuquisaca. What happened in his school was different from any other known school. New concepts were required to name what took place there. In this sense, he wrote "all foundations are pious... – some for foundlings, others for orphans, others for noble girls, others for sons of the military, others for the disabled... in all of them charity is mentioned: they were not made for the common good but for the salvation of the founder or the flaunting of the Ruler" (Rodríguez 1999, p. 358).

For him, common knowledge from institutional schools was not appropriate to show what happened in Chuquisaca, precisely because his project was something completely new for the political and social situation in which it was applied. In his own words "the establishment set in Bolivia is social, its combination is new, in a word it is the Republic" (ibidem). It was necessary to create a concept that, up to that point, escaped any educational terminology. His call to philosophy may be read in this sense. In *American Societies* he wrote "public teaching in the nineteenth century asks for a lot of philosophy: common interest claims for a reform and... America is called, by the circumstances, to undertake it" (1999, p. 234).

The school, his school, needs philosophy. For Rodríguez there is a close relation between theory, concepts, facts, and life in general. In the case in point, philosophy thinks, argues, criticizes, and conceptualizes what took place in his school. It

is the ground for his decision to break apart from the traditional educational order and creating a new one. Ultimately, it is that through which Rodríguez justified a way of acting and living (Kohan 2014). According to his interpretation of American reality in his school in Chuquisaca, a problem existed for which there were no proper concepts to notice it. The presence of boys and girls from the different castes as equals created a political anomaly within education. That is to say, something new and unnamed was introduced from a decision. This incursion opened a new setting that was unthinkable with the concepts and teaching methods of the time. New concepts were required as well as the commitment to uphold them before the battering of tradition and conservatism.

Popular education in Rodríguez's work fulfills that double role. On the one hand, it is the philosophical name through which Rodríguez conceptualizes this dimension of equality materialized in the presence of all the boys and girls of the city in his school. It is a theoretical construction from which he shows a decision that guided the rest of his life and constitutes the strongest invention of his ideas. It was a new concept that showed a new school in America. A public, equal, irreverent, and welcoming school. One that "combines knowledge and life, one that teaches people how to live, which means teaching them how to be active, animated, self-sufficient people" (Kohan 2014).

Militant Life: The Popular Teacher

On the other hand, *Popular Education* is an expression of a militant life. That idea is shown through his whole life as the foundation of any emancipation process of the people, for the people, and by the people in a radical and intransigent manner. Beyond relevant conveniences, Mr. Simón upheld *Popular Education* in each and every action and place. He always argued, debated, wrote, and proposed *Popular Education*. In his last writing *An extract from Republican Education* (Rodríguez 1999) published between April and May in 1849 in *Neo Grandino*, it is

possible to clearly see this committed gesture that supports a way of life dedicated to equal education for all. In the beginning of this text published six years prior to his death, he writes: "I have been talking and writing both publicly and privately about the republican system for twenty-four years, and the fruit of all my good actions has been the title of MADMAN" (225). Failure, mockery, ostracism, and coldness had been his companions since the failed experience of Chuquisaca. Few were those who listened to him, even less those who read him. The only appeal the old philosopher showed, walking erratically through the American continent, was the title of "teacher of the liberator." Everything showed the most definite failure of his ideas. Rodríguez himself seemed to confirm it in his writing. However, it is not so. The text continues, the paragraph ends in a fiery, challenging, potent, and why not, militant statement. Rodríguez, exhausted and full of failures upon him raises his pen once more and writes: "Children and madmen speak the truth" (*ibidem*). Far from quitting, changing, or betraying his ideas, he raised the odds and claimed them as truths.

This project of *Popular Education*, which Rodríguez puts into practice and defends during his whole life, is a revolutionary invention in the Latin American nineteenth century. Within it there is a new meaning to the position of those teaching, learning, and of what is taught. In relation to those learning, as we have said, the basis is equality as a true fact of reality. This simple fact is carved in a devastating manner within a tradition that wants to remain and blows it away. As for content, Rodríguez's work does not provide a body of specific ideas and doctrines to be taught or learnt beyond setting relations between work, political life, and knowledge. The only possible exceptions are some remarks in *Friendly advices to the School of Latacunga* (Rodríguez 1999:) and a comment to the note in page number 10 of *Defense of Bolívar* (Rodríguez 1999). Finally, the standpoint of the person who teaches is reimagined from two models of teaching: the horn teacher (Rodríguez 1999, p. 233) and the teacher that makes knowledge available to all (Rodríguez 1999, p. 63).

The horn teacher is the teacher that comes from tradition, concerned with dropping knowledge foreign to the art of living. They are people interested in their own knowledge, with no sensitivity for others' feeling, thinking, knowing, and living. For this he writes: "as proof that hoarding knowledge alien to the art of living nothing has been made to shape social behavior – observe how many spoiled wise men inhabit the land of sciences" (Rodríguez 1999, p. 104). They are individualistic wise men that can do little for thinking, creating, and developing a school that teaches how to live as the popular school intends.

As an answer to horn teachers, Rodríguez places the *teacher of all*, the *popular teacher*. For Rodríguez, the popular teacher that inhabits the new school is the one concerned with making knowledge available to all. Unlike the horn teacher, locked within himself, the popular teacher is one that volunteers unconditionally to his students and their needs with the aim to "INSPIRE some, ROUSE others, the DESIRE of KNOWLEDGE" (Rodríguez 1999, p. 17). He does not provide a particular knowledge but is concerned with teaching how to learn. He creates in his students a different relationship with knowledge and its output, places them as beings capable of understanding, questioning, and creating knowledge relative to the life each person wants to have. To summarize, as Kohan says, the popular teacher: "is he who creates in others the desire to understand and transform his own and others' life" (Kohan 2014).

These notions of *education*, *school*, and *popular teacher* are materialized in the city of Chuquisaca with Bolívar's support. The project only lasts a few months. The oligarchy in the city spread a series of ill intended rumors regarding Rodríguez and his work. These defamatory statements come with a series of disagreements with the government of the Republic which caused Rodríguez's resignation to his position and the closing of the school. A few months after leaving his position, Rodríguez left the Republic of Bolivia and set on a journey that would take him through Chile, Ecuador, and Peru.

As he did in Europe, everywhere he went he worked as a teacher. Always in the company of

two trunks where he kept his writings, he traversed different countries communicating his idea of a school for all. He practically lived in misery. He never accepted charity; he only asked for work. Ever faithful to his ideas and friends, he tirelessly repeated the need for a popular education project.

Eventually, he managed to publish his writings with little success. Most of them were partially published and distributed in installments. In the city of Arequipa, he published an early version of what would later be *American Societies in 1828*. In 1830, he publishes *The liberator of America's noon and his brothers in arms defended by a friend of the social cause* and *Comments on the land of Vincocaya in relation to the endeavor of deviating the natural course of its waters and drive them through the Zumbai River to Arequipa*. In the city of Concepción, Chile, he published *Social lights and virtues* for the first time in 1834. He published *Social lights and virtues* in the city of Valparaíso, Chile, in 1840. That year, in the same city, he published a series of eleven articles in the newspaper *The Mercury* entitled “Parties” along with an “Extract to the Defense of Bolívar.” In the city of Lima, Peru, in 1842 he published the second edition of *American Societies in 1828. How will the coming centuries be and how they can be*. In 1843, he published six issues of a work entitled “Critics to the Measures of the Government.” In Bogotá, the newspaper *The Neo-Granadino* published in issues 38, 39, and 40 during April and May 1849 “A short extract of my work on Republican Education.” This is his last publication while he was alive.

Exhausted, practically forgotten by all and very ill he arrived to the town of Amotape. The town priest, regarding him as a heretic, did not grant him entrance. He was forced to stay in a ruined house in the outskirts of town. He was accompanied by Camilo Gómez. The next morning the priest was asked to come to the bed of the teacher who is at death's door. He finally died in the Peruvian town of Amotape on February 28, 1854. Some biographers tell that in his death-bed, instead of confessing and requesting the last rites from the town priest, Rodríguez decided to perform a materialistic dissertation in which he

recalls the Oath Bolívar had made before the teacher not to rest until the continent was emancipated from Spanish power. According to those who support this version, the last Rodriguean gesture is proof of his faithfulness to the promise of liberation to which he dedicated his life. It is true that there are no solid data that may confirm this version. However, his writings, along with all biographic documents kept are more than sufficient evidence of the strength, courage, coherence, and creativity of a man who, with his way of life, transformed education in his time.

Role Model

► [Quest for Heroes](#)

Rorty, Richard (1931–2007)

Kenneth Wain
University of Malta, Msida, Malta

Richard Rorty's (1931–2007) autobiographical article “Trotsky and the Wild Orchids” (1992, henceforth TWO) described his philosophical education and intellectual journey up to the writing of his last and controversial “philosophical” book *Contingency, Irony, and Solidarity* (1989,

henceforth CIS). (Rorty's last book is really *Achieving Our Country*, published in 1998, but he described it specifically as a "political" rather than a philosophical book: "The book does not deal with philosophy at all. It's just a political polemic" (2006, p. 88). His volumes of collected essays and papers, and his interviews and participation at symposia are not here included among his books.) The article described his early life and upbringing in his bourgeois family home in New York where his parents were Trotskyite political activists and where the discussion of revolutionary left-wing literature and politics were the order of the day. There, he says, he learned "that the point of being human was to spend one's life fighting social injustice" (1992, p. 142). The article also referred to his youthful predilection for taking solitary walks in the mountains of north-west New Jersey and becoming inexplicably but profoundly enamored of the study of "socially useless" wild orchids (1992, p. 143). In later years, as a philosophy professor at the University of Western Virginia, before he wrote TWO or CIS, he summarized his political and philosophical outlook at the time as "bourgeois," "liberal," and "postmodernist." Earlier, in *Postmodernist Bourgeois Liberalism*, he had identified himself as one of "us postmodernist bourgeois liberals," using the term "postmodernist," he said, in the same sense as Jean-Francois Lyotard's (1979/1999) to signal a "'distrust of metanarratives,' narratives which describe or predict the activities of such entities as the noumenal self or the Absolute Spirit or the Proletariat" (1983, p. 585).

Subsequently retracting on being "postmodernist" because Lyotard's book "did not succeed in giving the term a useful sense, nor have later attempts," to do so, he said that he "would prefer to talk about Foucault, Derrida, and the rest individually rather than try to lump them together as representatives of something called postmodernist philosophy" (2006, p. 95). In TWO he summarized the work of these philosophers as "philosophically right though politically silly" (TWO 1992, p. 152). The judgment that they were "philosophically right" signaled his broad but consistent identification with the post-Nietzschean/post-Heideggerian philosophical platform the

philosophers shared and which is often signified by "postmodernism." The "politically silly," on the other hand, signaled his radical disapproval with their politics which he regarded as still saturated with a "repellent Parisian world-weariness and hopelessness, as well as with leftover Marxist cynicism about gradual, non-revolutionary reform" (1990a, p. 44). *Philosophy and the Mirror of Nature* (1980, henceforth PMN), the book that first brought him his real fame, marked his critical break with the analytic tradition within which he had been educated and had worked as a philosopher. There he identified his philosophical outlook with that of Dewey, Wittgenstein, and Heidegger who he described as the great "revolutionary" philosophers of the twentieth century and whose merit it was to break free "from the Kantian conception of philosophy as foundational" which had held their earlier writings captive and to embrace instead a philosophy which was "therapeutic rather than constructive, edifying rather than systematic, designed to make the reader question his own motives for philosophizing rather than provide him with a new philosophical programme" (1980, pp. 5–6).

PMN was written to carry out the same therapeutic work on analytic philosophy with the view of contributing to the three philosophers' basic agenda of undermining what he called Cartesian/post-Kantian "epistemological foundationalism." This he defined as the claim made on philosophy's behalf to be the guardian of culture, underwriter of the knowledge claims of science, and "the notion of the philosopher as guardian of rationality" (1980, p. 317). A claim made good by its special expertise in epistemology. The book proposes abandoning these hegemonic claims, abandoning epistemology as a project of commensuration to bring all knowledge claims under a common set of rules, and filling the "cultural vacancy" thereby created with "hermeneutics" conceived "largely [as] a struggle against this assumption." Not as epistemology's "successor subject" but to signal the end of the need for such a subject (1980, p. 316). Hermeneutics would be content to replace epistemology's ambition for truth with that for temporary agreements. Its purpose would be *edifying* rather than systematic, its intellectual culture

conversational rather than truth-tracking. Its politics would be akin to those of a Deweyan democratic community where the conversation needs no grounding in an “antecedently existing common ground” to achieve its consensus (1980, p. 318) but is conducted “within an agreed-upon set of conventions about what counts as a relevant contribution, what counts as answering a question, what counts as having a good argument for that answer or a good criticism of it” (1980, p. 365). A hermeneutic conversational intellectual and political culture would have no need for “systematic” thinkers or “systematic philosophy” conceived as a *Fach* or discipline and engaged in a “project of universal commensuration” (1980, p. 371). It would need no overarching, hegemonic, metanarrative to bring all the smaller local narratives together under one truth discourse. The only sense whereby its conversation would be systematic is that it would accord with the community’s conventions worked out democratically through the same conversation. “Being hermeneutic with the opposition” for such a democratic community would be about showing “how the other side looks from our own point of view . . . how the odd or paradoxical or offensives things they say hang together with the rest of what they want to say, and how what they say looks when put in our own alternative idiom” (1980, pp. 364–365).

The aim of “edification,” of “edifying philosophers,” Rorty says, is “to help their readers, or society as a whole, to break free from outworn vocabularies and attitudes” (1980, p. 12). It thus corresponds with “Gadamer’s romantic notion of man as self-creative” (1980, p. 358), substituting “the notion of *Bildung* (education, self-formation) for that of ‘knowledge’ as the goal of thinking” (1980, p. 359). Rorty chooses the term for “this project of finding new, better, more interesting, more fruitful, ways of speaking” rather than “education” because education, he says, “sounds too flat,” too unexciting (1980, p. 360). Because “self-formation” is more suggestive of what he has in mind than “education” which is more associated with the transmission and acquisition of knowledge, whether the “self” in question is an individual intellectual self or the collective democratic

self of a community. The promotion of edification opposes the educational “to the epistemological or the technological, point of view,” with the specific understanding of the educational conceived as edifying (1980, p. 359). In *Consequences of Pragmatism* (1982a, henceforth CP), Rorty describes the presence of all-purpose intellectuals in the community and educated public, who would replace the philosophers as the protagonists of this hermeneutic, “post-philosophical,” intellectual culture, who were specialists not in truth but “in seeing how things hung together,” who had “no special ‘problems’ to solve, nor any ‘method’ to apply, abided by no particular disciplinary standards, had no collective self-image as a ‘profession’,” and who were “ready to offer a view of pretty much anything, in the hope of making it hang together with everything else” (1982a, p. xxxix). Earlier in PMN he had also described what he called the “inverse of hermeneutics” as “the attempt to reinterpret our familiar surroundings in the unfamiliar terms of our new inventions . . . to take us out of our old selves by the power of strangeness, to aid us in becoming new beings” (1980, p. 360). In other words, differently from the edifying language of a hermeneutic culture, its language is poetic, and his reference to it in the book anticipates a much stronger characterization of individual self-formation later in CIS in the figure of “the strong poet,” which will be returned to later.

In 1982, the same year that he published CP, Rorty published an article specifically on university education named “Hermeneutics, General Studies, and Teaching.” There he defines hermeneutics more simply as “anti-Platonism,” and Gadamer is still his “principle example of a ‘hermeneutic’ philosopher” (1982b, p. 2). Dewey, whose influence was written large in CP, is linked with Gadamer in the sense that, Rorty says, for both “human experience is ‘essentially linguistic’” (Gadamer, *Philosophical Hermeneutics*, p. 19) (1982b, p. 3) and in the sense that both identified the same “educational problem,” for the university, namely, “finding a way to guide students between the Scylla of Platonism and the Charybdis of vulgar relativism,” between the “reliance on a God-surrogate and on one’s

individual preferences,” and their answer is also similar; to put one’s reliance “on the common sense of the community to which one belongs” (1982b, p. 6). The essay then takes up the question: “what educational apparatus could be relied on to provide such a sense?” (1982b, p. 6). It criticizes the way humanistic and scientific education are distinguished and opposed to each other and wants to conceive university education as one into “great books” that put us in touch with great minds (as against, with respect to science, into a “scientific method” that can put us in touch with the nature of things). Students should be taught to read the books “as vehicles of *Bildung*, of the self-formation of the race, rather than as means for escaping the human condition by grasping eternal Truths.” In a manner such as to arrive “at a sense of human community, and of this community as foundationless, supported neither by science nor by history” (1982b, p. 9) and nor evidently by philosophy either. The scientific culture to promote this reading would be Kuhnian, the historical Nietzschean. The object of reading the books would be to “give students a chance for intellectual-hero worship by letting them see intellectual greatness as greatness at overcoming problems” (1982b, p. 10).

The historicist thrust of this educational program would be how the threat of vulgar relativism is defeated. Rorty refers to it as “liberal” and expresses his fear in the essay that it could be lost to a purely “vocational” one as “the fear that the student will never have heroes, will never fall in love with anything . . . will never ‘use his mind’, have his higher faculties awoken, utilize the better part of his soul,” hence “he” will be incapable of identifying with “his” humanity or of engaging in critical reflection on his society’s beliefs (1982b, p. 10). Nor does such a liberal account of an educational program signify some descent into irrationality or intellectual anarchy or lead us “to give up the notion of a ‘core curriculum,’ of ‘a body of knowledge common to educated men.’” On the contrary such a core is needed to prevent the “love affair” from being narrow and obsessional, “to make sure no student has only *one* hero, and that there is enough overlap between the students’ *sets* of heroes to permit the

students to share their romantic sensibilities, to have interesting conversations with one another” (1982b, p. 11 emphasis in original). “To pick a core curriculum,” Rorty continues his account, “is, therefore, to pick a community,” and the teachers suited to teach it would be those “whose sense of participation in the community – and thus whose sense of the point of their own lives – is somehow bound up with reading the books, or performing the activities, which they have picked for the ‘core’” (1982b, p. 12). Their teaching, he adds, should be seductive rather than instructional: an invitation to join a community of problem solvers “united by the romantic sense that solving these problems is the point of living” (1982b, p. 13).

Shortly after the appearance of CIS, in the early 1990s, there were a number of philosophers who speculated differently on the educational significance of his philosophical work (see Nicholson 1989; Arcilla 1990; Neiman 1991; Hostetler 1992; Wain 1995). But his response to them was far from encouraging. He replied by warning against what he described as “the danger of over-philosophication” in education, stating that he was “dubious about the relevance of philosophy to education, for the same reason that I am dubious about the relevance of philosophy to politics” (1990a, p. 41). (Arcilla (1995) himself subsequently wrote a book about Rorty and education, *For the Love of Perfection: Richard Rorty and Liberal Education*, Routledge (NY, London).) The statement which casts doubt on the very legitimacy of the philosophy of education is consistent with his attacks on philosophy as an academic, professional discipline in PMN and CP where, as we saw above, he supported the emergence of a new post-philosophical hermeneutic intellectual culture. Earlier than this short article on “over-philosophication,” in an invited address to the American Association of Colleges published in 1990 also titled “Education Without Dogma 1999,” he had dismissed what he termed the long-standing intellectual debate between left and right over whether education is properly about truth or freedom (the sort of debate, he said, Dewey had described as pointless) as a waste of time rendering the issue more complicated and

intractable than it needed to be. Thankfully, he claimed, the stakeholders had moved on and resolved the issue pragmatically by accommodating the purposes of truth and freedom within different processes of education and in different institutions, the first in “lower education” (i.e., primary and secondary schooling) which “is mostly a matter of socialization, of trying to inculcate a sense of citizenship,” the second in “higher education” (i.e., the nonvocational university), which is “mostly a matter of individuation, of trying to awaken the individual’s imagination in the hope that she will become able to re-create herself.” He wasn’t sure, he had concluded in this article written and published in the same year, “that philosophy can do much for any of these enterprises,” which was exactly the same point he made in his other 1990 article (1990b, p. 41).

This abjuration of “philosophy” does not mean that there is nothing about education in CIS, quite the contrary. But there is no reference in it at all to Gadamer or a hermeneutic culture nor to edification or the politics of conversation. The language at work in the book is of contingency and irony instead, and its politics are those of a liberal utopia. The education of the individual is now not about an edified “self-formation” but about the self-creation of the strong poet, who is “the maker” rather than “the finder,” whose poetry is that of radical self-redescription, and who is now “humanity’s hero – rather than the scientist,” as she was in the modern world (1989, p. 26). The strong poet is someone who is not content “to accept someone else’s description of oneself, to execute a previously prepared program, to write, at most, elegant variations on previously written poems” (1989, p. 28). Though a long self-declared Deweyan pragmatist, this figure of the strong self-created poet is clearly not Deweyan; it is primarily of Nietzschean inspiration and elaborated by reference to such as Freud, Proust, and Harold Bloom (who invented the term). All are strongly present in the book. CIS is the terminus of the intellectual journey described in TWO when he had abandoned his original project to find some “intellectual or aesthetic framework” that would let him “hold reality and justice in a single vision” (1992, p. 143) as “self-deceptive” all along, and

“... decided to write a book about what intellectual life might be like if one could manage to give up” (1992, p. 147), on this sort of philosophical project “to hold self-creation and justice, private perfection and human solidarity, in a single vision” (1989, p. xiv). The strong poet cast as “liberal ironist” is the intellectual hero of the “liberal utopia” the book articulates; the liberal is one who believes that “cruelty is the worst thing we do,” while the “ironist” is “the sort of person who faces up to the contingency of his or her own most central beliefs and desires” and has “abandoned the idea that those central beliefs and desires refer back to something beyond the reach of time and chance” (1989, p. xv). One is educated as an ironist and strong poet by reading the works of authors like Kierkegaard, Nietzsche, Baudelaire, Proust, Heidegger, and Nabokov, all “useful as exemplars, as illustrations of what private perfection – a self-created, autonomous human life – can be like” and as a liberal, by reading the works of authors like Marx, Mill, Dewey, Habermas, and Rawls, all “fellow citizens rather than exemplars” (p. xiv). The sentiment of “solidarity,” the third term in the title of the book, indispensable to social justice, corresponds with the liberal aversion to cruelty, with the hope “that suffering will be diminished, that the humiliation of human beings by other human beings may stop” (p. xv). Its education is about learning to identify imaginatively with the suffering of others in one’s community and in humanity at large, coming to see them as “one of us,” and is obtained by reading appropriate narratives, “e.g. novels or ethnographies” (1989, p. 192).

Rousseau on *Bildung* and Morality

Kimmo Kontio

University of Oulu, Oulu, Finland

Introduction

When the idea of *Bildung* is attached to Rousseau's educational thinking, it is, of course, an anachronism. The idea of *Bildung* emerged in relation to the emergence of classical German idealism and is profoundly intertwined with its fundamental philosophical motives. When speaking about German idealism, we do not refer to a monolithic idea but to the thematically rich and complex philosophical discourse that often includes contradictory views on the fundamental philosophical concepts. If there is a common denominator that characterizes all the

philosophies of German idealism, it is that they are all theories of freedom and this fundamental motivation is definitely Rousseauian in spirit. It was Rousseau who “discovered” the peculiar concept of autonomy that inherits from (and advanced) Kant to become a shared aspect of German idealism. It is this concept of autonomy on which the modern tradition of *Bildung* is based. It should be possible, then, to reconstruct the idea of *Bildung* from Rousseau's writings and, consequently, to point out the profound influence on Rousseau's pedagogical thought on the emergence of the tradition of modern educational thought. The task of this entry is to do this – briefly and selectively – mainly in the light of Rousseau's principal writings, *The Discourse on Sciences and Arts* (*Discours sur les sciences et les arts*, 1750) and *The Discourse on Inequality* (*Discours sur l'origine de l'inégalité*, 1755) and *Émile* (*Émile ou De l'éducation*, 1762). According to Rousseau, these writings are “inseparable and together form the same whole” (Rousseau 1995, p. 575). In addition, Rousseau defines their fundamental and unifying motivation to defend, with their full force, the principle of *natural goodness*. The *Bildung*-theoretical significance of the principle of natural goodness becomes, also, evident when it is related to the concept of autonomy.

On *Bildung* and Morality

Jean-Jacques Rousseau's (1712–1778) profound influence on the emergence of the tradition of modern educational thought, its fundamental argumentation models and motives, is based on Rousseau's “discovery” of the concept of freedom as self-legislative autonomy. Rousseau developed this peculiar concept of freedom in opposition to Hobbes' definition of “freedom as the absence of external impediments” or “freedom as the silence of the laws” and, inherently, the limited definition of human rationality as instrumental to the nature (passions). Instead, according to Rousseau, human rationality has, because of its spontaneity, the capacity to determine from itself the universal and necessary theoretical and moral principles.

This definition is crucially modern: Reason as self-legislative autonomy does not have a cosmological grounding in divinity or in external nature but is inherent in reason itself and has, thus, the productive power to create from itself the ends for human life (see Henrich 2003, pp. 46–61; Velkley 1995). Although Rousseau does not use the notion of *autonomy*, it is clear that freedom in its truest sense, i.e., moral freedom (*liberté moral*), corresponds with and anticipates accurately the Kantian concept of autonomy:

It is he who knows how to conquer his affections; for then he follows his reason and his conscience; he does his duty; he keeps himself in order, and nothing can make him deviate from it. Up to now you were only apparently free. You had only the precarious freedom of a slave to whom nothing has been commanded. Learn to become your own master. Command your heart, Emile, and you will be virtuous. (Rousseau 1979, V, pp. 444–445.)

This passage (see also Rousseau 1997b I, pp. 8, 54) from the end of *Émile* summarizes how the idea of *Bildung* can be connected to, or reconstructed from, Rousseau's educational philosophy. As the passage makes clear, freedom as autonomy is distinct from the "apparent" and "precarious" freedom that the pupil has enjoyed "up to now." So, freedom as autonomy characterizes the *end* rather than the *beginning* (cf. Lockean concept of autonomy) of the process of *Bildung* and is, for Rousseau, the highest affirmation of human nature. Obviously, or at least according to Rousseau, we cannot attain (the idea of) freedom unless we are assumed to be not free from the beginning. Thus, the first anthropological category that demarcates man from animal is defined by Rousseau as a "property of being a free agent" (Rousseau 1986a, p. 148) (i.e., freedom of the will), and it is, specifically, consciousness or sentiment of this freedom (of power of willing and choosing) that constitutes the inalienable core of humanity. Instead of defining freedom, as just a necessary condition for the possibility for the obedience to the "dictations" of nature (passions), for Rousseau freedom, when referring to self-imposed laws, constitutes the very essence of the human being (see Henrich 2003, pp. 46–61). Submitting one's freedom – whether the dictations of

nature, of divinity, or of opinion of others – is therefore giving up the very essence of humanity and the moral dignity constitutive to it (see, e.g., Rousseau 1997b I, pp. 4, 45; I, 2, 42). The "property of being a free agent" makes it possible to conceive of man as a self-determining source of his actions; from this follows that the process of *Bildung* can be understood as a transformative process where man, in the medium of self-activity, cultivates the original sentiment of freedom into freedom as autonomy. The metaphor of perfection adequately describes Rousseau's idea of *Bildung*, as follows. In order to explain how the transformative process of *Bildung* is possible, Rousseau introduces, as the other anthropological category which differentiates man from animal, the faculty of perfecting oneself (*perfectibilité*) (Rousseau 1986a, p. 149). *Perfectibility* (cf. *Bildsamkeit*) refers to the plasticity of human nature, not only defined superficially as the human's potential to learn and develop all his natural faculties in the medium of self-action and in *relation* to the things and men (or in relation to the physical and moral worlds) but more fundamentally, referring to the idea that is *not* natural for man to stay in his original condition but instead, to strive beyond his condition and devise for himself "a new form of existence that is his own" (Cassirer 1989, p. 105). The concept of *perfectibility* has, therefore, not only an adaptive meaning but a crucially normative and critical one: There is, indeed, an idea of transcending what is "now" to the new form of existence. In this sense, the "world of *Bildung*" presumes, as its necessary *other* the prevailing order of things that is not accepted as a final and definite. In the case of Rousseau, this is the "world of *alienation*."

When this "new existence" is defined in terms of freedom as autonomy, it follows that *Bildung* is, for Rousseau, always moral *Bildung*. In the passage above, the concepts of *duty*, *virtue*, and *order* refers to the moral nature of the idea of *Bildung*. More precisely, the concept of autonomy includes the idea that true freedom is more than just negative in nature but is, so to speak, "more freedom" to guarantee also the freedom of others. Thus, this "new existence" presumes a moral character that is enabled to judge her aims and the ends of life

not only from the point of view of the private good and well-being but from a generalized point of view, in relation to the well-being of others and, ultimately, in relation to the overarching human good. That is, the concept of autonomy includes the idea of a reciprocal recognition of *persons*, i.e., it explicitly excludes treating others as a means to an ends, which would be an instrumental-strategic rationality (see Dent 1992, pp. 120–121). To put it briefly, when anchoring his theory of the *Bildung* to the concept of autonomy, the necessary consequence is that the idea of going beyond oneself to the “new existence” means accepting moral responsibilities toward others, society, and humanity in general. With this in mind, it is now also possible to explain what Rousseau means by saying that man is naturally good. After anchoring his theory of *Bildung* to the concept of freedom as a self-legislative autonomy, it is evident that by “the principle of natural goodness” Rousseau does not mean the moral goodness of natural instincts (*pitié*) or passions, but rather, to rephrase Cassirer’s (1989, pp. 104–105) formulation, the fundamental orientation and destiny of the human free will. Man is, consequently, “by nature good” if he/she lifts himself/herself spontaneously and without external help to the idea of freedom and surrenders voluntarily to the ethical law that safeguards not only his own person but that of others too.

Moreover, the idea of autonomy as a self-legislative rationality presumes, naturally, that there is an active *self* who is able to define for himself the commitments that he is willing to follow. When these commitments are characterized as *laws*, it means that they are general and, thus, products of reason (*raison*). The concepts of *self* and of *reason* and the link between these can be clarified as follows. Human rational faculties refer, in general, to the active faculties of the human mind or consciousness, the basic activity of which is comparison. Reason (*raison*) must be demarcated from the more limited form of human rationality, namely, understanding (*entendement*). Understanding refers, of course, to the synthetic activity of the *self*, i.e., the force of mind that brings together and compares the sensations, i.e., impressions made by the objects (so to say “not-

self”). Understanding is, thus, the basic activity of the *self* that, still, cannot function if nothing is given to it through sensibility (passivity). In fact, according to Rousseau, the *self* can be known and distinguished from the objects (or “not-self”) only because of its activity (see Rousseau 1979, IV, pp. 270–271). This is the form of rationality Rousseau attaches to primordial human nature and, to a certain extent, also to the animals (Rousseau 1986a, p. 148). A crucial feature of understanding is that because it is dependent on sensation, it represents the minimum combination, restricted to the immediate future or immediate past, or the “what is happening now” (see Henrich 2003, p. 49). One of Rousseau’s famous examples from the *Discourse on Inequality* illustrates the limits of understanding: “Such is still nowadays the extent of the Carib’s foresight: he sells his Cotton bed in the morning and comes weeping to buy it back in the evening, having failed to foresee that he would need it for the coming night” (Rousseau 1986a, p. 151).

What Rousseau calls reason (*raison*) is the distinctive human rational faculty that strives toward totality in cognition, a productive capacity to formulate general, intellectual ideas (i.e., the ideas that exceed the boundaries of the sensation, e.g., the idea of unconditioned duty). It is only with the help of discursive reason that the idea of the world as a totality of things can be formulated. Moreover, Rousseau defines reason as “two dimensional” (i.e., not as alternatives). This means that reason can have “two objects” that differ qualitatively and must be seen simultaneously (see Rousseau 2001, p. 40). This distinction is made in *Émile*, with the concepts of sensual and intellectual reason (see Rousseau 1979, II, p. 125) or alternatively childish-sensual and intellectual-human reason. Whereas the objects of sensual reason are sensible and material, measurable objects of intellectual reason (like moral beauty) are not, but discovered only by estimation. Thus, as it is easy to see, the distinction between these rationalities corresponds to the distinction between the definitions of prudential or instrumental-strategic reason and moral reason. As the Carib example above illustrates, understanding alone does not offer sufficient rational

resources for human life, and for this reason Rousseau, as the paragraph above expresses, attaches freedom to *reason*, not to understanding. Obviously, it is moral reason that has the capacity to give the ultimate ends for human life and, thus, has also a critical function when evaluating the utility of the ends arising from prudential reason.

It is of utmost importance to notice that in this passage Rousseau – as ever – attaches to the basic moral concepts *duty* and *virtue* (as a fulfillment of a duty) the idea of commanding, i.e., duty as imperative in nature: “Command your heart, Émile, and you will be virtuous,” and this means following the dictations of reason. This is one of the many examples Rousseau gives in order to exemplify that although freedom belongs to the intellectual realm, it can have effects on sensible world, i.e., the self can “conquer his affections” by imposing on itself the ethical law. Moreover, it makes no sense to speak about “conquering” if there is nothing to be conquered. So, virtue and vice are defined in relation to each other, and virtue is then, of course, always about overcoming the vice. From this it follows that Rousseau’s philosophy cannot be characterized as advocating primitivism (see Lovejoy 1923) because escaping vice is, at the same time, escaping the possibility of virtue and thus the possibility for the highest affirmation of human nature. This notion is furthered when the next important concept of the paragraph above is taken into consideration. The concept is “moral order.” Again, it must be noticed that it does not make sense to speak about “the order” if it is not defined in relation to something that is understood as its opposite.

There is some moral order whenever there is sentiment and intelligence. The difference is that the good man orders himself in relation to the whole, and the wicked one orders whole in relation to himself. The latter makes himself the center of all things; the former measures his radius and keeps to the circumference. (Rousseau 1979, IV, p. 455)

Rousseau introduces here two different, contradictory concepts of moral orders. The difference between these is defined according to the general moral perspective of their subject. The difference between a good and wicked man is that the latter promotes solely his private good

but the latter has adopted a more generalized moral point of view and, as consequently, strives to contribute not merely his private good, but the general good or well-being of humanity. This distinction has a crucial importance in Rousseau’s thinking in general because the core problem of modern subjectivity – what Rousseau designates *bourgeois* – and consequently the core of the evil, is egocentricity. Thus, the moral psychology characterizing bourgeois subjectivity stresses the self-interest connected with the definition of reason as instrumental to the limitless ends of passions. As Rousseau’s principal writings attempt to prove, this bourgeois characteristic or “ethos of the modernity” that defines man’s place as dominant within the whole has a great tendency in the end to destroy ideas of common good, fatherland, and citizen, for example. It follows, then, that for Rousseau virtue is overcoming an egocentric perspective of life. For this reason Rousseau defines virtue, in its most general sense, as a *love of order* that can be known, as it is clear, *only* in relation to the factual moral order. In other words, virtue as the highest affirmation of human nature is possible only within society. This is the reason why, for Rousseau, society is not a resignation of human freedom (Hobbes) but its fulfillment, and this is the credit that ensues from the societal bond (Rousseau 1997b I, pp. 8, 54). So in the end these clashing moral orders refer to the inner conflict of modern subjectivity, and this, of course, also underlines Rousseau’s modernity. It is clear that the idea of moral order does not refer, for Rousseau, to any concrete historical or societal conditions (e.g., primitive idea of *Golden Age*) but, rather, when anchored to the freedom (i.e., of course, indeterminate from historical and societal conditions), representing an abstract idea that is, in a way, realized and constituted in every virtuous action, i.e., in every time when a subject overcomes the egocentric order. This is how the concept of autonomy attempts to answer to the core problem of modernity: It does not define man’s place as dominant within the whole, but instead, “relativizes” it in a sense that “s/he orders himself in relation to the whole and not vice versa.”

The function of the concept of general moral order is, clearly, to offer a solution to the

teleological problem of modernity, i.e., to demonstrate that reason is “at home” in the universe in spite of all the contradictory evidence and apparent human suffering. What is equally clear is that this solution differs from other early modern solutions to this very same question based on anthropological empiricism (the tradition of modern natural law, modern individualism, or liberalism), which – still after rejecting the premodern teleology – is based on the idea that (1) reason can discern a natural order if the primordial nature is recovered by philosophical inquiry and (2) the observance of the consequent revealed natural order can overcome the human sufferings (see Velkley 1995, pp. 186–187). Rousseau rejected categorically all the variations of modern individualism (e.g., Grotius, Hobbes, Locke, moral sense theory) for a very simply reason: According to Rousseau the “cure for the disease” must be discovered from the disease itself, and the fallacy of modern individualism is that the individual searches for the cure for moral sufferings from the wrong source, i.e., from the *nature*, and as a consequence any resulting solution is ineffective. By defining freedom as at the core of core of humanity, Rousseau shifts the Archimedean point of philosophy from nature to freedom and establishes from this point of view the justification of reason by introducing an idea of the general moral order where observance can overcome human suffering. In other words, the idea of general moral order is not a projection of nature, nor does it have a model in nature, but is instead a projection of freedom whose critical function is to offer a normative orientation for human life in modernity, exactly what the main philosophical doctrines of British and French Enlightenment did not, according to Rousseau, manage to do.

There is still one crucially important *Bildung*-theoretical concept mentioned in the passage at the beginning of this entry that needs to be considered: namely, the *conscience*, which Rousseau also calls the *love of order*. Rousseau’s idea is that although reason can help us discern the idea of moral order, it does not alone have (the step Kant took) the motivational force to make us act morally. Thus, the status of the concept of conscience in Rousseau’s theory of *Bildung* is clearly

to function as a motivational principle for moral action. Indeed, one may be tempted to ask “why must I follow, or what makes me follow, the dictations of my reason and being faithful to my true nature by committing myself to the moral maxims that are at odds with the factual order of things?” Or “what makes me to search for the truth which is indifferent to my material well-being and perhaps not rewarded in ‘this world’ at all, if ‘this world’ is, so to say ‘untrue’?”

There is another interest, which is entirely unrelated to social advantages, which is relative only to ourselves, to the good of our soul, to our absolute well-being, which therefore I call spiritual or moral interest [– –] an interest which, in spite of having no sensible, material objects, is no less true, no less great, no less solid, and, in a word, the only interest which tends toward our genuine happiness, since it is intimately related to our nature. This, Sir, is the interest which virtue pursues and ought to pursue, and which in no way deprives the actions it inspires of merit, purity and moral goodness. (Rousseau 1997a, p. 262)

The words, “another interest” (or another principle of *love of self* (see, Rousseau 2001, p. 28)) refers to the fact that conscience offers a motivational basis for human action that is not the same than an interest of passions, i.e., the demands of self-preservation (in physical and moral sense of the word, i.e., *amour de soi* and *amour propre*). Whereas passions are, according to Rousseau, the principal instruments of freedom, serving the well-being of the sensitive being (in physical (*amour de soi*) and moral (*amour propre*) sense), conscience serves the well-being of the intellectual being (see Rousseau 2001, p. 28). What is passion for the body, conscience is for the soul. Conscience as a love of order is precisely the innate, i.e., transcendental (also named as a voice of God), principle of justice that requires a certain kind of an order – where happiness and moral merits are distributed according to the principle of justice – that the factual order of things constantly violates and cannot be accepted as a definite order of things (see Rousseau 1979, I, p. 66). Moreover, although conscience is, according to Rousseau, independent of reason, it cannot be developed without reason: “To know the good is not to love it; man does not have innate

knowledge of it, but as soon as his reason makes him know it, his conscience leads him to love it. It is this sentiment which is innate” (Rousseau 1979, IV, p. 290). Thus, the development of conscience is related to the moral comparisons (i.e., the activity of moral self) and the development of moral reason. In this way the concept of conscience offers, in Rousseau’s theory of *Bildung*, the critical *Bildung*-interest. Thus, the process of *Bildung* and the development of the moral perspective of life require, then, the cultivation of the rational faculties of mind together with the development of consciousness. Thus, the idea of moral order given to us by *reason* and *conscience* – a moral order that directs us to love it – develops together with the development of the moral perspective of life, affording a simultaneous and unitary whole (see Henrich 1992, pp. 13–14).

What, then, is the relation between moral needs (*amour propre*) and conscience? Rousseau uses the concept of *amour propre* in a double sense. In its natural and constructive form, it represents the necessary and healthy human need to enter into the moral world and to be acknowledged as a morally worthy being (person). In short, *amour propre* refers to the very basic human need: the need for recognition from others. Also, in its natural form this recognition is reciprocal. This becomes apparent in the fourth book of *Émile*, where Rousseau describes the birth of the first moral sentiments in relation to the “birth” of moral reason. Namely, the moral comparisons (moral reason) awaken the first moral sentiments: “This choosing, which is held to be the opposite of reason, comes to us from it [...] Far from arising from nature, love is the rule and the bridle of nature’s inclinations. It is due to love that except for the beloved object, one sex ceases to be anything for the other” (Rousseau 1979, IV, p. 214). So, it is reason that introduces to the sensible being the first forms of moral attachments by distinguishing the object of love from other objects. This identification presumes moral comparisons where certain objects are compared favorably to other objects. So, if this is how *amour propre* is born, its morally constructive role becomes evident when its reciprocal nature is taken into account: “To be loved, one has to

make oneself more lovable than another. To be preferred, one has to make oneself more lovable than another, more lovable than every other, at least in the eyes of the beloved object” (ibid.). So, *amour propre* is, in this form, an important avenue to virtue because it directs us to seek recognition from others and, thus, because of the reciprocal nature of the love, it grants to the other the same recognition that it demands (see Dent 1992, pp. 33–36).

On the other hand, Rousseau refers to *amour propre* in a very different and, with respect to the preceding discussion, directly opposite, destructive sense. This is closely related to the moral psychology of bourgeois subjectivity and to the theme of alienation. More precisely, if the former definition of *amour propre* can be designated natural, it can, however, attain the *inflamed* form that manifests the desire for domination, prestige, and will to power at the expense of others (as Rousseau defines vanity – that is one of most typical sentiments related to the inflamed *amour propre* – as an attitude that demands everything without giving anything instead), and in order to satisfy the demands of inflamed *amour propre*, the subject must adopt – to use the Habermasian terminology – instrumental-strategic modes of action. Clearly, this description closely resembles Hobbes’ definition of natural man and, as its consequence, a bourgeois society at war against all. However, Rousseau’s idea is that this form of *amour propre* is unnatural in the sense that it is against the principle of natural goodness and, thus, against the true well-being of humanity. Indeed, as we see from the description of the history of civilization in *The Second Discourse*, it is clearly Rousseau’s idea that *inflamed amour propre* steers humanity to its tragic end. Why this form of *amour propre* does not achieve dominance in *Émile* has to do with the pedagogical conditions found in the account.

On the other hand, conscience, as the passage above illustrates, demands a kind of moral action that does not seek primarily satisfaction from the opinion of others. It requires *unconditional* fulfillment of moral duties, and that is the reason why Rousseau writes that the satisfaction of this interest is “entirely unrelated to social advantages” and

is “relative to our absolute well-being.” Thus, the relation between the demands of conscience and *amour propre* is that the justification of the demands of *amour propre* should be considered in light of the conscience and not vice versa. As Dent (1988, p. 236) writes: “It is conscience that can check us in yielding to the importunate press of sensual desire and pleasure, to resist the urges of inflamed passion, and it can direct us to choosing to do what is right and just instead.” In this sense, it is exactly the principle of conscience that, in the end, constitutes us as a truly social being (see Henrich 1992, pp. 11–12).

In light of the concepts defined above, it is possible to give a brief interpretation of the relation of Rousseau’s principal writings. *Discourses* (second in much mature form) concentrate mainly, first, as an introduction to the genealogy of the pathologies of the modern bourgeois society and its subject and, second, to anticipate the course of the history of humanity as a perfection of bourgeois corruption to its tragic end. These writings introduce the first influential modern theory of alienation according to which the problem of modern bourgeois subjectivity is that the subject’s self-definition or the *sentiment de l’existence* is based solely on the opinion of others and, thus, not on the consciousness of one’s freedom. Thus, instead of thinking autonomously, the life of modern bourgeois subjectivity is a constant anticipation of the thoughts and opinions of others (i.e., living outside oneself and, thus, “losing the self”). It is easy to see how the theme of alienation is in contrast to the principle of natural goodness. Alienation refers, precisely, to the form of existence that is *not one’s own* and from the subject’s consciousness of this, according to Rousseau, originates all moral sufferings. The theme of alienation is related to the theme of egocentricity so that, in the end, the satisfaction of the limitless ends of passions, especially those that are related to the moral needs (*amour propre*), can be satisfied only by the affirmation of other people’s opinion. *Émile* may be defined, then, as an anthropological complementary to the *Discourses*. Because these contradictory moral orders are defined as direct opposites, it follows that the genealogy of the pathologies should be

understood as directly in opposition to the idea of *Bildung*. If man had in the primordial state of nature a sentiment of his original freedom (sentiment of the power of willing and choosing), then the history of civilization is not a cultivation of this but, instead, its suffocation. Thus, Rousseau’s critique of civilization is a description of the bourgeois moral order with egocentricity as its core. *Émile*, of course, introduces an alternative history of sorts to *Discourses*. From this follows, also, that the basic concepts of Rousseau’s anthropology are introduced mainly in a dramatically different light in *Discourses* and *Émile*. In *The Second Discourses*’ history of civilization, for example, *pitié*, i.e., “natural repugnance at seeing any sentient Being, and especially any being like ourselves, perish or suffer” (Rousseau 1986a, p. 132), turns into the weakness and the primordial *amour de soi*, i.e., the intense interest in well-being and self-preservation (ibid), reaching violent or inflamed modifications (inflamed *amour propre*, e.g., vanity). Reason is introduced in its one-dimensional prudential or instrumental sense and, thus, impotent to introduce morally sustainable ends for humanity. Conscience (i.e., the love of order) is not even mentioned. In *Émile* all these concepts are, instead, introduced in a constructive sense, as necessary resources when building a moral perspective of life, and in this sense it does not describe the genealogy of alienation but can be considered as a *Bildungsroman*.

Conclusion

Although the idea of *Bildung* – or the principle of natural goodness – includes the idea of an individual elevating himself/herself spontaneously and without external help to the idea of freedom, Rousseau asserts that the individual cannot do this without external and intentional pedagogical help. The fundamental pedagogical problem *Émile* attempts to solve is how to transform the natural, *amoral* being into a morally competent being who is able to define his place in the society (see Benner and English 2004). Clearly, for Rousseau, education is the bridge between these two anthropological images of man. Thus, the cardinal idea

of *Émile's* natural education is – as can be assumed on the basis of Rousseau's concept of *Bildung* – to prove to the pupil that he is, although always partly socially determined, also free to resist its corruptive power and choose virtue rather than vice, i.e., to submit his will rather to the commands of his conscience and reason rather than surrender uncritically to the power of passions. *Émile* can therefore be considered as a “study” of how education can promote the actualization of freedom or, in other words, help determine those pedagogical *necessities* needed to support the cultivation of freedom.

It is perhaps easy to see why education – when committing to this task – is designated *natural*. It is not natural in the sense that, e.g., the moral development of the pupil takes place or is targeted outside bourgeois society or “just happens” without an educator's intentional pedagogical efforts (*Erziehung*) or, for that matter, that the learning processes are supposed to “happen easily” without sometimes even “painful” efforts from the pupil himself. It is natural because it is related to the genuine well-being of the pupil and the actualization of his/her proper character. In fact, *Émile's* natural education is highly artificial, and this makes it possible to construct “the curriculum” of natural education in a way that it is not determined by prevailing bourgeois ideology. Thus, the concept of natural education is crucially a critical concept. Namely, if *Discourses* and *Émile* are seen as defining an alternative point of references for the future of humanity, then it is also clear that there are alternative concepts of education promoting the different courses of history. In this sense *Émile* introduces a fictional pedagogical reform that is a direct critique of the contemporary (mainly French) materialistically orientated bourgeois education. Because of this, natural education is an almost absolute negation of contemporary bourgeois education, i.e., the rationale of natural education is not even attempted to adopt from the prevailing pedagogical praxis. As Rousseau constantly emphasizes, bourgeois education is nothing but an instrument of the bourgeois moral corruption, i.e., does not cultivate freedom but its opposite (see, e.g., Rousseau 1986b, pp. 20–21; Rousseau 1986a, p. 210;

Rousseau 1979, I, pp. 43–46; Rousseau 1979, II, pp. 84–85; Rousseau 2001, p. 35).

The idea of *Bildung*, when anchored on the concept of freedom-as-autonomy, has a revolutionary significance from the point of view of educational theory (in a sense of *Erziehung*). Indeed, it can be claimed that Rousseau's educational thinking represents the first influential modern attempt to define the concept of education on the basis of the principle of autonomous subjectivity. Thus, Rousseau's educational philosophy can be understood as a critique that is targeted, first, against premodern attempts to define the concept of education on cosmological grounds and, second, against the previous modern attempts to define the concept of education on the basis of the anthropological empiricism typical to the tradition of modern individualism or liberalism. The “discovery” of autonomy, as should be apparent, alters radically the fundamental argumentation models and motivations of modern educational thought because when humanity is defined in terms of freedom, the fundamental questions of educational theory as well as the interest of educational science are, consequently, attached to the concept of freedom. Thus, the questions are: how can education promote the actualization of freedom and, thus, the actualization of humanity? How can educational science offer us “reflective tools” in this endeavor? This is, of course, the educational philosophical application of Rousseau's critical idea that all the philosophy has to be oriented toward a concept of freedom for this is the only way to restore the rights of humanity. It is well known that Kant adopts this Rousseauian idea as the “keystone” not only of his critical philosophy but also of his pedagogical writings (i.e., the idea of pedagogical paradox) (see Henrich 1992, 2003; Velkley 1995).

Introduction

If there are two truths nearly universally recognized in the history of American schooling, they are that Americans have an unwavering faith in schooling to transform the individual and society for the better and that American schools are deficient and in need of reform. These two beliefs – limitless potential and inadequate realization – have combined historically to make school reform something of a national pastime. This entry explores the political, cultural, and organizational dynamics that animate the constant drive for school reform and that have produced the sense – not wholly unwarranted – of constant failure and the need for still more reform. The first section explores the political and organizational features of schools that have given rise historically to one major source of calls for school reform: the transformation of social problems into school problems. The second section examines the specific and competing goals of schooling itself, and how attempts to resolve the tensions between these goals has also given rise to constant calls for school reform. Though this entry explores these two sources of school reform separately, as will become clear, reform efforts are rarely strictly in one category or the other as calls for school reform are a function of perceptions of the broad array of social institutions in which schools feature prominently.

School Development and Societal Roots of School Reform

Though many American towns particularly in the Northeast had developed an array of institutions to educate their young – charity schools, church schools, private academies – by the late eighteenth century, scholars generally date the beginning of the common school movement to the 1830s and the rise of a tireless cohort of school system builders including, notably, Horace Mann and Henry Barnard. While access to schooling and literacy levels among Americans was already quite high by world standards, the common school reformers distinguished themselves by arguing for more systematic instruction, increased professionalization of teachers, more consistent attendance, and, crucially, a single system of tax-supported public schools. The promise held out by common school advocates that schools could produce morally upright, republican citizens was well attuned to the anxieties of the age. Faced with the socially disruptive effects of urbanization, the factory system, an increasingly interconnected market economy, and large-scale immigration – primarily Irish Catholic – Americans in the North were increasingly convinced that universal schooling was the key to social cohesion and preservation of the republic in an increasingly turbulent age. Thus, the curriculum of the common school tended to emphasize the middle-class Protestant themes of discipline, hard work, and self-improvement rather than strictly scholastic achievement. As many scholars have noted, the overtly moral themes of individual responsibility in the early common school curriculum meshed well with a society increasingly characterized by the inequality of market capitalism and the dissolution of the family unit in the face of shifting patterns of work and migration (Kaestle 1983; Reese 2011).

Though the arguments made by common school reformers proved alluring to a wide swath of Americans, the distinct legal and organizational character of American school schooling meant that the uptake of these ideas was uneven and the provision of schools available varied considerably by region and urbanicity – the South generally had fewer schools for poor whites and none

for African Americans; rural communities tended to have more limited educational offerings than urban centers.

The organization of the American school system is best characterized, especially when compared to other countries, as radically decentralized. The US constitution makes no mention of education or a school system, and while federal policy has encouraged the establishment of schools and universities through the granting of federal land to States (e.g., the Northwest Ordinance (1787); Morrill Act (1862)), the responsibility for the creation, organization, and perpetual funding of schools has always been left to individual States. States themselves, in turn, have transferred this responsibility to individual cities and towns – either permitting or requiring towns of a certain size to make provision for the creation of publicly funded schools.

The upshot of this organization – often described as “loosely coupled” – meant that historically there has been very limited federal or State government infrastructure to support the creation and oversight of individual schools. Unlike national ministries in other countries, responsibilities of the US Bureau of Education (founded in 1867) extended only to the compilation of statistics and the dissemination reports about school activities rather than direct influence on them. Likewise, the median number of officials in State departments of education in 1900 was two. Though States exerted increasingly strong influence on school policy starting around the turn of the twentieth century in the form of compulsory attendance laws, district consolidation, minimum school standards, and contingent State aid, these efforts were frequently aimed at prodding local officials to direct their school reform energies in particular ways and usually remained dependent on local acquiescence (Steffes 2012). Even in the second half of the twentieth century when school quality increasingly rose to the level of national concern, federal education legislation was still dependent on State and, more often, local officials for implementation. The distributed responsibility for schools has helped sustain the cherished American ideal of “local control” of schools and is a good example of the tendency of the American State to develop in

ways less visible – though not necessarily less strong – than European States.

The combination of the relatively limited, distributed State educational infrastructure; association of schools as community, rather than State or federal, institutions; and enduring cultural faith in the power of education to solve social problems through the betterment of individuals helps explain the seeming permanent state of school reform.

First, it has made schools a primary location for State intervention in social problems. The transmutation of social and economic problems into educational ones can be traced in a nearly unbroken line from early nineteenth-century concerns about social stability through late nineteenth-century concerns about assimilation, alcohol consumption, and public health to twentieth-century concerns about national defense, drug use, sexual health, economic competitiveness, racism, and inequality. In each case, schools were identified by combinations of social reformers, politicians, and the public at large as the appropriate site for addressing the problem of the day in part because of their ubiquity – nearly all communities have them and nearly every child attends one – and in part for the comparatively light touch that these efforts seem to impose. That is not to say that these efforts have not generated a fair bit of controversy – they have – but it is easier to aspire to change the flexible attitudes and behaviors of youth than the ossified ways of their parents. Since American society is rarely at a loss for social problems in need of solving, the task of school reform becomes a permanent tool of social policy.

Second, while the belief in the power of schooling has made schools a reflexive answer to many social problems, the multiple layers of organizational control – federal, State, local, school, classroom – and the limited capacities within each layer means that the translation of school reform policies into classroom practice is difficult and prone to the introduction of local adaptations at each level. One result of this organizational challenge is that cycles of “policy talk” – and even actual policy – can be largely disconnected from actual change in schools

especially given that timelines for policy action and policy implementation are often entirely distinct (Tyack and Cuban 1995). As was the case during the Cold War, lawmakers could be viewed as effectively combating the Soviet threat by supporting new and more rigorous math and science curricula even when the social payoff was in the distant future and ultimately unrealized when the curricular reforms were supplanted by still more and different reforms.

More often, successfully implemented school reforms have been those that have focused on structural reforms or the addition of distinct organizational features that are easier to achieve and more readily discernible than changes in classroom practice. Examples of these kinds of structural and organizational changes include the age grading of schools, the creation of issue-specific courses (e.g., sex ed, health, home economics), the establishment of kindergartens and junior high schools, and the introduction of curricular standards. Though all of these reforms are widely recognized as comprising the core of modern schooling, as organizational features of school, their capacity to address the social concerns that gave rise to their creation is limited: the introduction of more articulated and rigorous curricular standards adopted by nearly every American State in the 1970s to combat threats to American economic competitiveness had little effect on either classroom practice or macroeconomic trends.

Third, while change through schooling is a very indirect intervention into social problems – if for no other reason than the considerable lag between intervention and desired outcome – the reflex to use schools in this way can be self-perpetuating. Directing State building efforts toward schools for one public health problem, vaccination, for example, makes schools a more “obvious” site for intervention in the next public health problem. Likewise, in the second half of the twentieth century, the effort to rectify the harms of centuries of racial subjugation, segregation, and discrimination via the integration of schools or the effort to fight poverty through the extension of school programs and an increase in school funding directed the expansion of the American State in the

direction of schooling – a decision that not only reframed these problems as educational in nature but also that directed attention from other possible solutions to these issues. At a broader level, as many scholars have noted, the educationalization of social problems has a tendency to emphasize the individual dimension of problems in ways that can obscure its larger structural dimensions as well as bring the school system in line for criticism (and more reform) for failing to solve problems largely beyond its institutional capacities and purview. Thus, the failure of minority populations to achieve similar labor, economic, or social outcomes came to be defined as a failure of the educational system in particular and a failure of social welfare policy more generally (e.g., Kantor and Brenzel 1992).

Conflicting Goals and Organizational Sources of School Reform

The previous section focused on the ways in which school reform was the result of larger social issues becoming repackaged as educational problems. This section examines another source of school reform efforts: inherent tensions within the multiple goals of schooling. As political institutions in a liberal democracy, schools have always had multiple constituencies – taxpayers, employers, and parents – and, in turn, multiple formulations of their intended goals of which some are largely collective public goods (e.g., creation of good citizens and productive workers) and others are largely private goods (e.g., individual attainment and upward mobility). Though historically there have been many components and formulations of these goals, they can generally be grouped under three headings: democratic equality, social efficiency, and social mobility (Labaree 2012).

Stated briefly, democratic equality is the idea that schools should be primarily concerned with the creation and equal treatment of capable citizens with the capacity for productive participation in a democracy; social efficiency is the idea that schools should be primarily concerned with the training of productive workers who can fulfill the

demands of the labor force; and social mobility is the idea that the schools should be primarily concerned with providing opportunities for individual upward social or economic mobility. Though at different times education policy has been driven by a different combination of these goals, the need to balance these three contradictory goals has been a core organizational challenge of public schools from the beginning. One way to understand the constant churn of school reform efforts, then, is the persistent effort to alleviate organizational tensions when one or more of these goals are perceived to be out of balance with the others.

The complicated interplay of these goals can be seen from the earliest days of public schooling in America. As noted above, one early impetus for widespread tax-supported schooling was white, Protestant middle-class anxieties about declining moral values and social cohesion. Whether by opportunity, suasion, or coercion, the resulting increase in school attendance among all classes of white children, it also had several consequences that became the impetus for subsequent calls for reform. While increased attendance may have quelled concerns over the creation of competent citizens, the increased educational attainment among all classes of whites reduced the value of education as a source of social distinction for the children of middle-class and wealthy families. Conversely, as education became associated with citizenship in antebellum America, African Americans found themselves increasingly excluded from educational opportunity (Moss 2010).

Families seeking to regain the value of school attainment as a means of upward mobility and social distinction pressed in the late nineteenth and early twentieth century for the upward expansion of tax-supported schooling in the form of public high schools. Though enrollment in high school was initially determined by entrance examination – a mechanism that supported claims of equal opportunity, academic merit, and social distinction – demand for equal access to this new source of upward mobility led, in the early decades of the twentieth century, to the massive expansion of high schools and high school attendance.

Here again the expansion of educational opportunity in the name of equal opportunity led to the further reform of the school system via the creation of distinct educational tracks. These tracks allowed those in the higher, academic tracks to distinguish themselves from the larger mass of high school attendees. The use of stratification within levels of schooling has been used repeatedly to hold open the possibilities of social mobility in the face of expanded educational access including after the Civil War with the provision largely vocational education opportunities for African Americans and, in the second half of the twentieth century, as a way of integrating schools while segregating access to academic content (Anderson 1988; Oakes 1985).

The interaction between the social efficiency and democratic equality and upward mobility goals can likewise be traced to recurring calls for school reform. The early success of the common school movement drove not only the expansion of school access but also calls to curb wasteful school spending and to bring more organizational coherence to burgeoning school systems. These calls for greater efficiency through rationality and, often the introduction of techniques from business, are a recurring theme in the history of school reform. In the nineteenth century, they helped introduce age grading into the formerly one-room school house and encouraged superintendents in the late nineteenth and early twentieth century to fashion themselves in the mold of managerial experts overseeing the fundamentally technical process of schooling and helping to build the “one best system” and created a push for the introduction of non-college-oriented, vocational curricular tracks to aid the training of blue collar workers (e.g., Tyack 1974).

In the twentieth century as federal school policy during the Cold War increasingly placed an emphasis on the development of human capital, social efficiency-based arguments were combined with the general expansion of high school enrollment to create a push for consolidating school districts and the creation of the comprehensive high school in order to maximize organizational efficiency and, aligning with upward mobility goals for social distinction, the creation of more

rigorous academic tracks for the cultivation of the country's most gifted and talented students. In the last decades of the twentieth century, calls for greater academic rigor and accountability in the use of public funds combined with critiques of American economic competitiveness to produce the modern standards-based accountability movement. The accountability movement, given voice in the famous *Nation at Risk* report and crystallized in the *No Child Left Behind Act*, embodied not only the prioritization of human capital development that is the hallmark of social efficiency concerns but also enduring equity concerns that low academic standards disproportionately affected poor and minority students and middle-class concerns that upward mobility increasingly involved distinction at the global rather than national level (Vinovskis 2009). The general failure of the standards movement to achieve its goals of greater American academic competitiveness or greater equality of educational outcomes reflects both the chronically limited capacity of the federal government to intervene in classroom instructional quality and the orthogonal interests embedded in the American school system – while the standards movements have induced improvements at the low end of the academic spectrum, it has induced still greater improvements from those at the higher end of the economic and academic distribution seeking to maintain or advance their social position.

Conclusion

The American school system has been, and continues to be, in a state of nearly constant reform. This condition can give rise to the perception that the school system is in a state of crisis or irreparability. Such a view, however, fails to account for the ways in which the persistent calls for school reform are a function of society's general faith in the capacity of education to cure social ills, the contradictory goals society seeks to produce through its school system, and the system's own success in meeting some of these goals. The result is a system that is in part a victim of its own success and that appears dysfunctional as a result – success at addressing certain social

ills is rewarded by the passing off of still more and greater social problems; and success in expanding opportunity along one dimension is met with calls for greater capacity or efficiency in another. Thus, the perpetual state of school reform should be viewed not as a sign of weakness or disrepair but, on the contrary, of the enduring vitality and perpetual growth of the school system.

Arthur Schopenhauer

According to Immanuel Kant, the outcome of moral growth should be a person that is rational and free and possesses a good will. The Kantian Enlightened mature person is a master of his or her feelings also in the case that these emotions are in accordance with the categorical imperative. Arthur Schopenhauer holds a very different view on what is a truly morally mature person. For Schopenhauer, a mature person is not the one that follows duty (categorical imperative), but the truly mature is a holy ascetic who has developed his virtues of compassion (*Mitleid*) to perfection. Schopenhauer claims that morality is a matter of intuition (*Anschauung*), not practical reason and duty. Nevertheless, Schopenhauer was impressed by Kant's architecture of thinking. Schopenhauer's ethics, in the same manner as his metaphysics, grows from his critique of Kant, which does not diminish his debt to Kant (On the relationship between Kant's and Schopenhauer's metaphysics, see Räsänen 2005; Viljanen 2009). Schopenhauer considers Kant's model of the two kingdoms as "Kant's greatest and most brilliant merit in the service of ethics" (Schopenhauer 2010, p. 184) (The phrase "member of two kingdoms" is not Kant's own expression but rather an established interpretation of his practical philosophy. Kant only wrote about being a member of the sensible and the intelligible world. Schopenhauer didn't use the phrase "two kingdoms" either. He used the expression "coexistence of freedom with necessity" (Schopenhauer 2010, p. 185).).

Kant claims that the causality of freedom exists alongside the causality of nature. The human being is simultaneously a member of two kingdoms: the

kingdom of necessity (natural causality in the sensible world) and the kingdom of freedom (causality of freedom in the intelligible world) (Kant 1971, p. 104; Kant 2002, p. 80; see also Hudson 2002). The causality of freedom simply means that a human being has the capacity (faculty) to begin a process in the world just by the power of his or her will. This capacity exists despite the lack of empirical proof. Kant postulates without a deduction that there exists such a thing as the causality of freedom which is related to the timeless essence of the human being, i.e., the transcendental ego (Kant 2007, p. A552/B580):

The causality of reason in its intelligible character does not arise or start working at certain time in producing an effect. For then it would itself be subjected to the natural law of appearances, to the extent that this law determines causal series in time, and its causality would then be nature not freedom.

Schopenhauer agrees with Kant that humans have an *intelligible character* and an *empirical character*. Schopenhauer follows Kant's so-called transcendental aesthetic and claims that the *intelligible character* is not limited by time and space. Time and space are just forms of sensuous intuition (*Anschauung*). Things appear to have a spatial and temporal dimension but these dimensions are not the properties of a *thing-in-itself*. Schopenhauer takes from Kant also the division between *appearance* (the world of representation) and *thing-in-itself*. Unlike Kant, Schopenhauer associates *appearance* with the human's *empirical character* and *thing-in-itself* with the *intelligible character*. And to distance himself even more from Kant, Schopenhauer does not believe in "the freedom of will" in a Kantian sense (Schopenhauer believes in another kind of human freedom. See Schopenhauer 1969, pp. 286–293. Schopenhauer is very skeptical towards Kant's notion of the freedom of will, because it arises the question of "Can you will what you will?" and after that "Can you also will what you will to will?" *ad infinitum*. Furthermore, Schopenhauer was not satisfied with Kant's definition that causality of freedom is the ability to initiate a series of alterations by oneself without preceding causes. For Schopenhauer, that is just *liberum arbitrium indifferentiae*, e.g., free

choice of indifference. See Schopenhauer 2010, pp. 7–43. Schopenhauer's critique of Kant shows that Schopenhauer was truly a master of rhetoric and eristic. He even wrote a small book called *The Art of Always Being Right*. See Schopenhauer 2004.), but he still considers persons to be responsible for their actions because of their *intelligible character* and voice of conscience (Schopenhauer 2010, p. 186):

Freedom belongs not to the empirical, but only to the intelligible character. A given person's 'doing' is necessarily determined externally through motives and internally through his character; hence, everything that he does occurs necessarily. But in his 'essence', there lies freedom.

Schopenhauer writes that it is commonly thought that the will of the human being is free and independent. Schopenhauer states that every individual action is determined by the effect of motive on the character. Effect and cause are one form of the universal law of principle of sufficient reason (*principii rationis*), and human action, like every phenomenon (appearance), follows this law. The *thing-in-itself*, or a *noumenal thing*, is free from the law of principle of sufficient reason (of acting). "But because in self-consciousness the will is known directly and in itself, there also lies in this consciousness the consciousness of freedom" (Schopenhauer 1969, p. 113). A priori (before experience), everyone considers himself to be quite free, but a posteriori (through experience), everyone finds that he is not free. Schopenhauer cites Helvetius: *La Liberté est un mystère* – Freedom is a mystery (Schopenhauer 2010, p. 33).

In his work, Schopenhauer combined eighteenth-century Enlightenment, early nineteenth-century Romanticism, and Ancient Indian philosophy. His philosophy contains strong pessimism, but still there can be found some positive Stoic and Buddhist notions of morality. Schopenhauer claims that the source of morality is our natural feeling of compassion (*Mitleid*) which comes to contradiction with the basic strive of "will-to-live" (*Wille zum Leben*) (see Salomaa 1944, pp. 305–308). According to Schopenhauer, all animals, including humans, are manifestations of the will-to-live. The will-to-live is for Schopenhauer the ultimate thing-in-itself (see

Schopenhauer 1969, pp. 112–120). Everything else is *phenomenal* – Platonic shapes on the wall. The will to live is *noumenal* (Platonic *eidos*). The *noumenal* world is the “world as will” (*Die Welt als Wille*) and the *phenomenal* world is the “world as representation” (*Die Welt als Vorstellung*). In a Spinozian manner, the (metaphysical) will is the world, but humans cannot have knowledge about the will. Human knowledge concerns spatial and temporal phenomena (appearances) wherefrom humans form representations – Platonic shadows of the shadows. In the *phenomenal world*, will manifests itself as the will-to-live. To deny will is same as denying the world and will-to-live, which is for Schopenhauer the ultimate moral end. Will is the source of all suffering, and a person who is free from willing is at the highest state of morality aimed at peaceful nothingness (see Schopenhauer 1966, pp. 603–633).

For Schopenhauer, the will-to-live is not an empirical will. Will is metaphysical (*noumenal*), and humans cannot have any empirical knowledge of this will. Nevertheless, we do know or feel it intuitively. Intuitively we understand that there exists some irrational essence that blindly forces us to live and makes us want to exist. We have this intuition because we have a body, and the body is a manifestation of will or the objectivity of will (Schopenhauer 1969, p. 100). Through our bodies, will makes us prefer existing over nonexisting. It makes us will rather than deny willing. Will is irrational, senseless, original, and groundless (Schopenhauer 1969, p. 290). Intuitively we follow the irrational ethics of the will-to-live. Intuitively we grasp the greedy hunger for life, but we cannot find any deeper meaning for life. We are thrown into existence without knowing what the point of living is. The will-to-live contains no deeper meaning. The will-to-live just produces the eternal circulation of life wherein a single individual’s life or death is unimportant. According to Julian Young’s interpretation, will is not only bad but also clearly mad (Young 2005, p. 82).

The will-to-live does not produce any lasting satisfaction or happiness. Quite contrary, blind and irrational will produces needs, anxiety, deprivation, distress, and suffering. Any achieved

satisfaction is limited and provisional. The grass is always greener on the other side of the fence. The will-to-live makes our existence almost a living hell. Happiness is more like an illusion, and the simple existence of evil makes us question the value of existence as a whole. Referring to Lord Byron, Schopenhauer declares (Schopenhauer 1966, p. 576): “For that thousands had lived in happiness and joy would never do away with the anguish and death-agony of one individual; and just as little does my present well-being undo my previous sufferings.” Mankind cannot expect any progress to happen related to the decreasing of suffering. Wars, crimes, and other forms of evil will always reappear *eadem sed aliter* – in the same but still a different way. Schopenhauer comes to the ultimate pessimistic conclusion (Schopenhauer 1966, p. 171): “. . . we very soon look upon the world as something whose non-existence is not only conceivable, but even preferable to its existence.”

The existence of the world we cannot – and should not – undo, and suicide is not an option. The best that we can do, according to Schopenhauer, is to liberate ourselves from suffering by denial of the will-to-live. That is the road to salvation. Will has the power to freely abolish itself. Schopenhauer refers to this as the euthanasia of the will (see Schopenhauer 1966, pp. 634–639). Here we have a certain kind of Schopenhauerian theory of moral development. It is a road from suffering to holiness and self-denial. Schopenhauer claims that mankind has two ways to liberate itself from suffering and needing: art and morality. With art we can achieve only momentary liberation in a form of aesthetic consciousness, which is quickly followed by a return to *mundane* suffering (Schopenhauer’s aesthetics consciousness in mind Adorno & Horkheimer made their famous interpretations on Odysseus and Sirens (Adorno & Horkheimer 1997, p. 34): “What Odysseus hears is without consequence for him; he is able only to nod his head as a sign to be set free from his bonds; but it is too late; his men. . . leave him at the mast in order to save him and themselves. . . The prisoner is present at a concert, an inactive eavesdropper like the later concertgoers, and his spirited call for liberation

fades like applause.” Adorno & Horkheimer transformed *will-to-live* into “treadmill of self-preservation of bourgeois subjectivity”). Only morality, which leads to a total denial of the will, can guarantee ultimate liberation, but only a few of us can achieve it.

Schopenhauer presumes that besides egoistic feelings like envy, humans have feelings of compassion (Schopenhauer 2004, p. 3):

Fundamental disposition towards others, assuming the character either of Envy or of Sympathy, is the point at which the moral virtues and vices of mankind first diverge. These two diametrically opposite qualities exist in every man; for they spring from the inevitable comparison which he draws between his own lot and that of others. According as the result of this comparison affects his individual character does the one or the other of these qualities become the source and principle of all his actions. Envy builds the wall between Thee and Me thicker and stronger; Sympathy makes it slight and transparent; nay, sometimes it pulls down the wall altogether; and then the distinction between self and not-self vanishes.

The basic principle of Schopenhauer’s morality of compassion is following (Schopenhauer 2010, p. 170):

‘Neminem laede, immo omnes, quantum potes iuva – Harm no one; rather, help everyone as much you can.’ This is and remains the true, pure content of all morals. . . From the other side, egoism screams with a loud voice: ‘Help no one; rather harm everyone if it brings you advantage;’ indeed, malice gives the variant: ‘but harm everyone as much as you can.’

The road from egoism to the total denial of the will-to-live is interpreted here as the Schopenhauerian theory of moral development. It has several stages or forms of character: The first is the stage (level zero, see Table 1.) of natural egoism which is a phenomenal expression of the *noumenal* will-to-live. From natural egoism, one can degenerate into the stage of malice (level –1). In this stage, a person gets satisfaction by hurting some person or animal. We could count aesthetic consciousness as stage 0.5, at which normal and egoistic consciousness ceases and the “I” becomes “decentered.” Actually, aesthetic consciousness is not a stage per se but a mode of consciousness of a normal person (whereas malign people and

Schopenhauer and Nietzsche on Moral Growth, Table 1 Reconstructed Schopenhauerian theory of moral growth

	–1	Malice	A person’s will another’s woe.
	0	Egoism	A person’s will one’s own weal.
	½		Disappearance of the usual egocentricity in a form of a aesthetic consciousness .
	1	Ordinary level compassion	Mixture of egoism and compassion.
	2	Saint-level compassion	Strong feeling of compassion, life of an ascetic.
	2½	Final level of saintness	Total withdrawal of all willing.

saints are considered abnormal). Like Kant, Schopenhauer thinks that beauty promises us happiness and pleases us without interest (*ohne Intresse; le désintéressement*). Aesthetic consciousness is a kind of Sabbath from the hard labor of always willing to act upon one’s own interest. If one is able to experience beauty without interests, one is not totally bad. Schopenhauer quotes his family friend Goethe (Schopenhauer 1969, p. 221): “Whoever beholds human beauty cannot be infected with evil; he feels in harmony with himself and the world.”

The second stage (level 1) is perfecting of one’s virtues of love and sympathy (partial denial of the will-to-live) and leaving the stage of natural egoism. This is the best thing that most of us can do. We can never entirely deny our egoism but we can limit it. We can listen to the voice of our conscience and enhance our natural feeling of compassion. The third stage (level 2) is that of a holy man and means a total denial of the will. It is attained only through asceticism and complete self-surrender. The person turns away from all the pleasures of life. This is the way of perfect virtue. It cannot be taught, and systems of ethics cannot produce a holy man. A saint or holy man understands the metaphysical unity of all things and feels everybody’s suffering as his own. A saint tries to ease others’ suffering, but in the

final stage (level 2.5) a saint gives up all willing, including wanting to help others, and withdraws from all earthly activities. We present the following Schopenhauerian moral stages.

If we force Schopenhauer's moral theory into developmental theory, we get an ethical scale on which one can go forwards or backwards. In *Parerga and Paralipomena*, Schopenhauer claims that the will-to-live causes embitterment, which might lead to a situation wherein one tries to lighten one's own suffering by agonizing others. This road eventually evolves into real malice and evilness, and the person gains satisfaction of others' suffering (see Schopenhauer 2000, p. 215). In this case, we can speak of moral degeneration. Schopenhauer wants people to avoid the road to embitterment and selfishness. He offers the road to salvation, which is the narrow path of asceticism and the holy man. In a way, this is Schopenhauer's notion of the *Übermensch*. The path of the holy man is only for the few and elected.

We cannot say that Schopenhauer has a theory of moral growth, because he insists that individual character is innate and unalterable. Though nobody is born with an innate malign character, one cannot become a saint if that is not one's innate purpose. Nevertheless, you can hope that there is a little saint inside you and act accordingly. That actually is Schopenhauer's practical advice. One must try to feel compassion like a saint feels and stop estimating persons by their worth of dignity (Schopenhauer 2000, p. 202):

I would, therefore, like to lay down the following rule in contrast to the above-mentioned moral principle of Kant. In the case of every man with whom we come in contact, we should not undertake an objective estimation of his worth and dignity; and so we should not take into consideration the wickedness of his notions; for the first could easily excite our hatred and the last our contempt. On the contrary, we should bear in mind only his sufferings, his need, anxiety, and pain. We shall then always feel in sympathy with him, akin to him, and, instead of hatred or contempt, we shall experience compassion; for this alone is the *ἀγάπη* [agape] to which the Gospel summons us. The standpoint of sympathy or compassion is the only one suitable for curbing hatred or contempt, certainly not that of seeking pretended 'dignity'.

Friedrich Nietzsche: Immoralist

Nietzsche's moral theory can be described as master-morality. His idea of moral is essentially aristocratic, and it does not include an idea of equality or kinship between all human beings. Master-morality is the morals of the few, who are essentially better than others. Master-morality is to be understood as a negation to the so-called slave-morality, which is closer to our common understanding of morality. The common notion of morality includes certain moral principles and virtues like equality and universality, goodness and happiness, compassion (pity), and caring for other people. For Nietzsche, it was *pity* which needed to be overcome, because it represents weakness. Hence his view on morality and moral growth is very different from Schopenhauer's, even though Schopenhauer was one of the most important philosophers for Nietzsche. Nietzsche sees Schopenhauer as a great teacher and a worthy opponent to his ideas. Schopenhauer saw compassion and pity as the ground for morality. For Nietzsche, those feelings are the lowest and the most destructive things, and they are features of the slave-morality of the masses. Nietzsche would have never said this, but from Nietzsche's point of view Schopenhauer is "a slave-lover or herd-lover."

According to Nietzsche, masses are like herding animals who only seek immediate satisfaction and release from senseless suffering. Their moral belongs to the lower slave-morality, and it is quite senseless to offer them a higher education. Only a selected group of people are worthy of being educated, and even fewer are capable of educating. There must be a different moral and a different education for the noble and for the masses. Nietzsche declares that the education of the masses cannot be the goal. Rather, it must be the education of individual, selected human beings – in other words, geniuses.

The only value of the masses is that they are needed when noblemen are educated in the spirit of master-morality. The masses are a kind of material storage from which noblemen can rise. The masses are not worthy of education. Education is a kind of mentor–student relation.

Education has nothing to do with either the majority of children or the majority of adults. The goal is to educate those few decorous students who understand the importance of committing themselves to the power of the genius-teacher and following him. Nietzsche describes this concept through the analogy of two kinds of travelers: mass travelers and the rarer lone travelers on the way to education. If you chose to follow the path of the smaller group, the road will be more difficult to follow; it will be steeper and more winding. The first path is quite easy to follow, which is perhaps why most of us choose it. And as you travel along this path, you are sure to encounter many likeminded souls traveling both in front of and behind you. The other path will offer less companionship and, as mentioned above, will be more difficult to follow, steeper, and often dangerous. Three types of people belong to this smaller group. First and foremost, is the teacher-philosopher, i.e., genius. Secondly, are the students who are likely to become geniuses, the first-rate talents. And thirdly, are the group of students who are needed in the process of the birth of genius. They are assistants who are second- and third-rate talents. Nietzsche considered himself to be a philosopher in this elitist group. Moreover, in the text *Schopenhauer as Educator*, it is Nietzsche who is the hero, not Schopenhauer, because he understands Schopenhauer's brilliance and genius, which elevates him to Schopenhauer's level and even beyond it (Kakkori 2008; Nietzsche 2004, p. 96, 1983, pp. 175–176) (The text *Schopenhauer as educator* is actually about Nietzsche as educator. See example Fitzsimons 1999.).

The true teacher is a philosopher, and for Nietzsche it was Schopenhauer. True teachers are great philosophers who teach the truth about things. These great philosophers do not give lectures every day, because they know that they cannot always speak about truth and true things. They also know that there are days when they cannot think of anything. A true teacher can also select his students, so he does not have to speak to the masses. According to this idea, lecturing on the history of philosophy is not speaking of truth. Nietzsche refers to those university philosophers

who must teach every day and cannot choose their students as “learned” – as opposed to philosophers (Nietzsche 1983, p. 186.).

Masters and Masses – Bad and Evil

Nietzsche presents his idea of morality and its division into master-morality and slave-morality in his book *Beyond Good and Evil* (2009). The division of people into the masses and the few and privileged is typical for Nietzsche in his entire production. Nietzsche considers master-morality as higher system of morality which makes a distinction between good and bad, or between “life-affirming” and “life-denying.” Wealth, strength, health, and power, the sorts of traits found in the Homeric hero, count as good, while bad is associated with the poor, weak, sick, and pathetic, the sorts of traits conventionally associated with slaves in ancient times. Examples of those who belong to the masters and whom Nietzsche admired are Alcibiades, Caesar, Descartes, Napoleon, and Leonardo da Vinci.

To the slave-morality belongs the difference between good and evil. The embodiment of slave-morality is the pregnant woman. Nietzsche associates slave-morality with the Jewish and Christian traditions and to the democratic movement. (Nietzsche 2009, fragment 202; see Hargiss 2011) Value emerges from the contrast between good and *evil*: good being associated with otherworldliness, charity, piety, meekness, and submission; evil seen as worldly, cruel, selfish, wealthy, and aggressive (Nietzsche 2009, fragment 260):

The noble type of man separates from himself the beings in whom the opposite of this exalted, proud disposition displays itself he despises them. Let it at once be noted that in this first kind of morality the antithesis ‘good’ and ‘bad’ means practically the same as ‘noble’ and ‘despicable’, – the antithesis ‘good’ and ‘evil’ is of a different origin.

Good means a different thing to noblemen and to the masses. The noblemen belong to a world wherein there is no division between good and evil – like the title of Nietzsche's opus *Beyond Good and Evil* (*Jenseits von Gut und Böse*) indicates. This other world does not mean the Kingdom of Heaven, but rather the world where the Nietzschean hero, the *Übermensch*, rules by

Schopenhauer and Nietzsche on Moral Growth, Table 2 Development of the moral of mankind according to Nietzsche (2009, fragment 32).

	Period	Time	Value of action
	PREMORAL period of mankind	The longest period of human history	Value is dependent on the CONSEQUENCES of action.
	MORAL period of mankind	Last ten thousand years	Value is dependent on the INTENTION of the action.
	ULTRAMORAL period of mankind	Nowadays, among immoralists (Nietzsche, Übermensch), or some day in the near future.	Value of action is outside of moral. Value of an action lies in that which is NOT INTENTIONAL.

revaluating all values. There is no more anything evil, only good or bad according to whether it is good or bad for the few noblemen. This moral is not for all people. Therefore, there must be different kinds of moral to different kinds of people (Nietzsche 2009, fragment 228): “The requirement of one morality for all is really a detriment to higher men, in short, that there is a distinction of rank between man and man, and consequently between morality and morality.”

The well-being of the Nietzschean hero is the only value. What happens to most of the people, to the masses, has no importance or value. It would be easy to interpret Nietzsche’s moral to be individual and subjective. But that is not correct – Nietzsche’s moral is not founded on individual decision, but rather on hierarchy of ranging order (Salomaa 1988, p. 51).

Valuable is what benefits noblemen. Nietzsche always looks into the world through the eyes of the noblemen. For example, in one of his texts he describes how young men are having a dialog with an older wise man up on a hill while watching at the same time a larger group of people wandering down in the valley. Zarathustra wanders alone looking at the world from the perspective of outsider. He never takes into account how things are for the masses, or what is good for the masses. There is no Kantian maxim nor virtues, only an order of the hierarchy of people. Both Kohlberg (1969) and Gilligan (1993) would consider this the lowest stage of moral development, but for Nietzsche it is an outcome of a nobleman’s moral development. Master-morality has no developmental relation to slave-morality. Master-morality and slave-morality are two separate forms of moral.

Nietzsche finds three historical periods in the moral development of mankind: premoral period, moral period, and ultramoral period. In the premoral period, the value or nonvalue of an action was inferred from its consequences; the action in itself was not taken into consideration anymore than its origin. In the moral period, the last ten thousand years, the value of action was inferred from its origin, and this origin is the intention of the action. In other words, the value of an action lay in the value of its intention. The ultramoral period is the period of the chosen few who are immoralists, like Nietzsche. The task for the immoralists is to surmount morality itself. The immoralists are members of master-morality. They are strong and powerful, and they do not fear, and as such they are beyond morality, because fear is the mother of slave-morality and herd-morality. Morality in Europe in the modern times is herd animal morality. The *Übermensch* is not a herd animal. He is a lion, an eagle, or a snake (Table 2).

For Nietzsche, there is only one imperative: “Know thyself!” This imperative is not of the same kind as Kant’s categorical imperative. Nietzsche’s imperative is not a moral one, even though it belongs to the development of the moral of mankind. In the premoral period, this imperative was totally unknown. In the moral period, it was the first attempt at gaining self-knowledge. The ultramoral period is the time of Nietzsche’s imperative. The imperative is not a moral one because it does not take into account other people, only oneself. Nietzsche sees no problem here because the whole point is to overcome the moral period and its focus to the intention of action, which keeps in mind the well-being of others.

The target of Nietzsche's ethical criticism is all forms of the slave-morality including Kantian deontological moral, utilitarianism, Schopenhauerian pity-morality, British sentimentalists, etc. All philosophers since Plato have made an error, because they wanted to give a foundation to morality. Nietzsche saw that the error is that morality itself has been regarded as something given. This means that the problem of morality itself and its existence has been omitted. Against pity, Nietzsche claims that he who feels pity is brought down to the level of the pitiful people. Pity makes person ill and weak. It is something which does not enhance life. In Nietzsche's *Zarathustra* (Nietzsche 1999), God dies in pity. When compassion or pity is considered as the basic principle of society, the will is denied. Schopenhauer makes the same point, but for him it constitutes the ultimate end of moral development.

Nietzsche and the Will

Nietzschean master-morality represents the will to power as revaluating all the values. The need for revaluating is the essence of Nietzschean nihilism. All old values have lost their meanings, even God is dead, and there is no transcendental horizon left. The will to power is all, and it is even better to will for nothingness than to deny the will to power. The opposite of the will to power is asceticism, which according to Nietzsche means the denial of life. Nietzsche's *Übermensch* is capable of the will to power and revaluating all the values. It seems also that the *Übermensch* has no pity or other weak sentiments; he is beyond all compassion and feminine feelings because they constrict the will to power (*Mitleid* is translated as *pity* when Nietzsche is using it. Schopenhauer uses *Mitleid* in a different sense, and Schopenhauer's *Mitleid* is translated here as *compassion*. *Mitleid* is always something very negative and destructive for Nietzsche. See Cartwright 1988, pp. 558–567.).

Moral growth means overcoming yourself by becoming what you are. This is what Nietzsche means by his slogan "Know thyself!". For Schopenhauer, moral growth means becoming something that is against the essence of the world,

which is the will-to-live. The Schopenhauerian ascetic holy man is an unnatural denier of life who has totally finished willing. Schopenhauer sees that the holy man possesses a mystical power to overcome the will. According to Nietzsche, there is no escape from willing, because "man would much rather will *nothingness* than *not* will. . ." (Nietzsche 1998, p. 118).

Nietzsche asks: "What does nihilism mean? That the highest values devalue themselves?" Devaluating the highest values, like beauty, goodness, and truth, means corruption and depravity. Even Nietzsche believes that time of nihilism has come, but he does not actually portray the decadence. He is interested in nihilism because it makes possible revaluating all the values, and this revaluating all the values is grounded on the will to power. Nietzsche says that the will to power is the innermost essence of being (Nietzsche 1968, p. 369 § 693). Willing in general always means willing to be stronger, willing to grow – and willing the means to this (Nietzsche 1968, p. 356, 675). Nietzsche's positive attitude toward willing is almost opposite to Schopenhauer's concept of the will. Nietzsche knows this and argues that what Schopenhauer calls will is a mere empty word (Nietzsche 1968, pp. 369, 692).

The will to power was not a problem for Nietzsche like it was for Schopenhauer. Nietzsche regards even ridiculous the way how Schopenhauer tries to overcome endless willing in the aesthetic experiencing of beautiful art. Schopenhauer follows Kant's idea of beauty. For Kant, beauty is at the same time universal and without interest. This beautiful has the power to ease endless willing. Nietzsche wonders how, for example, "under the enchantment of beauty one can look at *even* robeless female statues 'without interest'" (Nietzsche 1998, p. 72). For Schopenhauer, sexual looking at a female statue destroys the aesthetic experience whose purpose is to free the consciousness from willing, especially sexual willing which always leads to misery.

Will is the essence of power. Will actually wants willing itself, and this way it overcomes itself. Will wants to get stronger, and this means it wants more power. Will is not only wanting but

also demanding. It demands all power – power to reevaluate all the values. Accordingly to Nietzsche, there are no transcendental powers to give us our laws, neither a Kantian maxim to tell us what we should do, nor laws from God. This is the reason why Nietzsche makes the existence of all moral questionable and considers himself to be an ultra-moral being who is beyond all morality. His denial of moral and all transcendental made had a strong influence on twentieth-century philosophy, for example Martin Heidegger, Jean-Paul Sartre, and Michel Foucault. Our moral thinking has not recovered from Nietzsche's announcement of the death of God.

Conclusion

We can conclude that for Nietzsche, moral growth means overcoming oneself by becoming what one is. At the same time this means overcoming morality and becoming ultramoral or immoralist. This is not possible for the masses. The masses follow a slave-morality like Christianity or Schopenhauerian pity morality. The overcoming of morality is only possible for the master race. So there is no developmental link between slave-morality and master-morality. We can also conclude that for Schopenhauer, moral growth means coming to something that is against essence of the world. The essence of the world is the will-to-live. The Schopenhauerian ascetic holy man is an unnatural denier of the world and will. Schopenhauerian ascetic holy is total opposite of Nietzschean *übermensch*. *Übermensch* does not recognize golden rule or other imperative than "Know thyself!" The Schopenhauerian "Übermensch" is a kind of Jesus who lives beyond the golden rule because his purpose is to sacrifice his own needs for the sake of others (the mass). Nietzsche was intentionally anti-Christian. His teacher, Schopenhauer, tried to understand the idea of agape better than Christian.

Carol Gilligan's theory of moral development has many common features with Schopenhauer's moral theory. Schopenhauer and Gilligan share the same critique of Kantian moral cognitivism. Their most striking difference is that

Schopenhauer was not sensitive for gender issues. Schopenhauer is, like Nietzsche, a practical and theoretical chauvinist. Our construction of the Schopenhauerian model of moral development has some resemblance with Gilligan's theory of moral development. In both models, the starting point is some kind of egoistic or egocentric point of view. After that, the Schopenhauerian model is a kind of reversal of Gilligan's theory. For Gilligan, caring both for oneself and for others is a legitimate ethical standpoint and actually the highest possible ethical stance (Gilligan 1993, p. 74). For Schopenhauer, there is no true synthesis of caring for oneself and caring for others. The highest ethical stance is the way of absolute virtue which means the total sacrifice of one's own well-being for the sake of the other.

There is one way in which the Schopenhauerian model can contribute to Gilliganian notion of growth. Gilligan does not consider or empirically study the possibility of moral degeneration or moral unlearning. In certain circumstances, a person can deviate – or just decide to do so – from everyday egoism to plain malice or evilness. In some extreme situations, social structures even support this kind of moral degeneration (war crimes, Milgram experiment, deviant socialization, etc.). It is of utmost importance for any theory of moral development to consider the case of moral degeneration and its remedies *ex pre & ex post facto* (before and after the act).

Science, Naturalism, and Education

Martin Mahner
GWUP e.V., Rossdorf, Germany

The relationship between science and naturalism has been a topic of an ongoing debate in both the philosophy of science and science education. That science and naturalism are somehow related is usually taken for granted. What is at issue, however, is the exact nature of this relationship as well as the particular variety of naturalism involved. More precisely, is naturalism a contingent outcome of science or a necessary presupposition for doing science, and is it an ontological or a

methodological position? Although these questions belong in the philosophy of science, science education is concerned with them too, because it needs to know what to teach about the *nature of science*, and because it is faced with the challenge of supernaturalists who attempt to introduce creationism or intelligent design into the curriculum.

Naturalism

The evolution/creation controversy reveals the kind of naturalism involved here: naturalism as the opposite of supernaturalism. This naturalism is a set of assumptions about the furniture of the world and about the way the world works – and thereby about which entities and processes are admissible referents of scientific theories and explanations. Thus it is an *ontological* (or metaphysical) view. Roughly speaking, naturalism is the view that all that exists is our lawful spatiotemporal world. Its negation is supernaturalism: the view that our lawful spatiotemporal world is not all that exists because there is a nonspatiotemporal world transcending the natural one, whose inhabitants are intentional beings that are not subject to natural laws. Naturalism assumes that everything in the world works according to its own laws as opposed to laws imposed from above or no laws at all; that nothing comes out of nothing and nothing turns into nothing; and, consequently, that also our perceptions and conceptions, that is, the very processes of gaining knowledge, are not manipulated by external, in particular supernatural, agents but are themselves purely natural and lawful processes.

Note that a lawless world could be natural, too. But a lawless or chaotic world (in the traditional sense of “chaos”) would not be able to sustain the existence of complex beings with complex brains for a longer time, although they could randomly pop into (and out of) existence once in a while. For this reason, the concept of ontological naturalism usually includes the assumption of a lawful natural world, in which even randomness is not lawless as there are probabilistic and stochastic laws. Likewise, a supernatural world is not taken to be chaotic either.

The previous characterization is somewhat unsatisfactory because it seems to involve some circularity: natural is what is not supernatural, and supernatural is what is not natural. This problem can be avoided only by a full-fledged ontological theory describing the features of natural entities and elucidating the concepts of thing, property, law, event, process, and cause. Such theories, which must also address the status of mind and of abstract objects, do exist, but they are too complex to be summarized here (Bunge 1977; Mahner 2012).

Supernaturalism

In ordinary language, “supernatural” applies not just to religious entities, powers, or processes (gods, angels, demons, miracles) but also to profane ones (poltergeists, clairvoyance, psychokinesis). The latter might better be called “paranatural” because, possibly, they could just be yet unknown natural entities or abilities. For more than 150 years, parapsychology has unsuccessfully attempted to prove their existence so that the paranatural is most likely illusory (and parapsychology remains a pseudoscience). Yet if parapsychology were successful, the paranatural would probably be incorporated into normal science, thus becoming natural. Therefore, “paranatural” is mostly an epistemological attribute.

By contrast, the supernatural is something that supposedly exists and works beyond natural, spatiotemporal entities, laws, and processes. In fact, the supernatural is usually defined but negatively, that is, by negating certain natural properties. For example, “transcendence” is the negation of “immanence,” that is, *not* being located in our spatiotemporal world. Or, a first cause is nothing but an *uncaused* cause. Other properties of the supernatural are just natural properties raised to an absolute degree (omnipotence, omniscience). In this construal, the supernatural is only quantitatively different from the natural and as its attributes are still conceived of on the basis of familiar natural properties, it remains somehow intelligible. Perhaps it is this familiarity that blurs the line to the paranatural and that helps people to believe in the existence of such entities. As this conception is more or less anthropomorphic, many

theologians consider it primitive and unacceptable. So they take the supernatural to be *categorically* different from the natural. God, then, is the *Wholly Other*, not someone or something to be understood even by the faintest analogy with anything known natural; his properties are genuinely transcendent and essentially mysterious, ineffable, incomprehensible. These two types of the supernatural may be called *overnatural* and *transnatural*, respectively (Spiegelberg 1951).

Obviously, if something is by definition transcendent and ineffable, it is unintelligible. Nobody, neither theologians nor scientists, should be able to know and say anything about it. So the transnatural is by definition beyond the reach of science. However, it is also useless for the ordinary believer – and ultimately also for theology – because every discipline needs a subject matter to investigate. To obtain a modicum of intelligibility, conceptions of the supernatural usually combine overnatural and transnatural features. This allows the believer to oscillate between these two conceptions, depending on his argumentative needs. Only by referring to the overnatural can he claim that the supernatural meddles with the natural world at least occasionally and that science is able to study the supernatural. After all, if some overnatural entity interacted with the natural world, it would have to work by partly naturalizing itself, that is, by being able to produce natural causes and, in turn, be affected by them (Pennock 2000). If the overnatural worked through sheer magic, it would work through principally incomprehensible processes.

Scientific Methods and Evidence

A popular view among scientists maintains that science need not bother with philosophy, let alone ontology, at all: scientists should just apply and follow the scientific method. If science is ultimately about finding the truth, all that counts is evidence. Whether it confirms the natural or points to the supernatural, we should follow the evidence wherever it leads. This empiricist view assumes that both scientific methods (such as observation, measurement, and experiment) and

the evidence they produce do not depend on any ontological assumptions, such as naturalism.

Yet why would some scientists and philosophers maintain that science is based on naturalism? This becomes clear by analyzing a simple measurement, occurring in ordinary life or in science: measuring temperature with a thermometer. First, does this measurement occur in the real world or in our imagination only? Assuming that both the thermometer and the surrounding medium are real things, that is, being aware that the measurement in question is not merely a thought experiment, is an instance of ontological realism. Second, do scientists expect that the mercury in the thermometer moves capriciously or lawfully? Of course, scientists expect that there is a lawful relationship between some property of the surrounding medium (its kinetic energy or temperature) and some property of the mercury, namely, its density or expansion. As the mercury can expand only within the narrow glass tube, there is a lawful relationship between the height of the mercury column and the outside temperature. And this lawful relation always obtains under the same conditions and at all times so that the measurement can be repeated as often as needed. This is the lawfulness principle. Third, scientists also expect that they can cause the thermometer reading to go up or down, for example, by heating or cooling the surrounding medium. This requires some ontic causality principle (as opposed to an epistemological one).

Fourth, a tacit assumption is that the thermometer cannot be causally influenced in a *direct* way solely by our thoughts or wishes, that is, without the interposition of motoric actions of our bodies. Indeed, if the world were permeated by causally efficacious mental forces, scientists would have no reason to trust the reading of any measuring instrument or the results of any experiment. This is the no-psi principle. Fifth, what holds for natural entities applies *a fortiori* to supernatural entities. Scientists (tacitly) expect, then, that no supernatural entity manipulates either their scientific tests or their mental (neuronal) processes or both. This is the no-supernature principle. The reason for these last two assumptions is quite simple: the data obtained through observation, measurement, or experiment could not function

as evidence if they were the telepathic product of wishful thinking or of supernatural manipulation.

Naturalism as an Ontological Presupposition of Science

The ontological expectations listed in the preceding are held mostly tacitly, and even if scientists are not aware of them, they are built in in the very design of any scientific technique: it would make no sense to conduct measurements or experiments in the first place if these ontological expectations were different. Of course, it is logically possible that the world does not conform to these ontological expectations, either entirely or partially. In the first case scientific methods should fail, in the second case they should work only wherever or whenever the world does possess the required ontic properties. However, if the very functioning of scientific methods depends on whether the world has certain ontic properties, the above “expectations” actually constitute ontological *presuppositions*: they are necessary ontological conditions for doing science. Again, this does not entail that the world actually exhibits such conditions, but that scientific methods can work only wherever they obtain (Mahner 2012, 2014).

Now scientists have no reason to assume that the world is ontically patchy, but the starting point is that it is uniform: that naturalism applies everywhere. Thus they hold the ontological *null hypothesis* that there is no supernature. A null hypothesis usually negates that something is the case, in particular that something exists or that two variables are related. Examples: “Junk food is not the cause of obesity,” or “The Loch Ness monster does not exist.” The reason for this approach is simple: science cannot assert that something is the case without empirical evidence. So in order to prove some positive alternative hypothesis, its corresponding null hypothesis must be refuted empirically. However, there is an important difference between scientific and ontological null hypotheses: the latter are usually regarded as unfalsifiable by *direct* empirical evidence. But some ontological hypotheses may be disconfirmed *indirectly*. For example, science

could fail as a cognitive enterprise, either in its entirety or in some particular area, so that naturalism as an ontological view applying to the whole world might have to be reconsidered.

Can Science Study the Supernatural?

Empiricists, who believe that scientific evidence can be had without ontological presuppositions, offer long lists of conceivable supernatural interventions that could be studied by science (Fales 2013; Fishman and Boudry 2013). Their argument: if science can confirm the existence of the supernatural, it does not presuppose naturalism. For example, if angels descended from the sky and raised the dead or if studies on the effects of intercessory prayer yielded significant positive results, we would have empirical evidence for the supernatural and hence a valid test. At first sight, this sounds convincing, but a closer look at the hidden assumptions of these two examples, abbreviated *A* and *B*, reveals some problems.

Both *A* and *B* still presuppose that our perceptions and conceptions of these occurrences are natural processes, that is, that they are *not* the result of supernatural manipulation. Otherwise they would not provide evidence for a real event, but could not be distinguished from hallucination. *A* requires that supernatural entities are able to naturalize themselves at least to such a degree that they are perceptible and able to interact with natural matter. *B* presupposes that both the praying as a neurophysiological process and the healing as a biological process are partly natural. Only the intermediate step would involve supernatural causation, and it would also have to be partly natural, as the praying would have to affect a supernatural entity, who in turn must stimulate the healing process. Obviously, what must be involved here are merely overnatural entities. By contrast, transnatural events would not be detectable. Think of transsubstantiation: whatever scientific analyses we undertake, we see nothing but bread and wine. Another example is *continuous creation*: there is no way we could prove scientifically that God recreates the world moment by moment out of nothing to sustain our existence.

Now what could science find out about over-natural entities? Not much. Science would be able to *empirically* study only the *natural* aspects of *A* and *B*, that is, the natural effects of overnatural interventions. It would not be able to study over-natural entities *directly*, unless we could catch, for instance, an angel and hold it for questioning or even dissection. But if that were possible, we would be faced just with some unusual natural entity, not an overnatural one. So science may confirm that some spooky events occurred, but the possible explanations would be entirely theoretical. As in many other areas, science would have to infer the unobservable from the observable by postulating so-called *theoretical entities* that are able to explain the observable. However, as is well known, an inference from the observable to the unobservable is never conclusive, because different unobservables may explain the same observable.

For example, if there were reproducible evidence that intercessory prayer works, there would be various alternative natural hypotheses compatible with the evidence, such as a superior alien civilization playing a prank on us. In the philosophy of science, this is known as the problem of underdetermination. Whereas in science underdetermination is an overrated problem because it can often be overcome in practice, it remains a problem for supernatural hypotheses. After all, in science it is ontologically innocuous that for some evidence *e* there are alternative hypotheses consistent with *e*, because all these alternatives refer to natural entities or processes. In the case of a hypothesis referring to an over-natural entity, however, there are also alternative natural hypotheses compatible with *e*, even if they are as outlandish as the alien prank hypothesis. So would *e* ever be good enough to make scientists opt for something that is even more outlandish for involving a supernatural entity?

Supernatural Entities and Scientific Explanation

At first sight, invoking a supernatural cause to account for some fact does seem to have explanatory power. For example, intelligent design

creationists claim that the theory of evolution cannot explain how certain complex organs have originated. So they invoke a supernatural entity, an intelligent designer (who allegedly need not be, but is in fact God) who helped to create these organs. This answer appears to have explanatory power because, by analogy with human handicraft, we all understand what creating artifacts is about. Yet in fact it explains nothing because it explains too much. The problem is that an answer like “God made it the way it is” can be applied to all facts. Whatever exists and whatever happens can be explained by reference to the will and actions of some supernatural entity. But an explanation that explains everything explains nothing. Also, explaining the unknown by something magical and occult is an instance of the *obscurum per obscurius* fallacy. It may be argued that referring to supernatural entities is an appeal to ignorance, the respective explanations being therefore pseudoexplanatory. Indeed, as science would know nothing about the possible powers and intentions of such entities, explanations of some fact *x* would reduce to the form: some supernatural entity chose to do *x* for unknown reasons. Is this superior to “we do not know what caused *x*”?

Furthermore, there are two proliferation problems with overnatural explanations. First, if we admit one supernatural entity into the explanatory realm of science, we are on a slippery slope to admitting as many as we fancy. If we admit God as an explainer, we may as well admit demons, angels, fairies, and so on. Moreover, in most cases all these overnatural entities would do the same explanatory work, so it would be hard, if not impossible, to choose between competing supernatural explanations. The God hypothesis is not per se more plausible than others, it only appears to be, because in our culture we are more familiar with it. Yet this does not increase its scientific merit. Second, even if science could study the overnatural and incorporate it into its explanations, how would scientists know that those are final? Alternatively, what would they do if they also encountered explanatory gaps in the supernatural world? The analogous procedure would be to resort to super-supernatural entities to fill these gaps in the first-order supernatural world – and so

on. This illustrates the problems of the god-of-the-gaps approach.

The Relation Between Ontology and Methodology

In a realist philosophy, being is prior to knowing. That is, the furniture and structure of the world must make cognition possible in the first place, and they must allow for the successful application of scientific methods. Hence, for a methodology to make any sense and to work successfully, there must be an ontology that helps to explain the functioning of this methodology. The ontology explaining the methodology of science is naturalism.

Empiricist philosophers who maintain that science can study the supernatural appear to believe that scientific methodology would remain intact if supernatural entities were admitted as explainers in scientific theories. But if there were solid evidence for the existence of supernatural entities, it would be hard to not also admit a nonnaturalist epistemology and methodology in which special forms of cognition, such as revelation, religious experience, or whatever nonnatural ways of communication with the supernatural may obtain, are accepted as legitimate sources of knowledge and means of justification. Indeed, some theologians make a case for a theistic science (e.g., Plantinga 2001). This illustrates that methodology is not free of ontology, and that the standards of evidence of science are bound to naturalism.

If its methodology (including its standards of evidence) is essential to science, science can work only in a naturalist world. If there is a supernature interacting with our world, then science can study at most the natural part of this world, including perhaps the quasi-natural features of overnatural entities, assuming of course that, in so doing, our cognitive processes are not manipulated by the overnatural. The alternative is to give up the naturalist definition of science and transform it into a supernaturalist, if not theistic, science. The question is, however, whether this “new science” would be a progress or rather a counter-revolution.

Scientific Communication and the Open Society: The Emerging Paradigm of “Open Knowledge Production”

Michael A. Peters

University of Waikato, Hamilton, New Zealand

Introduction

The history of scientific communication, even in the postwar period, is a mammoth undertaking where technological developments and the new paradigm of open knowledge production seem to outstrip our capacity to give an adequate account of them. There is so much experimentation by way of new electronic journals launched and new projects being established that it is near impossible to document even the range in its diversity let alone

theorize its main characteristics and implications for modes of scientific communication. One source, perhaps the most comprehensive, provides a bibliography on scholarly electronic publishing that runs to 1,400 items in English under such categories as: economic issues; electronic books and texts; electronic serials; general works; legal issues; library issues; new publishing models; publisher issues; repositories, e-prints, and AOI (Bailey 1996–2006; see also 2001).

The history of electronic scientific communication itself is now nearly 20 years old if we date the process from the appearance of the first electronic journals. The electronic revolution of those first utopian years in the early 1990s with predictions of the collapse of the traditional print-based system, the demise of academic publishers, and the replacement by electronic journals has not yet come to pass. As Valauskas (1997) argues “electronic scholarly journals differentiate themselves from printed scholarly journals by accelerated peer review, combined with mercurial production schemes . . . The sheer interactive nature of digital journals . . . and the ability to access the complete archives of a given title on a server make that sort of publishing a significant departure from the long established traditions of print.” He concludes, “Electronic scholarly journals are indeed different from traditional print scholarly journals, but not as radically different as some would argue. They are different in terms of process, but not in terms of the ancient traditions of peer review and verification.” At the same time, while slower than originally thought there are certainly revolutionary changes taking place that I will refer generically to as “open knowledge production,” a term that might be said to embrace open source, open access, open “science” (referring to systematic knowledge), open courseware, and open education.

History of Electronic Forms of Scientific Communication

To begin let us remind ourselves that the history of scientific communication demonstrates that the typical form of the scientific article presented in print-based journals in essay form is a result of

development over two centuries beginning in seventeenth century with the emergence of learned societies and cooperation among scientists. *Journal des Sçavans*, the first journal, was published in Paris in 1665 (Fjällbrant 1997) as a twelve page quarto pamphlet, appearing only a few months before the *Philosophical Transactions of the Royal Society*, the oldest journal in continuous production (see the journal’s website where it is recorded “The Royal Society was founded in 1660 to promote the new or experimental philosophy of that time, embodying the principles envisaged by Sir Francis Bacon. Henry Oldenburg was appointed as the first (joint) secretary to the Society and he was also the first editor of the Society’s journal *Philosophical Transactions*.” The first issue appeared in 1665 and included Oldenburg’s correspondence with some of Europe’s scientists as well an account by Robert Boyle of a Very Odd Monstrous Calf. Subsequent early issues include “articles” by Robert Hooke, Issac Newton, and Benjamin Franklin. The entire archive is available online). The development of the journal and scientific norms of cooperation, forms of academic writing, and the norm of peer review was part and parcel of the institutionalization of science first with the development of the model of the Royal Society that was emulated elsewhere in Europe and the USA, and then later institutionalization received a strong impetus from the emergence of the modern research university beginning with the establishment of the University of Berlin in 1810 in the reforms of Humboldt. This institutionalization of science necessarily also was a part of the juridical-legal system of writing that grew up around the notion of a professional scientist and academic, the notion of the academic author, the idea of public science or research, the ownership of ideas, and academic recognition for the author who claimed originality for a discovery, set of results, or piece of scholarship (Kaufer and Carley 1993).

Over 180 years later, the form, style, and economics of scientific communication were to undergo another set of changes to its socio-technical ecology and infrastructure. The prehistory of the emergence of electronic forms of scientific communication can be traced back at least to Ted Nelson’s notion of “hypertext,” which he

coined in 1963 and went on to develop as a hyper-text system. It is also a prehistory that reveals the development of networking and network publishing in the Advanced Research Projects Agency Network (ARPANET) launched by the US Department of Defense in 1969 and in the Education Resources Information Center (ERIC) launched by the US Department of Education's Office of Educational Research and Improvement and the National Library of Education (ARPANET was discontinued in 1990 while ERIC advertises itself as "the world's largest digital library of educational literature" with free access to more than 1.2 million bibliographic records of journal articles <http://www.eric.ed.gov/>). In this context, it is important to recognize that the concept of "information" emerged from the combination of the development of modern military intelligence (breaking codes, deciphering messages, encoding information, resolving conflict of sources, etc.) and the development of new communication technologies, often also strongly related to the military context and the cooperation between the military and business sector, for instance, the US Advanced Research Projects Agency (ARPA) developed in response to Sputnik, the contribution of RAND to packet switching through its research on the control of missiles and the ARPANET constructed in 1969 linking the University of California at Los Angeles, SRI at Stanford, University of California at Santa Barbara, and University of Utah.

Here some account of the impact of computers on writing is required including the shift from: literacy to orality and the way that computers re-introduce oral characteristics into writing; linearity to connectivity; fixity to fluidity; and passivity to interactivity (Ferris 2002). Jay David Bolter's (1991) *Writing Space: The computer, hypertext and the history of writing* is the seminal text that explores the computer's place in the history of symbolic (textual) media. The consequences of the networking of science and culture have yet to be worked through fully yet certainly as Bolter points out the new definition of literacy is synonymous with computer literacy and while it is the case that the computer signifies the end of traditional print literacy it does not signify the end

of literacy. The Web has now spawned a whole set of new media genres and forms and the Internet has been accepted into education enthusiastically and in a way that previous technologies like television were not. We have not begun to identify systematically the way these new media forms and the development of visual literacy have and will impact upon scientific communication but already there have been some telling signs (see Woolgar 2000; Nentwich 2003).

The Economic Context and the Serials Crisis

A media industry overview conducted by Morgan and Stanley in 2002 revealed a US\$7 billion market for global STM publishing broadly divided into scientific publishing (with libraries as major markets) and medical publishing (with hospitals and practitioners as major markets) with Reed as the market leader. The report indicated that scientific publishing is the fastest-growing media sub-sector of the past 15 years and that since "1986 the average price of a journal has risen by 215% while the number of journals purchased has fallen by only 5.1%" (Morgan and Stanley 2002, p. 2).

Global Scientific Publishing Market Players, 2001

	2001 Revenues	2001 Market
	(US\$m)	Share (%)
Reed Elsevier (Elsevier Science)	1,055.3	23.3
American Chemical Society	357.3	7.9
Thomson	259.0	5.7
John Wiley & Sons	243.6	5.4
Inst. of Electrical & Elect. Engineers	200.3	4.4
Wolters Kluwer	169.3	3.7
McGraw-Hill	146.2	3.2
Taylor & Francis	144.6	3.2
Springer-Verlag	44.0	1.0
Others	1,916.9	42.3
Total Scientific Market	4,536.4	100.0

Source: Simba, Morgan, and Stanley (2002: 2)

The report concludes that the nature of the industry is unlikely to change although it will experience a cyclical slowdown due to budget cuts; large publishers will enjoy economies of scale through “bundling” and margins will expand for those publishers with successful online platforms.

In “The Oligopoly of Academic Publishers in the Digital Era” Vincent Larivière and his colleagues provide an account of the consolidation of the scientific publishing industry and its high profit rates. Analyzing some 45 million documents indexed in the Web of Science over the period 1973–2013 they show that “in both natural and medical sciences (NMS) and social sciences and humanities (SSH), Reed-Elsevier, Wiley-Blackwell, Springer, and Taylor & Francis increased their share of the published output, especially since the advent of the digital era (mid-1990s). Combined, the top five most prolific publishers account for more than 50% of all papers published in 2013”.

They comment further as part of their conclusion: Since the creation of scientific journals 350 years ago, large commercial publishing houses have increased their control of the science system. The proportion of the scientific output published in journals under their ownership has risen steadily over the past 40 years, and even more so since the advent of the digital era. The value added, however, has not followed a similar trend. While one could argue that their role of typesetting, printing, and diffusion were central in the print world..., the ease with which these function can be fulfilled—or are no longer necessary—in the electronic world makes one wonder: what do we need publishers for? <http://journals.plos.org/plosone/article?id=10.1371/journal.pone.0127502>

Their ingenuous question seems unable to take account of the fact that knowledge capitalism is not based on need but rather on opportunity, risk, profit and competition with a natural tendency toward monopoly, especially in a global digital world where extra users and new journals can be added to publishing platforms at virtually no extra cost.

The European Commission’s (2006, p. 5) report *Study on the Economic and Technical*

Evolution of Scientific Publication Markets in Europe corroborates and updates the Morgan & Stanley report confirming

The core STM (science, technology and medicine) publishing market is estimated between USD 7 billion and USD 11 billion, while in 2001 OECD countries allocated USD 638 billion to R&D. In the last 30 years, the prices of scientific journals have been steadily increasing. Between 1975 and 1995, they increased 200–300% beyond inflation.

The report goes on to record that as of 1995, publishers started to adopt digital delivery modes and to provide online access to their journals, but while the new technologies and the Internet have dramatically improved the accessibility of scientific publications for researchers, the actual access to the literature still relies on their library’s ability to pay subscriptions.

The report outlines the broad market trends from 1995 which is taken as the approximate start of the “electronic revolution” including the following main features that have remained constant since about 1975:

1. The increasing reliance on journals as the main channel for dissemination of scientific knowledge, with a growth that parallels the growth of research produced
2. The dominance of the “reader-pay” or “library pay,” as opposed to the “author-pay” model of journal dissemination
3. The existence of many publishers in the market, with two big groups of publishers: For-profits (FP) and Not-for-profits (NFP), the latter group including learned societies and university presses
4. The very fast growth of some big FP publishers, through new journal introduction, through the running of journals from learned societies, and through mergers (EC, 2006: 7)

In 1987, *New Horizons in Adult Education*, perhaps the earliest electronic journal, was established by the Syracuse University Kellogg Project (The journal is now titled *New Horizons in Adult Education & Human Resource Development* and run from the College of Education at Florida International University <http://education>.

fiu.edu/newhorizons/) and in 1989 *Psychology* (Psychology). In 1990 three online journals were launched: Electronic Journal of Communication, Postmodern Culture, and Bryn Mawr Classical Review) was established by Stevan Harnad the same year that the Newsletter on Serials Pricing was launched and there was serious talk of a crisis in scholarly communication which has grown ever more insistent. The origins of the crisis are the increasing volume and high cost for print journals and books together with loss of control in the marketplace and through copyright (see, for instance, the statements of the Universities of Connecticut and Iowa State respectively, <http://www.lib.uconn.edu/about/publications/scholarlycommunication.html>, <http://www.lib.iastate.edu/libinfo/reptempl/origins.html>).

The United Kingdom House of Commons Science and Technology Select Committee (2004) determined that in face of the high and increasing prices of journals imposed by academic publishers that the Government should develop a strategy to improve the provision of academic publications. The issue at stake is put succinctly quoting statistics from The Chartered Institute of Library and Information Professionals:

Whilst the volume of research output and the price of scientific journals has been steadily increasing - one respected source cites average journal price increases of 58% between 1998 and 2003 - library budgets have seen funding decreases. (Introduction).

The concern is that the results and profits of government investment in public good science are being increasingly diverted to the publishers' shareholders ("Between 1986 and 2004, journal expenditures of North American research libraries increased by a staggering 273%, with the average journal unit cost increasing by 188%. During this same period, the US Consumer Price Index rose by 73%, meaning that journal costs have outstripped inflation by a factor of almost 4" see the website Scholarly Communication at UIUC <http://www.library.uiuc.edu/scholcomm/journalcosts.htm>). The Select Committee on reviewing technological developments that have fundamentally changed the way that

scientific articles are published making it feasible to be published free online and acknowledging that several new models have emerged around the movement known as "Open Access" recommends

that all UK higher education institutions establish institutional repositories on which their published output can be stored and from which it can be read, free of charge, online. It also recommends that Research Councils and other Government funders mandate their funded researchers to deposit a copy of all of their articles in this way. The Government will need to appoint a central body to oversee the implementation of the repositories; to help with networking; and to ensure compliance with the technical standards needed to provide maximum functionality. Set-up and running costs are relatively low, making institutional repositories a cost-effective way of improving access to scientific publications. (Summary).

The Committee also suggests that the UK Government become a proponent for change internationally leading by example (The full report Scientific Publications: Free for all? is available as a pdf file). The report was seen in some quarters as an important step forward in the global movement for open access to scientific and medical literature. The Government's response was lukewarm: it was not convinced of the "serials crisis" arguing that consortia can make a big difference and, in general, it supported the concept of "healthy" competition in the publishing industry (A full account of the process and the UK Government's response is given by Steven Harnad at <http://www.ecs.soton.ac.uk/~harnad/Hypermail/Amsci/4131.html>. Harnad comments that the Committee originally had a vague remit to reform publishing but went on to discuss problems associated with journal publishing, affordability, pricing, and accessibility, recommending author self-archiving).

The Open Access Movement

The EC report also provides a useful summary of the Open Access Movement beginning with SPARC's (Scholarly Publishing and Academic Resources Coalition) launch in 1998 (<http://www.arl.org/sparc>). SPARC on its website

advertises itself as “an international alliance of academic and research libraries working to correct imbalances in the scholarly publishing system” and provides the following self-description.

SPARC (the Scholarly Publishing and Academic Resources Coalition), launched in 1998 as an initiative of the Association of Research Libraries, is an alliance of 222 academic and research libraries working to correct imbalances in the scholarly publishing system. These imbalances have driven the cost of scholarly journals (especially in science, technology, and medicine) to insupportably high levels, and have critically diminished the community’s ability to access, share, and use information. At the core of SPARC’s mission is the belief that these imbalances inhibit the advancement of scholarship and are at odds with fundamental needs of scholars and the academic enterprise.

(from its 2007 Program Plan)

The movement, its complexity, and its momentum can best be represented by a timeline of developments. Clearly no one paper or indeed book can give a complete picture of its developments and with every passing day the overall picture becomes more complex.

Open Access Timeline

I have focused on major reports including all the EC report’s significant events in the initial period 1990–2006. The most detailed timeline is that by Peter Suber of which this is but a small selection. (Suber’s timeline ends in 2009, <http://legacy.earlham.edu/~peters/fos/timeline.htm>; see also <http://symplectic.co.uk/open-access-timeline/>; <http://oad.simmons.edu/oadwiki/Timeline>). Marie Lebert’s chronology at <https://marielebert.wordpress.com/2015/06/20/openaccesschronology/> provides a simplified view that provides some of the major developments after 2006 including: SPARC: Open-access Journal Publishing Resource Index, Enabling Open Scholarship (EOS), Academia.eduOAPEN (Open Access Publishing in European Networks), CiteSeerX, The Open Access Directory (OAD), DASH (Digital Access to Scholarship at Harvard), Open Access Tracking Project (OATP), COAR (Confederation of Open Access Repositories), DataCite, Open Access Journal Bibliography, Bibliography on Citation Impact, IS4OA (Infrastructure Services for Open Access), Open Access,

The Research Impact Measurement – Timeline, to name some of the major developments.

Pre-1990 (I have focused on major reports including all the EC report’s significant events. The most detailed timeline is that by Peter Suber of which this is but a small selection. See his website.)	ERIC (1966), Project Gutenberg (1971), <i>New Horizons in Adult Education</i> (1987), <i>Psychology</i> (1989)
1990	<i>Electronic Journal of Communication, Postmodern Culture, Bryn Mawr Classical Review</i>
1991	<i>Surfaces, Behavior and Brain Sciences, Ejournal</i>
1992	First Symposium on Scholarly Publishing on the Electronic Networks
1993	<i>Aboriginal Studies Electronic Data Archive, Education Policy Analysis Archive</i>
1994	Digital Libraries Initiative, <i>Electronic Journal of Sociology</i>
1995	<i>Stanford Encyclopedia of Philosophy</i>
1996	Electronic Publishing Trust for Development

2002	Budapest Open Access Initiative, Creative Commons
2003	Bethesda Statement on Open Access Publishing, Berlin Declaration on Open Access to Knowledge in the Sciences and Humanities, US Public Access to Science Act
2004	UK House of Commons Science & Technology Report, Wellcome Trust Reports, OECD’s Declaration On Access To Research Data From Public Funding

(continued)

2005	Policy on Enhancing Public Access to Archived Publications Resulting from NIH-Funded Research, The Open Knowledge Foundation
2006	UK Research Council's Statement on Open Access, EC Commission Report, launch of Open J-Gate ("an electronic gateway to global journal literature in open access domain" (Informatics India Ltd), as of March 22, 2007, it indexed 3,913 open access journals)

What these reports and declarations have in common is a statement of commitment to the principles of open access and open knowledge production. By "open access," the Budapest Open Access Initiative (BOAI) means: free availability on the public internet, permitting any users to read, download, copy, distribute, print, search, or link to the full texts of these articles; crawl them for indexing; pass them as data to software; or use them for any other lawful purpose, without financial, legal, or technical barriers other than those inseparable from gaining access to the Internet itself. The only constraint on reproduction and distribution, and the only role for copyright in this domain, should be to give authors control over the integrity of their work and the right to be properly acknowledged and cited (Budapest Open Access Initiative).

As the BOAI public statement puts it, "[p]rimarily, this category encompasses...peer-reviewed journal articles, but it also includes any unreviewed preprints that [scholars] might wish to put online for comment or to alert colleagues to important research findings."

Typically, these statements and declarations also make reference to the serials crisis, the economics of academic publishing, and an emerging global intellectual property (IP) regime that expands and looks after the interests of IP owners without the same or sufficient regard for the rights of users, especially in the Third World. More activist associations provide histories of the open access movement and develop alliances across a variety of organizations involved with scientific communication including libraries and their associations, research institutions, universities and

university consortia, learned societies, open access journals, small university presses, government and State agencies, and publishers. There is general concern about the extent of new IP regulations, increased duration of copyright, and the extension of IP to new areas of activity including databases and software. There is also strong concern for questions involving the governance of the Internet, the protection of its intellectual commons, and the way that private interests are being allowed to muscle in and enclose some areas of the public domain (see Intellectual Property Reform and Open Knowledge, <http://www.soros.org/initiatives/information/focus/access/grants/reform>) (Höök 1999; Jacobs 2006; Willinski 2006).

Most of these statements also place their faith in the promise of open access and the architecture of the Internet to distribute and disseminate public knowledge. Thus, the Statement of the Libraries & Publishers Working Group (Bethesda Statement on Open Access Publishing, June 20, 2003 <http://www.earlham.edu/~peters>) runs

We believe that open access will be an essential component of scientific publishing in the future and that works reporting the results of current scientific research should be as openly accessible and freely useable as possible.

The Statement then itemizes a set of proposal for libraries and journal publishers aimed at encouraging the open access model. The Statement of Scientists and Scientific Societies Working Group from the same source reads:

Scientific research is an interdependent process whereby each experiment is informed by the results of others. The scientists who perform research and the professional societies that represent them have a great interest in ensuring that research results are disseminated as immediately, broadly and effectively as possible. Electronic publication of research results offers the opportunity and the obligation to share research results, ideas and discoveries freely with the scientific community and the public.

In the Preface to the Berlin Declaration (Berlin Declaration on Open Access to Knowledge in the Sciences and Humanities, October 22, 2003 <http://www.zim.mpg.de/openaccess-berlin>), there is a recognition of the way the Internet has

changed scientific practice focusing on how the Internet has emerged as a “functional medium for distributing knowledge” that will also significantly “modify the nature of scientific publishing as well as the existing system of quality assurance”:

The Internet has fundamentally changed the practical and economic realities of distributing scientific knowledge and cultural heritage. For the first time ever, the Internet now offers the chance to constitute a global and interactive representation of human knowledge, including cultural heritage, and the guarantee of worldwide access.

The Association of College & Research Libraries (ACRL) “Principles and Strategies for the Reform of Scholarly Communication,” issued August 28, 2003, defines scholarly communication as

the system through which research and other scholarly writings are created, evaluated for quality, disseminated to the scholarly community, and preserved for future use. The system includes both formal means of communication, such as publication in peer-reviewed journals, and informal channels, such as electronic listservs.

The Principles then examine the system in crisis mentioning specifically increasing prices, commercialization, and economic pressures facing university presses and the humanities, creeping licensing agreement and the expansion of copyright, long-term preservation and access to electronic information, and the way that powerful commercial interests have been successful at the national level in limiting the public domain and reducing principles of fair use. It goes on to stipulate a set of principles and strategies.

Both the OECD (Organisation for Economic Co-operation and Development (OECD) Declaration on Access to Research Data From Public Funding, January 30, 2004 <http://www.oecd.org>) and the UN World Summit on the Information Society (UN World Summit on the Information Society Declaration of Principles and Plan of Action, December 12, 2003) emphasize the importance of shared knowledge and the significance of the international exchange of data, information and knowledge for the advancement of scientific research and innovation, and for meeting the development goals of the Millennium

Declaration. In addition, open access is recognized as having the potential to maximize the value derived from public investments in science, help with training researchers, increase the scale and scope of research, and enhance the participation of developing countries in the global science system. The World Summit goes further by politically linking open access and open knowledge production to principles of democracy and to fundamental human rights of freedom of expression and opinion under the United Nations. Furthermore, it emphasizes the role of governments in the promotion of ICTs for development, the importance of the information and communication infrastructure as an essential foundation for an inclusive information society. There are a broader set of arguments that predate open access, open knowledge production systems, and open education that argue for the necessity of open information to democracy more broadly (see Peters 2007).

The Open Society

Whatever the historical origins, the term “open” has now become associated with “open knowledge production,” although Benkler (2006) and others also use other terms such as “commons-based production.” In any event, the term open has resonance with systems theory, cybernetics, and with open systems. In systems theory, an open system is defined as a system where matter or energy can flow into and/or out of the system which is thus in continuous interaction with its environment. In computer science, open systems are computer systems that provide some combination of interoperability, portability, and open software standards. The term openness as developed from systems theory especially as adopted and modified in economics, sociology, and politics can mean “open” markets, “open” science, and “open” institutions. In this sense, openness is opposed to secrecy and associated also with both participation and self-governance. Often the case is made for the openness of markets and political systems in Eastern Europe following the demise of the closed system of Soviet authoritarianism although there is no conclusive data on the

empirical relation between liberalization in the political and economic senses (i.e., “free trade,” “open capital markets” or globalization, and democracy). As Eichengreen and Leblang (2007: 4) argue

The idea that globalization promotes the diffusion of democratic ideas goes back at least to Kant (1795). Schumpeter (1950), Lipset (1959), and Hayek (1960) all argued that free trade and capital flows, by enhancing the efficiency of resource allocation, raise incomes and lead to the economic development that fosters demands for democracy. Within modern political science, the connections between economic and political liberalization is one of the foundational topics of international political economy.

This kind of understanding, for instance, underlies The Open Society Institute (OSI), a foundation created in 1993 by George Soros (Soros became acquainted with Karl Popper’s ideas on the open society when he was at the London School of Economics and writing a number of books defending the open society including *Open Society: Reforming Global Capitalism* (2000); *The Crisis of Global Capitalism: Open Society Endangered* (1998); *Underwriting Democracy* (1991); and *Opening the Soviet System* (1990)) to support his foundations in Central and Eastern Europe and the former Soviet Union established to help countries make the transition from communism. The OSI

aims to shape public policy to promote democratic governance, human rights, and economic, legal, and social reform. On a local level, OSI implements a range of initiatives to support the rule of law, education, public health, and independent media. At the same time, OSI works to build alliances across borders and continents on issues such as combating corruption and rights abuses.

(The Open Society Institute)

The concept of the “open society” was given its first formulation by Henri Bergson (1977 orig. 1932) in *The Two Sources of Morality and Religion* as an outgrowth of his *Creative Evolution* (orig. 1911). He described two sources of morality, one open whose religion is dynamic, the other closed whose religion is static. Only the former is both creative and oriented toward progress; it is genuinely universal and aims at peace.

Some years later, Karl Popper (1945) wrote *The Open Society and its Enemies* while a political exile in New Zealand during 1937–1943. It was an influential two-volume work that criticized historicism (Plato, Hegel, and Marx) and provided a defense of the principles of liberal democracy. His aim in this work was not unrelated to his doctrine of fallibilism, especially in relation to the social sciences and its powers of prediction, and the promotion and defense of the critical ethos in science. The relationship of Popper and his ideas to Hayek is still a largely unwritten story; Hayek was responsible for championing Popper’s appointment at the LSE and cited him first in his early “Economics and Knowledge” 1936 paper which established the field of the economics of knowledge and heralded the “knowledge economy.” There is some evidence that Hayek’s attack on central planning strongly influenced Popper’s attack on historicism and closed societies (Caldwell 2003).

There are some general arguments for making the association between the open society and the knowledge economy. Joseph Stiglitz, the renegade ex-Chief Economist of the World Bank who resigned over ideological issues draws an interesting connection between knowledge and development with the strong implication that universities as traditional knowledge institutions have become the leading future service industries and need to be more fully integrated into the prevailing mode of production. He asserts, “We now see economic development as less like the construction business and more like education in the broad and comprehensive sense that covers, knowledge, institutions, and culture” (Stiglitz 1999a, p. 2). Stiglitz argues that the “movement to the knowledge economy necessitates a rethinking of economic fundamentals” because, he maintains, knowledge is different from other goods in that it shares many of the properties of a “global” public good. This means, among other things, a key role for governments in protecting intellectual property rights, although appropriate definitions of such rights are not clear or straightforward. It signals also dangers of monopolization, which Stiglitz suggests, given the economies of scale to be achieved, may be even greater for knowledge

economies than for industrial economies. In more technical terms, knowledge is nonrivalrous, that is, knowledge once discovered and made public operates expansively to defy the normal “law” of scarcity that governs most commodity markets. Knowledge in its immaterial or conceptual forms – ideas, information, concepts, functions, and abstract objects of thought – is purely non-rivalrous, that is, there is essentially zero marginal costs to adding more users. Yet, once materially embodied or encoded, such as in learning or in applications or processes, knowledge becomes costly in time and resources. The pure non-rivalrousness of knowledge can be differentiated from the low cost of its dissemination, resulting from improvements in electronic media and technology, although there may be congestion effects and waiting time (to reserve a book or download from the Internet). Stiglitz argues that these knowledge principles carry over to knowledge institutions and countries as a whole. If basic intellectual property rights are routinely violated, the supply of knowledge will be diminished. Where trust relationships have been flagrantly violated learning opportunities will vanish. Experimentation is another type of openness, which cannot take place in closed societies or institutions hostile to change. Finally, he argues that changes in economic institutions have counterparts in the political sphere, demanding institutions of the open society such as a free press, transparent government, pluralism, checks and balances, toleration, freedom of thought, and open public debate. This political openness is essential for the success of the transformation toward a knowledge economy (see Peters 2007).

Open Knowledge Production

Open or Free?

The terms “open knowledge” and “open knowledge production” are now well accepted in the literature to refer to a range of related models of “peer production” and “peer governance” that provide an emerging alternative to traditional proprietary models of knowledge production. The concept of “open” and “openness” deserves

special attention because it has come to christen a range of related activities concerned with the advantages of decentralized distributed networks that characterize what Benkler (2006) calls “commons-based peer production” and increasingly defines the political economy of the digital networked environment. The concept of “openness,” for example, has been applied to:

- Open source
- Open access
- Open content
- Open courseware
- Open communication
- Open archives
- Open urls
- Open learning
- Open education

Typically, as we saw with the BOAI definition, the concept “open” is sometimes associated with “free” although Richard Stallman prefers the term “free” in relation to both “free software” and Free Software Foundation. Stallman provides the following definition of “free”

Free software is a matter of the users’ freedom to run, copy, distribute, study, change and improve the software. More precisely, it refers to four kinds of freedom, for the users of the software:

- The freedom to run the program, for any purpose (freedom 0).
- The freedom to study how the program works, and adapt it to your needs (freedom 1). Access to the source code is a precondition for this.
- The freedom to redistribute copies so you can help your neighbor (freedom 2).
- The freedom to improve the program, and release your improvements to the public, so that the whole community benefits (freedom 3). Access to the source code is a precondition for this.

(Richard Stallman)

Stallman distinguishes “free” from “open.” While criteria for the latter was derived from his definition of free, it is something less than free and attempts to avoid the ethical question. He explains:

In 1998, a part of the free software community splintered off and began campaigning in the name of “open source.” The term was originally proposed to avoid a possible misunderstanding of the term

“free software,” but it soon became associated with philosophical views quite different from those of the free software movement... Nearly all open source software is free software; the two terms describe almost the same category of software. But they stand for views based on fundamentally different values. Open source is a development methodology; free software is a social movement.

(Richard Stallman)

Social Dimension of Open Knowledge Production

This may have been the case at the end of the 1990s, but today the notion of openness as it applies to the new convergences of open source, open access, and open knowledge production has clearly taken on the hue of a political and social movement. Open access and open knowledge production, sometimes also referred to A2K and P2P (peer-to-peer), now customarily refers to knowledge creation and sharing as well a range of other topics such as framing human rights and development, political economy of trade treaties and intellectual property, peer production and education, digital right management, and open archives (OA), OA publishing and libraries, among others.

In a study of how social production transforms markets and freedom, Benkler (2006, p. 1) begins his authoritative work with the following words:

Information, knowledge, and culture are central to human freedom and human development. How they are produced and exchanged in our society critically affects the way we see the state of the world as it is and might be; who decides these questions; and how we, as societies and polities, come to understand what can and ought to be done. For more than 150 years, modern complex democracies have depended in large measure on an industrial information economy for these basic functions. In the past decade and a half, we have begun to see a radical change in the organization of information production. Enabled by technological change, we are beginning to see a series of economic, social, and cultural adaptations that make possible a radical transformation of how we make the information environment we occupy as autonomous individuals, citizens, and members of cultural and social groups... The change brought about by the networked information environment is deep. It is structural. It goes to the very foundations of how liberal markets and liberal democracies have coevolved for almost two centuries.

Benkler is not alone in making what seem like extravagant claims. His work rests on and is in turn reinforced by a range of scholars mostly working in the related areas of informatics, international law, and political economy, including James Boyle, Hal Abelson, and Lawrence Lessig (see Peters 2007). They concur that the role of nonmarket and non-proprietary production promotes the emergence of a new information environment and networked economy that both depends upon and encourages great individual freedom, democratic participation, collaboration, and interactivity. This

“promises to enable social production and exchange to play a much larger role, alongside property - and market based production, than they ever have in modern democracies” (Benkler 2006: 3). Peer production of information, knowledge, and culture enabled by the emergence of free and open-source software permits the expansion of the social model production beyond software platform into every domain of information and cultural production.

Open knowledge production is based upon an incremental, decentralized (and asynchronous), and collaborative development process that transcends the traditional proprietary market model. Commons-based peer production is based on free cooperation, not on the selling of one's labor in exchange of a wage, nor motivated primarily by profit or for the exchange value of the resulting product; it is managed through new modes of peer governance rather than traditional organizational hierarchies and it is an innovative application of copyright which creates an information commons and transcends the limitations attached to both the private (for-profit) and public (State-based) property forms (I based this formulation on Michel Bauwens' P2P Foundation work at the P2P Foundation < P2P Foundation).

Related Approaches

As Michael Bauwens' P2P Foundation acknowledges there are and have been many thinkers and scholars who have expressed similar ideas in terms of the “High-tech Gift Economy” (Richard Barbrook), “the Public Domain” (James Boyle), “Copyright, Commodification and Culture” (Julia Cohen), “Peer Governance and Democracy” (Erik Douglas), “Connective Knowledge” (Stephen

Downes), and “An Economic Theory of Infrastructure and Commons Management” (Brett Frischmann 2005). There is a clear link of this set of ideas to those that employ ecological or environmental models to talk about the commons such as “Freedom In The Commons” (Yochai Benkler), “the Second Enclosure Movement” (James Boyle), “Circulation of the Commons” and “immaterial labor” (Nick Dyer-Witheford) and “the Tragedy of the Commons” (Garreth Harding). Others have sought to provide, in addition, an evolutionary thesis concerning societal evolution and/or changed states of consciousness, including “the movement from tribes to networks” (David Ronfeldt), “the Participatory Worldview” (David Skrbina), and “the Enactive Theory of Consciousness” (Evan Thompson). Finally, some scholars have sought to link open knowledge or commons-based production to a political system and especially to Marxism including “Socialist Individualism”(Magnus Marsdal), “The DotCommunist Manifesto” (Eben Moglen), “the tradition of civil socialism” (Bruno Theret) and “sharing culture” (Raoul Victor). This list is quite useful but also potentially difficult to decipher and interpret; three sets of ideas outlining the economics of open knowledge production systems, reinterpreting this phenomenon in terms of ecological or environmental models, shifts in evolutionary consciousness, and its exemplification of political models. The first set of links to ecological or environmental models is now well established across the literature whether it be in political economy, law, sociology, psychology, or some combination of all four (see Peters 2007); the second set of links to evolutionary models also in some way can be considered an extension of the first set and is a powerful paradigm in psychology (computational models of cognition), philosophy (connectionist epistemology), and anthropology (There are a number of dominant precedents for this work including that of the so-called Cybernetics Group sponsored by the Macy Foundation series of conferences beginning in 1946 (Feedback Mechanisms and Circular Causal Systems in Biological and Social Systems) and including Gregory Bateson, Julian Bigelow, Frank Fremont-Smith, Kurt Lewin, Warren McCulloch,

Margaret Mead, John von Neumann, Northrop, Arturo Rosenblueth, Claude Shannon, and Norbert Wiener, among others (see Heims 1993; Dupuy 2000). Bateson’s (1972) *Steps to an Ecology of Mind* is one of the classics to emerge but see also more recently Piero Scaruffi’s (2006) *The Nature of Consciousness* that attempts a synthesis of Philosophy, Psychology, Computer Science, Mathematics, Biology, Neurology, and Physics, at <http://www.thymos.com/nature/preface.html> or Ken Wilber on “integral psychology”); the third set seems particularly problematic with scholars from both marxist and liberal traditions of political economy claiming open knowledge production systems for their own, even though the principles they articulate are overlapping.

The Foundation for P2P Alternatives| provides the following brief sketch that outlines the relationships between these different set of ideas:

- That technology reflects a change of consciousness toward participation and in turn strengthens it
- That the networked format, expressed in the specific manner of peer-to-peer relations, is a new form of political organizing and subjectivity, and an alternative for the political/economic order, which, though it does not offer solutions per se, points the way to a variety of dialogical and self-organizing formats to device different processes for arriving at such solutions; it ushers in an era of “nonrepresentational democracy,” where an increasing number of people are able to manage their social and productive life through the use of a variety of networks and peer circles
- That it creates a new public domain, an information commons, which should be protected and extended, especially in the domain of common knowledge creation, and that this domain, where the cost of reproducing knowledge is near zero, requires fundamental changes in the intellectual property regime, as reflected by new forms such as the free software movement
- That the principles developed by the free software movement, in particular the General Public License, provides for models that could be used in other areas of social and productive life

- That it reconnects with the older traditions and attempts for a more cooperative social order, but this time obviates the need for authoritarianism and centralization; it has the potential of showing that the new egalitarian digital culture is connected to the older traditions of cooperation of the workers and peasants and to the search for an engaged and meaningful life as expressed in one's work, which becomes an expression of individual and collective creativity, rather than as a salaried means of survival
- That it offers youth a vision of renewal and hope to create a world that is more in tune with their values; that it creates a new language and discourse in tune with the new historical phase of "cognitive capitalism"; P2P is a language which every "digital youngster" can understand
- That it combines subjectivity (new values), intersubjectivity (new relations), objectivity (an enabling technology), and interobjectivity (new forms of organization) that mutually strengthen each other in a positive feedback loop, and it is clearly on the offensive and growing but lacking "political self-consciousness"

There is no doubt that there exist relationships between these different sets of ideas, and the emerging information environment is based upon a new form of open knowledge production that has strong implications for a kind of informational democracy (Peters 2007); whether the same set of relationships between these ideas can be extended to shifts of consciousness understood in ecological or evolutionary terms, or whether they imply a certain kind of political system or even spirituality is best treated as a set of working hypotheses at this stage. The actual complexity of establishing theoretical relationships between these different sets (rather than assuming them) is staggeringly difficult.

Second Language Acquisition: An Edusemiotic Approach

Saeid Atoofi

Department of Linguistics, University of Chile,
Santiago, MT, Chile

Experience; Language learning; Signification;
Sign user; Systems approach

Introduction

This entry introduces the methods of second language acquisition (SLA) from the perspective of edusemiotics (Semetsky and Stables 2014; Stables and Semetsky 2015). This approach moves away from educational psychology that traditionally informed research in SLA to a new direction in, specifically, philosophy of education informed by such important precursors to edusemiotics as

Charles S. Peirce, Gilles Deleuze, and Félix Guattari, as well as Gregory Bateson. Edusemiotics of SLA conceptualizes the process of teaching a second language not merely as a method of transferring words, grammatical structures, and phonology of a target language to a new learner as assumed in many language classrooms but as a way of conveying new kinds of experiences embedded in meaning-making systems of signs.

Mainstream SLA Theory and Philosophy

Since its inception, SLA theory and research have been strongly influenced by psychological theories of learning, such as behavioral, cognitive, and sociocultural theories. The grammar translation and audio-lingual methods of language acquisition followed the principles of behaviorism that addressed learning mainly as a habit formation realized through instrumental conditioning by implementing constant repetition of language forms. The cognitivist theory of learning coincided with Chomskyan revolution in linguistics and the birth of computers that compared learning to simple information processing and stressed the ways language learners internalized language forms, initially through conscious reflection and then through pattern-building practices. Since the 1980s, SLA has adopted the Vygotskian sociocultural theory (SCT) by focusing on learners' subjective experiences (e.g., accommodation to individual differences and learning strategies), by viewing learning as a social act (e.g., incorporating group activities in the classroom), and by utilizing language contents that are real, engaging, and socially relevant (e.g., introducing authentic materials). As it is shown further in this entry, these pedagogical advances were handicapped by top-down philosophical pressures of modern theoretical linguistics that kept derailing the SLA toward mostly cognitive models of education.

The Chomskyan Linguistics and SLA

Noam Chomsky found an elegant way of explaining common structures among many

languages termed universal grammar. Yet Chomsky crunched language to its core and dismissed an everyday use of language. Additionally he proposed that since all languages share similar principles, we could not have acquired these common features throughout our lives but were born with a language acquisition device or LAD. Such device is an assumed module in the brain equipped with principles of language structures that allow children to acquire language without much effort. Chomskyan linguistics considered language in the abstract rather than in concrete usage and practice, ignoring the most fundamental aspect of any communication, inclusive of pedagogy, that edusemiotics posits as the construction of shared meanings. The human language became devoid of its pragmatic force; instead the emphasis was placed on the surface level and mechanical structure of language. Following Chomsky who saw the I-language (internal language) different from the E-language (external language), the SLA classroom sought to teach a standard form of a target language that was not influenced by the presumed irregularities of language frequently found in everyday form of talk. Hence, mainstream SLA followed a pedagogical approach in which words had exact definitions, grammatical structures conveyed particular functions, and pronunciations were modeled after ideal native-like fluencies. At the conceptual level, any deviation from the alleged standard form of language was either ignored or reduced to “interferences.”

The *social turn* (Block 2003), as it is called, challenged Chomskyan legacy, but mainly at the pedagogical, rather than theoretical, level. It was claimed that language learning cannot be separated from its social and physical contexts. The social turn includes socio-cognitive, sociocultural, language socialization, complex adaptive system theory, as well as ecological and semiotic approaches. Building on Lev Vygotsky’s vision of language as a social sign and a tool, the social turn affirmed that learners do not merely learn a new method of communication but are acculturated into a new meaning-making system allowing them to perform meaningful social acts. The most important aspect of the social turn was to establish that language learners are not

incompetent communicators; rather, they attempt to construct an intersubjective space between their first and the target language. Complemented by complex adaptive system theory of SLA (Larsen-Freeman 2011), the social turn claimed that through local interactions between agents, including language learners and native speakers of the target language, a relatively stable pattern of language use emerges. Congruent with the naturalistic approach of fractal growths in the physical world, language learners expand on and access resources in the second language analogous to the growth of a branching tree. In general terms, the social turn emphasized the communicative aspect of language learning. However, it fell short of an understanding that the communication itself emerges from the interaction and interpretation; hence, it followed the same methodology of teaching a standard and ideal form of a target language.

SLA in the Context of Edusemiotics

Edusemiotics (Stables and Semetsky 2015) posits learning as not only a matter of cognitive understanding but of exploration and growth analogous to, and embedded into, the living process of semiosis as the evolution and transformation of signs. From the perspective of a language learner, acquisition is not simply reduced to the memorization of words and grammatical structures with fixed properties and functions. For instance, while mainstream SLA education evaluates the progress of a language learner with the finite acquisition of new vocabularies, grammatical structures, and other forms of a new language, edusemiotics considers all aspects of language as signs subject to interpretation and meaning-making entangled in the ever-growing symbolic network. Importantly, a sign is not just a tool reduced to a conventional relation to its referent but is intermingled in a web of concepts and ideas that relates to and brings out multiple references and signs. When a language learner is offered the opportunity to know that a word or grammatical structure signifies something, she does not reduce it to a simple one-to-one correspondence as a new word pointing to a

single referent. A native Spanish speaker, for example, does not merely learn that the word “*mesa*” in her native language corresponds to the English word “*table*” as a certain object in the manner of direct representation. She is always already participating in a broader semiotic system where other words and concepts, *not as objects but as signs*, are related to the word “*table*.” In the experience of the learner, a newly acquired sign has already expanded, leaked, and interfaced with other related signs, such as other words (chair, furniture, tablecloth), contexts (dining room, office room, living room), shapes (things with horizontal surface, usually hold above the ground with some legs), and functions (things usually used for working, eating, or holding decorative articles). In contrast, a child learning English as a native language must still work out such a web of symbolic interrelationship.

From the perspective of Peirce, a sign does not have a direct representation but is always involved in a triadic relationship. That is, contrary to the semiotic model of Ferdinand de Saussure, who perceived of signification in a dyadic relationship, only between a sign and an object (or a concept), Peirce was convinced that it is an interpretant (and accordingly, interpretive, semiotic process) that is a necessary part of any signification. In this triadic model, signification results when an agent (any living thing) interprets that a sign means something beyond itself. As such, in Peircean semiotics, signs are not static; they constantly grow and change. From an edusemiotics perspective, signs expand in a mode analogous to the growth of a rhizome (Deleuze 1994; Deleuze and Guattari 1988). A rhizome is a metaphoric model of growth when contents of natural world and its cultural products expand in multidirectional routes and planes, irreducible to a single point of reference or root but analogous to the spreads of grass. A rhizomatic growth is in contrast to linear and additive – what Deleuze called arborescent – progression. In most language classrooms, it is usually assumed that learners advance in a linear way, by knowing more words, grammatical structures, or other features of the new language.

When language particles are assumed to have fixed definitions and functions, the learner appears

to have to simply reproduce the knowledge of the teacher: “do as I do.” In this model it is the teacher who takes one thing (passive student) to another (language as a fixed object). But language seen as a web of interwoven signs and concepts growing in a rhizomatic network of relations forces both the teacher and her student to enter the symbolic field. In this model the teacher asks the learner: “do with me.” The learner then would not be connecting signs in a unidirectional way: a sign user herself functions as a sign in a triadic, recursive, and ever-growing semiotic system of interpretants. Indeed Peirce reminds us that symbols are similar to living things, in a very strict sense. He emphasizes that we can learn as much from the words as the words from us. Peirce provides a poignant example: “how much more the word electricity means now than it did in the days of Franklin; how much more the term planet means now than it did in the time [of] Hipparchus. These words have acquired information; just as a man’s thought does by further perception” (Burks 1958, p. 353). Such recursivity between a sign and its users is intensified in the classrooms permeated with meaningful interpretations rather than forceful corrections of the perceived “deficiencies” from the ideal form of language.

Incidentally, knowing more and more variables (age, motivation, language identity, aptitude, acculturation, anxiety, self-esteem, etc.) involved in SLA has not helped advance the field (cf. Larsen-Freeman 2011; van Lier 2004). Variable-based theories of SLA follow a positivistic philosophy of direct causality assuming that the world is basically a mechanism whose behavior, although at times appearing to be complex, follows a linear path and can be explained away by the reduction to its variables. Gregory Bateson, however, offered a systems approach to the complexity of nature. He emphasized that any delinication made in studying parts of a living system, whether physical or cultural, is an arbitrary choice and convention, and rather than components, parts, or variables, it is mutual interfaces that produce change, development, and the evolution of the system as a whole. This perspective forces us to pay attention to the *relations* within a system rather than its isolated members. It also opens our

eyes to see that the very variable we analyze is always dynamically *becoming* rather than just *being* a variable. Describing how a blind man perceives of the world by tapping his cane on the surface of a sidewalk, Bateson asked: “consider a blind man with a stick. Where does the blind man’s self begin? At the tip of the stick? At the handle of the stick? Or at some point halfway up the stick?” (1972, p. 318). The blind man’s “self,” in interactions with the world, is a complex system including the man, the cane, and the sidewalk which is not an arbitrary pathway but has a specific pattern that follows a still-larger system of a particular city codes and rules. The world for the blind man presents itself as a system, a complete unit that included the man sign in itself and, as Peirce would say, is perfused with signs.

Similarly, from an edusemiotic perspective, language acquisition is not reduced to a learner influenced by additive or subtractive variables. The learner is not a sole recipient of changes being acted upon by the phenomenon branded “language acquisition.” The learner, the target language, the content of the subject matter used in teaching, the physical aspect of the classroom, the teacher, other learners, the native language of the learner, and so forth are all semiotic systems with their own particular histories, affordances, and degrees of freedom that are brought in together, each one of these systems signifying a different thing to different participating entities. A language-learning event occurs at the borders of these systems, in the membranes of these constantly changing signs. When these systems meet, they collide and assemble *something* (language acquisition) experienced by *someone* (language learner) to *stand for something other than itself* (the target language).

None of the systems involved in language acquisition are reduced to static objects, pre-existing concepts, or entities as typically assumed in many SLA theories. A semiotic system is composed of *assemblages* (Deleuze and Guattari 1988) that are not reduced to contradictory or competing opposites as per Cartesian philosophy. The term assemblage, in this case, is used to denote that a social or ontological event, such as acquisition of a new language, is not an

aggregation of smaller events or objects with fix functions or properties. An assemblage is constituted in the interaction between multiple systems, each with varying functions and properties. When these systems communicate and interact, they create a unique organization. From such perspective, systems are engaged in constant *becomings* through their borders and along the *lines of flight* that run away as much as they leak and flow in-between. Such collisions and interfaces do not create a simple cohesion but transformations and mutations. Larsen-Freeman (2011) noted that language learners frequently “coadapt” their communicative resources to match with those of their interlocutors. Thus, language learners are viewed as systems and not individuals, and the act of communication is a dynamic organization. In acquiring a new language, a learner is never the same, nor is her experience of the language she is learning. When they meet, they mutually leak along and through their surfaces. They change and become transformed into other signs thereby contributing to mutual coevolution within and beyond a given semiotic system. Language acquisition is always a creative process. The language teacher cannot bring the new language to the language learner. It is ultimately the language learner who must make sense of the words: to figure out what they *point to* and what actions can be *performed by/with* them.

Conclusion

Knowing another language plays an important role in the way we experience and increase the overlap of the phenomenal world we share with others. As Stables (2012, p. 50) notes with regard to people with whom we seem to share a similar phenomenal world, it is epistemologically impossible to know everything about them or nothing at all. The acquisition of a second language increases the range of semiotic interpretants and expands the boundaries of the world in question. Learning a new language cannot be limited to classroom practice filled with grammar drill, out-of-context sentences, and filling in the blanks. The role of language “is not limited to first, second or foreign language classes, it

pervades all of education, in all subjects... All education is language education, since language is a defining quality of what it means to be human” (van Lier 2004, p. 2). Edusemiotics sees language not as an abstraction of mind dominated by static words and grammatical structures but as a participatory experience and activity. The learner is not a dot moving across a stationary space toward a finite goal while loaded with separate parts of language. She is a dynamic field or, according to Bateson and Deleuze, a *plateau* – attracted to another one, coping, fusing, and collapsing thereby changing and expanding this very field. The language learners are not arriving at the gate of the language of other speakers from the starting point as in the bottom-up approach, from letters to words and to sentences, or as they are divided up in courses from basic, then intermediate, and finally advanced level, each time linearly increasing vocabulary, grammar, and discourse. From an edusemiotic perspective, learners are not raw materials that enter a factory and are put on an assembly line where a teacher adds something and passes them on further.

Far from being on an assembly line, a language learner is experiencing a new field of becoming, and language is a dynamic system of signs the learner is engaged with and is using in practical experience. All language is a form of action. A language learner is experiencing what new words and grammatical structures “do” and how she can creatively use them to perform actions and make her experience meaningful. Deleuze compares the experiences of a new learner to a novice athlete or a surfer entering a wave for the first time. As the new surfer has to learn what to do with the surfboard in the context of waves, so the language learner needs to know what to do with the new language in the ever-evolving contexts and amidst new experiences. And the very nature of the various experiences permeating these two semiotic fields, whether of a surfer with a board entering a wave or a new language learner entering the field of another language, of getting wet, and of joining and mutating between these phenomenological realities, explains the initial attraction, the desire to learn a new language, and the process of signs becoming other signs.

Introduction

Semiosis is widely understood as the process by which humans make meaning, drawing on more

than linguistic resources alone. For Charles S. Peirce, however, semiosis is no less than evolution itself, driving forward all universal processes, from the play of cosmic forces to the progress of human thought. Something is always in relation to something, or some things, else (that it is not) such that a third or interpretant (to use Peirce's terms) is produced, which itself stands in relation to, on Peirce's account, both sign *per se* and its object. The specific concern of edusemiotics is with how human beings develop in the context of the broader universe of signification: in effect, the universe as permeated with signs, both human and nonhuman, both linguistic and extralinguistic. Edusemiotics defies the logic of either-or in favor of both-and. Accordingly, it goes beyond classical humanist assumptions about the discreteness of the human condition grounded in Cartesian and Newtonian beliefs about the separateness of two substances, rational mind and mechanical matter, without lapsing into either pure cognitivist idealism or crude behaviorist empiricism. It acknowledges fully both the embodiment of the human condition and its relationship with the nonhuman. The fully semiotic account of education is necessarily posthumanist.

Be(com)ing Human: Toward a Posthumanist, Relational Framework for Educational Policy and Practice

The sign, as an irreducible minimal unit of semiosis, makes sense only in its context, as the word in its sentence, the sentence in the text, and the stem cell in the part of the body in which it is to serve. In short, things are defined by what they are not, by those other things to which they exist in relation. This insight is merely an extension of the basic tenets of Saussurean structural linguistics. The broader (Peircean) perspective posits semiosis as a dynamic process, the transformation of signs *per se*. The sign is not a fixed entity but is ever changing: sometimes slowly, like the rock, and sometimes quickly, like the gust of wind. We must understand things, therefore, with reference to what they are not and as always *becoming*. These premises lead to theories of the human,

the child, and education (Stables 2008/2011, 2012). Such theories are both fully semiotic, in taking the sign as the basic unit of analysis and semiosis as a process that embraces evolution and adaptation as well as specifically cultural meaning, and posthumanist, in the sense of denying the absolute distinctness of human essence and mind. This posthumanist perspective on education stresses the interdependence of human and non-human life: both are embedded in semiosis as a relational process of signs becoming other.

Both religious and secular humanisms encounter problems on two fronts: in defining where human identity begins and ends and in explaining the supposed uniqueness of the human mind manifested in its powers of reason and language. If it were self-evident where human life begins and ends, there would be no strong debates on abortion, children's rights, or end of life. The violence and complexity of these debates reveal fault lines in humanist assumptions. Can the fertilized egg really be regarded as human or the not yet independently breathing baby as nonhuman? Is the brain-dead accident victim on life support as fully human as the doctor who treats him? These ethical questions emerge from taking a dualistic prospective on human nature as opposite to non-human and the all-or-nothing human condition. But the human is never fully human; it is always concerned with *becoming human* (even if not always consciously) in terms of an orientation toward flourishing. The human is trying to perfect being human, simultaneously falling short in this but defining her humanity through her failure and vulnerability.

This perspective differs from the classical humanist position in terms of treatment of the other. If we are a priori fully human, then others (even other humans) inevitably fall short of our expectations through their differences. Humanism, which overtly commits to peaceful coexistence, contains within itself the seeds of mutual destruction. If we begin with our sense of ourselves as struggling to meet our human aspirations, we are more inclined to sympathize with others of our species and may be more sympathetic to those sentient beings guided by different regulative ideals. To be human on this account is

therefore to be on a quest for greater human flourishing in the context of other forms of life and nonlife that are not dismissed as mere resources to enable us to meet selfish ends. If we destroy the not us which defines us, then we also damage ourselves. Given that a fully semiotic position regards evolution and adaptation as matters of semiosis, the move from a humanist to a posthumanist age is in the interests of human flourishing. After several centuries in which the human interest has considered itself best served by dismissing the natural environment as mechanical resource, humanity now acknowledges its relational debt to the nonhuman and its duty to value biodiversity. Interestingly, animal studies have increasingly come to recognize similarities with, rather than differences from, the human. Recent work on primate communication that shows how monkeys follow basic linguistic laws forms one striking example of this (Semple et al. 2010).

Regarding specifically educational theory, the edusemiotic, process-oriented, and relational account offers a number of radical insights. The first is the problematization of the child. If adults are not finite beings, the power of the common conception that children are adults-in-the-making is compromised. Increasingly, social theory posits the "kidult" as flexible and uncertain, in opposition to the assumption of adulthood as a settled state, akin to Aristotle's fulfillment of a citizenship role. Less and less do we expect a person to do the same job or have the same interests and inclinations from the end of childhood to a fixed age of retirement and inevitable decline. The current uncertainty and widespread anxiety about childhood is at root a problem grounded in the unsettling of adulthood. If adulthood is not clearly definable, then childhood too cannot be defined. Furthermore, if a child's legal and educational rights are defined with respect to the rights of adults on the grounds that the latter are fully human, then agreement on those rights is proving increasingly problematic. On the other hand, insofar as adults are the engagers with signs, so are children. The fact that children's relatively limited life experiences render them less able to act safely and reliably as apparently autonomous agents

should not be confused as a simple fact of biological and psychological development, for no adults are fully autonomous or reliable either. This perspective has implications for teaching, learning, and educational policy. Semiosis cannot be stopped or ultimately controlled by any agent or group of agents, and the narrow focus on educational outcomes and precise evaluation of institutions and organizations necessarily leads to damaging reductionism.

The edusemiotic premise that knowledge is always contextual does not imply that it has no transferability. Still, what the adult speaks in the context of one set of relationships, the child hears in the context of another so that what something means varies between interpreters and changes over time. What is being taught is never quite what students learn. At the same time, we rely on the next generation to solve the problems we have left them. Succeeding generations are always required to feed a growing population or deal with a degraded environment. It is counterproductive, therefore, to continue with an educational regime that is grounded in the mechanistic language of precisely defined learning objectives. Whatever we teach, it remains unclear whether students will have learned this content, and we require new insights from new generations. In the long run, the outcomes of teaching cannot be fully predicted, and educators and students, as embedded in semiotic relations, both exercise their respective judgments and reflect and modify their cultural positions. If governments intend to go on funding education, they must do so on a basis of some trust, or they will impoverish what they are funding by stages as they increase ever greater control over it. Ultimately, such attempts at control will fail, just as totalitarian government will ultimately fail, but much repression of human aspiration can take place in the process.

Educational policy is so far a long way from acknowledging the insights offered by this fully semiotic, posthumanist account that posits both teachers and learners as engaged in relations and interpreting signs situated in the greater, cultural and natural, environment. The application of edusemiotic theory in practice demands transformation of the structure of the school system and

has important implications for the degree to which learning outcomes can be predicted. Considering that semiosis operates at both conscious and unconscious levels, if we take a broad view of interpretation as a response across those levels, then edusemiotics posits a view of the student as an interpreter rather than a plain receiver of education. Respectively, teachers are interpreters of their students' signs, both verbal or explicit and nonverbal or subtle. Schools are not mere preparations for adult life, which is too a matter of continuous interpretation. Rather, schools are places where people develop interests and skills that they may continue to develop in later life, within the process of semiosis. A much quoted educational "opportunity" is only an opportunity if interpreted as such, even if not immediately.

Edusemiotics defies an all-or-nothing approach to schooling. Instead, schools should offer increasing scope for student interpretation rather than taking the view that the formative years should be mainly devoted to acquiring knowledge and skills to be deployed later, during the adult years. There is, in reality, no such sudden switch, and children are not motivated to learn that which has no value for them in relation to their ongoing life process. In relation to this, one of the hardest things for educators and policy makers to acknowledge is that (perceived) compulsion is one of the strongest detrimental factors in education. As soon as students are old enough to make their minds up about anything, they are able to plan and decide how they will respond to any particular educational intervention, and they will respond most probably when motivated by resonance with their own aspirations toward a more satisfying human condition. Some contested areas that elicit contemporary debates in educational theory while simultaneously expanding the scope of edusemiotics are listed below.

The Specialness of the Human

The account outlined in this entry is one that regards differences between the human and the nonhuman, between immaterial mind and material nature, as always of degree rather than kind. This relationship is construed somewhat differently by various commentators. Some take an

anthroposemiotic view, arguing that full semiosis only occurs at the level of the rational human (and perhaps divine) mind. Whether such accounts make the case for, or merely assume, the specialness of human-meaning making is a matter of debate. Deely (2009) construes as *metasemiosis* the action of signs coming to terms with beings as beings, both mind dependent and mind independent, with relationality transcending the customary subject-object and mind-matter divides that are the legacy of Cartesian dualism. Some edusemioticians, such as Pikkariainen, have regarded full semiosis as the province of the human, but do not explain this simply by virtue of humans having a biologically distinct capacity for reason.

It is clear from the range of such accounts that the distinctness case for humanity, from the edusemiotic perspective, can be variously construed. There are many points of possible compromise, not least in recognizing that as humans, we inevitably take the human species as being better at the things we humans usually do than other species are. In debates within educational theory, while often little hangs on where one sits in relation to this debate, the implications of this position can be wide ranging (Stables 2012). Whatever one's position on this, a purely mechanistic account of physical nature is clearly in conflict with the unlimited semiosis described by Peircean relational categories.

Some debates in this area thus map closely onto broader philosophical questions around rationality and realism. These, in turn, relate to debates around the nature of the semiotic object.

The Rational Belief Systems Problem

If semiosis pervades, even constitutes, the universe, is the whole universe and everything in it rational? There are live debates within edusemiotics about the limits and scopes of both rationality and realism. Notable examples include Inna Semetsky's research on the symbolism of tarot that culminated in her exploration of this medium from the edusemiotic perspective (Semetsky 2013), which takes this phenomenon out of the supernatural realm by postulating the radical rationality of edusemiotics per se. A second is a range of views about the importance of

the semiotic/Peircean object in learning that can refer to a material entity, a physical process, a purely psychological entity, or a merely another sign, as well as – while grammatically singular – to a collective or range of the above. A third is a wide range of views among semioticians about the validity of forms of religious and nonscientific thinking. Connected to this is a debate about semiotic realism, again turning somewhat on the conceptions of the object, with semioticians positioned on a continuum from strong Peircean realism to strongly relativistic poststructuralism. These debates continue to prove productive in the context of edusemiotics. For example, one can sympathize with Olteanu's realist thesis that learning begins with the recognition of similarity and proceeds, across Peirce's categories, from icon to argument (Olteanu 2015). Edusemiotics posits that teachers often work on the basis of their own and their students' preconceptions and habits of thought (that may be irrational or unconscious); this poses a problem to those who espouse simple transmission models of educational practice that assume a priori Cartesian rationality and disregard individuals' commitments to pluralistic models of reality, including the reality of signs.

Indeterminate Outcomes

Because education is such a politicized field and so dependent on State funding, the fully semiotic commitment to unpredictable outcomes presents an option that many policy makers are simply unwilling to consider. Policy makers seem determined to continue breaking "Stables' Law" (Stables 2012): that universal conclusions cannot be validly inferred from contingent premises. What is put into the system in one context cannot be guaranteed to produce identical outcomes to the same intervention in another context. If context A has a perceived weakness and intervention X produced apparent improvement in context B, it may be erroneously assumed that the same improvement will occur if the intervention is applied to A ($AX = BX$). Unfortunately, this is never the case ($AX \neq BX$). Interventions can never account for *all* the variables at play in either A or B. On the account of performance, policy makers would be giving into weakness to admit

this. According to Lyotard (1986), public services in many parts of the world operate in a narrowly performative manner, in which success is determined by the measurable achievement of predetermined outcomes: in everyday terms, a sausage machine model that conceives of teachers as the inputters and students as the outputs. Educators generally recognize such limitations, regardless of their commitment to edusemiotics that elicits the necessity to embed semiotic insights into educational policy making, even if the transformative process may take a long time. As long as politicians and/or educational policy makers seek quickly achieved, measurable outcomes as the proof of their effectiveness in office or institution, they are likely to resist accounts that stress the ubiquity of interpretation pertaining to edusemiotics and hence continue to be committed to narrow conceptions of education and its aims. Edusemiotics shares the democratic politics as a matter of open-ended debate, in relations with others and in mutual exploration; it is time, a full century after Dewey's *Democracy and Education*, to acknowledge fully that education should be conducted in this spirit.

Conclusion

A growing body of work is broadly in line with the fully semiotic, posthumanist approach, outlined here, whereby humans are considered to be in dynamic relations with a greater posthuman environment. Among examples acknowledging their semiotic roots are Pesce's work on teacher development and Pigrum's on creative teaching and learning processes (Pesce 2014; Pigrum 2014). Stables' work with Gough on learning as interpretation and adaptation speaks more strongly to the posthumanist strand in the thinking (Gough and Stables 2012). There are further developing areas, including a recent collaboration with Adam Ockelford, whose work on musical interaction with children with disabilities is already internationally renowned but which can be further strengthened through more explicit use of resources from edusemiotics (Ockelford 2010)

and the bringing together of researchers in biological anthropology with semioticians to develop the understandings of human-nonhuman communications as a research area within educational semiotics.

Introduction

Service-learning (SL) is widely defined as a form of experiential education that integrates

meaningful community service into the curriculum. SL contains two main elements: engagement within the community (service) and reflection on that engagement (learning). According to Bringle and Hatcher, these elements should be balanced by expecting students to “participate in an organized service activity that meets identified community needs” and “reflect on the service activity in such a way as to gain further understanding of course content, a broader appreciation of the discipline, and an enhanced sense of civic responsibility” (1995, p. 112). SL is well established in K-16 schools (primary, secondary, and higher education) in North America, Western Australia, and New Zealand.

Definitions of service-learning can be divided in two main groups. The first group of definitions describes SL as a form of education, and the second group of definitions defines SL as an educational philosophy. Definitions of SL as a form of education share three key elements that differentiate SL from other forms of experiential education. These elements are structured extensive reflection, application of learning in real-life settings, and relevant service. Student reflection encourages integration of theory and practice. Application of learning in real-life contexts should complement objectives of students’ future careers. Therefore, service needs to be relevant, meaningful, and tightly integrated into the curriculum. Participants in SL should demonstrate a balance of abstract and concrete knowledge, the development of social intelligence, and civic responsibility.

Service-learning as a philosophy is characterized by “human growth and purpose, a social vision, an approach to community, and a way of knowing” (Kendall 1990, p. 23 as cited in Jacoby 2014, p. 5). Based on the assumption that engagement in community service may cause changes in social reality, SL belongs to the tradition of radical/critical pedagogy. SL is related to the Freirean concept of educational *praxis*, since it links concrete experiences to abstract theoretical concepts and broadens the perception of power and change. Using the concept of *history*, SL encompasses the broad context of addressed social issues, various responses to those issues, and efforts to address

them. SL is based on *dialogue*, which is prerequisite for the formation of partnerships between teachers, students, and communities.

SL is usually placed under the same umbrella with student volunteerism. However, volunteerism is focused on the service being provided and its benefits for the community, while SL puts equivalent focus on students and the community. The active civic participation in SL distinguishes it from various forms of active learning (e.g., field studies, internships, or problem-based learning). According to Eyler and Giles, “the thing that separates service-learning from other field-based and experiential forms of learning is the service, the giving to others, and students seem aware of this particular value” (1999, p. 37). Unlike various forms of field-based education, which are usually more beneficial to providers (students) than to the community, SL defines both students and community members as direct and equal beneficiaries of service.

Four Stages of Service-Learning

SL projects typically consist of four interlocked stages: investigation and preparation, action, reflection, and demonstration (Kaye 2004). During investigation and preparation, students identify a community need or issue that needs to be addressed and analyze key resources they can offer (skills, interests, and talents). Investigation is performed through different approaches: interviews, surveys, books, the Internet, and personal observations, and it requires teamwork. At the end of this stage, students document the nature and extent of the identified community need. Investigation and preparation consists of acquisition of relevant knowledge and skills and their alignment to curricular goals. Here, teachers define relevant learning outcomes and cross-reference them with student interests, identified community needs, and related academic content. Students are often placed in smaller groups. Roles, responsibilities, and prerequisite skills of each group member are clarified, and project timelines are developed. In collaboration with the community, students identify and analyze different viewpoints toward the

same problem. In this way, they learn about the “historical, sociological, cultural, economic, and political contexts that underlie the needs or issues” (Jacoby 2014, p. 3). In the tradition of critical education, SL pedagogy might sometimes be linked to a progressive political agenda. Experiential learning is paired with critical analysis and reflection, leading students to place their service inside a social context through academic readings.

During action, students implement the planned project, engage in meaningful and personally relevant service, and apply the newly acquired knowledge and skills. Action may take a form of direct or indirect service, research, or advocacy and should represent a collaborative and safe environment to learn, grow, and make mistakes. Reflection takes place before, during, and after the service and links all stages of SL. Reflection should foster empathy for others. It integrates experience and aims to situate emotional, cognitive, and social features of experience into a larger context. Multiple challenging reflection activities (such as reflection journals, group in-class or online discussions, directed writings, portfolios, role-play, etc.) are vehicles for assessment of individual student performance and SL projects at large. Through critical reflection, students perceive influence of their service on the community and themselves. Using another concept attributed to Freire, students simultaneously learn how to read the word and the world (Freire 1972).

In demonstration, students summarize their SL experience. They document the entire project to be able to draw on all stages of their service-learning experience and use project results for improvement. Practical activities during demonstration include public presentations, blogs, portfolios, videos, and other ways of communicating developed competencies and achieved outcomes within the community.

Benefits and Criticism of Service-Learning

SL has five major stakeholders: students, teachers, universities/schools, community partners, and local community members (individuals, groups,

or organizations). Understanding among stakeholders is established through SL partnerships. Students, working as a team, are engaged in real-life SL projects that complement their theoretical learning and stimulate deep thinking about themselves and their relationships to the society. Educational aspects of SL are evaluated based on the connection between learning and service, and practical aspects of SL are evaluated in relation to the community. In lieu with the tradition of critical pedagogy, students engaged in SL are treated as equal stakeholders with a strong voice in preparation, implementation, and evaluation of projects. Service-learning research brings consistent evidence of students' improvement in problem solving, communication skills, teamwork, intercultural competency, leadership, and career decision-making (Carrington and Selva 2010; Harris et al. 2010; Kenworthy-U'ren 2008; Milne et al. 2008, Prentice and Robinson 2010, as cited in Smith and Shaw 2012, p. 1). Students also report richer and longer-lasting relationships between them and teachers (Pribbenow 2005, as cited in Workman and Berry 2010).

In their review of relevant literature, Workman and Berry (2011) indicate that teachers actively learn from and about their students. SL enables them to position their schools and universities as service-branded and to establish various networks. Teachers report the following benefits of SL: taking on new roles, enhanced teaching through active mentorship, building richer connections with students, fostering stronger student engagement, and increased relevance of teaching and learning. Community partners begin to perceive teachers as pragmatic, engaged experts, and teachers become more aware of their own impact on the local community. Community partners (such as NGOs or local authorities) and their clients from the local community provide learning opportunities for students, benefiting in return from the valuable human capital. "Satisfied community partners sometimes offer students paid internships and final professional career placements upon graduation," while "universities sharing the SL mission become leaders for cross-institutional teaching and research opportunities"

(Workman and Berry 2011, p. 137). SL projects enhance reputation of educational institutions, since community partners provide information to other community organizations about their experiences. They also provide universities and schools with the framework for the development of long-term community partnerships and strategic planning.

SL is commonly critiqued based on its longitudinal impacts on all stakeholders, particularly students and the community. In SL, student performance and learning is based on reflection, which is very hard to assess (Clayton et al. 2013). Furthermore, most SL is course based, so limited time frames and numbers of engaged participants may twist its focus toward students and their learning achievements. In such cases, teaching and learning might be conducted at the cost of the community or even preserve unjust social structures (Roschelle et al. 2000 as cited in Mitchell 2008). SL is also critiqued on theoretical grounds. Critics point at the lack of an articulated conceptual framework, where SL is at the same time interpreted as a pedagogical strategy that enhances student learning, a field of education, a philosophical approach, a vehicle for raising student empathy, self-awareness and social intelligence, and a radical social movement. They seek for

a more comprehensive approach to the assessment of service learning institutionalization that can provide researchers and practitioners with the kinds of data and evidence needed to more fully understand the most effective strategies, structures, and policies for facilitating the institutionalization of service learning. (Clayton et al. 2013)

Some critics are also concerned that SL might reinforce stereotypes and aggravate power asymmetries between cultural and social groups (Stewart and Webster 2010).

In response to practical critiques, SL community has identified a plurality of perspectives and value-based frameworks that unify service-learning. A range of quality standards and core principles for service-learning have been offered, most notably the four Rs: respect, reciprocity, relevance, and reflection (Butin 2003 as cited in

Smith and Shaw 2012, p. 2). Mutual respect among all stakeholders is prerequisite for supporting diversity, promotion of tolerance, and acceptance of others. Respect needs to be demonstrated to views, circumstances, and ways of life of service recipients. Reciprocity indicates a value exchange process which benefits all stakeholders. Students enhance their learning; teachers engage with the community; and educational institutions improve quality of their work, while the community benefits from direct outcomes of SL projects. Relevance is achieved through integration of service and curriculum. Finally, intentional reflection about the service-learning experience enables students to examine their beliefs and make their learning meaningful.

In response to theoretical critiques, scholars have put forward a complex pedagogical and philosophical concept of SL based on multiple theoretical models (Jacoby 2014, p. 6). This concept draws from Dewey's philosophy of experience, its links to reflective thinking, and the importance of interaction between students and the community. SL is also based on David Kolb's learning cycle and the psychological importance of reflection. Emphasizing social responsibility, change, and social justice, recent literature situates SL with the tradition of critical pedagogy. This has emerged into a progressive pedagogical orientation called critical service-learning, which requires "students to not only participate in communities, but to transform them as engaged and active citizens" (Mitchell 2008).

Service-Learning and Digital Technologies

Until recently, SL was widely assumed incompatible with educational technologies: SL puts emphasis on community engagement and hands-on practice, while technology implies individual work with computers. However, technological development has slowly but surely brought SL closer to digital technologies. Service-e-learning (SeL) (also called *technology-based service-learning*, *e-service-learning*, and *digital service-*

learning) is "an integrative pedagogy that engages learners through technology in civic inquiry, service, reflection, and action" (Dailey-Hebert et al. 2008, p. 1 as cited in Waldner et al. 2012). SeL links educational technology to a meaningful community service, utilizing technological devices to enhance civic engagement and filling the technological gaps within the community.

In the network society, environmental and social issues, online communities, and online service span across country borders. Working in teams, students in SeL use technologies such as teleconferencing, blogs, virtual classrooms, online videos, discussion boards, digital storytelling, etc. As a consequence, they are able to address needs and issues beyond their local contexts, develop cultural understanding, and engage in service-learning projects that expand from local to global. Dealing with complex issues of abroad communities, students develop understanding of needs and issues in their own communities, develop cultural sensitivity, overcome stereotypes and prejudices, and obtain a more nuanced understanding of cultural differences.

Waldner et al. (2012) list four types of SeL courses: Type I (instruction is fully online and service is on site), Type II (instruction is fully on site and service is fully online), Type III (instruction and service may be both on site and online), and Type IV (instruction and service are fully online). The identified types of courses bring various benefits (e.g., independence of time and space) and various limitations (e.g., technological challenges, communication barriers, and teacher workload). However, SL can be aligned with various other approaches beyond e-learning. Competing approaches to the relationships between SL and digital technologies, most notably those based on connectivism (such as networked learning), might transcend some limitations of SeL and bring fresh benefits. Based on community engagement, contemporary SL might also benefit from research on digital cultures and their complex relationships with education. As an evolving educational practice, contemporary SL needs to be continually thought of in relation to digital technologies.

Conclusion

SL aims to support the development of basic twenty-first century skills: critical and creative thinking, reflection, communication, collaboration, information literacy, and social skills. SL is closely linked to other field-based and experiential forms of learning, but its success is conditioned by active civic participation. The way in which SL is implemented varies greatly between educational institutions. Some institutions emphasize social responsibility, change, and social justice and advocate critical pedagogy. Others are more oriented toward the international communities and cross-cultural education: Furthermore, there is also a growing trend of serving online communities through online civic action. Yet, what unifies different forms of SL is a value-based framework with the core standards such as respect, reciprocity, relevance, and reflection. Research documents worldwide integration of SL into curriculum and its positive impacts on student ability to develop relevant and situated knowledge. In a rapidly changing educational landscape, educational institutions continuously seek to discover best SL practices, address changing student populations, and achieve institutional sustainability.

There are several trends that might impact the future of SL. Civic mission and integration of community engagement into curricula have become priorities of many educational institutions, and they continue to expand strategic investments in community partnerships. Educational institutions are faced with pressing requirements to evaluate the outcomes of SL in quantitative and quantitative ways and to focus on creation of interdependent community partnerships. With the globalization of education, SL has also become progressively internationalized. In order to support students with diverse backgrounds and abilities, in a variety of settings, educational institutions are faced with the challenge of integrating digital technologies and SL. Global sustainability, along with the huge potential of educational technology, is the continuous challenge that SL will need to address in the times to come.

Sketching the Multiple Relevance of Postmodernism to Educational Theory

Marianna Papastephanou
Department of Education, University of Cyprus,
Nicosia, Cyprus

Introduction

Philosophically, the last decades of the twentieth century have been marked by debates concerning postmodernism. At times denoting an artistic

trend; at other times signifying a whole era and its self-understanding; or designating a new line of thought (Hutcheon 1989), the postmodern has attracted much theoretical attention and exerted a strong influence on contemporary worldviews and academic disciplines. Educational philosophy has been especially receptive of postmodern thought. The present entry maps this influence through a brief reference to major postmodern ideas and thinkers and to the transfer of postmodern insights to educational-theoretical discourses.

It has not been easy to define the term “post-modern” (and the related -ism) or to determine the advent of the corresponding era. The notion has proven too elastic to cover overspecified, exclusive, and narrow semantic contents. Likewise, the passage from modernity to postmodernity cannot be treated as an accomplished reality, let alone as a rigidly demarcated event with a clear chronology leading up to its stabilization. But the very effort strictly to define postmodernism and to demarcate postmodernity would be a rather “un-postmodern” thing to do because part of what counts as postmodern is the resistance to pinning down meanings and to simplifying complex phenomena. Therefore, this entry will employ only minimal approximations of the term and will let the rich and diverse semantics of postmodernism be figured out through the exposition of postmodern ideas and of their basic educational bearing.

Postmodern Ideas

For the purposes of this overview, postmodernism is minimally taken to denote a set of philosophical orientations that share incredulity towards master, grand, or meta-narratives (Lyotard 1984). The term “meta-narratives” signifies modern, ambitious, theoretical systems that aspire to answer comprehensive and totalizing questions about the self and the world. Meta-narrative answers to such questions draw their hegemony and social currency from the legitimizing power of rationality and/or science. Postmodern thought examines the modern construction of the self and the world through its rich variety of implications

(ontological, ethical, aesthetic, epistemic, and political) and discloses modern distributions of power.

This can be illustrated with reference to epistemic and political implications. Epistemic implications of meta-narratives that attract postmodern attacks comprise: the tailoring of reality to the purposes and confines of purportedly all-encompassing, overarching theories; the assumption of a uniform reality on which humanity supposedly has full representational control; and the subject–object relation of the self and the world that (re)produces binary oppositions (e.g., “the mind vs. the body”) and misses more complex and ambiguous intersections. Against the modern, metaphysical connection of the human and the world as a relation of a “subject (*hypokeimenon*) versus an object (*antikeimenon*),” postmodernism posits the text (*keimenon*) and our textual relationality as the binding force of thought and existence. Textual operations construct the world for us and construct us as effects of language and enculturation. Political implications of meta-narratives that postmodernism combats comprise: the assumption of a privileged relation of the West to reason, knowledge, and truth; the emphasis on western technological and scientific achievements of “universal” value that rationalizes Eurocentric expansionism and discrimination against (cultural) otherness; the glorification of identity as a rigid determinant of who we are; and the anthropocentric (re)presentation of nature as an object to be observed, studied, possessed, and exploited by the “modernizer” and “developer” to the “benefit” of humanity. Against the modern politics of anthropocentrism, Eurocentrism, and self-centeredness, many postmodern thinkers have defended: a view of nature as a coplayer in the game of life rather than as an object on which we act; a respect for otherness and cultural diversity; a fluidity of identity along with a multiplicity of identities and corresponding citizenships; and an acknowledgment of the otherness within us (within our own geographical spaces and within our own selves).

With Friedrich Nietzsche, Mikhail Bakhtin, Georges Bataille, and Roland Barthes as some of its diverse precursors who prefigured part of what later became the general trend of (especially

French) continental thought, postmodernism shifts philosophical attention toward neglected themes. Some such are the will to power, the erotic, the “carnavalesque,” desire and drives, sacrifice, mythology, metaphor, affect, excess, and polysemy. Postmodernism engages with these themes in ways that single out how and why such socially and theoretically repressed topics return to haunt thought and action, certainties and hopes, and priorities, institutions, and systems. In so doing, postmodern scholarship ultimately exposes the repressive effects of means-ends rationality and the didacticism, sterility, and facile cognitivism of modern pedagogies and educational systems. It also condemns the obsession with order that turns teaching and learning into appropriation and transmission of digestible, deliverable, and marketable “products.” Indicatively, modern metaphysics, politics, and didactics stand accused of favoring thought over language, reality over relationality, unity over plurality, community and commonality over difference and diversity, foundationalism over contingency, rigorism over playfulness, consensus over dissent, dialogue over agonistics, transcendence over immanence, authenticity or purity over hybridity, measurability over the new and the unknown, securitization over risk, and regulative disciplinarity over resistance.

The set of philosophies that are typically termed “postmodern” involves multiple (and often ambivalent) reactions to modernist reflection, values, and self-conceptions. Despite deconstructive reservations concerning the -ism of the postmodern trend (Derrida 1994), philosophers who have typically been described thus (even those whose reaction to such a label has been reticent or even negative – e.g., Foucault, Lacan, Lyotard, Derrida (Blake et al. 1998, p. 5) have profoundly shaped academic discourses of the turn of the millennium. They have made academics more suspicious of claims to scientific innocence and of uncritical praise on knowledge, more cautious about the dangers and paradoxes of identity, and more vigilant regarding hierarchies that research consolidates. Thinkers as diverse as Richard Rorty and Gilles Deleuze increase awareness of the room that scholars should be prepared

to make for noncanonical thought and encourage openness to what Rorty names “abnormal” discourse. Post-Freudian and Lacanian psychoanalysts detect a controlling, scopophilic drive operating underneath the supposedly disinterested scientific curiosity, the cultivation of which education has so unreservedly declared its major aim. Julia Kristeva has given a feminist twist to the Lacanian preoccupation with the symbolic as law-bound, articulated order through her theorization of the semiotic as a counteracting, material level of language of great educational implications for our analyses of the mother–child relationship. The postmodern feminist use of the concept of *chora* as a nonpatriarchal, undifferentiated space resisting articulation and being potentially subversive of political hierarchies has, from Kristeva down to Luce Irigaray, contributed to philosophical-educational innovative discussions of childhood, care, and the teacher–pupil relationship. Foucault’s and Judith Butler’s philosophies had set the premises for what later formed a solid literature of attacks on heteronormative naturalizations of gender. Such attacks have made educationists more sensitive to the demands of social movements and marginalized or excluded groups but also more self-reflective regarding the paradoxical effects of education on identity formation.

Transferred to educational theory, the postmodern influence means that we can no longer maintain an “innocent” eye as concerns unquestioned pedagogical emphases on the desire for knowledge and on the dialogical classroom grounded in Rationality or in the Scientific Method or in Community. Educational philosophers who endorse the postmodern framework describe modernist educational practice as operating “within an overarching norm of consonance, notions of sameness and agreement that permeate schools and classroom life” (Stone 1994: 49). Against it, they promote the kind of postmodern educational theory and practice that favors dissonance rather than consonance. Even educators such as Barbara Thayer-Bacon and Charles Bacon (1998, p. 2) who wish to preserve and employ a notion of community, epistemic relationality, and dialogue for the sake of a caring,

democratic classroom feel obliged first to take into account the challenges that a postmodern context presents to such notions. They ask: "is it possible for a form (or forms) of community to emerge that does justice to particularity and universality?" They explain that this question is topical because "we live in a time when our situation, a postmodern situation as Habermas describes it, is one in which 'both revolutionary self-confidence and theoretical self-certainty are gone.'" Hence, to them, it is appropriate to ask further: in a postmodern theoretical context, "is there hope for achieving communities based on undistorted communication, dialogue, communal judgment, rational persuasion, nonviolence, and an ethic of care?" (ibid). Their affirmative response to this question comes only after their critical consideration of the postmodern objections and their cautious avoidance of the pitfalls of modern educational complicities.

Postmodern thought has provided educational theory with conceptual tools that help it respond to the new givens of a postmodern condition and of a globalized world typically accompanied in the nineties with (neo)liberal educational agendas and systemic pressures. The incredulity toward meta-narratives and its significance for reconsidering educational operations of reality construction and of the legitimizing role of reason and theory has helped educators notice (neo)liberal educational expectations that smack of bad utopianism. Managerial, one-sided and ideological pleas for more data and measurable "outcomes" that promised a more ordered and productive world became the target of much postmodern educational thought. Neat categorizations of philosophical persuasions as either analytic or continental that used to block exchanges across the relevant divide also within philosophy of education became complicated when educational theory saw them through the prism of Stanley Cavell's philosophy. Paul De Man and Derrida deconstructed the metaphysics of plenitude and presence that segregated *logos* from art (a segregation that downplayed the epistemological value of metaphor). The broader deconstruction of logocentrism contributed to strengthening

the critique of those "back to basics" curricular provisions that tended to marginalize aesthetic education or physical education.

Humanism, individualism, and liberalism educated generations of white, male, affluent, superior Westerners who oppressed other human beings on grounds of their supposed "inferiority" or "barbarity" and exploited nature in the name of progress and development. The postmodernist response to such an education is the exploration of the prospect of what is termed "antihumanist" education, an education that should not be mistaken as, ostensibly, operating against humanity but should be understood as beyond and against the specific humanism that had, from the Renaissance onwards, placed the human self (in fact, the "educated man of action," the "rational egoist," the administrator and scientist fabricating technologies of the self, etc.) centre stage and tasked a supposed universalism with serving "man." Thus, postmodern educators are less confident than their modernist colleagues regarding the tenets and visions of "Enlightened" education and progressive pedagogy. Enlightenment principles and the concomitant education are said to mask implicit and unacknowledged violence the very moment that they purport to free the self from its shackles. But, for many postmodern thinkers, there is no human nature which was once, or still is, in chains. Therefore, at best, emancipation is empty and, at worst, a pretext of hegemonic discourses complicit in discrimination or even terror. Generally, postmodern educators have reconsidered and problematized truth, justice, equality, liberation, autonomy, and other such ideas, also known as "the Shibboleths of modernity" that infiltrated educational discourses of humanism, individualism, and liberalism. The meanings of such notions and their educational significance have been "mapped," "negotiated," "challenged," "deconstructed," "queered," and "interrogated" – and all these verbs are placed here in quotation marks that indicate the fact that all are part of a typically postmodern vocabulary of "acting" and "performing" instead of providing consensual truths, assertions, reconstructions, foundations, systems, and proofs.

After postmodernism, educational theory has become more sensitive to technologies of the self, performativities, and biopolitical operations (from Foucault down to Giorgio Agamben) and does not rush to recommend educational aims or measures without prior genealogies and cartographies of how concepts and values have historically developed into key terms of pedagogy. Jacques Rancière's exploration of the "no-count" (that which remains invisible and inaudible in major distributions of the sensible) in established social ontology and Agamben's notion of the "state of exception" have offered educators critical insights into facile "no-child-left-behind" educational policies. The complication of modern notions of identity, allegiance, and citizenship has had important implications for political education especially concerning inclusion and exclusion. In awareness of state mechanisms of power that interpellate various subjectivities (Louis Althusser) and produce the I (eye) of the student and teacher, much educational philosophy today is largely reluctant to support the cultivation of specific subjectivities or collective identifications and allegiances (e.g., the autonomous subject, patriotism, feminism, cosmopolitanism). Challenges to particularist identities, even to those which appear progressive such as gender, have shown that, when belonging becomes naturalized, it betrays and undermines any positive promise (e.g., the promise to promote equity) (Bryson and DeCastell, 1993). But even the educational fostering of more inclusive identities or virtues such as cosmopolitanism becomes challenged, especially when such -isms are based on universalist pretenses or reflect glossed over elitism. Poststructuralism, postfeminism, postanalytic philosophy, post-Freudian psychoanalysis, and other "postisms" have been broad frameworks for revisiting older commitments and for investing them with new intellectual and pedagogical energies.

The critique of the Cartesian subject, of mentalism and solipsism as epistemic warrants, and of the related rationalist individualism prepared the ground for a rapprochement of educational theory with nonrationalist alternatives to modernism and

non-Western philosophies (e.g., Buddhism). Many current educational philosophers feel free from older ideological constraints to pursue and investigate pedagogical convergences of East and West concerning the (knowing) subject and the ethics of teaching. Harkening to postmodern ethics, ethical (rather than moral) education moved away from both deontology and utilitarianism to explore alternative paths that go beyond the "human rights" discourse or the "gains and losses" talk. Though tackled also within a liberal philosophical educational framework, topics such as shame, guilt, forgiveness, friendship, and hospitality have educationally been approached anew through reference to major postmodern ethical philosophers. Postmodern educational research on ethics has been more investigative of the possibility of transcending the moral(ist) education of duties and obligations toward a face-to-face ethics of asymmetrical responsibility of the I to the Other (Levinas). Attentive to the textual fabric of what we perceive as ontological order (Derrida) and to the simulated, "hyperreal" character of educational, cultural material (Baudrillard), educational theory dismisses apolitical complacency, positivist claims to value neutrality, and facile recourse to facticity and "reality" as justificatory framings. Postmodern education is vigilant regarding the political role that narratives play in the shaping of the learner and alert to the "committed" rather than disinterested position of academia and research (Lyotard), retrieving context-sensitivity and situatedness against abstraction and generality.

Following postmodern thought, many educators have become suspicious of educational promises of obtaining representational knowledge and effecting the emancipation of their students or of society; in their eyes, there are no handy solutions to educational issues or prescriptions for a better educational practice, no gigantic leaps to school improvement through bold educational reforms, no radical utopianism but, rather, piecemeal betterment through trial and error (Rorty). The loss of revolutionary confidence, the challenge to knowledge and the questioning of theoretical certainties create space for the educational accommodation of playfulness, pastiche, and experimentation.

Questioning pinned-down meanings and illusions of authenticity enables political educational attention to semantic precariousness and diasporic diversity, framing schools as multicultural contact zones. Deleuzian terms such as “deterritorialization” and “rhizomes” shed a different light on educational routes and roots, inspire a writing of multiple entrances, and allow more complexity beyond linear argumentation.

Conclusion

Postmodernism questions ‘all forms of foundationalism and the absolutist and ahistorical categories and values, sustained and propagated through the symbolic unifying power of the grand narratives, by which “man,” “reason,” “history,” and “culture” were first projected in universalist European terms’ (Peters 2005, p. 442). Its relevance is manifest in many educational-theoretical texts of the last decades. The influence of postmodern thought on educational theory is evident in the sources (journals, collections of essays, monographs) of the field, the directions that the corresponding research has taken and the scholarly activities (conferences, fora, website postings) of the corresponding international academic community.

However, this has not been done without contestations and significant objections. Additional issues are the ambivalent positionalities of some philosophers (e.g., it is difficult to situate Levinas within the “postmodern” designation) whose work resists camps and trends, and the predicament that the effort to have rich and multiple philosophical underpinnings of education often leads to placing together difficult theoretical bedfellows.

Even within broadly conceived postmodern idioms, the supposed deconstructibility of truth, knowledge, and justice; their wholesale indictment; and the loss of faith in the Shibboleths of modernity are not always associated with enabling educational ramifications. There have also been challenges to educational tendencies toward newly consolidated postmodern vogue. Modish work tends to be blind to developments in educational theory outside the confines of

postmodernist thought and ends up fortifying the walls of postmodernism in the un-postmodern manner of creating new hierarchies and binary oppositions and of blocking exchange and osmosis. Postmodern educational theory requires more engagement with the Frankfurt School (Habermas, Apel, Honneth), (post)analytic and liberal philosophy, and with critics of postmodern thought such as Alain Badiou and Quentin Meillassoux who cannot easily be dismissed as supposedly “modern” or “Enlightened.”

Nevertheless, despite shortcomings such as sterile polemics, fad, and stronghold attitudes, the encounter of education and postmodernism involves the hybridization and pollination that postmodernism celebrates even if somewhat one-sidedly.

Social and Restorative Justice: A Moral Imperative for Educational Leaders

Anthony H. Normore
California State University Dominguez Hills,
Los Angeles, CA, USA

Synonyms

Community engagement; Cultural relevance;
Holistic development; Inclusion; Layered leader-
ship; Marginalization; Social issues

Introduction

In 1994, Herman Bianchi suggested that education scholars were so connected to the retributive model of criminal justice for school students they were unable to accept the effectiveness of other models in other times and places. Five years later, Jon Braithwaite (1999) argued that through the history of the world, restorative justice had been the dominant model of criminal justice, and as such, a move toward a restorative justice model was a return to our roots and not the latest attempt to solve our ailing justice system. Other research (Llewellyn and Howse 1999) argued that restorative justice is not a new idea, but a prominent concept of justice visible throughout most of human history and often used interchangeably as “restorative processes” including restorative discipline, restorative practices, and restorative values.

Brief History of Administration of Justice

Prior to our modern system of State-centered public justice, the administration of justice was not simply about applying rules. Instead, it was a mediating and negotiating process known as community justice. Community justice grew out of the need for communities to resolve disputes,

reconcile harm, and maintain relationships. The use of retributive justice, or forced resolution, was seen as a last resort. As governments grew, they began the process of replacing community justice with courts. Courts established rule of law and applied the rules, established guilt, and set penalties. Victims, offenders, and the community lost control of disputes; instead, punishment served the interest of the State while doing nothing to address the harm caused by the wrongdoing (Llewellyn and Howse 1999).

The retributive approach to justice is the philosophy that has underlined our Western systems of criminal justice that relies on third-party sanctions and punishment to address societal wrongs (Schweigert 1999). This model measures wrongdoing through a system of rules associated with particular consequences, establishes the wrongs committed, and assigns guilt. The traditional retributive model has the offender as the focus and does not consider the needs of the victim or the community. In addition, it does not take into consideration the view of offender as a victim or the stigma that comes with labeling a person as a criminal (Calhoun and Pelech 2010). Today, the United States juvenile justice system is burdened by the cost of high rates of incarceration and the maintenance of the world’s largest jails and prison system. In addition, there is the stigmatization and marginalization of those in juvenile courts which limits their opportunities once back into their communities. As a response to these issues, and a growing emphasis on human rights, restorative justice and practices have begun “to move away from a retributive justice approach in order to focus on ‘putting things right’ between all those involved or affected by wrong-doing and achieves this by shifting the focus from individuals to whole communities” (Wearmouth et al. 2007, p. 196). It has since found its way to the corridors of schools and communities. Restorative practices in the form of highly structured processes of victim-offender conferencing are being, or have already been, developed in a number of areas around the world including North America, Europe, Australia, and New Zealand (see Schweigert 1999).

The Rise of Restorative Justice: An Education Context

Two peoples have made very specific and profound contributions to practices in the field of restorative justice – the First Nations people of Canada and the United States and the Maori of New Zealand. By the second half of the 1990s, “the expression “restorative justice” had become popular and attracted many segments of society, including schoolteachers, principals, politicians, juvenile justice agencies, police, judges, victim support groups, aboriginal elders, and parents” (Johnstone and Van Ness 2007, p. 77). Although the origins of restorative justice are widely contested and varying definitions continue to unfold, many education scholars agree that the inherent failings of school discipline and the implementation of zero-tolerance policies have created an impetus for alternative models to be devised.

Recent developments in education throughout the world have highlighted how important it has become for educational leaders (e.g., school administrators and teachers) to focus on an inclusive approach to leading, teaching, and learning (Wearmouth et al. 2007). These educational leaders and other educators are now required to deal with greater understanding of human rights issues including cultural, physical, and intellectual diversity in schools. A factor that is often missing from much of the debate around inclusion is an understanding that within any institution, educators and students’ relationships are defined by that institution’s social practices. Research has clearly asserted that difficulties in learning and behavior in schools are highly contextual in nature (Wearmouth et al. 2007) – that young people’s thinking and behavior are shaped by the social contexts in which they live and learn (Bruner 1996). Essentially, there is an understanding that family and culture are highly influential in shaping the thinking and behavior of young people in schools.

The principal aim of restorative processes in schools is to repair the harm that has been caused by the incident through the active involvement of all stakeholders – victims, offenders, and their

supporters or community representatives (where they want this) – in discussing what happened and deciding on the appropriate outcomes (Sumner et al. 2010). Given the range of due process concerns that arise from such interaction, most restorative justice practices that are used within the school and community settings require the offender – oftentimes the “at-promise” student – first to admit responsibility for the offense and for both the victim and the offender to consent to their involvement in the process. It is thought that through such a process, stakeholders will subsequently have a deeper understanding of the circumstances and consequences of the offense; that all participants will have agreed and contributed to the drafting of a behavioral or task-oriented contract to which the offender has to adhere; and that all participants will experience a sense of procedural justice.

Beyond the significant shift required of the schools and community effectively to curb violence and achieve justice within a restorative response is the impact this has for altering the leadership role at the school level and throughout the community. Social and restorative justice leaders engage with the communities. In the best interest of students (Stefkovich and Begley 2007), they feel a moral imperative to work with those they serve including students, teachers, families, partners, and other entities in the communities to understand the problem and then to seek positive solutions to those problems as a whole community.

Restorative justice models are increasingly advocated by educators who regularly work with student suspensions and expulsions and considered as the preferred alternative to retributive justice (Johnstone and Van Ness 2007). It is a process in which parties involved in a specific offense work collectively to find resolution. A wider more comprehensive definition is provided by Gilbert and Settles (2007) who state crime is viewed “as a harm to individuals, their neighborhoods, the surrounding community and even the offender. Crimes produce injuries that must be repaired by those who caused the injury” (p. 6) and that “crimes are more than violations of law, and justice is more than punishment of the guilty.” They further posit that restorative

justice “strives to promote healing through structured communication processes among victims, offenders, community representatives and government officials. . . to accomplish these goals in a manner that promotes peace and order for the community, vindication for the victim, and recompense for the offender” (p. 7).

Although models of restorative justice differ, there are several common components to how parties work toward restoration. The process of restorative justice must be voluntary and must include telling the truth. The only way to repair the wrong is to know and understand what has happened. At the heart of the restorative justice process is an encounter which involves sharing the truth in the presence of the offender, victim, and community. Sharing the truth allows the community to see the truth, allows the offender to see the harm inflicted, and allows the victim to see the offender as a person. For the encounter to be successful, it must include a facilitator who serves as the symbolic representation of the community and who allows the participants to decide what is important and what the right resolution is. Through a series of encounters, healing can begin and agreements can be reached. Through listening and understanding, participants can commit to restoring their relationship to one of dignity, concern, and respect (Llewellyn and Howse 1999). Finally, the restorative process empowers the offender, and the victim, to take an active role in the justice process. In order for a program to be completely restorative, it must include several components:

- Involves all parties with a stake in the resolution of the conflict, the victim, perpetrator, and the community.
- Recognizes and seeks to address the harms to one another, remembering that harm is not restricted to the victim but can be expressed by the offender and the community.
- Is voluntary. Participation cannot be the result of coercion, fear, threats, or manipulation brought to bear on either the victim or the offender.
- Is premised on and include truth telling in the form of an admission of responsibility for what

happened on the part of the perpetrator. This is a precondition for a restorative process.

- Involves encounter, a face-to-face sharing of stories and experiences between victim-offender and community.
- Protects the rights of victims and offenders.
- Involves a facilitator who can ensure the need of a broader social perspective.
- Aims for reintegration of the victim and offender into the community.
- Develops a plan for the future or agreement for resolution out of negotiation.
- Does not involve punishment.
- Is evaluated by its results, whether it restores or not (Llewellyn and Howse 1999, p. 73).

Social Justice and Restorative Justice

The term social justice is evoked daily in literature and the news media; however, it can be difficult to define. According to Murrell (2006), “social justice involves a disposition toward recognizing and eradicating all forms of oppression and differential treatment extant in the practices and policies of institutions, as well as a fealty to participatory democracy as a means of this action” (p. 81). Narrowing the definition of social justice from the world stage, to the classroom, does not make the task any easier. How social justice relates to and influences educational areas such as program development, curricula, practicum opportunities, educational philosophies, and social vision is a large conversation. What can be said is that education plays a part in promoting justice and the development of democratic citizenship. One might argue that this educational commitment to social justice is diminished through our current political environment of emphasizing curriculum tied to basic literacy and numeracy and not much else.

In addition to a modern emphasis on academic success in the face of globalization, countries throughout the world continue to adopt the social justice principle of universal education for all children including “at-promise” students. This increasing inclusiveness has led to challenges of diversity, individuality, and discipline. Schools

must now weigh the needs of the many with the needs of the few. An individual student's right to an education and to be college-ready must be weighed against the majority of students' rights to a safe and affirming educational environment. To combat these challenges, schools in Europe, Australia, New Zealand, and North America are implementing restorative practices in the form of victim-offender conferences as a process for conflict resolution and student discipline. Teachers and staff are trained as mediators and lead restorative circles to bring together the offender, victim, and community members in an effort to turn injury into personal healing and community development (Wearmouth et al. 2007).

Within the United States, a restorative approach to discipline could be perceived as a realistic alternative to zero-tolerance retributive policies, which mandate suspension and expulsion, and disproportionately target minority students. Specifically, minority youth are disproportionately represented in the number of school suspensions, expulsions, and referrals to the juvenile justice system. Restorative justice is increasingly being implemented as an alternative to retributive school discipline policies and a social justice response to the school to prison pipeline. There is minimal research on school-based restorative justice and even less on its implementation and efficacy in schools serving youth of color. However, one example of how restorative justice policies reduce violence, suspensions, and referrals to the juvenile justice system can be found in the Oakland Unified School District. In a 2007 case study conducted by the Thelton E. Henderson Center for Social Justice at the University of California, Berkeley, Cole Middle School in West Oakland's restorative justice program (created as an alternative to zero-tolerance disciplinary policies) was found to resolve conflict and build school community.

All teachers and staff at Cole Middle School were trained in the practice of disciplinary circles and community-building activities (Sumner et al. 2010). This new restorative discipline program then became the primary way of resolving disciplinary issues at Cole. Students were also offered an elective restorative justice class, and a

full-time disciplinary case manager was provided. Students participated in restorative circles which also included teachers and staff. The circles were led by a circle keeper to ensure everyone had an opportunity to speak. The morning advisory period was utilized as time to hold restorative circles and address disciplinary infractions. The study concluded that the restorative justice program strengthened school relationships, promoted and fostered social justice, helped students and adults deal with violence in their community, reduced suspensions by 87%, expulsions to zero, and saw increased student responsibility and autonomy (Sumner et al. 2010).

Restorative justice programs implemented in schools provide students with the opportunity to confront the harm they have caused, and in the process, students learn empathy and accountability. From a philosophical lens, restorative justice practices appear to be well suited for school campuses because they have the ability to support student learning by providing an alternative to retributive discipline and creating a supportive atmosphere. The restorative justice models employed by recovery programs promote social justice and restorative practices through an attempt to reintegrate offenders back into the school community. This initiative goes against the current education policies at the federal, State, and local level, which tend to lean toward retributive justice.

Conclusion

This encyclopedia entry focused on current realities for marginalized populations in urban schools. The author presented a broader theoretical, inclusive framework rooted in social justice and restorative practices that offer the best practices for a greater number of students who are "at-promise" of minimal academic success. "At-promise," as opposed to "at-risk," is used when describing underperforming student populations as it eliminates the deficit connotation associated with these learners. The extant literature suggests that examination of restorative justice practices specific to "at-promise" students and

those from “other” populations within a social justice framework is very limited (Bacon 2010). It is evident, however, from the few studies conducted that by adopting this approach, researchers and practitioners can connect and extend long-established lines of conceptual and empirical inquiry aimed at improving student learning outcomes and school practices and thereby gain insights that may otherwise be overlooked or assumed.

A further argument posits that this broader conceptualization of social and restorative justice adds to extant discourses about students who not only experience various types of daily oppression at schools (e.g., bullying, rule-breakers, homelessness, mental health issues, etc.) but also regularly live on the fringes of society. The time has come to share alternative models of justice, practices, and discipline strategies that school leaders, teachers, community members, policymakers, scholars, and practitioners alike might find beneficial when searching for more effective means to create safe teaching and learning environments for all students. It is hoped that lessons learned from effective restorative processes in schools will improve the preparation and practice of school leaders, thus improve educational outcomes for all students, and help prevent the gross injustice done to children who make poor decisions and end up on the bus from schools to juvenile hall or to prison.

It is morally imperative to provide safe and supportive learning environments for all students and to generate, refine, and test theories of restorative practices in education.

Introduction

As an educational movement, social-emotional learning (SEL) is gaining momentum nationally and internationally. Considered by some to be “the missing piece” in education, SEL is a process of building emotional resiliency and relational competency as necessary skills in school, work, and life. Social-emotional learning is a process that builds self-awareness and social awareness while also providing practical skills for managing oneself effectively and interacting with others in constructive and responsible ways. In other words, social-emotional learning is “the process through which we learn to recognize and manage emotions, care about others, make good decisions, behave ethically and responsibly, develop positive relationships, and avoid negative behaviors” (Zins et al. 2004, p. 4). These skills are positively linked with range of personal, interpersonal, and academic outcomes while also being associated with a reduction in conduct problems, aggressive behavior, and emotional distress among K–12 students. SEL programming has been found to be effective for ethnic and racially diverse students within urban, suburban, and rural settings with benefits including: (1) an increase in social-emotional skills, (2) improved attitudes about self and others, (3) greater connection with school, (4) positive classroom behavior, and (5) an improvement in academic achievement (Durlak et al. 2011). There is strong evidence to suggest

that social and emotional skills are the foundation for personal, relational, and academic flourishing.

Within the United States, interest in social-emotional learning is growing, especially with recent developments in affective neuroscience linking SEL with resiliency and enhanced brain functions essential for learning. Globally, interest has also spread widely. In fact, in 2003 UNESCO (The United Nations Educational, Scientific and Cultural Organization) “initiated a worldwide plan to promote SEL by preparing a report delineating ten basic principles for integrating SEL based on the latest empirical research in the area. . . the report was sent to ministries of education in 140 countries” (Schonert-Reichl and Hymel 2007, p. 22). As a leading organization, the Collaborative for Academic, Social, and Emotional Learning (CASEL) has identified five core SEL competencies: (1) self-awareness, (2) self-management, (3) relationship building, (4) social awareness, and (5) responsible decision making. While individual competencies are inherently valuable, it is especially helpful to consider how these skills are interconnected and embedded within a larger educational paradigm. What is the bigger picture of social-emotional learning, and why is it relevant for the education of Latino students in particular?

Social-emotional learning can be deeply understood within a broader perspective known as holistic education—a philosophical framework interested in human flourishing. From a holistic standpoint, social-emotional learning is more than a set of skills that can be taught in isolation.

Rather, the core SEL competencies are best thought of as being embedded within a larger, integrative, and ecological perspective guided by a vision of hope and possibility for humanity.

Holistic Education: Defining the Paradigm

Holistic education is a comprehensive and integrative approach to teaching and learning. It departs from schooling traditions that over-emphasize cognitive development, individualism, and competition. Instead, principles of

interconnectivity, community, and human potential serve as guiding values. As an ecological perspective, holistic education is interested in cultivating the whole person within the context of community and the natural world. Community from this perspective is understood as an interconnected network of wholes. The individual exists within the context of family, neighborhood, and school; these communal contexts are embedded within the larger context of society, which is itself embedded within the global community; and the world as a whole is embedded within the greater context of the universe. As a philosophical paradigm, holistic education seeks to integrate all aspects of the human being in the process of teaching and learning. This includes cultivating the social, emotional, intellectual, aesthetic, and physical development of individuals. From this perspective, both students and teachers are seen as complex human beings in development and in need of supportive and enriching environments in which to thrive. A holistic approach to teaching and learning is at odds with policies that pressure educators to mainly focus their efforts on raising test scores.

With contemporary education's focus on standardized testing and the cultivation of mostly logical, rational, and analytical mental abilities, other human faculties like emotional intelligence, social bonding, and the development of empathy and compassion are often neglected. The result is an unnatural fragmentation within self and between self and world, which can have profoundly negative consequences. When it comes to schooling experiences, some argue that much of traditional education promotes alienation, fragmentation, and suffering; the opposite is connection, integration, and well-being, which is what the holistic perspective advocates—and it is what social and emotional learning makes possible.

The overvaluation of standardized testing rests on the assumption that academic achievement and cognitive skills (as measured by test scores) lead to a productive competitive workforce that ensures a vibrant economy. This is an assumption that is challenged by leading economists who call for greater integration of social and emotional skills in schools:

To meet the economic, political, social, and personal demand for competency, much more is required of students and adults than just cognitive proficiencies as measured by test scores. *Individuals must develop interpersonal skills that enable them to relate to others in many different societal situations. They must also develop the intrapersonal skills that include good judgment and strategies for meeting their own needs in effective ways.* (Levin 2012, p. 270, emphasis added)

Leading economists, psychologists, neuroscientists, and educators agree: it is no longer enough to *only* educate the brain; we must *also* educate the heart and develop relational competencies while becoming healthy and productive members of society.

Children are growing up in rapidly changing and challenging times. With its focus on learnable skills and constructive ways of being, social-emotional learning equips young people with key competencies to navigate the complex realities of life, inside and outside the classroom. The development of social-emotional skills benefits all children and has unique implications for Latino students in particular.

Latino Students: A Growing Population

Latinos constitute the largest and fastest growing ethnic group in the nation. In States like California and Texas, Latino students make up nearly half of the public school population. The enrollment of English Language Learners (ELLs) in US public schools has increased by over 50% in the last decade. According to census data, approximately 80% of English Language Learners are Spanish speakers, and about one in four ELLs lives below the poverty line (Migration Policy Institute 2015). The question of how to support Latino students, and in particular those who are English Language Learners, is a pressing one for educators.

As the Latino student population grows, socioeconomic and educational disparities continue. On measures of academic achievement, Latino students, on average, perform far below their peers; high school dropout rates are high, and college entrance rates are low. Latino children are less likely to have access to early childhood

education, which has been found to positively impact long-term school and life outcomes. For children living in poverty, challenges faced outside of school have significant implications for what happens in school (Noguera 2003). Issues like hunger, access to health care, complex living arrangements, economic hardship, and mental-emotional stress impact a student's ability to focus and engage in the academic demands of school. For Latino immigrant youth, these challenges are compounded through the acculturation process, which may include the experience of marginalization, social alienation, low self-esteem, low levels of school bonding, and language barriers (Castro-Olivo 2014). Integrating social and emotional learning in schools can help mitigate some of the challenges Latino students face.

Social-Emotional Learning and Latino Students

Research on social-emotional learning and Latino students is limited. However, there is evidence to suggest that while young Latino students enter school lagging behind in literacy skills, their social-emotional competencies are “on par or even excel that of their non-Latino peers” (Murphey et al. 2014, p. 4). This foundation, coupled with strong family ties and bilingualistic resources, is an asset that schools can build on. When working with Latino students – especially those living in high-poverty neighborhoods and those classified as English Language Learners – it is essential to consider the emotional experience underlying cognitive tasks as well as the role of relationship building and positive classroom culture in facilitating language and literacy development.

The cognitive demands that English Language Learners experience are substantial. For example, students whose native language is not English are working to understand conceptual information and subject-specific content knowledge while simultaneously learning the very language through which that knowledge and information is shared. Not only are the cognitive demands

great, the emotional dynamics involved are equally challenging. Learning a second language or developing biliteracy is a socially and cognitively challenging process that is laden with a range of emotions, including a sense of confusion, doubt, fear, worry, anxiety, frustration, and embarrassment – all of which can impede learning. At the core of social-emotional learning is the cultivation of awareness, emotional intelligence, social bonding, and self-regulation – all of which have been found to facilitate productive engagement in school and life. Educators working to improve the quality of education for Latino students would benefit from understanding the role that emotion plays in the process of teaching and learning. Self-awareness and self-regulation are core SEL skills that help mediate the profound connection between emotion and cognition.

Self-Awareness and Self-Regulation: The Emotion-Cognition Connection

The interplay between emotions and cognition either enhance or inhibit learning.

Understanding the role that emotions play in cognitive functioning is highly relevant for educators as they facilitate learning among their students and simultaneously consider the implication of their own emotional landscape in the classroom:

Recent advancements in neuroscience are highlighting connections between emotion, social functioning and decision making that have the potential to revolutionize our understanding of the role of affect in education. In particular, the neurobiological evidence suggest that the aspects of cognition that we recruit most heavily in schools, namely learning, attention, memory, decision-making, and social functioning, are both profoundly affected by and subsumed within the processes of emotion. (Immordino-Yang and Demasio 2007, p. 3)

In other words, emotions and cognition are deeply interrelated. Understanding the connection between emotions and cognition is relevant for advancing the ways in which student learning and teacher development are supported. Of key consideration is the relationship between stress and critical aspects of cognition.

Under non-stressful conditions, the brain's executive control center functions in optimal ways; under stressful conditions, it is impaired. This creates a situation where emotionally laden impulses ("fight, flight, or freeze" reactions) override higher-order thinking and decision-making abilities, resulting in behavior being more reactionary and impulsive rather than thoughtful and deliberate. The stress response is a survival mechanism essential amidst real danger. However, in the course of a regular day, having a heightened state of stress, worry, anxiety, or fear gets in the way of optimal cognitive functioning and impacts the health and well-being of an individual.

Understanding the emotion-cognition connection is especially relevant for educators working with Latino populations given that this group is identified as being high risk for mental health issues like anxiety and depression. When experiencing challenging and depleting emotions, students are less able to fully engage in the cognitive demands of school. This is where social and emotional learning can help.

As a core competency in the SEL framework, cultivating self-awareness includes developing the ability to identify emotions as they arise and label feelings, which can help reduce the stress response in the moment. Connected to self-awareness is self-regulation or the ability to manage feelings as they arise; it also includes the ability to manage behavior, control impulses, and redirect attention as needed. For Latino students who live in high-poverty neighborhoods and immigrant youth who experience a range of stressors associated with learning a new language, adapting to new sociocultural norms and moving through the migration and acculturation process, having the opportunity to develop and strengthen SEL skills can support their personal and academic development (Castro-Olivo 2014).

Given the neurobiological connection between emotion and cognition, it becomes essential to help children learn how to regulate their emotions and manage their stress – developing these skills is an issue of well-being and academic achievement. At the heart of social-emotional learning is the ability to: (1) identify emotions as they arise and (2) regulate emotions and behaviors for

optimal cognitive and social functioning – these are learnable skills found to enhance personal, interpersonal, and academic outcomes.

The cognitive, social, and emotional dynamics experienced by students in school are mediated by the quality of the learning environment and the nature of relationships with teachers and peers. Social-emotional learning can help build positive relationships while cultivating nurturing environments conducive to learning – these elements are particularly relevant for literacy and language development among Latino students.

Social Awareness and Relationship Building: The Social: Cognitive Connection

Human beings are a social and emotional species. As such, our emotional state is influenced by our moment-to-moment experiences within the multiple social contexts in which we find ourselves. Positive relationships among peers and between teachers and students help create enriching learning environments that optimize learning. When considering the needs of Latino English Language Learners in particular, educators must acknowledge the role that social interaction plays in language and literacy development.

Given that human development occurs within multiple social contexts (i.e., family, peers, school, media, community, etc.), learning is continuously taking place between and within individuals. From a sociocultural perspective, learning takes place on the social plane (interpersonally) and is internalized in the mental plane (intrapersonally). Cultivating learning environments and developing positive student-teacher relationships support English Language Learners in feeling safe as they navigate the complexity of school while learning a second language. In addition to creating a sense of safety and belonging, relationships in school become critical scaffolds that facilitate language and literacy development.

From the sociocultural perspective, human development is a socially mediated process, which means that relationships and social interaction are key to learning. One important issue for

teachers working with Latino students, especially those who are considered to be English Language Learners, is finding ways of meeting their linguistic needs while supporting their academic development in the process. When it comes to supporting English Language Learners, research suggests that second language acquisition is best achieved by building on the primary language. This necessarily requires a deep valuing of a child's home language and sociocultural resources which can radically help bridge the cultural and linguistic disconnect that often happens between home and school. Building bridges necessarily requires cultivating and sustaining trusting and caring relationships between teachers, students, and families, which is a process greatly supported by social-emotional learning for students and for teachers.

Given the range of personal, interpersonal, and academic benefits of SEL, research in K–12 continues to grow. However, the preparation of teachers to facilitate social-emotional learning is surprisingly limited: “Teachers rarely receive and are not required to take courses on social and emotional development in childhood as part of their teacher training. . . . To our knowledge, there are no pre-service or in-service training programs that focus on improving teachers’ knowledge and skills regarding students’ social and emotional development. . . .” (Jennings and Greenberg 2009, p. 512, emphasis added). Knowing that social-emotional skills are foundational for a variety of school and life outcomes, it is increasingly necessary to prepare and support teachers in cultivating social-emotional competencies themselves. By integrating SEL into teacher preparation and ongoing professional development – and by modeling social-emotional competencies in the classroom – teachers can be better equipped to facilitate these skills among their students while experiencing the benefits of developing SEL competencies themselves.

There is a depth and vastness to social-emotional learning that is worth noting. Within each of the five core competencies are a range of learnable skills as outlined by the Collaborative for Academic, Social, and Emotional Learning (CASEL). For example, the domain of self-

awareness includes the ability to recognize and manage emotions; discern the interrelation between feelings, thoughts, and behavior; and accurately assess personal strengths and weaknesses. Social awareness includes the ability to consider the perspectives of others, read social and emotional cues, and cultivate empathy and compassion. The domain of self-management includes the ability to regulate emotions, manage stress, control impulses, and set goals. Relationship building includes the ability to relate well with others, resolve conflicts in constructive ways, collaborate, and develop clear communication skills (Zins et al. 2004, p. 195). Finally, responsible decision making, which underlies all of the above, calls for recognition that every individual matters, that every word and action have an impact, and that impact is either constructive or destructive. Considering the well-being of self and others while making moment-to-moment choices requires self-awareness, self-regulation, social awareness, and relational competency – all of which form an integrative intelligence.

Social-emotional learning is essential in educating the whole person; it highlights the power of the individual while acknowledging the fragile yet solid interconnected web of life. As interrelated skills, social-emotional competencies support individuals in taking personal responsibility for themselves while recognizing their ethical responsibility to the greater whole. As an educational movement, SEL encourages individuals to move in the world carefully, thoughtfully, and constructively while making an effort to consciously reduce any intentional or unintentional harm that may be caused along the way. The value and promise of social-emotional learning lie in its focus on practical tools, learnable skills, and core competencies that enhance traditional school outcomes while facilitating personal and interpersonal well-being in the process.

In considering the education of Latino students, social-emotional learning is highly relevant. For English Language Learners, SEL skills can help facilitate the process of language and literacy development while also supporting the mental-emotional well-being of children from

high-poverty neighborhoods – all of which have implications for school, work, and life. These critical skills are best thought of as being interrelated and embedded within a larger ecological perspective. As a theoretical framework, the holistic educational paradigm outlines a hopeful vision for humanity, while the practical application of social-emotional skills brings to life that vision and fosters a more just, compassionate, and humane society – starting within the walls of a teacher's classroom and rippling out from there.

Introduction

The United Nations Convention on the Rights of the Child (“CRC” or “the Convention”) is the global community's agreed vision for its children. It establishes a set of values and norms, agreed by the world's governments over a quarter of a century ago to inform laws and guide State action and social attitudes. It is a key expression of global states' conception of childhood and one that has been influential, to varying degrees, in shaping wider social imaginaries in the member states of the United Nations.

The Convention was adopted by the United Nations (“UN”) General Assembly in 1989 after 10 years of negotiation between the world's governments (42 of whom participated in the drafting Working Group). Within its text, education features prominently not just in two dedicated provisions (Articles 28 and 29) but also through references to education for particular groups of children (such as children with disabilities and those in detention) and to specific topics to be included in education (health and drug education). Given that its standards have been endorsed in law by 196 member states of the UN (in fact, all members bar the USA), the Convention is a high profile and comprehensive statement of the world's aspirations for its children and their education.

A Contested Yet Powerful Global Vision for Children

The Convention is the first legally binding human rights treaty that provides bespoke rights for children. However, it is not the first articulation of them internationally. Its forerunners, the Geneva Declaration (1924) and Universal Declaration on the Rights of the Child (1959), were conceived and endorsed as part of the global response to the suffering of many children in the wake of the two world wars. The 1924 Declaration, promoted by Eglantyne Jebb, the founder of Save the Children, reflects a construction of childhood that is particular to the social and political context of the time, with its overriding concern for children's welfare and protection. Its text, well intentioned but profoundly paternalistic, states: "The child that is hungry must be fed, the child that is sick must be nursed, the child that is backward must be helped, the delinquent child must be reclaimed, and the orphan and the waif must be sheltered and succoured." The 1959 Declaration modernized the terminology on childhood and extended the agreed aspirations for children to include matters such as the child's right to an identity, but it did not go so far as to afford children the autonomy rights that characterize human rights instruments for other protected groups. Nor at that stage was the UN prepared to move beyond a non-binding declaration and embed its promises into a legally recognized human rights treaty.

While the CRC is the most widely and rapidly ratified international human rights treaty, its path to adoption as a legally binding human rights instrument by the UN General Assembly in 1989 was neither easy nor fast. Much of that delay can be attributed to the discussion, theoretical and practical, about the existence or extent of children's rights to autonomy and in particular to participate in the decision-making that impacts on their lives. It was not until the late 1970s, prompted by the work of the child "liberationists" (in particular John Holt and Richard Farson) and aligning with the feminist movement for equality, that the demand for children to be acknowledged as independent rights holders began to gain ground. This relatively tardy path to recognition

in international human rights law (a Convention for women was agreed two decades previously) was in large part due to an ongoing debate about what rights entail as well as who can have or exercise them. This discussion is fraught often but perhaps no more so than in relation to children (see Tobin 2013). The resistance is often linked to perceived inadequacies in children's capacity to make rational decisions in their own lives and therefore in their ability to "claim" or exercise their rights (Archard 2014), a position that has been evolving both in law (e.g., the landmark Gillick decision in the UK) and in the scholarship that emerged from a new sociology of childhood scholars (such as Jens Qvortrup and Allison James). Legal theorists have debated and discussed the nature of rights for decades, choosing children and their perceived lack of capacity as a "test case" for rights more generally (MacCormick 1976).

The drafting of the CRC provided an opportunity for the world's governments to discuss, describe, and ultimately determine its position in this contested debate, not only providing a collective vision of a world in which children thrive and develop but also defining children's own role and entitlement to influence those processes. Its predecessors had gone some way in paving the road for children to be recognized as rights holders. However, the vision that they offered was one of protection and welfare rather than autonomy and capacity for self-determination. During drafting, discussion of the latter continued to be contentious, often because of the perception that affording these rights to children would impinge on the authority of parents, a particular concern in the USA and the main reason it has not yet ratified the CRC. For the treaty to be adopted by the UN, the draft had to be accepted unanimously so the product, while having global endorsement, is the inevitable result of significant political negotiation.

Compromises were reached so that the diverse states of the UN were able to find a consensus on the conditions of childhood that they could live with and embrace collectively. The end product covers all of the key socioeconomic rights (education, health, and an adequate standard of

living) as well as civil and political rights (to identity, expression, association, and conscience). It places an obligation on states to protect children from abuse, neglect, and economic and sexual exploitation and includes protections for particularly vulnerable groups of children including children with disabilities, children in detention, and child soldiers. Even so, it has been described as “a beginning but only a beginning” given a series of gaps in coverage, including its neglect of citizenship rights as well as the needs of gay and lesbian young people and adequate provision for children with disabilities (Freeman 2000).

Although the Convention is open to a dynamic and evolving interpretation, it is a vision that has been articulated for (some would argue imposed upon) one group (children) by another (adults). While this is arguably the case for all human rights treaties (they are negotiated and agreed by political elites and powerful advocacy groups), one of the most cogent challenges to the notion of the CRC as a global social imaginary is the fact that children had almost no input into defining these values and norms, leading Freeman to observe that there is “not a little irony in having a Convention which emphasises participatory rights (in Article 12) whilst foreclosing the participation of children in the formulation of the rights encoded” (2000, p. 282). Children may agree with much of what adults have chosen for them but still have their own views on the content, style, and interpretation of it. Had they been involved in contributing to the global, legal statement of the imagined ideal states of childhood it is likely that it would have been expressed differently, with matters such as the right to play or to vote in elections being given greater priority or included respectively (Lundy et al. 2015).

Others argue that what has been included represents a Western vision of childhood and one that has been imposed on other countries, particularly the global south. This is a criticism of human rights standards more generally and those who defend the universality of the values expressed draw on the engagement of many diverse countries in drafting and the fact of ratification, albeit that many countries ratify subject to sweeping

reservations (e.g., that they will comply only so far as that is compatible with Sharia law). In contrast, it has been suggested that most States have accepted the universalism of the standards but blame poor progress in implementation on the disconnect between the attitudes of the government and the values of the people. Harris-Short (2003, pp. 176–177) argues that, if international human rights are to be effective, the individual and his or her culture, beliefs, and values must become constitutive of international human rights law and international society as a whole: “the whole system must undergo a fundamental transition from a society of states to a society of humankind.” This approach has links to a further body of thinking on “living rights” for children, that is, the rights that are shaped and crafted by children themselves (Hanson and Nieuwenhuys 2012).

The ongoing plight of many of the world's children also belies the notion that the CRC has in fact been globally endorsed. Child deaths, exploitation, hunger, and illiteracy exist in all societies and are prevalent in many in spite of the global aspirations. King, drawing on autopoietic theory, suggests that those who endorse the Convention have been carried away on “a magic carpet” of excessive optimism” (1994, p. 385). Blame is attributed to the fact that it is not “real law,” given its nontraditional and arguably weak enforcement mechanisms. In response, it can be argued that it is important that this type of global imaginary exists even if it is incomplete, not fully embraced, and/or limited in terms of its implementation and enforcement. It is, in many respects, an imaginary in the making. Even recalcitrant States, those who have ratified the CRC without being persuaded by its values, can over time be prompted by the international peer pressure and ultimately acculturated to it is norms (Lundy 2012). Social attitudes too can follow suit with public attitudes (e.g., to corporal punishment or child labor) shifting in line with the implementation in law of these global norms. Freeman (2000) argues that its existence in law is important since law is an important symbol of legitimacy – an accomplished fact – which is difficult to resist. Moreover, a focus on what remains to be done, considerable though those challenges are, can obscure its many achievements, not least its

incorporation into domestic law and policy in many countries (Lundy et al. 2013).

Global Norms for Education: Balancing Pragmatism with Idealism

Education rights have been a consistent feature of international human rights law. Although education is not a right that is exclusive to children, it is one enjoyed mainly by them and one that is recognized as crucial to their development and ability to enjoy their other rights. The CRC, in articulating bespoke rights for those under the age of 18, thus provided a fresh platform on which to build on the agreed global aspirations for education with a specific focus on *children*. In doing so, it emerged that one article was insufficient to capture all aspects of this particular articulation of global governments' imaginary for children with the result that the drafters chose to expound it in two lengthy provisions: Article 28 focuses primarily on issues of access to education, while Article 29 addresses the aims of education.

Article 28, in addition to reiterating rights of access to primary, secondary, vocational, and higher education, includes new provisions requiring discipline to be administered with dignity and for States to take measures to promote regular school attendance. Although there is a requirement to implement the rights progressively (that is, striving for continuous improvement), Article 28 in particular contains several qualifications and limitations that reflect the actual rather than the ideal situation in many of the signatory States. Only primary education has to be free. States are obliged to "encourage" secondary and vocational education and to "take appropriate measures" which include the introduction of free education and offering financial assistance in case of need. In this instance, the imaginary is far from the collective notion of the ideal and indeed the actual experience of many children.

Article 29, in contrast, includes a very broad and ambitious account of the goals of education, addressing many current national and transnational dilemmas. Article 29 defines the aims of education to include quality education as well as

tolerance, equality, and respect for human rights. Notably, it expands the aims of education in Article 13 of the International Covenant on Economic Social and Cultural Rights to include two entirely new themes: one on respect for identity and culture (29 (1)(c)) and the other on respect for the natural environment (29(1)(e)). For example, it requires education to be directed to "the national values of the country in which the child is living, the country from which he or she may originate, and civilizations different from his or her own" as well as the "preparation of the child for responsible life in a free society, in the spirit of understanding, peace, tolerance, equality of sexes, and friendship among all peoples, ethnic, national and religious groups, and persons of indigenous origin."

The Convention also recognizes that the aims of education are not just delivered through what the child is taught in the curriculum but how the child is treated in the classroom and beyond. Addressing children's rights "in" education is considered to be crucial if the aims of education are to be learnt through experience. The Committee has emphasized that students do not lose their rights when they pass through the school gate: children should enjoy their civil rights to freedom of conscience, privacy, and expression as well as protection from abuse and neglect and cruel, inhuman, and degrading treatment. Moreover, all of this must be provided without discrimination and must give his or her views due weight; and his or her best interests must be a primary consideration in all decisions affecting him or her. As such, the Committee has stated that Article 29 has "a qualitative dimension which reflects the rights and inherent dignity of the child; it also insists upon the need for education to be child-centred, child-friendly and empowering, and it highlights the need for educational processes to be based upon the very principles it enunciates" (UN Committee on the Rights of the Child 2001, para. 2).

Several of its provisions underscore the vision of child-centered education. Of most relevance in this context is Article 12, one of the most widely cited but misunderstood provisions of the CRC (Lundy 2007). Crucially, it recognizes that children are not just able to express their views but that they are *entitled* to do so in all matters

affecting them. Not only does Article 12 establish the entitlement of students to be heard but, when read along with other key provisions of the CRC, it defines how this should be operationalized. In particular, it places emphasis on the obligation of duty-bearers (including educationalists) to ensure that children's engagement is in itself rights-respecting. Unlike adults who also have a right to freedom of expression, children are also entitled to have their views taken seriously. At the heart of the human rights agenda is the desire to ensure that the State (and its agents) do not exercise power in a way that undermines a person's right to be treated with dignity and equality. Ensuring that those who do not hold power may nonetheless exert influence on their own lives is one important dimension of this.

In spite of the global vision articulated in the CRC and some evidence that its standards are influencing law, policy, and practice in education (Lundy 2012), there is no country in which all children receive acceptable education in safety and security, with equal access to good-quality teaching and learning and in an atmosphere which respects their identity, culture, and values. Moreover, there are some groups of children (e.g., those in detention, children with disabilities, and many indigenous children) who experience fundamental and persistent disadvantage and some contexts (such as conflict, forced migration, and extreme poverty) which pose significant challenges for implementation. However, the fact that global consensus was achieved on education rights in the CRC at all is notable given the scale of the challenge and the diversity of the nations and cultures that embraced it. While States are afforded considerable discretion as to how they respond to implementing education rights in practice, the existence of a worldwide accord on the need for and content of children's rights and education is important in and of itself, irrespective of patchy, unsatisfactory, or reluctant implementation. Much progress has been made in education through rights-based advocacy and monitoring and it appears that there continues to be a high degree of continuing support for education rights not just among NGOs but also the world's governments.

Conclusion

The UNCRC is an important global conception of what constitutes a desirable society for children. The views and experiences of the societies in which it has been implemented (to varying degrees) do not always align with its articulation of a desirable childhood but they have undoubtedly been impacted by it. Moreover a question arises as to whether the vision agreed 25 years ago and articulated in the Convention on the Rights of the Child, remains appropriate and/or will endure. It has been suggested that the CRC has failed to keep pace with recent developments in children's lives such as the use of new technologies and increased use of drugs and alcohol. However, if the social imaginary changes, as it already has and will undoubtedly continue to do, experience suggests that the CRC may be flexible enough to adapt and cope. It is a living instrument, one that is currently embracing practices (such as the use of social media and cyber-bullying) that were barely envisaged a quarter of a century ago. Moreover, part of its enduring strength rests in its connections with and capacity to bolster other movements and imaginaries, for example, the case for inclusionary practices in schools or the student voice movement. These may have developed independently but they draw frequently on the perceived additional legal and moral imperative as well as the global reach of the CRC to define their terms and practices. The Convention will, for the foreseeable future, continue to be a concrete, if incomplete and contested, expression of the world's aspiration for its children, shaping law and policy as well as influencing social attitudes.

Social Imaginaries and Democratic Teaching and Learning

Moshi A. Mislav

University of Dar es Salaam School of Education,
Dar es Salaam, United Republic of Tanzania

Introduction

Over recent decades, the world has undergone a major shift in education policy from State-led to market-led reforms spearheaded by a neoliberal ideological and political ascendancy. This has been manifested through structural adjustment programs (SAPs) in both developed and developing country contexts (Carnoy 1995). This entry discusses how neoliberal policy reforms have

further undermined the possibility of democratic teaching and learning in developing country contexts. The entry begins with a discussion on the characteristics and conditions necessary for what is imagined in modern society as democratic teaching and learning. It then discusses how democratic teaching and learning has been, and continues to be, constrained by dominant education marketization policy discourses. It is argued that democratic teaching and learning does not just begin and flourish in the classroom. Rather, it should be viewed as the result of continuous historically, culturally, and socially constructed and reconstructed phenomena at the societal, institutional, and local classroom levels. Democratic teaching and learning practices socially construct teachers' and students' identities by giving them opportunities to participate actively in knowledge construction. However, under neoliberalism, SAPs have affected public service provision in particular ways in developing country contexts by emphasizing the necessity of marketization, privatization, and capped State expenditure on education in order to achieve universal participation in primary and secondary schooling.

Social imaginaries may be understood as the various ways in which a society conceptualizes its ideal collective reality and the social means through which people work with others to attempt to realize this ideal. These ways include the nature of interactions between themselves and their colleagues and the social expectations they attempt to achieve in the context of moral and practical imaginaries that motivate these expectations. Conceptions of the imaginary emphasize "the social," "expectations," and the "normative." Taylor (2004) identifies three basic forms of social imaginaries in contemporary modern society: "the market economy, the public sphere, and the self-governing people" (p. 2).

Understanding Democratic Curriculum Through Critical and Poststructuralist Theories

An understanding of democratic teaching and learning practices in the real world, and

particularly in developing country contexts, requires an understanding of critical and post-structuralist discourse theories because they offer a systematic approach to analyzing education policy and social realities. These realities vary considerably between the Global North and the Global South and between OECD bloc countries and developing country contexts, including those which have been subject to SAPs required by the World Bank and International Monetary Fund in what Carnoy (1995, p. 653) describes as the “new structural reality.” While critical theory informs the analysis by identifying social ideologies reproduced through discourse, poststructuralist theory provides concepts of how power/knowledge, subject positioning, and subjectivity are important in understanding democratic teaching and learning. According to poststructuralists, democratic teaching and learning may be seen as culturally, socially, and historically constructed through discourse. Discourses are representations of social structures and practices that carry with them power relations and ideologies. They represent what people think, say, and do. Poststructuralists differentiate between dominant and nondominant discourses (Foucault 1972). Dominant discourses are those produced and sustained to benefit the interests of powerful people in society. Dominant discourses carry ideologies and power of dominant groups. Ideologies and discourse are related in that social ideologies work through language that mediates social action. Ideologies are partially constitutive of social reality. Therefore, the imaginary of democratic teaching and learning in the classroom may be constrained or facilitated by power relations between students and teachers that are reproduced through dominant discourses and ideologies over the various subjects.

According to poststructuralists, dominant curriculum policy discourses have two major constructive and constitutive effects. Foremost, they constrain how teachers and students participate in curriculum because these discourses furnish possible subject positions. Subject positions continuously occupied by particular social subjects over a considerable period may construct subjectivity (Davies & Harre, 1999). Second, discourses

construct objects in various forms through the deployment and use of particular vocabularies. Understanding discourses is important in understanding the theory and practice of democratic teaching and learning.

Consistent with scholars who have criticized the limitations of *purely* functionalist and structuralist approaches to understanding the material practices of social institutions (e.g., Bourdieu 1977), this entry applies critical and poststructural theories of discourse. Such theories are illuminating insofar as teaching and learning practices are thereby represented in and through language discourse, which is open to multiple interpretations. The application of critical theory in this entry is also informed by the view that democratic teaching and learning practices, to a greater or lesser extent, may be influenced by both individual and group teacher and student ideologies, values, and strategies at local community, family, institutional, and classroom levels. Critical theory thus helps to uncover the ways in which these ideologies, values, and strategies materially influence the presence or absence of democratic teaching and learning practices. Curricula in schools and classrooms also need to meet the imagined and practical expectations of teachers and students who come from different social backgrounds, with different needs and abilities. Democratic teaching and learning offers significant possibilities and opportunities for achieving this in developing country contexts although, as this entry illustrates, this is not always the case.

Basic Principles and Features of Democratic Teaching and Learning

Teaching and learning may be said to be democratic if it follows certain morally informed principles. Democratic education emphasizes the common interests of the many, rather than the particular interests of the few (Dewey 1916). Further, for Dewey, democratic education should enhance all children’s ability to develop and apply “deliberative, practical reason in moral situations” (Jenlink 2009, p. 4). Dewey suggested that teachers could not promote this by teaching what

he called “ready-made knowledge” that served to constrain moral reasoning. Instead, it could best be achieved by introducing “a mode of associated living.” Foremost, democratic education occurs when teachers and students together have equal say or freedom in curriculum, pedagogy, and evaluation. For example, in the curriculum, they are free to select content: what and how much content and how and when to teach it. Moreover, they have power to participate in content planning and decision-making. The creation of democratic schools, classrooms, and curriculum requires teachers and students to learn, choose, practice, and evaluate democratic ways that will empower them and improve the knowledge construction process. For example, in a democratic classroom discourse, teachers and students have the freedom to participate in theorizing, experimentation (Kelly 2009), and research based on their immediate school and classroom contexts, because curriculum on this view is context specific (Smith & Lova 2003). In democratic education, there is less interference or imposed institutional barriers to constrain to the freedom of teachers and students to perform such practices according to their local school contexts. The fundamental role of democracy in education may be summarized in two conceptual constructs: social and political liberation and empowerment of those who experience the curriculum (Kelly 2009). These two values are argued to enhance mental independence, respect for others, and respect for the ideas and contributions of both teachers and students in the curriculum and knowledge construction process.

Similarly, all teachers and students have equal opportunity to participate in the planning, decision-making, and implementation of the selected content, experiences, resources, pedagogy, and evaluation practices. Practicing democratic curriculum is possible if tracking, norm-referenced testing, and other mechanisms that constrain students’ access to educational programs (based on their gender, race, age, or socioeconomic class, location) are eliminated. However, teachers and students’ decision to practice curriculum in democratic way may either be facilitated or constrained by their existing capability and capacity, that is, their knowledge,

attitudes, and beliefs about curricula aims and objectives’ roles and rights, and responsibilities in the curriculum process.

Moreover, in a democratic curriculum, students cooperate and collaborate in the learning process rather than competing. They work collaboratively through a learning community. Competition is considered to reduce teachers’ and students’ ability to work together as a community of learners and to concentrate on thought-provoking and creative curriculum practices. Finally, democratic curriculum content, process, and praxis (thoughtful practice) are argued to be more likely to produce democratic citizens who will think, behave, and act in a democratic way. Democratic content is thereby produced in a democratic way. It is an outcome of dialogue and participation of all stakeholders in the society or community. Stakeholders’ voices and needs are represented in the curriculum making, implementation, and evaluation. The democratic curriculum takes into account the knowledge, cultures, and experiences of students from different historical, sociocultural, and political backgrounds. As will be demonstrated, this view of education is markedly different from that imposed in recent decades through neoliberalism, SAPs, and the marketization of curriculum production in developing country contexts.

Conditions That May Facilitate Democratic Teaching and Learning

Proponents of democratic teaching and learning in developed countries (e.g., Beane 2005; Apple and Beane 2007; Fielding and Moss 2011; Riley 2004) accept that it is more likely to occur when the following conditions are fulfilled. Foremost, there are smaller class sizes that enable each student to have an equal say on the ways schools and curricula are run. Similarly, it occurs where teachers develop a pedagogic identity of being listeners to pupils’ talk rather than talking at them. This is seen to facilitate teachers’ understanding of the day-to-day challenges students face within and outside schools. Teachers and students who respect each other’s contributions

create more demanding lessons that promote motivation for creativity, critical thinking, and ideas in a safe environment. Moreover, democratic curriculum flourishes where teachers provide opportunities for students who have missed learning for any reason to facilitate their participation and construction of knowledge. In addition, it may be said to take place in situations where teachers and students develop opportunities for both formal and informal learning, both inside and outside schools and classrooms. Finally, democratic education may be said to occur where stakeholders work together with schools, teachers, and students to improve physical learning environment, curricular resources, and social interaction (Riley 2004).

Discursive Construction of Nondemocratic Teaching and Learning

Over the past several decades, neoliberal theories of the ideal society and economy have led to the proliferation of education policies of marketization, privatization, deregulation, and decentralization. Education policy and provision in many countries have been transformed from State-led to market-led. In many developing countries, such movements took the form of SAPs. However, despite the imagined emphasis on decentralization, in practice education policymaking and implementation continued to be centrally controlled. In such a centralized education system, policy decisions and implementation are tightly controlled from upper hierarchy. In this model, the possibility of democratic teaching and learning may be seen to be constrained by power relations reconstructed through dominant policy discourses that aim to serve the interests of the powerful, rather than those of teachers and students. Thus, the State, publishing companies, school management, and elite communities construct less democratic school curriculum, pedagogy, and evaluation discourses for reproduction at the lower hierarchy of the education system and institutions. In developing countries, these discourses commonly include prescriptions for syllabus

coverage, centrally set examination, textbook approval, financial, school inspection, and curriculum policy changes.

One of the conditions of modernity is the dominance of the market in the many aspects of society from production, distribution, and consumption of goods and services (Taylor 2004). In theory, markets are assumed to provide greater freedom of choice of education programs and resources like textbooks, reference books, teachers' guides, teaching aids, and lesson plans. However, in practice, in a centralized education systems, schools, teachers, and students' freedom to select resources may be constrained by multiple dominant competing and contradictory policy discourses constructed by the market, the State, community, school owners, and school administrators. For example, while the market may be structured to produce textbooks, the government produces subject syllabi that outline curricular content selected by State policymakers, and centrally set examinations. The contradictory objectives of textbook producers and distributors, the government, teachers, and students constrain the possibility of democratic curriculum because while some teachers and students may want to select particular textbooks that facilitate deeper understanding, the market may not produce such textbooks. In addition, those produced may be too expensive for some students or they may contain contents that do not meet the needs and expectations of teachers and students. Similarly, freedom may be constrained by school inspectors and State policymakers who direct the type and nature of textbooks available for selection through the discourse of finance and textbook approval. The availability and amount of money collected and spent on textbooks is directed by the State, whose interpretation may in turn be subject to variation at school level. This has implications on the quantity, nature, and textbooks categories teachers and students purchase, which in turn, materially shapes pedagogic and evaluation practices.

It may be argued that marketization policy reform texts and discourses reconstruct the discourse of competition that constrains teachers and students from working in collaboration and cooperation in a community of practice. Competition

reduces teachers and students' ability to work together as a community of learners that enable shared thinking and collaboration that provokes creativity. The imposition of SAPs in developing countries requires both rapid achievement of universal primary and secondary education and rapid increases in the proportions of students who successfully complete secondary school qualifications. Curriculum construction consequently emphasizes official syllabus coverage and passing national and local examinations, rather than constructivist teaching for understanding.

A lack of adequate school resourcing at system level and greatly increased class sizes at the local level, especially in rural areas, further constrain teachers' pedagogical freedom. Together, State syllabus coverage requirements, examination imperatives, and market positioning by official and unofficial textbook publishers combine to influence the curriculum toward their interests. Teacher and student ideologies and beliefs are guided to select the most affordable and readily accessible resources that appear to offer easy syllabus coverage and the opportunity to pass nationally set examinations. Teachers and students lack the freedom to select content that may encourage learning for understanding. Furthermore, these material conditions of work influence teachers to select and practice nondemocratic teacher-dominated pedagogies in order to cover syllabi and prepare students for examinations. The two discourses of syllabus coverage and examinations, thus, become the publishers' advertising discursive tool to influence schools, teachers, and students' textbook and pedagogy selection decisions and practices.

SAPs in a developing country context may also reinforce the existing central control of educational decision-making. Schools have less autonomy on how much, when, and on what resources to spend allocated from the central level. Instead, the central authorities provide revenue collection and spending rules and procedures. Related to finance are the centrally set national examinations where teachers and students have little control on the form, content, and timing of those examinations. These examinations intersect with other policy texts and discourses to influence what,

how, and when teachers teach. As a result, schools have fewer resources which affect how they teach and evaluate their work.

Democratic teaching and learning may also be constrained by teacher ideologies and attitudes about students, subject matter, and the nature of learning because teachers select and practice pedagogies that position students as passive participants and limit their creativity and critical thinking. For example, teachers who believe that some curricular contents are more difficult than others may omit them, even though they are part of the official syllabi, believing that they cannot teach such topics. Similarly, teachers who are constructed and constituted by examination ideologies and believe that participatory pedagogies are impracticable will construct syllabus coverage discursive practice that call for lectures and notes taking pedagogies.

In addition, students' democratic participation in curriculum in the case of most developing countries is constrained by very large class sizes that deny their equal share in the classroom discussion due to limited time and other resources. Teachers have less time to listen to each student's contribution. Further, large classes means having inadequate funding to purchase textbooks for each student to access the necessary power/knowledge that would enhance their participation in classroom activities and future social identity formation. However, the small minority of students from affluent families will access power/knowledge and, therefore, dominate curriculum discourse and reproduce their already dominant power/knowledge. Such domination and reproduction demotivate the majority of students' creativity and reflection on their work and constrain their self-esteem and self-actualization.

Conclusion

This entry has examined how contemporary education marketization policy and practices adopted over the past two decades in many countries constrain democratic teaching and learning, a condition that is argued to be necessary for a democratic society. The democratic curriculum remains an

idealized form of pedagogical practice in developing country contexts that have experienced SAPs because its realization is constrained by dominant discourses socially and historically constructed by the market and the State and reproduced at the institutional and classroom levels. Thus, a major challenge is that democracy in theory is far from democracy in practice. Marketization policies required by SAP interventions continue to serve to reproduce the existing social arrangements of inequality, discrimination, and marginalization. Democratic curriculum practices in schools and classrooms would require policymakers, school administrators, teachers, and students to practice democratic values in their individual, institutional, and societal relations. That is, democracy must begin with the thinking and actions of individuals in schools, the State, and family level practices. Such an imaginary is difficult if not impossible to achieve in developing country contexts under the current constraints of structural adjustment programs.

[Denouncing the monopoly held by schools](#)

Introduction

From a perspective gained over the 50 years since they were first formulated in the 1960s and 1970s, deschooling theories may be studied as a direct rejection of underlying paradoxes in the modern social imaginary. The initiators of this pedagogic school of thought focused their attention on the discourse generated by modern education centers and the impact it had on broad sectors of the general public. The central thesis that united the different advocates who developed their ideas under the deschooling umbrella was that both education and the teaching-learning processes were threatened in a world where States structured their education systems on the monopoly held by schools.

Theoreticians of deschooling saw education as a way to ensure social order by means of the mutual benefit of its participants. This led them

to denounce the monopoly that traditional education institutions held on education and learning. In their most well-known texts, they decried schools as places that generated social problems rather than being places where they were solved. This criticism of schools and universities – institutions that were the torchbearers of modern society's highest aspirations – caused unprecedented commotion in academia in the 1960s and 1970s. The impact was similarly notable on many of the social movements that at the time considered educational institutions as places for solving the main challenges faced by society.

It is worthwhile to note how the ideas developed in the 1960s and 1970s by writers such as Ivan Illich (1926–2002), John Holt (1923–1985), Paul Goodman (1911–1972), and Everett Reimer (1910–1998) continue on in theories of education in the twenty-first century. The works by this generation of authors act as theoretical underpinnings for new pedagogical approaches in the twenty-first century that show the possibilities of creating organized spaces for teaching and learning beyond the school. Such approaches are now reconsidering deschooling theories in the context of the online society in the wake of the Internet revolution, the modern liquidity, the crisis of capitalism in 2008, the ecological crisis, and the disrepute of representative liberal democracies. It is therefore of great interest to analyze not only the main lines of criticism that Illich, Holt, Goodman, and Reimer expounded in their works but also the genesis of the discourse structured by this generation of authors as well as the way they made use of linguistic conventions that were laid out 50 years ago.

Cuernavaca (Mexico): A Landmark for Deschooling

Even a cursory look at theories of deschooling must take into account the undertakings in Cuernavaca, Mexico, specifically at the Centro Intercultural de Documentación (CIDOC) between 1963 and 1976 (Cayley 1992, pp. 202–204). Founded by Ivan Illich, this center acted as a meeting place for important

intellectuals interested in opening up lines of economic, cultural, political, and social criticism that were both necessary and possible in the second half of the twentieth century.

Illich's leadership was key to the way in which CIDOC evolved as a space for thought. Founded in the shadow of the training programs for missionaries of the Catholic Church, by 1970 the center had become an international gathering point where avant-garde intellectuals and politicians came to study, do research, and converse. Critical study of modern-day institutions was the starting point in the analyses and reflections emanating from Cuernavaca. Broad sectors of the antiestablishment social movements in Latin America took part in its activities. The center reached out to intellectuals from the newly emerging counter-hegemony and counterculture sectors that were turning the region into one of the most outstanding political testing grounds in the world. There, they came up with genuine alternatives to institutional development and progress. CIDOC was home to exploration of and debate about radical options to such an extent that a reversal in the predominant societal trends of the time was deemed to be unavoidable and imminent.

In the summer of 1967, Reimer and Illich began their systematic and radical analysis of the school system. One year later, in 1968, Reimer started an 8-week seminar that he taught at CIDOC called *Alternatives in Education*. From July 15 to September 1, 1968, both men established a set of periodic meetings. Holt participated in Reimer's *Alternatives in Education* seminar at Cuernavaca as well. Along with Holt, many other educational philosophers in American critical pedagogy, such as Martin Carnoy, Joel Spring, Edgar Friedenberg, John Ohlinger, Jonathan Kozol, George Dennison, and Jerome Bruner, took part in the seminar and publications that were organized in Cuernavaca. Together, these critics formed a generation of pedagogues that held the work of Paul Goodman as their intellectual model. Goodman himself also became a frequent collaborator in activities at CIDOC.

The lines of discussion raised at the *Alternatives in Education* seminar often led to the publication of different texts that clearly reflected the

critical approach being taken in Cuernavaca. In 1968 in CIDOC Cuaderno 45, two of Reimer's texts were published in Spanish: *La educación descarriada I* and *La educación descarriada II* ("Education Gone Astray I" and "Education Gone Astray II"). In September 1970, the CIDOC Notebooks collection published the book *The Dawn of Epimethean Man and Other Essays* by Ivan Illich. In 1971 and 1972, CIDOC published four more issues featuring texts that had been discussed in the seminar as well as ones written from lectures after 1968. The title of this collection was *Alternatives in Education*, which was released in four issues (numbers 74, 75, 76, and 77) in the CIDOC Notebooks collection. This same collection also published four of Holt's papers: "A Letter Advocating School Resistance," "Summerhill and Beyond," "A Commentary About the Magnitude of the American Educational Establishment, 1960–1970," and "Reformulations: A Letter Written after Two Weeks in Cuernavaca."

Criticism of Schools and Alternatives to Schooling

It is important to situate the starting point of criticism against prevailing educational institutions as proposed by the theoreticians of deschooling. For participants in the *Alternatives in Education* seminar in Cuernavaca, for example, egalitarian schooling of the population *en masse* was economically unfeasible. All over the world, it was evident that the funds spent on schooling were never quite enough to meet the expectations of parents, teachers, and students. In the 1970s the USA was regarded as proof that no country was wealthy enough to afford a school system capable of satisfying the demands that the system itself created. Thus, it was argued that radical change was needed in the discourse on education to acknowledge that the whole endeavor of schooling was economically absurd.

In addition to the economic strand in the theoretical approaches of authors such as Illich, Reimer, Holt, and Goodman, there were psychological and social elements as well. These authors found schooling to be socially paralyzing and

intellectually disempowering. They believed that one of the main problems created by the ever-growing schooling of society was the inability school-educated people displayed in being able to imagine a world without school. This could be seen in how completely unable those who attempted school reforms (politicians, educators, academics) were to value any learning process achieved outside the traditional confines of school. With their values institutionalized by planned and technically constructed processes, members of modern-day society were socialized to believe that the "good life" consisted in having institutions for the purpose of defining whatever values they and their society believed were necessary. Indeed, the ethos of institutional insatiability was the defining feature of modern-day societies.

Furthermore, deschooling theorists held that education possessed a subversive potential that was mitigated by schooling. They argued that any society that hoped to make each individual's human experience and consciousness-raising the center of its development should find in "education" a way to overcome the "training" that took place in the classroom. A desirable goal was a society where everyone had equal opportunity to become educated. However, for them the problem was that schools had already taken over most of the funding available for education. Illich pointed out that the first article in a Declaration of Human Rights appropriate for a humanistic society should be based on the State not decreeing any law establishing compulsory education, on the grounds that no ritual could possibly be obligatory for all.

The conception of learning underlying the deschooling approach starts from rather romantic notions. These theorists considered the widespread belief that most knowledge resulted from teaching to be a fallacy that encompassed school systems. In contrast, deschooling theorists argued that people acquired most of their knowledge outside the classroom. Learning came about casually and was the human undertaking that least needed any third-party involvement at all. They noted that even the most intellectual learning was not the result of programmed instruction.

As an alternative to schooling, a number of different ways were conceived of for regaining

control of the means of education. In that regard, Illich's book *Deschooling Society* (1971) and Reimer's *School is Dead* (1971) developed road maps to speed up the deschooling process. In his book *Freedom and Beyond* (1972), Holt, too, posited theoretical bases for a possible alternative to the spread of school systems. What united these authors was that each developed an alternative that upset the traditional pedagogy then being deployed in school systems. According to conventional schooling logic, resources in education were administered on the basis of the curricular goals of the teachers. What proponents of deschooling advocated was to do the opposite, that is, to develop approaches to learning that let the students gain access to any educational resource that could help them define and achieve their own goals.

The Context of Deschooling: Between Progressive Education and the Counterculture

One of the hallmark models for deschooling is progressive education. However, unlike the pedagogical proposals of representative authors from the progressive movement, advocates of deschooling discarded from the start any possibility of merely reforming the existing institutions. Consequently, by analyzing the linguistic conventions used by deschooling and that in turn emanate from the contemporary social imaginary, we find a clear continuity with progressive pedagogy in matters of active learning and the internationalization of pedagogic renewal. The schism with the framework of formal educational institutions, however, goes back to similar arguments from political protest movements against the economic, political, and cultural system of the 1950s, 1960s, and 1970s in the West.

In their main works, theorists of deschooling emphasized experiential learning or "learning by doing," critical thinking, development of social skills, democracy, looking to the future for ideas about how to structure present-day education, and using the interest of the child as a mainstay in the teaching-learning process. All those aspects bear witness to the continuity with progressive

education developed in the late nineteenth and early twentieth centuries. More precisely, it can be said that the main influence was the ideas of John Dewey and, in particular, his conceptualization of the subject who learns from a pragmatic perspective. The main difference deschooling theorists make with progressive education has to do with the possibility of transforming educational institutions. Thus, whereas Dewey saw the feasibility of school reform and the constitution of schools as a form of community life, authors such as Illich, Reimer, and Holt insisted on school institutions' intrinsic inability to be reformed. To them, the only possible option was the immediate elimination of school systems altogether.

This idea of a radical split and elimination of the institutions that acted as barriers to progress and development must be studied as a plausible response in the context of late twentieth-century thought. This was a time when a sense of decline took hold in Western society in the aftermath of the Second World War. This feeling of crisis bears close relation with political, cultural, and economic questions of the age. In politics, it was a time of deteriorating relations between the Cold War powers. International politics then became further reduced to two opposing fronts, and nearly every country in the world found itself on one side of the battlefield or the other. It was a time in which there was little room for nuances in an official field of tremendously polarized ideologies.

From the economic point of view, industrial production underwent a slowdown in growth. Symptomatic of this trend is the fact that in the late 1960s, the prestigious Club of Rome questioned the bases of the development model of international markets that had witnessed soaring production and yields. In fact, the Club of Rome was foreshadowing the energy crisis that would grip the world in the early 1970s (Meadows et al., 1972). The Yom Kippur War in October 1973 was a clear example of how dependent the world economy had become on fossil fuels such as oil and gas.

On a cultural level, in the very heart of the West, different movements were afoot that would shape the counterculture movement. The underpinnings of this trend lay in their criticism of the patrons who

had governed the artistic world and its officialdom for most of the twentieth century. Cultural liberation, breaking away from the official framework, and seeking out new ways of experiencing art, the body, technology, and nature are all an expression of a feeling of distance with respect to the structures and institutions of the past and with the predominant notion of authority at the time.

This is therefore the philosophical setting that made it possible to theorize a radical line of criticism of educational institutions. The writings of authors such as Illich, Reimer, Goodman, and Holt must be read as a response to this context of political, economic, and cultural relations. Here is where their radicalism finds its fundamentals and breaks away from the institutions of the past.

Deschooling Theories in the Twentieth Century

Research conducted in recent years has shown that, even though the basis of criticism against educational institutions was the common denominator shared by the different authors of deschooling, there were in fact a number of important nuances in how they focused their criticism and what objectives they hoped to achieve. Many of those nuances surfaced in works published by these same authors in the 1980s and 1990s. Thus, Illich's criticism of how modern notions of education perverted learning – a line of argument he especially developed in the texts he published after *Deschooling Society* (1971) – is not the same as the need Reimer found in his only book, *School is Dead*, (1971) for freeing education from the monopoly of schools and other educational institutions. Similarly, questioning of the role of the school as pedagogical structures was not the same as the advocacy of unschooling or homeschooling as featured in John Holt's works from the 1980s, and nor was it the same as the countercultural criticism presented by Paul Goodman in the books he wrote to analyze the question of education and its institutions from a libertarian perspective.

Bearing in mind the above in terms of the divergences in thought among this generation of

writers, we still find at least one aspect they had in common: they all discerned the need to explore the disregard for modern-day Western institutional school systems in the late twentieth century. From this perspective, schools, studied as institutions in charge of supplying education, were a key piece in the web of institutions that formed a macrostructure claiming to guarantee the provision of services that covered the needs of individuals in society. Thus, in their convergent criticism of schools, Illich, Reimer, Holt, and Goodman were among those who believed it was possible to combat against the psychological paralysis, social disempowering, cultural uprooting, and economic inequality with which the modern world was threatening large segments of the population. In the end, what advocates of deschooling called into question was the educational discourse that had located schooling as the main institution responsible for educating the population at large for their own good ever since the end of WWII.

Conclusion

It may be broadly concluded that by the 1960s and 1970s, the big, absolute truths, like the big, absolute institutions (and the latter above all because they legitimize the former), had begun to become questionable. As a result, the idea of public institutions as a means of mass emancipation began to decline. There was, therefore, an opportunity to articulate a theory of suspicion on the three fundamental aspects of modern educational discourse: its structure as a meta-story, its link to social progress, and the fostering of individual emancipation. In consequence, schools, and the education provided in them, could now be challenged with a certain amount of support from significant fractions of society.

Social Imaginaries and Econometrics for Education Policy

Causality; Control variables; Linearity; Optimality; Proxy variables; Statistical significance

Introduction

A notable feature in the evolution of economics in the past 50 years has been the emergence of “mainstream” economics. This is a term adopted largely by its critics in the economics community to highlight the dominance of a pared-down approach reliant on abstract theory, primarily neo-classical economics. Economists have also come to focus principally on quantitative research methods, with one in particular, econometrics being overwhelmingly dominant. Not surprisingly, then, economists have encouraged the use of econometrics in the analysis of the teaching of economics, or, as they refer to it, the study of economic education. The American Economic Association has produced an “Online Handbook for the Use of Contemporary Econometrics in Economic Education Research,” developed by Becker, who is also coeditor of a book on the subject. The dominance of the technique is made clear in the preface to the book. There MacDowell and Highsmith suggest that its coverage of model building, simultaneous equations, and qualitative response analysis offers inexperienced researchers “a comprehensive coverage of the basic statistical

estimation and testing procedures *required* for the evaluation of learning” (Becker and Walstad 1987, p. xii, emphasis added). It is implicitly assumed that the techniques are appropriate.

It is not only in economics education but also in education and education policy more broadly that these techniques have taken hold. Hanushek in particular has published extensively in this area and econometrics is increasingly being used for policy-focused analysis in education.

In his discussion of social imaginaries, Taylor (2004, p. 33) writes:

Ideas always come in history wrapped up in certain practices, even if these are only discursive practices. But the motivations that drive toward the adoption and spread of these packages may be very varied.

The practice of econometrics involves the acceptance of generally unstated ideas about the nature of variables and the relationships between them. The interpretation of results involves assumptions about the nature of causality and policy decisions. So what drove the development of these practices and the adoption of these approaches?

In econometrics, there has been simultaneous development of computer-based packages and electronic databases. Over time, this meant that the techniques have become accessible to an increasing number of analysts, the required skill level has fallen, and conventions have developed. Initially tentative assumptions have evolved into firm foundations required for the application of the techniques. These are now so familiar that they are unquestioned by all but a small minority. In other words, “. . .the theory is schematized in the dense sphere of common practice” (Taylor 2004, p. 30).

Mainstream neoclassical microeconomic theory is built on a foundation that takes universal perfect competition as an ideal. Its suitability is not questioned in standard textbooks and research papers, although it is based on an unrealistic view of the world and a specific optimality criterion (Pareto optimality). Deviations from the ideal are considered to be “market failures” for which various remedies have been devised.

A parallel could be drawn for econometrics. Criteria for determining the relationship between

selected variables, trying to find a “best fit,” were originally tentatively selected but have subsequently assumed great significance. There is now a concept of optimal estimation which can be achieved under “ideal” circumstances and corrections that can be made where the required assumptions are not met. Consider a variable, Y , the value of which depends in large part on the values of a set of variables, X_1 , X_2 , and so on. Y could be a test result, and the X s could be the student’s mark the previous year, hours spent studying, the teacher this year, etc. Ordinary least squares multiple regression might be used to estimate such a relationship. In econometric theory, it has been shown that, under the required conditions, this approach meets certain desirable criteria. Specifically, it provides the “best linear unbiased estimates” (BLUE) of the parameters of a model. This has conventionally been viewed as giving the best estimates that can be achieved. If the required conditions are not met, problems arise. Without going into technical details, some common problems are those of autocorrelation, heteroskedasticity, and multicollinearity. These are well covered in standard econometrics textbooks, and methods have been devised to address them. Resulting training has focused on application of these techniques. By comparison, limited attention has been given to broader issues of choice of technique (what should a “best” estimator do?) and associated reservations and qualifications (are the variables related to each other in a linear way?). Consequently there still remains the question whether the “ideal” is really so desirable or relevant.

The purpose of this particular section is to identify the social imaginaries which may be associated with this approach. In other words, the aim is to identify some of the limitations that are commonly overlooked in the standard approaches. This is done by looking at the basic assumptions of the assumed ideal situation.

Econometrics involves the estimation of a relationship between variables. A general functional form is specified, with the parameters indicating the relationship between variables. The estimation process then provides information on possible values for the parameters and additional statistical diagnostic information. The starting point is

therefore the choice of variables and specification of the functional form.

Ideally there is some theoretical basis for these decisions. Statistical criteria relate to the numbers alone, the values in the data set. They are independent of the meaning assigned to the numbers, whatever they are (student grades, class size, teachers’ years of teaching, etc.).

Theory involves simplification. Subsequent empirical analysis, even if based on theory, involves further simplification. The result is at best a tenuous relationship with reality. The following sections consider first the criteria for BLUE estimators, then the relationship between such estimators and theoretically specified relationships between variables, followed by some common refinements and interpretations of results.

BLUE Estimators

Consider an equation:

$$Y = \beta_0 + \beta_1 X_1 + \beta_2 X_2 + \dots + \beta_n X_n + \varepsilon$$

where Y is the dependent variable, $X_1 \dots X_n$ are the explanatory variables, and ε is an error term (which exists because the relationship is not fully specified).

- (i) Linearity – linear models assume a fixed value for each β_i . This is actually very restrictive. Consider Y as an individual’s income in a particular year and X_i as years of education. First, if these variables are used, each extra year of education is assumed to have the same incremental effect, β_i , on income irrespective of whether it is the third or the twelfth year of education. Second, the effect is assumed to be invariant to differences in the values of any other explanatory variables, such as the school attended, or parents’ socioeconomic status – an additional year of education would still increase income by an amount β_i . Third, if the aim is to determine the effect of a year’s education on income, the effect is considered to be fully identified in the income of the period represented by the data.

This would not suit careers with very different earnings profiles over time, such as doctors for whom income can be expected to rise with age and manual workers whose incomes may peak much earlier. Fourth, the effect of an additional year of education is assumed to be the same for every person in the study. More generally, all the observations are assumed to be of the same structure, and so the effects are also identical. These requirements are far more restrictive than most theories would specify. Nevertheless, poor explanatory power for an equation is put down to either measurement error or omitted variables. Inappropriate or imprecise specification of the relationships should be an equally serious concern.

- (ii) Unbiasedness – an unbiased estimator is one for which the expected value of the estimate is equal to the true value. This means that the estimator is unbiased in the estimated form of variables. Sometimes a linear relationship is estimated when the underlying relationship of interest is nonlinear. Note that, by using log transformations, multiplication can be undertaken by adding, and raising by a power through multiplication. Consider $Z = AX^aY^b$. Converting to log form, this becomes $(\log Z) = (\log A) + a(\log X) + b(\log Y)$. The latter form is linear. Adding an error term, it can be estimated using linear regression. If the required assumptions hold, the estimates will be unbiased and so the resulting estimates of $\log Z$ will be unbiased. However, that does not mean that the results will still be unbiased when transformed back into the desired form, Z . Consider Z having the values 10 and 100 and hence a mean of 55. $\log Z$ to base 10 is 1 and 2, respectively, with a mean of 1.5 which has an antilog of 31.6.
- (iii) Best – an estimator of the parameters β_0 to β_n is BLUE if, of all the possible linear unbiased estimators, it is best according to some quality measures. The measure used is that it has the lowest sum of squared errors, the sum of the squared differences between actual and estimated values of the dependent variable in the observations used. This is a conventional measure, but there are other possibilities, such

as for quantile regression which uses absolute errors. “Best” means best out of the subset of possible estimators. There may be nonlinear or biased estimators with lower sum of squared errors such that the resulting estimates are more accurate. (It may be better to have many shots hit a target closely grouped but slightly to the right of the bull’s eye, rather than being widely scattered but with the bull’s eye at the center of the loose grouping.)

Estimators and Theoretical Relationships

Econometrics involves the estimation of values for the parameters of a specified relationship along with related diagnostics. The data used are all assumed to be based on the same underlying structure with the same parameter values. This applies whether the data are from several observations at the same time (cross-section), or over time (time series), or a mix of the two (panel). The assumption is nontrivial, with flawed analyses being recognized in education long ago:

It is not uncommon to find, for instance, research on dropout that fails to distinguish dropout resulting from academic failure from that which is the outcome of voluntary withdrawal. Nor is it uncommon to find permanent dropouts placed together with persons whose leaving may be temporary in nature or may lead to transfer to other institutions of higher education. (Tinto 1975, pp. 89–90)

There are also limitations in the functional forms that are being estimated. Stock variables describe a point in time and flow variables measure quantities aggregated over discrete units of time, such as semesters or years. Reality occurs in continuous time, in which the values of stock variables can change and the timing of flow variables is important, although it is not possible to identify from the data where within a time period events took place.

There is also commonly a very restrictive functional relationship between independent and dependent variables (or, in simultaneous equation models, exogenous and endogenous variables). Consider the pattern of change over time of an independent variable providing an “input wave”

and the impact of this on the dependent variable observed as an “output wave.” In a linear model, the two waves would have either identical patterns if the coefficient, β , is positive or inverse patterns if β is negative. A new teacher is assumed to result in an immediate increase or drop in student performance, for example. The timing and nature of impact of one variable on another can be far more complex than this, but that cannot be easily identified. Similarly if a change in an independent variable occurs at the end of a time period, the impact on the dependent variable will be felt not in the current, but in the next or later periods. Hence aggregation into time periods results in imprecise specification even if the real timing of impact is exact and identical in all cases.

The relevance of a variable in an equation is commonly assessed by statistical criteria. However, statistical significance depends in part on the number of observations (which is quite distinct from the underlying importance of the variable), and statistical significance is not the same as policy significance. A statistically significant result, even if it coincides with underlying causal factors, may be such that attainable changes are very small or very costly, or alternatively a useful policy instrument may have a large but variable (and hence statistically insignificant) effect.

Moreover, there is a fundamental problem with statistical tests of significance. Known as the “fallacy of the transposed conditional,” significance tests estimate the probability of an outcome if the null hypothesis is true. It is argued that an unlikely result indicates that the null hypothesis may be false. However, there is no information about the likelihood of an outcome when the null hypothesis is false. “The likelihood of an outcome given (conditional on) the null hypothesis” is not the same as “the likelihood of the null hypothesis given (conditional on) an outcome.” The latter is the situation in a hypothesis test, hence the reference to a “transposed conditional.”

An additional problem arises in that correlation neither implies causality nor does it cover all possible causal relationships. Correlation is a measure only of linear association between data

series. There are numerous other possible causal patterns that could be observed, such as a threshold effect (drowning and depth of water), or a viable range (survival in relation to temperature), not to mention INUS conditions. These latter refer to situations where an event can occur when a set of conditions arises, and there may be several such sets that produce the same effect. University study could be considered an INUS condition for higher income. It is *Insufficient* on its own (the person would then have to work). It is a *Necessary* part of a set of conditions (getting higher income by becoming a doctor). The set of conditions is *Unnecessary* (high income can come from being a top sports person or musician), but it is *Sufficient* (the education followed by employment as a doctor will give higher income). Similarly, consider “causes” of car accidents, workplace deaths, or obtaining a company directorship.

Interpretation of results is further complicated in that some data series are used as proxies for something else; hence, household income or a parent’s education might be used as a measure of socioeconomic status. Should results then be interpreted in terms of the intended variable or the proxy variable? Even if not planned, the result for one variable may actually be picking up the effect of something else with which it is highly correlated.

Econometric results aim to identify average relationships over a sample, but individual situations may be very different. As Egon Guba wrote in the Foreword to a book on action research in education:

generalized, one-size-fits-all solutions do not work. . . Without intimate knowledge of local context, one cannot hope to devise solutions to local problems. *All* problems are de facto local; inquiry must be decentralized to the local context. (Stringer 2007, p. ix)

Interpretations of Results

Regression results are generally biased if relevant variables are omitted. One commonly accepted approach is the inclusion of “control variables,”

which are claimed to control for the effects of the designated variable. Hence, for example, addition of a household income variable could be used to claim that results apply “after having controlled for household income.” Unfortunately these variables are added without regard to the functional relationship. In the extreme cases, this is achieved in blanket fashion simply through the addition of a “vector of control variables,” an increasingly common practice. The functional form is important, but linearity assumes “additive separability,” whereby each variable can be considered in isolation. This is problematic because “Observational data...are rife with dependency structures...No one variable can meaningfully be ‘held constant’ while others are allowed to vary” (Babones 2014, pp. 123–124).

Hanushek writes: “Most research articles, after finding a set of things that is correlated with student performance, immediately go to a section on policy conclusions” (Hanushek 1997, p. 303). He is concerned about causality and replication, or the wider applicability of findings from a study. Models alone do not address all the aspects to be considered when making policy decisions. Moreover, “A good model is merely one type of evidence among others, not the end of the argument. Much less the ultimate authority.” (Majone 1989, p. 51)

There are many complicating factors, including differing responses to passive versus active use of policy variables, learning and changed behavior (so the structure may change), the need to consider alternative policy options and their costs and benefits, and subgroups responding differently to an approach. In discussion on teacher value-added estimates as a basis for performance pay, Hanushek and Rivkin (2010, pp. 269–270) raise: “concerns about accuracy, fairness, and potential adverse effects of incentives based on a limited set of outcomes...[and] concerns about incentives to cheat, adopt teaching methods that teach narrowly to tests, and ignore non-tested subjects.”

Conclusion

The focus on econometrics as a social imaginary provides a valuable insight into the problems that

might result. The concerns are further highlighted in parallel literature on the concept of framing, the role of theories as providing analogies and the additional issues to be considered to relate these to the real world (Birks 2015). Additional support can be found in cultural political economy, which asks why particular imaginaries may arise and emphasizes that “both history and institutions matter” (Jessop and Oosterlynck 2008, p. 1156).

Fifty years ago, basic econometric research focused on building up techniques with the expectation that there would be parallel improvements in data bases. It was hoped that this would result in valuable research at some stage in the future. In reality, econometrics packages and online databases made the techniques far more accessible, but the techniques and data quality were not able to live up to expectations. However, the practices became entrenched and people chose to focus on this “high status” activity using packages and large available online databases, ignoring the reservations that should be raised. This was at the cost of more pragmatic analysis of real world situations. There is a place for econometrics in an analyst’s toolkit, but it must be used with care, is only suited to certain types of data, and should be used in conjunction with other research techniques. The term “mainstream economics” is increasingly used to refer to what is perceived by many as a current narrowly focused approach to economics. In contrast, pluralist approaches are less prominent but offer alternative, more diverse techniques and theories. Education researchers may find that this alternative literature can provide useful insights.

Social Imaginaries and Education as Transformation

Andrea R. English

Moray House School of Education, University of Edinburgh, Edinburgh, UK

Introduction

Education as a transformational process has been discussed across traditions of philosophy of education. If we initially consider the basic meaning of transformation as a process of change, we can say that education, in the social imaginary of western society, is commonly understood as a process by which human beings undergo change through the acquisition of new knowledge and skills. Philosophy of education, however, has developed a more specialized concept of education as transformation that will be discussed here.

As early as 1916, in his major work *Democracy and Education*, John Dewey refers to the “ordinary” conception of education as the transmission of information from the older generation to the younger (Dewey 1916/2008, p. 12). Today, 100 years after Dewey’s remarks, such a notion of education as *transmission* remains a prominent part of the social imaginary. This popular

understanding of education continues to be reinforced through a particular image of the teacher, a figure frequently represented in popular culture as the person at the front of a classroom authoritatively passing on information to children sitting in rows of desks, passively listening. At the same time, this image of “teacher-centered” education, influenced by traditional ideas of education as the passing on of intellectual and cultural heritage, has been countered by a different notion of education influenced by progressive education movements. Commonly referred to as “child-centered” education, progressive ideas of education are reflected in common notions that learning should be enjoyable and that children should be happy when learning. On this view, the child’s interests guide the educational process and in turn determine the organization of classroom activities. In popular culture, images suggestive of child-centered education also emerge: children playing together, sitting in circles rather than at desks, or engaged in a hands-on school activity or project, often without the teacher in frame. Although teacher-centered and child-centered images point to contradictory theoretical positions, they nevertheless coexist in the social imaginary today. Both views of education can be seen to be competing for dominance in educational policy and practice, for example, in parts of the United States, Canada, the United Kingdom, and Europe.

These popular images and the related ideas surrounding the nature of education stand in contrast to the critical philosophical notion of education as transformation, which has been developed in the traditions of philosophy of education. In these contexts, thinkers have sought to distinguish *education* from *socialization* and *schooling*. Socialization involves habituating the younger generation into the rules, customs, and norms of a given society. “Schooling,” in this specific context, describes a mere transfer of facts from older generation to younger. For many philosophers of education, this sense of schooling departs from the ideal role of the school in modern society as one of engaging the younger generation in transformative educational processes.

This entry discusses the philosophical notion of education as transformation by first considering

Plato's *Allegory of the Cave*. It then describes related notions of education from three different traditions of philosophy of education – the concept of *Bildung* in the German tradition of educational theory, John Dewey's American pragmatist conception of education, and British analytic philosopher R. S. Peters' ideas of education and transformation – and also identifies some contemporary viewpoints from current philosophy of education. Finally, the entry indicates how current trends in twenty-first-century educational policy relate to the idea of education as a transformative process.

Plato's Cave Allegory as an Image of Transformation

Early in the western philosophical tradition, Plato's *Allegory of the Cave* (1997) tells us something important about education as transformation. Socrates asks Glaucon to imagine prisoners inside a cave staring at shadows on a cave wall and believing them to be real. When one slave is pulled out of the cave and freed, at first he is painfully blinded in the brightness of the light and then he is able to gradually see brighter and brighter objects until he can look at the sun. In the process, he starts to question and compare this new world outside the cave with the old one inside the cave. His gradual change in perspective on knowledge and truth, and on himself and his relations to the world, is so dramatically altered that he can hardly imagine how he could have ever held the beliefs he held while in the cave. Plato's cave offers a foundation for thinking about education as transformation because it illuminates the idea that, in educational learning processes, what was once familiar and taken for granted becomes strange and what was once strange becomes familiar. This theme of transformation arises in various forms in classical and contemporary traditions of philosophy of education, as discussed below.

Bildung as a Transformational Process

The German idea of *Bildung* (commonly translated as education or formation) has its roots in the

Greek Sophist and Socratic traditions and the questions they posed about the legitimacy of our basic forms of perception and understanding of the world (Ruhloff 1993). German philosopher Wilhelm von Humboldt's short writing entitled *Theorie der Bildung des Menschen* (translated as *Theory of Bildung*) (1969 and 2001) provides a foundation for thinking about how education involves a human being's active and passive interaction with the world. From these interactions, human beings are able to come to new ideas, gain new perspectives, and learn. Humboldt draws out the idea that human beings learn from difference and otherness; we need difference in order to flourish, such that we rely on a world that is "not us" [*NichtMensch*] (Humboldt 1969, p. 235). Thus, *Bildung* is dependent upon the manifold, "most general, most free, and most animated interplay between self and world"; this interplay is one in which both self and world change (Humboldt 1969, p. 235).

Bildung as a transformative process is mediated by moments in which we question our taken-for-granted ways of seeing and being in the world, moments that Humboldt refers to as "self-alienation," and these are followed by a return to oneself with a different perspective and understanding of the world and one's relation to it (Humboldt 1969, p. 237). Self-alienation relates to what G.W. F. Hegel calls the experience of consciousness, when one is aware of oneself in the world. Processes mediated by self-alienation are part of what make it possible for human beings to arrive at a transformed outlook on the world, such that their feelings, wishes, capabilities, and questions change and reshape the ways they inhabit the world.

Nineteenth-century German philosopher of education J. F. Herbart (1806/1902) extends the notion of *Bildung* and the idea of human beings as capable of transformation. Herbart considers the fact that the world as other can either help or hinder human transformational processes. For Herbart, educators have the responsibility of making the world into a space that facilitates human transformation. Herbart differentiates between two kinds of transformations, one cognitive and the other moral. The cognitive transformation involves the extension and expansion of an individual's "circle

of thought” [*Gedankenkreis*] to include differentiated ways of knowing and modes of participating in the world. The moral transformation involves the individual becoming capable of self-critique of his own motives of action and established norms (Herbart 1806/1902). In particular, Herbart emphasizes that transformation in the moral realm involves us in a necessary “inner struggle” incited by the difficulty of moving away from egoistic ways of interacting with others and learning respect and recognition of others (see Benner and English 2004; English 2013).

Herbart (1835/1913) develops the notion of *Bildsamkeit* (translated as educability) as the foundational principle of education. Both terms, *Bildung* and *Bildsamkeit*, have the same root word *bild*, and the word *bildsam* relates to the Latin word *formabilis* or *docile*, meaning formable or teachable, respectively. The concept of *Bildsamkeit* captures the idea that human beings are capable of forming the world around them and being formed by it, and for Herbart, it therefore describes an aspect of the human condition that educators must presuppose before they can consider educating another human being. The term *Bildsamkeit* underscores the idea that human beings are learning beings, capable of transformation.

Education as Reconstruction: John Dewey’s Notion of Transformation and Education

John Dewey, a philosopher of education in the tradition of American Pragmatism, draws upon a central idea in pragmatism that can be found in similar forms in C. S. Peirce, William James, and George Herbert Mead, namely, the idea that experiences of resistance lead human beings to fall into doubt or become confused and that this can promote thinking about and questioning of taken-for-granted habits and ideas. This idea of how thinking and questioning are initiated informs Dewey’s notion of education as a transformative process. Dewey’s concept of education ties educational processes to our experience of the world, in particular to our experiences of new, as yet unfamiliar objects and ideas that, because they are new, are

unexpected and point out a limit to our existing knowledge and ability (see, e.g., Dewey 1916/2008). Such experiences interrupt our common, habitual ways of thinking, judging, and acting (English 2013). Our encounters with new objects and ideas can incite what Dewey calls “reflective experiences,” experiences in which we reflect upon the strange and unfamiliar encounters we have had in the world and rethink how we understand our relationship to the world.

In contrast to the “ordinary” definition of education as transmission, Dewey puts forward a “technical” definition of education as reconstruction. Education as a process of reconstruction involves the “reconstruction or reorganization” of a human being’s experience, such that our experience gains new “meaning” and increases our “ability to direct the course of subsequent experience” (1916/2008, p. 82). Education, on this view, has to do with the enrichment of our experiences through our encounters with difference and newness.

Dewey’s understanding of education has commonalities with the German tradition of *Bildung*. In particular, Dewey highlights the idea that in educational processes, our interaction with the world incites self-reflection and struggle and, through this interaction, both self and world change. However, Dewey places more emphasis than his predecessors on the idea that human beings are capable of holding themselves in “suspense” before taking action or fixating on a solution to a problem. When we are in suspense, we are held between old, “tried and true” ideas, that now appear flawed, and the new ideas that have not yet been established, a space which can be thought of as an “in-between” realm of learning (English 2013, pp. 65–78). This realm between old and new knowledge and ability, in which we have not yet found the ways out of our difficulties, is a space of reflection upon self and world, in which we are engaged in inquiry and experiment with new ways of thinking and new possibilities for action.

In engaging in such reflective experiences, which Dewey also refers to as “reflective inquiry,” our experiences become more meaningful because we have increased our understanding of the connections between self and world, that is, between what we “do” and what we “undergo” in consequence

(see, e.g., Dewey 1916/2008, p. 146 ff.). This process does not simply involve adapting to our environment as it is nor simply forcing the environment to adapt to our will; rather it involves an interaction between self and world. When such interactions are transformative, they enhance our ability to reimagine the future and create new aims.

Transformation and Education in the Thinking of R.S. Peters

For R. S. Peters, a philosopher of education in the analytic tradition, education as a transformational process is not equivalent to mere self-actualization, nor does it amount to one's conforming to the existing order of things. Peters' discussion of education addresses the issue of the learner's confrontation with the otherness of the world and its connection to the learner's transformation (English 2009). Without reference to Herbart, Peters takes a similar approach to the issue. Early in *Ethics and Education*, he notes the possibility of the individual's narrow, limited and undifferentiated development and emphasizes throughout his work that the learning individual needs to be initiated into the differentiated forms of knowledge, awareness, and practices that make up the tradition of human thought and activity (Peters 1966, pp. 47–48). In his discussion of education as "initiation," Peters utilizes a metaphor of getting learners "on the inside" that helps clarify his understanding of education as transformation. Educators not only have to "initiate" learning processes of learners, but they also must initiate learners in the sense of getting them "on the inside" of human modes of thought and understanding (see Peters 1966, e.g., p. 31). This process involves more than merely learning by rote or acquiring inert knowledge, activities which would not be considered education: "education implies a man's outlook is transformed by what he knows" (Peters 1967, p. 7). For Peters, what is referred to as education is only education in this deeper sense when it results in an individual's transformed perspective, which affects how he or she sees the world.

Although he spends less time considering what is entailed in the process by which an individual's

perspective is transformed, Peters does discuss the interaction between the child and the world in a way that helps clarify how he is conceiving of this process. The world that the child enters is a shared world, common to both teacher and learner, that Peters describes as an "impersonal world" made up of human traditions of thought and knowledge and "the criteria by reference to which that content is criticized" (1966, p. 52). Peters views the child as starting life on the "outside" on this world, without knowledge, language, or an understanding of human relationships. Both the natural order, the world of objects, and the moral order, the world of human relationships, appear fixed to the child (Peters 1966, p. 52). As the child develops and gradually gains an understanding of things and human relationships, the child gets on the "inside" of the shared world.

The transformation that is part of the child's development occurs in both the "natural order" and the "moral order." Transformation in the natural order involves the child coming to distinguish between real and imaginary and understand causal connections that are beyond his control (Peters 1973, p. 118). In the context of the moral order, the child's transformed perspective arises from learning to take the "point of view of the other" into consideration (Peters 1973, p. 118).

For Peters, the teacher plays a critical role in the learner's transformational processes. The teacher understands the shared world and knows how to question the validity of thought and knowledge. A central task for the teacher in supporting educational processes is to question learners so that they find their errors, which in turn helps them to take on "the questioner in [their] own mind[s]" (Peters 1967, p. 20).

Contemporary Notions of Education and Transformation

Contemporary philosophers of education continue to develop ideas of education as transformation and have drawn largely upon the traditions of hermeneutics and phenomenology to illustrate key aspects of transformational processes. For example, in contemporary German philosophical

discourse, the notion of *Umlernen* is used to capture the idea of learning as a “painful turnaround” that involves the transformative restructuring of foregoing and possible experience (Meyer-Drawe 1984; Buck 1969). Other scholars have discussed negative and discontinuous experiences as constitutive of both teaching and learning as transformative educational processes (e.g., Koch 1995; Benner 2003; English 2013). Others within the Anglo-American discourse discuss how certain kinds of interactions that challenge one’s self-understanding are transformative in that they offer new insight into oneself and the world (e.g., Kerdeman 2003).

Conclusion

In the twenty-first century, diverging trends in educational policy indicate that teacher-centered and child-centered understandings of education are still significant features of the social imaginary which continue to compete for representation in contemporary educational policy. Narrowly teacher-centered views of education, which reduce the idea of teaching to a mechanical transmission of facts to be regurgitated by students on tests, point to an understanding of education as a linear process, rather than a transformational one. Such views of education and teaching are increasingly reinforced by the global educational policy movement toward international comparative testing. Arguably, the value placed on test-based accountability in education has influenced a new global social imaginary in which education is generally thought to be easily measurable by standardized tests. There also has been a reaction against this trend, in which the stresses of the testing regime on young people are thought to be counterproductive to their well-being. These reactions tend to be associated with alternative child-centered policy trends, such as those that place emphasis on active learning (in contrast to rote learning).

On the other hand, some recent policies reflect ideas more strongly associated with philosophical notions of transformation. For example, the Scottish Curriculum for Excellence’s guidance documents for teachers of “Religious and Moral

Education” encourage teachers to initiate “moral challenge” as part of students’ learning processes. Additionally, the National Council for Teachers of Mathematics in the United States has introduced the notion of “productive struggle” as essential to mathematics learning at all ages and provides guidance for teachers as to what “productive struggle” looks like in practice. In the European Union, higher education policy is promoting the development of students’ ability to self-correct, think critically, and communicate across difference. It is yet to be seen the extent to which these ideas will take hold in the social imaginary.

What remains essential to the idea of transformation is that it involves a change that can be painful and entails moments of self-critical reflection in which we question the old ways of thinking and being before the change toward the new becomes fully possible. This notion of education as transformation is still significant in philosophy of education today, and it is seen to provide us with criteria for evaluating whether or not an individual’s interaction with objects (e.g., a child’s interaction with science lab resources in a classroom), or with other human beings (e.g., a child’s interaction with the teacher), is truly *educational*, in the critical philosophical sense.

Social Imaginaries and Inclusion

Synonyms

Exclusion; Inclusion; Inclusive learning environment; Inclusive schools; Neoliberalism

Introduction

The main goal of this entry is to introduce inclusion as a sociological concept consistent with which exclusion is an internal part of inclusion. When exclusion is the basis of inclusion, the establishment of communities will always involve both inclusion and exclusion processes. Similarly, the development of inclusive schools and inclusive learning environments will involve both inclusion and exclusion processes.

With this starting point, international educational research knowledge about inclusive schools and inclusive learning environments in general will be related to the fundamental dilemma that inclusion on the one hand may be seen to be about human rights, solidarity, and democracy, and on the other hand, it is about ensuring the cohesion of neoliberal society by means of every person's obligation to realize one's potential through learning, development, and education regardless of one's needs and skills.

Research in Inclusive Schools and Inclusive Environments

The social imaginary of developing inclusive schools has called for new pedagogical and educational strategies that support inclusion of all students, irrespective of their needs. As a consequence, much educational research knowledge has been produced concerning the characteristics of inclusive learning environments and about how to develop inclusive schools (e.g., Booth et al. 2000). Educational inclusion research has mainly been based on ideology and human rights with reference to the Salamanca Statement. The Salamanca Statement was signed by 92 countries in 1994. It asserts that schools with inclusive practices are most effective in relation to guarding against discrimination and ensuring the rights of individuals with disabilities to achieve equal opportunities for participation in society. Moreover, the 2006 United Nations Convention on the Rights of Persons with Disabilities, Article 24, has the purpose to ensure the right of everyone to education, development, and learning no matter

what the particular situation and needs of the individual. Article 24 considers how schools and educational institutions ought to offer inclusive learning environments. According to the article, it should not be possible to be rejected or excluded from an ordinary school because of one's disability. Ideally, there should be no risk factors that might prevent participation. Exclusion, therefore, is primarily about how risk factors are handled and how they are given meaning and significance of society.

The predominant understanding of inclusion in both the Salamanca Statement and the United Nations Convention on the Rights of Persons with Disabilities takes as its starting point the idea of society "failing" individuals, excluding them from participation in society. The conception of society failing individuals means that reasons for exclusion are related to the constitution of society and its institutions, which, on this understanding of inclusion, ought to ensure that all individuals may participate, acknowledging the differences of those individuals.

The predominant, normative conception of inclusion contains the premise that communities are heterogeneous and able to handle a high degree of diversity. From this point of view, inclusion is about solidarity, democracy, and civil rights. Everyone should have the possibility to be included, regardless of their contribution to society or their competencies or special needs. To ensure the individual's right to participate, society must make itself accessible to the individuals, regardless of conditions and needs. Inclusion is, in this perspective, a practical expression of the ideal of creating a pluralistic community culture, which recognizes heterogeneity and insists on everyone learning to live with diversity. This is viewed as strengthening society. At the same time, this conception of inclusion involves an understanding of exclusion as an expression of a dysfunctional society and as discrimination.

Much educational inclusion research has also been based on ideologies of human rights, solidarity, and democracy in order to investigate how to support inclusive educational processes and how to achieve inclusive learning environments through identifying dilemmas, barriers, and

opportunities in relation to inclusion. Research has developed knowledge of how different disciplines, professions, practices, and forms of knowledge can be developed, integrated, and linked in various ways in order to develop new capacities and new intervention forms within ordinary learning environments.

Even though a lot of educational research knowledge has been produced in recent decades about the characteristics of inclusive learning environments and about how to develop inclusive schools, it has also been found that it remains a great challenge to achieve inclusion in practice (e.g., Hansen 2012; Thomas and Loxley 2007; Thomas et al. 2005).

Exclusion as an Integral Part of Inclusion

The gap between educational theory and practice has of course many reasons. Here, the consequence of the dominant understanding of inclusion in educational inclusion research, namely, not taking into account the sociological fact that all communities constitute themselves through both inclusion and exclusion processes, will be emphasized (Laclau 1996; Jenkins 2000). A unilateral focus on inclusion ignores the sociological fact that all communities need to place limits on what can be included and what must be excluded in order to secure their own existence (Hansen 2012). The point is that inclusion cannot be achieved by eliminating exclusion processes if exclusion is an integral part of inclusion. The relationship between individual and society is both about society failing individuals and about individuals failing society (Bjerre 2015). From a sociological perspective, the constitution of communities always presupposes the establishment of common rules, moral, values, and norms – a collective social identity. This explains why individuals need to adapt to society by learning and following rules and morals and by internalizing common understandings, in order to be included. In the construction of a social identity, internal differences within society are ignored, and thereby the differential character of identity is undermined. Consequently, commonality is not

an expression of uniform character but an expression of establishing differences between “us” and “them.” Society will consequently reflect the differences among individuals to a certain degree, and at the same time, the individual will reflect a collective social identity. In inclusive communities, the balance between the unique individual identity and the collective social identity will differ from the balance in integrative communities, because inclusive communities will reflect the differences of the individuals to a higher degree compared with an integrative community. But, in inclusive societies, there will also be limits on how much diversity a society can accommodate before it breaks apart, thus destroying its social structure (Hansen 2012).

Both inclusion and exclusion processes are thus part of the constitution of all kinds of communities, and a boundary is always set between inclusion and exclusion. This boundary is dependent on context and possibility but never necessity. Neither determining structures nor free and volitional individuals decide the placement of this boundary.

The phenomenon of educational inclusion research that investigates how to develop inclusive learning environments without taking into account that exclusion is an integral part of inclusion may be explained in several ways, for example, by defining inclusion as a vision or as a process that can never be fully realized or never ends or by accepting that inclusion has a limit in practice and that it is therefore not beneficial to all children’s learning and developing to participate in the same classroom which enables a distinction to be made between “responsible inclusion” and “full inclusion” (Evans and Lunt 2005). In general, there seems to be acceptance of a pragmatic solution to the relationship between a conceptual understanding of inclusion as limitless in principle and an *a priori* assumption that inclusion in practice always has a limit – regardless of the different explanations. However, these different perspectives or explanations primarily compensate for the lack of a theoretical determination of the limit to inclusion in the conceptual determination of inclusion. The limit to inclusion is then

explained by theories and concepts outside the concept or theory of inclusion itself.

Conceptualizing Inclusion and Exclusion

In order to develop a theoretical determination of the concept of inclusion and exclusion, discourse theory can be helpful (Laclau 1996, Hansen 2012).

According to Laclau (1996), all concepts are constructed by virtue of the otherness of the concept and that every concept presupposes its otherness. This otherness of the concept makes the concept possible as a concept, but at the same time, it makes it impossible as a concept in itself. If inclusion is to be considered as a concept in itself, it has to exclude that which constitutes its otherness: exclusion. From this point of view, inclusive communities should be developed by excluding exclusion. By excluding exclusion, inclusion is grounded in various normative principles that state *a priori* what should be included and what should not be included; in inclusive communities, exclusion should not be included, and thereby a distinction is made between the morally acceptable and the morally unacceptable. Exclusion is not morally acceptable in inclusive communities. But communities are not inclusive if they only include what is morally approved to include. Compared to the construction of concepts, grounding inclusion in a norm different from itself dissolves inclusion as a meaningful category (Laclau 1996). Therefore inclusion means to include what is morally approved (Hansen 2012).

On the other hand, it is not possible to consider inclusion as limitless because an unlimited inclusive community cannot exclude exclusion processes by which the inclusive community unintentionally may lead to an exclusive community. In understanding inclusion as a concept, inclusion presupposes exclusion and exclusion presupposes inclusion. The point is that inclusion and exclusion are two connected and interdependent processes. Exclusion makes inclusion possible, and simultaneously it makes limitless inclusion impossible. And the other way

around, inclusion makes exclusion possible, and simultaneously it makes limitless exclusion impossible. In other words, inclusive communities need to include a certain degree of exclusion to ensure their own existence as inclusive (Hansen 2012).

So, on the one hand, all communities are characterized by some degree of differentiation. On the other hand, there need to be limits to how much differentiation a community can sustain if it is not to pose a threat to the cohesion of the community. Inclusion and exclusion are therefore both necessary processes in the constitution of all communities, and exclusive processes will always be a fundamental part of the existence of an inclusive community.

How Inclusive Schools Exclude

Looking at educational inclusion research from this point of view, the question in relation to inclusion is how to handle both inclusion and exclusion processes in the task of ensuring the learning and development of all pupils in ordinary schools. Even though teachers may really want to develop inclusive learning environments, they cannot avoid excluding some ways of acting or specific kinds of behavior from the established classroom because of the limit to inclusion. The main challenge to inclusive schools is thus how to handle the dilemma both to construct an inclusive environment, containing a higher degree of diversity in order to ensure all students' participation, and at the same time manage the necessity of exclusiveness and exclusive values even though exclusion processes are not politically acceptable and therefore could not be legitimized as "exclusion."

To analyze both inclusion and exclusion processes thus takes as its starting point the investigation of how a specific school or learning community constructs its own limit to diversity and to what degree the community handles diversity without perceiving diversity as a threat to the cohesion of that community. This means uncovering the processes that make specific, meaningful constructions and subject positioning possible and at the same

time exclude other constructions and subject positioning as impossible within a specific school or learning community. In this way, a space is created to identify patterns which exclude the differences that would make it possible to create a more inclusive learning environment.

Inclusion and Neoliberalism

To uncover the processes that exclude specific meaning constructions and subject positioning and thereby to identify patterns which exclude specific differences has become increasingly important since it has become a dominant political goal to ensure the participation in society of all persons and to develop inclusive schools. As early as 1992, the then EU president, Jacques Delors, formulated the idea that the biggest threat to European welfare States was no longer poverty and inequality but social exclusion, and, by extension, nonparticipation in society. From this point of view, fairness is no longer concerned with creating economic and social equality but with providing every person an equal possibility to participate actively in societal life in order to ensure the cohesion of society. From this perspective, inclusion and participation are not only about solidarity, democracy, and human rights. They are also about how to ensure the cohesion of society through the duty to participate of all individuals.

Inclusion and the right and duty of every person to participate might therefore also be linked to dominant neoliberal conceptions of humanity: the idea that everyone has the resources and potential to make themselves relevant to society through self-development and developing their potential. By ensuring their own inclusion, individuals ensure the cohesion of society. From a neoliberal perspective, every person is presumed to have the potential as well as the possibility of participating in society. Accordingly, the category of "unable" no longer exists in neoliberal political rhetoric, as every person is expected to be able to become an active participant in societal life (Pedersen 2011). On the other hand, society must ensure that the individual actually has the possibility of taking

responsibility for his or her own inclusion, and some might need help toward inclusion, realizing their potential through motivation and support. Viewed from a neoliberal perspective, problems related to inclusion processes are thus not structurally conditioned, while personal, social, or familial barriers to participation and inclusion are no longer approved. Problems are rather determined by destiny, and the individual is master over his or her own destiny (Andersen 2005).

Understanding inclusion as a means to advance the neoliberal project has a major impact on individuals. From a neoliberal perspective, the relationship between individual and society is only a matter of will, commitment, and responsibility; the individual's will to participate, commitment to society, and responsibility for him or herself to become included in society. Politics is therefore about contributing to the individual's creation of a self which can shape itself and its own destiny, thereby ensuring the realization of every person's right and duty to participation. Should they not – against expectations – succeed, individuals themselves must take responsibility for their own destiny as being excluded (Andersen 2005).

Political discourses, as well as those based on rights and control strategies, thus contribute collectively in creating a powerful hegemonic force directed toward ensuring the rights, duties, and possibility of every person to be able to participate in society and in communities. This hegemony encourages individuals to live the heralded life, expecting everyone to have the desire to both comply with the political objectives and to find meaning and purpose in them. To optimize one's learning and thereby prepare oneself for further education and active participation in society is the only life strategy which can be ascribed meaning within the prevailing political discourse. The dominating inclusion discourse thereby unintentionally contributes to exclusion processes by excluding the variations of conception that would make it possible for specific individuals or groups to live a life in society which is different from the heralded life which is to realize one's potential for learning, development, and education.

Similarly, inclusive schools have not only the task of making themselves accessible to the

individual through the handling of increased diversity. Inclusive schools are also responsible for supporting the individual student's possibility of realizing his or her potential for learning and education. Further, to be included in the inclusive learning, environment demands a specific social identity as a student who can and will realize his or her potential for learning and development, irrespective of any personal, societal, or familial situation. In this way, the inclusive school places demands on all students to position themselves as subjects who can and will – or become able – to live a normalized life through learning and further education. So, even though inclusive schools are characterized by a higher degree of diversity, there will still be limits to diversity through an obligatory collectivity; to find one's potential for learning and development.

In this perspective, the main goal of the inclusive school is to ensure that everyone optimizes their educational opportunities and readies themselves for further education. On the one hand, this task can be seen as a way to realize solidarity, human rights, and democracy, because a lack of education in the future will be one of the most crucial socioeconomic risk factors in relation to marginalization and exclusion (Pedersen 2011). On the other hand, pure recognition fails to appreciate the question of social injustice, dysfunctional family relations, and individuals who do not thrive either psychologically, physically, or socially. In this context, an absence of recognition and legitimation of personal, social, and familial barriers to learning and further education could inadvertently lead to the exclusion of certain individuals' chances of participation and inclusion. This is simply because some individuals cannot – and may never be able – to meet the demands of finding and realizing their potential.

Social Imaginaries and Possibilism in State Schooling

John O'Neill

Pragmatism; Rationality; Rationalization; Realism

Introduction

This entry considers first, the purpose of State schooling as modern social imaginary; second, selected examples of contemporary possibilism in schooling policy and practice; third, some of the theoretical and empirical flaws in possibilism; and finally, a productive distinction between possibilism as rationality and possibilism as rationalization.

The term “modern social imaginary” was coined by the Canadian hermeneutic philosopher Charles Taylor (2004) to convey the ways in which societies imagine, idealize, and attempt to realize themselves in both moral and practical terms. The social imaginary comprises three spheres through which these occur; namely, the economy, the public sphere, and self-governance. All three may be said to be relevant to a theoretical analysis of “State” or “public” schooling systems. From an administrative perspective, these systems comprise: (i) their constituent policy ensembles, narratives, and trajectories over time; (ii) policy settings at particular historical junctures (including both the quantum of funding appropriations and particular weightings or priorities within this); and, (iii) the specific policy texts (curriculum, pedagogy, evaluation) that are negotiated daily by teachers, students, and families.

From a hermeneutic perspective, schooling policies also inscribe a community or a society’s assessment of what is morally worthwhile and what is worth striving to realize through publicly funded and delivered schooling provision that is always imperfect. In this sense, a State schooling system is about the practical articulation and realization of a society’s moral aspirations for its young people. However, no society is homogeneous. Lobby groups (for-profit, not-for-profit), cultural and geographical communities, adherents of particular schooling theories, and diverse participant groups all engage in the public sphere in order to advance their own ideologies of the most important purposes of State schooling and how best to enact these.

Ideologies and theories of “possibilism” are central to this educational project not least because the day-to-day administration of schooling proceeds pragmatically on the premise that there will never be sufficient public funding to meet all the demands made on it by society as a whole, by the intellectual elites, politicians, powerful business interests, and secular or faith communities within it.

State Schooling

The practical administration of State schooling addresses questions of effectiveness and

efficiency. Effectiveness concerns questions such as: What are the realistically possible outcomes of a comprehensive, compulsory schooling system that must satisfy the needs and goals of a socially, economically, spiritually, and cognitively diverse student population? Efficiency concerns questions such as: How can a publicly acceptable array of possible student outcomes be achieved at optimum cost to the State? Possibilism may be similarly understood as a matter of State school administration but at ideological, theoretical, *and* practical levels. In terms of its contribution to the modern social imaginary, it is about the ways in which the polity, civil society, and families conceive of and proselytise purported causal relationships between State schooling provision and improved individual student outcomes, enhanced intergenerational family prospects, and greater aggregate prosperity and harmony in society as a whole.

In the sense that they have always examined, judged, and progressively sorted young people for society's preferred occupational destination types (manual, technical, professional, entrepreneurial), State schooling systems embody society's official aspirations for, and practical pathways to, adult economic self-sufficiency and wellbeing. This operates on the jurisdiction as a whole (e.g., Gross Domestic Product), the family unit (e.g., school choices), and the individual (e.g., subject choices). State schooling systems similarly have been mandated a major role in the normative development and socialization of children, including their preparation for meaningful participation in and contribution to those aspects of society that are held in common (e.g., social capital). Equally, through their modes of central steerage and local self-governance, in their relative levels of public, private, and philanthropic funding sources, and in the degrees to which they variously serve social reproduction, redistribution, and equity purposes, State schooling may be understood as an archetypal modern social imaginary.

Political and cultural struggles to advance society's idealized view of schooling rely on acceptance or rejection of the proposition that schooling is a "wicked problem" (Rittel and

Webber 1973). Rittel and Webber refute the notion that public policy can be conceived of or enacted scientifically. On their criteria, State schooling would be a wicked problem because it cannot be definitively described due to the myriad of cognitive, affective, physical, spiritual, economic, and social challenges or problems it is intended to resolve on behalf of the rest of society. Moreover, there is no universal agreement on the nature of the public or social good that State schooling is intended to promote, or on the meaning of equity against which to evaluate its success. In this context, they argue that definitions of "optimal" or "acceptable" solutions must always be qualified while the criteria against which the success or failure of State schooling is judged, cannot be considered definitive or objective, but only ever subjective or intersubjective and partial.

In direct contrast to the view that State schooling's inherent complexities are irreconcilable with policy science solutions, the school effectiveness and school improvement (SESI) movements (Morley and Rassool 1999) have greatly influenced the conception and operationalization of State schooling policy in developed economies since the latter part of the twentieth century. SESI theory and practice are premised on the position that it is possible for academics and officials to define a schooling problem, help practitioners and their communities to implement precise pedagogical strategies intended to overcome the problem, and evaluate the extent to which this has occurred – definitively and objectively. Moreover, it has been forcefully asserted in scholarly, professional, and popular cultural texts that it is possible to do this irrespective of the family, social, and economic circumstances in which teachers and students interact. This deliberate excision of the impact of local context and circumstances from definitions of the schooling "problem" represents what is arguably the dominant version of possibilism today. In the context of teachers and schools being required to meet officially mandated minimum outcomes from compulsory schooling for *all* their students, Nash (2003) has described this as "state-sponsored possibilism."

Possibilism in Practice

In this part of the discussion, three representative texts are briefly described to illustrate the practices of contemporary State-sponsored possibilism. In the following part of the discussion, selected ideological and theoretical underpinnings of possibilism are examined.

In 2005, the Organisation for Economic Cooperation and Development (2005) released an analysis of how its developed economy member states reportedly conceptualize and respond to the challenges of improving schooling outcomes for the significant minority of children who do not experience minimum expected levels of success. Known vernacularly as the “Teachers Matter” report, the report’s summary drew a distinction between matters that were judged to be readily open to influence by policy makers and those that were not. In terms of the latter, it was recognized that the greatest influences or sources of variation on student achievement overall were those that students brought with them to school: prior abilities, attitudes, and family and community background (OECD 2005, p. 2). Foremost among the former was reportedly “the broad consensus [...] that ‘teacher quality’ is the single most important school variable influencing student achievement” (p. 2). In the context of the modern social imaginary, this may be regarded as an attempt by influential policy elites to refocus society’s imagination and idealization of what “matters” in State schooling sharply on what goes on inside school, as opposed to outside, and on matters of teaching practices and dispositions rather than broader social policy and its material effects. In this sense, it is a conscious effort to include teachers and teaching within professional and popular conceptions of the realm of the “possible,” and to exclude prior ability, attitude, and family and community background on the basis that these are matters over which it is “not possible” for schooling to exert direct influence.

By any definition, this utterance represents a radical attempt to alter the social imaginary of State schooling. It is one that has since been seized upon by politicians, officials, academics, and

schooling policy entrepreneurs and advocates from both the public and private sectors across the OECD bloc. A few years later, for example, John Hattie, a professor of education at the University of Auckland, published *Visible Learning: A synthesis of over 800 meta-analyses of studies relating to achievement* (Hattie 2009), which was immediately labeled by one professional magazine reviewer as “reveal[ing] the holy grail” of teaching and learning, and thereafter marketed as such. The book continued the increasingly normalized possibilist theme of differentiating between matters that were open to influence by teachers and those that were not. It claimed to identify and rank order those dimensions of teaching and learning that according to “research” exerted the greatest measurable “effect size” on students’ cognition. The heavily qualified scholarship that underpinned the book’s opening sections was later widely ignored in the public sphere while the “scientific evidence” was repurposed to argue that teachers should be expected to increase all student’s achievement outcomes by at least the “hinge point” of the average achievement effect size, or 1 year’s growth, each year and then continue to do so every year.

In 2011, Sir Michael Barber, a former professor of education at the Institute of Education, London, and senior public policy “standards and targets” adviser in the UK Blair governments, published a possibilist manual with colleagues at McKinsey and Company called *Deliverology 101: A field guide for educational leaders*. Deliverology is defined in the manual as “a systematic process for driving progress and delivering results in government and the public sector” (Barber et al. 2011, p. vii), and the authors offer the reader proven strategies to “create an irreversible delivery culture” (p. 171). From roles as Head of Global Practice at McKinsey, and Managing Partner of Delivery Associates, Barber has since been appointed Chief Education Adviser at Pearson, the world’s largest private educational organization. A major focus of Barber’s work at both McKinsey and Pearson has been to exercise global “thought leadership” in the use of achievement data analytics. The agenda has been to

encourage governments to adopt standardized measures of student achievement, to collate and authoritatively interpret comparative student achievement outcome data at system level from various primary sources on their behalf, and to then offer governments publicly and privately delivered State schooling “solutions” in partnership with a wide range of venture capital, social investment, and philanthropic schooling policy actors.

Looking across State schooling in both the OECD bloc and the Global South in 2016, then, one may discern a consistent discourse of possibilism in official policy, commercial and philanthropic schooling services delivery, and ongoing scholarly activity in the SESI tradition. Most significantly, perhaps, in terms of its adoption as part of the State schooling modern social imaginary within broader civil society, possibilism appears at present to be accepted as a largely unremarked feature of popular cultural texts: All children can and should succeed at school irrespective of prior ability, attitude, and family and community contexts.

Possibilism in Theory

Three approaches to possibilism are discussed. In order to broadly differentiate them, they are here called psychologically optimist, sociologically realist, and methodologically pluralist.

In 1976, the *Journal of Teacher Education* published a special issue to commemorate the American bicentennial and look forward to its “third century.” The guest editorial was written by S.K. Bailey (1976), vice-president of the American Council on Education and an academic expert in American schooling legislation and its administration. The title of his editorial was: “The case for ‘possibilism.’” Quoting a contemporary possibilist colleague, Bailey asserted that “the future is up for grabs. It will be, in part, what we *will* it to be” (p. 290, emphasis in original). Bailey then elaborated “four steps to possibilism”: first, “tell it as it is”; second, “dream how it might be different”; third, “affirm people’s capacity for decency and growth”; and fourth, “plot the

instrumental means” (p. 290). While the brief editorial in no way attempts to theorize or justify possibilism, it does neatly capture its essential bureaucratic or public policy imperative, namely to socialize the belief that it is possible to will a beneficial State schooling future, irrespective of present circumstances. This is in some senses precisely the same ideology espoused by the OECD, high-profile policy actors, and academics working in the SESI tradition.

In contrast, the sociologist of education Roy Nash has argued that possibilist ideologies selectively ignore or fail to appreciate a large body of quantitative and qualitative empirical evidence that explains precisely why some children fail to succeed at school. According to Nash, this predictable and consistent failure to succeed is not amenable to simple will on the part of policy makers, administrators, or teachers. Educational inequality and difference occur sociologically because of what Nash conceives of as “the cognitive *habitus*.” According to Nash’s research, “durable cognitive schemes, acquired by children in classed environments, are a principle cause of observed class variation in educational performance” (p. 171). This cognitive *habitus* is necessary to success in “the kind of abstract problem-solving exercised in mathematics and other language-based, symbolic information processing” (p. 172), in other words during schoolwork. However, it develops differentially in families. Given Nash’s arguments that essential features of the cognitive *habitus* are formed in early childhood and that prior attainment is demonstrably the strongest predictor of subsequent scholastic achievement, he rejects the possibilist ideology that achievement gains can simply be willed by bureaucrats and delivered by teachers irrespective of the state of the child’s cognitive *habitus*. Nash holds to a realist view in the world in which social properties, such as the family resources framework that generates the child’s cognitive *habitus*, have material, durable effects.

The methodological possibilism of Albert O Hirschman (Lepenies 2008) also sits in opposition to the bureaucratic possibilism of the kind denounced by Nash. However, it offers something

of a problem-solving alternative that could be of practical assistance to those charged with developing public policy responses to intractable schooling challenges, like the polity expectation that all children should succeed. According to Lepenies, “Hirschman advocates an escape from the ‘straightjacket constructs’ of policies grounded in generalizations, universal laws and fixed sequences by searching instead for the uniqueness or unique features of a given situation” (p. 448). This form of what might be called methodological possibilism is thus concerned with identifying what is possible given the unique features and local circumstances of, in this instance, a particular State schooling challenge. In this sense, like Nash’s realist family resource framework, Hirschman’s possibilism seeks to understand the complexities of how the social world actually works in practice, not how ideally it should work in theory, and to then encourage local interventions on that basis. Similarly, like Nash’s realist rejection of State-sponsored psychological possibilism, Hirschman’s methodological possibilism rejects externally imposed, mandated solutions in favor of flexible approaches that are locally responsive. Methodological possibilism assumes that a solution of some sort may commonly be found provided that the complexities of local circumstances, and their material effects, are sufficiently appreciated as a result of examining the same real phenomenon through multiple perspectives. In contrast, psychologically optimistic possibilism appears to claim that a solution may be found provided only there is sufficient common will and commitment.

Conclusion: Possibilism as Rationality and Rationalization

These opposing views of possibilism may usefully be understood in the context of State schooling by applying Flyvbjerg’s (1998) distinction between rationality and rationalization. The former is a description of the world as it is depicted according to official discourses articulated and circulated by those in positions of power. The latter is a description of the world as it is actually

experienced by most people in society. According to the rationality of State-sponsored possibilism, centrally mandated schooling policies and officially preferred teaching and learning practices are claimed to offer the promise of a State schooling system in which all children can succeed irrespective of prior ability, attitude towards schooling, and the day-to-day material realities and effects of the child’s family and community circumstances. This is a possibilism constructed on a highly partial view of childhood and on an idealized view of the pedagogical relations between teachers, students, and families. In contrast, what we might describe as the rationalization of a realist or methodological possibilism would begin by developing a rich, nuanced appreciation of the durable cognitive dispositions that the child brings to school; of the ways in which these both enable and constrain the child from engaging in meaningful learning; and of what supports, opportunities, and resources the child may need to become more confident and agentic in school, in the family, and in the community. State-sponsored possibilism in schooling represents a concerted effort by those in power to decouple achievement from family and community circumstances. Such a psychological possibilism seeks to reorient the popular narratives that maintain the modern social imaginary of State schooling to ones in which all children can succeed provided only that teachers will it and children aspire to it. A realist or methodological possibilism of State schooling would instead begin with the material realities of inequitable early childhood experience as they are lived, and seek to identify all the necessary interventions (family, community, and polity) that might be required to mitigate them over time.

Achievement; Charles Taylor; Modern social imaginary; Schooling

Introduction

This entry considers the status of schooling through the notion of the modern social imaginary. The relationship between schooling and the modern social imaginary is first introduced generally and then explored in more detail through the two primary concepts that define the modern social imaginary, specifically secular time and bifocal consciousness. The role of achievement is taken as emblematic of schooling as a modern social imaginary institution. This entry concludes

with some brief critical considerations of schooling as a modern social imaginary.

Charles Taylor brings together the three domains of economics, the public sphere, and a self-governing (sovereign) people to mark what he terms a modern social imaginary. Each of these domains, alone and collectively, represent what Taylor identifies as a significant shift in the assumptions that people, specifically Western people, make in their everyday, ordinary lives. These assumptions are the baseline from which the activities of modern individuals proceed. When one thinks about going to school, attending classes, raising their hand to speak, expecting a teacher present, etc., they are actively (but likely not reflectively) participating in the modern social imaginary. In other words, the modern social imaginary is the way one's ordinary life makes sense and is made sense of. Being able to imagine the scenario described above, to picture the arrangement of desks, the interactions between the students and teachers in the classroom, and the kinds of work being done, is a part of the modern social imaginary to the degree that one is able to fill in the details for this sparsely described scenario in a way that makes sense not only to the one doing the imagining, but makes sense of that person as well. When a person can put themselves in this scenario, they are participating in the ordinary life of schooling – not because they necessarily do this in their ordinary life at present but because they can imagine what this scenario involves and most likely have had experiences in schools that inform their imagining of school. Many of the details that accompany these activities can be imagined as though they were a part of their everyday activities, which is precisely what indicates one's engagement with Taylor's notion of modern social imaginaries.

In his defining work for modern social imaginaries, Taylor (2004) posits two interrelated notions that make the Western social imaginary particularly modern. The first notion is secular time. Taylor offers a broad definition of secularity by emphasizing that secular time rules out an external guarantor standing outside of time and acting as a reference point for a society's normative order. While secularity for Taylor captures the

sense of “without religion” that more colloquial uses of secularity connote, he emphasizes a notion of secularity that deals more generally with the distinction between immanence and transcendence. At this more general level, society within secular time is not based on a model whereby some higher authority like God has preordained social categories and processes that hierarchically sort genus and species according to some transcendent ordering principle such as the Great Chain of Being. Instead, society is entirely immanent to time: the actions and objects in and of time operate in a horizontal world wherein the legitimating authority is found in and as a part of society rather than being transcendent to it. Recalling Habermas’ work on the structural shift from religious to rational authority in Enlightenment Europe (1989), Taylor highlights the uptake of reason and rational discourse as a significant consequence of society’s transition to secular time. For this theory, authority is a matter of debate that reason legitimates the actions in and order of society. Accordingly, actors can change society via rational debate, and reason is the grounds from which actors act. Through secular time, then, individuals in the modern social imaginary assume a new type of rational and immanent order wherein society is a sphere upon which action is based, and actors are capable of changing society.

This split between actors (or agents) and the society in which one acts offers the second fundamental notion for modern social imaginaries – the bifocal consciousness of society. Taylor reasons that in order for secular time to be immanent, individuals’ consciousness of society must maintain two foci, agency and objectification. Agency can be understood here as the limitations and affordances one has to act in society, particularly as those actions can direct social change. Objectification is the process by which something is made into an object (objectified) to be acted upon. At the most general level, objectification turns society into an object. In order for the modern social imaginary to operate, individuals must be able to instigate change in society without appeal to a transcendent authority; they must be able to imagine society as an object to be acted

within, i.e., to objectify society, and to imagine that their actions can cause change. Conversely, in a transcendent model, actors are limited in what they can change by the plan of a higher authority. This transcendent position supports ideas like the great Chain of Being where anything outside of this chain is apart from God’s domain. Thus, if one were to act outside of this transcendent normative order, they would not be changing society but likely damning themselves or in need of salvation through some intermediary. However, with the immanence of secular time, agents are sovereign actors among equally sovereign actors who act through social institutions and agencies. While these social institutions are objectified as operating independently of particular agents, and regularly do so, they are also open to being challenged and changed by agents and regularly are. Thus, the modern social imaginary maps the terrain in which agents act, i.e., objectify society, as well as flattens that society so agents are able to change it through their actions without the need for intermediaries like kings or priests. Taylor offers the economy as a prime example of this bifocal consciousness. The economy, on Taylor’s view, is objectified as a system of transactions between agents that economic agents assume to exist (objectify) as a precondition of the actions for which they are the agents. Economic transactions take place independently of individual agents and agencies, yet they are also the mode of action for economic agents. An individual can buy, sell, and produce an array of products, but these acts operate within a system of supply and demand that does not rely on any specific individual performing them. Yet, in order for an individual to enter into economic transactions, they objectify the economy as a system in which these transactions both make sense to the individual and make sense of the individual (as an economic agent).

With the fundamental roles of secular time and a bifocal consciousness of society outlined, the implications of the modern social imaginary for schooling begin to take shape. To understand the role of schooling in the modern social imaginary, it will be helpful to take a brief detour into the transformation of schooling projected by the

Enlightenment. Schooling is one of the primary social institutions that has come to define and be defined by Western modernity and Enlightenment thinking. While it would be a mistake to think of schooling as a uniform, monolithic construct across the space-time of Western society, Kant's "What is Enlightenment?" (1784/1996) offers a general starting point to distinguish modern schooling within the context of the modern social imaginary from previous varieties of schooling. For Kant, Enlightenment represents individuals' freedom to make public use of their reason. This culminates in his demand that followers of the Enlightenment "Dare to know!" by which he urges individuals to throw off dogmatism of all sorts and to reason for themselves about any and all public matters. Kant offers examples of officers, tax collectors, and clergy as those potential dogmatists (what Taylor would consider intermediaries) who can curtail the freedom required for the public use of one's reason through their obedience to a higher order, be it the State or Church. Kant's move away from dogmatism and toward the public use of one's reason, including the freedom such use requires, offers the mark of distinction for modern schooling whereby schools can be viewed as social institutions dedicated to the maturation of children being spoken for into adults who speak for themselves rather than speaking for some higher authority.

When schooling is viewed through the Kantian approach to Enlightenment, Taylor's modern social imaginary merges ordinary life with philosophical justification. The reason for modern schooling in its Western iterations is premised on the development of sovereign individuals capable of acting in the public sphere as rational agents. Philosophically one might say the shift for schooling from Medieval to Modern is a shift from final to efficient cause, or from schooling toward an end like salvation to schooling toward developing one's ability to reason, what Kant describes as speaking for one's self. Taylor's work on the modern social imaginary lays a foundation for schooling as an institutional practice through which children continually encounter society in secular time and through a bifocal consciousness

in which students learn through their own actions as well as through being acted upon.

Following Taylor's argument, one should expect to find Western schooling in its modern iteration to operate in accordance with the premises of the modern social imaginary, namely, secular time and bifocal consciousness. To understand schooling as a process and set of institutions embedded in the modern social imaginary, schooling should largely promote reason as the primary legitimating authority in the development of children into rational actors able to direct social change while objectifying the society in which they act. Due to the diverse approaches contained within Western schooling, exceptions will be present (religious schooling for example), but the important question for modern social imaginaries is whether schooling promotes these premises in the main. Thus, what is needed is a common reference point that describes Western schooling in relatively established yet current ways. One such reference point can be found in the notion of achievement.

A feature of Western schooling that bears out Taylor's modern social imaginary is what Parsons (1959) refers to as the single axis of achievement found in schools. This axis can take any number of forms; though in contemporary Western schooling, it has been drawn largely in terms of standards for literacy and numeracy and evaluated through student performance on standards-based tests. Parsons highlights the importance of the axis of achievement in legitimating the kinds of differentiation that schools enable and enact. Through national standards-based testing and international comparative testing, rankings, and league tables between schools, regions, and nations are produced and used as reasons for reforming education policy and practice at macro (international and national), meso (regional and district), and micro (school and classroom) levels. Because different levels of achievement manifest a range of consequences specifically in terms of failure and success, the formation of the axis of achievement must be seen as fair in its processes and outcomes. The differentiation between student performance along the axis of achievement requires the

assurances of objective measurement as well as equality of opportunity. The measures must differentiate based on work and ability and not on factors beyond a student's control. Moreover, evaluation must be controlled so students who are being tested in common have been taught in a common curriculum. These two features of the axis of achievement mirror Taylor's notions of secular time and bifocal consciousness.

Parsons' single axis of achievement is a notional construct located in secular time as it is shared among the various publics and stakeholders involved in schooling. It offers a systematic way to evaluate student performance and differentiate between student ability in an agreed upon manner. Yet, this agreement does not look beyond society for its reasoning. With contemporary Western schooling in view, the single axis of achievement is entirely immanent to society, i.e., within secular time, whereby schooling is a social institution orientated toward developing students' abilities in literacy and numeracy. Rather than appealing to a transcendent notion of salvation, for example, the rationality of the subject matter, e.g., the logics of literacy and numeracy, provides the legitimating authority for achievement. An answer is correct or incorrect based on reasons immanent to the subject matter, and achievement differentiates students based on reasoning they are generally capable of performing. While exceptions can be identified to rational authority whenever a student is told they need to learn a subject because it will be on the test or because the teacher or State said so, at a general level schooling establishes the axis of achievement within secular time and in this aspect represents an institution within the modern social imaginary as Taylor defines it. What remains is a consideration of whether and how schooling in the modern social imaginary operates according to a bifocal consciousness of objectification and agency.

Accepting achievement as a common feature of Western schooling in general and an important process for schooling as part of the modern social imaginary requires, in addition to secular time, that one locates the features of bifocal consciousness, namely, the mutual relation of objectification

and agency, as a precondition of action that operates independently of agents while also maintaining the freedom for agents to act. The axis of achievement identified by Taylor relies upon the families and staffs of schools sharing the value of achievement as an objective means of differentiation. This shared value entails objectifying assumptions about teaching, learning, knowledge, and ignorance, in the sense that achievement is able to point to these dimensions of schooling as existing independently of individuals. The independent existence of achievement is especially acute in its ability to be quantified in ways that indicate whether a learner is performing their role successfully. Receiving a low score on an achievement test shows that a student did not learn something, did not pass from ignorance to knowledge in an acceptable way. While any number of mitigating factors can be used to direct and redirect arguments of why a learner did not achieve an appropriate score, the objectification of achievement stands as the ground from which such arguments issue. Yet, achievement also guarantees the freedom of agents in schooling due to the agents' ability to improve their scores over time through learning and gaining knowledge. As such, achievement is a form of objectification embodied by schooling that provides an environment in which agents of schooling (teachers, students, policy makers, parents, etc.) can act to change achievement. This achievement objectification mirrors Taylor's consideration of the economy as a field that must be objectified in order for one to act within it: in fact, agents have no environment in which they can act without such objectification. Western schooling based on achievement is a paragon of the modern social imaginary to the extent that it is located within secular time and premised upon the ability of its agents to improve not only the achievement of individuals but also achievement itself.

Understanding schooling as emblematic of Taylor's modern social imaginary offers a set of regulatory criteria. For instance, a proponent of schooling in this model may approach school reform based on the support of programs and practices that reinforce achievement understood

through secular time and bifocal consciousness. However, there are also limitations to this way of conceiving schooling, one of which Taylor acknowledges. Given his reliance on the historical events of the French and American revolutions as definitively breaking from previous social imaginaries, his concept of the modern social imaginary is exclusively Western in its development and focus. This commits the modern social imaginary to a narrow geography and history that schooling as a social institution far exceeds. While elements of the modern social imaginary may be located in non-Western paradigms of schooling, the geographical and historical development of schooling in non-Western areas do not have constitutive ties to the French and American revolutions and Enlightenment thinking that are fundamental to Taylor's notion of modernity. As such, the status of schooling as a part of the modern social imaginary excludes a significant portion of the world from what Taylor defines as modern.

Taylor points out that the modern marks a new normative order, but the normative status of modernity does not make up part of his consideration on modern social imaginaries. That is to say, modernity as Taylor uses the term comprises historically situated forms of reasoning, secularity, objectification, and activity to the exclusion of non-Western contexts. Taylor acknowledges that his work does not extricate modernity from Western history and philosophy and suggests widening the notion of modernity to include non-Western contexts. This approach views modernity as capable of being disentangled from Western philosophy and history and generalized to non-Western contexts while maintaining modernity's defining features of secular time and bifocal consciousness. Modernity acts as a normative category into which Western and non-Western alike can fit.

Conclusion

Critiques of modernity as a normative category have focused on the problems of assuming continuity within what is labeled as modern (Foucault 1984), as well as problems with the denigration of what (and who) falls outside of modernity

(Bhabha 1994) and the processes by which the non-modern are made to be modern (Said 1994). Tellingly, these critiques issue from what can be called a postmodern concern with grand narratives (Lyotard 1984), and they offer an important set of questions when considering schooling as a part of the modern social imaginary. When focusing on modernity as a normative category rather than as a concept that nonnormatively marks the arrival of a new normative order as Taylor does, the criticisms of the normative status of modernity can be addressed to schooling and achievement. For instance, when achievement is used as a device to identify students as at risk, priority learners, failing, exceptional, below standard, etc. and those students who are disproportionately identified as minority and non-White, questions arise concerning what is being valued as achievement and how normative assumptions of identity underpin otherwise objectified and agentic achievement in the secular time of schooling. Schooling may provide a powerful example of the modern social imaginary at work; however, questions remain around the normative status of modernity and its implications for schooling.

Social Imaginaries and the New Education Fellowship

New Education Fellowship (NEF); Progressive Education Association (PEA)

Introduction

The New Education Fellowship (NEF, the “Fellowship”) was the largest, most influential, and enduring of the organizations that emerged from the new education movement. The NEF was established in Europe in 1921 primarily to promote new education ideals following the founding of the Progressive Education Association (PEA) in the USA in 1919. These two progressive organizations were part of a broader wave of “crusades” that comprised the initial global development of “the new education” in the late nineteenth century and early decades of the twentieth century. Both the NEF and the PEA built on the efforts of the new or pioneering schools, the progressive ideas of eminent educational thinkers, and the development of a range of new education teaching methods that enabled pioneering teachers to put new education ideals into practice.

The NEF had a broad agenda that not only included the promotion of new education but also emphasized international tolerance and citizenship, the spiritual development of mankind, and the creation of a global democratic fellowship of educators and affiliated organizations. The organization’s roots were not just strictly in the new education but also drew upon theosophical thought and the Theosophical Society, the conferences and followers of Maria Montessori and the Montessori Method, the so-called first wave of the feminist movement, and the enormous influence

of a small group of progressive educators, in particular, Beatrice Ensor.

This entry presents an outline of the origins, founding, organizational structure, and underlying principles of the NEF. The last section considers the central role of the NEF in the international promotion of the new education and how aspects of progressivism came to maintain an enduring place in the educational landscape.

The Origins of the New Education Fellowship (1915–1920)

The immediate antecedents of the NEF organization were forged in the historical, political, spiritual, and educational milieu encompassing the First World War. As the NEF stalwarts, Boyd and Rawson (1965) explained, this conflict forced people around the world to scrutinize every aspect of their way of life leading to greater solidarity and the formation of a range of global organizations. However, while social and economic restoration was a high priority in international politics, *educational* reformation was not. This role was assigned to voluntary international educational bodies, such as the NEF.

There were significant issues to leaving this task to voluntary organizations. On the one hand, new organizations could be formed relatively quickly to respond to changing needs (as the NEF was), and educators with vision, spirit, and commitment could achieve significant gains where perhaps a larger officially sanctioned international organization might not. On the other hand, such voluntary groups frequently struggled with a lack of ongoing financial security and changing personnel, as well as often debilitating debates around philosophy and strategic approaches. Both the NEF and the PEA as voluntary organizations were to struggle with these issues throughout their existence.

Despite this, the NEF managed to flourish and succeed in its early years by harnessing the passion (and personal finances) of progressive and theosophical educators. The NEF was fortunate to gain high-level national and international political

support derived from its inclusive and diverse membership policies, its democratically based, semiautonomous organizational structures, and the broad international appeal of its principles. The NEF was also extremely adept at spreading its philosophy through its international journals, conferences, and networks.

Founding of the New Education Fellowship (1921)

By the early 1920s, the international education community had begun to focus on reconstruction, and unsurprisingly progressive educators worldwide were discussing and writing about the need for educational reconstruction after the war. The theosophical community endorsed this desire for postwar reconstruction. Theosophists had become increasingly disillusioned with Western materialism and modernism. The utilization of modern science and technology to maximize carnage in the war effort had pushed them to critique materialism and look for spiritual solutions to mankind's problems. The theosophists were not just focusing on educational reconstruction after the war but on a much grander spiritual ideal – the creation of a New Era and the coming of a New Age.

It was amidst this general mood for reconstruction that Beatrice Ensor's Theosophical Fraternity in Education group held their conference in Letchworth in August 1920. The Fraternity by then had over 500 members in England and sections around the world. This conference had two aims: fostering a global network of educational innovators and education for peace. Resonating with theosophists' earlier views on educational reconstruction, the Fraternity argued for a major reconstruction of both educational and spiritual provision. This could only be achieved by replacing competition with cooperation, external discipline with self-discipline, indoctrination with critical thinking, and materialism with spiritual growth. During the Fraternity's 1920 conference, it was agreed to convene a larger conference of new educators in France to be held in the summer of 1921, and it was here that the NEF was to be formally constituted.

What became known as the first world NEF Conference was held in Calais in August 1921 and was deemed to be a great success. There were over one hundred delegates from at least fifteen countries, including Belgium, Czechoslovakia, Denmark, England, France, Holland, Ireland, India, Italy, Russia, Scotland, Spain, Sweden, Switzerland, and Yugoslavia. This Conference thus represented the first major opportunity, postwar for educators to meet.

In what was to be the case in successive NEF conferences, there was a considerable variety in the program of lectures. The sessions were broadly based around the theme of *The Creative Self-Expression of the Child*, and presenters considered core aspects of the new education from a multidisciplinary perspective, including the nature of the child, self-government, creative education, analytical psychology, and the schools of tomorrow. There was also an exhibition of children's art and craft work including paintings, jewelry, lacework, bookbinding, and needlework from English and Scottish theosophical and progressive schools. This mix of varied presentations and exhibitions of children's work was to become the model for future regional and international conferences of the NEF.

The Calais Conference was international in nature and intent, bringing together a diverse group of people with varying (and contradictory) views on the nature of education and educational reconstruction. Distinguished international guests included Dr Decroly (founder of a new education movement in Belgium), Dr Ferrière (director of the Bureau International des Ecoles Nouvelles in Switzerland), MR Nussbaum (director of the first Ecole-Foyer), Professor A Beltette (secretary of the International Federation of Secondary Schools), MJ Loiseau (leader of the new Scout movement in France), and James Young (a pupil of Dr Jung).

A major concern expressed, however, was whether there would be enough "community of spirit and purpose" to enable the creation of a workable world organization. The formation of such an organization fell to a small committee (the Committee of Five) that met during the Conference. The Committee argued that the time had

come for a union of new educators who could see the signs of the emergence of a New Era and that such a Fellowship should be flexible, non-bureaucratic, and truly democratic. The following scheme was proposed and accepted: (a) there should be three journals (English, French, and German); (b) journal subscriptions included membership of the NEF; (c) there should be no rules or constitution; and (d) member countries would be independent. The NEF as an organization was thus formally constituted in 1921.

Without doubt, Beatrice Ensor was the main force behind the founding of the NEF and she had a multilingual background, a powerful personality, strong theosophical and progressive beliefs, and a persuasive ability. Ensor had been a progressive schoolteacher, inspector of schools (HMI) for the Board of Education, and from 1915 the organizing secretary of the Theosophical Educational Trust, and in 1920, she established the *New Era* journal.

Organizational Structure and Principles of the New Education Fellowship

The NEF from its beginnings was intended to be an international movement that sought to bring together those who believed that the problems confronting society were fundamentally issues of human relationships that necessitated a new approach to education. The structure developed for the organization was designed to carry out three functions:

1. *The promotion of new education ideals.* The NEF became a “permanent working laboratory” where new developments in educational theory and practice could be shared. Notably the Fellowship’s network of conferences, national sections and groups, and journals in a number of languages provided a global vehicle for this role.
2. *The development of human solidarity.* This spirit of human solidarity was facilitated by the Fellowship and manifested through close personal networks between educators nationally and internationally and underpinned the Fellowship’s aims for collective action.

3. *The facilitation of internationalization.* Members of the Fellowship came to learn about, understand, and respect the social and cultural differences between the regions and nations of the world where previously misunderstandings could lead to division and conflict in human relationships.

There was a small central body organized by a committee structure that comprised an international body of elected representatives and an executive body for more day-to-day affairs. An inclusive “sections and groups” structure allowed countries to join the NEF as a national umbrella “section” under which any number of more local “groups” could be formed. The three initial journals that were the official organs of the organization later expanded to over twenty Fellowship journals in fifteen languages. The NEF also facilitated the organization of official congresses, both regional and world conferences, and was involved in other activities such as acting as a clearing-house for progressive material, publishing conference proceedings and progressive material, and establishing research commissions. As such, the Fellowship’s organizational structure was a simple, parsimonious one suited to the needs of a voluntary organization that was, in essence, a global network of new educators.

In addition, Ensor argued that the NEF should be nonsectarian, nonpolitical, not committed to any specific educational approaches or methods, and sufficiently flexible for every institution and country to develop independently in order to fully meet their own local needs, while still being true to a broad set of shared principles. The set of common principles developed by the Committee of Five was very broad and reflected the core tenets of the new education. They also closely resonated with theosophical thought, particularly the spiritual references and the placing of “the supremacy of the spirit” as the first principle. The seven principles focused on children’s spiritual development, the development of individuality and innate interests, developmental appropriateness, cooperation, coeducation, and citizenship. This first set of principles was distributed widely and published in each version of the

organization's journals up until their revision at the Nice Conference in 1932.

The 1932 revision of the principles reflected a general trend in the new education literature from fostering complete individual freedom to the inclusion of more social responsibility. In addition, the emphasis on international fellowship was heightened, while the spiritual references were toned down considerably. Again, this new set of nine principles was widely distributed.

The New Education Fellowship and the Crusades of "The New Education"

The rise of "the new education" in the late nineteenth and first decades of the twentieth century was part of a broader movement of social, political, economic, and industrial reforms. Political and social theorists and others were challenging the existing conditions and traditions of the time, and progressive educators were an important part of this movement. "The New Education," as it was termed at the time, was a reaction against traditional or "old" educational thinking, approaches, and practices, and at the forefront of this movement were many of the leading educational thinkers of the age.

In particular, the NEF increasingly saw itself as the organization that lay at the center of this movement and that could play a leading role in facilitating the development and consolidation of the new education globally. Beatrice Ensor conceptualized the growth of new education as a series of "crusades." The first crusade was the establishment of new or pioneer schools globally, beginning around the turn of the twentieth century. The most significant of these schools (and their founding date) were: *England* – Abbotsholme (1889); Bedales (1893); West Down (1897); Little Commonwealth (1913); *Germany* – the Leitz Schools (1898); Free School Community (1906); Odenwald (1910); *France* – L'École des Roches (1898); *Belgium* – the Hermitage (1907); *Italy* – Montessori's Orthophrenic School (1900) and Casa dei Bambini (Children's House School

(1907); *Switzerland* – Glarisegg (1902); Hof Oberkirch (1906/7); *America* – Cook County Normal School (1883); George Junior Republic (1895); the Deweys' Laboratory School (1896); Meriam's Laboratory School (1904); *India* – Sanctuary School, Santiniketan (1901); Christian Boys' School, Kharar (1923); and, *New Zealand* – the Vasanta Garden School (1919). Each country developed particular pioneering schools and progressive approaches that reflected its own social and educational contexts. Later, the schools were promoted by the NEF and their staff became members of the Fellowship.

The second crusade revolved around the ideas of a group of pioneering educational thinkers who inspired the new educators and which became, as Ensor put it in 1930, "a mighty current changing the whole trend of education." These thinkers included CH Becker, Boyd Bode, Pierre Bovet, William Boyd, Martin Buber, PC Chang, Fred Clarke, George Counts, Ovide Decroly, John Dewey, Sigmund Freud, Edmond Holmes, Julian Huxley, Susan Isaacs, Carl Jung, IL Kandel, WH Kilpatrick, Homer Lane, Paul Langevin, Arthur Lismer, Norman MacMunn, Karl Mannheim, Maria Montessori, Cyril Norwood, AS Neill, Percy Nunn, JA Lauwerys, Helen Parkhurst, Jean Piaget, Wyatt Rawson, Harold Rugg, Michael Sadler, E Salter Davies, Hu Shih, Rabindranath Tagore, RH Tawney, and Laurin Zilliacus. They wrote articles for the NEF journals and were speakers at NEF regional and world conferences and articulated in their writing and actions a body of progressive educational ideas that quickly spread around the globe in the first decades of the twentieth century. Of note, the majority of these ideas were heavily based on the writing, methods, and educational practices of a number of earlier social, political, and educational reformists such as, Rousseau, Pestalozzi, and Froebel.

The third crusade involved the adoption of new education methods and approaches by pioneering teachers in State schools around the world. These teachers followed the experiments being undertaken in the new experimental schools and were inspired by the new educational thinkers. They

were able to draw upon a burgeoning literature on new school practices and the large body of new education ideas being expounded by progressive educators in the early decades of the twentieth century. In the United States, there was the Dalton Laboratory Plan (Helen Parkhurst), the Project Method (inspired by Dewey and formalized by William Kilpatrick), and the Winnetka Technique (developed by Carleton Washburne for the Winnetka schools in Chicago). In France, there was the School Co-operative (B Profit), the Free Group or Cousinet Method (Roger Cousinet), and the Printing Press in the School Method (Celestin Freinet). Those working with children with physical and mental disabilities included the Montessori Method (Maria Montessori) and the Decroly Method (Ovide Decroly). The “artist-educators” included Franz Cizek’s Viennese studio where children were given free rein to their artistic expression, Émile Jaques-Dalcroze who developed the Eurythmics Method of music education, and Caldwell Cook who developed the Play Way Method. These methods and approaches were frequently discussed in NEF journals and newsletters and at their conferences.

The fourth crusade related to organizations that supported and facilitated the spread of new education globally, particularly from the end of the nineteenth century and into the first half of the twentieth century. The most relevant philanthropic organizations were the various trusts set up by Andrew Carnegie. Many universities made a significant contribution to the new education, including the School of Education at the University of Chicago and Teachers College, Columbia University, the University of Manchester, and the Institute of Education, London University. Progressive educational research institutes also promoted new education ideas, including the Scottish Council for Research in Education, the South African National Bureau for Educational and Social Research, the Australian Council for Educational Research, and the New Zealand Council for Educational Research. Professional organizations that supported the new education aims and the NEF included the Theosophical Society, the Quaker movement, the Institute of Pacific Relations, the Austro-American Institute of Education,

the League of Nation’s International Institute of Intellectual Cooperation, the Geneva-based JJ Rousseau Institute’s International Bureau of Education, and the short-lived Bureau International des Ecoles Nouvelles. Organizations established solely to meet the needs of the new education movement were the New Education Fellowship (NEF) and the Progressive Education Association (PEA). The PEA and NEF developed closer ties in the late 1920s, and the PEA later became an official section of the NEF, changing its name in 1944 to the American Education Fellowship. The PEA was disbanded in 1955 (Graham, 1967).

All of these organizations became magnets for new educators and progressive education approaches. The NEF played an important role in promoting their progressive activities while helping to breaking down their geographical isolation, from newspaper and journal articles to overseas visitors and travel grants. Educators globally in the early decades of the twentieth century were very much in touch with the key new education developments that were occurring elsewhere, and much credit must go to the NEF for this.

Conclusion

The New Education Fellowship was a remarkable new education initiative that started from small beginnings and grew to become the largest progressive education organization in the world. From its early origins in the Theosophical Fraternity in Education, the NEF quickly attracted a membership of many of the most eminent educators in the world. While it was formed decades after the first “crusades” of the new education, it filled a global educational vacuum in international efforts for social, political, and economic reconstruction after First World War. The Fellowship’s rapid expansion seemingly occurred without much overt planning, and its spirited ideals and principles for creating better people for a better world struck a chord with educators, policymakers, administrators, official international bodies (such as UNESCO), and others interested in education around the world.

The Fellowship's democratic grassroots organizational structure also contributed to its popularity and growth, but conversely was to be a source of its inherent weakness. The fundamental issues for the NEF were its financial foundations (that were primarily based on membership numbers alone) and its voluntary status. Despite a rapid growth in membership, and much enthusiasm from its adherents, the NEF was not able to undertake many of the projects that it wished to, and this limited its potential growth. When external funding was available, the organization prospered; when it was not, the organization fell into decline, particularly in the 1940s. The Second World War also disrupted the NEF's activities globally, and, it could be argued, the conflict broke the "spirit" of the organization, founded as it was to stop such a cataclysm from recurring. Also, the NEF suffered a drop in membership as progressive ideas and methods became more accepted in public schools worldwide.

Into the 1950s and beyond, progressive ideas and methods were being increasingly challenged by other pedagogical approaches and philosophical ideas and its popularity waned. At the same time, fundamental aspects of child-centered education were being seen as much less radical and were being appropriated into the language of policymakers and adapted into the normal practices of educators globally. As a result, the zeal for progressive crusading had passed. The PEA disbanded in 1955 and in 1966, and the NEF changed its name to the World Education Fellowship (WEF) and still exists as a global organization with relatively similar goals, albeit with a considerably reduced funding base and membership.

Social Imaginaries: An Overview

John O'Neill

Institute of Education, Massey University,

[Educational history](#); [Educational myths](#); [Hermeneutic philosophy](#); [Policy scholarship](#)

Introduction

Historical analysis of the life cycle of educational ideas and ideals is integral to an understanding of educational policy and practice in a particular society at any given time. How do ideas and ideals about the nature, aims, and effective organization of formal educational activities come into being, flourish, and wither? To what extent do they become embodied in the everyday language, practices, and relations of education policy discourse in various parts of an "education system"? Why do some appear to gain widespread popular support and acceptance within a society and others do not?

The term "modern social imaginary" was coined by the Canadian hermeneutic philosopher Charles Taylor (2004). Taylor analyzes the way in which western societies have both imagined and attempted to realize themselves according to popular conceptions of their moral purpose and moral order. He does this according to three modes of imagination and realization: the economy, the public sphere, and self-governance. His philosophical interest concerns the continuities and discontinuities in the ordinary social processes through which ideas and ideals transform and renormalize the everyday practices of societies over centuries. In this respect, his analysis has far more in common with, say, Foucault's (2002) archeology of discursive knowledge-power formations and their embodiment in disciplinary practices and individual subjectivities than it does with, say, Lacan's psychoanalytic study of

the imaginary self. The social imaginary serves as a heuristic to examine the material relationships between educational ideas or ideals and educational policies and practices as they operate within an educational system and its host culture. Using this heuristic, we may also raise useful questions about the reasons why public education is so contested, why some educational ideas appear to enjoy universal appeal and similar effects irrespective of local context, while others are seemingly realized in quite different and even contradictory ways across diverse cultural settings.

This entry begins by briefly elaborating Taylor's philosophical concept of the modern social imaginary. It then presents a selection of analyses of the ascendancy of major educational ideas and ideals in the nineteenth and twentieth centuries. It concludes with an assessment of the insights on educational ideas, policy, and practice that are afforded by adopting a philosophical orientation of education as social imaginary.

Modern Social Imaginaries

Taylor uses the term "modern social imaginary" (Taylor 2004) to describe the way in which people imagine and work to maintain the society in which they live. The imaginary is essentially a commonly shared moral conception of the ideal society. Taylor's social imaginary has elements of both moral structure (what is right) and moral agency (what is worth striving for). A social imaginary, for Taylor, is about how people "imagine their social existence, how they fit together with others, how things go on between them and their fellows, the expectations that are normally met, and the deeper normative notions and images that underlie all these expectations" (p. 23). Taylor uses the term imaginary in preference to theory because he is concerned with how "ordinary people" imagine the social "and this is often not expressed in theoretical terms, but is carried in images, stories and legends" (p. 23). Imaginaries are shared by large fractions of society, whereas theory may remain the preserve of minorities or elites. Additionally, "the social imaginary is that

common understanding that makes possible common practices and a widely shared sense of legitimacy" (p. 23). Public education, particularly schooling, is not based on a single canonical body of objective knowledge. Instead it is a culturally based selection of ideas and ideals that have to become accepted as meaningful and right for families, communities, and a society as a whole. These features of social imaginaries are highly relevant to an appreciation of how common understandings of education shape the genesis, enactment, and continual contestation of specific educational policies and practices within a system.

For Taylor, modern social imaginaries manifest three distinct forms of "social self-understanding" (p. 69). These are the economy, the public sphere, and democratic self-governance. In the transition from classical to modern social imaginaries, Taylor identifies a shift in conception of the moral order from one in which society was divinely prescribed and hierarchically organized, and where one's duty was to one's designated place in that moral order, to one in which humans exchange goods and services within what we conceive of as an economy. Consequently, what is right and what is worth striving for is increasingly an economic order, with all that entails about normative valuing of behavior, relations, and achievements in social institutions such as education. Within an economically framed moral order, the ability of individuals to engage in productive work and to create and maintain a private space for their family unit, together with the personal autonomy these require, is of primary importance. Taylor's notion of the primacy of economic self-understanding helps to explain how education policies that are premised on personal responsibility, family advancement, and freedom of choice and association may acquire significant appeal within contemporary society because they are essentially seen as morally good and worth striving for.

For Taylor, the public sphere is a fluid and mobile social commons where people meet (physical and virtually) "to discuss matters of common interest; and thus to be able to form a common mind about these" (p. 83). The public

sphere is part of and essential to an appreciation of the importance of civil society. In the public sphere, individuals choose to associate in order to pursue their mutual interests. The public sphere is “extrapolitical” and “metatopical” (pp. 92–93). The public sphere actively mediates the political and polity spheres. Accordingly, in terms of public education, it may be seen to be vital for education ideals, ideas, and the resultant policies to speak to and be responsive to concerns articulated through the public sphere if they are to gain enduring popular consent and support.

Taylor’s third form of self-understanding concerns the transition from the undivided monarchical rule of the classical age to the constitutional political State of the modern age. The transition has been characterized by struggles, often revolutionary, as peoples become dissatisfied with what they perceive as the unjust exercise of power over their lives and seek to have this replaced by a more acceptable balance between executive power, collective obligations, and individual freedoms. A simple summary of the process during such periods would be that elite theoretical attempts to identify moral and practical problems grow to become a mass popular resentment at the perceived injustice of the current settlement. This precipitates attempts to initiate practical governance change. At first, such attempts may continue to draw on social imaginaries that successfully made sense of the past. That they cannot explain new and changed practices leads eventually to the emergence of new theories and conceptions of the ideal moral order. These permit a more radical departure from old assumptions and a move towards new governance settlements.

Public education represents a microcosm of these societal transitions in the form of efforts to achieve lasting education settlements that meet the needs and aspirations of greater and greater fractions of a society. However, the ideologies and ideas that underpin these have carried quite diverse understandings of the economy and the public sphere and how these should inform system level education funding and provision. Thus, at the time of writing, education policies in many Western and non-Western societies still exhibit ongoing unresolved struggles for ascendancy

between, for example, neoliberal, social-democratic, and authoritarian conceptions of the purposes and necessary forms of organization and administration of education (early childhood, school, tertiary, and community).

Overall then, the social imaginary is focused on common or popular understandings of what is right and worth striving for in society rather than on the abstract theories of academic, political, or bureaucratic elites. Taylor’s three forms of self-understanding enable us to examine the complex and contested ways in which educational ideas and ideals are positioned with regard to: (i) both the macroeconomic (re)distribution of public educational resources at national level and the micro-economic strategies families follow to improve their personal circumstances, (ii) the positioning and choices of groups within society to associate and communicate around particular educational policies in the public sphere (physical and virtual), and (iii) the extent to which educational policies and practices are perceived to advance a society’s moral ideals and norms in respect of acceptable social and economic settlements.

Educational Imaginaries

Until the second half of the eighteenth century, education in England was largely the church’s educational enterprise based on “the idea that education is a unity, the key to which lies in religion” (Burgess 1958, p. 4). Universities and grammar schools were the preserve of social elites, while basic charity schools were established for the deserving poor. During the eighteenth century, the church’s corporate monopoly on schooling and a classical curriculum was gradually fragmented by the emergence of what Burgess calls the private classical school, established by individuals to provide a liberal education (p. 7). As grammar schools became more exclusive, charitable founders and private benefactors greatly increased the number of “non-classical charity schools” (p. 8) to provide moral education though religious instruction and the teaching of literacy and numeracy: “these were to be the answer to both pauperism and irreligion”

(p. 9). The number of day charity schools grew, through donations and subscriptions, and their administration became incorporated in the form of local and, later, national societies, many of which exhibited active cooperation between church, dissenters, and secular groups. The second half of the eighteenth century saw the introduction of State maintenance grants and a short-lived system of payment by results. The 1870 Education Act created school boards to advance the ideal of universal entitlement to elementary education and, subsequently, the establishment of a unified national system of local education authorities to provide greater assurance to central government that this was actually occurring. While this example is peculiar to England and Wales, it has broad historic parallels with education systems elsewhere. Together they illustrate the emergence over several hundred years of what is arguably the first systemic educational imaginary, mass compulsory schooling.

Similar discursive trajectories may be seen in the emergence, proliferation, and decline of educational ideas and their contiguous policies and practices in all western countries, together with many examples of contestation or rejection of dominant schooling forms through “alternative” education. Cremin’s (1961) classic study of the ordinary school, for example, shows how the American progressive education movement emerged after the Civil War and was “part of a vast humanitarian effort to apply the promise of American life—the ideal of government by, of, and for the people—to the puzzling new urban-industrial civilization” (p. viii). While it declined and disappeared in the decades after the Second World War, Cremin argues that its success as an idea lay in broadening the scope of schooling beyond basic skills to include issues of health, work, and the quality of life; introducing pedagogies that were based on the new psychological and social science research; a recognition that the education offered must meet the needs of a diverse child population; and the democratization of cultural values (pp. viii–ix). While progressive education attracted a significant following across political, polity, and civil society groups, including teachers, its dominance was by no means

uncontested. Kliebard (2004) thus documents, across much the same historical period as Cremin, the constant struggle for ascendancy and popular support among four curriculum ideologies, each of which held relatively greater sway at particular times across the different interest groups that make up the schooling discourse community. Herbert’s four ideologies were: humanist, progressive, traditionalist, and social reconstructionist. Each may be said to reflect diverse understandings of how society and the economy interact and, consequently, therefore, what the school curriculum should comprise in order to best prepare young people for meaningful social and economic participation.

That curricula and attendant schooling forms in a given period reflect the ideas and ideals of dominant groups in society aptly demonstrates that “how one conceives of education . . . is a function of how one conceives of the culture and its aims, professed or otherwise” (Bruner 1996, p. x). Moreover, notes Bruner, “learning and thinking are always *situated* in a cultural setting and always dependent on the utilization of cultural resources” (p. 4). In this sense, the educational imaginary materially shapes and is shaped by topical economic, social, and cultural discourses. Thus Callahan (1962), for example, is able to show how at the beginning of the twentieth century in America, the administration of public schools came to be dominated by what he called the “cult of efficiency” expressed in the form of business ideas, assumptions, processes, and practices applied to educational activities. In seeking to explain the dominance of industrial or commercial over educational ideas, he observed that educators enjoyed relatively low status in American society at the time, compared with business which was regarded as a defining cultural, social, and economic ideal. Furthermore, “what was unexpected was the extent, not only of the power of the business-industrial groups, but of the strength of the business ideology in the American culture . . . I had expected more professional autonomy and I was completely unprepared for the extent and degree of capitulation by administrators to whatever demands were made upon them” (pp. vii–viii).

Formal education may therefore be seen in some ways as an idiosyncratic modern social imaginary in terms of how Taylor's three forms of self-awareness play out. While mass compulsory schooling has consistently lain at the heart of system level official education policy because of its facility to sort entire student cohorts for diverse employment and higher education outcomes, discourses around the value of adult and community education (and, for that matter, early childhood education) have proven more ephemeral. This is so despite periodic recognition that adult and community education (e.g., Blyth 1983) has an important role to play in enabling those who may not have succeeded in formal education to acquire the knowledge, skills, and dispositions to engage more confidently and autonomously in the economy and the public sphere.

For many students, there may also be a significant difference between the official curriculum and how it is experienced. In this regard, for example, Branson (1991) analyzes the relationships between gender, education, and work and argues that "we are all born into an economically and culturally biased environment, biased in class, gender and ethnic terms" (p. 95). Education both produces and reproduces existing power structures within a society and therefore needs to be seen as potentially regressive, not progressive. According to Taylor's conception of the imaginary, gradual realization of the regressive elements of an education system will create the conditions in which elites, alliances of interest groups, and then society as a whole seek to change what becomes perceived as an unjust educational settlement.

Relatedly, Ball (2012) uses the term "neoliberal imaginary" to describe how, today, influential individuals, non-governmental organizations, venture philanthropists, and business interests develop largely private, virtual networks of interest outside the public sphere to promote the adoption of privatization and commercialization ideologies in the policies and practices of public education provision. Finally, returning to Taylor's notion of the imaginary as "images, stories and legends" (2004, p. 23), an iconic former Director

of Education in New Zealand, C E Beeby (1986) articulated the notion of an "educational myth" which is required to sustain any successful educational settlement. In Beeby's case, the defining myth of the decades following the Great Depression in 1930s New Zealand was the State's commitment to provide free, universal access to education according to need and merit and thereby to create equality of opportunity. Looking back a quarter of a century after his retirement, Beeby argued that a successful myth needs to be in accord with a strong public aspiration, expressed in language flexible enough to accommodate different interpretations of it, and unattainable for at least a generation. In time, as the weaknesses of the old myth become clear, the old myth is absorbed into a new educational myth of the next generation (pp. xv–xvi). This description is consistent with Taylor's account of how accepted norms of self-governance change through growing public awareness of the injustices of the current social and economic settlements.

Conclusion

The conception of the social imaginary enables analysis of the dominant moral purpose and moral order of a society in terms of private (or familial) and public (or systemic) economic agency. It also encourages a focus on the strategies of association and communication that are employed by interest groups within the public sphere and between the public, political, and polity spheres. Finally, it requires an analysis of the ways in which societies over time change their shared understandings of socially just economic and social settlements and the events through which old settlements are abandoned in favor of others that appear to have greater moral purpose and utility.

The introduction of modern mass compulsory education has typically been advocated on the basis that it provides significant economic, social, and community benefits, both public and private. The concept of the social imaginary permits contiguous analysis of each of these, and of their complex interactions in the context of general

and particular educational ideas and ideas, in and between societies, at particular historical junctures and over much longer periods of time. In this sense, it makes sense to talk of modern educational imaginaries. A hermeneutic philosophical orientation such as Taylor's encourages a focus on the meanings, values, and moral worth that ordinary people in society attach to educational ideals and ideals, how political and polity groups both shape and are shaped by these, how lasting educational settlements are achieved, and why they fail.

Sociological Approaches to Educational Administration

Scott Eacott
University of New South Wales, Sydney,
Australia

Introduction

The generation and classification of data about society and social groups was pivotal in the establishment of public administration. Analysis of such data predates the establishment of any academic departments and was arguably central to early Western philosophy. It is the analysis of the social world that is the focus of sociology. As a branch of social thought and analysis, sociology at its broadest is concerned with the study of human behavior and its origins, development, organization, and institutions. Significantly, sociology is not confined to any one particular set of theoretical resources or approach to data generation (e.g., qualitative or quantitative). It is a broad multi-paradigmatic discipline concerned with social behavior.

While it is difficult to pinpoint the moment of origin for sociology as an academic discipline, three scholars considered to be the founding

architects of contemporary sociology are Émile Durkheim, Karl Marx, and Max Weber. Durkheim held a strong belief in a *science* of the social world – comparable to the natural sciences – and it is this stream of sociology that was influential during the early phases of the North American-driven *Theory Movement* in educational administration in the mid-twentieth century. Marxist analysis of the social world, and the centrality of power, remains prominent – even if not always identified – in the critical stream of scholarship. Weber, who incidentally was writing at around the same time as Frederick Winslow Taylor – arguably the father of contemporary management sciences – wrote a highly influential, but significantly misunderstood, account of the role of the economy, administration, and society and included a discussion of charismatic leadership.

Sociology however is not a homogenous discipline. There are many differing orientations, or traditions, including, but not exclusively, structural-functionalist, political-conflict, constructivist, and critical humanist perspectives. Slater (1995) provides an overview of the ways in which these differing perspectives manifest in the educational administration literatures. The structural-functionalist perspective conceives of administration as a set of measurable behaviors or skills. With links to trait theory, this mode of inquiry frequently leads to lists of desirable actions or attributes. There is an underlying rational logic and research findings are designed to improve the efficiency and/or effectiveness of organizations. With the contemporary policy agenda of professional standards or licensing requirements, this perspective is a major contributor to the literatures of the field. Political-conflict approaches are concerned with power relations (similar to Marxism) and in particular dominance-subordination. Bureaucratic approaches are linked to this perspective and researchers frequently argue that educational administration is a technology of control. Feminist accounts of educational administration seek to trouble, or problematize, the forms of domination and legitimation of power structures in existing education systems. The constructivists

are less focused on the actual behaviors and more with the meaning ascribed to action. This shifts the attention from universal measurable behaviors to the particular meaning and intent of behaviors in context. Unlike other approaches (e.g., structural-functionalist), from a constructivist perspective, it is impossible to distinguish between cause and effect and nothing is value-free. The critical humanist is concerned with an explicit moral point of view and giving meaning to collective effort. With the expanding critique of neoliberalism and managerialism in educational administration, the critical humanist is focused less on getting people to do something and instead about getting them to do what is right. The distinctions between these perspectives are not always clear as such partitioning serves the classifiers' purposes more so than scholars. In addition, it is symbolical of the way in which sociology is focused on an always in motion social activity.

Apart from having many different traditions, sociology also operates at two – although deeply connected – levels. The most commonly recognized is sociology of a field of practice, for example, sociology of education or educational administration. In this case, sociology provides a set of theoretical resources for thinking through and describing events in the social world. The “education” or “educational administration” is used to demarcate the object of analysis. It is often possible to recognize this form of scholarship through the appropriation of great thinkers (e.g., Bourdieu, Weber) to theorize educational administration. The difficulty here is that the received terms remain intact and the two domains of inquiry “sociology” and “educational administration” remain separate. A second approach is a sociology of knowledge production. In this sense, much like the sociology of science, focus is on the epistemological and ontological preliminaries of research. The leading proponent of this approach in educational administration (although frequently using the more contemporary title of educational leadership) is Gunter. For example, her latest book, *An Intellectual History of School Leadership Practice and Research* Gunter (2016), classifies research around traditions, purposes, domains, contexts, and networks to provide

those working in educational administration and leadership with an analytical framework for understanding knowledge production.

Sociology and Educational Administration

The importance, or significance, of sociological approaches for educational administration is a well-rehearsed argument. As Bates (1980) argued, “the processes through which learning is organized in society are of central importance in both the production of knowledge, the maintenance of culture, and the reproduction of social structure” (p. 1). However, a coming together of sociology and educational administration is not easily achieved. Educational administration sits at the intersection of well-developed traditions of sociology of education and the sociology of organizations (often referred to as organizational studies), among others. This poses a problem as sociology, including the sociology of education, has continued on with little explicit reference to educational administration (see Tipton 1977).

In the pursuit of validity within the academy, educational administration sought to establish boundaries around itself as an academic discipline. In doing so, any disciplinary knowledge from beyond the constructed boundaries of educational administration was excluded. Primacy was given to understanding individuals within organizations and their interactions with the structural arrangements of institutions and systems. What sociology offered educational administration was an opening up beyond the individualistic and structural accounts of organizations. As Clark (1965) argued:

sociology should be able to make a major contribution to the study of administration within formal structures. It is also notably a discipline whose sensitivity to emergent phenomena and informal patterns should aid greatly in extending the study of educational administration to the many influences on policy and practice that are located outside of formal structures. (p. 69)

The study of educational administration had been rooted in psychology and a psychological

framework due to an interest in individuals and individual-level phenomena. The Hawthorne Studies and subsequent Human Relations Movement brought relationships between and within organizations to the fore. Introducing a more interactive approach to understanding organizations and those within them was generative of new questions for educational administration. If administration is a social activity, then it is only logical to have theories of educational administration embedded within broader theories of the social world. Enduring questions of the sociological project such as structure/agency, individualism/collectivism, and universal/particular became productive spaces for educational administration. The imperialism of disciplinary boundaries was less important than the development of theoretical and methodological resources for engaging with the increasingly complex nature of educational organizations and their administration.

Key Moves

In North America, but primarily the USA, the W.K. Kellogg-supported Cooperative Program in Educational Administration (CPEA) centers were important mechanisms for encouraging sociologists, psychologists, and others to conduct scholarship on educational administration during the mid-1900s. As a result, psychology and sociology were influential during the importation of *science* in the lead-up to the *Theory Movement*. The sociological influences in the *Theory Movement* were built upon an appropriation of Talcott Parson's systems theory through Jacob Getzels' (1952) *A Psycho-Sociological Framework for the Study of Education Administration*. From a sociological perspective, this approach reflects a very particular form of scholarship, one built upon logical empiricism as *the* way to do science. In mainstream discourses, this approach was – and continues to be – popular. The use of survey techniques and the construction/classification of social groups for analysis provided the basis of substantive applied research.

Australia and New Zealand are another well-recognized home for sociological-based

scholarship in educational administration. While the USA has drawn from sociological approaches at large, the Australian and New Zealand contribution has been very much based in critical social theory. Primarily grounded in the work of scholars at Deakin University during the 1980s–1990s, in particular, Richard Bates' critical theory of educational administration, Jill Blackmore's contribution to feminist theorizing, and John Smyth's critique of the self-managing school, Australia has long been recognized as a site of sociological-inspired scholarship.

The social sciences have long been thought of as a useful theoretical resource across the Commonwealth. This is arguably captured in Baron and Taylor's (1969) classic text *Educational Administration and the Social Sciences*. This history is particularly important. In the USA, the brand of sociology that informed the *Theory Movement* and whose traces remain in major outlets (e.g., *Educational Administration Quarterly*) is very much concerned with objectivity in measurement and the exhibitionism of data (production and analysis). Of greatest import were the scientific method and the construction of rigorous and robust research.

In contrast, the UK, Australia, and New Zealand adopted a more open form of sociology. The interpretive was accepted at a greater scale and as a legitimate form of knowledge production. This goes part of the way to explaining why when Greenfield launched his attack on the apparent objectivity of the *Theory Movement* he received far greater support from Commonwealth-based scholars than he did from US-based ones. In the USA, early professors of educational administration and then the *Theory Movement* sought to establish an apolitical account that could acquire legitimacy within the broader academy. Objectivity, measurement, and causality (e.g., cause and effect) were imperative. In contrast, across the Commonwealth, there was a stronger recognition or conceptualization of education as a political activity. In England, for example, schooling had a long history of class warfare and scholarship could not easily overlook this sociocultural context. At scale, and contingent on temporality, the effects of colonialism/imperialism still linger

across the Commonwealth, and sociopolitical accounts of educational administration are far more evident in both practice and scholarship. The closest equivalent in the USA is the attention to matters of race, particularly through the University Council for Educational Administration (UCEA) and general educational research associations such as the American Educational Research Association (AERA). However, this takes less of an explicit sociological approach and instead draws more broadly on a range of social sciences.

With the broad definition of sociology, the histories of different traditions and how they play out in different academic communities is easily overlooked. It highlights the need to understand how actions are located in contexts. In this sense, sociology works as both content and method. Sociological analysis calls for understanding the interplay between actions and contexts. An important distinction here centers on how this interplay is conceived.

There are two major schools of thought on the nature of relations in sociological analysis: substantialist and relational. The substantialist, sometimes referred to as entity-based in the broader leadership and management literatures, constructs research objects as discrete – even if interrelated – entities. This is core to systems thinking and the partitioning of organizations, context (or the environment), and the multitude of subsystems. Each entity becomes a variable in the research framework and then can be the focus of interventions (e.g., experimental or policy). Quantitative analysis of educational administration requires a substantialist lens. The mechanistic partitioning and measurement of external knowable entities is linked to structuralist-functionalist accounts. Relations in this approach are reduced to relationships between entities and can be measured for strength and directionality. Such approaches are often critiqued for being essentialist or deterministic as labels (e.g., gender, age, socioeconomic status) are effective static measures overlaid on context and assigned based on a preexisting criteria. In contrast, relational approaches are more fluid. Separate entities are not possible and understanding of particular events or actors can only be in

relation to other actors and events. Variables in a substantial account are instead rethought as positions within a social space rather than essentialized. Questions shift from attempts to construct a list of desirable behaviors for effectiveness (with a particular version of cause and effect) to elaborated descriptions of unfolding social activity. The move is subtle, but the final product is considerably different. What this highlights is that sociological resources facilitate many different forms of scholarship and contribution.

Contemporary Developments

Gunter (2010) identified an emerging trend of using sociological approaches in educational administration and leadership research. While it is difficult to capture the scope of this scholarship, there are some recognizable areas that are leading contemporary developments in educational administration.

Unlike the sociology of education (and post-structuralist accounts of education), educational administration calls upon compensatory more than reproduction-based accounts of the role of the schooling. Primarily built on the work of Bourdieu and Passeron (1970[1990]), reproduction argues that education systems serve to sustain the existing social order. This position is common in parallel discussions in critical social theory. Not surprisingly, educational administration has an underlying generative principle that key actors in organizations and organizations at large can make a positive contribution to society. To that end, educational administration is conceived as a compensatory role, where, if enacted effectively, education can overcome any form of disadvantage that students may experience. The minimal engagement across approaches (reproduction and compensatory) is a limitation to contemporary dialogue and debate in educational administration and with other forms of education scholarship.

With an increasing use of sociological approaches in educational administration, there is also substantial evidence of appropriation of great thinkers. There are many great thinkers from sociology and more broadly social theory

being imported into educational administration literatures. The likes of Bourdieu, Foucault, Arendt, Derrida, Lyotard, among others have texts dedicated to them and the application of their theories to educational administration. At least two difficulties exist with this trend: (i) the separation of sociology and educational administration remains as ideas and vocabularies are imported and overlaid leaving the received terms intact, and (ii) the theoretical resources are rarely mobilized at scale and instead cherry-picked to serve the researchers purpose. In the case of the former, the challenge is to move beyond the novelty and to provide insights not possible with existing theorizations. With the latter, the epistemic histories of concepts and their relations to a larger theory of practice are lost when applied in isolation.

Closely related to the above is the slippery use of sociological language in education administration. The current example is “capital.” As a concept, capital has a rich history in many disciplines but particularly sociology and economics. A rapidly expanding set of literatures in educational administration are using capital – and various adjectives to demarcate it. Social capital and cultural capital as theoretical resources have long histories in sociology, primarily through the work of Bourdieu. This has gone underdeveloped in educational administration. With a degree of presentism in contemporary work, epistemic equivalence is granted to these resources in ways which are theoretically indefensible.

Consistent with a relational turn in contemporary sociology and increased attention in broader leadership and management literatures, educational administration is paying more attention to relational approaches (Eacott 2015). This has taken many forms and could be a fad, but with the sustained attention in both sociology and leadership literatures, it is potentially a fruitful direction for scholarship in educational administration.

A final trend is the expansion of work on knowledge production in educational administration. With the exception of the *Theory Movement* and a few interventions (e.g., Greenfield’s

subjectivism, Bates’ critical theory of educational administration, Evers and Lakomski’s natural coherentism), relatively little attention has been paid to understanding how knowledge is produced, disseminated, and sustained. The potential for providing insights into the relations between knowledge production and practice has arguably never been greater than during a period of increasing professional standards, certification, and licensing.

Conclusion

Sociology offers educational administration the means to theorize how it is perceived, understood, and enacted within the contexts of particular sociocultural, political, and economic conditions. It is a broad multi-paradigmatic discipline. To mobilize sociological resources in the scholarship of educational administration requires substantial reading in order to locate one’s work within broader discussions. This entry has provided a brief overview of the history of sociology and educational administration. Importantly it drew attention to some of the ways in which geography played in the adoption of sociology and the implications for scholarship. In addition, it identified some contemporary developments in the mobilization of sociology in educational administration that offer both challenges and new insights into how the field works. Importantly, it has been stressed that what sociology can provide are a set of theoretical resources for understanding the ways in which educational institutions go about their work, and because of the dynamic and contradictory nature of the social world, this is an ongoing and inexhaustible intellectual project.

Introduction

Socrates and his pupil Plato believed that education through dialogue is good. Although there are no written traces and we only know about Socrates through the work of other authors, Socrates and the dialectic method attributed to him have left a permanent mark both in the history of philosophy, as well as in the dialectic method as an educational method which teaches students how to think. Guthrie mentions Socrates as a tipping point in philosophy. Socrates insisted on philosophy aimed toward his fellow citizens and the moral and intellectual issues they were coming across, disregarding issues of natural philosophy that most of the pre-Socratic philosophers were focused on. Guthrie quotes Cicero's *Tusculan Disputations*:

Ancient philosophy up to Socrates, who was taught by Archelaus the pupil of Anaxagoras, dealt with number and movement, and these early thinkers inquired zealously into the magnitude, intervals, and courses of the stars, and all celestial matters. But Socrates first called philosophy down from the sky, set it in the cities and even introduced it into homes, and compelled it to consider life and morals, good and evil. (Guthrie 1971)

Socratic Method

This is precisely one of Socrates' main qualities: he tried to encourage his fellow citizens and interlocutors to think about the things truly relevant for people. The method he employed is known as the Socratic method. Therefore, Socrates was an advocate of enlightenment and constantly urged his fellow citizens to think. We should also point out that aiming philosophy toward citizens was a process started by the sophists. They offered their intellectual and philosophical services to anyone who could afford them, while Socrates strived to enlighten his pupils and citizens. Socrates used questions to guide the interlocutor toward "the truth," something the interlocutor was unaware prior to the conversation with Socrates. In modern terms, it could be said that Socrates did not teach his interlocutors what they should think but how to think. There is the comparison between Socrates and a midwife; Socrates is helping with "the birth" of an opinion. He used to help the interlocutor to form and state their opinion and bring it into the world. In *Theaetetus*, Plato as Socrates draws a comparison to the midwife:

SOCRATES: Well, my art of midwifery is in most respects like theirs; but differs, in that I attend men and not women; and look after their souls when they are in labour, and not after their bodies: and the triumph of my art is in thoroughly examining whether the thought which the mind of the young man brings forth is a false idol or a noble and true birth. And like the midwives, I am barren, and the reproach which is often made against me, that I ask questions of others and have not the wit to answer them myself, is very just – the reason is, that the god compels me to be a midwife, but does not allow me to bring forth. And therefore I am not myself at all wise, nor have I anything to show which is the invention or birth of my own soul, but those who converse with me profit. Some of them appear dull enough at first, but afterwards, as out acquaintance ripens, if the god is gracious to them, they all make astonishing progress; and this in the opinion of others as well as in their own (Plato 2014).

Perhaps it can be said that Socrates was able to make people "birth" their opinions, strictly paying attention to the argumentation and "closeness to the truth." Socrates' midwifery art refers to, naturally, his use of ironic-maieutic method which can be observed on any example of Plato's dialogue:

with carefully constructed questions, Socrates puts the interlocutor in a position to, first, question their principles (irony) and then, with another series of careful questioning, to bring forth new, logically based principles (maieutic).

The Socratic method is (rightfully) attributed to Socrates and the way in which he pulled the opinion out of the interlocutor and how he made them question their own principles and judgment. Copleston describes the method:

What was Socrates' practical method? It took the form of "dialectic" or conversation. He would get into conversation with someone and try to elicit from him his ideas on some subject. For instance, he might profess his ignorance of what courage really is, and ask the other man if he had any light on the subject. Or Socrates would lead the conversation in that direction, and when the other man had used the word "courage," Socrates would ask him what courage is, professing his own ignorance and desire to learn. His companion had used the word, therefore he must know what it meant. When some definition or description had been given him, Socrates would profess his great satisfaction, but would intimate that there were one or two little difficulties which he would like to see cleared up. Accordingly he asked questions, letting the other man do most of the talking, but keeping the course of the conversation under his control, and so would expose the inadequacy of the proposed definition of courage. The other would fall back on a fresh or modified definition, and so the process would go on, with or without final success. (Copleston 1993)

Copleston points out the main characteristics of the Socratic method. Apart from "birthing" the opinion of the interlocutor, he also taught or, better yet, practiced how to think and ensured the procedure followed logical rules. Socrates did not allow the interlocutor to state their principle without the proper argument, that is, every definition, sentence, and statement had to be corroborated. Moreover, whatever was said was examined from all possible "sides." This process of questioning what had been said allowed rejecting any ideas cofuted by either Socrates or the interlocutor. In this way, only the ideas resistant to the fiercest questioning could be maintained. As observed by Haynes, any mental "debris" would be removed:

The Socratic method was called *elenchus*. The idea was to open space for learning through liberation

and prevent garbage to clutter the mind, and address pure, fresh thinking. This includes both the intellect and emotion in challenging previously established beliefs and assumptions. (Haynes 2003)

No matter how idealized Socrates may be in Plato's dialogues, it is clear that for most of the interlocutors, the conversations with Socrates, at least in some part, are not pleasant. Socrates uses any means necessary, he does not hold back and does not play games, and any invalid line of argument rejects the thesis in question. For most of the interlocutors, it is not easy to keep calm, while their beliefs and attitudes crumble like a house of cards. To most individuals, it is not easy to experience the total denial of their established principles or opinions (whether this is done by Socrates or someone else). Hayes is obviously right when he says that both the intellect and emotions play a part in the *elenchus* (this refers to Socrates as well). Socrates confronts the interlocutor with their opinion, with themselves, revealing their misconceptions and mistakes, and that is not an easy task for anyone. Socrates may be helping them to birth the truth about the subject in question, but the collateral damage consists of the people themselves, because the truth that is brought to light is the truth about the people themselves. Discovering your own flaws has to cause negative emotions. Without facing our own "negativity," there is no "pure and fresh thinking."

Socrates' dialectic method has two parts: irony and maieutic. Irony is the initial part of the method where Socrates asks the interlocutor to define the basic notions relating to the subject, because he (Socrates) "does not know them." In his work *Socrates. Towards the discovery of Human Wisdom*, in chapter on Irony, dialectic versus maieutic (Reale 2003), Reale discusses the Socratic method. He also talks about Jan Patočka, who says:

Essentially, irony is part of the Socratic educational method, that is, the care for the soul. (Reale 2003)

Is the Socratic method an educational one? Given everything that has been mentioned so far, yes, even more so than many other methods considered to be educational. The Socratic irony is not simple. It is not easy to use irony in the

Socratic sense; every answer offered has to be met with its essence, while seemingly naively pretending not to know what the subject is, and then offering a counter answer or question either to allude or provoke doubt.

Socrates, in fact, logically questions the opinions and principles of the interlocutor, while irony brings into question the attitude of the interlocutor, so that the confused individual has to elaborate on their opinion or principle, in accordance with logical consistency of what they are about to say.

Socrates believed that only through a live conversation can we get closer to the truth, find out something new, and eventually learn. All of that is not possible without thorough thinking on the subject, and rules of thinking are used to deny the logical inconsistencies and to reach, if possible, a satisfactory logical conclusion. Socrates used his methods to establish greater knowledge, based on sound principles and definitions of things that he discussed:

His "irony," then, his profession of ignorance, was sincere; he did not know, but he wanted to find out, and he wanted to induce others to reflect for themselves and to give real thought to the supremely important work of caring for their souls. (Copleston 1993)

Maieutic is a more complex process than irony. Through careful questioning, Socrates examines the attitudes stated by the interlocutor but also guides them to a logically consistent conclusion. However, the conclusion may not always be reached, as evident from Plato's dialogues. Lack of a real conclusion is not or, at least, should not be a problem, because thinking about and raising awareness of the issue is the path toward solving it. Nevertheless, there are authors who doubt that maieutic was actually created by Socrates. According to Reale:

But everyone did not consider maieutic as Socrates' expression, rather, they thought it was Plato's poetic invention. For instance, Burnyeat and Vlastos believed that the method [sc. maieutic] is Plato's invention, alien to Socrates from Plato's early dialogues. (Reale 2003)

Regardless of whether or not maieutic is an original Socratic method, together with irony, it

is a part of the Socratic dialogue, as it is called today, with its contemporary interpretation being used more and more in formal and nonformal education.

Contemporary Version of the Socratic Dialogue in Education

Colloquially, Socrates “made” the interlocutor to think about their judgments, principles, and statements, but more precisely, he encouraged thinking. The definition of Socrates as the grandfather of critical thinking, that is, of “learning how to think,” can be found among most critical thinking theoreticians. Some contemporary philosophical tendencies, such as “philosophy with children,” use dialogue based on irony and maieutic. This is called the “Socratic dialogue,” “Socratic method,” or “elenctic method.” It is a form of discussion based on questions and answers used to encourage critical thinking and “shed light on the path to the truth.” It is a dialectic method that includes opposing views, defending those views logically and problem-solving.

What is the goal of the Socratic method in education? The standard answer would be that the method encourages children and teenagers (and all those who participate in this type of educational programs) to develop critical thinking. The participants’ benefit from the development of critical thinking is probably best described by Shaw: “The process of Socratic dialogue assists students to organise their thoughts and sequence their learning. It guides learning by emphasising what is important and relevant” (Shaw 2008). Furthermore, Socratic dialogue develops what we refer to nowadays as critical thinking and what John Dewey referred to as reflective thinking. It was John Dewey who reestablished the need to learn how to think in modern society. “No one doubts, theoretically, the importance of fostering in school good habits of thinking” (Dewey 1926, p. 226). However, according to Dewey, although in theory the problem of thinking in educational process observed in practice is different. However, even the theoretical does not

recognize the importance of this problem: “But apart from the fact that the acknowledgment is not so great in practice as in theory, there is not adequate theoretical recognition that all which the school can or need do for pupils, so far as their minds are concerned (i.e., leaving out certain specialized muscular abilities), is to develop their ability to think” (Dewey 1926). So, one of the main goals of the school is to develop the ability to think. Dewey continues: “Thinking which is not connected with increase of efficiency in action, and with learning more about ourselves and the world in which we live, has something the matter with it just as thought” (Dewey 1926). Bringing back “the learning how to think,” that is, getting used to critical thinking, can be achieved by using the Socratic method in educational systems.

As a rule, contemporary tendencies and programs which aim to teach children how to think and develop their critical thinking include an updated version of the Socratic dialogue, that is, a dialogue which features the Socratic question and answer method. The method’s tagline could be “question everything” but based on sound arguments. The method can be adapted according to age, and the most important question of the method is “Why?”. However, modern-day Socratic method in education is primarily based on thoughtful series of questions. These questions open up new question and new explanations. R. W. Paul divided the questions of the Socratic method into six basic types:

1. Questions for clarification: Why do you say that? How does this relate to our discussion?
2. Questions that probe assumptions: What could we assume instead? How can you verify or disapprove that assumption?
3. Questions that probe reasons and evidence: What would be an example? What is....analogous to? What do you think causes to happen...? Why?
4. Questions about viewpoints and perspectives: What would be an alternative? What is another way to look at it? Would you explain why it is necessary or beneficial, and who benefits?

- Why it is the best? What are the strengths and weaknesses of...? How are...and... similar? What is a counterargument for...?
5. Questions that probe implications and consequences: What generalizations can you make? What are the consequences of that assumption? What are you implying? How does... affect...? How does...tie in with what we learned before?
 6. Questions about the question: What was the point of this question? Why do you think I asked this question? What does...mean? How does...apply to everyday life? (Paul et al. 2002)

Paul is good at establishing the types of questions in a contemporary Socratic dialogue. During workshops and while working with clients, apart from these types of question, the most frequently asked question, and also the most efficient one, is *why*, which demands a logical response.

Encouraging Intellectual Engagement

Socrates walked around the streets and town squares in Athens and encouraged people to think, to develop their own opinion, to dare to think, and to dare question the socially acceptable norms. Eventually, he was sentenced to death. Nowadays, we may not be sentenced to death if we think for ourselves and encourage others to do the same. Nevertheless, lethargy and mental laziness mean that most people lack the will power to bravely face everything that is put in front of them. To live thoughtfully and to live according to Kant's *Sapere aude!* is difficult, but it is the only life worth living. Laziness and self-neglect is not life, merely survival. This is why changes have to be made in the educational curricula. They should encourage moral awareness among students, which also comes hand in hand with responsibility and, ultimately, freedom. These programs may be manipulated; therefore, they have to be planned carefully. Such programs offer no ready-made answers. On the contrary, they provide content for thinking and methods to do so. Each student is welcome to come to their

own conclusion or what Hare calls the critical level of moral thinking. A curriculum which tries to achieve that – encourage students to think critically and reach their own conclusions – is present in educational systems around the world. However, formal education is hard to change; so many programs that are dedicated to learning how to think and development of critical thinking via the Socratic method are often part of nonformal education. The French philosopher Oscar Brenifier developed such a method called the Socratic method of Oscar Brenifier, in the UNESCO book *Philosophy – a School of Freedom* (Goucha 2007).

Example: The Socratic Method of Oscar Brenifier

Brenifier's method is based on Socratic dialogue in the literal sense. Discussion with children has no formal or technical rules (sitting arrangement, talking order), but the method relies on logic, naturally. The teacher/moderator guides the discussion and points out the logical errors in children's abstraction. Oftentimes, the discussion revolves around clarifying a notion or a problem. At first, the method may seem too abrasive for working with children, because the moderator points out children's misconceptions, which is not easy for children (or anyone else). Nevertheless, the method is good for raising awareness about contradictory statements; associating child's personality with general rules; becoming aware of your own character, personality, and thoughts in a given setting; identifying an issue and ways of dealing with it; facing and accepting the truth; rejecting the strict good versus bad dichotomy; etc.

Why did Socrates' interlocutors feel uncomfortable? Because Socrates disputed their misconceptions and pointed out the flaws in their reasoning. This is how people feel any time someone shatters their prejudice and misguided opinions. This is an issue of the ego, that is, egoism and vanity. This is what seems to be Brenifier's focus. If we can disregard our ego in a philosophical dialogue, if we can confront a logical line of thought, then we are in a far better position to find the answers we seek.

Socratic Dialogue: A Comparison Between Ancient and Contemporary Method

Laura Candiottio

Eidyn Centre, School of Philosophy, Psychology and Language Sciences, University of Edinburgh, Edinburgh, UK

These last years have witnessed the emergence and blossoming of practices inspired by philosophy on the didactic and pedagogical scene. In this context, Socrates' philosophy represents one main point of reference. Socratic dialogue is now a model for a maieutic conception of teaching as well as for the constitution of dialogical communities and for an interrogative inquiry into reality. However, at times this recovery of the Socratic model is not exempt from misunderstandings and anachronisms. The aim of this entry is to underline the main differences between the ancient and contemporary method.

Socratic Dialogue in the Ancient World

Socratic dialogue as a literary genre emerges in Athens during the fourth century BC, immediately after Socrates' death in 399 BC, in order to bear testimony and leave a durable trace of Socrates' life and method. (Some researchers argue that the Socratic dialogue as a literary genre was already present during Socrates' lifetime, assuming a didactic function, cf. Rossetti (2011a).) These instances are at the basis of the development of the *logoi sokratikoi* genre, of which Plato is a proponent among many. The Socratic method, as a dialogic practice experienced by various interlocutors, has obviously an earlier origin, which can be traced back to the discursive or rhetoric practices characterizing democratic Athens. Public speeches, orations, and discussions in court mark the emergence of an art of the word that is nurtured by democracy. Within this context, Socrates embodies an educational methodology and an idea of philosophical research markedly distinct from methodologies which were fashionable at the time, especially those of the sophists. Also the sophists practiced dialogue with their disciples, but the purpose and characteristics of their method were different from the Socratic approach.

The first Platonic dialogues (the dialogues written by Plato immediately after the death of Socrates; those credited as authentic by most scholars are *Apology of Socrates*, *Menexenus*, *Protagoras*, *Laches*, *The Republic* Book I, *Charmides*, *Euthyphro*, *Lysis*, *Hippias Major*, *Ion*, *Hippias Minor*, *Crito*, *Euthydemus*, *Cratylus*, *Gorgias*, *Meno*) represent a vivid testimony of the Socratic method: it is thus possible to extract from them crucial information to delineate the general characteristics of this approach (for an analysis of the Socratic method in Plato's first dialogues, cf. L. Candiottio (2012a)).

The Maieutical Character of the Socratic Dialogue

The first and fundamental feature of the method is that it is a maieutic method. Maieutics (literally, midwifery) can be defined as an art which, by operating through dialogue (the basic mode of dialogue is that of questions and answers), enables

the soul to give birth to the truth it seeks. The truth is already present in the soul of the seeker: the Socratic questioning is the modality through which Socrates helps his interlocutor to discover the truth he already possesses. The dialogue enables, within a joint research, to get closer to the truth; it allows the interlocutor to find out the truth in first person, avoiding thus dogmatic expositions on the teacher's part. A knowledge which is not experienced in first person by the interlocutor cannot be acknowledged as true, as it is necessarily perceived by him/her as something external: accordingly, it does not possess the strength to compel the subject towards a conduct consistent with its specifications.

Maieutic knowledge unfolds thus as a form of practice implying the transformation of the subject involved in its elaboration. Through continuous questioning and answering, maieutics enables the questioning soul to generate what she/he already knows and possibly, at a further stage, presents discursively the knowledge it gave birth to. For the soul to be ready, it is necessary to have a preliminary-cleansing work addressing errors, false beliefs, stereotypes, and prejudices; for achieving this purpose, Socrates uses the elenchus (refutation). The elenchus articulates two moments: firstly, the thesis of the interlocutor is analyzed; secondly, objections are proposed. Examination and objections are strictly interconnected – given their mutual dependency, the elenchus can be defined as a refuting process which tends to generate a positive thesis. The moment of analysis enables the individuation of contradictions intrinsic in the thesis, a process automatically resulting in its negation. The logical movement bringing to the negation of falsity is always accompanied, in the Socratic method, by a psychological movement through which the interlocutor subjectivizes the contradictory character of his/her argument. If this moment of awareness (moment of negativity) is lacking, the elenchus is *ineffective* (see Candiotta 2015), and it cannot support the second phase of Socratic maieutics, namely, the production of a positive thesis (the passage of the Plato's sophist describing the noble sophistic is enlightening in this sense, cf. Plat., *Soph.* 230 b4–d4).

The Practical Relevance of the Dialogue Topic

The second key feature of the Socratic method is its ethical, political, and educational relevance. The topics debated by Socrates and his interlocutors in the first Platonic dialogues establish always a strict connection between working on one's self and improving the life of the polis. Socrates urges the subject to take care of his soul in order to be good, beautiful, and just (for a contemporary reading of this theme, cf. M. Foucault (2001)). The pedagogic valence of the Socratic method builds upon this basis: philosophical research is a pedagogical modality which Socrates shapes in order to enable his interlocutors to improve. From this perspective, it is possible to affirm, with Pierre Hadot (1995, 2002), that philosophical research, in its dialogic form, is Socrates' and Plato's main spiritual exercise. Furthermore, the debated themes are always interesting for the interlocutor: the examples adopted by Socrates are interesting for him/her as they always relate to his/her daily life. It is no coincidence then if in the *Laches*, where the interlocutors are two strategists, the argument is courage, or if in the *Charmides*, where the interlocutors are two figures that will play an important historical role in Athenian politics (*Critias* and *Charmides*), the primary emphasis is on temperance. Socrates and Plato, in fact, considered temperance as a necessary skill for a good politician. However, these considerations imply neither that Socratic dialogues are always successful nor a constant openness on the part of Socrates' interlocutors – quite the contrary. For instance, in *Gorgias* it is possible to notice both ferocious defenses by the interlocutor and violent refutations by Socrates. In my opinion, this signals Socrates' and Plato's interest in criticizing the political situation of the time through a refutation of its representatives. By refuting Callicles, Socrates demonstrates his inadequacy to the audience; Socrates is aware that Callicles is not willing to be "purified" and thus directs his elenctic action towards the public attending the debate (see Candiotta 2014).

The Collaboration of Interlocutors and Their Partaking in “a Philosophical Form of Life”

The third main feature concerns the type of relation which develops between Socrates and his interlocutors. (Elsewhere, I called this particular process “retroactive extended elenchus.” To approach this theme more in detail, cf. Candiotta (2012b, 2015).) On the one hand, Socrates emphasizes that the interlocutors must collaborate towards a common goal (unveiling truth), rather than asserting their preeminence through a kind of dialogical fight (this aspect marks a crucial difference from sophistry). Philosophical research enacted through dialogue is thus a joint research, unfolding in a collective context towards collective goals. This communitarian aspect is not accidental, but a central prerequisite and instrument of orientation without which the research could not be successful, not even at a gnoseological level. Of course, it is possible to think alone; however in this case, it is always necessary to test dialogically the correctness of what has been thought. In general terms, apart from this case, Socrates emphasizes how the truth can be discovered maieutically only through dialogue, thus through a shared dimension of research – even if the moment in which the truth is grasped is individual and cannot be completely presented at a linguistic level. These various facets of the Socratic method are clearly delineated in Plato’s *Seventh Letter* (Plato, *Seventh Letter*, 340b–345c), where the author underlines that philosophical research through dialogue is fruitful only if the subjects involved in the dialogue partake in a common form of life, a philosophical form of life, and the achievement of knowledge is a sudden event taking place in the soul of the person involved in the dialogical activity. A fundamental nexus is thus established between community and self-knowledge – intending with self-knowledge an intellectual achievement which is not an end in itself but, again, oriented towards the communitarian aspect of the common good.

For Plato, philosophy operates within a social network where the example and teaching of a single person cannot suffice. The whole community must practice philosophy. Not only political action supported by philosophy, but philosophical

knowledge itself requires a communitarian dimension. Also the aspect concerning *theoria* has to do with what is common rather than individual. Plato argues in fact that philosophical knowledge emerges in the individual soul, thanks to the dialogue among people who share a given form of life and which are constantly in contact with each other.

There neither is nor ever will be a treatise of mine on the subject [philosophy]. For it does not admit of exposition like other branches of knowledge; but after much converse about the matter itself and a life lived together, suddenly a light, as it were, is kindled in one soul by a flame that leaps to it from another, and thereafter sustains itself. (Plato, *Seventh Letter*, 341c4–d2)

The truth is grasped by each person by dialoguing with oneself and others. Truth is never possessed and achieved by a single individual: it cannot be grasped independently from dialogical interaction except in rare cases, and even such cases require a proof of their veridicity which can only be obtained within a discursive setting.

However, differently from Dionysius, they were aware that those [insights acquired through dialogue] were not their own thoughts, but a “possession shared amongst friends” of the Academy, emerged through that admirable exchange of spiritual energies implying giving and receiving; in the mediation of acting and experimenting, which establishes the academia as the highest form and eternal model of any community of culture, education and life, the quintessence of any community of men bound by a reciprocal understanding. (Stenzel 1966, p. 302 (my translation))

Only an adequate preparation or propaedeutic can lit the flame of philosophical knowledge. This propaedeutic is obtained on the one hand through a form of communitarian life, where interests and philosophical discussions are shared and, on the other hand, through a quotidian individual study and through the radical choice to live a specific form of life – namely, a philosophical one. It is crucial to emphasize how, from this perspective, the highest forms of philosophical knowledge depend, on the one hand, on markedly material circumstances – to live in a specific place, with certain people, and during a given span of time – and on the other hand, on aspects which refer to a personal choice. Philosophical

knowledge cannot be enclosed in a dogmatic definition as it emerges in a particular “shape,” con-substantial with a relational-dialogic context. On the other hand, the relation ensuing between Socrates qua proponent of maieutics and his interlocutors is asymmetrical. Socrates, although reiterating his lack of knowledge, guides his interlocutor towards prefixed avenues of inquiry, singles out viable paths through fictitious questions (Longo 2000), causes paradoxes and aporias to expose errors, and orientates the research towards themes that bring into question the whole being of his interlocutor. Socrates is thus a guide that knows where to lead his interlocutor, even if he does not know exactly which type of knowledge such interlocutor will be able to attain. The asymmetry between Socrates maieutician and his interlocutors is different from the traditional asymmetry that exists in the relationship between teacher and disciple, where the teacher transmits a specific range of knowledge to the disciple. The asymmetry between Socrates and his interlocutors is underlined by Socrates’ solid methodological knowledge and in his role as a guide throughout the research journey. In this sense, Socrates’ approach differs both from the dogmatic knowledge typically transmitted by the traditional teacher and from the sophists’ conception of dialogue as deployment of dialectical weaponry functional to subdue the interlocutors.

The Use of Rhetorical Strategies in the Dialogue

In recent years, however, it has been pointed out (Kohan 2009; Rossetti 2011b) how Socrates does not really listen to his interlocutors. Not unlike the sophists, Socrates makes use of a number of strategies to control the dialogue. Such strategies are the fourth fundamental characteristic of the Socratic dialogue. Livio Rossetti furthers this thread of analysis by emphasizing how the emotional style adopted by Socrates was intended to corner his interlocutor. It is interesting, however, to understand why Socrates deemed useful to push the interlocutor in difficult positions. Arguably, the strategy which effected emotions was functional for what Socrates aimed to elicit in the interlocutor (and in the public): not a

substantive doctrine but the awareness of contradictions. The emotional preparation, creating a particular atmosphere, was functional to the interiorization of a specific dilemma or latent problem. This process could bring the subject to live a liberating emotion able of disclosing unexpected perspectives. Rossetti points out that the effectiveness of the Socratic dialogue does not rest on the strength of the proposed arguments (they are often incomplete or erroneous), but in rhetorical techniques which display, among other things, a sapient use of emotions. Moreover, Socrates used to ridicule interlocutors and often enacted violent patterns of refutation. When he was more lenient, he applied, at most, a paternalistic style.

Rossetti’s reading enables us to grasp the rhetorical strategies used by Socrates. These are specific dialogical modalities which aim to produce a given effect in the interlocutor. Some of them may appear similar to the ones employed by the sophists; however, in my perspective, their different purpose marks a cleavage between the two: for Socrates the ultimate aim of dialogical interaction is the improvement of the interlocutor (or the public), through the recognition of one’s errors and, possibly, the achievement of truth, while for the sophists the main goal is the agonistic defeat of the interlocutor as a way to obtain fame, honor, and glory. In fact, the Socratic asking invites constantly the interlocutor to question him-/herself within a perspective of “self-knowledge” and care of the self.

The Self-Improvement of the Interlocutors as the Purpose of the Dialogue

The model of philosophy proposed by Socrates is thus consistent with the definition of philosophy as an art of life (Horn 1998), as daily practice enabling to live a dignified life, virtuous, and therefore happy. Through a philosophic interpretation of the Delphic maxim “know thyself,” Plato, through Socrates, establishes philosophy, and in particular philosophical dialogue, as the most profound form of education available to individuals and society.

This last aspect introduces a fifth characteristic, concerning the purpose of Socratic dialogue, and more specifically its gnoseological-ethical-

political purpose, aiming to improve both the individual and the polis that she/he inhabits. It is necessary to emphasize here that the figure of Socrates qua model of philosopher is crucial for the development of the ancient Socratic dialogue in its Platonic acceptance.

Socrates embodies the philosopher who does not know but is aware of his lack of knowledge. For this reason Socrates addresses those who think to possess knowledge; by declaring his ignorance, he forces them to question their knowledge and to recognize its lack of foundations. The beginning of any true research is in fact the awareness of one's own ignorance and the liberation from his/her own mistakes of judgment. Socrates defines his research method as follows, speaking in first person:

Of what sort am I? One of those who would be glad to be refuted if I say anything untrue, and glad to refute anyone else who might speak untruly; but just as glad, mind you, to be refuted as to refute, since I regard the former as the greater benefit, in proportion as it is a greater benefit for oneself to be delivered from the greatest evil than to deliver someone else. For I consider that a man cannot suffer any evil so great as a false opinion on the subjects of our actual argument. (Plato, *Gorgias*, 458a)

Socratic dialogue leads to aporia; however, aporia is not to be intended as a negative outcome – it rather exemplifies a first great dialogical conquest: the awareness of error, of not knowing. One main outcome of Socratic dialogue is thus an urgent need to continue researching, starting in the first place from a process of self-examination. By investigating the opinions of his interlocutors, Socrates enables them to call into questioning themselves and their own mode of life.

Nicias: You strike me as not being aware that, whoever comes into close contact with Socrates and has any talk with him face to face, is bound to be drawn round and round by him in the course of the argument—though it may have started at first on a quite different theme—and cannot stop until he is led into giving an account of himself, of the manner in which [188a] he now spends his days, and of the kind of life he has lived hitherto. (Plato, *Laches*, 187e–188a)

Socrates possesses a knowledge different from those paradigms which were conventional at the

time; it is not a theory which can be taught but rather a sapience immediately conducive to practice: the necessity to research and embody an ethical form of common life. Socrates does not aim to limit the discussion to concepts such as “good,” “fair,” “pious,” etc., but wishes that these concepts, once made available to the interlocutor by means of rational demonstration, become for him/her a form of life. Crucially, Socratic knowledge qua work on the self is an appeal to “being.” Socrates knows the value of moral action as such action is implied by his own choice, on his personal commitment, and on a personal urgency to improve, and this is possible only starting from the awareness of one's own errors.

Accordingly, Socratic knowledge is “knowing how to live.” The “art of living” is a mode of life oriented towards the good and animated by a constant strife to improve and to avoid errors; this attitude prevents the occurrence of evil to the person who has embraced this mode of existence.

...no evil can come to a good man either in life or after death. ... (Plato, *Apology*, 41d)

The Contemporary Method

Philosophical inquiry carried out as a dialogue or discussion is a philosophical practice that never disappeared and that in the last 40 years, thanks to a growing interest towards philosophical practices by nonphilosophers or specialists and beyond strictly epistemological concerns, produced (has been object of) a thriving experimentation in various fields and contexts – hence the emergence of various initiatives to practice philosophical dialogue collectively: philosophy for children, philosophy for community, café philo, etc.

Socratic dialogue can be included in this group of practices; during the twentieth century, it has been redesigned in several formulations and re-proposed by various schools with different purposes, not only philosophical. The method has been applied, especially in the Anglo-Saxon world, in psychotherapy (especially cognitivist paradigms), in legal settings, in context of conflict mediation, in health-care settings, in companies to

facilitate the achievement of common objectives, in schools, etc. Here I will provide a general outline of contemporary Socratic dialogue focusing in particular on its elaboration in the German context. Arguably, such elaboration is the variant that remains closer to the spirit of ancient Socratic dialogue, although differing from it in some respects.

The philosophical thread in question originated in Germany in the second decade of the twentieth century, thanks to the work of Leonard Nelson and his disciples Gustav Heckmann and Minna Specht. Methodologically, the starting point of Socratic dialogue is a question that interests the research group and that is supported by a number of concrete examples. Usually, a participant proposes a personal experience prompting a philosophical question, which is thereby proposed to the group as starting point for research. Questions are generally related to moral and ethical fields but can also refer to a gnoseological or ontological dimension.

The basic question is formulated according to the Socratic *ti esti*, “what is x?” But it can also assume different shapes. It is crucial, in order for a productive common research to take place, that the participants find the question interesting and somehow close to their personal experience (in this respect it is possible to detect a similarity between Socratic dialogue and the first rule of biographic-supportive communication (Madera and Tarca 2007), which refers to autobiography and to a type of first-person philosophy). The initial formulation of the question will therefore affect the whole course of the common inquiry.

Once the question is asked, participants examine examples drawn from concrete life experiences: the discussion focuses, firstly, on the situation proposed by the participant who formulated the question and, secondly, on other examples illustrated by other subjects participating in the dialogue. Starting from examples, philosophical research can produce a knowledge which is embodied, rather than abstract or distant from the experiences of the research participants. This process enables – as Socrates knew – an immediate involvement of interlocutors and the possibility of realizing the acquired knowledge in concrete

forms of life. From a gnoseological perspective, this process tends to privilege induction over deduction and to emphasize how knowledge – also in its theoretical, general, and even universal acception – can be discovered starting from sensible experience.

The discussion follows the exposition and analysis of examples. During this moment, the correctness of argumentative logic is emphasized and contradictions and fallacies are underlined, while the group strives to individuate shared axioms. Incidentally, it is necessary to point out here how main presuppositions of the method are both a kind of rationalism, a specific confidence in human beings’ rational capacity of achieving a form of coherent knowledge (a form of knowledge, itself rational), and a specific conception, typical of the modern age, of understanding truth in its logical-mathematical formulation. Contemporary philosophy highlighted the crisis of such model in different occasions. While the validity of such position is open to debate, it is arguably necessary to be aware that adopting the Socratic method implies assuming a certain epistemological paradigm, characterized by its own strength and limitations. Also in the ancient method, there was a tendency towards rationalism; however, for Socrates, the main emphasis is on the moral purpose of dialogical inquiry; Socrates was ready to set aside formal correctness if this could facilitate a moral improvement in the interlocutor (Dorion 2004). Anglo-Saxon commentators interested in Socratic dialogue, operating from an analytical perspective, often underscore logical inconsistencies in Socrates’ arguments. In my perspective, however, these inconsistencies signal how, for Socrates, logical correctness was a valid instrument, but not the ultimate goal of the dialogue. Accordingly, in specific occasions, it could be considered of secondary importance. Moreover, the “errors” were used with strategic purpose, assuming thus a rhetorical role.

In terms of the subjective disposition of the participant, Socratic dialogue requires an attitude of sincerity towards oneself and others, as well as trust in one’s own capacity of inquiry and in that of other participants. Socrates himself emphasized this aspect, pointing out how the attitude of the

interlocutor towards the inquiry and his guide was crucial to determine whether or not he could attain philosophical knowledge (Plato's *Gorgias* is exemplificative in this sense). In the dialogues written by Plato, we often find interlocutors who cannot achieve a productive attitude as they are perched on their positions, unwilling to admit their mistakes. They do not trust Socrates, believing that he aims to obtain a heuristic-agonistic victory rather than to help them. Plato describes these characters – mostly sophists, rhetoricians, orators, and politicians – in order to criticize Athenian society, demonstrating their low moral qualities and the way in which they pursue a life of fame, honor, and glory.

Moreover, Plato staged hostile interlocutors for emphasizing Socrates' figure. Socrates was the teacher whose main activity was to liberate his interlocutors from error through strategies which were at times violent and that affected their emotions and who subsequently guided them in the search for truth. Accordingly, in the ancient Socratic dialogue finding, hostile interlocutors were almost the norm.

The contemporary Socratic dialogue is, however, a freely chosen philosophical practice characterized by a form of symmetry among all the participants. Therefore, the abovementioned dynamics do not take place, except in the form of accidents due to participants' inability to maintain the required behavior. A positive disposition of the participants is thus a necessary prerequisite to implement the philosophical practice in question.

There is no figure like Socrates in the present Socratic dialogue. Within research groups, there is a moderator which acts more as a facilitator, rather than as a teacher or guide. His/her task is neither to orient discussion nor to intervene in relation to contents, but to verify that during each step of the research, participants proceed with order towards shared forms of knowledge – forms which are obtained through a progressive agreement concerning the various points under discussion. We could say that each participant has the task of playing Socrates' role both for him-/herself and for others.

It is thus possible to notice that the underlying assumptions of ancient and contemporary

Socratic dialogues are noticeably different. In the first one, the truth to be known is already ontologically posited, and the subjects participating in the dialogue follow a common path, punctuated by questions and answers, which leads them, thanks to an expert guide (Socrates), to approach truth maieutically. In the second case, the truth is not predetermined but constructed within the dialogical-linguistic context through an agreement between research participants. In the first case, Socrates does not necessarily listen to his interlocutors; in the second availability to listen, empathy and sharing are essential conditions. The journey undertaken by the subjects participating in contemporary Socratic dialogues is constructive, rather than revelatory. Ancient Socratic dialogue strove to achieve truth, while contemporary Socratic dialogue is in search of shared truths.

This fundamental difference – based on the role of the facilitator, the relation between facilitator and interlocutors, and the type of knowledge underpinning the entire process – depends on profound differences between the epochs and cultures in which these dialogic practices were implemented and between the overall conceptual frameworks of orientation animating their proponents.

Within the fourth-century Athens, Plato aimed to distance himself from the risks characterizing the emerging democracy – a political form which, in conjunction with the sophists' teachings, resulted for him in relativism and instability in the ontological, gnoseological, moral, and political fields. Against this risk, Plato constructed Socratic dialogues having as main point of reference a stable and universal ontology, which could support stable ethical and political instances. The 1920s in Germany, conversely, are characterized by the emergence of National Socialism, and Socratic dialogue was intended by Nelson as a practice of freedom, resistance, and democratic struggle against dictatorial and totalitarian tendencies.

The cultural and political backgrounds are thus extremely different and in some ways opposite. This is, in my opinion, the main reason behind the methodological difference separating ancient and contemporary forms of Socratic dialogue. In both cases, however, the dialogical practice was experienced as an activity which enabled a space of

opposition vis-à-vis the dominant ideology of the times, thus the emergence of critical and autonomous thinking in the people participating in the dialogue.

The Socratic dialogue of German mold, not unlike the ancient Socratic dialogue handed down by Plato, is characterized by a marked political and pedagogical valence, an aspect that in other contemporary formulations of Socratic dialogue is not equally central.

Accordingly, in spite of the abovementioned substantial differences between the ancient method and the contemporary German approach, the latter can be considered as the worthiest heir of the spirit and attitude animating the former. Arguably, present forms adopting the Socratic method instrumentally, without a political and pedagogical background and using the method as a self-referential communicative strategy rather than as a pathway to improvement where the logical dimension is subordinated to the moral dimension involving the participants, risk in some cases to be closer to the method of the sophists than to that of Socrates.

Students Who Want Banking Education and Related Challenges to Problem-Posing Education

Liz Jackson

University of Hong Kong, Hong Kong, China

Introduction

In *Pedagogy of the Oppressed* and other works, Paulo Freire conceives education as a political act that takes place in contexts marked by unequal power relations. His elaborations of these views and their pedagogical implications have influenced generations of educators who have sought to liberate or empower their students to reconstruct and enhance society through teaching and learning processes. In particular, Freire's concept of "banking" versus "problem-posing" education illustrates how ideology frames practices in schooling (Freire 1970/2000). According to this view, the banking educator spoon-feeds so-called objective, abstract knowledge to students, and the students are responsible only for memorizing and reiterating the educational "truth" back to instructors. On the other hand, the problem-posing educator works hand in hand with students more as equals, to collaboratively identify problems in society that matter to both parties and generate solutions to improve spiritual and material life for all members of society. Although Freire cautioned against the possibly uncritical export of his views to global contexts that might contrast significantly with the Brazilian settings, he himself primarily

worked within (Freire 2005), this framing of education as a relationship of power between students and teachers can be seen to undergird contemporary pedagogical trends around the world, echoed in such discourses as experiential learning and student-centered and outcome-based education.

Given the popular interest in progressive education in philosophy of education worldwide, much recent research has explored how different aspects of Freire's work can help enhance education in diverse cultural, political, and geographical contexts (see, for instance, Peters and Besley 2015). Outside of Freire's Brazil, settings marked by colonialism and/or mass oppression and inequality of indigenous populations are particularly explored in such work, given that decolonization of society through empowerment of students and communities is one of Freire's major themes. Yet in considering Freire's work in such diverse environments, interesting counter-examples and complexities have been identified in implementing Freirean problem-posing education. In particular, recognizing students as equals and valuing their views and interests are essential to a Freirean approach to pedagogy. Yet some innovators have observed challenges in realizing these ideas in global classrooms, which are related to students' expressed or apparent interests in passive transmission-style education, aimed at neutral facts and objective knowledge. This can lead a Freirean educator to ask what pedagogy "for the oppressed" entails in practice, where students claim to want a kind of banking education! In other contexts, the power relationship between teachers and students is more complex than that portrayed initially in the dichotomy of banking versus problem-posing education.

This entry focuses on challenges contemporary educators and philosophers of education have observed in implementing a kind of empowering student-centered, anti-banking education aligned with Freire's thought. It also considers the role of hope in Freire's work. The aim of this entry is not to suggest a singular resolution to conceptual and practical difficulties educators face today but to draw attention to complexities of Freirean themes and explore how a progressive Freirean educator might round out their critical understanding of

Freire's views and their educational implications in relation to some major predicaments in contemporary pedagogy and education.

The Paradox of Students Wanting Banking Education

Pedagogy of the Oppressed (Freire 1970/2000) elaborates how the inequality and oppression of students in authoring schooling experiences leads to their systematic disadvantage over time. Freire describes banking education on political, relational, and epistemological levels (1970/2000). First, banking education is *politically* aligned with the interests of the elite or privileged in society in Freire's view. While students and the mass of disadvantaged members of society have little say regarding curricular content, pedagogy, or learning goals or outcomes, banking education reflects the will of powerful members of society, who wish to keep the status quo of inequity and oppression in place. In terms of *relations*, unequal power positions are embodied through the teaching-centered classroom environment. The teacher and his or her thoughts and views are at the center or the "front" of classroom focus, and thus that of student aspirations and labor, as Freire observes. Students face the teacher as individuals, and the teacher has a one-to-one relationship with each student, wherein the teacher assesses each student according to top-down standards. Students stand in relation to one another only as competitors in a material context in banking education. Knowledge, it follows, is used nearly as a tool against students, against their collective flourishing. Schooling does not normally empower them as a community, as Freire sees it, but serves to maintain the unequal political-economic status quo, although it is expressed as neutral and objective.

Student-centered, problem-posing education, or "pedagogy of the oppressed," is the opposite: students should have an equal say in education's goals and features, *their* experiences and values are the focus of practice, and *their* views, in acts of constructing meaningful collective understanding, are conceived as valuable knowledge.

Though *Pedagogy of the Oppressed* has a clear Marxist sociopolitical orientation, focused on class conflict, that is not palatable across all contemporary contexts today, its student-centered educational perspective has resonated quite broadly with many theorists and teachers across diverse societies in recent decades. Its influence can be seen in student-centered statements on pedagogy, echoed in national- and international-level policy documents, that regard classrooms where students are active in social construction of knowledge and where their interests and background experiences are considered as more productive to enhance learning (Jackson 2015). Such statements reflect the recent popularity of the view that empowering learners entails listening to and considering them fully as humans, in contrast to traditional teacher-centered approaches that trace the banking-education classroom power relation.

However, many educators also observe today how pedagogical concerns can get split from curricular and measurement issues in contemporary education, maintaining schooling environments that are not entirely student-centered from a Freirean view, though they are described as student centered in reform discourse. They observe that content knowledge is, across a great variety of educational settings worldwide, rarely developed by students or teachers in local, as Freirean endorsed. Instead, across diverse setting standards are organized increasingly at an international level, to enhance educational accountability and transferability and mobility across systems (Rizvi and Lingard 2010; Berman et al. 2007). Furthermore, in so-called student-centered contexts, teachers can be seen as accountable and therefore as the key focus for scrutiny and intervention (such as through professional development processes), rather than students. Unlike the basic banking education framework which casts teachers as powerful and students as powerless, teachers also report feeling like pawns in this case! They are held to account, like their students, to higher-ups from this alternative standpoint. As their success or performance hinges in part on the work of students, some suggest that the assumed power relationship of teacher and student in the banking-education formula is inverted

in contemporary student-centered education (Jackson 2015).

Furthermore, Freire's own view of the teacher-student relationship in everyday educational spaces is less binary than the basic framing of the two in banking education initially suggests. In *Pedagogy of the Oppressed*, Freire notes that so-called oppressors are also victims of dehumanization, as the oppressed are, within oppressive systems. For the empowerment of both, the liberation of the oppressed is essential. Yet this liberation does not depend on liberation by oppressors but by their self-emancipation, as Freire contends. This liberation, authored by the oppressed (in a new harmony with former oppressors), has an empowering and humanizing impact on both. In later works (2005), Freire also observes that complicated and inverse power dynamics can be found in classrooms between middle-class teachers and elite students, reflecting a nuanced view of learning relations in education, rather than a simple binary approach.

Major challenges for practicing problem-posing education follow from the recognition that teachers are not all powerful in designing education and enhancing educational opportunities. In contexts where banking education has been commonly used, educators may struggle with balancing power relations. On the one hand, Freire's theory suggests that one must strive to change him or herself through envisioning a new kind of classroom climate, as a teacher may not have experienced liberatory education as a student. A related situation is faced by Freirean professors and teacher educators, who may struggle to persuade teacher education students to see a student-centered practice as feasible (see Budge 2015; Neumann 2015). People tend to view as essential to education features from their own school experience. If a teacher experienced a teacher centered or banking model of education as a student, he or she may feel uncomfortable with implementing a different style in his or her own class. He or she may fear a new approach does not count as proper education, as has been seen among teachers facing various educational reforms generally. On the other hand, a framework where students are active in constructing

knowledge and generating social problems and solutions also depends more on students' willingness and ability to express their views. Thus, educational reformers in diverse contexts note that changing pedagogy in the course of an individual's overall formal education can be met with (perhaps unwitting) resistance from the student. If students do not count their views as knowledge or valuable due to their past educational experiences, this may fuel resistance.

There are also situations where teachers have less power than students in the first place in the educational system, contrary to the view that banking education is the *de facto* state in schooling. Teachers may feel at the mercy of students as the latter's achievement in standardized tests increasingly is used to measure their own work performance. Alternatively, there are cases where students may resist teacher authority and knowledge, having greater political or material power in society. The discourse of student-centered versus teacher-centered education (banking vs. problem-posing education) supposes that teachers are powerful within a society, but this does not hold true across societies worldwide nor within all segments of a society. In elite schools and in societies where many educators are relatively disadvantaged, teachers can face students refusing their knowledge, views, and/or pedagogies. As student-centered or problem-posing education is dependent upon active student participation, such students can reject problem-posing education in favor of banking education.

The United Arab Emirates has a context of empowered students who want banking education. In this society, local students are elites compared to migrant laborer teachers in schools (Jackson 2015). It is difficult to apply a Freirean framing here. When teachers are migrant laborers coming from outside the society, it is not straightforward that their particular pedagogies are aligned to appropriate visions of indigenous empowerment. Where cultural differences across host and sending countries are clear, local students may see it as in their interest to reject the influence of foreign or global interventions, in seeming alignment with a decolonization orientation as elaborated by Freire. In such a case, it would

seem that banking education could be demanded by students who want to resist undue outside cultural influence on their lives, while a problem-posing education is a globalist incursion on students who may not clearly experience harmful oppression or inequity (Jackson 2015).

This situation also brings to mind how problem-posing education ultimately requires more of students, intellectually and emotionally. Problem posing can make individuals vulnerable to despair, as real-life problems are complicated and hard to resolve. Such realizations can lead one to feel bleak regarding the impossibility of resolving problems once and for all (Roberts 2016). Problem posing in the classroom can also bring out conflicts across students, who may not all face or experience problems in similar ways. This creates more complex classroom dynamics than those in the contrasting, presumed neutral, teacher-centered classroom, for both students and teachers.

From a Freirean perspective, such labor may be worthwhile, to change society for the empowerment of all. Yet as Freire notes, students may be socialized before entering the problem-posing classroom toward banking-education attitudes about schooling and society. In this case, a teacher meets with their "false understanding of the world" (Freire 1970/2000). This also presents a problem for a progressive educator: if empowerment requires the equality of the teacher and students, relying on a dialogue where both parties' experiences, values, and interests are considered, is it reasonable or coherent for a Freirean educator to judge students' views as false or naïve? Acts of authoritarian judgment of, and the desire to correct, false understanding risk retracing the traditional, banking view, wherein the teacher knows best. How an educator can encourage students, without exerting undue will, thus remains a challenge for many Freirean educators and philosophers of education in conceiving of and practicing problem-posing education.

Freire writes of these and other challenges without offering anything like a recipe to resolve them (1997). In light of such concerns, he does encourage educators to remain *hopeful* in the quest for education as a liberatory act of societal reconstruction. In Freire's writings, hope can be

seen as an essential element in the quest for humanization that he regarded as part of what it means to be a human, unfinished and not determined (Roberts 2016). Freire saw problem posing and human desire to resolve problems through increasing understanding as natural parts of what it means to be human. The processes of dialogue, accompanied by the ongoing practice of dialogic virtues of compassion and empathy, humility, open-mindedness, and honesty, always have as its purpose problem posing and problem exploration in Freire's view. Starting a dialogue that aims to enhance mutual understanding is therefore more critical to humanization and mutual empowerment of educators and students from a Freirean perspective than alleviating false consciousness authoritatively.

Some, including Freire himself, have suggested that faith is implied in such processes. There is no guide or linear progression. Freire would assert that such a notion is contrary to problem posing within authentic contexts that is essential to pedagogy for liberation. Rather, there is a process of increasing mutual understanding around issues of social significance that leads to some exploration of what can be done in the future, as well as identification of further problems and challenges. When faced with the difficulties of implementing problem-posing education in tough circumstances, teachers pursuing dialogue for better understanding of the context at hand, including their students as individuals and their lives, may find that they need to rely on hope and faith. Such hope and faith are seen from a Freirean view as more human or natural alternatives to cynical reversion to banking education, for example, or giving in to student desires. Such "advice" (to have hope. . .) might not be seen as practical to the most proactive educational reformer or innovator, who wishes to turn things upside down in the classroom at a rapid pace. Yet Freire did not see reversing the status quo or token reaction as solutions to the challenges of education in society, in his work. As humanization and empowerment are relational, having hope and encouraging hope in others can be seen from a Freirean lens as more

modest first steps toward an appropriately reconstructive form of education

Freire's philosophy of education has inspired educators around the world, and his model of banking versus problem-posing education has had a particular impact, as the former model resonates with many people's own educational experiences, while the latter symbolizes a conceivable educational utopia. Yet despite its attractiveness in the abstract, the model of pedagogy for the oppressed and problem-posing education can be quite difficult to implement in classrooms. It is not just a matter of educators handing over power in contemporary education but of both educators and students gaining greater power over their lives and labor. As a utopian vision, it can be challenging to implement a kind of education one has not experienced or to participate in it as a student with contrasting past experiences. Finally, students and educators may retain attraction to banking education for a host of pragmatic reasons: it is easier, more comfortable, less risky, and less emotionally and intellectually taxing. This raises a question of how educators can implement problem-posing education when students may express desire for banking education, which seems to paradoxically demand that teachers use banking education to respect students within a problem-posing orientation! Though Freire offers no recipes, the importance of hope in educational endeavors remains vital in such impasses, according to a Freirean view. As we are not finished beings but possess hope as essential to our quest for humanization, exploring possibilities relationally remains important despite such major challenges.

Introduction

In this entry, we consider how the transition to a healthy society existing on an ecologically viable Earth requires committed, critical, and competent citizens whose education enables them to aspire to values that are not purely based on the material side of their existence but also on care for fellow human beings and, indeed, other species, here and elsewhere, now and in the future. From this perspective, sustainability is primarily viewed as a driver of educational innovation, and education as a driver of sustainability. More specifically, sustainability is held to be an emerging property of an ongoing learning process, rather than an agreed upon outcome that can be comfortably and authoritatively prescribed, transferred, or taught. Examples of the possibilities and limitations of education and learning in addressing the key sustainability issues of our time are also introduced, highlighting the significance of *Bildung*, wicked problems, and whole-of-institution approaches.

Sustainability: What Does Education Have to Do with It?

Despite over 40 years of effort to promote and develop environmental education (EE), and over 20 years of the equivalent for education for sustainable development (ESD), educational philosophy, theory, policy, or practice has not been sufficiently reoriented to serve the well-being of people and planet. Unsurprisingly, forces to ensure that education services economic needs prevail, e.g., by positioning young people as flexible workers who switch jobs in line with changing economic demands (Nussbaum 2010). As a result, education has, in many instances, been governed by the global economic climate, rather than become a field of activity that also addresses the ecological climate, that is, fosters the means to become more human and more sustainable.

This is despite the growing recognition in society that sustainability concerns need to come into focus in education, even if it is not so clear how to do this. In part, this is a result of what we might call the nature of sustainability and associated challenges. On the one hand, sustainability is urgent, yet on the other, it is inevitably unknown and unknowable. Furthermore, it remains a contested concept both normatively and scientifically (although there is increased consensus within the scientific community about the rapidly declining state of the planet). This is compounded in the case of sustainable *development*, as some groups in society consider the suggestion that we must always develop to be highly problematic and inherently unsustainable. Equally, the relationship between education and development is a continuous subject of debate (McCowan and Unterhalter 2015). So key questions to be asked include: Should education always lead to development? And are all forms of development appropriate for all, including all species?

Within the field of educational philosophy and theory, leading scholars such as Martha Nussbaum, Michael Apple, and Gert Biesta, who paid little attention to global sustainability challenges early on in their careers, are beginning to address such questions. They are now strong advocates for strengthening the role of education

in co-creating more equitable, democratic, responsible, and meaningful ways of living (see Apple 2010; Biesta 2014, and Nussbaum 2010). In this essay, we consider key parameters for these and other responses.

Sustainable Development and Sustainability: Hopelessly Ill-Defined or Attractively Vague?

While there is very little reasonable doubt about the seriousness of the global socio-ecological challenges threatening our planet, there is a lot of *unreasonable* doubt around such topics as climate change, intentionally created by interest groups seeking to maintain current unhealthy systems. Citizens and, indeed, many educators and policy-makers, among them, can find themselves confused and caught in the middle, often defaulting to the everyday routines and systems they are accustomed to in their personal and professional lives.

Nonetheless, the existence of diverse definitions and interpretations of various sustainability-related notions in different contexts may be inevitable and furthermore desirable. From the perspective of education, the view that sustainable development is something that requires continuous learning in order to find out what works best within a given context and given with what we know today is an interesting one: sustainable development as a journey, rather than a destination (Scott and Gough 2004). However, the ill-definedness, contestation, and confusion connected with such terms can easily become an excuse to not engage with sustainability in education. This might be a risky response as emerging sustainability challenges are too important to be ignored by educators, most recently and forcefully expressed in the UN's Sustainable Development Goals. For those who do want to engage, there are a number of educational challenges to grapple with.

First, the growing urgency may require quick instrumental responses to change people's lifestyles and behaviors. In the extreme, these could lead to an eco-totalitarian society where education

is one of several “tools” to be used instrumentally. This instrumental response might be considered problematic when education is seen as *Bildung* (Biesta 2014). *Bildung* usually refers to semiautonomous learning processes that enable people to become human through their own exploration, discovery, and interaction with and in the world, mindful of its possibilities and constraints (physically, socially, morally, ecologically, economically, culturally). In EE, and more recently in ESD, such a perspective is referred to as an emancipatory perspective, where the nature of the sustainability crisis calls for a rethinking of values, reconnecting people with places, and leading meaningful, ethical, morally defensible, and globally responsible lives. Here education is about enabling people to deal with, among other things, complexity, uncertainty, ambiguity, and loss of identity and sense of place, in a meaningful, ethical, and caring way (on the latter, see Noddings 2005). From an emancipatory point of view, education is not an instrument to be used to prescribe certain behaviors or inculcate certain values, but rather a means for meaningful engagement, making deliberate choices, and for relating and connecting with the world on both human and more-than-human grounds.

At the same time, there are more socio-critical perspectives that call for critique, disruption, and transformation, and developing people’s capacities to contribute to all three. Education, it is argued, needs to enable and empower people to question and even disrupt unsustainable patterns (abuse of power, exploitation, marginalization) and systems (capitalism with built-in inequities and a focus on growth and expansion), while simultaneously exploring new ones that are based on healthier relations between people and between people and planet.

Perhaps from an “educative” point of view, it may be more generative to consider sustainability as an emergent and continuously redefined and recalibrated property. This reconceptualization needs to occur within and is a function of the physical boundaries (e.g., the Earth’s “biocapacity”) and social boundaries (e.g., limits of democracy and participation). In fact, Biesta (2014) argues that we cannot always focus on

personal growth and development as if this is an infinite possibility: we must also learn to live with constraints and within boundaries and learn to live meaningful, fulfilling, and responsible lives within inevitable limitations. In a sense, the seminal “Limits to Growth” warning from the Club of Rome in the early 1970s not only applies to economic development but also to human development, and perhaps, any form of development. This position does not match well with prevailing innovation, development, and growth discourse.

The Difficulty of Reorienting Education

That educational systems have hardly engaged with sustainability is hardly surprising when considering the everyday reality of schooling (Wals and Dillon 2015). Three widely reported global trends are particularly unhelpful:

1. Teachers are held accountable for the performance of their students in international comparisons such as the Programme for International Student Assessment (PISA), which focus on literacy, numeracy, and science, making it difficult for them to engage in something as ill-defined as “sustainability.”
2. People, including pupils and students, spend many waking hours gazing at an electronic screen looking for instant gratification and quick responses, even during school hours. This makes it hard to develop a sense of place and to connect more deeply with the complex issues of sustainability affecting our world.
3. Although, not officially and often subliminally, educational institutions are increasingly seen as the manufacturing sites for the “human capital” needed to serve the economy. They are also treated as places where the seeds of consumerism can be planted from an early age, as seen in the growing influence of commercial interests shaping education systems.

Nonetheless, there are parts of the world where there is space for teaching and learning in a more sustainability-oriented education system. Several factors, often in combination, seem to be critical

for such an education to occur, including (Wals and Dillon 2015):

- Space for a localized curriculum;
- A school ethos conducive to connectivity and place-based learning
- A culture of reflexivity as opposed to a culture of accountability
- A local community concerned about sustainability
- The vision, leadership, and capacities of key educators

It may come as a surprise to find there are countries where the entire school system has adapted to the challenges of teaching for sustainability while also doing well on international comparisons. Finland is one such example where schools are permitted to develop their own localized curricula working on existentially relevant issues without losing sight of the so-called basics. It helps, of course, that in Finland, teachers have a high status in society, are well paid, and are encouraged to research their own practice. A key question then is whether the nature of sustainability, both conceptually and empirically, calls for a particular pedagogical and didactical orientation, and a particular way of schooling.

Sustainability Pedagogy

Sustainability pedagogy is hardly referred to in current discourses on education and learning. But in linking with the earlier referred to as a *Bildung* orientation as an appropriate orientation to emancipatory education, it is useful to reflect on what sustainability pedagogy might entail. Pedagogy in general refers to the creation of spaces (emotional, social, and physical) that are conducive for learners to develop, become, and be in the world. Sustainability pedagogy adds to this a normative orientation that presupposes a certain way of developing, becoming, and being in the world in light of certain expectations (e.g., about living together, what is fair, just and democratic) and inevitable constraints (e.g., the fragility of eco-systems and limits to the carrying capacity

of the Earth). There are some clues available about what such pedagogy might entail, based on critical pedagogy and place-based pedagogy, but also on earlier work done in the field of environmental education. These suggest that such pedagogy would need to be:

- Relational (allowing for caring for and connecting with people, places, other species, etc.), critical (allowing for critique and questioning),
- “Actional” (allowing for agency and creating change), ethical (opening up spaces for ethical considerations and moral dilemmas),
- Political (confrontational, transgressive and disruptive of routines, systems and structures when deemed appropriate).

Sustainability Didactics

Sustainability, as an inevitably ill-defined and ill-structured concept, poses didactical challenges too. Sustainability represents what some refer to as *wicked problems*. These defy definition, have no single solution that works always and everywhere, are marinated in ambiguity, and are submerged in conflicts of interest among multiple stakeholders. Sustainability, in a sense, cannot be taught. At best, teachers can create environments that are conducive to the exploration of sustainability issues around climate change, poverty, food security, biodiversity, and so on. As such, teaching *about* as well as *for* sustainability also becomes an educational design challenge.

Given this, there is a need to develop a new didactical orientation that enables learners to grapple with wicked problems. It requires teaching and learning and the design of learning environments or spaces that enable learners to:

- See the world more holistically through, for instance, systems thinking
- See the local manifestations of global phenomena but also the global manifestations of their own choices and actions
- Consider different perspectives (e.g., past-present-future but also to consider short- and

- long-term effects, through the eyes of others, other species and the more-than-human world)
- Deal with complexity and uncertainty, not with the aim of reducing them but rather with the aim of making it generative for reflection and continuous learning
- Navigate socio-scientific disputes, anticipate probable futures, and imagine and articulate more desirable ones
- Move beyond awareness and the threat of paralysis by actively involving them in change and transformation
- Reflect on and discuss values, ethics, and moral dilemmas

Sustainability didactics can be developed within distinct traditional subject areas (e.g., within Mathematics) or can become a cross-cutting approach that integrates or transcends specific approaches that align with the traditional academic disciplines.

Schooling for Sustainability: Boundary Crossing and Whole School Approaches

One way to work on sustainability competencies and outcomes in a meaningful and integrated way is to take existential or “real” sustainability issues as a starting point for teaching and learning, advancing more reflective ways of thinking while also engaging learners in change and transformation. A so-called whole-of-institution approach to sustainability is a good example of simultaneously creating more responsive and responsible teaching and learning, improving health and environment in and around the school, strengthening school-community relationships, and creating space for participation and transformation. Such an approach implies a different way of designing spaces for learning, in that it allows for boundary crossing between different disciplines, perspectives, interests, and values. Research on the impact of whole-of-institution approaches in the UK suggests that such an approach has the potential to improve the school ethos, the quality of both health, and students’ learning and reduces the school’s ecological

footprint (Barratt Hacking et al. 2010). However, a recent Australian study points out a range of problematic aspects, such as when impact is foregrounded over educational priorities and concerns, and factors that bring about influence on sustainability and educational outcomes are not understood transparently and ethically (Rickinson et al. 2016).

Nevertheless, sustainability education can be seen as a mechanism for capacity-building and the creation of so-called vital coalitions or partnerships to enable citizens, young and old, to determine together what it takes to move from their current ways of living. These typically rely on consumption, continuous growth, and technology, at the expense of more sustainable ways of living that not only meet economic needs but also and foremost, address the needs of people and planet (Noddings 2005). Multiple actors are brought together in the context of addressing a common sustainability challenge, using a blend of learning processes (for instance, discovery learning, joint fact finding, problem-based learning, social learning, interdisciplinary learning, place-based learning) in order to bring about real, meaningful, and responsible change, with people and planet in mind (Biesta 2014).

Concluding Remarks

At its heart, sustainability has something to do with an ability to sustain. But *what* to sustain? *what for?* and *how?* are critical questions that are not easily answered, particularly as the world changes rapidly. Knowledge quickly becomes obsolete and values and interests shift, as do the powers that drive them – through, as well as despite, education. The indeterminacy of sustainability, coupled with the normative position of having a moral responsibility of taking care of people and planet in a way that enables quality and dignified lives for all – including nonhuman species – now and in the future, calls for new and renewed forms of learning, learning spaces, and learning environments. When sustainability is considered an emerging property of an ongoing learning process, a key focus needs to be on the

spaces (physical, social, cultural, and psychological) and the conditions (levers, barriers, support mechanisms) that allow for such learning to take place in the first instance. These learning spaces and conditions should allow for the critique and even subversion and disruption of existing frameworks, frames, institutions, rules of the game, procedures, and patterns that have been established over time, particularly in recognizing that these may have been useful in the times they were conceived but may turn out to be inherently unsustainable.

Thus by stressing disruptive capacity-building and transgressive learning (see also Lotz-Sisitka et al. 2015), the focus of education can shift away from learning to cope with the negative and disempowering effects of the current hegemonic ways of “producing,” “consuming,” and “living,” towards addressing root causes of unsustainability as part of the wider quest for morally defensible, ethical, and meaningful lives. As such, sustainability can become a driver of educational innovation in education, while simultaneously education and learning can become drivers of sustainability.

Taking Our Time: Slow Learning, Cautious Teaching

Richard Smith

Durham University, Durham, UK

In his later works, Wittgenstein offers some remarks that seem to point to the importance of slowness in various kinds of learning. A principal object of his interest is the making of progress in philosophy. In *Culture and Value* (1980, 80e), we read that philosophers should greet each other by saying “Take your time!” and that “In philosophy the winner of the race is the one who can run most slowly. Or: the one who gets to the winning post last” (34e). Wittgenstein notes that his own writing – his own “sentences,” as he puts it, which here must mean his philosophical writing – is “all to be read *slowly*” (57e, emphasis in original). His other remarks on the importance of slowness include, in the collection of fragments published as *Zettel*, the warning that “In philosophy we may not *terminate* a disease of thought. It must run its natural course, and *slow* cure is all important” (§ 382). The emphases are in the original: they seem themselves to enjoin a slow reading.

In this short chapter, I ask a number of questions. Why should philosophy necessarily be slow? We should not assume that the answer here is obvious, for example because the philosopher goes about constructing her arguments with

an unusual degree of care. Might what Wittgenstein writes here about progress in philosophy be true also of other forms of thoughtful apprehension and ratiocination? Yet I do not mean to attribute to Wittgenstein a theory of learning, still less a theory of all learning. That would go against the efforts he made in his later work to insist that he only made “investigations” (see the first sentence of his Preface to the *Philosophical Investigations* 1972, p. vii) and that he offered only “miscellaneous remarks” (*Vermischte Bemerkungen*). The edition of a translation of these under the title of *Culture and Value* is unfortunate in suggesting something more coherent, when the emphasis on “miscellaneous remarks” warns us neither to expect to find a systematic theory here nor, by implication, to construct one on the basis of them. It is nevertheless interesting to ask – to investigate – whether what Wittgenstein writes largely about the learning of philosophy may have some wider bearing. I shall do this by considering possible connections between “slowness” and some of Wittgenstein’s other central ideas, particularly the idea that art, rather than science, might be a model for understanding, and his well-known conception of philosophy as a kind of therapy. Why and in what ways might all this seem to require or involve a kind of slowness?

The reflections that I offer on these questions are lent topicality by the tendency of educational systems throughout the developed world today to emphasize the very opposite of slowness. “New and improved” education must instead constantly

be, as Fendler notes (2008), “faster, more powerful and longer lasting.” For instance, why should a university student not complete a bachelor’s degree in 2 years rather than 3? Such accelerated programs are usually designated “fast-track,” to trade on the associations of elite athletes or first-class train travel; at the same time advertisements tend to foreground the advantages of paying only 2 years’ worth of fees and entering the job market sooner (Staffordshire University n.d.). In education in schools, but now increasingly in higher education too, PISA (Programme for International Student Assessment) with the cooperation of the OECD (Organisation for Economic Co-operation and Development) is widely held to be responsible for the manic demands for quick solutions and immediate results. Its 3-year assessment cycle is blamed for causing “a shift of attention to short-term fixes designed to help a country quickly climb the rankings, despite research showing that enduring changes in education practice take decades, not a few years, to come to fruition” (Andrews et al. 2014). This leads to ignoring the “important role of non-educational factors, among which a nation’s socio-economic inequality is paramount. In many countries, including the US, inequality has dramatically increased over the past 15 years, explaining the widening educational gap between rich and poor which education reforms, no matter how sophisticated, are unlikely to redress” (ibid.). The first step toward a better understanding of nation states’ relative educational performance is clear: “slow down the testing juggernaut” (ibid.). The emphasis on “short-term fixes,” by contrast, leads to the desperate search for the philosopher’s stone of “accelerated learning,” versions of which generally rely on a few dubious or discredited shibboleths such as talk of “brain learning,” Howard Gardner’s theory of multiple intelligences, and the idea that we each possess a “personal learning style” (see Accelerated Learning Systems Limited 2001 for an example that includes all of these).

What does Wittgenstein mean by *slow* learning, then, and on what grounds does he value it? His remarks on this in *Culture and Value* occur in the context of reflections on art and especially poetry and music. At 34e, where we also find his remark

about the winner coming last to the winning post, he quotes Longfellow’s poem *The Builders*:

In the elder days of art
Builders wrought with greatest care
Each minute and unseen part,
For the gods are everywhere.

This stanza was so important to Wittgenstein that he considered adopting it as a motto for the *Philosophical Investigations* (Brenner 1999, p. 11). In fact the last line is not Longfellow’s: he wrote “For the gods see everywhere.” The alteration may be intentional (Baker and Hacker 2005, p. 32). Wittgenstein’s version of it strongly recalls a remark attributed to the early Greek philosopher, Heraclitus, usually quoted as “there are gods everywhere.” The next stanza seems to confirm that Wittgenstein had this in mind, whether he changed the wording in the previous stanza deliberately or unconsciously:

Let us do our work as well,
Both the unseen and the seen;
Make the house, where Gods may dwell,
Beautiful, entire, and clean.

It is worth recalling the context which supposedly occasioned Heraclitus’s famous remark. Some visitors had come to see the celebrated philosopher and were disconcerted to find him warming himself at his stove, as if such an everyday activity was incompatible with his status and reputation. The story is told by Aristotle (*De Partibus Animalium* I 5.645a15-23): Heraclitus “urged his visitors to come in without fear, for there were gods there too.” We might express this by saying he reminded them that the element of the sublime that they expected to find was indeed present in the room, in the most mundane particulars (Gregoric 2001). There is thus a nice irony in that Heraclitus denies them the kind of profound philosophical observation that they seek (of the sort that they could proudly relate to their friends back home) and in doing so offers them one worth their visit, if they have the wit to see it.

We are to take our time then, and run the race slowly, by being prepared to engage, to wrestle, with the details of the ideas that puzzle us – the “minute and unseen parts,” as it were – thinking

them through for ourselves rather than expecting to find, even to have served up to us, ready-made answers of a recognizably philosophical kind, or literary or historical kind depending on the context. We might compare Wittgenstein's insistence that philosophers have to "go the bloody *hard* way" (Rhees 1969, emphasis in original). The point is not that philosophy inevitably involves drudgery. It is more that going the hard way is essential in order to proceed against the tendency to seek comfort or stimulus (*ibid.*).

Although Wittgenstein instances only philosophy when he recommends the virtues of slowness, it is not difficult to think of everyday examples from formal education. We might imagine a class of sixth formers learning to read a poem: in this case one by James Fenton, whose title is *Nothing* (2013). It is necessary to include the poem here in full:

I take a jewel from a junk-shop tray
And wish I had a love to buy it for.
Nothing I choose will make you turn my way
Nothing I give will make you love me more.

I know that I've embarrassed you too long
And I'm ashamed to linger at your door.
Whatever I embark on will be wrong
Nothing I do will make you love me more.

I cannot work. I cannot read or write.
How can I frame a letter to implore.
Eloquence is a lie. The truth is trite.
Nothing I say will make you love me more.

So I replace the jewel in the tray
And laughingly pretend I'm far too poor.
Nothing I give, nothing I do or say,
Nothing I am will make you love me more.

It is no disrespect to the beginning student of poetry to say that she is likely to identify the speaker of the poem with the poet and to assume that the poet has been rejected by someone he or she is in love with. One Internet version encourages this, declaring that it is "a poem about unrequited love in honour of Valentine's day. James Fenton speaks of that simple, sad truth which most of us have to accept at some point in our lives – the fact that we just aren't wanted." The confident connection to Valentine's Day and to the alleged

"simple, sad truth" attempts to fix the meaning of the poem in place by nailing it to reality: as if the meaning of the poem could be fixed and grasped easily and, of course, quickly.

A slower and more attentive reader may notice a problem here. The speaker of the poem addresses someone he or she calls "you," and the second stanza indicates a relationship that has a past ("I've embarrassed you too long"), an unhappy present ("I'm ashamed to linger at your door"), and a future, even if it is an empty or frustrating one ("Whatever I embark on will be wrong"). These sound, we might think, like real pasts, presents, and futures. They encourage the identification of the speaker with the poet and the assumption that the poem is autobiographical. However, the literary figure of the lover shut out at the door of the beloved is one of the oldest in poetry, so common in the poetry of classical Rome and Greece that it has its own technical term: the *paraclausithyron* (Smith 2014).

Once the reader is alerted to the distinctively literary quality of the poem and is thus released from the expectation of finding a simple meaning located in autobiographical fact, she might notice and enjoy the paradox of a line of poetry that declares "I cannot work. I cannot read or write." She might even explore the possibility of a reading in which nothing will make the speaker more loved because he is already as loved as he can be: in which case he is not so much desperate at being wholly unloved but in search of the impossible guarantee of perfect love. In that case, so far from pitying himself for being unloved, he is gently laughing at himself (final stanza) for his search for that guarantee: and then the last two lines register his realization that he is loved as much as can be reasonably be hoped for.

One reader treats such explorations with impatience, wanting to nail down "the meaning" and move on. Another reader relishes the play of interpretation. Something similar is often the case in the study of history: one student expects to be able to conclude, fairly quickly and with a degree of finality, that Germany held or did not hold imperialistic ambitions in 1914 and these were (or were not) among the causes of the First World War. The more sophisticated historian

understands and even relishes the way that interpretations change, so that it is hardly possible to state with finality just what the causes of the First World War were.

A comparable contrast can be found in different approaches to the experience of art. On the one hand, there is the long contemplation and repeated revisiting of an artwork that yields dawning recognition of its complexities. On the other hand, to take a particular example, in 2014 Amsterdam's Rijksmuseum hosted an exhibition called "Art is Therapy." It was intended to show "what art can mean to visitors. And not so much from an (art-) historical point of view, but focusing rather on the therapeutic effect that art can have and the big questions in life that art can answer" (Rijksmuseum Amsterdam 2014). The usual labels, which often give little more than the name of the artist and the date of the painting, were variously replaced or upstaged by enormous yellow Post-it notes. For example, a painting of a tumultuous naval battle "is frank about pride in achievement," according to its accompanying Post-it, and stands as a reproof to our tamer and less spirited world where we often lack "the sheer courage and force of character" to see things through. The message is that "Goodness should be strong" (ibid.). Here everything there is to say about the painting is readily known in advance, without the need for any real engagement with it, without the effort and slow struggle of interpretation. The visitor only needs to glance at the Post-it and move on. It is not hard to see that the nature of teaching in the arts is at issue here (Smith 2015).

There is a familiar philosophical distinction between *Erklären* (explanation) and *Verstehen* (understanding) that registers much of the contrast sketched above. *Erklären* has its principal home in the natural sciences, as when we seek to explain the phenomenon of the rainbow. *Verstehen* points to the interpretative element in understanding a poem, painting, or indeed a person. While there should be no implication that explanation in the natural sciences is typically a quick matter, still less a rushed one, nevertheless an explanation that is arrived at speedily (an explanation of an outbreak of typhus, say) is clearly desirable; and once the correct explanation has been arrived at, there is

usually no need for further research, at least as far as the simple explanation of the particular phenomenon is concerned. Things are different with *Verstehen* or understanding. One's understanding of a poem or sculpture is always provisional or, in the title of this chapter, cautious: the reader may want to revise her interpretation of a particular poem or artifact at some point in the future, and another critic may offer an interpretation that she will concede is an improvement on her own.

One way to think of the difference between the earlier and the later Wittgenstein – roughly, between the author of the *Tractatus* and the author of the *Philosophical Investigations* – is that the earlier Wittgenstein is strongly inclined to take scientific and mathematical knowledge and its acquisition as the model for all knowledge and its acquisition. This is perhaps one reason why Wittgenstein remarks that mathematicians make bad philosophers (1967 § 382). The later Wittgenstein is far more hospitable to the idea that there are many kinds of knowledge and many ways of learning or – what comes down to much the same thing – that metaphors from a wide range of human experience may prove illuminating here. The regular references to art and music in *Culture and Value* seem to play this role, in part. They draw attention to the emotional and volitional aspects of cognition. Thus, shortly before his remark that philosophers should greet each other by saying "Take your time" (80e), Wittgenstein writes:

I may find scientific questions interesting, but they never really grip me. Only *conceptual* and *aesthetic* questions do that. At bottom I am indifferent to the solution of scientific problems; but not the other sort. (79e, emphasis in original)

Some brief remarks about Wittgenstein's conception of philosophy as a kind of therapy (*PI* §133 and elsewhere) will serve as a conclusion. First, a particular "disease of thought" in our time that stands in need of therapy is our expectation that there will always be quick answers and easy routes to comfort or satisfaction. Secondly, the therapist – one working in the traditions of psychoanalysis and psychotherapy – works slowly. The patient is not to be offered solutions, but helped to learn how to go about finding solutions.

Wittgenstein regards this as an essential feature of therapy, writing that “In philosophy we may not *terminate* a disease of thought. It must run its natural course, and *slow* cure is all important” (*Zettel* 382, original emphasis). It should be unnecessary to add that quick answers are indeed desirable in many areas of life and that perspicuity and quickness of apprehension are in most cases significant intellectual virtues. The cautious teacher simply bears in mind Wittgenstein’s reminder that there are by contrast areas – most prominently what he calls “conceptual and aesthetic” ones – where “bloody hard” and slow is the only way to go.

Introduction

This paper examines *talanoa* as a notion that guides cultural approaches, pathways, and activities and which Pacific peoples undertake to create meanings about themselves within the world in which they live and their relationships to that world and to each other. It will also endeavor to unravel layers of *talanoa* to fathom the wisdom and the spirit within it and to discuss how it may be used as culturally appropriate methods and methodology for researching Pacific issues.

Talanoa, Context, and Some Background

The ideas about *talanoa* in this paper are written from a Tongan perspective, located in Aotearoa (New Zealand), which is predominantly western in its institutional values and general disposition. Māori as *tangata whenua* (people of the land) have challenged these positions over time for

more control over their own political, economic, and cultural development. In social development, Māori values and concepts were included in health and education policies, methodologies, and pedagogical approaches to make research and education more reflective of Māori realities and worldviews. The growing acceptance of Māori holistic notions (e.g., *aroha*/compassion, love), *awhi* (care, cultural support) as business, pedagogical, or research notions (Smith 2012; Vaioleti 2011), have fired my imagination to propose *talanoa* methods and methodology for Pacific research and others.

The word “tala” means to command, tell, relate, and inform while “noa” can mean common, of no value, or without exertion. *Talanoa* is a conversation, a talk, and an exchange of ideas, be it formal or informal (Churchward 1959). It is a verb but as a noun, and it can be a story. As a process, it is used in multiple ways to obtain information, building relationships and for creating and transferring knowledge. Tongans, Samoans, Fijians, and other Pacific communities in the Pacific, Aotearoa, Australia, and the USA use *talanoa* as discussed in this paper or variations of it.

While working in Fiji and Samoa in the early 2000, the way that leaders received information from the community, which they use to make decisions about civil, church, and national matters, was through *talanoa* (Vaioleti 2006). In the early 2000s, *talanoa* was written as a culturally appropriate means through which Pacific peoples can authentically share their issues in research and provide philosophies to guide it. This approach is the Talanoa Research Methodology (TRM). According to Farrelly and Nabobo-Baba (2012 in Vaioleti 2013), TRM is the most accepted Pacific methodology across the Pacific.

Talanoa: hala kuo papa (Well-Used/ Proven and Ancestral Pathway)

Talanoa itself as a word is functional and relational; it is an instruction of what to do and how that is to be done. It is an epistemological and ontological process that is used to explain

philosophies, to secure identity, to provide rationale for important decisions, to seek solutions, to heal, to entertain, and to cause *māfana* (positive warm feeling, energy) in peoples’ heart. It can be a storehouse, framework, and even a network in which knowledge, secrets, and other information are held. *Talanoa* as well as chants, songs, poems, phrases, and even iconic words are often ways of remembering genealogies, landmarks or oceanic pathways, tribal boundaries, signs of looming natural or man-made disasters, and even important prayers.

Because these types of knowledge were or are often about the difference between life or death, their preservation in the *mo’oni* (truest) form was paramount – hence, the accuracy of the *uho* (content), *fu* (sequence), and even sounds which later turned into written letters and words of *talanoa* are likely to have stayed *mo’oni* over generations of ancestors. The accuracy and robustness of the *talanoa* as a way of passing on and constructing knowledge are spiritually significant and have a proud and robust genealogy, and therefore I suggest a fitting base for a Pacific methodology.

My son Andreas, founder and owner of several companies, intrigued me with a particular gift. He was a spelling champion at primary and high schools. I recall him once sharing that he was fascinated by words, their construction, and their origin, and he spent much time breaking them up to form other words and even searching for possible foreign origins.

After much *talanoa mo hoku loto* (deep self-reflections), I realized that Andreas had a *faiva* (a magic, trick, formula, performance). His *faiva* was to treat words as stories. He would break up words into combinations of letters which he saw codes for different parts of the plot for a story. The codes were held together by the flow of the story. During his turn in the competitions, the judges will hear the combinations of the letters but for Andreas, it was the totality of his *talanoa* (story) he was reliving as the word spelling was unfolding.

I will use Andreas’ *faiva*, a *hala kuo papa*, to make Tongan iconic words *mahu’inga mālie* (contextually meaningful), but instead of using

the letters as plots for a story to guide the spelling, I will break up the iconic *talanoa* to sense if there are sounds or even some *laumālie* (essence or spirit) that may animate from it. I must however consider two foundational matters to guide this.

Tongan language is functional and relational, and as mentioned already, it is organized around specific epistemology and arranged ontologically. For this reason, it is neither grammatical nor simple in its meaning from a western or mainstream perspective. The second point to this is that the Tongan (and other Pacific) languages have tonal and rhythmic patterns: song-like, chant-like, poetic expressions and rhythmic in their *fu* (form); therefore, its delivery is also a *faiva* that can stir up *māfana* in one's own or another indignant person's heart.

If one is to analyze the word *talanoa* using the above perspectives, three tonal and ontological notions intersect rhythmically as in *ta-la-noa*. *Ta* is often known as *tā* meaning beat, as of a chant, pulse, or the beat of the heart. *Noa* on the other hand can be space and space is also known in Tongan, Samoan, and other Pacific languages as *vā*. *Ta*, *la* and *noa* are notional, functional, spiritual, relational and some of the cornerstones of Tongan onotogy.

An Epistemological and Ontological Unpacking of *Talanoa*

Ferris-Leary (2013, pp. 134–135) proposed that:

In accordance with Māhina's Ta-Va Theory of Reality and the Hypothesis of Laumālie, I propose . . . that Moana (Pacific) "words" are . . . constructed from intersections of other Moana "words" or abbreviations of "words" rather than having a specific linguistic root, and each "word" or "abbreviated word", implies through its *laumālie*, multiple and deeper layers of epistemological and ontological content. In other words, a single Moana "word" may be an "additive" construction using intersections of other "words" or . . . other "words" in order to include their *laumālie*.

When *tā* and *vā* are repeated, one will have pulse, pause, pulse, pause again, and again in a cyclic rhythmic dance (performance) a symbol of *mo'ui* (life, essence, sense of being alive) and

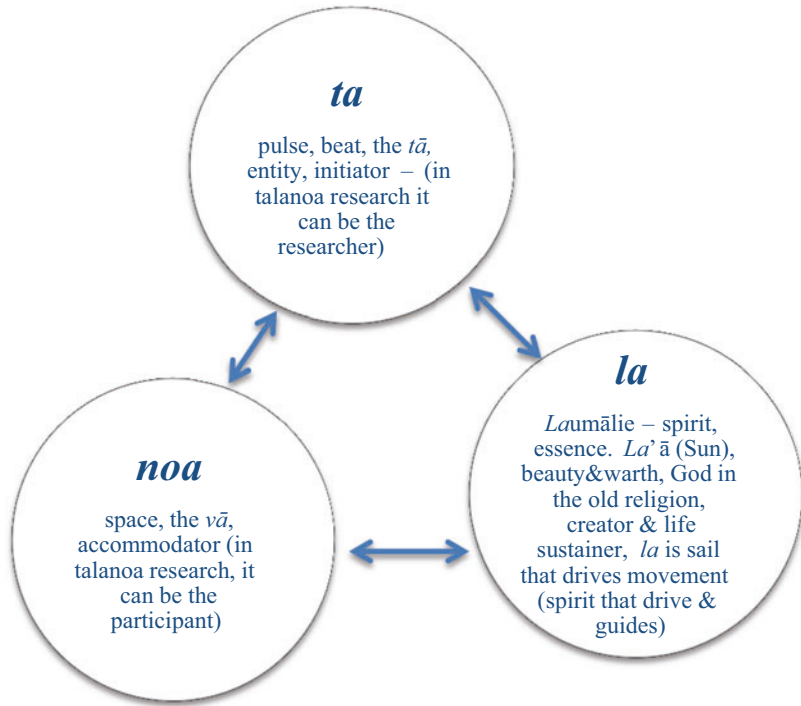

membership of a bigger collective. *Tā* energizes and *vā* provides the space to give meaning (*mālie*) to the *tā*. In Tongan performing arts, *tā* and *vā* occur in ways that create much *melie* (aesthetically sweet, pleasing emotion). In the ancient times, drumbeats were a form of long distant communications, and the *tā* (beats) and *vā* (spaces between beats) were arranged to communicate all cognitive and emotional and spiritual contents. *Tā* and *vā* of drumming were even used to energize people to fever excitements in preparation for battle. There seems to be direct connections between *tā* and *vā* of performing arts (*faiva* including *talanoa*) and the *loto e tangata* Tonga (psychology or essence of that Tongan person). Tongan thinkers such as Māhina and Ka'ili use *tā* and *vā* as theories of reality to explain and predict ontological phenomena of Pacific peoples, particularly Tongans.

The middle of *ta-la-noa* is *la*. *La* can be a short for *La'ā*, the word for the Sun, a god of the old Polynesian religions. *La'ā* directly or indirectly provided life's necessities, and much was tributed to it for those reasons. Polynesians as great navigators of the past prayed to the *La'ā* for favors in their oceanic travels. It is not a coincidence that the sail that took their great *vaka* (ships) to many new places is still called *la*. The genealogy of *la* may lead also to (*La*)*ngi* (sky), reference to the great spirit or the place of the god/s. Also, *la* is the start of *La(umalie)*, the Tongan for the great spirit, god. In the past, it was customary not to use a name of a god for fear of violating their *tapu*. When it was necessary to refer to them, it was the start of the name only that was mentioned.

If we accept *la* as symbolism for *La(umalie)*, then *tā* and *vā* have a third intersecting notion often associated with *māfana* (warm sense of anticipation, light-heartedness, positive warm sensation) which if intensified can lead to achieving *mālie* (elevated sense of spirituality; sense of ecstasy). *Manu'atu* (2002) shares how the processes of three Tongan concepts lead to achieving *mālie* from Tongan *katoanga faiva* (cultural performance of Tonga). She suggests that *mālie* is a process that produces meaningful connections between *ta'anga* (the context in Tongan language and culture), *hiva* (singing), and *haka* (the bodily

Talanoa: A Tongan Research Methodology and Method,

Fig. 1 Graphical intersection that represents connections between *ta*, *la*, and *noa*

movements); the psyche and the spirit of both the performers and audience become *māfana* (light-heartedness, positive warm sensation), all of which energize and uplift people to a different level of spiritual enlightenment and oneness.

If *tā* and *vā* in *faiva* or even in the skilful to and fro in the performance of *talanoa* is repeated, then meaningful *mālie* can be achieved. If *mālie* is sustained over a period or intensified, it can lead to much elation even ecstasy and a sense of enhancement and positive well-being. This stage is often referred to by Tongans as *kuo tau-homau-langi* (we have touched or been touched by *langi*/heaven), or we are now one with the great spirit/god. This is the state of spirituality that Halapua (in Vaoleti 2013) suggested that if reached in *talanoa*, information that emmerge is straight from the heart, uncluttered hence can be trusted findings.

The figure below is a graphical intersection that represents a notional connection and relationship between *tā*, *laumalie*, and *noa* (*vā*). A metaphoric representation of the relationship in a research situation can be that *tā* is the researcher who may lead the *talanoa*. The participant is *noa*, the

giver of knowledge. *La* can be the goodwill, ethics, protocols, and the spirit that positively energize and guide the research relationship. (*La*)*umālie* may even be the aim and hope of the research, which will include a result that will benefit Pacific interests. The *laumālie* of *talanoa* will allow the participant to lead and be the *tā* at different stages in the to and fro of the *talanoa* fusion. *La* can even be the metaphor for the sail that harnesses the information fused between *tā* and *noa* (*vā*) (Fig. 1).

In terms of the value of this approach, Pacific societies have traditionally used the process of *talanoa* to both develop knowledge cooperation and understanding. *Talanoa* is a process that is an important part of social identity and a Pacific way of viewing and negotiating the world.

Talanoa as a Methodology

Methodology deals with the philosophy, the assumptions, and values that underlie and guide the methods used for TRM. TRM takes on a critical stance for emancipation purposes. For

talanoa, its “ology” is about centralizing Pacific ways and values in how the research methods are applied. For research, this should ensure that the integrity of Pacific participants and Pacific knowledge are maintained or enhanced and the result of research will be relevant and beneficial to Pacific issues.

In TRM both researcher/s and participants are active in the process and are involved in defining and redefining meanings in order to arrive at agreed knowledge. If philosophy is about the ways people undertake to understand or create the fundamentals about themselves, their world, and their relationships to that world and each other, then it is about those people constructing knowledge in their own ways, not as prescribed by other peoples’ ideals.

Langafonua (elevating or advancing the *fonua*) is Tongan for working together for the benefit of society or country. It is about co-building and can be represented by constructionism inherent in *talanoa*. *Langafonua* is the building or enhancing what *fonua* represents such as language and cultural notions such as *talanoa*. *Langafonua* by *talanoa* is achieved in spread and understanding of culture and ways of being by those involved. *Talanoa* told are lives re-lived and stories re-told are lives shared with an ever growing concentric circle of possible hosts for such knowledge. Every time they are shared, they have the chance to be examined, challenged, enriched, reshaped, recomposed, and re-owned through good *vā* (relationship, relational space). The circle of learning and reconstruction of fundamentals starts again so *talanoa* assures currency and relevancy of *fonua*.

Talanoa shares similarities with a narrative approach to research, especially with reference to the process used to share information, and sharing information is sharing of self. TRM shares a phenomenological approach to research with grounded theory, naturalist inquiry, and some ethnographical research approaches. In *talanoa*, however, culture is central and in such *talanoa* can become a specific environment too. In this sense while it is nonlinear and responsive like the above mainstream methodologies, *talanoa* is a phenomenological process that is appropriate to

Tongan or Pacific environment, and philosophy therefore is different as it is ontologically embedded.

In previous papers I have argued that for a while Pacific peoples have been exposed to research that have not been beneficial for them and suggested that non-Pacific/indigenous methodologies and methods used to guide research for Pacific issues were ill-equipped to fully comprehend Pacific phenomena. The quality of *talanoa*, and thus TRM, is dependent on how accurately a researcher can recognize participant actions and nonactions, what is said and unsaid in combination with how they are or are not said (*fiuo*), and then affirming and interpreting those through the cultural ways of the participant (*uho*). These involve *tā* and *vā* (the researcher and participant/s). What is obvious is the third element represented by *la* and in this case *laumālie* (spirit or spirituality) as represented by *mālie*. Achieving *mālie* is necessary for a sense of empowerment by both researcher and participants, a state that will encourage more critical deep thinking and freer contributions to the research.

Despite shared characteristics with other methodologies, *talanoa* centers Pacific cultures and paradigms, with emancipation of their processes as a by-product. Using *talanoa* and its cultural protocols is a philosophical approach that provides strategies that empower Pacific peoples to have control over their knowledge creation and operationalizes a certain amount of self-determination. Its philosophical base is collective and it acknowledges Pacific aspirations for knowledge creation and knowledge searching. *Talanoa* advocates for control over authentic and trustworthy knowledge-making processes while developing its own theoretical and methodological base for relationship to Māori in Aotearoa and others and each other.

Talanoa as a Method

Methods are about the way *talanoa* is used as a tool, technique, or process to secure or co-construct knowledge. For that reason, *talanoa* involves learning to live, tell, relive, and retell

stories of relational knowing as narrative inquirers, that is, stories in which ideas are not owned but shared, reshaped, recomposed, and renowned through relationship and conversation at the different levels of *talanoa*.

When a life (in *talanoa*) is shared, a certain essence of the *vā* (space) environment and *tā* (time) which it is shared becomes a part of that life marking it (*talanoa*) different from the last time it is shared. For thousands of years, *talanoa* lived and were told orally and relived. In the late 1800s the missionaries taught Tongans to re-live their lives (hence *talanoa*) in written texts. Today, *talanoa* as lives are relived in emails, phone conversations, surveys, and even observations. New forms of lives are retold or relived electronically therefore *talanoa* as a tool, and a method has to reshape itself to stay timely, precise and phenomenal.

The following methods are approaches that can be applied at different stages of the *talanoa*. The methods can be utilized singularly, simultaneously, or discursively. One method of the *talanoa* may be dominant, and others can be employed interchangeably to set a good atmosphere, pass or obtain information holistically, and prod or triangulate while observing cultural protocols. Based on Tongan protocols and language, methods of the *talanoa* that are likely to be used are:

Talatalanoa

Talatala can mean consultative; therefore, *talatalanoa* can mean consultative talk with a view to uncover something. *Talatalanoa* allows the speakers and participants to go to and fro many times, and every time those involved go back, they pick up and unpack matters missed/not realized (Linita Manu'atu, *talanoa*, Aug. 2016). It is almost always done calmly and with a positive spirit. Since a composition by the late King Tupou IV called *Toe Talatalanoa* (let us talk again), *talatalanoa* had taken a softer, deeper, and spiritual meaning. The late King implied that *talatalanoa* is the method in which God communicates with his unreserved compassion. One of the lines is *fakaikiiki hangē ki ha tamaiki* which actually means the messages are simplified as if for children and that love is given out of compassion and freely.

Talatalanoa then from the above discussions uses simple language, and it requires minimal formality because of the good understanding or relationship between those involved; however, as it is for the Tongan language, it is ontologically shaped. It may just be a way to maintain connection, or to lay the foundation for a more objectified *talanoa* such as *faka'eke'eke* and *talanoa'i* at a later stage.

Talanoa faikava

Faikava is the process in which kava is prepared for drinking at a gathering. A *faikava* can consist of two or more people in a circle, and the main ingredient shared are kava and *talanoa*. In *faikava* the most senior person of the group monitors and directs the activities of the occasion including the *talanoa* to maintain a good *vā* and the group on any task at hand.

The use of *faikava* is a metaphor for a group of shared characteristics; therefore, its use in *talanoa* is likened to a focus group. In *faikava*, it is common for one person to speak at a time, and while they speak, everyone actively engages and reflects until it is the next person's time to contribute. One topic is interrogated at one time until what needs to be covered has been completed.

Talanoa usu

'Ana Mo'ungatonga (*talanoa*, Dec, 2010) suggested that *talanoa usu* is "...*me'a fa'u pe...*" (just a construction), a makeup story. She further suggested that "...*'oku 'aonga ia ke fa'u ha founa ke fakatefito kiai hano fakamata'i ha 'uhinga 'oku faingata'a hono fakamatala'i...*" (it is used as a metaphor for scaffolding those involved in the *talanoa* to more important or key information that may be difficult to explain). Experts in *talanoa usu* can capture appreciative participants as these experts are skilled in humor and in contextual constructions to suit topics but still respectful to participants' age, gender, and rank. It is ideal for building trust and for relaxing participants.

Talanoa faha'ikehe (tevolo)

Faha'ikehe means those from the other side (including ancestors). The Christian missionaries

rename *faha'ikehe tevolo* (devil) to discourage the Tongan people from activities that involved *faha'ikehe*. However, today these *talanoa* engage the emotion, spirit, body, and the mind in ways that most other *talanoa* cannot. This is an ontological dimension of *talanoa* and has to do with supernatural matters. This is fundamental to understanding Tongan thoughts, relationships, spirituality, and knowledge as it strikes at the heart of their epistemology. As epistemology includes how knowledge is legitimated, some Tongans (and other Pacific peoples) still consider dreams, visitations, and visions to be a source of legitimated knowledge.

Talanoa faka'eke'eke

'Eke implies act of asking direct questions. *Faka* means the way of and *'eke'eke* implies verbal searching, interviewing, or even relentless questioning. *Talanoa faka'eke'eke* can start with a question, and depending on the answer, more probing questions may follow. The questions connect or build on the answers given by participants in order to identify or uncover certain point/s.

Because this *talanoa* has a more objective aim, it is efficient and likely to be dominated by the researcher. This approach is more likely to miss social contexts and other dimensions necessary for a full picture. However, one can employ *pōtalanoa* to gain more data on issues missed by this approach. *Faka'eke'eke* is the term given to formal police investigative procedures in Tonga.

Pōtalanoa

Pō implies night or evening which points to this *talanoa*'s origin. In a Tongan village life before the time of television, after the evening meal, friends, relatives, and neighbors would visit each others' house to *talanoa*, discuss family matters, as well as the more secular such as sharing plans and hopes for the days ahead. It may be what we identify as conversation and can be held anytime, both day and night. Manu'atu (2002, p. 194) describes *pōtalanoa* as:

...Cultural and political practice of Tongan people where space in time is created to connect to the contexts of their experiences through discussions and talking with others. Through *pōtalanoa*, the

people come to know questions, find out, ...about their world and their relationships to it. In my view a key to the practice of *pōtalanoa* is the capacity of people to connect with each other within a context of whether it is kinship, a work experience, common knowledge, faith or whatever.

It is fitting that Manu'atu (above) saw *pōtalanoa* as the way people come to know questions and become aware of their world and their relationships to it which form the elements of the very philosophical argument of this chapter for *talanoa*.

Talanoa'i

Talanoa'i is a verb; purposeful, has a particular aim which may be an outcome. *Talanoa'i* allows participants to go back and forth many times, and every time those involved go back, they pick up and unpack matters that may have been missed. It implies high-level analysis and synthesis. Those involved in *talanoa'i* have similar backgrounds or status, complementary expertise in the topic of a *talanoa*. *Talanoa'i* then is a more rigorous process guided by its purpose/s and possibly a leader. It may even take the form of a robust debate but with the normal respect for age, gender, and others' cultural conventions.

In *talanoa'i* the researcher is not a distant observer but is active in the *talanoa* process and in defining and redefining meanings in order to achieve the aim of what is being *talanoa'i*. *Talanoa'i* is suited for stripping layers of history and hurt that may have lead to tension, bad relationships, and even conflict. *Talanoa'i* encourages contributions from participants just as participants may demand the same of the researcher. Different people may take leadership at different stages of the encounter in the active pursuit of the best knowledge, solution, or a final consensus.

Tālānga

Tālānga is dialogical and involves both the acts of speaking and listening. *Tālānga* can be used to challenge. The two approaches of *tālānga* are *kau'i-talanoa* and *tau-ngutu*. *Kau'i-talanoa* can mean joining a conversation which one is not expected to (Vaka'uta 2008, as cited in Vaiotei 2013). This may be a result of exclusion based on

rank, gender, age, or class. *Kau'i-talanoa* is used to disrupt and challenge the authenticity or fact of a *talanoa*. It is used by outsiders or less powerful individual or groups to invite themselves into a *talanoa*. At another level, *tau-ngutu* (fighting or warring mouth) is talking or arguing back, a more forceful way of stating opposing views (ibid). *Tālānga* can be used to challenge a process or findings during and even after the *talanoa* process.

Further Discussion on *Talanoa* and Application

When the methods of *talanoa* are used skillfully, positive relationships and richer findings can result. They can be used to triangulate; to assess authenticity as well as cause and effect through power differentiation (e.g. between researchers (tā) and or between participants (vā)) and adjust reflexively whenever needed. These can be done using *talatalanoa* or *tālānga* while *talanoa faikava* is introduced regularly to maintain the *mālie* (enjoyment) of *talanoa*. The person who is leading the *talanoa* can use one or as many methods simultaneously as appropriate to assist participants in reconstructing or recapture the full richness of experiences being studied.

When TRM is used to study a phenomenon, *talanoa* attempts to understand it through the eyes of the participants. For that reason, the multiple approaches of *talanoa* would be a culturally, spiritually, intellectually flexible method for explicating the meaning, structure, and essence of such phenomenon as it appears to the participants. *Talatalanoa* may be a good start for a *talanoa* to focus participants into the task and then the researcher or the participant/s can use *talanoa faka'eke'eke* to clarify points or even establish credibility or either party. *Talanoa usu* can be used concurrently to scaffold any party to the topic or relax them while layering on meaning in the reconstruction of the phenomenon being studied.

Cultural interplays during *talanoa* include emotions, silence, reflective thoughts, and eye and body movements which are all integrated and inseparable parts of *talanoa* as collectively they are articulation

of participants' communication. It is in the flexible and multilevel manifestations of *talanoa* that allow skillful researchers and participants to construct, relive, retell, and re-share their experiences in their richest and most authentic forms.

Protocol/Ethics in *Talanoa*

Vaiioleti (2006, pp. 29–32) discussed *faka'apa'apa* (respect), *anga lelei* (appropriate disposition), *mateuteu* (prepared well), *poto he anga* (culturally apt), and *'ofa fe'unga* (exercise appropriate compassion), based in *'anga faka-Tonga* (Tongan processes and ways) and how to apply them contextually to guide *talanoa*. These will protect the integrity of participants and researchers and ensure that data collected, findings, or construction are as authentic as possible. *Talanoa* should be pragmatic, and when it loses *mālie* (aesthetics, authenticity, spirit) or no more new information is forthcoming, then it should cease. The protocols proposed to guide *talanoa* emphasizes that while truth is good, respect for human dignity is better.

Fakakaukau (Bringing Together): Thoughts on Analysis

Talanoa research approach can generate a large quantity of information, notes, tape recordings, jottings, and emails all of which have to be analyzed, and information do not naturally fall into neat categories. However, in a small-scale *talanoa* research using physical documents, the analysis of the information is likely to be manageable. This can be done by reading through material generated and get a feel for what is collected, identifying key themes and issues in each text. They should be then entered under different headings but categories related to the research questions to be juxtaposed and compared to identify relationships between different themes and other factors.

However, for larger projects with a significant numbers of participants, it is now customary for the data to be uploaded to an electronic database to be coded and processed using programs such as

Nvivo in order to analyze, characterize, classify, and visualize the information gathered. The skill in interpreting the data and creating the knowledge from the TRM findings still rests with the researcher/s. The advice given here though is that reasons for making decisions on influential elements of the analysis such as coding or chunking, main categorizes, and how those are related or contributed to answering the research questions should be recorded and transparent as this will contribute to the robustness and acceptance of the final findings of the TRM.

Talanoa shares a philosophical base with Kaupapa Māori and other localized critical research methodologies; therefore, it is effective in visualizing deep issues and making voices heard. This is not always comfortable for funders or dominant institutions. On the other hand, many organizations value the new and cultural insights that can be the start for developing authentic and lasting solutions, which an indigenous research approach can bring in terms of cutting through issues that limit the opportunities for those that have not benefitted fully from what our civilization has achieved.

Introduction

In the Western world, modern teacher education developed at the juncture of long-term processes: the educationalization of world problems since the eighteenth century; the emergence of pedagogical theories that eventually led to a body of knowledge in the nineteenth century – the educational sciences; and the creation of the modern educational state in tune with a liberal economy and a new mode of governance. Teacher education went through changes influenced by developments in Western thought but also by external contextual external forces such as the settings and demands created by industrialization, technological changes, and the more recent push to an incremental alignment of teacher education programs in a globalizing, neoliberal environment.

Teacher Education in the “Longue Durée”

The educationalization of the world (Depaepe and Smeyers 2008; Tröhler 2013) – the understanding

of social problems as educational ones – took full shape in the nineteenth century. The encompassing conditions of possibility for this process have been the ideology of progress, which implied a new positioning in the historical continuing influenced by philosophers of the Enlightenment, increasing interdependency between State and capital, and a new understanding of governance and of the relationship between State and the political subject. Notions of republicanism circulated widely in Europe in the sixteenth and seventeenth centuries alongside the secularizing processes associated with the Enlightenment that took place in Europe and North America. The mission of the new school would configure the role of the teacher; civic virtue, and the formation of the political subject for the nation-state, would become a relevant educational component. Of importance here is the catalytic role of Johann Heinrich Pestalozzi (1746–1827) in the educationalization process (Tröhler 2013). Although his concern was not the professional teacher but the loving mother as teacher, Pestalozzi became a point of reference in teacher formation by the mid-nineteenth century. In Pestalozzi's method of observation – or art of education, as he called it – the role of the teacher is to remove the confusion of first sense impressions, to make objects distinct, and to classify those related or similar to each other (moving confusion to units). It would be John Frederick Herbart (1776–1841) and Frederick A. W. Froebel (1782–1852) who would begin developing systems of educational thought – Herbart's based on associationism and Froebel's on activism.

The Protestant reformation, a central element in the ideological and political configuration of modernity, had a very early impact on the creation of school systems, an example being the Duchy of Württemberg in 1559 followed by other States. The Prussian State is of interest here because during the revival after the Napoleonic wars, Prussia created the first State department of public instruction, and its director sent 17 teachers to study for 3 years with Pestalozzi; the teachers became directors of normal schools to train teachers in Pestalozzi's methods and ideas. The Prussian model, and with it the Pestalozzian

principles, reached the USA (Horace Mann's design of the Massachusetts systems), Canada (Egerton Ryerson, architect of public elementary education in Upper Canada), other European countries, and Latin-American countries like Argentina. There was an element in the Prussian model and in the normal schools that fit well with emerging ideologies: instead of coercive rules associated with a monarchical system, there was a transformation of the notion of sustaining power that the governed would participate in some way in their own governance (McGarry 2012). After mid-eighteenth century liberalism, other ideologies as well circulated transnationally and at their point of reception were mediated by local conditions and inserted in the narratives there. For example, the language of schooling and teacher training in the USA was assimilated into the early nineteenth-century American Protestant-republican ideology.

Teacher preparation and State certification were part of the development of common schools and mass public instruction, the modern school being a central element of the modern nation-state in northern and Western Europe. Over a century, there was a shift from education as a function of church and family to education as a function of the State. The teachers had the responsibility to educate the nation's children, to build their subjectivities, and to help generate a governable polity. It was also a time of empire building, and secular teachers as well as teaching religious missionaries had a civilizing mission within the context of a new form of colonial empire. Colonialism moved ways of being in the world to those perceived as lagging behind. Catholics carved their place in the educational enterprises and negotiated to partake in the educational systems while keeping their identity. Members of congregations pursued certification and later attended normal schools and higher education institutions.

Normal schools – which ranged from high schools with specialized courses to a few months or 1–2 years of classes after high school – provided formalized teacher training according to the “science of pedagogy.” The separation of elementary and secondary teaching preparation led easily to the feminization of teaching, particularly at the elementary level. By 1888,

63% of US teachers were women, and in urban areas it reached 90% of teachers (Fraser 2007). At the end of the century, the teachers were by and large middle-class Protestant women of European origin; there were also some African-American teachers from the free black communities of the North, there were some poor women with scholarships, and, of course, there were large numbers of women religious teachers (Fraser 2007).

Canada was not different. The feminization of teaching was encompassed by the ideal of domesticity for women, which translated into the profile of the woman teacher as holder of ethical superiority and, above all, community builder. It is not surprising that history and history of education figured prominently in the normalite instruction in Canada and in other Western countries. Herbart and the Herbartians – like American Charles McMurry, who wrote textbooks used in normal schools, or English Herbartian Catherine Dodd – valued history as a source of character development and used stories and biography to illustrate desirable moral qualities. Froebel was no less influential with regard to the advocacy of kindergarten and the promotion of manual training; in Ontario, Canada, provincial inspector James Hughes' *Froebel's Educational Laws for all Teachers* (1897) circulated widely among teachers.

In the late nineteenth century, prestigious universities created chairs in pedagogy not only in the USA (at the universities of Iowa, Ohio, Michigan, Columbia, Berkeley, Chicago, Stanford, and Harvard) but also in Europe (in the UK, the first chairs in education were established in 1876 at Edinburgh and St. Andrews in Scotland). These would evolve into departments and later schools or colleges of education. Whereas the normal schools prepared a large number of elementary teachers (mostly women), university education professors focused on the preparation of high school teachers and school administrators (mostly men) and on educational research. Early in the twentieth century, normal schools in the USA evolved into teachers colleges with diversified offerings, becoming liberal arts colleges with various missions, and then from the 1950s, most of them won the title of “university”; the path was from normal school to teachers college to State

college to State university (Labaree 2008). The process in Canada was somewhat different: teachers colleges replaced normal schools in the mid 1940s and 1950s, and in the 1960s teacher education, including elementary teaching, was moved to the university.

In Spain, the Chair of Pedagogy was created at the Universidad Central in Madrid in 1904, and the University of Barcelona began the Seminar of Pedagogy in 1930; these steps and the creation of the *Escuela Superior de Magisterio* (Magisterium Upper School) in 1909, devoted to the preparation of professors for the normal schools, led to the creation of departments of pedagogy in the Faculties of Philosophy at the Universities of Madrid and Barcelona; the new departments would prepare teachers and administrators for the higher echelons of the system, including secondary schools, as well as researchers (Bruno-Jofré and Jover 2008). This explains the bipolar constitution of the system and its different teacher education cultures still dominant today.

Toward the end of the nineteenth century, educational theories and theories of childhood began to form a body of knowledge referred to as educational sciences. They intersected with political developments, evolutionism, Herbert Spencer's social Darwinism, experimental psychology, and emerging social ideologies. A complex material infrastructure emerged, composed of departments, societies, laboratories, institutions, groups, congresses, and journals with circulation among teachers and administrators such as *The School Journal* (published in Chicago and New York).

Within the New Education Movement figured prominently Ovide Decroly (1871–1932), Belgian neurologist specializing in medical pedagogy and pedotechnics; Edouard Claparède (1873–1940), Swiss neurologist and child psychologist; Georg Kerschensteiner (1854–1932), German educational theorist; Adolphe Ferrière (1879–1960), Swiss educator, founder of the New Education Fellowship in 1921; and Maria Montessori (1870–1952), Italian physician and educator, among others. The movement carried a reformist agenda albeit of a variegated quality.

The American progressive movement had a set of tendencies that Labaree (2005) categorized into

two groupings. Pedagogical progressives focused on teaching and learning in the classroom and included John Dewey, Francis Parker, G. Stanley Hall, William Kilpatrick, and others. Administrative progressives were utilitarians who focused on social efficiency, governance, and curriculum, a group which included Edward L. Thorndike, a behaviorist psychologist. Both major tendencies were grounded in developmentalist theories despite being embraced from different positions: the administrative progressives were leading to professional management of schools, vocational training, and differentiated outcomes; the pedagogical progressives were focusing on the purposes and interest of the students driving the curriculum.

The question here is how these varied reformist tendencies were translated into teacher preparation. Disperse monographic studies show that elementary teachers graduating from normal schools, teachers colleges, and early programs at universities were exposed to John Dewey's theories as well as William Kilpatrick's active methods, Ovide Decroly, and others, and there were many examples of reformist ideas in classes all over the world, including the emergence of specialized schools like the Montessori or the Waldorf schools (created by Rudolph Steiner), which required special teacher preparation. However, teacher education – intellectually not very strong, particularly with regard to the preparation of elementary teachers – aimed at preparing teachers and administrators who could function efficiently in a system that sorted students by academic ability and future job prospects, while the notion of nation building persisted with modifications and intersections of internationalism after the First World War until the post-1945 era. It is interesting to note, however, that case studies have shown that the official discourse on citizenship and nation building was not necessarily taught and learned in schools, which had their own contours; the teachers brought to the class their own existential conditions and contexts.

At the end of the nineteenth century, educational congresses were organized in line with the establishment of international scientific congresses; however, they were linked to educational

exhibitions and world fairs that included education as part of propaganda of the industrial powers. At the same time, starting with the Bureau International des Écoles Nouvelles, founded by Adolphe Ferrière in 1899, reformists embarked on a transnational networking process emphasizing moral and political assumptions of the teaching profession (Fuchs 2004). The concept of scientific education and the ideas expounded by the new education advocates and progressive educators were, as Fuchs (2004) has argued, European-based concepts that were grounded in the differentiation between a “civilized Europe” and a “barbaric” rest of the world.

Teachers' associations promoting material interests were organized nationally and internationally; a case in point was the World Federation of Education Associations. Teachers' leaders and particularly secondary teachers were exposed to these developments in various parts of the world. It is viable to say that there was, in the first half of the century, an internationalized discursive network with various layers and types of network structures and situations. Of note, based on recent studies, was the relationship among teacher educators such as in the case of Australian, British, and North American teacher educators.

The post-1945 period signaled great changes in education at various levels in response to changes in capitalism, its relationship with modernity, and the incoming demands of neoliberalism. Teacher education went through a transitional process in most places in the long 1960s (1958–1974). There was, as Rohstock and Tröhler (2014) wrote, a process of scientification of teacher education within the context of the cognitive revolution – within the tenets of cognitive psychology, the teacher was expected to provide students with knowledge structures and scaffolding in the learning process. Teacher education was influenced by notions of education as human capital and a future-oriented point of reference. The Cold War provided the overall ideological framework. Faculties of education, rather new in many countries, tended to deliver eclectic programs not alien to the complex historical context. There was a coexistence of residual elements shaping teacher education with emerging ideas on education

sustained by the power of science and upcoming new technologies. The civil rights movement, the decolonization processes, the search for differentiation, and intercultural/multicultural issues started to reach the programs, particularly in the 1980s as public education became more inclusive. At the time, teacher education began to emphasize the preparation of a teacher for the future and continued stressing teachers' cognition, while the Organisation for Economic Co-operation and Development called attention to the need to reform teacher preparation (referred to as teacher training). Educational reform had an international dimension. Toward the 1990s, faculties of education changed their programs, having in mind an ideal teacher who would serve as a teacher-researcher. The ideal teacher would be able to reflect upon their own thinking and actions. This approach led to the creation of teacher education models from a practice-and-theory perspective. On the way to renewing paradigms, teacher education programs tended to align teacher practice with a globalizing, neoliberal societal environment in a world that assumed the validity of international standardized tests to define and measure teaching success.

Today, history and philosophy of education are not afforded much of a place in most programs, and, thus, there are few or no questions regarding intellectual habits of mind, educational aims guiding the constructions of goals, or discussions of what is good education. The “new language of learning” in education and, in particular, effective learning focuses on process and misses questions of content, relationship, and purpose (Biesta 2014). From the perspective of educational policy, the Bologna Process in Europe, which aimed at the harmonization of higher education and fostering mobility of students and workers, created conditions for change, even as resistance generated interesting situations of heteromorphism. Teacher education has been part of this process, although differences among European countries abound.

The technological revolution changed the tenets of teacher education, bringing the reality of ubiquitous learning to the class and a new positioning of the students breaking boundaries of space and time. Teachers' organizations had to

contend with the opening of education to the private sector, the legacies of conservative discourses dominant in the 1980s and 1990s, as well as with the “need” to produce skilled and knowledgeable students for the global economy who are assessed through high-stake tests.

Teacher education is now its own field. Since 1984, division K – Teaching and Teacher Education – has played a role within the American Educational Research Association (AERA); in 1993, the Self-Study of Teacher Education Practices was recognized as a special interest group; journals devoted to the study that teachers make of their own practice embody the paradigmatic changes. Nonetheless, teacher education has an inherent dynamism at the crossroads of its insertion in universities – which are themselves going through fluid changes and are being shaped by new managerial practices, transnational agendas, private and public stakeholders, and the fragmentariness of life. Teacher education reveals again and again the unique agency of teachers, reformers, philosophers, and historians of education and their commitment to generate conditions for a pedagogy of wonder and imagination in a school responsive to the various dimensions of being human.

Teacher Evaluation and Islamic Education, A Critical Perspective

Saheed Ahmad Rufai

Department of Curriculum Studies, Sokoto State University, Sokoto, Nigeria

Teacher Evaluation and Islamic Education

Teacher evaluation is intended to improve student outcomes through the instrumentality of better teacher performance in the form of both enhanced teaching quality and improved teaching practices. Yet it should be pointed out from the onset that what separates other forms of evaluation from

teacher evaluation is just a very thin line. While generally evaluation is concerned with the act of associating values with scores achieved through measurement, teacher evaluation is associated specifically with teacher performance. The Organisation for Economic Cooperation and Development (OECD) *Review on Evaluation and Assessment Frameworks for Improving School Outcomes* (2009, pp. 3–4) identifies six main interrelated aspects that constitute teacher evaluation and therefore distinguish it from the general concept of evaluation. One, there is the *unit to be assessed* which covers the "who" question of evaluation and concerns the individual teacher whose performance is to be analyzed as part of an evaluation and assessment framework alongside other components like the system, the school, and the student. Two, there are the *capabilities to assess and to use feedback* which answer the "by whom" question of teacher evaluation. The focus of this question is the preparation to evaluate and offer feedback. Three, there also are *aspects assessed* and this is all about the "what" question of teacher evaluation. The concern here are the main activities of teaching that should be covered in the exercise. These include planning and preparation, the classroom setting, and the teaching process itself. Four, *evaluation "technology"* which is all about the "how" question and addresses issues bordering on procedure, device, or approach to evaluation. Fifth, *purposes of evaluation* which address the "for what" question, namely, objectives of evaluation and mechanisms formulated and targeted at the realization of the objectives. The sixth and last are *agents involved* and focus on the "for whom" question which deals with the stakeholders such as parents, teachers, school administrators, teacher unions, and policy makers in the development and implementation of teacher evaluation processes.

The question to raise at this juncture is, if the evaluation of students is so central to the job of the teacher for the purpose of achieving academic excellence which is targeted by teacher performance, would it be out of place to rationalize that the teacher who him or herself is arguably the chief promoter of excellence through his or her pedagogical performance cannot but be subjected

to such an enrichment experience that seeks to enhance the quality of their performance. The Holy Qur'an enjoins that he who promotes righteousness or spiritual excellence demonstrates it first, "Do you order people righteousness and forget yourselves, while you recite The Book: Then, will you use reason?" (The Holy Qur'an: 2: 44). What excellence can students achieve if their teachers are deficient and substandard in the subject involved?

In a particular notion of Islamic education which may be explained as the process of imparting knowledge, skills, and values for the purpose of producing a good (wo)man through the development of all his/her domains namely the cognitive, the affective, the psychomotor, in consonance with Islamic principles, practitioners have often called attention to the inconsistency of learning experiences with educational objectives, especially with respect to spiritual and moral development. A tenable explanation of Islamic education has been offered by the First World Conference on Muslim Education. One of the features of such education is to aim at the balanced growth of the total personality of a human being through the training of his/her spirit, intellect, rational self, and feelings. Another feature is the infusion of faith into the totality of man's personality. Yet another feature is a sense of emotional attachment to Islam that must be stimulated in (wo)man to enable him/her access to the Qur'an and Sunnah and general dictates of Islam in a manner capable of facilitating his/her attainment of the status of vicegerent of Allah (Al-Attas 1979, pp. 158–159).

However, it should be pointed out that the above characterization of Islamic education seems faithful to the conception of education as a form of *tarbiyah* which connotes good breeding. Al-Al-Attas further explores the idea of Islamic education to be more of *ta'dib*. A man of *adab* is defined as a good and honorable man nurtured by the Qur'an which may be likened to Allah's invitation to a spiritual banquet. He elucidates that the acquiring of real knowledge of the Qur'an is the partaking of the fine food in it in a manner akin to the enjoyment of fine food in a fine banquet whose quality is invariably enhanced by worthy

company and that partaking of the food be in keeping with the rules of refined conduct. It is derivable from Al-Attas' argument that the concept of *ta'dib* by far surpasses and transcends the idea of *ta'lim* whose implication is restricted to instruction or knowledge dissemination as well as the concept of *tarbiyah* which, as noted earlier, applies to good breeding and is therefore limited in its philological implication. The significance of illustrating with these three concepts lies in the comprehensive and somewhat all-encompassing nature of the idea of *ta'dib*, in connection with education as it presupposes that teacher evaluation must not elude any aspect of man, given the fact that a comprehensive and all-embracing education requires no less than an all-encompassing teacher evaluation.

Al-Attas' view as enumerated above finds support in Rosnani (1996, p. 31) who identifies "the way we teach and the way we evaluate educational objectives as the root of the problem of education in the Muslim world." She observes that the educational objectives among Muslims are not screened by their own educational philosophy but "rather by the Western, secular, and liberal philosophy of education" (Rosnani 1996, p. 31). She emphasizes the need for Muslim teachers to dispel the notion that teacher evaluation is no more than their evaluation of their students which is synonymous with giving the paper and pencil test and make the procedure closely consistent with the educational objectives of the curriculum in order not to make the evaluation procedure become the focus of students' attention and even of the teachers' attention.

To underscore the place of a teacher evaluation method that is capable of serving Islamic purposes, this entry examines the basic concept of evaluation in the Islamic tradition as espoused by the Qur'an, with a view to making a case for teacher evaluation. It therefore becomes imperative to turn first to the Holy Qur'an which is replete with injunctions on *thawaab* (i.e., reward) and *'iqaab* (i.e., punishment) which are both contingent upon *hisaab* (i.e., judgment) which itself is a product of accountability and evaluation.

In a tradition of the Holy Prophet whose chain of narration is traced by Nu'man bn Sa'd through

Ali, he gives a clear picture of heavenly reward and punishment, saying:

When the Almighty Allah says in the Qur'an:

The Day We shall gather the pious and righteous persons into the Most Gracious (Allah), like a delegation (presented before a king for honour) (Qur'an, 19: 85)

The honor talked about will be in various dimensions. They will not be allowed to walk on legs but rather carried on horseback, the horses too will be of a worthy stock the like which would not have been seen by humankind. At the gate of *al-jannah*, they will be received by Allah's angels as Allah has said: And the angels will meet them, (with the greeting):

This is your Day which you were promised (Qur'an, 21: 103).

And as regards the sinners, the Almighty Allah says:

"And We shall drive the disbelievers to Hell, in a thirsty state (like a thirsty herd driven down to water) (Q. 19:87), and in another injunction, explains their light saying: "Those who will be gathered to Hell (prone) on their faces, such will be in an evil state, and most astray from the Straight Path" (Qur'an, 25: 34).

That the outcome of man's accountability is determined by his actions and efforts is clearly articulated in another injunction of the Qur'an, as follows:

So whoever does good equal to the weight of an atom (or a small ant) shall see it. And whoever does evil equal to the weight of an atom (or a small ant) shall see it (Qur'an, 100: 7-8).

The above Qur'anic injunction emphasizes the outcome of labor and may be applied to student's achievement as a result of the teacher's effort. That explains why the teacher's excellence in his/her practice matters much.

The aspects of learning covered and evaluated in Islamic education explain why it proves strong where the Western model of teacher evaluation proves deficient. In other words, the concerns for and issues involved in teacher evaluation for Islamic education proves unnecessary. Dhaou (2005) has offered a credible analysis of evaluation-related verses in the Qur'an, in

connection with the teacher. Yet it is noteworthy that the message contained in the various verses of the Qur'an cited in above should be studied with specific details for systematic application as part of the principles of any systematic Islamic education program.

Muslim thinkers have, along the path of the foregoing, contributed significantly to the discourse on teacher evaluation. Al-Talbi (2000), for instance, argues that Al-Farabi is of the view that the aim of the teacher's examination of his students is to find out a learner's level in the field being studied. He opines that in such a situation, it is not only the student but also his teacher that is under examination. According to him, the questions asked by the teacher could have either an educational or an experimental character. The latter concerns questions asked a student who is expected to know something so as to demonstrate that knowledge while the former has to do with a person's testing of himself to ascertain if he has made a quantitative or methodological mistake.

Unless there is a good mechanism for teacher evaluation with a view to addressing his professional deficiencies, his own evaluation of students may not be regarded as trustworthy. Relying on Al-Farabi's *Ihsan-ul-Ulum*, Al-Talbi enumerates instruments that are available to help us check the compass, the ruler, the scales, the abacus, astronomical summary tables which are few in number yet applicable to many things. He asserts that the teacher's evaluation should not be restricted to only the test of knowledge and that the intelligence also can be tested. He identifies the ability to discriminate, the capacity for deductive and critical reasoning, understanding the relationship between isolated pieces of information, and grasping the links between them, as belonging to the family of intelligence, and emphasizes that one of the most important ways of recognizing intelligence is through mathematical ability (Al-Talbi 2000, p. 45).

As regards Ibn Sina, who is reputed for his original thinking and distinctive educational view and as "the leader of a philosophical school which influenced education both in the Islamic east and the Christian west," as presented by Al-Naqib (2000, p. 7), there is need to expose the teacher to various evaluation techniques. The

varied nature of his techniques will be an asset to him in determining the place of motivation in his own evaluative experience with his students. Ultimately, such skills shall culminate in his realize the central nature reward and disapproval as the case may be. To Al-Ghazali (1898, 1986), however, evaluation of prospective teachers should not be restricted to his knowledge but also extended to his character and practical application of the subject of his learning. This in fact is a good justification for the practical programs component of any credible Islamic education program. All those views show why Muslims should not continue to train their teachers along the Western educational lines whose rationale is not necessarily grounded in divine principles.

Accordingly, a teacher's potential for stimulation of critical debates, creative discussions, intellectual discourses, and public speaking, for assessment among students, are among salient concerns to underscore in teacher evaluation especially where he is required to develop in his students' soft skills such as critical, creative, and ethical skills as well as communication skill, social or interpersonal skills, and self esteem. However, much is desired of the teacher educator in this regard who is expected to use his creativity, resourcefulness, and versatility in generating or applying appropriate evaluation procedures in order to facilitate teacher evaluation for effective performance in different classroom situations.

Documentary certificates as a means of expressing the outcome of teacher evaluation were not known to the Muslims during the early days of Islam. It was for the student or student teacher himself/herself to decide whether (s)he was truly competent enough to hold a new circle in which he would sit as a master. Yet many students were often hesitant to do so in view of the technical nature of the discussions and arguments which were expected to take place between a teacher and his students and which required the teacher to prove himself as worthy of his teaching position. For instance, Shalaby (1954) observes that Abu Hanifa once felt capable and therefore left Hammad's circle and sat as a teacher but when he was asked some questions which he was not able to answer he dissolved his circle and rejoined

that of his teacher. Shalaby also observes that, contrary to Abu Hanifa's experience, Wasil Ibn 'Atta' (181 A.H.) "departed from the circle of al-Basri (110 A.H.)/728 AD) when the subject of the commission of crime was discussed, then he successfully forms a new circle where he proved a remarkable thinker" (p.147). It was owing to the significant place of the Traditions of the Prophet that the *Muhaddithun* (scholars of Hadith) began the tradition of issuing certificates to their students as a way of declaring them ripe for teaching. The objective of such certification was for the teacher to enable such students as having been so certified to recite Traditions taken through him (Shalaby 1954). The practice later passed to other subjects whereby "the master would grant a recognized certificate to those students who satisfactorily passed the prescribed course of study under him...and...such a certificate was usually written upon the fly-leaf of the book studied" (Shalaby 1954, p. 148). It was such a practice that later metamorphosed into *ijazah*, with the passage of time.

The *ijazah* method is the teacher's authorization of his students to disseminate his knowledge to others. It is a product of teacher evaluation because it seeks to determine the suitability of the candidate for teaching. Six different types of such exercise were identified and described as *al-Munawalah* (Shalaby 1954, p. 51). One of the six notable types is the variant of *al-Munawalah* in which case a Shaykh gave his books or some of them to his students or any scholar (Shalaby 1954). In such a situation, the teacher would (instruct the students to) assure his own students that the authorization bears the handwriting of his Shaykh. Another approach to *al-Munawalah* was for the Shaykh to grant a student use of all the books in his library. Again, another approach is to authorize others to quote him in reference to all the books read by him or experiences recorded by him. This seems unacceptable to many scholars. The third form of *al-Munawalah* was for the Shaykh to send in writing some Hadiths or portions of some Hadith books with an authorization to the bearer. The fourth form was the authorization of an individual on the narration of authentic Hadiths in certain books. The lack of identification of the individual's specific Hadiths or areas of

competence earned this form of authorization some opposition. The fifth form was self authorization of which an endorsement was secured by the Shaykh. The sixth form is an authorization issued by a Shaykh to another.

Teaching and Critically Reflective Practice in Freire

Leon Benade

School of Education, Auckland University of Technology, Auckland, New Zealand

Synonyms

[Contemplative wondering about work](#); [Critically: analytically](#); [Diagnostically reflective practice = teacher inquiry](#); [Thoughtful reflection on classroom work](#)

Introduction

Few of the many books written by Freire drew particular, and extended, attention to the teacher in the way *Pedagogy of Freedom* (1998) was able to do. While this entry draws on many other important works by Freire, it specifically probes elements of this book to place before readers some of the salient qualities and attributes Freire believed teachers, educators, and thinkers of education ought to aspire to.

There are four themes of relevance here. The first is Freire's commitment to the idea of teaching as a political activity, particularly in the context of the contemporary neoliberal grind, which was widely evident across multiple nations by the time of his death in 1997. The second is that teaching could be, indeed should be, regarded as an ethical activity, and this entry explores that claim. It is an important claim to uphold in a climate that increasingly regards teachers to be mere functionaries of the State and its pursuit of "achievement objectives" for the twenty-first century labor market.

Freire is well known for his, sometimes controversial, position on the development of a critical consciousness. Relating ideas about the development of a critical consciousness to teachers and teaching leads to a double consideration: first, teachers have a role in initiating their students into the process of developing criticality, and second, teachers have a responsibility to both themselves and their profession to develop as critically reflective practitioners. Both roles will be dealt with in the second half of this entry.

Before advancing any further, however, it will be helpful to review some of the central ideas contained in Freire's concept of teaching as a profession. He regarded teaching to be a vocation that was "mysterious" and the reason for the devotion of teachers (p. 126). Freire believed that the individual teacher has "consciously taken [the] option to intervene in the world" (p. 122), and for him this was no mystery. Freire's words highlight the ethical nature of intrinsically valuable work of teaching professionals who focus on matters of great significance to people and their lives. In this context, it may be understood why Freire stated unequivocally that teachers must struggle "to bring dignity to the practice of teaching" (p. 64). These commitments demanded of teachers may, however, be discomforting to some.

Teaching Is a Political Activity

Not all teachers (especially beginning ones) may immediately comprehend the direct influence of policy on their professional lives. Becoming aware of the role of policy, and coming to realize that teachers have the potential to challenge the effects of those policies, does, however, reveal teaching to be a political activity. One of the most important ways in which policy has influenced teaching was the (infamous) "No Child Left Behind" (NCLB) policy of the United States administration of George W. Bush. It was an example of policy reflecting a reaction to public (and political) perceptions of a systemic failure in education to deliver a return on taxpayer investment (namely students

successfully navigating the school system and being deemed "employable").

Paulo Freire argued that modernizing reformist policies in education (such as NCLB) spawned a "neoliberal technoscientific education," creating a false dichotomy between the need for a broader liberating education and the narrow economic intentions of vocationalism (1996, p. 131). Freire's *Pedagogy of Freedom* (1998) revealed his concern with the impact of the "scourge of neoliberalism" (p. 22) on teachers' thought and practice. The fatalistic ideology of neoliberalism encourages teachers to see the world as a given, discouraging theorizing of its underlying causes and tensions, giving preference instead to data manipulation as an explanatory tool. The neoliberal agenda thus places enormous emphasis on the accumulation of grades through continuous assessment. The promise of a hopeful education that develops a love of society and consequently egalitarian tendencies is no more than a vain hope under these policy agendas. Instead, what these policies do teach is acceptance of growing socioeconomic disparities that consign most students to a narrow vocational life (Freire 2005).

In the face of this, teachers of courage and love have the "right and duty to opt" (Freire 1998, p. 53) and "consciously [take the] option to intervene in the world" (p. 122). Thus, Freire contended that there is no neutral pedagogy (Shor and Freire 1987), and so when they take up a position, teachers commit to making a difference to the lives of their students. One sense in which this proposition can be understood is for educators to recognize that their role is more influential than merely teaching content – their role includes the moral formation of learners (Freire 1998), which cannot be separated from teaching content.

As teaching occurs in a sociopolitical and economic policy context, it is further appropriate for teachers to display their respect for the sociocultural location of their students. Teachers have a direct influence on the cultural formation of students. This role may be particularly important to teachers helping their students to survive in a world they find alienating and one that often denies the cultural background of students or

subsumes this background in the mainstream culture. Confronting these political realities presupposes that teachers exercise ethical care and love for their students.

Teaching Is an Ethical Activity

Teaching is people-centered and draws heavily on, and significantly influences, human motivations, desires, beliefs, and goals. The relationships that develop in an educative context are therefore complex, and so Freire wanted teachers to note, “it is not possible to imagine the human condition disconnected from the ethical condition” (1998, p. 39). Therefore, teaching, Freire would argue, is an ethical activity.

Freire believed it not possible to be a teacher who educates, while at the same time avoiding the development of an attitude of love and care towards students (1998). So much so, he believed it the duty of teachers to be knowledgeable of the background of their students. This entails coming to understand first-hand of the daily living conditions of students and the context of their socioeconomic lives:

It's impossible to talk of respect for students...without taking into consideration the conditions in which they are living and the importance of all the knowledge derived from life experience, which they bring with them to school. I can in no way underestimate such knowledge. (1998, p. 62)

In classrooms that emphasize relationships, mutual trust between teachers and students will grow from the coherence of the actions and words of teachers. “Children are extremely sensitive to teachers who do exactly the opposite of what they say” (Freire 2005, p. 98). Therefore, Freire accentuated teachers’ actions over their words (actions speak louder than words), but ethical teachers must strive to ensure their words and deeds cohere. When, however, unethical choices are made, such as violating trust, then the relationships that exist in a school community are violated.

The ethical teacher is disposed to listening. This implies a focus on what is being said rather

than a focus on speaking or, as Freire ([1970] 1996) has it, delivering “communiqués.” A focus on listening over speaking does not silence the teacher’s voice, but allows the student’s voice that is struggling to make meaning and sense of knowledge. To create the climate in which this student voice can be heard requires a spirit of humility on the part of the teacher (Freire 1998), although this does not imply the submission of the teacher. By being an active listener, however, the teacher models appropriate behavior for students to follow in their relations with teachers.

Freire challenged the deepening instrumentality of teaching, suggesting that “to transform the experience of educating into a matter of simple technique is to impoverish what is fundamentally human in this experience: namely, its capacity to form the human person” (1998, p. 39). Thus, teaching is not a technical matter, Freire suggesting that to “educate is essentially to form” (p. 39). Teachers therefore engage in a task that is both richly ethical, yet radically uncertain. This state of uncertainty was captured by one of Freire’s well-known notions that humans are never complete; thus he was committed to an ontology of teaching that recognized teachers to be in a state of ever becoming (1998).

A final point of relevance to the idea of teaching as an ethical profession is what Freire had to say about power imbalances, possibly a reality of all classrooms, even democratic ones. Freire wanted teachers to respect the curiosity of students by not crushing their spirit. The ethical teacher respects “the dignity, autonomy, and identity of the student” (1998, p. 62), bringing “dignity to the practice of teaching” (p. 64). Needless to say, this is a challenging call, given the obvious power imbalances between (younger, less experienced, and less knowledgeable) students and teachers who are older, more experienced, and (possibly) more knowledgeable.

Commitment to Developing Critical Thinking in Students

In his famed *Pedagogy of the Oppressed* (1970/1996), Freire rejected “banking education” in

favor of “problem-posing education,” a rejection he reiterated in *Pedagogy of Freedom* (1998). He was thus condemning a transmission style of teaching in favor of a dialogical education that would develop critical epistemological curiosity (1970/1996, 1998) or, in other words, a critical disposition (1976). In Freire’s notion of problem-posing pedagogy, the life experience and prior knowledge of students become a text, or authentic context, in the development of knowledge and critical understanding. Problem-posing teachers demand academic rigor, yet also realize that students are always “recreating and remaking” knowledge (1998, p. 31). Thus, problem-posing teachers will seek ways to bridge the body of existing knowledge with that which students have and bring with them to ensure their students cross over from ingenuous curiosity to critical curiosity and consciousness.

Students should not have to engage in this development of critical understanding alone, or unaided. Rather, they require an “educator with a democratic vision or posture [who] cannot avoid...insisting on the critical capacity, curiosity, and autonomy of the learner” (p. 33). Therefore, it is important, argued Freire, for teachers to be reminded of their responsibility to promote and develop critical thinking: “The teacher needs to model an active, skeptical learner in the classroom who invites students to be curious and critical...and creative” (Shor and Freire 1987, p. 8).

Developing the critical thinking of students does not take place in a vacuum, and if students are to think critically, they must think *about* something. Specifically, this will be the knowledge of the curriculum and the knowledge of the students. It is important therefore that teachers must see themselves, and be seen, as authorities in their field of expertise (Freire 1998; Freire and Macedo 1987; Macedo 2000). This position is, however, counterbalanced by Freire’s insistence that democratic educators are not elitists or authoritarians (1985). Authoritative teachers ensure that minimum knowledge content is made available so that each student is equipped, not only for a gainful and meaningful life but a critically reflective one too. On the assumption that there is no value-free

pedagogy (Shor and Freire 1987), teachers seeking to develop the critical thinking of their students will problematize concrete human relations as a precursor to the development of critical consciousness (Freire 1970).

Teachers are challenged by a policy climate of accountability, and a demand for ever-increased student attainment, and may thus choose to ignore Freire’s behest to support students in developing their ability to become critically aware of their world. Or they can engage with the democratic import implicit in the promise of problem-posing education. Critically reflective teachers can achieve this goal for their students by demanding academic rigor and having the expectation that *all* their students can benefit by this rigor. Thus “a culture of excellence and justice” (Duncan-Andrade and Morrell 2008, p. 172) pervades the classroom, replacing low expectations and discrimination.

There are, however, dangers here. The notion of “critical thinking” is one that has become popularized by many national and State curriculum documents. As an example, see the New Zealand Curriculum (Ministry of Education [MOE], 2007), which is significantly influenced by the “key competencies” research of the Organisation for Economic Co-operation and Development (OECD) (see Benade 2012; OECD 2003). This curriculum makes only one reference to “critical thinking” (MOE 2007, p. 23) but uses the terms “critical” and “critically” eighteen times and “thinking” 20 times, this is in a document with only 43 pages of curriculum-relevant text. This policy outlines five key competencies for schools to focus on, one of which is “thinking”. So far, this seems laudable, but the detail yields a somewhat different message where “thinking” is defined as “using creative, critical, and metacognitive processes to make sense of information, experiences and ideas” (p. 12). Positively, this thinking should encourage students to “challenge the basis of assumptions and perceptions,” but may end up being little more than “developing understanding...constructing knowledge...[and]...reflect[ing] on their own learning” (p. 12).

Therefore, caution is advocated, as Freire’s notion of “critical consciousness” is not

equivalent to the suggestions advocated by this curriculum document in relation to “thinking” or “thinking critically.” It can be seen how Freire’s concept can be domesticated though, and it has been pointed out before (Roberts 2000) that Freire’s notion of critical consciousness is linked to his praxis of humanization – the ideal that all people will attain their ontological ideal of becoming more fully human *through liberation*. The on-going search for humanization is an on-going search for critical consciousness of the changing material world, to reflect on that world, and to transform it accordingly (2000). That is somewhat different to thinking about thinking.

Teachers’ Reflective Practice

Not only are teachers “unfinished” (Freire 1998), as are all humans, but by virtue of their exercise of an option to intervene in an imperfect world, they commit themselves to bring about transformative change. Therefore, the daily practice of teaching suggests that the identity of a teaching professional is actively forged and developed and is constantly evolving. In *Pedagogy of Freedom* (1998), Freire clearly intended that teachers be open to change and new ideas, through critical reflection. This reflective activity will support teachers to be consistent in their work, so that there is no incoherence of word and deed (1998). As already noted this coherence builds trust in the classroom. Coherent teachers are characterized by their “right thinking” (p. 40), which is developed not in one-off bursts but rather through regular and consistent practice. Such an approach “demands a seriousness in the search for secure and solid bases for his/her positions” (p. 40).

Freire noted on several occasions in *Pedagogy of Freedom* (1998) that action precedes theory, that a critically reflective teacher is open to change and novelty, and, of course, that both the words and deeds and theory and practice of a teacher must be coherent. Critical reflection on practice is thus central to Freire’s theory. When teachers think critically about their present practice, their future practice will benefit, and they develop their

theoretical understanding of their own purpose as educators. In Freire’s own words: “My theoretical explanation of [educational] practice ought to be also a concrete and practical demonstration of what I am saying” (p. 49). This interaction between practice and theory was termed “praxis” by Freire. An explicit Freirean strategy of praxis involves: problem identification, problem analysis, creation of a plan of action to address the problem, implementation of the plan, and analysis and evaluation of the action (Duncan-Andrade and Morrell 2008). This process supports teachers in their own research and knowledge development, and its action-orientation is in keeping with Freire’s view that reflective activity has the potential to transform the world (1976).

Praxis may thus also be understood as a process of critical self-reflection. Underlying this pedagogical approach is the teacher’s commitment to students “recreating and remaking” knowledge (Freire 1998, p. 31). A further underlying feature of praxis is wrestling with the differences of ability among students, who are not all ready to learn at the same time. Through a process of reflection, self-reflective teachers theorize their practice then try out their emerging theories as they gear classroom programs in such a way that students can bridge the gap from ingenuous to critical curiosity.

As self-critical learners, and problem-posing educators, teachers research their students as if they were themselves “texts.” Teachers seek to understand their students much as a reader seeks to understand a text. It is especially important that a teacher seek to understand the meanings their students construct. In doing so, teachers must demonstrate their respect for the dignity of their students and their acceptance of the idea that the moral formation of students cannot be separated from the teaching of content (1998).

Therefore, it may be seen that praxis, as a way of understanding critical reflection on practice, is morally informed and committed to transformative action. A focus on the relationship between theory and practice by teachers as part of their daily routine helps to challenge the technical and instrumental rationality pervading education in

the twenty-first century. Praxis is a resolution of the tensions that exist between theory and practice, enabling teachers to develop new approaches to knowledge and understanding, based on their interpretation of their students and what they know, existing knowledge, and the unique contexts of their classrooms.

Conclusion

In *Pedagogy of Freedom* (1998), Freire explicitly addressed himself to what it means to be a teacher. In so doing, he implicitly and explicitly provided a sense of what it means to be a *professional* in the context of the early twenty-first century that is dominated by an agenda driven by economic concerns. These concerns have been referred to here as neoliberalism, which Freire labeled a “scourge” (p. 28). The neoliberal agenda for education is reformist modernization, often played out in education as a demand for greater student achievement against a backdrop of data accumulation and accountability requirements. Too often, teachers meekly acquiesce – but Freire called for courage and set out a number of priorities for teachers.

Teaching is not a neutral activity and demands that teachers take up a position – on this point, Freire was clear. Ideally, the position he wanted teachers to take up is that of a critical, democratic, and progressive educator. In particular, he wanted teachers to be culturally responsive to their students and to contribute to their cultural formation. This position presupposes an orientation of love and care towards students, and this exhortation draws attention to teaching as an ethical activity. Teachers would have to be mindful of the inevitable power imbalances in their classrooms and work to overcome this challenge. In so doing, teachers commit themselves to keeping to the fore the dignity of their students as human beings. Teachers have other commitments beside. They must show the way so that their students develop as critical thinkers who know and understand their world, so that, like their teachers they may choose to intervene and transform their world. Finally, teachers cannot be helpful in supporting their

students to become critical thinkers and doers unless they too are models of critical reflection and action. Freire, a man grounded in the day-to-day of his students’ lives, recognized the significance of practice, yet believed theory to be significant in shaping practice. There are tensions and contradictions in the relationship between theory and practice, and Freire’s emphasis on praxis attempted to alert teachers to the dialectical ebb and flow between practice and theory, and theory and practice.

Freire’s simple humility and respect for the dignity of others, and his driving passion for the attainment of a just world in the face of a global orientation that emphasizes greed, self-aggrandizement, and individual attainment over social cohesion, serve as an object lesson to all educators and a model for all teachers to emulate.

order for the latter to receive education that meets their needs as Singapore citizens and as Muslims.

Much is known about the full-time Islamic religious schools, the madrasah (e.g., Abdul Rahman 2006). Perhaps less well known is the equally important part-time Islamic education offered in the weekends by the mosques and other establishments. Both the madrasah and its part-time counterparts suffer from negative perceptions chief of which relate to the quality of such education and the impact that this education has on social cohesion in multicultural Singapore. In recent times, Islamic education has undergone a steady transformation. New programs have been introduced that are more responsive to the issues facing Muslims in a multicultural society and a globalized world. This reflects the Singapore Muslim community's confidence to try out new models of Islamic education.

This entry describes some aspects of the part-time Islamic education program offered in the mosques in Singapore. The program is designed to cultivate spirituality and morality at the same time enabling its students to feel at ease with their identity as Muslims and as citizens.

Teaching for Thinking

Teaching Islam to Children in Multicultural Singapore

Mukhlis Abu Bakar
National Institute of Education, Nanyang
Technological University, Singapore, Singapore

Introduction

For many Singapore Muslims, secular education provided by the national schools is a legitimate and useful system that promises access to socioeconomic mobility. But it is a deficient system that must be completed with a supplementary Islamic education that offers the religious and cultural knowledge that is important to Muslims. Families enroll their children in both types of schooling in

Islamic Education

The history of Islamic education has been well documented (e.g., Kadi 2006; Leiser 1986). Much has been said about its contributions to the development of Muslim and non-Muslim societies – the production of sacred and pragmatic knowledge including the *hadith* (the verified words and actions of Prophet Muhammad), mathematics, medicine, and the humanities among others. The scientific greatness of this religion-based civilization, however, has since declined due to internal and external strife – the political rivalries among Muslim leaders and the Western colonial expansion being notable among them.

At the heart of Islamic tradition is the study and transmission of religious knowledge and practice. All knowledge, whether revealed or acquired, is revered, but knowledge linked to faith occupies a privileged place in the Muslim religious imaginary (Moosa 2015). The Qur'an is held by

Muslims to be the exact and immutable words of God and thus is the perfect example of revealed knowledge, i.e., knowledge as revealed by God. Acquired knowledge is derived from reason, or science, through the study of the physical universe and human societies. Memorization is a purposeful choice in the study of the Qur'an and a methodology that is used extensively in Islamic educational institutions.

Muslim children are taught about their religion from a young age (Boyle 2006; Hefner and Zaman 2007). Education of Muslim children can take place in the home, mosque, study circles, and after-school programs where the heritage of Islamic knowledge and practice is passed to future generations. Education for Muslims may also take the more formal structure of the *madrasah*, a full-time school, where the curriculum may include both religious and secular education, and the range of purposes can be as pragmatic as training students to become religious experts, to training students to become skilled tradespersons and employees of public and private secular institutions (Park and Niyozov 2008).

Where Islamic religious instruction is supplementary to public secular schooling, which can take place at the home of a Qur'anic teacher for a duration of time daily or in the weekends, the minimum a child would be tasked to learn is to recite the Qur'an if not also memorize some *surah* (chapter). This is a testament to the centrality of the Qur'an in Islamic education. The teacher might add to his teaching some aspects of *fard 'ain* (obligatory acts performed by each individual Muslim such as ablution, *solat* (five daily prayers), and fasting). Once the teacher is satisfied that the child has recited the Qur'an in its entirety with the proper *tajweed* (rules governing pronunciation during recitation of the Qur'an), the occasion will be celebrated by the child's family.

Learning and Memorization

Memorization of the Qur'an is synonymous with learning the Qur'an and is very important to the Muslim communities. It instills in the children the practice of living life as a good and observant Muslim. This type of learning has the lasting effect of embodying the revealed knowledge of

the Qur'an in the beings of the students (Boyle 2006). Embodiment, however, is exclusive to the Qur'an; other forms of knowledge such as those arising from reason are not fixed and therefore do not need to be embodied or engraved in memory. In her study of Islamic schools in Morocco, Yemen, and Nigeria, Boyle (2006) suggests that while the students might not be able to explain what they had memorized, they do "know" some of the Qur'an in the primary sense of being able to recite parts of it (Boyle 2006). Following the Muslim jurist, theologian and Sufi Al-Ghazali and the historiographer Ibn Khaldun, Boyle (2006) explains that memorization of the Qur'an is not the opposite of understanding it:

Memorisation is generally considered the first step in understanding (not a substitute for it), as its general purpose was to ensure that sacred knowledge was passed on in proper form so that it could be understood later. (p. 488)

Indeed, the meaning of what is memorized may gradually unfold as children advance in maturity or as they go on to higher education studying the various disciplines of Islamic Studies such as the exegesis of the Qur'an and the rule-based practice of the discipline of law (*fiqh* or *shari'ah* – a moral discourse on ethical guidelines), which make reference to the Qur'an. The memorization of the Qur'an is therefore meant to be the first step in a lifelong enterprise of seeking understanding and thus knowledge.

Putting memorization at the forefront of learning the Qur'an, however, may not be the best method in all contexts. The Qur'an was revealed to Prophet Muhammad (peace be upon him) in his own language and that of his community of followers. The majority of the Muslim communities cited in Boyle (2006) (Morocco, Yemen, and Nigeria) also speak Arabic. For all of them, memorizing of texts in their own language surely comes with at least a vague understanding of what the texts mean. It is another matter when one memorizes a text in a language one does not speak and understand as in the case of Singapore Muslims who are generally non-Arabic speakers. A tweak in the way memorization is utilized would be required, a point that will be clarified in the next section.

Rethinking Islamic Education in Singapore

Singapore is an island city-state of over six million people where Muslims (the majority of whom are indigenous Malays) constitute 15% of the population, with Taoists, Buddhists, Christians, Hindus, Sikhs, and believers of other faiths making up the rest of the population. It is secularly governed; however, the constitution upholds the right of groups to adhere to their religious faiths for as long as they do not compete with each other and their beliefs do not contest the ideological and administrative practices of the government which safeguards racial tolerance in the law, pushes race out of the front line of politics, and relegates racial cultural practices “to the realm of private and voluntaristic, individual, or collective practices” (Chua 1995, p. 106).

The majority of Muslims in Singapore grow up enrolled in the secular national schools and attend weekend religious classes for their Islamic education as described earlier. Since the early 1980s, when villages gave way to modern high-rise flats in multiracial neighborhoods, children receive religious instructions in the mosques where the curriculum incorporates the memorization of *du'a* and the basic rules (e.g., concerning ablution and *solat*) in addition to the recitation and memorization of the Qur'an. Today, the majority of Muslim children receive their supplementary Islamic education at the mosque (commonly known as mosque madrasah) or through private religious establishments.

For some time, Singapore shares with other Muslim countries in the region an Islamic education which is perceived to suffer from shortcomings. These include the inappropriate use of memorization other than for the learning of the Qur'an, rote learning, and the attention to rituals and aspects of mysticism. Such emphases appear to depart from ideas on education in contemporary society which place importance on the acquisition of knowledge and understanding, the cultivation of a spirit of inquiry, the development of responsible attitudes, and the preparation of young people for later life and wider society (Abdul Rahman 2006).

The rapid globalization and Islamic revivalism in the last three decades provided the impetus for the Islamic Religious Council of Singapore – a

statutory body that looks after the religious, social, educational, economic, and cultural interests of Singapore's Muslim community – to rethink the approach to Islamic education. In the mosques, a new curriculum has been introduced for different age groups. It exists alongside the more traditional mosque madrasah curriculum which it is gradually replacing. The new curriculum prepares Muslim children to better understand, appreciate, and practice Islam in light of the present and future challenges. It strives to develop students intellectually, spiritually, and emotionally into a responsible social being. The change in curriculum and pedagogy extends to the medium of instruction, from Malay to English, to cater to Malay children who prefer English and to accommodate non-Malay-speaking Muslim students. This is a departure from the traditional practice of using Malay as a medium of instruction.

The new curriculum moves beyond the subject of “faith and practices,” which is essentially *fard 'ain*, and “Qur'anic literacy,” which involves reciting, understanding, and memorizing selected chapters of the Qur'an. Using values-based, interactive methods and age-appropriate activities to aid active learning and participation, teachers inculcate values (*akhlaq*) through the stories of the prophets. Students, in turn, by engaging in interactive activities and field trips, build “life skills and character” as well as learn about “social and civilizational Islam.” There is a clear attempt to help children understand, in an age-appropriate manner, the connection between the knowledge learned and the environment in which they live: about friendship, neighbors, giving to charity, helping the needy, and appreciating the environment. These are preludes to being an active contributor and participant of the larger society. The relevance of Islamic values and practices in the students' daily lives and their identity as Muslim citizens living in a multicultural society are thus important components of the curriculum.

A distinctive feature of the curriculum is in the way it puts a premium on understanding of what is being taught from the start rather than later (cf. Boyle 2006). However, just as children's cognitive skills and behavioral dispositions develop in stages, so too should content be selected and

delivered in such a way that understanding is appropriate to the age. For instance, the essence of a *surah* (chapter) could be distilled early in the program appropriate to the age but revisited in the later years. Similarly, *fard 'ain* is taught and provided practice in a way that is age appropriate. Understanding is therefore incremental, progressing over the 20 years that the students receive religious instructions from the program.

Another important feature is its thematic content. On any particular day, the various subjects – Qur'anic reading, the values taught, a historical event discussed – would revolve around the same theme. In the case of Qur'anic literacy, instead of reciting the Qur'an cumulatively from page 1, children recite and memorize chapters that are relevant to the theme. Tying a *surah* to a theme offers a better chance for it to be fully embodied (Hardaker & Sabki, 2015) considering that the children do not understand Arabic but rely on the translation and teachers' explanation of the text. In this way, memorization, which is facilitated through appropriate hands-on activities, remains a crucial part in learning but not foregrounded.

This mosque-based program is not meant to develop religious experts or Islamic scholars who would require a more intensive training and assessment which the full-time madrasah is in a better position to provide. The mosque curriculum is designed with a specific purpose, "to develop *soleh/solehah* (pious/righteous) children who are nurtured with *taqwa* (God-consciousness) and good *akhlak* (character), knowledgeable in Islam, become practicing Muslims, and show care and concern towards others" (Majlis Ugama Islam Singapura 2015). Importantly, they have a holistic understanding of the religion, and the knowledge they gain enables them to establish a relationship with the Creator as well as develop good relations with fellow citizens – Muslims and non-Muslims – and the environment around them.

Final Remarks

Supplementary Islamic education serves a purpose specific to the needs of non-Arabic-speaking Muslim children who attend secular national schools in

multicultural Singapore. It departs from the almost exclusive use of memorization and rote learning as a pedagogical tool in earlier and some versions of Islamic education. The depth and intensity of knowledge and skills taught and how they are taught must not be compared with those of the full-time madrasah which has its own peculiar aims. The new approach to Islamic education in the mosques gives emphasis to the development of spirituality and morality and good citizenry. Importantly, it offers a learning experience that has the power to be transformative – where learning goes beyond the surface and touches the soul of the student leading the individual to act upon what has been learned. This experiment with Islamic education in Singapore is worth watching!

Technofeminist Lens on Schooling in the Digital Age

Heather Greenhalgh-Spencer
Texas Tech University, Lubbock, TX, USA

Introduction

The site of the school is, increasingly, a site of the digital. Teachers and students increasingly interact with each other and learn about and comment on the world around them using digital tools. The culture of schools, and the culture of student life, is presented, shaped, disputed, and contoured by students, faculty, staff, and parents interacting, around the school, online. In order to engage with this online culture-making, this encyclopedia entry draws on many of the conceptual terms and theoretical interventions of technofeminist scholars, such as Elizabeth Grosz, Anne Balsamo, Donna Haraway, Toril Moi, Iris Marion Young, and others, to excavate the ways a technofeminist lens allows us to draw forth the shaping of the site of the school in the digital age. The school engages in technological identity-making, identity-making along gendered lines, and a technofeminist lens allows us to explore those intersections.

Technofeminism explores cultures and practices around digitalia, and in this way technofeminism adds to ongoing discussions around digital culture, that are happening in cultural studies. This paper brings the lens of technofeminism to bear on the school and highlights the intersections of digital technology and gender at the site of the school. While often overlooked as a site of culture-making within cultural studies literature, schools are places where youth (and parents, and community members) spend 7–10 h every week day engaging in culture-making, identity-making, and culture-learning. The school is a site of intensive culturing, and this entry uses technofeminism as a way to explore the gendered and digital intersections of that cultural interaction.

In order to examine the ways that technofeminism is brought to bear on the site of the

school, first technofeminism as a field of study is defined. Technofeminism is then divided into four subfields or lines of inquiries: progressive inquiries; radical inquiries; embodiment, materiality, and ecological inquiries; and cross-disciplinary inquiries. These subfields are explored as a way to make meaning of digital technology, gender, and other positionalities, within the school.

Technofeminism and Education

Technofeminism is a line of research and praxis that unites gender studies, science and technology studies, and the study of digital and material spaces. There is a focus on critical intersectionality but also more on the ways that materialities, digital processes and programs, corporeal bodies, performative identities, and regimes of truth work together – and sometimes push against each other, in ways that make up our experiences with our technological and digital present. Technofeminism works to bring these intersections to light but also to highlight questions and practices in ways that push toward greater equality and critical inquiry in our society.

Technofeminism, as a lens for inquiry into education, examines the ways that intersections between technology and gender shape what we think of as the purposes of schooling, the ways we think schooling is done, and what counts as a proper teacher, learner, and technological subject. Technofeminism in education examines questions such as: How do gender and technology shape the ways we understand what counts as learning and teaching?; How does technology shape how we think about and perform identity?; How does access to technology shape outcomes in the school, and how do access points align with gender?; How does technology shape school curriculum, pedagogy, and evaluation, and how does this production interact with gendered expectations?; How does technology shape what counts as knowledge, and then how does this interact with gender to shape who counts as a “knower”?

These questions can have progressive, ecological, and even radical effects and lines of inquiry. The next sections parse out some of the ways that

technofeminism can be used to shed light on the school as highly embedded in cultures of the digital and technological – with gendered shaping.

Progressive Inquiries

The progressive line of inquiry in technofeminism and education takes up issues of access and empowerment in a way where gender is considered stable. Rather than thinking about how technology challenges what we think of as a woman or a man, progressive lines of inquiry regard these categories as stable. Gender shapes who has access to various technologies, how those technologies are used, and how technology is made or created. Schools are spaces of gendered practice, and gendering, as well as spaces of technology. Progressive lines of inquiry often explore specific subject positions in the school, such as librarians, school teachers, students, and mothers, and their diversity of experience with and access to technology in the school. This research takes up questions such as: How does technology shape teaching and librarian work as women's work? How is technology built for female teachers (or not), and how is it that gender shapes how technology is practiced in the schools? How does access to technology shape the ways that girls and boys think of themselves and their future lives?

Technofeminism, as a progressive line of inquiry, examines all forms of unequal access, technological engagement, and facilitation toward technological savvy. An example of this kind of scholarship which focuses on access to technology is the work being done on the STEM pipeline and the ways that women often “leak out” of pathways toward STEM education and STEM careers. A 2011 report by the US Department of Commerce reports that, while women make up about half of the workforce, they hold less than 25% of STEM jobs. This percentage drops even further if we remove STEM-oriented jobs in healthcare or education. President Obama released a report in 2013 which showed that women currently earn 41% of PhDs in STEM fields but make up only 28% of tenure-track faculty in those fields. However, this is not just a US problem. Likewise, the European Commission, in

2012, released a report showing that women made up 45% of the workforce, gained 53% of tertiary degrees, and yet only made up 32% of the STEM workforce. The International Federation of University Women released a 2015 report noting that, in Asia, only 18.9% of the STEM workforce are women. This same report revealed that 12% of the global STEM workforce are women. Women are not equally represented in STEM fields, and schools can be both part of the problem, or part of the solution, as we seek to critique and reverse the cultural norms and institutional policies that lead to the “leaky” STEM pipeline.

Beyond thinking about the STEM gender-gap, there are myriad ways that our interactions with technology in the site of the school are gendered. The labor of teaching in the digital age involves the creation of class websites, the creation of parent e-mail lists, data input into online programs that allow parents to have constant access to student grades, and the use of smart boards and other specialized digital technologies. And yet, the position of teacher is inherently a feminized subject position. Thus, teachers are shaped by an identity-paradox. Discourses that interpolate teachers as feminized link into discourses that interpolate the feminized position as antithetical to competent use of digital technologies. Teachers are asked to master the use of digital technologies and yet are always/already seen as incompetent users of digital technology. This same gendering shapes interactions between students, where boys and girls who are both asked to use digital technologies to create school work are judged as “naturally talented,” or not, in ways that draw on both actual access to digital technologies, as well as discourses that shape how labor and practice become intelligible to the viewer in gendered ways. School parents (often school moms) are asked to complete tasks for the school that involve digital labor, and this labor is often both erased and made suspect because it involves *moms* doing the kind of work that would normally be done by digital “professionals.”

These lines of thought foreground the ways that women are disempowered, made suspect, made second-class citizens, not given equal opportunities, and interpolated into a discourse

of technology that renders women and girls automatically out of bounds. This type of research is vital because it takes up diversity and equity issues, but it also validates current gender norms and often reinforces heteronormative and gender normed ideas of women, men, and uses of technology. Another line of inquiry in technofeminism foregrounds the ways that technology can be used to challenge gender and hetero norms. This is a more radical line of technofeminism.

Radical Inquiries

In its radical form, technofeminism works to deconstruct and push against the concept of gender as stable, and explores ways that technology can work as counter-hegemonic discourse and practice that proliferates a multiplicity of gender identities. This line of inquiry takes up questions such as: How does technology validate and interpolate gender normativity? How does technology challenge gender normativity? How are these practices used in the classroom? How does the use of technology in the classroom, in ways that focus on identity, create and challenge perceptions of gender and sexuality in the classroom? For this line of inquiry, pushing against the stability and binary of gender is key, and exploring what it might mean to more fully think about and practice trans or hybrid forms of gender becomes critical.

There are many examples of this line of inquiry – inquiry that focuses on the ways that digital technology can work to both cement and challenge gender binaries. For example, the edited collection *Adolescent Literacies and the Gendered Self* (2013) contains multiple articles on ways that teachers and students use new media and digital tools to grapple with the ways that gender is performed, policed, and challenged. There are also numerous digital tools that aid in questioning and pushing against patriarchy and gender normativity. *Jailbreak the Patriarchy* is one digital tool – a web browser extension for Google Chrome – that switches gendered pronouns on everything that is read using your web browser as a way of exploring gender normativity and gendered expectations. There are games, sometimes

used in classroom environments, which invite people to explore what it might mean to play with gender binaries in their creation of avatars and in-game interactions. Critical teachers and students can then use these games to create discussions around gendered and hetero norms.

While these games and digital tools, and these lines of inquiry, often invoke a feeling of play, virtuality, and experimentation, technofeminism is also grounded in embodiment, materiality, and ecological relationships.

Embodiment, Materiality, and Ecological Inquiries

While technofeminism explicitly takes up the intersection of gender and technology, it is always embedded in the idea that this intersection involves real bodies, virtual spaces, material spaces, and ecological and relational processes. The most fecund space of research is found in the reciprocal shaping of the virtual/digital and the corporeal/material. There is also a commitment to parsing out the ways in which geographies, things, and the world of the not-human both shape and are shaped by human bodies, ideologies, and cultures. Technofeminism assumes that technology must always interact with culture, ideology, and also with corporeality and real objects. There is a physical corporeality, as well as virtual, dimension to the reciprocal process of embodiment by/through technology. This commitment to culture, materiality, and embodiment in research informs studies on soma-cognition and soma-pedagogy with digital tools, ecological and relational research on classroom practices and investments in glocality, as well as research and curriculum development in eco education.

For example, Carol Taylor (2013), Greenhalgh-Spencer (2014), and Christina Hughes and Celia Lurry (2013) have all done extensive research on the ways that relationships between bodies, objects, and the larger ecology shape how we make sense of the world, how we come to know what we know, and how we operate in a classroom. There is also extensive scholarship being done on using digital devices that create

hybrid moments – where you are interacting with the digital device and also with a real world environment – that are designed to give students experiences that help them to think about environmental disasters, biomes, ecological interventions, manufacturing and global trade, and the ways that geography, commerce, race, class, nationality, and gender factor into labor, knowledge, and policies for our environment.

There are many researchers and teachers who are making connections between the uses of digital technology and ecological disasters. There are now curricula designed to help students think about e-waste and making green contributions to their communities. Many are using digital technology to work toward ecological understanding and cleanup. Schools are foregrounding these issues through a focus on ecology and eco education, and also doing this by highlighting a relationality to the earth, ecology, and materiality. Technofeminism works with these research projects and curricula to focus on the gendered implications. The use of digital technologies in the school invariably links into the world of digital production: where women (often in the Global South) work to produce and dispose of digital artifacts, while (most often) men both design and take credit for these digital artifacts. This process creates a system where men are designing the tools used by everyone, and women are making and then cleaning up after the tools that are used by everyone. Technofeminist research and curricula work to highlight these issues and push against injustice. Schools organize to create awareness campaigns around e-waste and provide safe avenues for disposal of dead devices.

This investment in making connections, between individuals, societies, material objects, ideologies, cultures, and technologies, is further aided and extended by a willingness to engage with other disciplines. One line of inquiry in technofeminist research explicitly takes up the ways that other fields can add critical illuminations onto the intersection of technology and gender. Critical cross-disciplinarity, as a line of flight within technofeminism, brings other fields to bear on the relationships and intersections of gender and technology.

Cross-Disciplinary Inquiries

Technofeminism, as an intersection of technology and gender, recognizes that objects, positionalities, cultures, language, and bodies interact in ways that form meaning and shape actions. As a field of research, it is well-positioned to foreground the value of bringing other fields of research and other ways of knowing to bear on phenomena. Critical cross-disciplinarity, as a sub-field of technofeminism, formalizes that process. Inquiries that are interdisciplinary ask questions such as: How do gender and technology intersect with race, religion, socioeconomic class, nationality, language, ethnicity, dis/ability, geography and age?; How do multiple positionalities interact in order to shape epistemology and praxis around technology?

For example, there is extensive research that looks at the ways that race and gender intersect with disability in the use of assistive technology and digital technology in the classroom more broadly. Shoshana Magnet (2011) offers an insightful critique of the ways that technology is used as a diagnostic tool to track students, to measure output, to categorize with a cognitive disability, etc.; and how these technologies often intersect with race, class, and gender in ways that sometimes make the use of digital tools for diagnosis problematic. There is also a strain of research that explores the ways that disability is symbolized or embodied, in raced, classed, and gendered ways, in RPGs or online worlds such as *Second Life*.

Furthermore, there is a growing body of scholarship that examines the power of positionalities outside of the standard race, class, and gender categories. For example, Fogle and King (2015) write about the ways that technologies are used to teach and assess English, language learners, and multilingual students; and they explore the ways that gender and sexuality inform the ways that students respond to these tools. These authors explore the ways that language – as a part of but also different from race and ethnicity – intersects with gender and technologies. Another scholar, Teresa Correa (2015), explores beyond the race, class, and gender categories to look at the

positionality of youth. She “investigates whether bottom-up technology transmission is associated with a possible reduction of socioeconomic-, age-, and gender-based digital gaps” (p. 1163). In her work, Correa argues that the status of adolescence, adulthood, parenthood, and childhood all influence feelings of efficacy with technology as well as the desire to experiment with and learn more about technology. Adolescent students gain experience with the digital in school, and then become the “experts” on digital interaction in their homes. An interdisciplinary or critical cross-disciplinary approach allows us to explore the ways that multiple identity markers work to construct the self as a technological subject within the context of schooling.

Conclusion

Technofeminism, in progressive, radical, ecological, or cross-disciplinary lines of inquiry, guides toward the consideration of technology as more than a set of tools, machines, or practices. Technology, and the making of the technological subject, involves reciprocal relationships where technology shapes what becomes intelligible and do-able but is also shaped by the desires, questions, practices, and cultures of people and institutions. This reciprocal relationship has implications for how we do research in technology more broadly and also has specific implications for what happens in schools. Schools foster the making of culture, the making of identity, and the becoming of both gendered and technological subjects. Technofeminism leads us to consider the intensive structuring of the subject that happens in schools, and explore how relationships with people and things are built. Technofeminism, further, leads to new forms of pedagogical engagement, where teachers and students use technology as a lens for critique and also as a way to oppose inequity and create multiplicity in thought and identity. Technology can validate the status quo and can also be reimaged by subjects using and remaking technology in new ways. This stance should guide future research and practices in schools.

Temporalities of Academic Work

Filip Vostal

Centre for Science, Technology, and Society
Studies, Institute of Philosophy, Czech Academy
of Sciences, Prague 1, Czech Republic

Synonyms

[Acceleration](#); [Higher education](#); [Research conduct](#); [Speed – positive aspects](#); [Time pressure](#)

Introduction

Since the beginning of the twenty-first century, academic work in institutions of higher education has been subject to manifold and unprecedented technological and political-economic pressures. For academics, it is nowadays far from sufficient to be committed and competent in a discipline, intellectually engaged with a distinctive research niche, and a competent teacher. To be professionally successful, academics now need to adopt output-oriented and anticipatory behavior. They need to negotiate – and in a sense internalize – ubiquitous digitally mediated metrics assessing their work. They are what their h-index of publication productivity and citation impact is. Academics also must navigate regimes of accountability, market-driven and managerial mindsets, and excessive (both externally imposed and internally steered) competition for resources (i.e., grant income) and prestige.

This entry surveys insights from the current debate on the changing temporalities of academic work and traces major argumentative threads and critiques that have emerged in this body of scholarship. Specifically, it identifies two major

discourses. The *prevailing discourse* stresses acceleration and time pressure in academic work in relation to the tectonic shifts in and of academia under digital capitalism (e.g., the role of information and communication technologies, increasing workloads, metrification of academic work, and personal and professional implications of these trends). The *marginal discourse* deals primarily, and perhaps unconventionally, with positive and often underestimated aspects of acceleration in academic work. Examples include fast communication, immediate access to publication databases, fast publication practices, and psychophenomenological attributes of research conduct.

Acceleration Experience

Until recently, in the social sciences, acceleration has predominantly been gestured at or used as a contextual reference. Nowadays, however, acceleration has become a prominent theme in current discussions on temporal dimensions of modernity (Rosa 2013; Tomlinson 2007). These discussions investigate, among other themes, the interconnectedness between acceleration and modernization, (digital) technologies, secularism, capitalism, modern warfare, and bureaucracy. The debates also include sources and expressions of acceleration, patterns of acceleration, motors, contours, and unintended ramifications. They trace, for example, what rush, hurry, time pressure, and speed-up mean for democratic order and mental well-being of modern individuals.

Technically speaking, acceleration is defined as change in velocity with respect to time. Physical movement is therefore a crucial attribute. Yet, the social sciences and the humanities treat acceleration differently: as a distinctive modern *experience*. Rosa says that experience of acceleration can be defined as the “increase of episodes of action and/or experience per unit of time as a result of a scarcity of time resources” (2013, p. 121). Thus conceived, acceleration experience does not (necessarily) express physical movement but rather captures a widespread state of mind, shared social ambience, and prevailing sentiment. In this sense, acceleration experience is also

stationary: as modern individuals, in fact, we “can experience time pressure, haste, hurry and rush – all of these essentially cultural-phenomenological rather than physical descriptions – without even stirring from our office desk” (Tomlinson 2007, p. 3).

Albeit largely stationary, acceleration experience manifests itself in very tangible ways (chronic time pressure, burnout, depression, frustrations). Acknowledging its intellectual grounding in critical social theory, the evolving “acceleration debate” is often overly preoccupied with such negative implications of acceleration. Acceleration is, often correctly, treated here as something inherently harmful – for social development, psychological conditions, professional conduct, sustaining social relations and formation of identity (see Rosa 2013). This interpretation, nonetheless, underestimates the possibility that acceleration can be energizing, useful, convenient, and satisfactory. Alongside its oppressive and detrimental effects, acceleration, although in a thin sense, might also manifest itself as a positive experience. This forms two major discourses in relation to acceleration experience. The prevailing discourse highlights negative aspects of acceleration, while the less-discussed marginal discourse emphasizes its energizing and liberating features.

Empirically and ethnographically, researchers have begun to explore how acceleration experience manifests in working life and in relation to digital technologies (Wajcman 2015). Since the end of the first decade of the new millennium, examinations of acceleration and temporality have also become an emerging field in critical studies of higher education. Academia is an apt field to explore acceleration. It is not only a “laboratory” of the economic (ir)rationality of neoliberalism; it has also morphed from society’s intellectual epicenter into a branch of the economy. Academia has smoothly adopted principles such as audit culture, managerialism, accountability, and efficiency. Such adoption has arrived at the detriment of cultivating disinterested research and *Bildung* – intellectual formation and development through education. In this connection, scholars scrutinize the shifting character of the academic profession and the transformation of

rhythms of academia (see Pels 2003; Gibbs et al. 2015), often contextualized by acceleration in and of academic life, and its consequences.

Prevailing Discourse: Oppressive Acceleration, or *Busyness*

In contemporary academia, there is a pervasive sense that things are constantly and incessantly speeding up. Academics report chronic time pressure, a “rat-race” lifestyle, fear of missing out (“FOMO”), tyranny of e-mail, frustration, stress, burnout, sleeplessness, exhaustion, mental problems, and inability to follow developments and debates in their respective disciplines and fields (see, e.g., Besley and Peters 2005; Ylijoki 2013; Müller 2014).

A common, rational reaction to such pressures is compression and speed-up of job-related activities such as reading, writing, communicating, conducting research, analyzing results, and so on. Academics, as widely reported, have lost their status of “leisure class” and the associated temporality. This pattern negatively impacts, perhaps even nullifies, the *unhasty* pace (Pels 2003) that had underpinned the academic profession. For instance, academics from humanities and social sciences report that due to excessive workloads and “text and information obesity,” they can barely find the time to read, not to mention write books (Rosa 2013, p. 136).

The involuntary and oppressive acceleration often reaches into extra-academic activities such as family life and regeneration activities (sports, hobbies), where it disturbs social ties and friendships. What seems to be disappearing is not “time as such” but “quality time” (see Wajcman 2015), which constitutes crucial functional and normative preconditions for knowledge reproduction and well-being of individual academics, and is defined in opposition to the currently dominant experience of “distorted or interrupted time” and “permanent distraction.” The spectrum of negative temporal experiences can be called “oppressive acceleration,” and its main feature is disruption of unique rhythms underpinning the academic vocation. This spectrum can be

contextualized with the ongoing and deepening neoliberalization of academia, transformation of academic jobs, progressive reduction of scholarship to metrics, massification of academia, and exponentially growing numbers of publications expected to be written and waiting to be read.

The neoliberal practices – with managerialism, the imperative of boundless productivity and the notion of “excellence” at their center – constitute a “fast academic time,” which is increasingly incompatible with the relatively unhasty rhythm or “slow time” of academic work. Steadily increasing job demands, rising number of administrative duties, and bureaucratic form-filling account for additional and substantial “time-thieves” in academic research. Academics certainly cannot conduct research fast; they can barely write “fast.” Reading, as another closely related near-universal academic activity, can occasionally be conducted speedily. Yet, this heavily depends on various parameters, including the character of the text (for instance, student seminars might read faster than latest research) or familiarity with the topic. Also, many experiments in natural sciences as well as research activities in the humanities and the social sciences (i.e., archival work, data collection) are temporally demanding and cannot be conducted speedily.

What it means to be an academic nowadays changes dramatically. Based on how academics understand own profession (and its transformations), and how this understanding is continuously (re)formed and (re)created, academic subjectivity generates “winners” and “losers.” Winners are capable of being “in synch” with the accelerating tempo of academic life due to their situatedness and position within the existing hierarchies (e.g., established male professors of natural sciences are arguably less susceptible to temporal pressures than female junior academics in the humanities and the social sciences). The most vulnerable group in this sense are postdocs and early career scholars who often report anxieties and “life at the bottleneck” resulting from, as Müller (2014) aptly asserts, the directionless race to the bottom.

Academic work, and research in particular, might under some circumstances be defined as unhasty or busyless activities. This means that

they are slow – not in a regressive sense but perhaps slower than professional pursuits in private domains, politics, media, and business (Pels 2003). Hence, the “slow ideology” and its appeal as a counterpoise to oppressive acceleration (e.g., Slow Science, Slow Academy, Slow University, Slow Professor) begin to appear as an important strand in critical debates on contemporary academia. Alongside neoliberalization and managerialism, the main target of slow ideology is academia’s fast time – i.e., the experience of rush, busyness, stress, and the like – “in which many are immersed,” but is unevenly distributed within academia (Barnett 2011, p. 74). Adding to this view, the academic time as such – and acceleration experience at its center – is ideally multifaceted: the overarching and desirable unhasty pace (especially in comparison with other social domains) is intertwined with “fast moments.”

Marginal Discourse: Conductive Acceleration, or *Eureka*

Without undermining the seriousness of oppressive acceleration for academic work, knowledge production, and human well-being, academic acceleration also results in certain positive effects. Conductive acceleration is defined as intended, controlled intensification or dynamization of a specific activity. Conductive acceleration may be related with a technological medium that enables faster movements or processes, or it can work through more subtle psychological dynamic associated with the act of research such as intuition, rule of thumb, or tacit knowledge. Conductive acceleration can be further divided in two categories: practical acceleration and psychophenomenological acceleration. These aspects of acceleration experienced in academic life are discussed, often in connection or contrast with the dominant discourse on acceleration (see Barnett 2011, pp. 72–5).

It is also commonplace among academics to highlight the conveniences of fast and remote access to entire journals and other scientific databases through university library interfaces. In terms of the pace of publication and distinctive

temporalities of different publication formats in the natural sciences, Ludwik Fleck (1979, pp. 111–125) introduces the fast-moving “journal science” and slow-moving “vademecum science,” and analyzes the interplay between them. The journal science accounts for tentative, cutting-edge, *vanguard*, fragmented, *fast* shaping of scientific knowledge, and vademecum science accounts for slow, codified, established scientific knowledge in the form of textbooks, handbooks, “stable” canons, and paradigms. Academics practicing “journal science” require fast-moving publishing industry, and tools monitoring speed of review and speed of publication offer valued orientation in publication landscapes.

Acceleration is not always reactive and involuntary – it is also attributable to fundamental tenets of scientific progress. Many academics appreciate open access short reports and blog contributions, with vast online readerships, which greatly outnumber readerships of academic journals. This opens up the question of whether the use of digital technologies which enables fast (scientific) communication can be also perceived – and experienced – in positive terms. In the case of learning, for instance, the overall perception of the “digital turn” in higher education is largely positive. Hence, next to digital technologies’ indisputably intrusive nature (permanent connectivity, email overload), there surely exist some practical and enhancing aspects (fast dissemination of research, prompt communication).

In psychophenomenological terms, acceleration experience in academic work can also be seen as energizing – it can and does contain the pleasure of discovery, accomplishment, application, and solution. This perspective stresses the role of (often unexpected or unintended) accident in scientific work, which potentially delivers innovative perspectives. The role of the mind in the “psychology” of academic work is also important here, particularly as teamwork, brainstorming, and other collective generative activities that potentially “ignite” a train of thought. Under the influential model of Daniel Kahneman (2011), thinking as such comprises of different speeds – fast *and* slow.

Experimenting, thinking through, and writing are slow, contemplative, and time-consuming

attributes of research. If academics (are forced to) speed up these activities, they may compromise accuracy, correctness, and validity. Yet there are other attributes of research which can be seen as “fast” in a positive sense, and which complement the productive “slow” attributes. This category of conductive acceleration reflects *moments* in academic work which are sensual and cognitive in nature. Conductive acceleration functions similarly to oppressive acceleration, as these moments account for a state of mind or mental (re)configurations of individual’s mindset, rather than a physical enjoyment produced by activities such as riding a motorbike or roller-coaster.

The triggers of conductive accelerative moments in academic work are “Aha moments,” the pleasure of discovery, and they can be captured with the familiar term *Eureka* (insight, epiphany). Conductive acceleration moments often result from accomplishment of research tasks, successful publications, and complete projects. Such propellants of acceleration are *conditioned* by the existence of the principle of temporal autonomy that academics would ideally enjoy, and academic institutions would ideally protect and nourish. Yet the opposite seems to be the case: together with leisure and comparatively unhasty rhythms of academic work, fast and energizing moments are equally compromised in the neoliberal regime.

Acceleration cannot be restricted to a rational reaction to short time supply. It can be intentional, voluntary, energizing, convenient, conductive; it may open new possibilities and connections (e.g., distributing research results on social media); it might accompany moments of discovery and propel intellectual endeavors. Acceleration which academics have fully under control, when they are able to “change gears,” externally imposed or resulting from the temporal demands associated with externally sanctioned duties, can bring accomplishment and satisfaction.

Conclusion

Individual time experience in the academia is far from singular or definitive. It can be thought of

using the prevailing discourse of oppression and the marginal discourse of positive effects. In spite of its strong domination, the discourse of oppression needs to be complemented with important energizing and convenient attributes of acceleration in academic life. In the emerging debate on the academic temporal experience, such nuanced view is often underestimated, as the prevailing discourse tends to criticize oppressive acceleration exclusively (albeit correctly and productively).

Reaching the ideal of slowness resolves only a part of the problem, as leisure and an unhasty pace coexist in symbiosis with conductive acceleration. The established dichotomy of “good slowness” versus “bad acceleration” is incomplete. If slowness can also be unwelcomed and undesired, then acceleration can also be practical and energizing. In spite of their analytic separation, the two acceleration experiences overlap and intermingle in the academic lifeworld; they are fluid and mutually constitutive. The productive tension between the two temporalities of academic work containing slow *and* fast attributes is in need of preservation.

Theorizing Curriculum Implementation and Evaluation in Early Childhood Education

Joce Nuttall

Australian Catholic University, Melbourne, VIC, Australia

Theorizing Curriculum Implementation and Evaluation in Early Childhood Education

Theories of curriculum implementation and evaluation in early childhood education during recent decades have been governed, broadly, by two

contrasting sets of assumptions. The first set of assumptions attempts to understand curriculum in early childhood education holistically, viewing children, educators, and families as learning together. The second takes a much more instrumental view, positioning teachers' practices as causal mechanisms for child and family outcomes. This encyclopedia entry will summarize each of these positions, concluding with a brief discussion of the possibilities for a rapprochement between the two positions.

One of the defining characteristics of the field of early childhood education is its ongoing struggle to define "the curriculum" (Gibbons 2011). In part this is due to the field's history of viewing early education holistically, extending beyond traditional subject-oriented domains such as science, mathematics, and the arts. The epistemological bases of this holistic definition position knowledge not as a purely conscious, intra-mental phenomenon, but as including embodied, esthetic, and affective dimensions of human knowing and being. This epistemological stance draws on a post-Cartesian understanding of learning and development (Simms 2008), viewing knowledge as developing in and through a unity of mind and body. Unlike the development of school curricula, with their origins in content-oriented syllabic models of content and allied teaching methods, early childhood curricula have developed through a long sociohistorical trajectory that has overlapped the domains of subject-oriented content, relationship-oriented teaching methods, home environments, classroom practices and materials, family culture and aspirations, children's interests and agency, educators' preferences and intentions, and the social and economic demands of the wider community.

This post-Cartesian and socioculturally-oriented definition of curriculum also means that the distinction between "teaching" and "learning" does not hold: if curriculum is understood holistically, then the pedagogies children experience are necessarily subsumed into children's experience of the curriculum, thereby forming a key aspect of curriculum implementation itself (Edwards and Nuttall 2005). This drawing together of curriculum implementation with curriculum per se has

been taken up to some extent in school settings through the concept of "enacted curriculum," which attempts to combine the demands of subject-oriented curriculum (the "intended curriculum") with what actually happens in the classroom, including teaching practices. The definition of curriculum in early childhood education remains even broader, since it aims to capture every aspect of the environment to which children are exposed. Aotearoa New Zealand's early childhood curriculum framework, *Te Whāriki* (Ministry of Education 1996), reflects this all-encompassing epistemological and experiential basis for early childhood curriculum when it states:

The curriculum is provided by the people, places, and things in the child's environment: the adults, the other children, the physical environment, and the resources. The curriculum integrates care and education and includes both specifically planned experiences and activities and interactions that arise spontaneously. (p. 11)

A holistic definition of curriculum raises particular challenges for curriculum evaluation, since the number of variables at play in curriculum implementation is enormous and many of these variables, such as the nature of spontaneous interactions, are highly subjective and context-specific. This definitional problem is complicated even further when identifying the epistemological and ideological discourses within early childhood curriculum documents. These include post-modernistic, humanistic-constructivistic, futures-oriented, and individualistic, which reflect implicit and shifting understandings about the ontological status of children and childhood (Turunen and Määttä 2012). Socioculturally-oriented definitions of curriculum implementation in early childhood education have also become widespread during this period and are consistent with a holistic view of curriculum implementation, since socioculturalism understands teaching and learning as interpenetrating and co-evolving (both for children and their teachers). Such discourses have given risen to attempts, in Finland, New Zealand, and elsewhere, to evaluate early childhood curricula by employing concepts such as ethical and political practice and through

localized strategies of teacher reflection and center self-review.

Although such broadly discursive strategies and localized practices have been shown to have impact at the local level, they have had only limited impact at the broader policy level, due to parallel developments in economics and education policy that rely on a much more instrumental view of the relationship between teaching and learning. This second understanding of the nature and purposes of early childhood curriculum has become influential since the 1960s and draws principally on human capital theory, which has come to dominate early childhood education policy globally during recent decades (Lightfoot-Rueda and Peach 2015). When applied to early childhood education, human capital theory argues that inequality in early years experiences leads to subsequent inequality in academic ability, health, and adult success, and that investment in quality early childhood education can remediate adverse parental and environment effects on achievement. Such arguments, although contested on ideological, epistemological, and methodological grounds, have been highly persuasive amongst governments in minority-world countries seeking to both contain government expenditure and maximize the effects of targeted expenditure. This persuasiveness has resulted in major policy investment in early childhood education, with an accompanying intensification of policy strategies to monitor quality in early childhood services (OECD 2015).

Many of these strategies rely on quantification of curriculum implementation activities as “inputs” and measurement of children’s subsequent scholastic achievement as “outputs,” in order to be assimilated into the complex mathematical formulae used to express human capital theory. Economist and Nobel laureate James Heckman has calculated, for example, that investment in high-quality early childhood education for disadvantaged children produces up to a 10% return on investment for government across a child’s lifetime, through reducing subsequent demands on health, justice, and social services budgets. This positivistic epistemology has been used by governments and lobby groups to subsequently make claims about “what works” in early

childhood education, particularly for historically marginalized groups of people. Although early childhood academics have contested the axiological bases for such claims (Dahlberg and Moss 2005), regimes of monitoring and accountability are now widespread and highly quantified. This has resulted in tensions for early childhood teachers whose axiological commitments do not align with the pedagogical implications of human capital theory, which have been identified as leading to an emphasis on the “academic” aspects of early childhood curriculum at the expense of a more embodied and holistic view.

Tensions over the definition of curriculum in early childhood education surface again as children move between prior-to-school educational institutions and school settings. Disturbances at this point in children’s lives are, at least in part, grounded in the contrasting ethical stances taken by educators with respect to what constitutes worthwhile knowledge (Carr 2013). These disturbances are most commonly evidenced through the assessment tools employed by educators, since these tools not only attempt to explain children’s learning and development but serve to reinscribe the epistemological and axiological commitments of particular professional contexts. Assessment tools provide a direct window into what is valued and understood as “the curriculum,” however defined.

Attempts to reach a compromise between these ideological, epistemological, and methodological attempts to make sense of early childhood curriculum have been only modestly successful, at best. Early attempts at theorizing curriculum implementation and evaluation in early childhood education tried to resolve this tension by quantifying curriculum evaluation whilst also capturing the complex nature of early childhood curriculum. These attempts adopted the concepts of “structural quality” and “process quality” as evaluative categories. Structural quality denoted observable features of the environment (e.g., materials, ratios of staff to children) and aspects of resourcing identified as influencing children’s curricular experiences (e.g., level of teacher qualifications, amount of ongoing professional development for teachers). The concept of process quality attempted to capture more ephemeral aspects of children’s experience,

including the number and nature of interactions between teachers and children.

Instruments such as the Early Childhood Environment Rating Scale (ECERS) and its revised version, ECERS-R (Harms and Cryer 1998), have been developed to support the attempt to evaluate both structural and process variables in early childhood education environments. The ECERS-R includes items, collectively referred to as “proximal” or “process” variables, to represent human interactions. In the case of the ECERS-R these rely heavily on spoken language, including “greeting/departing,” “encouraging children to communicate,” “discipline,” “staff-child interactions,” and “staff interaction and cooperation.” The embodied aspect of children’s experience is evident in the category of “Personal care routines,” which includes items such as “toileting/diapering,” “nap/rest,” and “meals/snacks,” separate from categories such as “Activities,” “Language-reasoning,” and “Interaction.” However critics of the ECERS-R have argued that it can provide only, at best, a global indication of quality as a broad construct in curriculum evaluation (Perlman et al. 2004). Furthermore, contemporary curriculum evaluation moves relying on instruments such as the ECERS-R also implicitly assume a unidirectional causal relationship between teachers’ practice and child outcomes, rather than attempting to resolve the relationship between them.

Although some research has attempted to identify the relationship between the two constructs of “structural” and “process” quality, the challenge remains to develop evaluation strategies in early childhood education that can make sense of the multiplicity of variables within a holistic definition of curriculum and the dynamic, multi-directional interplay of teaching and learning.

Theory Building and Education for Understanding

Carl Bereiter
Institute for Knowledge Innovation and
Technology, University of Toronto, Toronto, ON,
Canada

The term “understanding” has many senses, most of them valid in their appropriate contexts. There is a sense in which our loyal dog understands

us. There is a spiritual sense, in which understanding is arrived at through inward reflection – something we may assume does not play a role in our dog’s understanding. There is a sense in which understanding means about the same as wisdom, a sense in which it is a form of deep practical knowledge, and of course a subjective sense signaled by expressions such as “Now I get it.” But then there is also the “illusion of understanding” (Jacoby et al. 1994). Non-illusory understanding must be able to pass certain tests, and the most convincing test is the ability to produce explanations that stand up under criticism and empirical testing. Producing such explanations is in essence theory building. This article examines the implications of viewing the collaborative pursuit of understanding by students as a theoretical enterprise.

From Brainstorming to Theory Building

Ask a roomful of elementary school children why something is the case – why leaves turn color in the fall, for instance, or how an airplane stays aloft – and they will produce a variety of explanations, some fanciful but some fairly reasonable and even ingenious. Their thinking will for the most part qualify as theoretical: They attribute the phenomenon to natural causes; faced with contrary evidence, they will abandon or alter their explanations. What is missing is theory development. The children are usually satisfied with their explanatory ideas and indicate no spontaneous interest in testing them or developing them further. What they are doing is a kind of brainstorming, and teachers may be thoroughly delighted with it, see no need to press on, and balk at getting young children to recognize that some of their ideas are wrong. Children, thus, are invited to spin theories but they are held back from theory building. *Theory building starts when an explanatory idea is modified or further developed to produce a better explanation.*

What constitutes a theory has been the subject of much discussion across a wide range of disciplines. At the school level, however, educators can afford to take a relaxed approach to the question of definition. There is little harm in calling every

explanatory statement uttered by a student a theory and placing the emphasis instead on theory change and improvement. This is in line with the programmatic view of science originating with Imre Lakatos (1970). According to Lakatos, a theory should not be judged on the basis of its status at a point in time but on its course of development, which may be progressive or degenerative, depending on whether negative evidence is dealt with in ways that strengthen or weaken the theory. Weak ways include adding exceptions and weasel words such as “usually” and “tends to.” What constitutes strengthening an explanation, however, is more complicated. The accumulation of supportive evidence may increase confidence in a theory, but it does not improve the theory itself. On the basis of concepts of “reasoning to the best explanation” and “explanatory coherence” (Thagard 2000), an explanation can be judged to be getting stronger if:

1. It explains more facts.
2. It excludes more false statements.
3. It connects to more other explanations.
4. It explains things in more detail.
5. Parts of the explanation interlock so that it becomes increasingly difficult to modify parts without altering the whole.
6. It is able more clearly to identify what it fails to explain.
7. It generates better predictions.
8. It explains *how* identified causal factors work, rather than only identifying and quantifying their effects.

A strong theoretical program may encounter many “anomalies,” as Lakatos called them – discoveries, observations, or failed predictions – that are problematic for the developing theory, but it gains strength by theory revisions in accord with the eight criteria just listed. The history of evolutionary biology, from Darwin onward, is a remarkable story of progress on every one of these points, with evolutionary theory becoming stronger and stronger as a result.

Young students’ explanatory theories are likely to consist of single-cause explanations: Hunting is the cause of species endangerment, summer weather is caused by the earth getting closer to

the sun, and so forth. Adding more causal factors is an improvement, but usually only with respect to the first and seventh criteria. Yet adding causal factors and accumulating evidence is often all that inquiry learning and guided discovery consist of. Such theory-free approaches are often inaccurately labeled “positivism,” which does injustice to a philosophical program that was a great deal more sophisticated. A more accurate label is “naïve” or “dust bowl empiricism.” Although the eight criteria may be difficult to meet, they are not particularly hard to understand. Consequently they can serve as goals for teachers and students and standards according to which students can evaluate their own explanatory efforts.

Progress in explanatory theory building means more than constructing a better answer to the initial question. It also usually means improving the question being addressed – “deepening” the inquiry. In Hakkarainen’s cyclical model of inquiry, “question deepening” is an essential part of the process, not an occasional outcome (Muukkonen et al. 2009). Theories, as Karl Popper maintained, are provisional solutions to problems, and a theory cannot be understood, let alone improved, without adequate understanding of the problem the theory is supposed to solve.

Question deepening is well recognized in mature science, but it is especially important with school students, because their initial questions are liable to be superficial or overly general, and explanatory progress does not really get moving until the problem is better formulated. Deepening or refining the question does not necessarily require a major conceptual shift, either. The following dialogue was reported by a grade 5/6 teacher:

Student: I need to understand: how does the heart work?

Teacher: What is it you don’t understand about that?

Student: Why does the blood have to circulate?

Why the blood needs to circulate is a much deeper question, one that “gets to the heart” of understanding the circulatory system: It needs to be answered before the whole system of arteries and veins and the existence of a subsystem devoted to the lungs make much sense. Yet the deepening took only a matter of seconds.

However, getting to a fruitful question may often require repeated cycles of theorizing and reformulating problems. Within the span of the school years, there may be no end to it. Although question deepening is often a responsibility left for the teacher, a current development in the learning sciences is to provide students with tools that help them carry out a deepening of inquiry by themselves (Scardamalia and Bereiter 2014).

Truth and Authority

In the preceding discussion of theory improvement, nothing was said about truth or getting closer to the truth. Philosophers of science mostly agree that there is no way of ascertaining that a theory is getting closer to the truth, and so such judgment can only be made retrospectively. In formal education, however, there is a stand-in for truth according to which student progress in understanding can be judged: expert consensus or the representation of it in authoritative texts. It is possible to judge student progress in terms of getting closer to the authoritative consensus, and this is how student understanding has traditionally been assessed (Nickerson 1985). Claims that the authoritative consensus is correct are commonly based on the weight of evidence. This becomes apparent when a vocal minority questions the authoritative consensus, as is currently the case with climate change and evolution. The scientific consensus in both cases is based on powerful theoretical models, but the arguments in support of the consensus appeal mainly to the massive evidence in favor of it rather than to the explanatory power of the models. Thus, for purposes of academic success and effective citizenship, it is important that students understand the strengths and weaknesses of expert consensus and weight of evidence, while still guiding their own efforts to achieve understanding by principles of explanatory coherence. One objection to the current emphasis on argumentation in school science and social studies is that it tends to overvalue weight of evidence and to neglect explanatory power. Weight of evidence is not ignored in applied sciences. If the science is lacking to explain why

treatment A works better than treatment B or to explain why in some cases treatment B works better, but the vast majority of results favor treatment A, then A becomes the treatment of choice. Similarly, if economic history shows that applying one economic theory usually leads to better results than applying another, then it is reasonable to base a choice on the weight of historical evidence even though the scientific merits of the two theories may still be in dispute. Scientific literacy and, more generally, knowledge literacy require recognizing the value of principled (e.g., theoretical) knowledge and also recognizing bases for rational and even creative action when principled knowledge is lacking (cf. Bereiter 2014).

Because for students the bulk of their disciplinary knowledge comes from authoritative sources rather than from original inquiry, it is important for them to develop an intelligent stance with regard to authoritative sources. Studies of student epistemologies have shown that, while naïve acceptance characterizes many students, blanket skepticism is also readily taken up by many adolescents. Serious and sustained engagement in explanatory theory building should lead to a more constructive stance. Theory builders are of necessity *bricoleurs*; they build things out of whatever is available, and what's available is often imperfect or intended for a different purpose. So they build on existing authoritative knowledge, while recognizing that that knowledge may be faulty or somewhat irrelevant. They learn to appreciate the work that previous generations of theorizers have put into developing what are now put forth as laws or facts. They may begin to appreciate that, while everyone has the right to criticize, not every criticism deserves to be taken seriously. Perhaps all this paragraph is saying is that explanatory theory building by students should take place within a larger framework of liberal education.

Theory Building Outside Science and Mathematics

Although students are most likely to encounter theories in science, explanation ranges much more widely over human experience. There is

explaining a particular poem, painting, or art movement; there is explaining a historical event or a current event that makes the news; there is explaining a social condition or problem; and of course there is the continual need to explain the words and actions of people near to us. Ideally such explanations have explanatory coherence and openness to evidence similar to what scientific theories have and so can be judged according to the same criteria. They differ from scientific theories, however, in two noteworthy ways. One difference is that nonscientific explanations are usually one-off. They are not part of a more extensive theoretical program. The other difference is that, while scientific theories are generally intended to apply universally to a class of phenomena, these other kinds of explanations are “theories of the case.” The term comes from jurisprudence where, for instance, the prosecution in a criminal trial needs to present a theory that explains the evidence, and the theory needs to have compelling explanatory power; otherwise, the defense wins. Medical diagnoses are also theories of individual cases, which need to have enough explanatory power to justify what may be life-or-death decisions. Theories of the case play a large role in the daily lives of thinking people. Any puzzling event will set people to theorizing, and hopefully discussion will progress toward greater explanatory power, which in turn will serve as the basis for more intelligent action.

In the learning and cognitive sciences, building theories of the case exemplifies a process known as “case-based reasoning”. This is reasoning from knowledge of particular cases rather than from general principles. It often makes use of analogy to arrive at conclusions based on similar cases. The goal of case-based causal reasoning may be simply to satisfy curiosity, but it may also serve practical purposes, such as lowering a fuel bill that has taken an unexplained rise or repairing a friendship when a friend has unaccountably taken offense at something we said or did. In everyday life, developing explanations case by case is probably for most people most of the time the most important kind of theorizing they do. It therefore deserves serious educational attention, which starts with recognizing that it is real

theorizing and can be judged against standards rather than being treated as wholly subjective.

Collaborative Theory Building or Collaborative Learning?

What has been called theory building here may often be called simply collaborative learning. This is most apparent when a group of students in a university lecture course meet to prepare for an examination. If all they do is rehearse information they wish to remember for the exam, that is cooperative learning pure and simple. But suppose they recognize that rote memorization is not enough, they collaborate in trying to work out the meaning of statements in their lecture notes or course materials whose meaning is unclear to them. They are trying to build a coherent explanation of the statements in question, and this warrants being labeled theory building. It is building a theory of a particular case – a particular set of statements – but the explanation or theory is likely to have application beyond that case, to explain something about the real world. But it is not developing original theory. It is, for practical purposes, sticking closely to someone else's – the lecturer's – ideas. So is it not more appropriate to call this collaborative learning rather than theory building?

From the point of view of process, what the students are doing is clearly theory building. It just happens that what they are theorizing about may itself be a theory. From the point of view of motive or intent, however, what the students are doing is clearly collaborative learning. They are not trying to solve a theoretical problem but are cramming for an exam. From the point of view of content, the answer is less clear. If successful, the result of their labors will have the properties of a theory; it will have explanatory coherence or explanatory power. And it will in a sense be original: not original in the sense of contributing something new to the science of political economics, for instance, but original in the sense that it contributes something new to the explication of certain ideas in political economics. From a pedagogical point view, it is probably desirable

to attend to both the collaborative learning aspect and the theory-building aspect. The collaborative learning results can be improved by improving the theory building, supporting the development of more powerful explanations, and bringing more world knowledge into the theory-building tent. From a pedagogical viewpoint, however, it is also important that the new insight produced by theory building be shared by all the participants. This imposes a further constraint on the theory-building process, a constraint of comprehensibility, which – although it may render the process more difficult – is relevant to its purpose.

Not only in preparing for examinations but also in any course work focused on ideas, much of the explanation-building students will do is explaining given explanations. Especially in science education, however, constructivist approaches encourage students' more direct efforts to explain natural phenomena. This is doing authentic, creative science. Questions that arise are whether students can actually do it, as compared to playacting the roles of real scientists, and whether it is a good use of classroom time, as compared to straightforward instruction (Kirschner 1992). Rather than disputing whether students' efforts constitute genuine scientific knowledge creation, a more relevant educational issue is how students' own explanatory efforts relate to existing explanations. Theories in the sciences and other progressive fields seldom arise simply from thinking about observed phenomena. They more build on or sometimes react against existing theory. From both a learning standpoint and a theory-building standpoint, the relation to authoritative knowledge, as discussed previously, is a major concern. From a learning standpoint, this relation receives much attention from educational philosophers and theorists, with concepts such as relativism, criticism, and opinion versus evidence figuring prominently. But when authoritative knowledge is regarded as something for students to build on in their own explanatory efforts, the game changes from one of accepting or rejecting knowledge claims to one of idea improvement – using authoritative texts as one kind of resource.

Third World Girl as an Educative Spectacle

Karishma Desai
Teachers College, Columbia University,
New York, NY, USA

The language of the spectacle consists of signs of the dominant system of production — signs which are at the same time the ultimate end-products of that system (Debord 1967).

Introduction

Children and youth have long been bodies in/upon which adult hopes and anxieties about political-economic futures rest. This social category mobilizes moral panics, articulation of social problems, and respective solutions (Lesko 2001; Katz 2008) – these hopes and anxieties manifest in image form. Accordingly, childhood has become a spectacle, “a site of accumulation and commodification – in whose name much is done” (Katz 2008, p. 5). Following Cindy Katz, in her analysis of Western media, Sarah Projansky (2014) contends that “spectacularization is a discursive and economic strategy” of the twenty-first century that is acutely applicable to girls. By this, she means that girls have turned into visual objects on display, as spectacular and/or scandalous, which results in the surveillance and discipline of everyday girls. The bodies of girls in and from the global South circulate as a cultural form, positioned as a vector of development with the greatest potential, yet facing the most risk. The Third World Girl is an extension and reconfiguration of the infamous Third World Woman figure framed by Mohanty (1986) to underscore Western liberal feminists’ consolidation and representation of “victimized women”

from the global South. In what follows, this entry illustrates how the Third World Girl has been constructed and how she has become an educative spectacle, which acts as a form of public pedagogy (Giroux 2004).

The Spectacle as an Educative Phenomenon

Spectacle is the accumulation of capital to the point where it becomes image, according to French Situationist scholar Guy Debord (1967). Spectacle is a term that “unifies and explains a great diversity of apparent phenomena” (p. 10). While Debord’s theorizing of spectacle is fairly abstract, broadly describing societal conditions, scholars such as Kellner (2005), Katz (2008), and Projansky (2014) have made the term concrete and specific. Kellner (2005) posits that spectacle is one of the organizing principles of modern economy, State, society, and everyday life. It refers to an understanding of society organized around the consumption of images and commodities, and furthermore, it signifies how consumer capitalism is normalized in institutions and social spaces and how social relations and individual subjectivities are therein governed. Therefore, what is significant about the notion of spectacle is that it is not a mere collection of images, but rather it is about, “social relation[s] among people mediated by images” (Debord 1967, p. 4, emphasis added). The term is useful to analyze the political economy of images associated with international development, and the teachings embedded within the assemblages of such images. Specifically, the campaign images function as commodity fetishism; the geopolitical relations signified by images and their production, and its influence on the politics of everyday life and social relations reveal the importance of such a framework in examining international development campaigns and rhetoric. The spectacle, then, manifests cultural dimensions of global, political, and economic logics. This is evident in representations of Third World Girls from the global South in transnational campaigns where girls become commodity fetish objects projected

to create economic growth and further consumer capitalism. Global insecurities about political and economic futures are channeled into images of Third World Girls who are represented simultaneously as victimized and possessing untapped and unlimited potential, and are hence positioned as prime subjects for investment.

Spectacles generally, and the spectacle of the Third World Girl specifically, can be understood as a form of public pedagogy. Public pedagogy, an educational term heavily utilized by cultural studies scholars since the 1990s, refers to educational activity and learning that occurs outside of formal schools: in institutional spaces such as museums and libraries; in informal educational sites such as popular culture and media campaigns; and through sites of activism, including grassroots social movements (Sandlin et al. 2010). Cultural studies scholars in particular have engaged this term to inquire into the ways in which spaces of public and popular culture have educative dimensions that reproduce, sustain, and challenge normalized and/or oppressive configurations of reality. For instance, Henry Giroux’s extensive work examining the educative dimensions of popular culture sites and products such as Disney argues that the realm of cultural has a pedagogical function that works to “construct identities, mobilize desires, and shape moral values” (Sandlin et al. 2010, p. 349). As illustrated by Kellner (2005) and Projansky (2014), spectacles are contested terrains that simultaneously represent and manufacture societal values, and therefore spectacles are educative productions. How has the Third World Girl as a commodified object of desire been produced? And what is taught and learned about geopolitical relationships and global fantasies through the spectacularization of the Third World Girl?

The Third World Girl: An Extension of the Third World Woman

In 1986, Chandra Mohanty argued that Western feminists essentialized the lives and struggles of women in the global South, representing them as a composite, singular Third World Woman. Third

World Women have been portrayed as objects and “victims of male violence, victims of the colonial process, victims of the Arab familial system, victims of economic development processes” (p. 57) with the capacity to be developed and liberated by white feminists. Colonial institutions and its neo-imperial counterparts have consistently used the perceived status and cultural practices related to women and girls as a signification of “traditional” and “backward” ways of the Third World. Third World Women are positioned as needing to be liberated from their oppressive cultures and men (Mani 1987; Spivak 1988) even though conditions of exploitation, oppression, and dispossession have been intensified through colonization, development, and more recently neoliberalization. The roots of the aforementioned geopolitical relationship between the Western liberator and victimized Third World Women is intimately tied to constructions of race embedded in Enlightenment thought that governed slavery and colonialism wherein colonial societies were constructed as stagnant. In the postcolonial era, binary oppositions of race were mapped onto development/underdevelopment; theories of modernization were structured around such differences. Third World Women, associated with the “backward,” unproductive end of the spectrum, were targeted by development initiatives focused on their reproductive roles, most notably through population control policies and microcredit initiatives (Wilson 2011).

Over the last three decades, as liberal feminism dovetailed with international development’s use of human capital logic, Third World Women have become further situated and centered as key instruments for economic growth and national progress. Along the commonsensical lines of modernization, the logic of development supposes that modernizing women and girls can lead to the progress of the State. Since then, images of the Third World Women in international development campaigns have shifted from representing tragic oppressive conditions of women as victims to positive agentic images that capture the potential of the entrepreneurial woman (Wilson 2011).

Recently, the gaze has shifted from the Third World Woman to the Third World Girl, as has the

responsibility to shoulder national development. Whereas women are portrayed as complete, fiercely bounded by tradition, and therefore requiring much undoing, as a child, the Third World Girl is seen as incomplete and in a stage of becoming. Therefore, the girl child has become a more strategic target for the project of international development as she better captures and mobilizes hope among her consumers. A regime of truth about the promise of Third World Girl has emerged through development entities like the United Nations partnered with transnational corporations like the Nike Foundation and in conversation with neoliberal postfeminist ideals of girlhood.

Still and moving visual representations of Third World Girls in transnational media campaigns such as Nike Foundation’s *Girl Effect*, international nongovernmental organization (iNGO) CARE’s *I am powerful* campaign, and the recently produced film *Girl Rising* showcase the Third World Girl as spectacle. In these campaigns, the Girl is shown pregnant with potential. In the *Girl Effect* viral video, for instance, we see the Third World Girl initially at risk without formal education. We are shown the trajectory of a young girl who faces the evils of Third World poverty that result in child marriage, early pregnancy, prostitution, and the spread of HIV/AIDS. The campaign video underscores that her life is out of her control, and investment in the girl child is imperative. The provision of formal schooling is the proposed solution to uplift her from this impoverished condition and *also* to secure the social and economic development of her nation. A classic still image from iNGO CARE’s *I am powerful* campaign depicts a young woman looking forward with fierce eyes, her multicolored scarf covering her head, and alone acacia tree situated behind her. Slogans rotating underneath clips within an associated campaign video include: I am invisible, but invincible; I am a natural resource with untapped potential; I can contribute if I am given a chance; I can change my community. In these transnational campaigns, the spectator is invited to hold together the simultaneous risk and promise of the Third World Girl. The audience is invited to consume her as a commodity guaranteeing profit and

security. However, we are informed that she cannot become powerful on her own. While “she has power to change her world” she needs you, who has the “power to help her do it.”

Tracing Global Investments in Girls' Education

The international development media spectacle manifests undergirding neoimperial economic and geopolitical relationships. The following section traces the trajectory of international development processes that has normalized the notion that if you educate a girl, you educate a nation as commonsensical truth. The United Nations, World Bank, and transnational corporations were instrumental in constructing the adolescent Third World Girl and positioning her as the most significant site for development. The logic of human capital undergirding the convergence around girls' education can be traced to economic liberalization during the Reagan-Thatcher era of the eighties. During the 1980s, Ronald Reagan and Margaret Thatcher developed domestic and international economic policies that broke down trade barriers in order to reduce government expenditure in public sectors and expand privatization by centralizing the market. The correlation between investment in girls' education and economic growth was proliferated by 1980s World Bank research that illustrated how improved access and enrollment of girls in formal schooling led to: increased GDP per capita, decreased infant mortality rates, and increased life expectancies (King and Hill 1995). At that time, the president of the World Bank, Sir James Wolfensohn, noted, “‘girls’ education is the single best investment that can be made in the developing world today” (UNICEF 1995, p. 3). This led to the proliferation of a discursive logic, which assumed that investment in girls would reduce poverty by increasing national economic growth. At the 1990 Jomtien Conference, the United Nations (UN), bilateral development organizations, nation states, and nongovernmental organizations together designed the Education for All (EFA) goals.

These goals saw increased global investment in girls' education. In 1995, Section L of the Beijing Platform for Action was the first global document to single out “the girl child” as a distinct demographic target for development (Croll 2006). At the Fourth UN conference for women, the girl child was given her own category, and strategies for her protection were outlined. In the year 2000, at the World Education Conference in Dakar, the Millennium Development Goals (MDGs) affirmed the necessary investment in girls' education, and a governing body situated under UNICEF, the United Nations Girls Education Initiative (UNGEI) was launched with the intention of monitoring and expanding this effort. Thus, within 20 years, the development apparatus (Escobar 1995; Ferguson 1990) constructed the girl child of developing nations as an object and set up institutional bodies specifically geared toward her “well-being” and “protection.”

Five years later, in 2005, the Nike foundation took hold of the World Bank's earlier research, partnered with the UN foundation, and echoed Wolfensohn's words in a slightly different way. The Nike foundation presented the *adolescent* girl in particular, as an “untapped resource” with extreme economic potential and thus the “catalyst for ending global poverty” (Nike Foundation 2005). Within the next few years, development entities and corporate bodies paid immense attention to this new category. Adolescent girls were centered in development discourse, policy, and programs. In 2007, United Nations bodies developed an interagency task force to support nations in developing policies and programs to reach girls between the ages of 14–19 (UNESCO 2011) and the World Bank launched the Adolescent Girls Initiative (AGI) in 2008 while the Nike Foundation partnered with Department of International Development (DFID) established Girl Hub, an online database. At the end of that same year, the International Day of the Girl Child was inaugurated and endorsed by governments and organizations across the globe. Within three decades, the monolithic Third World adolescent girl was constructed, and governing institutional bodies

were created in order to ensure she could be protected, provided for, and invested in.

Therefore, the notion that the adolescent Third World Girl is the missing link to national development is situated within a larger narrative of development history. Over the past three decades, girls and women's empowerment have become centralized in development programs. Moreover, liberal development's focus on investing in human capital and liberal feminism's emphasis on gender equality in education and the labor market in the West led development agencies to position girls as an instrumental means for alleviating poverty in the global South (Moeller 2014).

Exporting Western Girlhood

While the campaign for girls' education and rights was cemented in UN agencies, discourses that endorsed ideals of girl power and "can-do" femininity (Harris 2004) situated young women as ideal late modern subjects gained momentum in the Western world. Young women in the global North emerged as subjects worthy of investment; they were represented as educationally and economically successful, responsible, and self-inventing in social and cultural spaces. Two predominant reasons account for this emergence of women in the "production of the late modern social order and its values" (p. 6). First, liberalization led to global economic restructuring, which relied on the labor of young women, and the advancements of liberal feminism increased opportunities for middle-class women. In addition, neoliberal ideas of responsibility, choice, and innovation converged with liberal feminist ideals of women's liberation and opportunity.

Several scholars demonstrate how the intersections of neoliberalism and postfeminism advance mutually reinforcing discourses of individualism and free choice and the argument that women as opposed to men are more suitable to be entrepreneurial leaders and agents of social change (Gill 2007; McRobbie 2009; Gill and Schraff 2011). In considering postfeminism as an object of analysis, Rosalind Gill (2008) describes the features of a postfeminist sensibility – "the notion that

femininity is a bodily property; the shift from objectification to subjectification; an emphasis upon self surveillance, monitoring and self-discipline; a focus on individualism, choice and empowerment; the dominance of a makeover paradigm; and a resurgence of ideas about natural sexual difference" (p. 3).

These features are characteristic of the empowered Western postfeminist subject who is positioned as normative. The narrative of the successful girl positions female subjects as assertive, self-inventing, ambitious, and confident; it assumes that girls can and often do "have it all" (Harris 2004; Gonick 2006). Young women are represented as having potential to be educationally successful, economically productive, and able to take control of their bodies and sexual capacities. Harris (2004) discusses how empowered young women are perceived to be successful citizen-subjects and leaders because they are seen as able to take responsibility for themselves, their families, and community with minimal dependence on the State; they are constituted as the new consumers and leaders for the global good. The ideal neoliberal feminine subject is consequently complicit with neoliberalism and postfeminism.

Alongside girl power are depictions of girls as vulnerable and "at risk" (Harris 2004; Projansky 2014). Their bodies are marked by teen pregnancy and hypersexuality, and they are also perceived as risk for nation building and progress. Gonick (2006) argues that girl power and at-risk narratives were produced during the same time and circulate simultaneously. She claims these narratives are interwoven and require one another as they "participate in the production of the neoliberal girl subject with the former representing the idealized form of the self-determining individual and the latter personifying an anxiety about those who are unsuccessful in producing themselves in this way" (p. 2). Even though the girl in the global North is an unstable category (Projansky 2014), empowered neoliberal Western girlhood is exported through girl empowerment campaigns and educational interventions.

The assumptions undergirding the global convergence around girls' education hinge upon the

juxtaposition of the postfeminist subject from the global North with the girl in/from the global South oppressed by her culture according to Rosalind Gill and Ofra Koffman (2013).

The *ideal* Third World Girl subject is represented as taking up standards of Western empowered femininity, which can be accessed through modern progress-oriented institutions such as schools and the market. According to the problematic discursive construction of Girl Effect, Third World Girls require formal schooling and empowerment interventions in order for their inert potential to be activated. Once the girl is empowered through education and literacy, she will marry later, delay and regulate her childbearing. And if her capacity is built, she will become an entrepreneurial agent of change and eventually “call the shots” (Nike Foundation 2009). Thus, as scholars have illustrated, the Third World Girl is represented as an entrepreneurial subject in waiting (Koffman and Gill 2013) and development programs seek to activate this subjectivity (Hayhurst 2014). The particular combination of agency, individualism, regulated sexuality, and empowerment are trademarks of espoused Western girlhood. As such, empowered liberal feminism, which is grounded in postfeminist fictions and neoliberalism, is exported from the global North to the global South. While this discourse suggests that investment in girls’ education can position young women to call the shots and lead a nation’s economic development, Connell (2002) has demonstrated that processes of globalization and a neoliberal economic order have in fact accentuated gender disparities and made gender democratization even more difficult.

Conclusions

The neoliberalization of girlhood involves the construction of economically productive, sexually regulated, self-dependent individuals through participation in formal education and has become requisite in contemporary times. As such, in both the global South and the global North, the girl has become an object of investment and the empowered girl has become an object of desire

(Lesko et al. 2015). In recent years, international NGOs paired with campaigns directed by transnational corporations have galvanized a spectacle about the problem of victimized, uneducated girls, and the urgent need to tap into their potential. The imagining of this ideal girl, paired with humanitarian longings to save and elevate her has mobilized immense traction among diverse actors. This compelling cultural production rests within the era of globalization – a context that engenders physical and ideological mobility, and thereby produces global imaginings and longings for Western ideals of girl power feminism. These idealized femininities are propagated as they rapidly move through corporate and international nongovernmental organization media platforms such as the Nike Foundation’s Girl Effect campaign and through Malala Yousafzai’s celebratory status recently advanced with the Nobel Peace Prize. The spectacle, undergirded by human rights discourses, has unleashed a moral crusade authorizing intervention in places far and near and requires investigation.

Three Views of Philosophy and Multiculturalism: Searle, Rorty, and Taylor

Carol J. Nicholson

Rider University, Lawrence Township, NJ, USA

Philosophers have been slow to join the public debate on multiculturalism in spite of the important philosophical issues at stake. Notable exceptions are John Searle and Charles Taylor, who address the philosophical implications of the controversy over the curriculum in several recent essays (John R. Searle, “Rationality and Realism: What Is at Stake?” *Daedalus*, volume 122, no. 4 (Fall 1992), pp. 55–84, p. 69; John Searle, “The Storm Over the University,” in *Debating P.C.* Paul Berman, ed. (New York: Dell, 1992), pp. 85–123; Charles Taylor, “The Politics of Recognition,” in *Multiculturalism*. Amy Gutmann, ed. (Princeton: Princeton University Press, 1994), pp. 25–73). Taylor defends multicultural education as a moral imperative of one branch of the liberal tradition, while Searle argues that a victory for multiculturalism would mean the destruction of the Western intellectual heritage. This entry will examine some of the arguments on both sides of the issue and propose an interpretation of multiculturalism as particularly significant for teaching philosophy.

John Searle views the current debate over the curriculum as far more dangerous than past controversies in higher education, because the very philosophical principles which make knowledge and education possible are under attack. The concepts of truth, reality, objectivity, and rationality which have been taken for granted in higher education (as well as in our civilization in general) have been challenged by what he calls the “subculture of postmodernism,” a loosely defined group of left-wing academics which includes multiculturalists, feminists, deconstructionists, and followers of Nietzsche, T.S. Kuhn, and Richard Rorty. I shall not attempt to discuss all of these movements but intend to focus only upon the issue of multicultural education, which

Thoughtful Reflection on Classroom Work

► Teaching and Critically Reflective Practice in Freire

I understand to mean teaching students about other cultural traditions in addition to their own.

Searle summarizes the main principles of what he calls “metaphysical realism” or the “Western rationalistic tradition” as follows:

Knowledge is typically of a mind-independent reality. It is expressed in a public language, it contains true propositions – these propositions are true because they accurately represent that reality – and knowledge is arrived at by applying, and is subject to, constraints of rationality and logic. The merits and demerits of theories are largely a matter of meeting or failing to meet the criteria implicit in this conception. (Searle 1993, p. 69)

All of the above principles, Searle argues, have been challenged for political reasons by those who are attempting to use the university in order to advance leftist causes. The culture of postmodernism debunks the scholarly ideal of the disinterested inquirer in quest of objective and universally valid knowledge and interprets claims to objectivity as disguised forms of power seeking.

According to Searle, the educational implications of the postmodern subculture have been devastating. The abandonment of traditional standards of truth and objectivity has left room for an educational agenda which aims, for example, to reinforce students’ pride in a particular racial or ethnic group, to treat all cultures as intellectually equal and therefore equally deserving of being represented in the curriculum, and to use affirmative action rather than academic excellence as the main criterion for faculty hiring. The denial of the presuppositions of the Western rationalistic tradition is not analogous to the denial of ordinary empirical or scientific theses, Searle maintains, because these principles function as the conditions of intelligibility of our linguistic, cultural, and scientific institutions. To reject them is to undermine the practices of teaching and research which are the *raison d’être* of the university and to threaten the foundations of Western civilization. Searle writes:

An immediate difficulty with denials of metaphysical realism is that they remove the rational constraints that are supposed to shape discourse, when that discourse aims at something beyond itself. To paraphrase Dostoevsky, without metaphysical realism, anything is permissible. (“The Storm Over the University,” p. 112)

One question that could be raised about this line of argument is, “Does the denial of metaphysical realism actually pose a threat to higher education and civilization?” Richard Rorty does not think so, and he gives a different view of the relationship between the philosophical principles of the Western rationalistic tradition and the practices of the university. According to Rorty, objective truth understood as correspondence between our knowledge and an independent reality is a notion without meaningful content. He would prefer to describe objectivity as the search for “the widest possible intersubjective agreement” (Rorty 1994, p. 52). Challenging traditional views of knowledge and truth poses no threat to educational or any other institutions, he argues, because philosophical principles do not support our practices but merely provide optional ways of describing them to ourselves. Their function is rhetorical rather than presuppositional. If academics stopped thinking about their work in terms of the correspondence theory of truth and adopted a pragmatic view, this would not result in their being less careful and honest in their research or teaching. Rorty thinks that people tend to be more loyal to traditional practices than to the philosophical theories which allegedly justify them. He would like to see us free ourselves from the belief that the ethics of the academy depends on meta-theoretical commitments to truth and reality, just as earlier generations gradually freed themselves from the belief that morality depended upon acting in accordance with God’s will. To him both beliefs are simply “rhetorical flourishes designed to make practitioners feel that they are being true to something big and strong” (Ibid., p. 61).

If Rorty is right (and I think he is) that it makes no difference to educational practice whether or not we accept the principles of the Western rationalistic tradition, then Searle cannot appeal to these principles to support the traditional canon, nor can the multiculturalists rest their defense on denying them. Searle says that the rejection of metaphysical realism “goes hand in hand with” a belief in multiculturalism, although he sees the relationship between the two as more complex than the “obvious” relation of metaphysical realism to the ideals of the university. He writes:

In my experience at least, the present multiculturalist reformers of higher education did not come to a revised conception of education from a refutation of the Western Rationalistic Tradition; rather they sought a refutation of the Western Rationalistic Tradition that would justify a revised conception of education that they already found appealing. (Rorty "Rationality and Realism. . .," p. 71)

But from Rorty's point of view, the new conception of education cannot be justified on the basis of the rejection of the Western rationalistic tradition, because there is no presuppositional relation between philosophical principles and educational practices.

Although he denies the traditional conception of truth and rationality, Rorty appears to have no views on multiculturalism or any interest in curricular reform. In the context of a discussion of general education, he writes, "it does not greatly matter what the core curriculum is as long as there is one – as long as each community defines itself by adopting one" (Rorty 1982, p. 112). Consistent with his general position on the relation between theory and practice, he argues that philosophy has no particular relevance to education, at least in the short run; in the long run, he would no doubt argue it would be better if students learned to describe themselves as "seekers of solidarity with other inquirers" rather than as "seekers of absolute truth." Rorty's analysis is helpful as a corrective to theories like Searle's which overestimate the influence of philosophy on ordinary practices, but since he admits that his version of pragmatism has no bearing on education, he cannot give us any help in resolving the dispute about multiculturalism.

Another question that could be asked about Searle's analysis of the crisis in education is, "Does multiculturalism in fact presuppose the denial of the Western rationalistic tradition?" Certainly, not all advocates of multiculturalism adopt the presuppositions of the "culture of postmodernism." Charles Taylor, for example, argues explicitly against the kind of "anything goes" subjectivism that Searle criticizes ("The Politics of Recognition," pp. 69–72). Taylor treats multiculturalism as a historical and political issue rather than an epistemological one. He distinguishes two traditions in liberal democratic theory – on the one

hand, the politics of equal dignity, based on the idea that all humans are equally deserving of respect and equal rights, and on the other hand, the politics of difference, based on the need for recognition of the unique identity of individuals and groups. These two perspectives appear to be incompatible, because the former requires treating people in a difference-blind manner, while the latter demands differential treatment, but Taylor maintains that both are built on the notion of equal respect.

Human identity is created "dialogically," in relation to others, he argues. Because it is partly shaped by recognition, the withholding of recognition (or misrecognition) can be damaging to a person's dignity. Multiculturalism, according to Taylor, is a logical extension of the politics of equal respect and the politics of recognition. In the context of education, the demand it makes is for equal respect and therefore equal recognition, for each culture within the curriculum. Taylor regards this claim as valid if it is taken as a starting hypothesis to bring to the study of other cultures, a presumption that "all human cultures that have animated whole societies over some considerable stretch of time have something important to say to all human beings" (Ibid., p. 66). In order to understand a very different culture and appreciate the value of its contributions, there must be what Gadamer calls a "fusion of horizons," in which we learn new vocabularies of comparison, and our standards are transformed by the study of the other.

However, the claim for recognition in the curriculum is often misinterpreted as a definitive conclusion that all cultures are of equal worth. Taylor rejects this interpretation as a "subjectivist, half-baked neo-Nietzschean" theory, according to which all judgments of value are really impositions of power. To designate a culture as worthy based upon this kind, subjectivism is an act of condescension rather than respect, which misses the whole point of the politics of recognition. Alternatively, designating a different culture as objectively valuable before the "fusion of horizons" has taken place makes the ethnocentric assumption that the necessary standards of judgment are already available (Ibid., p. 70). Taylor

thinks that a proper understanding of the politics of recognition demands of us:

... an admission that we are very far away from that ultimate horizon from which the relative worth of different cultures might be evident. This would mean breaking with an illusion that still holds many "multiculturalists" – as well as their most bitter opponents – in its grip. (*Ibid.*, p. 73)

He succeeds in showing that we need not lapse into a self-defeating relativism or subjectivism if we are open to comparative cultural study and committed to developing a more inclusive curriculum.

I have argued that there is no necessary connection between multiculturalism and the rejection of the Western rationalistic tradition. It is possible to believe the assumptions of the "sub-culture of postmodernism" without being a multiculturalist (like Rorty) or to be a multiculturalist without believing these assumptions (like Taylor). In other words, contrary to Searle, the denial of metaphysical realism is neither a necessary nor a sufficient condition for multiculturalism. The central issue involved in the debate about the curriculum does not seem to be a contest between rational and irrational epistemologies or left and right wing politics. In the unlikely event that all of the disputes between realists and idealists or conservatives and liberals were resolved tomorrow, college teachers would not suddenly see the light about which courses to offer in their programs and which readings to include in their syllabi.

Epistemological and political controversies have tended to obscure the most important issue at stake in the debate over multiculturalism – its educational value, especially in teaching philosophy. The challenge of different points of view has been a stimulus to think at least since the origins of Western philosophy in ancient Greece. In the sixth century B.C. on the Turkish coast of the Aegean Sea, trade in ideas flourished as well as trade in goods. Thales of Miletus challenged traditional anthropomorphic views of nature, predicted an eclipse of the sun, and is said to be not only the first philosopher but also the father of the natural sciences. Xenophanes of Colophon criticized anthropomorphic views of the gods in sayings such as: "Ethiopians have gods with snub

noses and black hair, Thracians have gods with grey eyes and red hair." He could be called the first multiculturalist as well as the father of the social sciences and humanities. Would it be an exaggeration to say that without cross-cultural interaction, borrowing, and debate there would be no liberal arts and sciences and no university today?

Pursuing this interesting historical question is far beyond my scope, and so I would like to focus on the relevance of multiculturalism for teaching philosophy in the present. The paragon of the teacher of philosophy, of course, is Plato's Socrates, and the best teachers emulate him in two respects – as midwives and as gadflies. In his role as midwife, Socrates assists in giving birth to the opinions of others, which, after critical scrutiny, invariably turn out to be mere "wind eggs." In his role as gadfly, Socrates pricks people out of their dogmatic slumber and stimulates them to think.

Undergraduate students today, not unlike the characters in Plato's dialogues, are often self-absorbed, arrogantly opinionated, and intellectually lazy. The followers of Socrates recognize that one of the main functions of philosophical education is what I call "the unfixation of belief," with apologies to C.S. Peirce. In Peirce's well-known essay, "The Fixation of Belief," he defends the method of scientific inquiry as opposed to the alternative ways of forming beliefs – tenacity, authority, and a priori thought. For philosophy teachers the challenge is not so much to improve students' methods of arriving at their opinions as to get them to loosen their intellectual grip on the opinions they have fixed upon so that they can see other points of view as legitimate.

Some courses work better than others according to the criterion of the "unfixation of belief." I have found that a multicultural approach to teaching philosophy is a very effective way to wake students up to different points of view and give them a sense of intellectual humility. To give some examples, a course in American philosophy that covers Jefferson, Emerson, Thoreau, Peirce, James, and Dewey is good. One that also includes Margaret Fuller, the Seneca Falls Declaration, Frederick Douglass, Martin Luther King, and Native American perspectives is much better.

Similarly, a course in metaphysics which includes non-Western systems of thought, a course in political philosophy which includes third world perspectives, and a course in epistemology or ethics which includes feminist theories are more likely to succeed in the “unfixation of belief” than those courses which are taught according to the narrow range of issues included in most currently available textbooks.

From a pedagogical point of view, the strongest argument against multicultural philosophy courses is that they are very difficult to teach well, given the present state of graduate training and available resources in philosophy. Most philosophers, even those young enough to have been introduced to the “subculture of postmodernism” as undergraduates, did not themselves receive a multicultural graduate education. Without faculty development opportunities – e.g., sabbatical leaves, faculty seminars, guest speakers, special conferences, and summer workshops – many philosophy teachers do not have the expertise or the confidence to teach new material in their discipline. Even with such programs, which are expensive enough so that not all colleges and universities can afford them, the lack of appropriate textbooks in most areas of philosophy makes it difficult to develop multicultural philosophy courses without depending upon the regular use of “spontaneous” xeroxing. Perhaps one reason multiculturalism has not caught on in philosophy, as it has in other humanities’ disciplines and the social sciences, is that most graduate training in philosophy is so narrow that few philosophers are prepared to teach multicultural courses or to write multicultural books.

Searle, Rorty, and Taylor have made important contributions to the debate on multiculturalism by addressing the large, abstract issues of its epistemological and political presuppositions. Concrete pedagogical issues, however, such as the educational benefits of multiculturalism and the obstacles to its implementation, have for the most part been neglected (For an exception see Lawrence Foster and Patricia Herzog, eds. *Philosophical Perspectives on Pluralism and Multiculturalism* (Amherst: University of Massachusetts Press, 1994). I have tried to show that from a teacher’s

point of view, multiculturalism is not a newfangled, “postmodern” movement which is destructive of rationality, nor it is a subversive plot hatched by tenured radicals from the 1960s. To paraphrase William James on pragmatism, it is just a new word for an old way of thinking and teaching. A multicultural curriculum works very well in fulfilling the traditional goals of education in philosophy. It can assist the teacher as Socratic “midwife” and “gadfly” in delivering students of their narrow and uncritical opinions and awakening them to a world of intellectual diversity.

Transliteracies

Introduction

Transliteracies involve people's mobile, emergent sense-making practices *across* various phenomena in a world characterized by rapid circulation of objects, ideas, and people over widening networks. Literacy researchers interested in tracing

these developing ontologies across new or expanding communicational landscapes need tools and frameworks to theorize and study the instability and contingency of literacy practices "on the move." To this end, the transliteracies framework attends to the ways people dynamically configure, synthesize, and adapt across the material/immaterial world while taking into consideration the role of objects in those mobile, emergent engagements. Following from the New London Group's (1996) call for broadening views of literacy, the transliteracies framework emphasizes the situated, contingent, and ideological nature of meaning-making and foregrounds issues of equity by examining the ways people and resources are simultaneously connected, distributed, restricted, and regulated.

This entry begins by tracing the development of the concept of transliteracies in educational research and elaborating the transliteracies framework in more detail. The subsequent section describes the three theoretical principles upon which this framework builds – mobility, activity, and materiality – and traces their genealogies in literacy studies. The final section outlines how researchers might study transliteracies through an inquiry process of flattening and unflattening that draws on various analytical "tools for inquiry." The conclusion suggests implications for educational practice and research, particularly in light of the ways new tools for meaning-making and new practices of global connection are rapidly emerging and evolving.

Defining Transliteracies

An interdisciplinary working group of scholars and educators building on the work of Alan Liu and the Transliteracies Project first used the term "transliteracy" in 2007 to describe an individual's ability to read and write across various tools, media, and platforms (Thomas et al. 2007). This definition was expanded by researchers who theorized *transliteracies* as mobile meaning-making practices involved in creating and maintaining social relations within and across complex networks (Stornaiuolo et al. [in press](#)). In emphasizing

the mobile and emergent nature of meaning-making, this latter definition was central to the development of the transliterations framework, a flexible heuristic for attending to learning and meaning-making “on the move.” The transliterations framework builds on foundational literacy scholarship characterizing literacies as mobile, multiple, multimodal, ideological, and situated in everyday practice and responds to one challenge of this scholarship, what scholars have called the “paradox” of mobility – the understanding that mobility must always be understood in relation to immobility. This paradox of mobility highlights the contingent, socially situated nature of literacy practice, which the transliterations framework traces across two intertwined dimensions: (1) a focus on the indeterminate nature of creating connections and boundaries across spaces, practices, and time (*trans*); and (2) attention to the dynamic, mobile nature of meaning-making using an array of available resources (*literacies*).

The first dimension important to a transliterations framework draws on the prefix *trans-* (often defined as across, beyond, or through) to highlight the inherent mobilities or traversals in literacy practice. A *trans* focus – explored in interdisciplinary scholarship through concepts like translanguaging, transmodalities, transmedia, *trans** identities, and transnationalism – highlights the fluidity and indeterminacy of practice, leaving unspecified who or what moves and in what direction or fashion. For example, when someone simultaneously “checks in” to a restaurant via an app on the phone, jokes with companions about the oversized menu at the dinner table, and ignores the unwanted remarks of one friend while exchanging meaningful glances with another, the transliterations framework offers analytic methods for tracing the ways these various “actors” (people and things) intertwine across virtual and physical space in activity and the role of literacies in such interactions. As people and things move in unpredictable, fluid, and asymmetrical patterns, a transliterations framework attends to the activity of making connections, constructing boundaries, and building relationships without assuming the nature of those connections or relationships in advance. Such analytic focus on the

ways people and things interact draws attention to the mobility paradox, to the ways people and resources “on the move” are also constrained, restricted, marginalized, or rendered immobile. In other words, a *trans* focus makes salient questions not only about what moves across space or time but also about who or what cannot move or whose movement is highly regulated or contested (e.g., refugees traveling to distant shores, multiple languages in English-dominant classrooms, and Black youth subject to schools’ disciplinary systems).

The second dimension, drawing on the root word *literacies*, emphasizes the mobile dimensions of meaning-making. Building on insights from New Literacy Studies (Street 2003), the transliterations framework highlights the ideological and socially situated nature of all literacy practices and recognizes the multiple ways literacies are practiced in response to emerging technologies and increasing cultural and social diversities (New London Group 1996). Such an expansive understanding positions researchers to examine not only the multimodal, designed nature of meaning-making, but also the emotional, affective, aesthetic, and embodied dimensions of making sense across the material/immaterial world. In the example above, a primary focus on how the individual is reading the menu or using the app would miss affective, emotional, collaborative dimensions of practice (e.g., the menu becomes salient only insofar as it helps create social bonds between some members of the group, further isolating and alienating others; the app’s meaningfulness may be less salient to the present company – colocated in the restaurant – but highly salient to the owner seeking to attract new business or the old friend who decided to drop in after seeing the “check in”). A focus on the emergent, mobile, and affective aspects of literacy practices extends understandings of literacy beyond traditional text-centric, school-oriented definitions that are primarily concerned with individual ability. The transliterations framework foregrounds the equity dimensions of transliterate practice, calling attention to the institutional, historical, cultural, and systemic ways people and things have been rendered mobile and immobile.

Three Key Tenets

Literacies, from the perspective of a transliteracies framework, are, and have always been, fundamentally mobile social practices (Leander et al. 2010). This means literacies are creative social practices that are lived, enacted, and understood within connected, ideological, and contingent systems through which people and things move. While literacies have always involved such mobilities, the last 30 years have seen a considerable increase in the speed and scale of global flows of media, cultures, people, information, and materials. In addition, the rapid development and global adoption of mobile technologies (e.g., mobile phones, tablets, activity trackers) have significantly changed people's everyday interactions and practices across time and space. These contemporary techno-social developments have changed the ways people interpret (e.g., geographic information overlaid on physical city streets through the use of a GPS device or smartphone) and produce (e.g., recording and remixing media to be shared with social networks) with/in the world while on the move. A transliteracies framework draws upon substantial work in literacy studies to account theoretically and methodologically for *mobility*, as people's practices move across multiple modalities, spaces, and time (see, for example, related concepts such as transmodality, semiotic repertoires, and timescales). A focus on transliteracies attunes researchers not only to contemporary movements of people and things as they relate to meaning-making, but also to the ways people's mobile practices are policed, monitored, surveilled, and controlled – including the histories of these practices, the ways these practices unfold differently for different people and groups, and the ways systemic dimensions of oppression become instantiated in mobile practices.

A central commitment of a transliteracies framework involves situating individuals' literacy practices in broader cultural, social, and historical contexts, with context understood to be socially constructed through *activity*. As literacy scholars who draw on cultural historical activity theory and actor-network theory (e.g., Prior 2008) demonstrate, such an activity orientation to meaning-

making highlights the collaborative and collective dimensions of practice, as artifacts, goals, communities, and rules emerge in dynamic relationships that are both patterned and emergent. By focusing on people's transliterate practices, researchers can attend not only to the ways people's individual and collective goals and intentions drive activity, but also to the ways emotions and feelings arise and emerge in unfolding action. Further, such an approach invites the historical tracing of such emergence over time and in response to mediating factors, especially via artifacts that carry traces of the past. While traditional literacy-oriented artifacts like texts, pens, and computers are often the focus of literacies researchers, an activity orientation in the transliteracies framework highlights a range of other kinds of mediational artifacts as possible interactants in activity (a favorite piece of clothing or the warmth and smell of a newborn baby). By rooting people's practices within unfolding activity and in relation to broader social, cultural, and historical systems, a transliteracies framework calls attention to the ways inequities become reinforced, perpetuated, and inscribed over time.

From a transliteracies perspective, the stuff of life – objects, media, artifacts, things – exert influence as people make meaning in the social world. Extending from work in artifactual literacies (Pahl and Rowsell 2010) and new materialisms in literacy practice, a transliteracies framework draws attention to the emergent material-semiotic assemblages that form, act, and circulate across complex systems of relations, becoming irreducibly intertwined with social semiotic systems and the body in experience. It is in this intertwining that meaning bubbles up among the resources, materials, texts, and things dynamically involved in lived experience. By emphasizing *materiality* as a central tenet, a transliteracies framework complicates the common placement of language and sign as the ontological center of literacies practices and invites expansive epistemological stances toward literacies research, inclusive of affective, corporeal, and performative learning ontologies. Attending to the histories and trajectories of the interinvolvement of people and things reveals how material resources become

distributed, at times and for some people, in inequitable ways, with some people's perspectives and voices valued and others silenced.

Transliterations Research as Inquiry Process

Researchers studying digital practices have emphasized the particular challenges of tracing meaning-making across globally dispersed, multilingual, and multimodal networks (e.g., Reddit, Instagram, Vine) and transitory and wearable technologies (e.g., Snapchat, Fitbit, Apple watch). The transliterations framework offers a flexible heuristic for studying contemporary meaning-making through its inquiry approach (Cochran-Smith and Lytle 2009) to tracing the meaning-making paths of people and objects as they interact in dynamic and fluid relationships. An inquiry approach in transliterations research involves following connections and relationships as they unfold without assuming the nature of those relationships in advance. Such a stance invites unruliness, indeterminacy, and uncertainty into the research process and leaves room for fresh insights into how meaning is made across space and time.

In transliterations research, inquiry is a reflexive process of “flattening” and “unflattening” the analytic landscape. “Flattening” the social world is an analytical move that involves both holding one's own assumptions and beliefs up to scrutiny and making space for alternative understandings about the world to surface. This move includes the challenging work of reflexively questioning one's assumptions, foregrounding the perspectives of others, and taking one's own positionality into account. While researchers bring their experiences and expectations about the social world to bear in research, a “flat ontology” (Latour 2005) requires that they refrain from immediately imposing such assertions on the phenomena at hand and instead initially hold all actors, people, or objects, as ontologically equal. By holding at bay determinations about the ways actors are connected, and their relative importance in activity, researchers make space for other perspectives

and ways of knowing to emerge. The “unflattening” process involves researchers flexibly and responsively taking up perspectives and positions in analytical response to the emergent phenomena, working to make visible the differing vantage points developing in experience (including their own). In this process, the researcher discovers new ways of seeing and understanding the transliterations topography. Such an unflattening process allows different experiences and voices to be heard, particularly those whose perspectives are rarely taken into account.

Four analytical tools have proven useful in the ongoing process of flattening and unflattening in transliterations research. These “tools for inquiry” help researchers remain sensitive in tracing emergent relationships and connections among people and things in interaction. Each tool acts as a framing device, a lens to guide inquiry, with each lens making visible some aspects of data while holding others out of frame. These tools, then, are starting points in transliterations research, and each is aimed at cultivating a reflexive, responsive inquiry stance. Certainly a number of analytical tools can be useful for flattening and unflattening, but these four in concert with each other offer a grounded means of tracing unfolding relationships while attending to issues of power and privilege, especially the systemic dimensions that play out in practice to disenfranchise, dehumanize, and marginalize.

The first inquiry tool, *emergence*, attends to the indeterminate unfolding of sociogenesis in experience and compels the analyst to “move with” the embodied, symbolic, and material intertwining threads in human action. The analyst considers how meanings shift, transform, and travel over time and across spaces in relation to differentially available resources and existing patterns of relations, tracing how possibilities emerge/open/close and re-emerge/re-open/re-close in practice. The second tool, *resonance*, attunes focus to the ways meanings ripple and sediment in different ways, patterning across spaces, practices, texts, and times. The researcher considers what “takes hold” for individuals, groups, and objects in interactions, and how resonating phenomena are

differently situated, amplified, and quieted. *Uptake*, the third inquiry tool, supports the analyst in making visible understandings as people and things respond to one another and become interpenetrated. The analyst attends to how meanings shift in relation to other texts, people, and contexts, both historically and proleptically, and how people signal their understandings and allocate their attention in activity. Finally, *scale*, the fourth inquiry tool, considers the ways spatial and temporal relationships are produced in and through people's practices, often highlighting hierarchies and asymmetries that emerge across different timescales (Lemke 2000). In attending to issues of scale, the researcher considers how scaling practices position people and things in relation across networks, time, and space and how these scalar relations are inscribed and articulated in texts, objects, and literacy practice.

The iterative processes of flattening and unflattening analytic landscapes require researchers to take into account multiple perspectives without privileging one dimension of practice. For example, literacies researchers often begin with an interest in how people use texts, but such a predetermined starting place risks overdetermining the role of texts and according them more importance than participants themselves do. By adopting an inquiry stance and tracing meaning-making as it unfolds, transliterations researchers are better positioned to attend to various dimensions (e.g., the role of the body or emotion) that emerge over time and in response to the material and social world. This flattening/unflattening process can help researchers challenge and expand dominant understandings of literacy even as it requires them to position themselves, and their histories and commitments, in relation to other participants in activity.

Conclusion

To account for the ways literacies are constantly shifting in relation to developing social practices and technologies, literacy scholars have called for capacious and flexible theoretical and

methodological approaches that put emergence and movement at the conceptual center. Such approaches would not predetermine what constitutes literacies nor take an a priori perspective on the nature of relationships among people and things. The transliterations framework offers such a flexible, inquiry-based approach in its charge to researchers to engage in the reflexive process of flattening and unflattening the ontological landscape through responsive analytic moves that attend to *emergence* across varied *scales* of activity – both time and space; *resonance* among artifacts and ideas; and *uptake* among people and objects (Stornaiuolo et al. [in press](#)). By situating an individual's practices in relation to the interconnected and systemic dimensions of activity, the transliterations framework challenges static, skills-oriented orientations toward literacy that can be applied to disenfranchise and limit opportunities for learners. Such an expansive approach is important today as accountability measures in education work to limit literate expression to what can be standardized and measured even as unprecedented means of communication and expression expand across digital and global networks. A transliterations framework helps educators, researchers, and theorists navigate this paradox of mobility, working to make visible how multiple practices emerge and develop beyond those currently supported and valued by established educational institutions and staid systems of learning.

Truth and the Pragmatic Theory of Learning

John R. Shook

University at Buffalo, Buffalo, NY, USA

Introduction

Pragmatism does not simply offer another competing theory of truth. The meanings of truth are many, as Peirce, James, and Dewey have observed. Debates over the nature of truth appeal to different intuitions about truth. They can be lexically enumerated, yet dictionaries also indicate a common root for the term. In the *Oxford English Dictionary* we read:

Truth. 1. The character of being, or disposition to be, true to a person, principle, cause, etc.; faithfulness, fidelity, loyalty, constancy, steadfast allegiance. (See also troth). 2. One's faith or loyalty as pledged in a promise or agreement; a solemn engagement or promise, a covenant: = troth.

Root meanings of truth are based on *fidelity* and *commitment*. Truth is about values. When someone is not able to stay true or be true, we call them "wrong." When someone says something untrue, we call them "wrong." When we need an explanation why a person has the truth or is in the wrong, then we appeal to one or another view of truth – how one can come into the truth. Pragmatism duly regards truth as a valuational and normative matter, and it acknowledges the plurality of views on truth.

A Synoptic View of Theories of Truth

A description of how a person can come into possession of truth is a theory of truth in

miniature, even if, at first, that description at most expresses an intuition. Developing an intuitive view of truth into a full account reasonably covering all knowers is serious philosophical work. Pursuing the additional question of whether one of those theories about knowing truth is most satisfactory is traditionally labeled as *epistemology*.

In epistemology, establishing one theory of truth while denying that rival theories are sensible is extremely difficult. Intuitions behind all those theories can be compelling and indispensable as any. Justifying one theory as more “truthful” to the nature of truth risks circularity, since appealing to that theory’s own intuitive basis begs the question, and any higher epistemic criterion must cohere with that theory of truth itself, again begging the question. Pragmatism is neither a singular theory of truth seeking greater validity than the rest nor a metaepistemic criterion passing judgment on all theories of truth. It offers an expansive theory of learning that accounts for the valuable ways that humans can faithfully appreciate reality.

As a first approximation, the following table lists nine views of truth, distinguished by their preferences about the provenance and temporality of truth.

Justifying truth by	Senses alone	Senses and reason	Reason alone
Nature of truth is			
Retrospective	<i>Empiricism:</i> truth is what has occurred in experience	<i>Realism:</i> truth is what reasonable belief corresponds with	<i>Rationalism:</i> truth is what necessary principles require
Circumspective	<i>Journalism:</i> truth is whatever is happening in experience	<i>Relativism:</i> truth is what is instructed by each culture	<i>Coherentism:</i> truth is whatever axiomatic systems affirm
Prospective	<i>Positivism:</i> truth is what will be arriving in experience	<i>Experimentalism:</i> truth is what will be learned by experiment	<i>Deductivism:</i> truth is what will be logically inferred

Each major pragmatist offered a formulation of experimentalism in order to rival views of truth loyal only to the senses or to reason. For William James, the “true” is “only the expedient in the way of our thinking.” (James 2011, 226) Dewey said, “The best definition of truth from the logical standpoint which is known to me is that by Peirce: ‘The opinion which is fated to be ultimately

agreed to by all who investigate is what we mean by the truth, and the object represented in this opinion is the real’” (Dewey 1938, 343n). These pragmatists never naively supposed that their preferred view of truth was true to every way that “truth” is ordinarily used in common language. It is no real criticism of pragmatism to point out that asking the truth from a person testifying on the witness stand during a trial cannot be covered by experimentalism (since trials expect retrospective truth from witnesses).

Pragmatism is not reducible to experimentalism, or to its cousins in philosophy of science, instrumentalism, and operationalism. Pragmatism is not primarily a theory of truth. Instead, pragmatism is better understood as a general theory of human learning and knowledge which combines the best features of realism, relativism, and experimentalism. Pragmatism sides with realism’s expectation that intelligence does reach the objectively real and takes relativism’s point that knowledge at any particular historical moment will be partial and perspectival rather than monolithic. As for the other six views of truth, pragmatism regards them as descriptions of stages or phases of intelligent inquiry to be treated as self-sufficient for limited purposes.

Pragmatism connects truth with learning, using a simple link through the concept of knowledge. If everything that can be *known* must be first *learned*, and if knowledge aims at *truth*, then the method of learning should aim at the truth. But this simple formula invites three approaches to learning. (1) Do we have a better grasp of the nature of truth? Then we should coordinate our learning methodology with this “truth” so that we can understand how knowledge is possible. (2) Alternatively, do we have a better grasp of how we actually do learn? Then our notion of truth should be constructed accordingly, so that what is knowable by learning is the truth. (3) Finally, we might suppose that we already have sufficient grasp of both “truth” and “learning,” leaving us with the question of whether knowledge is possible. If they are in harmony, (3a) knowledge is possible, but if not, then (3b) we must be skeptics about the possibility of knowledge.

Philosophers who have chosen path (1) are usually classified as rationalists. They start from a vision of truth and infer how the mind possesses the powers of knowing this truth. Philosophers who instead opt for path (2) are usually called “empiricists.” They proceed from a theory of human learning to determine what is knowable and only then proceed to define the nature of truth in terms of what is knowable. Option (3a) is distinguishable from rationalism, but in actual practice, since the result is the same in both cases, both (1) and (3a) philosophers take the rationalist course. However, option (3b) cannot be assimilated into (2), since (3b) does not agree that truth should be defined in terms of what is knowable. Philosophers who prefer (3b) are best termed “skeptics” since they use an independently ascertained notion of truth to explain why we cannot possess knowledge of the truth.

Pragmatism seeks to avoid both rationalism and skepticism by making novel developments to the tradition of empiricism – its “naturalizing” and “historicizing” contributions.

Learning and Knowledge in a Naturalistic Context

The first contribution lies in pragmatism’s efforts to naturalize our understanding of human learning and knowledge. Pragmatists disdain any rationalistic determination of truth or knowledge performed independently of an understanding of actual human learning. Pragmatism is quite often lumped together with skepticism by rationalists, since rationalists are disdainful of pragmatism’s willful disregard for what must be, in their view, the “real” nature of truth. Rationalists typically claim that on the pragmatic theory of knowledge, we would be barred from knowledge of truth and limited to learning only what is pragmatically relevant. Rationalism, in the form of absolute idealism, ruled the philosophical scene when the primary pragmatists began their struggle to revive empiricism. But long after the demise of absolute idealism, rationalism remain alive today in many guises. For example, it is quite common for a

present-day epistemologist to grudgingly admit that pragmatism has made contributions to the understanding of human learning. Yet that same epistemologist makes sure to disclaim any pragmatic influence on his own theory of knowledge. A popular way to keep pragmatism at bay is to assert that pragmatism offers only a “non-epistemic” theory of knowledge, and thus cannot be relevant for the epistemologist who is solely concerned with an “epistemic” theory of knowledge. “Epistemic” in this context means that such a theory of knowledge is concerned with the relationship between knowledge and truth. A “nonepistemic” theory, for this epistemologist, ignores truth and instead probes other mundane causes for belief besides the pure quest to know the truth.

But this attempted demarcation simply begs the whole issue, since the epistemologist is evidently relying on some definition of truth that stands independently from a theory of actual human learning and knowledge acquisition. The fundamental disagreement is exposed when the pragmatist retorts that she is indeed concerned with the relationship between knowledge and truth and refuses to admit any conception of truth having origins independent from the theory of human knowledge. If the epistemologist responds that there is in fact a concept of truth on which “the truth” exists independently of any and all human learning, that strongly rationalist metaphysical position only earns scorn from pragmatists. Pragmatism would not attempt to make sense of a notion of a truth or a reality completely transcendent of all possible human knowing. Of course there are realities yet to be known, and we could not adequately understand human learning without a notion of that realm. But by “truth” a pragmatist simply refers to what is and will be known, because any other notion of truth lacks useful meaning. That is why pragmatists reject the “justified true belief” theory of knowledge – fully justified belief simply is what we can possibly mean by true belief. Allowing “truth” to float freely as a superfluous criterion for knowledge invites in the rationalistic notion of truth divorced from actual human powers of conception and learning. Rationalists categorize philosophies as

“realist” if they admit the existence of a completely transcendent truth/reality independent of human knowledge. If pragmatism cannot be metaphysically realistic, can it be realistic in any sense?

Metaphysical, or transcendental, realists have traditionally answered negatively, because they assume that a denial of realism entails an acceptance of idealism. Idealism, by claiming that all reality must be characterized by mental qualities or activities, does indeed hold that there cannot be any reality forever beyond knowing minds (human and/or divine). But idealism can be, and very often is, just as rationalistic as metaphysical realism. Pragmatists have developed many of the most powerful objections to forms of idealism. However, by assuming that idealism is the only alternative to realism, metaphysical realists are driven to classify pragmatism as an idealism of either the personal relativism or social relativism kind. Metaphysical realists are particularly tempted to find in pragmatism only idealism because of pragmatism’s explicit adoption of empiricism. In modern philosophy since Descartes, empiricism has indeed been closely linked to idealisms and especially to personal, or subjective, idealism. Instead of allying with idealism, pragmatists have undertaken the task of “naturalizing” experience, learning, knowledge, and truth.

Although scientific reductionism has claimed the label of naturalism for itself, pragmatism resists. The role of the learner cannot be irrelevant to the reality known. First, scientific inquiry is nothing but the effort of human learning to better understand the ongoing relationships among observable matters. Thus, proper objects of scientific knowledge include those observable matters – the matters to be explained cannot be less real or unreal by comparison to the related matters explaining them. Second, scientific inquiry discovers those dependable relations among natural matters only through our deliberate conduct of experimental inquiry, and confirmed results enhance our potential control over the environing world. The experiential processes of controlled inquiry cannot be relegated to any subjective or unreal status – they are as naturally real

as any unobservable entities postulated by subatomic physics. Philosophical intuitions or reasonings that judge experience to be irredeemably detached from the world have no standing with pragmatism, either. The genuine growth of human knowledge requires that this growth exists within a wider context of experienceable nature whose existence is independent of, but not transcendent of, human learning.

Learning and Knowledge in a Historical Context

Pragmatism’s second special contribution to empiricism lies in its historical standpoint on the nature of learning. Empiricism, like rationalism, traditionally assumed that the central faculties responsible for learning have not altered their functioning for as long as humans have been on the planet. Pragmatism rejected that ahistorical psychology, finding that human intelligence was itself an evolving and growing power. Furthermore, scientific methods of experimental inquiry are recent inventions, showing how the best methods for human learning can develop over time.

Most of humanity still relies on their relatively fixed set of habitual beliefs, modifiable mostly by less-than-scientific methods. Three lower modes of belief have always been available, and until recent centuries, these have been the only methods available. The first mode is the period of infancy and young childhood, during which imitation and emulation build up habits of practice. The second mode is to place unquestioning confidence in the common beliefs of one’s society, which seem enduringly intuitive and familiar. Peirce called this second stage the “method of tenacity.” The third mode is to resort to the respected rules of one’s society whenever troublesome situations arise and to stand by those rules even if they prove useless. Peirce called this third stage the “method of authority.” The fourth stage is the “method of science,” which is characterized by a higher-level logic of inference that can propose alternative rules appropriate to situations,

and thus provide for a wider variety of alternative habits available for testing.

Pragmatism prefers tried and tested rules for controlling belief, and therefore it endorses fallibilism: Any item of knowledge might be modified or overturned by future experimental inquiry. This position is not a retreat into anything-goes relativism or a resignation to skepticism. It is fallacious to think that just because any item of acquired knowledge may be amendable by future inquiry, most or all of knowledge must be wildly inaccurate or that humanity is fated to forever know very little about the world. Skepticism towards knowledge is unwarranted because discovering the inadequacy of some knowledge occurs only through the discovery of other, better knowledge.

Pragmatism characterizes skepticism as a consequence of demanding too much from any individual learner. Knowledge, however, is never primarily the possession of anyone in the singular. The smallest unit possessing knowledge is the community of inquirers; a person has knowledge only in virtue of being a participating member. Learning is entirely social in nature, and methods of inquiry are likewise communal. Because the amount of knowledge is presently so vast, we now credit memorization as a form of knowledge, but this derivative “knowing” is not the primary mode of learning. The acquisition of new knowledge is confirmed through the inquiries of communities, never those of a single individual. Only a community can confirm that experiments are conducted properly, and results are repeatable and reported accurately.

Communities skilled in conducting scientific inquiries (inquiries avoiding poor observations and fallacious reasoning, and utilizing advanced abductive procedures permitting future self-correction) are together responsible for accumulating knowledge in a coherent manner. Scientific disciplines can correct each other, for no science can falsify another science’s knowledge, yet a science can reveal another science’s knowledge to be limited, partial, and perspectival. As there is no supreme independent method for adjudicating among sciences or ranking sciences, the sciences themselves are responsible for determining how

they possess perspectival knowledge of their subject matters and how best to coordinate their respective ontologies.

Pragmatism and the Primacy of Science

No scientific discipline ever needs to compromise on knowledge with a less-than-scientific community, or with cultural convictions generally. Cultures are replete with valuable practices that work well enough without hardly anyone understanding why they work, so memorable narratives do the work of conveying credibility to succeeding generations rather than scientific explanations. Pragmatism understands the philosophical anthropology behind traditions and narratives about cultural practices, but it cannot lift cultural narratives aiding convenience or prosperity to a cognitive status higher than science.

Pragmatism is not about legitimizing a utilitarian criterion for truth, pragmatism denies that learning is controlled by popularity, and pragmatism rejects the idealistic view that one’s society dictates what one can know. The scientific knowledge of the few always overrides the habitual beliefs of millions, no matter how tenaciously held. Science is not just another cultural practice or cultural authority alongside all the rest. Science established its own standards of conduct in order to form inquiry communities devoted to testing and disproving beliefs, not to form a culture propagated by conforming consensus. A “scientific culture” is any culture relying primarily on science for material and civic advancement, not a separate kind of culture to rival others.

Social sciences studying how cultures like to describe the world, and discovering why a group maintains a belief in something, are not inquiring into whether that thing is real. For example, understanding that an indigenous group blames malevolent spirits for illnesses is not equivalent to learning about those spirits or confirming their reality. Whatever passes for learning within a culture does not automatically make the resulting beliefs instances of genuine learning or knowledge. A social science paradigm presuming that

the acceptance of cultural narratives is necessary for comprehending a culture simply abandons science. Cultural studies preferring relativism about knowledge fall to an intellectual level below science. Educational theory can be pragmatist in spirit by prioritizing experimental inquiry without adopting social relativism about truth or knowledge.

Universities and the Politics of Autonomy

Mark Murphy

University of Glasgow, Glasgow, Scotland, UK

Introduction

Political debates concerning the university are numerous and usually rancorous. They also unfortunately tend to be played out along fairly predictable binaries – autonomy or control, freedom or responsibility, and neoliberalism or professionalism. Much of the academic literature tends toward one side of this debate, painting a rather dystopian image of the present and future of university life as plagued by some combination of marketization, privatization, commodification, and even reification. In this version of the events, the space for autonomy, whether academic or institutional, appears to be narrowing in the face of a disappearing State apparatus and the rise of a hype-consumerist culture.

Not surprisingly, then, many academics have responded negatively to current changes in university administration. In particular, they have set their sights on the growth of accountability systems in universities, a trend that is noticeable internationally and identified by some as a “corrosive” development in the university sector (Schwier 2012). Accountability mechanisms

such as audit and inspection are viewed in some quarters as Trojan horses for senior management, which “together act to codify behaviors” of academics (Hammersley-Fletcher and Qualter 2009, p. 363).

These concerns should not be a surprise, given that questions have been asked about the consequences of increased accountability in higher education since the 1980s (e.g., Elton 1988). There may be some truth in the claims concerning accountability and its function as a control mechanism, but nevertheless it would be worthwhile exploring a less polarized and one-sided account of university management and administration. What needs to be engaged with currently is a more nuanced account of institutional autonomy in the context of ever-greater demands for accountability. How do universities and the academy balance competing demands for autonomy *and* control? This is a more pressing issue to deal with and can help move us away from a pervasive politics of nostalgia when it comes to academic life. To explore this question, the entry draws on theoretical concepts from critical theory, which are used to help delineate the limits of both autonomy and control. This entry explores the implication of these limits for issues such as academic freedom, academic identity, and institutional democracy.

Universities and the Politics of Nostalgia

When passing judgment on the current travails of higher education internationally, appealing to previous historical formations can only provide so much comfort. As with many aspects of modern professional life, retreating to idealized versions of the past as a bulwark against current challenges raises as many questions as it answers (Murphy 2011). The fact that institutional cultures, structures, and identities have shifted dramatically over time ensures that there is no idea of the university “free of historical contingency” (Rochford 2006, p. 147). The twentieth-century development of a mass higher education system driven by demographic and economic pressures led to a proliferation and diversification of institutions, many of which bear little resemblance to “traditional”

forms. The consequent heightening of institutional competition has meant that historical notions of identity and purpose have had to accommodate more prosaic concerns with marketing and recruitment.

Likewise, the transformation in the student demographic does not help the traditionalist case. This overhaul of the demand side brings with it a range of pressures and additional complexities that make historical comparisons even more problematic. Chief among these pressures is that students are now much more concerned about receiving “value for money,” a situation exacerbated by the global trend for decreased government support for higher education while placing increased financial burden on students.

Appeals to history as a defense against government interference are similarly inclined to failure. Past form suggests that the current heated debate is just the most recent manifestation of a perpetual tension between higher education and government (Murphy 2009, 2011). The audit backlash could also be viewed as a visible example of the “forgotten history” linking educational and commercial conceptions (McWilliam 2004, p. 160), a history that renders auditing as an “alien invader” highly dubious. This history acts as a useful reminder that traditional concepts of professionalism, identity, and purpose are as manufactured and artificial as any current attempt to re-brand the sector.

These issues suggest that contrasting modern and “traditional” forms of university, brutal and disquieting as this may be, offers a reality check for those looking to use the past as a weapon against current higher education policy. The strategy is fraught with both factual and analytical challenges, something that applies equally to proponents and detractors of market-driven accountability. It is also useful to remember that valorizing the ideal over the real, and vice versa, is a popular political pastime, with no one ideology holding a monopoly over historical truth. The past is as contested as it is oversimplified, with the political left no stranger to romantic notions of yesteryear.

At the same time, these qualifications of historical arguments are not enough to dispel troubling thoughts regarding the shift in public policy.

Some of these troubling thoughts are associated with the heightened bureaucracy around quality assurance – performance indicators, audit, inspection, and evaluation. Consumerism is also becoming increasingly embedded in a more established cultural ethos, *student-centeredness*, and a “soft” institutional framework that has found its significance magnified alongside the expansion of market-based forms of governance. Increasingly orthodox, student-centered approaches to teaching and learning can be said to have provided a sympathetic cultural environment for consumerism to flourish, a classic case of conservatism “piggybacking” more liberal/progressive intentions.

In the context of consumerism, the historical movement away from more traditional teacher- or discipline-centered approaches has proved a difficult transition. The alignment of received “best practice,” consumer rights, and institutional sanctions has heightened professional anxiety regarding the relationship between academic and student. This anxiety is manifested in what some categorize as the therapeutic turn in education (Ecclestone and Hayes 2008). At its worst, this turn encourages a tendency to confuse student support with intrapsychic affirmation, a confusion that reduces intellectual engagement to the level of rehabilitation (Barrow 2009, p. 186).

This is a particular concern in the context of assessment feedback, where the now standard avoidance of terms like “weak” and “poor” prioritizes conceptions of self-esteem at the expense of honest and appropriate communication (Barrow 2009, p. 186). Some have argued that the perceived vulnerability of students and the subsequent emphasis on individual needs makes it a challenge to confront their belief systems, an unintended consequence of progressivism that can have potentially damaging effects on the teaching-learning relationship in HE.

So those concerned with the function of the university in a modern liberal democracy, and the place of academic autonomy within it, can find much to be worried about. The dangers of increasing political and economic encroachment are real – the question is, how worried should one be about the loss of freedom in the academy?

Ideology and Critique

Although academic autonomy has been reshaped with the advent of marketization, the more troubling aspects of this association are tempered to some degree by the presence of a strong democratic impulse combined with the inevitable force of historical change. There is another sense in which universities and academics should be *really* troubled by the past, which relates to the powerful force that swept marketization across higher education in the 1980s. This force was nothing other than a “fundamental change in the ideology of higher education” (Peters 1992, p. 126), a change, for example, pursued with zeal by the Conservative Party in the UK, who shamelessly used industrial and technological changes as a justification to “bring the university into line.”

It is difficult to perceive this transformation in the character of universities other than as a direct attack on the institution. Far from being inevitable, the transformation was a form of counter-revolution against one of the last bastions of liberalism and source of enlightenment, a political offensive that sought to recast the university as irrelevant, outdated, and anti-vocation. Integral to this undertaking was the development in the 1980s of a “hostile, negative view of the educational past” that “held the ‘educational establishment’ responsible for the problems that needed solving” (McCulloch 1997, p. 74). This political strategy set the stage for an evangelical pursuit of efficiency, performance, and marketization, and Peters was correct to note in 1992 that this form of historical branding “will set the parameters within which higher education is to be conceived for a considerable time to come” (Peters 1992, p. 126). The benign tension between the State and university was swept aside by the real politics of ideological score settling, leaving in its wake a tangible antagonism.

The consequences of this political debacle indicate that, while the present should not be a slave to the past, neither should history become the “enemy, something dangerous and alien, to be controlled or expunged” (McCulloch 1997, p. 74). Historical lessons are there to be learned, in this case the fact that the process of “making markets,”

as Newman and Clarke call it (2009, p. 89), is itself “inherently political.” This lesson appears relatively straightforward; the manner in which it has been learned, however, has proven hazardous for academics. Different historical methodologies have been used to explore the current hybrid of markets and accountability, mostly with diminishing returns. Some have used Michel Foucault’s moral archaeology to capture the oppressive nature of modern public sector governance, identifying in current policy a shift toward a panopticon-like state, one in which audit technologies result in institutional self-censorship, new forms of rationality and morality, and regimes of power.

This concentration on the micro-politics of subjectivity comes to some extent at the expense of a more nuanced debate over accountability and professionalism. Postmodern-inspired talk of oppression and resistance is not the most appropriate way of characterizing a predominantly State-funded sector, one that must be democratically answerable to its tax-paying electorate (Murphy 2009). Conversely, the emphasis on fluctuating and amorphous notions of “identity” and “self” as forms of resistance or otherwise loses some of its strength in the face of budget cuts and threats of redundancy. As Jenkins (2000, p. 22) suggests, Foucault’s panoptic vision is not necessarily the best way to appreciate the “potential for utilitarian social control that lies at the heart of modern rationalization.”

Framing the discussion in terms of power and subjection avoids offering concrete solutions to the problems faced by the academy. The inadequacy of this approach begs the question of what can provide a normative grounding for critique. Strong residues of another source of historical critique can be detected in various commentaries on higher education – Marxism. Although currently out of favor as a source of intellectual dissent, it is not difficult to perceive a residue of historical materialism in much critique of public policy, with universities becoming “marketized,” “commercialized,” and even “commodified.” These terms are sometimes used interchangeably, but alongside “proletarianization” offer a rudimentary source of dissent for many.

As with the use of Foucault, the use of Marxist-inspired ideas to generate a theory of loss in academic institutions tends to be unconvincing. Its inadequacy as an explanatory theory in this context is partly due to the fact that the critique of commodification has been cast adrift from that which gave it meaning in the first place. It is also due to a lack of fit between critiques of capitalism and current debates over the purpose of universities. Whatever universities may be, they are not definably capitalist in nature, one of the reasons why notions of consumption applied to higher education tend to run aground. It is also why characterizing the loss of academic autonomy as “proletarianization” makes little sense in the context of institutions that are not built to extract surplus economic value from their “workers.”

The inability of theories such as Marxism and postmodernism to provide an effective and coherent account of academic loss is one of the more troubling aspects of historical comparison. Laments for a bygone era are no substitute for theories that can adequately gauge what has in fact been lost in the shift toward a mass HE system. Cast adrift without normative foundations, what can the academy offer in the face of marketization? How can it defend itself from further intrusion while retaining whatever autonomy it has left?

One place to start would be for the academy to take control over its own professional identity and play to its strengths as a form of public good and public service. Such a route would make sense given academic unease in the face of creeping privatization and help reclaim the agendas around accountability and democracy at the heart of public service. This could help reverse the ceding of control over these agendas to institutionalized versions in the shape of “impact” and “knowledge exchange” and act as a bulwark against further erosion of autonomy.

Whether or not the academy is in a position to “publicize” itself in such a fashion is open to debate and must inevitably confront real challenges in the shape of professional insularity, disciplinarity, and the increasing proliferation of academic identities (Murphy 2011). There is also the lingering suspicion that reclaiming a public service ethos plays into the hands of modern

institutional agendas around impact and relevance. However, if academics continue to avoid delivering their own response to these issues, it must surely be the case that institutions will only too gladly provide the response for them.

Conclusion

In detailing some of the different approaches to academic autonomy, this entry has evidenced the complex nature of debates around professional control and institutional/national politics. These debates, shaped by intellectual concerns over power and ideology, have often led the academy down blind alleys and into the world of simplistic binary divides. These competing historical narratives around academic autonomy have also helped to increase the sense of uncertainty, eating away at foundations based on traditional authority. It is therefore not surprising that the urge to authenticate is consequently strong, but this does not excuse the fact that this urge to cement and codify professional parameters has come at the expense of more reflective inquiry into sources of control. For a profession devoted to meaning making, it is surprising that it has been less successful at making sense of its own world. To suggest that fluctuating levels of control are unwelcome divergences from some kind of natural harmony misunderstands the fragile nature of autonomy, professional or otherwise, in the first place.

As suggested in this entry, the academy could do worse than reconsider its function as a public service, a function that allows it a legitimate source of identity while at the same time wrestling control back from institutional and governmental agendas. This take on issues of control also suggests that identity and autonomy are intertwined in the academic profession, a suggestion that invites comparison with other professions such as teachers, doctors, and social workers. While issues of control inevitably play out differently in these professional contexts, it might prove beneficial to explore how the politics of autonomy has manifested itself elsewhere, as such comparisons would help the academy turn the gaze away from itself and instead face outward, toward the public sphere.

Unmaking the Work of Pedagogy Through Deleuze and Guattari

David R. Cole

Centre for Education Research, Western Sydney University, Sydney, NSW, Australia

Synonyms

[Critique of capitalism](#); [Educational change/reform and norms](#); [Pedagogy](#); [Schizophrenia](#); [Subjectivity](#); [Time](#)

Introduction

The application of Deleuze and Guattari's philosophical work to pedagogy would seemingly position them on the side of the bottom-up, child centered, antiauthoritarian, nonconformist progressivism of the 1960s and 1970s. While this characterization is superficially correct and can raise the ire of conservative critics of educational provision, this entry will show that the application of Deleuze and Guattari to pedagogy is an involved, convoluted, and strenuous activity. This is because (1) the philosophical position of Deleuze and Guattari's work is not as straightforward as *only* working through a (de)centered or "a"-centered self that challenges the creation of subjectivity by capitalism or is simply anti-capitalist. Indeed, many of Deleuze's philosophical works and Guattari's speculative/political pieces focus on the construction of subjectivity (e.g., in Kafka's literature) and understanding how and why Deleuze and Guattari's move beyond subjective construction by capitalism in social life is key to comprehending how to use their work in education for pedagogy; (2) Deleuze and Guattari sought evidence for their claims about the creation of subjectivity and how to comprehend capitalism in this light. The creation of subjectivity by capitalism is mirrored in/through education according to Deleuze and Guattari (1988), which is a compelling argument for understanding the unmaking of pedagogy of

this entry. This entry will explore the application of Deleuze and Guattari to pedagogy, which is far from an "anything goes" attitude to educational provision, but looks to include all factors in the complete analysis of educative power; for example, (3) Deleuze and Guattari were particularly concerned about how their philosophy would be received and taken up, especially with respect to its use by interested power elites. Therefore, there is a necessary coding and movement in thought, alongside and between the reception and use of their work, which can be frustrating for critics, that determines the immanence of their philosophy and specifically provides a schema for how to use their ideas in education as pedagogy. This entry will show how Deleuze and Guattari pedagogy unravels what has gone before in education, does not produce "ready-made" solutions to today's educational problems as part of "the same," but signifies an "unmaking" of normative defined notions of pedagogy.

Schizophrenia, Capitalism, and Pedagogy

Gilles Deleuze is perhaps best known for his dual writing projects with the French theorist and activist, Félix Guattari, which resulted in two extraordinary books that focused on the multifarious relationships between schizophrenia and capitalism (Deleuze and Guattari 1984, 1988). These works are almost impossible to summarize and deserve multiple readings before one comes close to understanding their range and importance. However, there is a connection between the theme of this writing, i.e., Deleuze and Guattari's notion of pedagogy through unmaking, and the unexpected and exciting aspects of Deleuze and Guattari's writings on capitalism and schizophrenia. Firstly, a coherent line of argumentation appears if the "image of thought" discussion as that was raised by Deleuze (1994) in *Difference and Repetition* with respect to philosophical dogma and that had been foreshadowed in *Nietzsche and Philosophy* and *Proust and Signs* is reimaged and reapplied to the subsequent *Capitalism and Schizophrenia* texts. The basic

argument taken from Deleuze's early texts with respect to pedagogy happens in relation to the "image of thought," in that the "unmaking" of pedagogy is enacted if one questions the "image of thought" as it has appeared in philosophical texts, because one comes closer to thought *qua* learning in the world, as a new mode of undogmatic pedagogy can appear, as Deleuze defines it, as a form of "transcendental empiricism" (Deleuze 1994).

Pedagogy can henceforth be realigned and performed as a mode of intense critical/affective thinking and subsequently as genuine learning, because one is able to effectively critique the "difference as difference" of philosophical texts to understand their places in the world, and the assumptions and repetitions in thought as have been set up by the philosophers become clear as dogma. Hence, Deleuze sets up pedagogy as "unmaking," in terms of specifically not being convinced by previously agreed upon norms and in the questioning of consensus, especially as it has appeared between philosophers or theologians. Pedagogy is according to Deleuze (1994) not something that is "done to one" or "is done by one to others," but is something that one participates in, it is a mode of co-construction, teaching and learning become fused, one is opened up to the future, and one is better able to question knowledge construction as such. In consequence, one is able to make wider and more profound "mindscapes" through thought, i.e., via the unconscious and with nature (Deleuze 1994), and this action strengthens the interrelated, reciprocating connection between teaching and learning as transcendental empiricism. The wider relationships that Deleuze and Guattari (1984, 1988) are interested in *Anti-Oedipus* and in *A Thousand Plateaus* concern capitalism and schizophrenia, which are taken as two poles in the contemporary, fluctuating situation that is dominated by capitalism. The point of analysis here is not that there is a general "becoming more schizophrenic" due to capitalism or that schizophrenia is directly caused by capitalism. The analysis that is given by Deleuze and Guattari (1984, 1988) tends toward understanding the processes invoked by capitalism that can have

long-term psychoanalytic effects which can be bracketed and organized through the rubric of schizophrenia.

Deleuze (1994) changed the name of his philosophical approach in *Difference and Repetition*, which he termed as "transcendental empiricism," to "transcendental materialism" in *Anti-Oedipus* (Deleuze and Guattari 1984). However, the transcendental aspect of the approach advocated by Deleuze in both texts is not *transcendent*, i.e., leading to a type of exploration of the conditions for experience or of "I" and as one finds in Kant. Rather, the transcendental in *Difference and Repetition* refers to the difference and repetition of empirical events; thought is embodied as partial objects and as the unmaking of pedagogy. In *Anti-Oedipus*, the transcendental refers to the material flow of things and their synthesis, as they pass through the (de)centered subject, or the subject undone by capitalism, in a parallel manner to Whitehead's (1929) panpsychism, which lends mind to objects and objects to mind, in the world and through process.

In the case of *Anti-Oedipus* and *A Thousand Plateaus*, a dizzying array of conceptual and intellectual units, methods, and ideas are invented and made apparent that link schizophrenia with capitalism such as (re-) and (de-)territorialization; coding, decoding, and over-coding; rhizomatics; desire and the desiring machines; assemblage; the body without organs or BwO; the war machine; abstract machines; the plane of immanence; and schizoanalysis. In and through this entry, these concepts from the *Capitalism and Schizophrenia* books will be related to the "unmaking" of pedagogy, in order to discern the forces which direct the ways in which teaching and learning happen in the contemporary capitalist, social, and psychological situation and to "unmake" this psychosocio-capitalist knot in terms of thinking through the image of thought produced by capitalist (and schizophrenic) education.

Deleuze and Guattari's aim in their *Capitalism and Schizophrenia* books is to understand the underlying psychic, cognitive, and affective processes that pass through the subject and that determine and play with being as becoming, as one lives through the dictates of capitalist social life.

For example, Deleuze and Guattari (1984, p. 190) take the omniscient fact of contemporary debt and how the reality of debt has expanded and broadened beyond the confines of straightforward, flesh-to-debt relationships that one finds, for example, in premodern societies, that literally mark the body of the debtors. Today, the reality of debt is pan global and often submerged, as the lines of credit have been expanded exponentially from small communities of interdependents and the overlords of their land and territory. The identifiable overlord figure has been replaced by a formidable mixture of debt powers, e.g., between banking systems, their clients, and mortgage credit finance packages, as were exposed during the 2008 global financial crisis, and between State systems and their taxation, bond, and monetary systems, by and in interest rates; in student loans, through corporate finance systems; and in consumer debt arrangements. The unmaking of pedagogy in this context requires understanding the image of thought that these interrelated debt arrangements afford.

The image of thought of debt relationships and pedagogy, what educators teach and learn, and how the items of the curriculum are delivered are all now incredibly involved and multilayered, as the notion of debt itself has gone from a recognizable bodily practice of power, exemplified by marking and scarring, to omnipresent and multiple forms of financial control and submission. In many countries, debt now accompanies college- or university-level study and reaches down into the education system as a whole through private education. Unless one is literally able to pay the study fees up-front (i.e., one comes from a privileged, previously capitalized position), one is caught in the web of debt over time, as soon as one goes to university or starts to study and learn (hence the notion of “edu-debt,” Cole 2013). Of course, this new reality of unrestrained and global finance capitalism has consequences for what one teaches and learns and how one learns, as debt incessantly mounts up and repayments incur interest. Under these conditions, one inevitably plays it safe and chooses a subject to study that should lead to a high-earning career and which will facilitate the repayment of the debt as

quickly as possible. Moreover, these conditions of debt have effects on the body and mind, as well as practical lifestyle and career choices.

Deleuze and Guattari’s (1984, 1988) process-orientated and interlinked arguments about capitalism and schizophrenia importantly include the incursion of machines into the frame about what it is like to live, think, and learn under capitalism. Machines are not a metaphor for the way one now thinks and learns or for capitalist pedagogy, but machines termed as “the machinic” by Deleuze and Guattari are a literal means to grasp the effects on desire that being in debt for the whole of one’s life has, as can be expressed through the conjunction “desiring machines.” Importantly, the insertion of the machine is not a categorical or projective stance taken by Deleuze and Guattari (1984, 1988) to replace the human self with something less comforting, but opens up, for example, a passage or process, to understand how debt now disturbs the way one teaches, learns, and thinks. As one goes ever further into debt – which is ironically often framed by metaphors of freedom and self-reliance – the necessity to make up the time of repayment becomes an imperative. A type of restlessness and agitation overwhelms the agent as the reality of the financial interest rates and the time frame of debt looms, and this psychic disturbance may be interpreted through forms of mental disease such as depression, neurosis, psychosis, or schizophrenia. The agent ultimately incorporates debt into themselves as a dead part of his or her being. One could say that debt is a machinic form of non-becoming that doesn’t change other than as a number or percentage and is an anathema to the chaos of the natural world or the creativity of the unconscious imagination – furthermore, debt importantly affects the desire of the agent. The desires of the agent become embroiled by debt as “machinic desire” and as a form of the death drive or as constant repetitions of financial repayments that (re)figure life as a tunnel with financial salvation at the end of that tunnel and as the only possible light coming from inheritance or from receiving some great windfall from an unexpected source and these extraordinary riches paying off the debt.

Clearly, under these conditions, one cannot teach and learn in the way that Deleuze (1994) states in *Difference and Repetition*, i.e., in contact with nature and through the creativity of the unconscious. Contrary to learning through the unconscious and in nature and contrary to the transcendental empiricism of *Difference and Repetition*, the pedagogy of capitalism is funneled through debt repayment and in having the means to make these installments, which produces a compelling argument for the unmaking of such pedagogy. However, Deleuze and Guattari (1984, 1988) do not give a simple, moralistic interpretation of the capitalized situation (and its unmaking) and do not attribute all evil or wrongdoing to the beneficiaries and elites of capitalism. Rather, they offer a sophisticated analysis of how the capitalist situation has been arrived at and how one can diagnose and explore the symptoms of what capitalism can do. Deleuze and Guattari (1984, 1988) show that the question of the precise effects of capitalism on the contemporary psyche is a complicated and convoluted one that it is based in nonlinear history and in developments in the ways in which socialization happens and collectives have been produced, and, furthermore, these processes have developed significantly since the time of their two major publications. It is clear that present-day children significantly learn through online environments and social media such as Facebook, as well as at school or in formal “face-to-face” situations (Cole and Pullen 2010), and this changes the unmaking of capitalist pedagogy.

Online environments are often fully connected to commercial interests, and this pressure to accept commercial dictates as norms has intensified considerably since the time of Deleuze and Guattari’s opus maxima during the 1970s. One can read Deleuze and Guattari’s work on capitalism and schizophrenia as a sophisticated extension of Guy Debord’s (1994) analysis of *The Society of the Spectacle* in that “(i)n societies where modern conditions of production prevail, all of life presents itself as an immense accumulation of spectacles. Everything that was directly lived has moved away into a representation” (Debord 1994, p. 3). In Deleuze and Guattari

(1984), the representation of life and pedagogy is enacted by the three syntheses of capitalism (connective-disjunctive-conjunctive), and these cannot be directly opposed, but only followed as flows, and diverted through intense thought and a new mode of pedagogy if one takes Deleuze and Guattari at their word that unmakes the pedagogy of the past and questions the image of thought of the capitalist present.

Conclusion

The strongest question with respect to the philosophy that one may derive from Deleuze and Guattari and that pertains to pedagogy is what is the point of articulating the Deleuze and Guattari perspective on pedagogy as unmaking? In an attempt to answer this question, the ways in which Deleuze and Guattari’s philosophy may be taken up by educational practitioners and researchers will be listed below:

1. The eight postulates as listed in the “Deleuze and Learning” entry (same author) and in Deleuze (1994) can be used for what could be termed as “critical thinking practice.” This practice involves examining texts and the representation of thought, e.g., in cinema, in order to understand the image of thought, and the assumptions and dogmas inherent in those thoughts and therefore leads to a new mode of pedagogy tied to these learnings (as unmaking). This form of educational practice has important work to do in questioning the image of thought of contemporary capitalism.
2. The application of “Deleuze and Guattari pedagogy” to literacy pedagogy opens up the field away from border control work around illiteracy and (re)introduces other multiple literacies that could be overlooked in the everyday life of the formal classroom (Masny and Cole 2009) and that further strengthens critical thinking practice.
3. The nature of schools as sedentary markers in society, and therefore schooling as such, and the conditioning processes in schooling, e.g.,

- institutionalization, are put under pressure due to the application of Deleuze and Guattari pedagogy as a practice (i.e., questioning fixed ideas about schooling).
4. The value of the end processes of pedagogy such as final examinations is seriously questioned according to this approach to pedagogy through unmaking. Deleuze and Guattari would applaud formative types of assessment, as well as quality feedback and the playing with the authority of having the “right” answer or even reframing the question. Of paramount importance to Deleuze and Guattari pedagogy is the process of thinking about “the image of thought” as has been described above.
 5. Deleuze and Guattari pedagogy puts emphasis on experimentation, role-playing, and the questioning of power games. At the heart of this practice are an affinity with environmental concerns, the nonhuman world, and the subversion of commercial culture as a banal imposition on what one learns. For example, many “technological innovations” in educational practice could be seen as attempts by educational software designers to sell new products.
 6. The unconscious is not an inaccessible other, but at the center of Deleuze and Guattari pedagogy. This means that exercises designed to stimulate the unconscious are important markers with respect to what one does as an educator. For example, one should be able to act spontaneously and in the moment, following unexpected cracks in the set curriculum as they appear.
 7. Deleuze and Guattari pedagogy indicates a move away from right-wing, market-based influences in education, often described under the rubric of “neoliberalism.” This point of the unmaking in/by pedagogy is not to head for a utopic, anarchic, communist, or agrarian state, but to create a space wherein other forms of socialization may become apparent in the future through education.
 8. Educational policy and curriculum design may be made more responsive to context and change if the principles of Deleuze and Guattari pedagogy were applied as a mode of thinking practice and unmaking.

9. Lastly, but importantly, Deleuzian pedagogy rests on the affect that he took from his reading of Spinoza and the ways in which the affect circulates in life and as a basis for all relations. Hence, affect needs to be recognized as a major component in all educational contexts (see Cole 2011a, b).

Introduction

In 1605, Felipe Guaman Poma de Ayala writes to King Philip III *El primer nueva coronica y buen gobierno* [First New Chronicle and Good Government] detailing the use of *quipus* in the administration of the Inca Empire and commenting on the people who did that job and the way they achieved this position. The Spanish administration ways are illustrated, together with their issues and defects, in face of which the author suggests to put back in place the Inca administrators, thus showing equivalence between writing and the use of *quipus*. The high social classes of the indigenous society were the first ones to have access to writing, so great

part of the responsibility implied in using this new tool rested upon them. Nevertheless, ordinary people, children, and even women – considers the author – should also have access to this knowledge.

The Author

In order to expose the unfairness suffered by the Incas, and using writing as a means to exert power, Guaman Poma declares himself to be a spokesman before the King. He poses the need to appropriate this technology in what he foresees as the transition from the use of *quipus* to the schooling process, which taught writing with the Latin alphabet. In the image below, he introduces his portrait (Fig. 1).

In his ample work of 1,189 pages, Felipe Guaman Poma de Ayala (ca. 1556–1644), a Peruvian ethnographer of his time, introduces the 12 Incas [Kings] and their Coyas [Queens], their royal functionaries, the rites, and ceremonies performed at the time, together with some considerations about the ages of the world. He addresses his text to King Philip III, to whom he describes in long pages the defective administration of the kingdom, considering that an Andean administrator “is better than a Spanish lieutenant” and “is likely to proceed without doing so much harm and mischief” (Adorno and Murra, 2006, p. 807). The harm in question is presented in the chapters about “The Conquer of This Kingdom” and “Good Government and Justice.” In the final sections, he depicts the Andean world, including a world map and details of different cities and villages. The work is particularly featured by 398 illustrations that accompany the text, “for it not to become tiring at the moment of reading” (p. 10). The current study presents some of those images, as well as the legends that accompany them in ancient Spanish, with their corresponding modern English versions. These images are analyzed as more than simple complements, as far as they contribute important information to the interpretation of the text.

The writer actually sent the text to King Philip III, but after a mysterious arrival to the Spanish

court, it had a hazardous fate. In effect, the manuscript got lost for centuries, until appearing recorded in the Royal Library of Copenhagen in the eighteenth century. But it was only until 1908 that the German librarian Richard Pietschmann published it as a new discovery. In 1936, Paul Rivet presented a facsimiled edition, which was the only available one until the publication of the critical edition by Rolena Adorno and John Murra in 1980. The current study resorted to the 6th Spanish edition by Adorno and Murra (2006) and to the images of “The Guaman Poma Website,” in charge of the Royal Library of Copenhagen.

The Peruvian author reflects on the uses of *quipus*, their administrators, and the transition from this way of administrative knowledge to its written equivalent, with which – he considers – it

should not be disjunctive. Just as well, he points out that the lower social strata should also have access to writing, which he acknowledged as an efficient way of expressing themselves.

The Use of Quipus

The *quipu* or *khipu* were an Inca tool for recording the movement of people and goods. A *quipu* consists of a series of colored, spun, plied, and knotted threads or strings made of cotton or camelid fiber and suspended from a main cord. The type of knot indicated a number, and the knot's placement signified units according to a base ten positional system. This device was used to monitor tax obligations; keep record of counted goods such as gold or corn; collect census, calendrical military,

or other data; and, according to Brotherston (1992), even to record narratives.

From the very first pages of his work, Guaman Poma mentions the use of *quipus*: “cin escriptura nenguna, no más de por los quipos y memorias y relaciones de los indios antiguos” [without any writing, and only by using *quipus*, ancient indigenous people used to keep records and memories] (p. 8). *Quipus* were the system by which the Inca kingdom was administered, as it can be observed in the following images: In Fig. 2, the Inca gives instructions to a *suyoyoc*; Fig. 3 shows *Condor Chaua*, one of the *chasquicoc*, as he presents the accounting system.

The *chasquicoc* (treasurers) and the *susuyoc* or *suyoyoc* (administrators) were among the most important functionaries in charge of the Inca kingdom. They were the sons of the great lords and as such they learned the duties of

“counting and commanding,” so that they became skillful at administrating the lands at the death of their fathers. They had to prove to be capable and diligent in order to take responsibility for the communities and their crops, thus honoring the gods, so that there was abundance of all type of food, fruit, clothes, cattle, and mines. Their duty was not restricted to administering the lands, because they also had to mete out justice by solving the quarrels of the people in their communities (p. 321). Justice, which was certainly scarce under the ruling of the newly established Spanish government, actually depended on the duty of the *susuyoc*. Guaman Poma complains to King Philip III and suggests that, if the former administrators were experienced in managing the kingdom, they were the most indicated ones to serve God and his Majesty the King.

As shown in Fig. 4, the native administrator holds a book and a *quipu* in his hands, in order to keep record of contracts, sales, and purchases. The author even proposes that those who perform in this position should have the authority to penalize the damage caused by *regidores* (aldermen) and *alcaldes* (magistrates), and that the major *caciques* (principal native lords) should also take the responsibility to protect the poor among the natives (Fig. 5).

According to the author, this administrator should be a former royal official, examined as follows:

The major *caciques* . . . must be raised as Christians and know the Spanish language, and even Latin, if possible. They must be skillful at writing and counting and at drafting queries and grievances in the defense of themselves and of the natives under their authority, who are actually their vassals, poor natives of Christ.

They should ideally be spirited, resolute men, not fearing the Devil, the *corregidor* (royal administrator), the *encomendero* (the Spanish functionary in charge of the *encomienda*, which was the legal system employed to regulate native labor) the priest or the Spanish; instead only fearing God and your Majesty. (p. 770/718)

This official not only had to know his duties but also be brave and confront his opponents, “not fearing the Devil or the royal administrator,” because the Spanish rulers used to violate the indigenous rights since the times of the discovery.

Writing and Power

The power of writing came from the moment of the discovery. Inherited by the sailors since ancient times, in the first place writing affected the religious scope through the sacred Scriptures,

which was the supreme and unquestionable text. In the second place, it affected legal aspects as a means to demonstrate true testimonies or the legality of any deed: agreements, summons, bulls, decrees, and others.

The members of the Amerindian cultures soon recognized the efficacy of this way of exerting power. Writing operated as an almost magical instrument, not allowing any reply or discussion, in what Lienhard (1990, pp. 22–23) designated as the *fetishism of writing*. Nevertheless, writing was neutral in itself; that is, it could be used with diverse purposes, which could go in favor or against the natives, the latter being the most frequent use.

The notion that writing could be used against the natives was soon recognized. Guaman Poma presents several examples such as the one shown

in Fig. 6, wherein a Spanish royal administrator dictates a letter to his assistant.

Writing in favor of the natives was actually scarce, but not totally inexistent. Guaman Poma also provides some examples such as when a woman receives a letter to seek justice from the authorities (Fig. 7).

The case of the woman who seeks justice provides an outstanding example of how writing was also used to favor the natives, as far as it indicates the likely authorities to whom it was possible to appeal in order to solve a grievance, as indicated by the small letter text that accompanies the image:

[she begs that] The mentioned magistrate gives her a justice letter, so that the vicar listens to her and metes out justice, also notifying the Bishop, for him to punish this and other [unfair priests], thus setting an example in this kingdom.

Use of Quipus in Peru and the Process of Alphabetization and Schooling, The,

An upstanding native lord drafts a grievance on behalf of an Andean commoner. The principals must be examined for Spanish writing, making petitions and interrogatories, and presenting disputes

(Special thanks to The Royal Library, Copenhagen, for allowing the use of the images of the *Guaman Poma de Ayala* manuscript, GKS 2232 4°. Retrieved from <http://www.kb.dk/permalink/2006/poma/info/en/frontpage.htm>. Drawing 292)

...And seeks justice from the mentioned magistrate, major cacique, administrator, protector, general lieutenant of the royal administrator, from the latter [himself], or from anyone [who metes out] justice. The town council or any other corresponding justice body are commanded to session and respond and sign the grievance, all of which the notary must testify about. This must later on be dispatched to the vicar general, who shall be in the middle of the mentioned province.

The request must be endorsed by the notary, for the procedure to follow its legal course. In this case, the fetishism of writing decreases notoriously: administrative and legal effectiveness does not rely on writing itself, but on the person who has the authority to communicate through writing. Quispe Agnoli (2006) analyzes the situation of writing and its consequences in the New

World, with particular emphasis on the work of Guaman Poma. She explains how the perception of the indigenous legitimate authority had been undermined, which she illustrates with the case of the *Nahua*, which is analogous to that of the Incas:

... In evaluating the pre-Hispanic culture, a transition can be observed, from the highly civilized *Nahua* to the ignorant native. ... the missionaries resorted to psychological punishment and emphasized the cultural inferiority of the pre-Hispanic culture, thus undermining and destroying the indigenous subjectivity. (Quispe Agnoli 2006, p. 170)

In the examples above, writing is only allowed to the dominant class. Guaman Poma proposes to extend this permission to the natives, for them to appropriate this form of power. The author questions the inferiority to which they have been subjected,

Use of Quipus in Peru and the Process of Alphabetization and Schooling, The, Fig. 6 CORREGIMIENTO. CORREGIDOR DE PROVINCIAS. Después de auerse hordenado los dichos corregidores. . . a resultado muy grandes daños en estos reynos del Pirú. Y al cabo salen del corregimiento con haziendas de más de cinquenta mil pesos a la costa y daños de los pobres yndios. (p. 488/455). The royal administrator (*corregidor*) and his secretary. After the appointing of the mentioned *corregidores* . . . Serious damage has

resulted in these reigns of Peru. And when they are done, they leave the *corregimiento* with fortunes of up to 50,000 pesos at the expense of, and damaging, the poor natives

(Special thanks to The Royal Library, Copenhagen, for allowing the use of the images of the *Guaman Poma de Ayala manuscript*, GKS 2232 4°. Retrieved from <http://www.kb.dk/permalink/2006/poma/info/en/frontpage.htm>. Drawing 198)

because they have a fairer and more efficient administrative system, as is the case of the *susuyoc*.

Schooling

As indicated by the author in the first part of his work, even before the coming of the Spanish, the

age of 5 was considered to be the appropriate time to start schooling: “The mentioned kids . . . are ready to attend school and be taught the doctrine” (p. 209/185). Under the Spanish ruling, these kids started school at the command of the priests, whose cruelty, however, was notorious (Fig. 8).

In face of the abuses suffered by boys and girls, the author proposes that the priests appoint a

Use of Quipus in Peru and the Process of Alphabetization and Schooling, The,

Fig. 7 PADRES. CAVILDO DE LA QUEJA. Que perdió la pobre yndia contra el padre y pide justicia . . . El dicho alcalde le dé carta de justicia . . . (p. 654/618). An Indian woman, falsely accused of concubinage by the parish priest, presents her petition for justice to the native magistrate

(Special thanks to The Royal Library, Copenhagen, for allowing the use of the images of the *Guaman Poma de Ayala* manuscript, GKS 2232 4°. Retrieved from <http://www.kb.dk/permalink/2006/poma/info/en/frontpage.htm>. Drawing 260)

“sensible Christian” as native instructor, for him to teach doctrine (i.e., to provide education) (p. 587/556), as it is observed wherein the hat type allows identifying an indigenous teacher. Spanish teachers were the priests, in figure 8 appears with a miter; Spanish authorities used flounced collars and hats as in figure 6; indigenous teachers and authorities used round hats with a flower like figures 9 and 10.

When the author mentions “all boys and girls,” he really means it: the children from high and low social strata, whose parents, he suggests, should pay the teacher according to their corresponding economic possibilities:

...alcalde o cacique, le pague al dicho maystro un patacón cada muchacho y un almud de maýs, otro de papas. Y ci es pobre, quatro reales y un almud de

maýs. Y ci es güerfano, que no le pague nada, cino que los domingos y fiestas le trayga una has de leña y le ayude en su sementera quando se ofreciere en el año, asi mismo las muchachas. (p. 672/635).

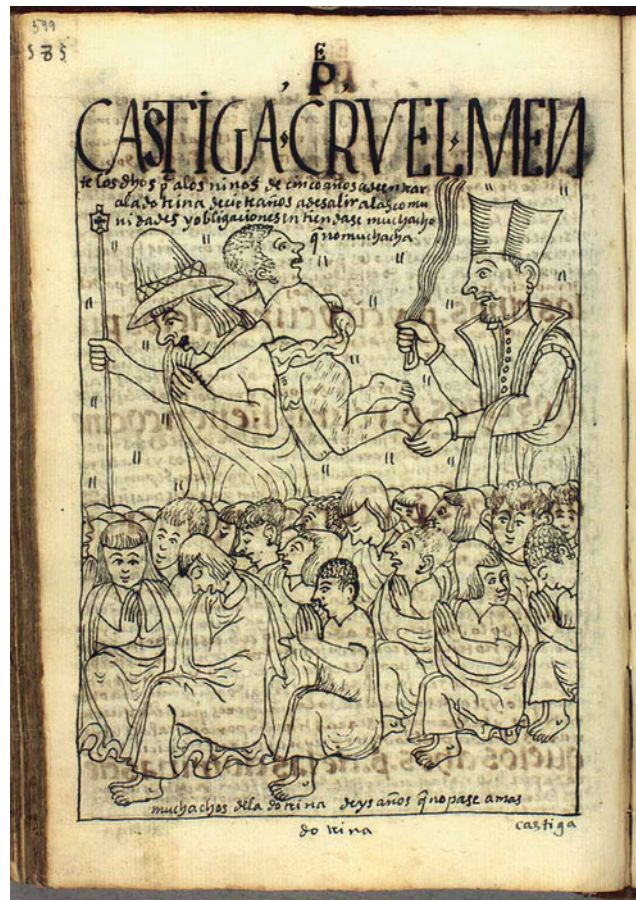

magistrate or major *cacique* pays the mentioned teacher one *patacón* [golden coin] per kid, and one *almud* [weight measure] of corn and another one of potatoes; and if [the child] is poor, 4 *reales* [a lower denomination coin] and one *almud* of corn; and if [the child] is an orphan, let them not pay anything to the teacher, instead bringing [him] a bundle of firewood and helping him in his garden on Sundays and holidays whenever necessary along the year, and in the same way the girls could do it.

It is worth while noting what the children are writing in the image: “may you all know how much/many.” Quispe explains that this is a usual sentence in legal documents. Therefore,

Use of Quipus in Peru and the Process of Alphabetization and Schooling, The,

Fig. 8 PADRES CASTIGA CRVELMENTE. Los dichos padres a los niños. De cinco años a entrar a la doctrina, de ciete años a salir a las comunidades y obligaciones. . . (p. 585/554). At the age of 5, native boys are brought to the parish, where they receive religious instruction and suffer cruel punishments

(Special thanks to The Royal Library, Copenhagen, for allowing the use of the images of the *Guaman Poma de Ayala* manuscript, GKS 2232 4°. Retrieved from <http://www.kb.dk/permalink/2006/poma/info/en/frontpage.htm>. Drawing 234)

“Schooling is not only aimed at acquiring a new literacy, but at training notaries as well, that is, natives that are capable of assuming this social role, which shall allow them to claim their rights and survive in the new colonial order” (Quispe Agnoli 2006, pp. 195–196).

For Guaman Poma, the hope of a deep change is in the hands of the new generations. They are the spokespeople of a consciousness that shall return. He considers that the indigenous society must rebuild their authority to claim their rights and propose solutions. Despite their acceptance of the figure of the “poor Indian,” his yearning is that they stop perceiving themselves as immersed in cultural misery and in the dependency of other

authorities. Their ability to assume the discursive forms of the other shall give them the possibility to be heard.

Conclusions

The transition from the use of *quipus* to writing illustrates the active reception of a technology imposed by the dominant society. The de-fetishization of writing, which takes place when the spokesperson is prioritized over the communication channel, leads the author to proposing the appropriation of this channel to transmit the voice of the indigenous culture. He

Use of Quipus in Peru and the Process of Alphabetization and Schooling, The, Fig. 9 MAISTROS. LOS MAISTROS DE CO. Y de escuela desde rreyno tributario. Que los dichos maystrosan de enseña a los muchachos, niños, niñas, mosos y las doncellas. . . Se les tome lición y le enseñe a leer y scriuir. . . Porque aci conviene para el seruicio de Dios y de su Magestad. Nota: En la imagen el niño escribe: “sepan cuanto” (p. 670/634). The cruel choir and school masters should teach their students to read and write, so that they become good Christians. That the mentioned teachers must

instruct the youngsters, namely, boys, girls, and lads and maidens . . . Let them be examined and taught reading and writing. . . Let there be schools in both the small and big towns of this kingdom, and all the mentioned boys and girls know how to read, write, and sing organ music. So it must be done to serve God and your Majesty. Note: In the image, the boy writes: “sepan cuanto” [may everybody know how much/many]

(Special thanks to The Royal Library, Copenhagen, for allowing the use of the images of the *Guaman Poma de Ayala manuscript*, GKS 2232 4°. Retrieved from <http://www.kb.dk/permalink/2006/poma/info/en/frontpage.htm>. Drawing 266)

suggests that the best users of the writing system are probably those former functionaries of the Inca kingdom who know the use of *quipus*. Yet, he promotes a generalized use of writing, also including women in these first steps

toward alphabetization and schooling in colonial Peru.

The author does not hesitate to present himself as a legitimate spokesman of a valid speech, enunciated from the dominant forms. Guaman Poma

Use of Quipus in Peru and the Process of Alphabetization and Schooling, The, Fig. 10 ESCRIVANO DE CABILDO NOMBRADO DE SU Magestad. Quilcaycamayoc. ...Se declara que no se meta español ni mestizo ni cholo ni negro ni mulato ni zambahigo, cino entre ellos [indios] por la ley de derecho lexítimo agtual, primizu, corporal que Dios plantó entre los indios en este rreyno. Va, Tauhi Va

‘Ana Hau‘alofa‘ia Koloto
University of the South Pacific Tonga Campus,
Nukualofa, Tonga

Introduction

The term “vā” exists in a number of Polynesian languages including Tongan and Samoan. In the New Zealand Māori language it is referred to as wā. In the Tongan language, vā is defined by Churchward (1959) as the distance between or distance apart. Ka‘ili (2005) elaborates on this definition by referring to vā as space between social relations, socio-spatial relations, or space that relates. Thaman (2003) simply refers to vā or vaa as interpersonal relationships. Another term that is sometimes used interchangeably with vā in the Tongan language is vaha‘a.

In Tongan, “tauhi” means to look after, tend to, or to take care of (Churchward 1959). The term “tauhi” can also refer to the person who looks after or takes care of another person, items, or place. Tauhi vā literally means to look after or protect the vā or space between two or more people or among groups who are related to one another in some way (Thaman 2003). Ka‘ili (2005) describes tauhi vā as “the art of creating and maintaining beautiful social relations (vā) through the mutual performance of social duties (fatongia).” These definitions point to the importance of vā in the Tongan

context, a social space that is created, nurtured, protected, and maintained.

This entry provides an overview of vā and tauhi vā from a Tongan perspective. Firstly, it focuses on tauhi vā as a core cultural value. It then discusses examples of the types of vā that exist in different contexts such as kāinga (extended family), schools, workplaces, and the church and relates how tauhi vā is practiced in those contexts. The entry then examines attempts to apply vā and tauhi vā as a theory to guide work in different spheres of life.

Tauhi Vā as a Core Value

Tauhi vā is considered as one of the four core values underpinning Tongan language and culture. The other three values are faka‘apa‘apa (respect), mamahi‘ime‘a (sense of responsibility and commitment to the cause), and lototō (humility). These four values are commonly referred to as the faa‘i kaveikoula (golden or fundamental values) which bind and hold together the Tongan culture. The widespread use of the faa‘i kaveikoula is attributed to the late Queen Salote Tupou III, a Tongan monarch who was committed to the protection and promotion of Tongan traditions, language, and culture. The inclusion of tauhi vā as a core value indicates the importance of relationships in the Tongan context. Nurturing and maintaining relationships is a fundamental practice in the Tongan traditional way of life.

Together with faka'apa'apa, mamahime'a, and lototō, tauhi vā position people first and foremost so that they understand what, where, why, and how they relate with others in social settings and in the wider society, as well as how they nurture, protect, and maintain their vā. Inherent in the faa'i kaveikoula is the value of 'ofa (love or compassion), which ultimately determines why Tongans are motivated and moved to act and/or behave in a certain way.

Tauhi Vā in Practice

Thaman (2003) suggests that vā implies certain behavioral expectations from and between persons who are involved in the relationships. Nurturing and maintaining the vā takes effort and it involves commitment, responsibilities, and obligations. Tauhi vā is a reciprocal activity whereby the persons involved will give each other time, food, and other material things as a sign of their respect of the vā. In response, the other party in the relationship reciprocates by giving something in return. Through mutual performance of their responsibilities and obligations their vā is nurtured, strengthened, and maintained.

While interpersonal relationships between one person and another can be the focus of the tauhi vā, membership in groups and institutions within the society also creates vā and requires one to engage in tauhi vā. This type of vā may include:

Tauhi vā mo e kāinga (Nurturing relationship with the extended family)

Tauhi vā mo e fonua (Nurturing relationship with the village/island)

Tauhi vā mo e ako'anga (Nurturing relationship with one's school)

Tauhi vā mo e siasi (Nurturing relationship with one's church)

Tauhi vā mo e 'Otua (Nurturing relationship with God)

States of the Vā

The vā may exist in various states. For instance,

'Oku lelei hona vā (lit. There is goodness or harmony or beauty in their relationship) meaning, they get on well.

'Oku kovi hona vā (There is harm in their relationship). This is also referred to as vā tamaki (strained or sour relations).

'Oku māfana hona vā (lit. There is warmth in their relationship) meaning, they are friendly with each other.

'Oku momoko hona vā (lit. Their relationship is cold) meaning, they cannot stand each other.

'Oku ofi hona vā (lit. There is closeness in their relationship) meaning, they are very close.

'Oku mama'o hona vā (There is a distance in their relationship) meaning, they are not very close to each other.

'Oku motu hona vā (There is a break-up in their relationship), meaning, they have decided to cut off all communications and interactions, and they do not get on.

The ultimate aim of tauhi vā is to coexist peacefully, that is, vā lelei (good or harmonious relationship). When people are practicing and experiencing vā lelei they are happy, healthy, willing to participate in whatever obligations, and productive. Where there is vā kovi or vā tamaki then there is an uneasiness in the flow of interactions and an unhappiness in the relationships. Such vā kovi may eventually lead to the motu or motuhi (break-up) of the vā. However, it is believed that strained vā can be recreated, repaired, and reconnected when the persons involved decide that the vā is far too important to be left unattended to.

Tauhi vā in the Kāinga

In the context of the family and kāinga (extended family), there are important vā that are nurtured and maintained. These vā may include the following:

Ko e vā 'o e tamai mo e fa'e (The relationship between father and mother)

Ko e vā 'o e fānau mo e matu'a (The relationship between children and their parents)

Ko e vā 'o e tuonga'ane mo e tuofefine (The relationship between brother and sister)

Ko e vā 'o e tokoua mo e tokoua (The relationship between sisters or between brothers)

Ko e vā 'o e makapuna mo e kui (The relationship between grandchildren and grandparents)

Ko e vā 'o e fānau mo e mehekitanga (The relationship between children and their father's sister)

Ko e vā 'o e fānau mo e fa'ētangata (The relationship between children and their mother's brother).

As Thaman (2003) suggests, the nature and scope of the vā in Tongan society is dependent on the context in which the relationships exist and are played out. At the kāinga level, vā has to do with how a person is genealogically positioned in relation to other members, past and present. This in turn is generally determined by sex and age, whereby females are ranked higher than males and older siblings higher than the younger ones.

The vā of the tuonga'ane (brother) and toufine (sister) is especially maintained and protected in the Tongan family. There are certain types of respectful behavior and language that are expected between brothers and sisters and people in any gatherings where brothers and sisters are present. The same appropriate behavior enacted by a sister towards her brothers would also be extended to her male cousins. Likewise, brothers would exhibit the same respectful behaviors and language towards their sisters as well as their female cousins.

The following paragraph is an example of how positioning is exercised in the Tongan culture.

The mehekitanga (father's sister) assumes the highest rank and most 'eiki (privileged) position in the extended family. The mehekitanga is considered one's fahu (the person who is 'eiki to you and is accorded the highest level of respect in one's family). Given the higher rank to one's mehekitanga (father's sister) she and her children have authority to make decisions and are influential in the conduct of certain rituals associated with significant life events such as births, marriages, and deaths. If there are more than one mehekitanga, then age will determine their rank in any given context, with the oldest mehekitanga occupying the most 'eiki (privileged) position and is the

fahu. On the other hand, one's fa'etangata (mother's brother) occupies the lowest ranked position in one's extended family, and one may have authority over the fa'etangata and his children. Each position within the kāinga comes with responsibilities and obligations. The fahu relationship is only practiced when the people involved acknowledge and respect it. Although the fa'etangata is considered the lowest ranked person in the extended family, a sister's love for her brother may lead her to decide for her children not to exploit the fahu relationship. However, out of faka'apa'apa (respect), lototō (humility), and mamahi'im'ea (loyalty) to his sister, the brother may encourage his children to undertake their obligations to their fahu.

The tauhi vā in the kāinga requires 'ilo (knowledge) of genealogies and the roles and responsibilities of particular persons within the kāinga. Young members of the kāinga would learn from the older members how members are related to one another and specific ways of nurturing and maintaining the vā within the extended family. The 'ilo (knowledge) and poto'i ngāue (skills) associated with tauhi vā are learned informally by young people through observation of older members of the kāinga. It is desirable that a person is anga poto (has the knowledge and how to apply the knowledge in their performance) and uses it to tauhi vā.

Tauhi vā is practiced by members of the extended family within the village and country and across the globe, wherever members of the extended family may reside. When Tongans send remittances to relatives in Tonga and other countries such as New Zealand, Australia, United States, and other nations in the Pacific, they are participating in what Ka'ili (2005) describes as transnational tauhi vā. As communal people, sometimes a person is asked to do things in support of other family members in order to tauhi vā. For instance, it is common for members of the family in the diaspora to call and ask that one pays a visit to a colleague, friend, or church member who may be visiting the country. One would prepare food and/or mats and other cultural artifacts to take in support of a family member in the diaspora who needs you to enact the tauhi vā on their behalf.

Tauhi vā in Educational Institutions

The tauhi vā in the extended family may also be practiced in the workplace including the school context. This is clearly evident in the event of a funeral where colleagues will contribute money, kakala (fragrant flowers), and food and cultural items such as mats and ngatu (tapa cloth) and pay their respect to a colleague who has lost a loved one such as a spouse, child, or a parent.

In the school context certain vā exist. Three of the most significant vā are those between the students and their teachers, between current students and former students, and between teachers and parents and community.

The 'ilo (knowledge) and poto (skills) that students have gained through ako (learning) during their time at schools is considered a treasure which is reciprocated through tauhi vā. The strength of this vā is maintained through the parents and ex-students becoming important sources of funding for the school. Almost all secondary schools in Tonga have an active ex-students association which fundraises and undertakes projects to support the teaching and learning resources of the school. Ex-students are engaged in such activities because of their appreciation for what the school had done for them. Ko e ako'anga e na'e lalanga ai 'eku mo'ui (This is the school which wove together the foundation for my knowledge, skills, and life).

Tupou College, a boys' college owned by the Free Wesleyan church, which was established in 1866, and which was the first high school to be established in the Pacific, recently celebrated its 150 years anniversary in Tonga. Children and grandchildren of former students, who had already passed away, present money in memory of their fathers, grandfathers, and in some cases great grandfathers. More than eight million dollars was raised by ex-students and their families in Tonga and in the diaspora to contribute to the renovation of school and staff buildings, equipment and teaching resources, and building of new facilities. Ex-students from various years and classes identified a project (e.g., renovation of the school church, dining hall, staff houses, school gate, landscaping, and garaging for the farming vehicles) and worked to raise funds and complete

the projects in time for the celebration. These are all forms of tauhi vā, by reciprocating and giving back to a school which they consider to have laid the foundation for the knowledge and skills of their family members. In some cases, the act of tauhi vā is done more than 150 years after the event, by the great-grandchildren and grandchildren of those who were involved. The historical event illustrates that tauhi vā can be performed over many generations. The tauhi vā by people in the past may benefit those in the present and the tauhi vā by people in the present will benefit those in the future. The scope and breadth of the benefits gained from tauhi vā in collective living is phenomenal.

Tauhi vā in the Churches

The churches also play a significant role in the lives of Tongans. It is generally believed that a Tongan is born to perform certain fatongia (duties) and to be 'aonga (useful) to the extended family, church, and nation. Thus, the church is a very important institution in the lives of Tongans. Certain vā are created within the church. The term kāinga lotu (kāinga meaning kin and lotu meaning religion) refers to the members of a congregation. Thus, the kin-like connections among members of the kāinga lotu creates vā among them which must be nurtured and maintained.

Christianity has become the main religion of the Tongan people; therefore, the majority of Tongans have come to accept a very significant vā, which is, their vā with Almighty God. Most Tongans contribute and tauhi vā to their church organizations as a way of demonstrating their love and respect for God. Their tauhi vā to the faifekau (minister/pastor) and people in need reflects their attempts to tauhi vā to their God. Their faith in God drives the protection of those vā.

Taufe'ulungaki (2004) ably sums up the centrality given to vā and tauhi vā when she says that the essence of any community is the relationships of its members. It is through these relationships that members come to share experiences and memories, acknowledge shared roots, address shared moral concerns, and share responsibilities and obligations.

Theory of Tauhi Vā and Its Applications

A few Tongan academics and researchers have attempted to apply vā and tauhi vā as a theory to guide work in various fields such as a theorizing about reality (Mahina 2002), intercultural understanding and peace building (Thaman 2003), social work practice (Mila-Schaaf 2006) and leadership model in the public service context in Aotearoa New Zealand (Paea 2015), and conceptualizing tauhi vā as a performing art (Ka'ili 2008) based on research with the transnational Tongans in Maui, Hawaii.

Mahina (2002, cited by Ka'ili 2005) has conceptualized vā (space) and tā (time) to proposed the tā-vā theory of reality. Mahina identifies four dimensions of vā: physical, social, intellectual, and symbolic. Although vā is connected to all four dimensions, within tauhi vā it is primarily concerned with the social dimension. Ka'ili (2008) builds on Mahina's tā-vā theory of reality to conceptualize tauhi vā as a performing art that transforms tā (time) and vā (space) to create mālie (beauty), which in turn evokes feeling of māfana (warmth), hakailangitau (elation), and langilangi (honor) among the performers of tauhi vā.

Thaman (2003, 2008) promotes the use of tauhi vā as the basis for intercultural understanding and building peace in society. For Thaman (2008), learning to live together requires understanding of the different cultures within a society. Hence, a strategy for intercultural understanding may be found in the notion of vā, which acknowledges the significance of interpersonal and intergroup relationships and responsibilities.

Mila-Schaaf (2006) proposes a vā-centered approach to social work practice in Aotearoa New Zealand. For Mila-Schaaf (2006) a focus on vā may lead to a closer examination of our interactions with others, our intentions, and the conscious actions that impact on the nature of our relationships with others. Using the concept of vā to examine the relationships of people in a crisis might be an effective tool to better understand what people are going through. For instance, examining the hurts associated with the vā that has been broken, sharing anxieties about obligations for tauhi vā, or making plans and steps to

restore or repair the vā between people can become a powerful tool for dealing with people in crisis.

Paea (2015) presents a Tongan model of leadership grounded on tauhi vā māfana (nurturing warm relationships), based on research with Tongans in the public service context in New Zealand. The Tauhi Vā Māfana leadership model conceptualizes leadership as the cultural practice of nurturing warm relationships, which is based on the dynamic interplay between fāмили (familial relationships), māfana (warm lover/inner passion), fua fatongia (fulfilling obligations), and faka'apa'apa within a cultural context.

Concluding Comments

Vā is central to the very existence of Tongan people. Tauhi vā is not only a core value underpinning Tonga language and culture, its practices in various contexts defines and determines how and why a person behaves in a particular way. Nurturing and maintaining an individual's vā to ensure a state of vā lelei requires commitment, resources, time, and effort.

In the practice of tauhi vā, other cultural values are at play, namely, faka'apa'apa (respect), mamahi'ime'a (sense of responsibility and commitment to the cause), and lototō (humility), with the binding value of 'ofa (compassion). The scope, breadth, and depth of living the benefits of tauhi vā have been made permanent in Tongan people's histories and cultural practices over many generations.

The reconceptualization of the cultural values and practices associated with vā and tauhi vā have led a number of Tongan academics to formulate models and theory to guide work in various spheres of life; including performing arts, peace building, social work practice, and leadership in public service. Future academics and researchers can build of these models, thereby increasing the 'aonga (usefulness) of vā and tauhi vā as appropriate cultural frameworks to guide provision of valued and meaningful services within our communities.

Validity

► Fairness in Educational Assessment

Validity Theory in Measurement

J. W. Hammond and Pamela A. Moss
University of Michigan, Ann Arbor, MI, USA

Introduction

While validity is widely regarded as the most important concept in test development and evaluation, its definition and scope have been matters of considerable debate. Since the “classic” definition of validity popularized in the 1920s – that validity is the degree to which a test measures what it is purported to measure – a range of alternative conceptions have been proposed. Successive

editions of two widely cited texts developed in the US contexts have brought some sense of evolving “consensus” to the dialogue: chapters on “validity” or “validation” in four editions of the *Educational Measurement* handbook between 1951 and 2006 (by Cureton, Cronbach, Messick, and Kane), as well as editions of the *Standards for Educational and Psychological Testing* (hereafter, *Standards*), jointly sponsored by the American Educational Research Association (AERA), the American Psychological Association (APA), and the National Council on Measurement in Education (NCME), first published separately by APA and AERA/NCME under somewhat different names in 1954 and 1955, with the most recent edition in 2014. These foundational texts have routinely sparked critical dialogue, suggesting that matters of how best to conceptualize validity and validation are not settled.

The historical development of the concept of validity – with its multiple definitions – is well covered in a number of texts, perhaps most comprehensively to date in the collaborative work of Newton and Shaw (2014; see also Kane, 2006; and Moss et al., 2006). While acknowledging the importance of this history, this entry will focus instead on scholarly debates about validity between 1999 and 2016. The entry draws first on the most recent editions of the *Standards* (American Educational Research Association, American Psychological Association, & National Council on Measurement in Education, 1999; American Educational Research Association, American Psychological Association, & National Council on Measurement in Education, 2014) and the chapter on “Validation” in *Educational Measurement* (Kane, 2006), then proceeds to illustrate a range of alternative positions in recent scholarship. Articles reflecting this range can be found in three special issues of journals focused on validity: *Educational Researcher* (ER, 2007), *Journal of Educational Measurement* (JEM, 2013), and *Assessment in Education: Principles, Policy, and Practice* (AIE, 2016). We focus on the work of Borsboom and colleagues, Cizek, Haertel, Kane, Moss, Newton and Shaw, and Shepard, each of whom has participated repeatedly in the dialogue, to illustrate the breadth of

perspectives. (Note: For position statements published in one of the special issues noted above, in-text citations will name the relevant issue (e.g., *JEM*), with a full citation for that issue to be found in the “References.”)

Current “Consensus” Positions on Validity

The 1999 *Standards* described validity as referring to “the degree to which evidence and theory support the interpretations of test scores entailed by proposed uses of tests” (p. 9) and characterized validation as “a scientifically sound validity argument to support the intended interpretation of test scores and their relevance to the proposed use” (p. 9). The text outlined five sources of evidence appropriate to validity arguments: (1) “test content,” (2) “response processes,” (3) “internal structure,” (4) “relations to other variables,” and (5) “consequences of testing” (pp. 11–16). This reflected a break with earlier editions of the *Standards*, which had relied on traditional categories of content, criterion, and construct in characterizing types of validity evidence; it also reflected an endorsement of a “unified” notion of validity reflected in Messick’s “Validity” chapter in the 1989 edition of *Educational Measurement*. Although the role of consequences with respect to validity has long been controversial, the 1999 *Standards* provided for the relevance of consequences to validity arguments when (a) they illuminate ways in which the test might underrepresent or contain components that are irrelevant to the intended interpretation of test scores, (b) the test is developed and administered with an intended use in mind, and (c) the test is intended to have an indirect impact that goes beyond direct uses of the test scores themselves.

In Kane’s “Validation” chapter in the 2006 edition of *Educational Measurement*, he discussed “validation as the process of evaluating the plausibility of proposed interpretations and uses, and . . . validity as the extent to which the evidence supports or refutes the proposed interpretations and uses” (p. 17). Building on earlier statements by Cronbach and Messick, Kane

highlighted the logic and structure of validation as that of a practical argument; he outlined two arguments that undergird the process of validation: (1) an *interpretive argument* that “specifies the proposed interpretations and uses of test results by laying out the network of inferences and assumptions leading from the observed performances to the conclusions and decisions based on the performances” (p. 23), and (2) a *validity argument* evaluating the plausibility and appropriateness of the interpretive argument. Importantly, plausibility and appropriateness are not acontextual – the amount of evidence needed to support a proposed test use is, to some degree, proportionate with the stakes of possible assessment outcomes. Validation is a process weighed against consequences. To guide readers in the process of validation, Kane described categories of inference that regularly appear in interpretive arguments: *score inferences* from the performance record to the score, *generalization inferences* from the scores on to the domain of other test-like tasks, *extrapolation inferences* from the scores to the target domain about which one wants to draw conclusions, and *decision inferences* which link test scores to decisions and actions, as well as to intended and unintended consequences. The 2014 edition of the *Standards* largely maintained the characterization of validity in the earlier 1999 *Standards*, with minor modifications that enhance clarity. While not inconsistent with Kane’s characterization in the chapter on “Validation” it does not fully adopt his key terminology.

Current Controversies Concerning Validity

The conceptualization of validity in the most recent *Standards* and “Validation” chapter in *Educational Measurement* has sparked a vibrant critical dialogue. Some scholars have sought to elaborate and extend the discussion of validity as it relates to test use and consequences to include the indirect impacts of test use and the actual uses of test scores. Some scholars have sought to narrow the scope to interpretations as distinct from uses or, further, to the test itself. And at least one

pair of scholars has argued that the concept should be abandoned altogether.

Kane's recent work (e.g., *JEM*, 2013) has elaborated his discussion of validity with respect to test use. He has revised his label of "interpretive argument (IA)" to "interpretive/use argument (IUA)," explaining his original "expression may give too much weight to interpretations and not enough to uses" (*JEM*, 2013, p. 2). For Kane, "the IUA includes all of the claims based on the test scores (i.e., the network of inferences and in the proposed interpretation and use)" (p. 2). Kane's view of intended test use articulated scores to decisions by means of "a *decision rule* which stipulates that certain actions be taken given certain test scores. The decision inference takes an interpreted score as its datum and yields a decision as the claim" (p. 46). Here as well, consequences must be taken into consideration, and participate in the evaluation of decision rules: "A decision rule that achieves its goals at an acceptable cost and with acceptable consequences is considered a success" (p. 47). Considering the fact that "[t]est users presumably know how they are using the tests," Kane argued these users "tend to be in the best position to evaluate the consequences of their own decision rules and have a responsibility to do so" (p. 57).

Haertel (2013) extended the discussion of test use and consequences by focusing on the distinction between *direct* or *indirect* "mechanisms of action" (p. 2). *Direct mechanisms of action* "encompass uses and interpretations that rely directly on the information scores provide about measured constructs," and include "instructional guidance," "student planning and selection," "informing comparisons among educational approaches," and "educational management" (p. 2). *Indirect mechanisms of action* are those "leading to intended or unintended consequences, that do not depend directly on test scores" (p. 3), and include "directing student effort," "focusing the system," and "shaping perceptions" (p. 2). Testing, in other words, affects schooling by a host of mechanisms in excess of those Haertel identifies as "direct." Acknowledging this fact has, for Haertel, important implications: "In order to maximize the benefits and minimize any

negative effects of educational testing applications, test validation must attend to indirect as well as direct effects of testing" (p. 17).

Carrying this direction of argument further, Moss (*AIE*, 2016) contended that validity inquiry is not only relevant to *intended* test score uses and interpretations but also to *actual* test score uses and interpretations. Her approach to validity complemented rather than contradicted Kane's work and the 2014 *Standards*, working toward "a more complex theory of validity that can *shift* focus, as needed: from the intended interpretations and uses of test scores that guide test developers to the actual or situated interpretations, decisions and actions that serve local users' purposes" (p. 237). She drew on empirical studies of test and other data use to argue that, "[i]ntended interpretations from standardised tests are always locally mediated and provide, at best, partial answers to local questions" (p. 247) like how and where to allocate resources, select curriculum, focus professional development, or even frame problems. Moss (*JEM*, 2013) argued that "validity theory supporting such data uses might be most productively conceptualized around the particular questions or problems that evidence is needed to address, rather than around an intended interpretation/use from a particular testing program and the circumscribed evidence it provides" (p. 96). But, given the myriad questions or problems that local educators face, it would not be possible to consider explicitly the validity of each local use of test scores. Consequently, she argued validation efforts might most productively be refocused "to the broader learning or organizational environment and the extent to which it is sufficiently well resourced to support an evidence-based professional practice that enhances student learning" (p. 96).

While the scholars whose work is described above have sought to elaborate and extend the concept of validity reflected in the most recent editions of both the "Validity Chapter" and the *Standards*, others have raised concerns about the expansiveness of these conceptions of validity and validation. Cizek (*AIE*, 2016), for instance, has argued that concerns about interpretation and use are "incompatible" (p. 212) and should be

treated as fundamentally separate, distinguishing “validation of an intended score inference and justification of a specific test use” (p. 214). While he endorsed four of the five sources of evidence from the most recent *Standards* for validation of score inferences, he reserved use of the terms “validity” and “validation” for evidence related to score inferences, relegating questions of consequences (alongside other considerations, like fairness) to the separate category “Justification of Intended [or Specific] Test Use” (p. 219).

Recently, too, challenges to the concept of validity advanced by theorists like Kane and Messick have come from Borsboom and his coauthors, and from the Newton and Shaw. In a series of coauthored texts, Borsboom has contested the very philosophical nature of validity. One 2004 article in particular, coauthored by Borsboom, Mellenbergh, and Heerden (hereafter, “Borsboom et al.”), seems to have inspired considerable debate. Borsboom et al. have proposed that the proper focus of validity is not interpretation but instead tests themselves: “a test is valid for measuring an attribute if, and only if (a) the attribute exists and (b) variations in the attribute causally produce variations in the outcomes of the measurement procedure” (p. 1061). This refocusing and simplification of validity shifts the scope of relevant inquiry from questions of epistemology (focused on test score interpretation) to questions of ontology (whether, in actuality, a test really “measures what it is purported to measure”). In this vein, Borsboom et al. “suggest not only that epistemological issues are irrelevant to validity but that their importance may well be overrated in validation research as well” (p. 1067). Epistemology-oriented validation would, in this view, be largely obviated by theory-driven test construction – for Borsboom et al., validity is “something that one puts into an instrument” (p. 1067).

Where Borsboom et al. (2004) called into question the philosophical foundations of validity, Newton and Shaw have advanced the possibility of retiring the term “validity” itself. Grounded in constructivism and animated by a historical review of validity theory literature, their work avoids proclamations about whether “validity” is

an essentially epistemological or ontological concept – expansive or narrow in scope – in favor of a view of “validity” as historically plural and irreducibly social: “Ultimately, this is not a technical matter concerning the *proper* use of the term ‘validity’. It is simply a matter of how we, the educational and psychological measurement supra-community, decide to use it. It is a matter of convention” (2014, p. 178). Validity, in other words, has no focus or scope but that which is ascribed to it. And because “validity” – as a term – has eluded a fixed and monolithic conventional definition, the best course of action for the supra-community Newton and Shaw (*AIE*, 2016) describe might be to abandon “validity” as a term altogether. The reason for this, Newton and Shaw have suggested, is that use of the term “validity” might manufacture conflict and confusion where few substantive controversies exist, at least in terms of how test evaluation is commonly imagined and practiced: “*disagreement has focused primarily upon how best to apply the label* [‘validity’], *not upon how best to apprehend the underlying concepts*. If we were to retire the word ‘validity’ our substantive concepts would undoubtedly survive intact” (p. 190).

Shepard (*AIE*, 2016) has defended the concept of validity from the kinds of challenges leveled by Borsboom et al. and Newton and Shaw (among others), arguing for a focus that encompasses not just questions of score meaning and interpretation but also questions of use – while not going so far as to agree that actual interpretations and uses incorporating test scores with other data sources should be included in the concept, as Moss had argued. Shepard has suggested that the concept of validity advanced by Borsboom et al. makes sense only when an attribute is solely, deterministically responsible for measured outcomes. Herein, for Shepard, lies an important problem: “In the social sciences, except for tautologies, causes aren’t deterministic” (*AIE*, p. 270). Instead, even if we were to assume the existence of real attributes, observed outcomes in the social sciences are necessarily multiply-determined or complexly indeterminate, such that any individual attribute like “intelligence” is impossible to fully disentangle from confounding causal factors (e.g.,

practice or test item familiarity). However attractive it might be, a highly narrow realist definition of validity cannot address the complexity endemic to most measurement in the social sciences.

Moreover, there is potentially an even greater problem with a simplified validity concept that eschews questions of bias, interpretation, and use. For Shepard (*AIE*, 2016),

The vocabulary of social science is embedded in institutional and legal contexts and laden with associated connotations. . . . It would be an inappropriate bait-and-switch tactic to deploy a narrower definition in these contexts in which validity is the more complex and decision-directed idea developed in the broader institutional-legal context. (p. 271)

Shepard has also contended that “[t]he fact that the 1999 and 2014 [*Standards*] definitions are so similar . . . speaks to shared understandings over time by a large majority of testing experts” – a level of consensus that renders *Standards* documents “the professionally defensible definition [of “validity”] to be shared with non-experts” (p. 272).

Newton and Shaw might correctly identify that definitions of validity have varied over time and that there is not yet a definition of validity assented to by all practitioners and theorists. This observation does not, Shepard (*AIE*, 2016) has argued, pose a fatal challenge to the consensus definition of validity. Shepard has described this consensus definition as providing simultaneously an “agreed-upon working definition of a complex idea,” a “research agenda,” and “a clear and well-organised framework for orderly debate” (*AIE*, p. 272). It might be said, then, that the affordances of a meaningful validity theory are not merely technical, but are also discursive, providing theorists and practitioners a vocabulary for constructing and contesting social scientific knowledge and policy. As Shepard has put it,

Disagreements about the definition of validity . . . are not necessarily a problem in a scientific field, so long as we are clear about the nature of the disagreement and track how differences in our conceptions lead in turn to differences in methods and findings. (p. 278)

Shepard has also cautioned against a pseudoscientific identification of technical purity with science itself. Science is always already ethical and social: “To act as if value choices and ethical decisions are outside of science is to ignore the value-laden nature of the scientific process involved in every aspect of test development and validity evaluation” (p. 276). For this reason, it might be assumed that a *scientific* definition of validity would necessarily incorporate and allow for questions of social consensus, contestation, and for putatively “social” questions of use – questions inextricable from meaningful test design and equally relevant to meaningful test evaluation.

Values in Science and in Science Classrooms

Ana C. Couló

Universidad de Buenos Aires, Buenos Aires,
Argentina

Introduction

Understanding the role of values in science is central in History and Philosophy of Science-informed curricular proposals and in science education research. At the same time, the nature and significance of values in scientific knowledge and practices has increasingly become an object of debate in contemporary philosophy of science: Is science value-free? Is value-free science an ideal that should be aimed at? The presence of cognitive (or epistemic) values is usually agreed on, though there is controversy over their nature and relative importance. Non-cognitive (non-epistemic) values provide for a much more contentious ground. Stances on the role of values have a bearing on central issues in the philosophy of science, such as rationality, objectivity, and

putative demarcation of science and non-science. Values are also related to current debates on technology, risk assessment or Big Science (authority or trust, for instance), and to the interaction of science and the wider social, economical or political context.

From a pedagogical point of view, values issues are an integral part of other areas of the curriculum: different philosophical fields (ethics, epistemology, political philosophy), citizen education, the social sciences, the arts. Therefore, bringing values issues into the science classroom has a double relevance: both towards the science classroom itself and, in a wider sense, towards the goals of education at large.

Here an overview of some current philosophical stances on the subject will be presented. Then, some rationales for including teaching about values in science education will be discussed. And finally both science education and philosophy education will be drawn from in order to indicate some questions that should be taken into consideration in introducing a particular type of values (ethics related issues) in the secondary education classroom.

The role of values in science has usually been a key element in the list of issues that should be addressed in the science classroom from an History and Philosophy of Science point of view. At the same time, the role of values in scientific knowledge and inquiry has been and is a debated question in contemporary philosophy of science. Is science value-free? Is value-free science an ideal that should be aimed at? Traditionally, several philosophers have held that science is and should be neutral. This idea is still popular among many scientists. Among philosophers, on the other side, it has become a controversial point. The actual presence of values in scientific inquiry is seemingly a matter of fact, since preferences and choices are apparent when scientists select which problems are worth resolving, when they decide which subjects to investigate, when a strategy is chosen or adopted, when the consequences or applications of research are contemplated and evaluated. However, a distinction is usually traced

between epistemic (cognitive or internal) values and nonepistemic (noncognitive, external) ones such as moral, political, economic, social, religious, aesthetical, and gender-related values.

There is an almost undisputed acceptance of the presence and role of cognitive values (empirical adequacy, explanatory power, internal consistency, simplicity, etc.) in scientific inquiry. All other things being equal, a theory that realizes an epistemic value to a greater degree is usually deemed to be preferable to another that does not instantiate it or that instantiates it to a lesser degree. There is however some controversy over their nature and hierarchy.

Nonepistemic values provide for a much more contentious ground. Stances on their existence and (un)desirability have a bearing on current debates on technology, risk assessment, or scientists' responsibility and accountability. They also impinge on central issues in the philosophy of science, such as rationality, universality, and objectivity. Objectivity has typically been considered as an identifying trait of scientific knowledge. The presence of noncognitive values is thought to undermine that trait, especially in the context of justification. Consequently, the value-free ideal aims at banishing noncognitive values from sound scientific research. Yet, they may be admitted in the context of discovery. Scientists may choose the problems they are interested in out of moral or political concerns for human flourishing or they may be interested in resolving a question out of aesthetical reasons, for instance augmenting the symmetry, balance, or elegance of a theory. Research programs depend on funding by institutions such as the State, the military, or the industry, which encourage or discourage specific lines of research.

In addition, scientific inquiry is not an individual enterprise but a social practice. Scientific communities embody or aim to embody certain norms and values in their practices, a specific *ethos*, sometimes described by the so-called Mertonian values: communalism, universalism, disinterestedness, and organized skepticism. Modesty or humility in the sense of recognizing indebtedness to the work of predecessors and colleagues and acknowledging the limitations of

self and of scientific knowledge in general are also praised. On the other hand, responsibility and concern over the application of scientific knowledge has preoccupied scientists and philosophers, especially since World War II: Is the research permissible if one can foresee that results of that research will aid on wrongful ends, on the damaging or exploitation of human beings, animals, or the environment? Ethical and political concerns appear with regard to methodology. Should scientists be free to pursue whatever issue they choose in whatever way they consider reliable? Is experimentation on human subjects acceptable? Is every potential subject equally vulnerable? Is invasive experimentation on animals acceptable? On what grounds? Should scientists be concerned and responsible for the environment? What would be the limits and restrictions in each of these cases?

Therefore, noncognitive values seem inevitable and even desirable in the contexts of discovery and application. But for most scientists and for many philosophers, they are supposed to be left out of any decision-making process scientists engage in when *accepting* a theory, that is, when considering it has been sufficiently tested that it does not immediately require further investigation (Lacey 1999). However, even against this ideal of value-free science, philosophers have posed different arguments: arguments from denying the distinction between fact and value, arguments from underdetermination of theory, and arguments from the social processes of science (Dupré et al. 2007).

A long standing philosophical tradition has emphasized that the distinction between judgments of fact ("is") and judgments of value ("ought") can be categorically established: no judgment of value can be logically derived from a judgment of fact. Moreover, judgments of fact are objective, while judgments of value are subjective. As such, they are neither factual nor analytical, and lack truth-value. Hence, judgments of value should not have any place in accepting a theory. This value/fact distinction has been challenged both from empirical examples and from theoretical stances, for instance by pragmatist philosophers and especially by Putnam (Gómez

2014). The second group of arguments draw from the Quine-Duhem thesis and from Kuhn's work. Since no observational prediction can be derived from a theory without auxiliary assumptions, then falsifying that prediction means that either the theory or the auxiliary assumption(s) are false. In this sense, there is no conclusive refutation, and theory is underdetermined by data. Theory choice is therefore relative to other values and assumptions that are adhered to by the scientist or the scientific community. Finally, the way in which scientists interact among themselves and with society at large and the way in which personal or social interests, values, and commitments shape these interactions has also been taken into consideration in arguing against the value-free ideal.

For instance, Hugh Lacey considers that scientific inquiry can be led within different worldviews and value outlooks, as long as it is objective and inclusive (Lacey 1999). Objectivity implies empirically grounded and confirmed knowledge. Science is inclusive as long as it can, in principle, satisfy multiple and different interests related to diverse worldviews. Lacey distinguishes three notions that form the core of scientific inquiry: neutrality, impartiality, and autonomy. Science is neutral insofar as it does not favor a particular value outlook and can be significant for every viable one. It is impartial as far as the criteria for theory acceptance do not embrace any noncognitive values. Science is autonomous as long as choice of problems, evaluation of theories, content of scientific education, and requirements for admittance into the scientific community are the prerogative of the community itself, with no external interference from the State, the Church, the Party, etc. Impartiality is the central notion with regard to epistemology: theories should be accepted if and only if, subjected to rigorous standards of evaluation, they display cognitive values to the highest degree, in agreement with relevant empirical data and other accepted theories.

Nevertheless, different worldviews imply different strategies. Modern science has been conducted mostly under a materialistic worldview that privileges quantitative categories and exclude links with values and with the wider environment

of human practices and experience. However, there are other possible ways of conducting science in accord with the requirement of impartiality. In addition, neutrality is better served by a plurality of strategies, connected to different worldviews and their related value outlooks. There is an important constraint: if a worldview requires abandoning impartiality (such as religious worldviews may do), then they are incompatible with well-conducted science.

Another perspective that does not deny empiricism but argues for a positive role of non-cognitive (or contextual) values is that of Helen Longino, who proposes a "modest" empiricism (Longino 1990). Evidence is relevant to confirm or disconfirm a theory only with regard to background assumptions. These express either "constitutive values" or cognitive virtues, on the one hand, and "contextual values" that convey social or practical interests on the other hand. Contextual values "guide interpretations and suggest models within which the data can be ordered and organized" (Longino 1990, p. 219). However, when contextual assumptions change, which data is considered significant also changes. There is a close interaction between background assumptions, general theoretical perspectives, and experience, but Longino does not embrace relativism. Contextual values do not exclude objectivity. Scientific inquiry is not an individualistic endeavor but the pursuit of a community. Therefore, subjective preferences can be minimized as long as they are subject to public questioning: The more heterogeneous the community, the more dissimilar the assumptions will be, and the more severe the criticism to which they will be exposed.

Values Teaching in the Science Classroom

Teaching about the role of values in science inquiry may seem debatable or even irrelevant to those who think science teaching should aim at the transmission of facts and the scientific method, or to those who think of science as value-free. Even cognitive values may not be easily recognized or acknowledged by science teachers. If

they do, deciding how much time and effort to invest in these issues may still be a hard choice. The amount of time required for addressing controversial issues with an acceptable degree of depth may be perceived as excessive, detracting from “real” scientific content, and yet not crucial to Nature of Science. The Teachers may feel overwhelmed by the need to address incomplete or insufficient information, uncertainty and risk. The same can be said about the variety and complexity of ethical and political philosophical standpoints, psychological perspectives, and sociological theories (Reiss 2010). An alleged lack of expertise, resources, and strategies regarding the teaching of open-ended issues adds to a feeling of discomfort. Finally, some topics may seem “too” controversial when they challenge religious faith or deeply held moral or political stances. So why bring value issues into the science classroom?

Arguments for integrating an understanding about the nature of science along with relevant science content have been about for a long time, and they have achieved a significant degree of agreement among science educators and curriculum designers (Matthews 2015). The initial training of the next generation of scientists is not the only goal for science teaching. Equally (or more) important are other general aims. One of them is helping in the growth of aesthetic sensibility and creativity, opening possibilities to appreciate and delight in different forms and expressions of beauty and art. Another, and no less important, goal is to educate every student for active, autonomous, and critical engagement as citizens, including concrete, responsible involvement in decision-making and action regarding ethically and politically laden scientific and technological issues.

Such issues have a relevant space in collective civic and political debates, and the media frequently reflect them. Topics may range from global dimensions (e.g., nuclear plant safety, global warming, stem-cell research, and nanotechnology) to regional or national dimensions (DNA evidence in determining the filiation of dictatorship victims’ offspring or identifying

human remains, local impact of GMO crops, wind turbines in the flyway of bird migration) to personal decisions (Shall I vaccinate my children against H1N1 influenza or MMR? Should I consume GMO vegetables? To what extent will the use of my cell phone affect my health or my social life?).

Deliberation and action around these foregoing issues presuppose accurate scientific information, well-considered ethical and political standpoints, and sound reasoning. In a sense, every teacher and every school is, in fact, a moral and political educator whether spontaneously or deliberately, explicitly or tacitly. Science teachers may help students acquire and develop conceptual and procedural knowledge required to select well-substantiated evidence over inaccurate opinion. Conversely, new interest on scientific content may derive from an involvement in science-related debates and dilemmas. Students can develop a more authentic representation of scientific inquiry and of the scope and limits of scientific knowledge. Crude images of science and scientists as pure, selfless, beneficial, and undisputable or as mere providers of ideology or power wielders that exclude the interests of great portions of humanity can be replaced by more nuanced, better-examined conceptions.

Different goals can be achieved by teaching ethics in the science classroom. Reiss states four of them: heightening students’ ethical sensitivity, increasing students’ ethical knowledge, improving students’ ethical judgment, and helping make students into better people (Reiss 2010). Should science teachers aim at explaining students about values in science inquiry, or should they aim at students *becoming* honest, sceptical, truthful, whether in science classes or more generally in school and outside it? Should teachers instill a particular moral and political outlook? Should they aim instead at students’ developing skills and attitudes required for making autonomous and critical evaluations and choices regarding values, moral codes, or ethical dilemmas? Taking a stance on these issues will inform choice of strategies and activities. On one side, classes can consist in the presentation, analysis, and

comprehension of different ethical or political perspectives. Asking students to make informed decisions about controversial issues would suppose a deeper involvement. Inviting them to develop the necessary skills and attitudes related to making autonomous choices among a plurality of moral systems and ethical theories would require another kind of teaching and learning activities. Aiming at long-lasting impact on actual principles and behaviors would require understanding of theories and training in sound reasoning, but at the same time would exceed those requirements.

Different aims call for different strategies and activities. Moral inculcation attempts to socialize, imparting a certain notion of the good life, and a specific value outlook. Emphasis is on what students are supposed to believe and do (according to some particular tradition), through explicit lessons or implicitly through habit formation and emulation of role models. However, education in modern multicultural democracies does not seem to be compatible with these methodologies. Values clarification approaches take a step in the direction of values being discussed rather than imposed. They seek to help students articulate their own preferences and inclinations, instead of simply assenting to received or prevailing traditions. However, no criterion would be considered in order to differentiate or judge between claims. To avoid naïve dogmatic or equally naïve relativistic stances, or mere common sense exchanges, a working understanding of some ethical frameworks developed throughout the history of philosophy would be a fundamental help (Haynes 1999).

Cognitive-development approaches aim at students making autonomous and critical judgments regarding a plurality of ethical or political views. Sound moral reasoning becomes a central concern, and philosophers such as Habermas or Rawls are drawn from for a philosophical background. Piaget's or Kohlberg's work can also provide psychological and developmental support. Teaching strategies may involve whole class or small-group work in the analysis of moral dilemmas, and critical debate and reflection on

values, norms, rules, rights, and duties from diverse ethical or political outlooks. The risk to avoid in this case would be presenting the class with a variety of ethical stances and no criteria to choose among them, which may lead to an unsophisticated, relativistic picture, wherein anything may be acceptable so long as one can find the right ethical theory to support that particular position.

Finally, moral emotions and sentiments can also be included, drawing from care ethics and care ethics education (whether virtue-caring or relational-caring), emphasizing moral sensitivity, particularly the ability and disposition to attentive listening, solidarity, and commitment. Aristotelian ethics can also be a fruitful stance from which to design teaching and learning about virtues, and especially prudence, the practical wisdom that helps choosing and deciding among different moral alternatives. Group dynamics, such as role-playing, may help in fostering empathy and understanding of others' values, interests, and needs. Works of art, especially in literature and cinema, can offer helpful resources. The work of Levinas can also be usefully explored, to suggest a different emphasis on responsibility and ethics as first philosophy founded in the face-to-face encounter with the Other.

Not all these educational frameworks, ethics theories, and theories on moral reasoning would be supposed to be the object of a science curriculum. Science teachers would not have the time or the required expertise. In-depth discussion of ethical theories or training in moral reasoning would turn the science classroom into a philosophy course. At-length consideration of these issues would probably find a more congenial environment in history, civics, or philosophy classrooms. However, socioscientific, ethical, and political questions arise in science classrooms, whether spontaneously or as part of the curriculum. Natural science teachers and their social sciences or humanities colleagues should have enough familiarity with one another's frameworks to be able to lead value-laden discussions and sound moral and political reasoning about science-related issues in their classrooms (Couló 2014). Moreover, this mutual acquaintance can facilitate cross-

curricular collaboration between subjects or departments in joint school projects on points of interest, such as ecological problems, public health topics, human rights questions, or social justice issues.

Videogaming and Literacies

Sandra Schamroth Abrams

Department of Curriculum and Instruction,
St. John’s University, Queens, NY, USA

Synonyms

[Digital gaming](#); [Situated learning](#)

Introduction

Historically, videogames have been effective teaching and learning tools. In the 1950s, early forms of simulation videogames as military training tools included “the ‘dynamic air war game’...used to train officers in the solution of strategy problems” (Problems of War, 1951). Videogame simulations also were useful training mechanisms for businesses and business schools, and these games were integrated into the academic and industry realms between the late 1950s and early 1960s. Entities, such as the *American Management Association* and the *Harvard Business Review*, published papers that focused on the role of simulation games in honing decision-making skills and applying learned information to face-to-face scenarios. Predating current high-definition versions of videogames and layered discussions of multimodalities and multiliteracies, these examples suggest that videogames have been honored for some of their teaching and learning capacities for over 65 years (for more, see Abrams 2015a).

The interactivity supported by videogames makes the particular medium different from others. Patricia Greenfield (1984), one of the first scholars to write about videogames and learning, noted that videogames are different from television because of the confluence of dynamic visuals and participatory roles. In other words, interaction sets videogames apart from other forms of media.

Further, digital games have been heralded as effective learning tools because they include immediate feedback and support iterative

learning. Videogames also include multimodal affordances that enable players to read, write, and communicate meaning in embodied and dynamic ways (Bailey et al. 2017; Steinkuehler et al. 2005). Experimentation, or learning through trial and error, enables the videogamer to benefit from making mistakes, and, depending on the game, there are different opportunities to respawn or restart and try again. Additionally, digital games enable players to achieve what they may otherwise be unable to do beyond the virtual space. For some, this may be completing a half-pipe in virtual snowboarding; for others, it may be flying across the sky and floating in the air in *Minecraft*. Gamers may have to suspend their disbelief to play a videogame, but there is creativity in doing so. Not only do many videogames feature forms of customization, from avatar design to world construction, but also players have a degree of autonomy within the game space, making decisions that make sense to them (and that typically lead to in-game success). Such meaning making hinges on player recognition and understanding of various multimodal sign systems, and this encyclopedia entry will address how such literacies are inherent in the gaming experience. Though focusing on game creation and the literacies related to coding extends beyond the scope of this entry, it is necessary to acknowledge how coding and the manipulation of software tools to create videogames involve discrete and evolving understandings and practices, and there are literacies necessary for critically participating in and negotiating the terrain of game design.

Definitions

In this entry, the term, literacies (in its plural form), may include print text, but it also encompasses expansive forms of meaning making with a variety of modes and within a variety of settings. Please see other contributions to this encyclopedia for more information about this definition. The socio-culturally imbued meaning of the word, literacies, inherently calls attention to interactions with multimodal texts, issues of identity, and the fluid nature

of literacy practices and spaces. Further, the examination of literacies includes on-screen and off-screen participatory meaning making, which are part of the collective learning experience and, thus, cannot be divorced from one another.

The term, videogame, will refer to any digital game played on a commercial console, including, but not limited to, the Microsoft Xbox, the Sony PlayStation, and the Nintendo Wii. Additionally, games played on a computer, tablet, phone, or other mobile devices are included in this definition. Currently, videogames can be streamed or downloaded and accessed via a website, an app, or a disc. The range in content and genre – from digital puzzles to world-building games to massively multiplayer online role-playing games – provides a vast array of choices for players, and all genres are part of this all-encompassing definition of videogaming.

Videogames and Identity

The discussion of identity is central to that of gaming literacies, especially given the socioculturally situated nature of meaning making (for more on literacies and identities, please see Donna Alvermann's entry in this encyclopedia). In other words, learners' interactions with multimodal texts are all part of their literacy experiences. Gee (2003/2007) explained that a videogamer has a real offscreen identity, a virtual representation on the screen (e.g., the virtual identity), and a projective identity that exists when the player feels responsible for the on-screen character. When players use the first-person perspective to refer to the character on the screen through exclamations, such as "Look at how high I just jumped!" they are showing evidence of a projective identity. Narratives within the game also help to create a personal connection to the game character (Squire 2012). Game-based identities also exist beyond the screen through the associative identity, which represents the extension of the online character and action into the offline world (Abrams 2011). When players enact specific movements (jumping when their character is jumping) or gestures (swinging a microphone to

enact the role of a rock star) or when they verbalize noises and linguistic characteristics (growling like a *Minecraft* zombie), their offline identity is shaped – even temporarily – by their game play.

These examples reveal how gaming literacies are intricate, interconnected, and fluid, and they help to underscore the important online-offline connection, supporting calls against separating the online from the offline; such arguments suggest that the boundaries are porous or even ruptured, as meaning making transcends both realms simultaneously (Burnett 2011; Burnett & Merchant 2014). Further, it is important to note the growing need for alternate ways to address learning without creating or perpetuating boundaries. Such a paradigm shift could occur if there is a focus on practices and an understanding that experiences online inform the experiences offline (and vice versa).

Despite the growing concern about the use of boundary-forming language to discuss meaning making that spans digital and non-digital spaces, in this entry the online and offline are addressed as such in order to account for previous scholarship and for materials encountered and engagement within specific spaces. Further, given that research continues to examine the affordances and constraints of technology and emerging spaces, there continues to be a need to acknowledge often-evolving site-specific parameters. Nonetheless, in what follows, the terms, online and offline, may be used to distinguish where learners encounter information, but the focus on literacy practices helps to underscore how learning transcends these spaces.

Key Concepts for Understanding Gaming Literacies

In 2007, Katie Salen published the article *Gaming Literacies: A Game Design Study in Action*, in which she specifically drew a connection between one's gaming attitude and play in relation to digital game designs and rules. Salen, who has been known for her work on game design, focused both on how games work and on how learning occurred in relation to the game-as-rule-based-system.

According to Salen, gaming literacies included how players worked within and through the game. Further, she noted that player creativity, which could be linked to playfulness, also signaled the ways that players could make the game their own by modifying, disregarding, and/or reinventing rules. Gaming literacies, therefore, were evident in these creative realms.

Salen's article on gaming literacies provides a framework to address the components of gaming and the literacies that are part of such meaning making across modalities and spaces. Namely, Salen called attention to four overall components, suggesting that gaming literacies included (1) understanding how a game works; (2) using related online and offline resources, such as game forums, walk-throughs, and gamer mentorship; (3) understanding how to socially navigate within the game space; and (4) engaging in player collaboration and knowledge distribution. Here again, the dynamic nature of videogaming is underscored, and the four components can be used to address how gaming literacies are intricately part of digital game play. These four categories are interrelated though they are addressed separately.

Understanding How the Game Works

In general, understanding how a digital or non-digital game works includes the mechanics of – or methods for – game play. For instance, all games hinge on governing rules. Even a non-digital game, such as tic-tac-toe, has rules. Traditionally, it is a two-player game. It requires each player to know that there is a symbol (in this case “x” and “o”) that, respectively, represents him/her. The game is based on turn taking, and the objective of the game is to get three in a row horizontally, vertically, or diagonally. No player may change, erase, or dismiss the other player's moves. Knowledge of the rules not only enables players to engage in game play but also provides them the ability to extend or defy the rules to create their own game play. For more information about game design and the role of rules, please see Salen and Zimmerman's *Rules of Play*.

Designing and/or following (and possibly purposefully breaking) the rules relies on the knowledge of, what Gee (2003/2007) called, the semiotic domain or “any set of practices that recruits one or more modalities (e.g., oral or written language, images, equations, symbols, sounds, gestures, graphs, artifacts, etc.) to communicate distinctive types of meanings” (2007, p. 19). In the example of tic-tac-toe above, the semiotic domain may include written symbols (the lines of the tic-tac-toe board, the “x” and the “o,” and the final line to signify a win) and gestures or spoken language noting turn taking, excitement, or frustration. Previous games on the page may serve as artifacts of successes, failures, or stalemates. Likewise, with a digital game, like *Candy Crush*, the semiotic domain includes many of those previously mentioned, as well as numbers, shapes, sounds, moving images, and finger movements. The discussion of gaming literacies, therefore, involves understanding how multimodal systems are part of the meaning-making process.

Additionally, by addressing videogaming as a semiotic domain, Gee created an opportunity to focus on gaming in relation to literacies and learning. More specifically, Gee (2003/2007) outlined 36 learning principles that are part of, what he distinguished as, good videogames. The majority of the principles involve self-reflection and meta-cognitive awareness of progress as they attend to:

- Information and sign systems the learner encounters in the game (e.g., Explicit Information On-Demand and Just-in-Time Principle, Text Principle, Design Principle)
- Identities and learning (e.g., Committed Learning Principle, Self-Knowledge Principle, Identity Principle)
- Customized/gamer-driven and adaptive/scaffolded features of games (e.g., Active, Critical Learning Principle, Transfer Principle, Insider Principle, Incremental Principle, Discovery Principle)
- Sociocultural influences on learning (e.g., Cultural Models About the World Principle, Cultural Models About Learning Principle)

Though not inclusive of all the principles, the above list underscores the interrelationship between game content and player action and can call attention to the resources that inform game play.

Examining Practices and Resources

Gaming is not simply about the program on the screen. Rather, there are online and offline resources that provide players information about the game, as well as suggestions for new moves or strategies. These spaces include, but are not limited to, forums, wikis, and walk-throughs that support gamer-to-gamer interaction and mentorship, which also influence game play and overall meaning making.

On the screen, players encounter and interpret a host of multimodal symbols – from alphabetic text to symbolic representations that are part of the text – and they navigate this information gleaned within and beyond the game to make decisions. Further, gamer practices can be connected to other online sources, such as the aforementioned sites, as well as blogs, discussion boards, fan fiction, and in-game texting (Steinkuehler 2007). In other words, there are semiotic domains related to gaming that exist beyond the game, itself, and the diverse meaning-making activities ultimately cohere in nuanced ways to inform learning and game play. Thus, game playing naturally involves a constellation of literacies (Steinkuehler 2007) that gamers negotiate as they engage socially and game successfully.

In addition to the constellation of literacies that players encounter on the screen, players also manage a constellation of information (Martin et al. 2013) as they draw upon online and offline game-based resources. Players may view diverse texts across multiple screens – from desktop to laptop to phone – and the constellation of information accounts for the various visual, audio, and physical stimuli within and beyond the game realm that influence game play. With a melange of texts and information, players layer their literacies (Abrams 2015b) as they make meaning in nuanced ways across various contexts.

The development of game knowledge also hinges on gamer exchanges that address strategy

and problem solving and involve fan-based extensions of game play. Fandom-related activities include, but are not limited to, fan fiction, fan art, and Machinima; respectively, these story-based creations elaborate on game knowledge and emerge through print text, image, and video. As such, these paratexts (Apperley and Walsh 2012) showcase players' re-creations, extensions, or modifications of a game's story line or characterizations. Fan-based work often is supported by other fans, who will tag, comment, or build upon the artifact.

Socially Navigating Within the Game Space

Though some may play digital games independently or against a computerized opponent, most videogaming situations are highly social. Gaming literacies, therefore, also include a player's ability to interact with others in the game space. Multi-player games that feature guilds (as seen in *World of Warcraft*) or teams (as seen in *Call of Duty*) require the coordination of players' actions. Be it through in-game texts or online voice chat, player socialization typically revolves around the ability to understand and participate in valued practices, such as strategizing, debriefing, or even talking about non-game social content. Such behavior harkens back to Gee's (1996/2012) theory of big D Discourses or being-doing-valuing combinations. Discourses involve speaking, reading, writing, gesturing, and other ways of being that not only are part of one's identity but also enable one to engage in the literacies of a specific space. In order for one to socially navigate and belong to a game environment (Abrams and Lammers [in press](#)), one must understand and inhabit the Discourses of that realm and, thus, communicate effectively within the game space.

Engagement in Player Collaboration and Knowledge Distribution

It cannot be assumed that all games are alike and that players can easily apply knowledge of one game to another. Because the semiotic domain

may be game specific, there are nuances that situate learning and collaboration with regards to one's knowledge of characters, symbols, icons, language or descriptors, and even the controller (Abrams and Lammers [in press](#)). Pressing the "x" button on the controller may move the on-screen character differently across games. Though gamers can learn through trial-and-error experimentation, gamers also learn through the distribution of knowledge; often players will verbalize suggestions and moves (e.g., "jump now") that will enable the other player to win. At times, players will serve as mentors to others, explaining the rules of the game and playing practice rounds to help a neophyte become familiar with a game. Additionally, collaboration occurs when players share strategies, offer feedback, and alert each other to when an opponent draws near. This type of interaction is seminal to players' development of their gaming literacies.

Games as Pedagogical Tools

Contemporary pedagogy has included digital gaming in an effort to enhance educational practice. Though some videogaming research has addressed violence and addiction, studies also have heralded games as motivational tools that encourage problem solving, that support the development of cognitive and spatial skills, and that promote agentive, relevant learning experiences. Elements of gaming even have been seen as parallel to those of the reading process, as both require predicting, checking, and revising (Beavis 1998). Videogaming also has been found to provide a meaningful context for academic material, enabling students to understand content area information within the game setting. In this way, gaming literacies can support the development of content area literacies, as research has revealed students learning historical, mathematical, lexical, and scientific information through videogame play. Finally, games have become platforms for student-driven instruction that emphasizes creativity, critical thinking, and (re)invention in the classroom. Though traditional practices of a factory model education may continue to exist within

many classrooms, there is a movement to veer away from teacher-dominated drill-and-skill instruction and shift toward student-generated content that applies academic concepts in imaginative, individualized, and innovative ways.

Viewing Early Years' Curriculum Through Poststructuralist Lenses

Alison Warren

Te Rito Maioha Early Childhood New Zealand,
Nelson, New Zealand

Introduction

Framing early years' curriculum documents and their implementation within poststructuralist theoretical perspectives reconceptualizes curriculum enactments. Early years' curricula command increasing attention from societies, education professionals, and government policy makers and regulators in many countries including those in Europe and North America and in Australia and Aotearoa New Zealand. This interest is often framed in terms of economic benefits, where children's early education is linked with better futures for themselves and their societies. Neoliberal ideologies lead policy makers to consider early education spending in terms of value for money. This entry discusses diverse understandings of curriculum and associated theoretical frameworks and

how curriculum frameworks and enactments interplay in early childhood settings. Poststructural perspectives are engaged, including Foucault's theories of discourse and circulating power relations and Deleuze's and Guattari's theories of rhizomatic assemblages of movement and becoming, mapping flows of desire and affect.

Many early years' curriculum documents are underpinned by developmental psychology and/or sociocultural theories of early learning. They are often influenced by policy makers' neoliberal concerns with measurable outcomes, standards, and accountability. Developmental, sociocultural, and neoliberal perspectives depend on centering of knowing human subjects acting with intention on others. In contrast, poststructural perspectives decenter the human individual; they resist binaries, hierarchies, and categories of being and becoming that serve to "other" and marginalize some while privileging others. They question taken-for-granted structures and processes and reconceptualize concepts like belonging, relationships, and connections. Power, desire, and affect flow among relationships or assemblages, rather than being owned and exerted by human individuals. Poststructural perspectives challenge hierarchies of thinking that position teachers as knowing and responsible for the learning of not-yet-knowing children or that position children's well-being as of prime concern and teachers' well-being as secondary. Children, teachers, and families and their curricular enactments are reframed within dynamic interconnections where power, desire, and affect flow.

Poststructuralism

Poststructuralist theories emerged into consideration by educational thinkers and researchers relatively recently, and their incorporation into curriculum frameworks, enactments, and research has been correspondingly recent. Important theorists of poststructural thought, including Foucault, Deleuze and Guattari, Lyotard, and Derrida, published and taught in the 1970s and 1980s.

Peters and Burbules (2004) describe poststructuralism as a philosophical response to structuralism. French structuralism of the late 1950s and 1960s challenges the humanist concept of a central human actor and thinker and instead proposes metanarratives, structures, and processes that provide overarching explanations in fields such as language, psychology, and education. Poststructuralist theories support structuralist challenges to humanism and share beliefs in social and historical influences shaping thoughts and actions. They question universal "truth" claims of overarching metanarratives and their associated hierarchies and categories, and instead they focus on dynamic and multiple knowledges. Peters and Burbules (2004) suggest that poststructuralism "is best referred to as a *movement of thought* - a *complex* skein of thought embodying different forms of critical practice" (p. 18). Poststructural critical approaches include deconstruction that seeks to disturb the taken-for-granted in texts (following Derrida), genealogy that investigates dynamic practices of power relations within discourses (following Foucault), and cartographic approaches that map flows of affect and desire (following Deleuze and Guattari).

Theoretical Perspectives in Early Years' Curricula

Curriculum frameworks outline aspirational visions, beliefs, and values that express particular theoretical perspectives on early learning and pedagogy. Diverse theoretical frameworks shape answers to curricular questions of what to teach and how to teach it and, conversely, what children need to learn and how they learn. Developmentally Appropriate Practices (DAP), a popular approach to early years' curriculum in the United States, is underpinned by developmental psychology. The Nordic curriculum tradition of Scandinavia is based in social pedagogy and highlights learning in interactions among adults and children. The Reggio Emilia approach originating in North Italy draws on multiple theoretical

perspectives including critical and poststructural theories and is based on images of powerful and competent children determining and constructing their own learning. *Te Whāriki*, the curriculum framework of Aotearoa New Zealand, and *Aistear*, from Ireland, are informed by sociocultural and developmental perspectives. The Australian curriculum framework *Being, Belonging and Becoming: The Early Years Learning Framework for Australia* draws largely on sociocultural perspectives (while acknowledging multiple theoretical perspectives including poststructural), describing curriculum and learning as co-constructed within respectful and caring relationships among adults and children.

Curricula are often underpinned by multiple theoretical perspectives, influenced by contexts at their initial development and subsequent implementation. Incorporation of poststructural perspectives into some early years' curricula has happened gradually and recently, as early years' theorists, researchers, and practitioners have become aware of these ways of thinking and possibilities they offer. Curriculum frameworks describe the "what," "how," and "why" of early childhood teaching and learning in terms of particular values, beliefs, and theories of teaching and learning. Curriculum enactments involve early years' services with diverse philosophies; educators, family members, and children with their own philosophical, cultural, and theoretical perspectives; and communities and environments. Over time, interpretations of curriculum frameworks can change through their implementation and enactments, alongside research, dialogue, and thinking. Drawing on poststructural theories of Deleuze and Guattari, White and Mika (2013) describe *Te Whāriki* as assembled with literature, philosophies (with attention to Māori philosophies), and teaching and learning practices. They argue for continual theorization of *Te Whāriki* as a living document in dialogue:

Te Whāriki invokes multiple dialogues: between text and infant, between text and teacher, between text and theories, and between text and cultures. These dialogues collectively call for a lived

response to curriculum that exceeds the text, or practice, alone. In this sense, curriculum is represented through the young child in dialogue with others. (White and Mika 2013, p. 105)

The curriculum approach of Reggio Emilia in northern Italy had its origins in the contexts and concerns of postwar Italy. Founder Loris Malaguzzi recounts how his involvement in small parent-run schools led to the curriculum approach now known as Reggio Emilia implemented in early years' services from the early 1960s (Gandini 2012). He explains an underpinning vision of openness to diverse perspectives, including those of Piaget, sociocultural, critical, and poststructural thinking: "We had to preserve our decision to learn from children, from events, and from families, to our full extent of our professional limits, and to maintain a readiness to change points of view, so as never to have too many certainties" (p. 31).

The early childhood curriculum of Aotearoa New Zealand *Te Whāriki*, formulated in the early 1990s, is underpinned by sociocultural perspectives within a bicultural context (consisting of indigenous Māori and Pākehā/New Zealand European cultures), alongside developmental influences. Collaboration among authors Carr and May and Māori co-writers Tamati and Tilly Reedy and community consultation processes opened up diverse theoretical perspectives. *Te Whāriki* describes principles and strands encapsulating values and goals while recognizing diverse enactments in early years' settings that reflect their philosophical and cultural contexts.

The more recent (2009) Australian curriculum framework *Being, Belonging and Becoming: The Early Years Learning Framework for Australia* describes educators drawing on a range of theoretical perspectives to enact curriculum including developmental, sociocultural, socio-behaviorist, critical, and poststructural theories. A resource for educators suggests diverse possibilities for engaging with the curriculum framework to enact curriculum: "It is not a book that will offer you the answer for 'how to do' the EYLF [Early Years Learning Framework], but rather it

illuminates the different processes of how people are engaging with the EYLF and why" (Giugni 2010, p. 7).

Reconceptualizing Early Years' Curriculum

The reconceptualist movement in education attends to power relations that produce marginalization and privilege, inclusion, and exclusion. Reconceptualist methodologies include "post-structural, feminist, critical, newmaterial, post-human and postcolonial approaches" (www.erm.hio.no/) and provide rich resources for exploring early years' curricula. In Canada, curriculum document writers have used reconceptualist perspectives "as counter narratives to dominant ECE discourses such as developmentalism, economic investment, and the universal child" (Iannacci and Whitty 2009, p. 10), which exert powerful influence on curriculum enactments in North America. In the early years' curriculum framework of British Columbia, and in guidance for curriculum implementation, educators are encouraged to critically reflect on "where our ideas about how the world works have come from, who has generated them and whom they benefit" and to "understand the world from the perspective of groups who are consistently marginalized and silenced in it" (Ministry of Education British Columbia, n.d., p. 11).

Poststructural perspectives provide useful tools for reconceptualizing early years' curriculum enactments because, in decentering the human individual, the focus moves from individual teachers and children to the ways they (and other aspects of the early childhood setting) affect each other. Humans are understood not as self-contained identities who know and act autonomously, but as subjectivities shaped within relationships, interconnectedness, and flows of affect, desire, and power. Ethical engagement in curriculum within poststructural perspectives involves attending to micropolitical flows of affect, desire, and power, how these act to privilege or marginalize, and possibilities for becoming otherwise.

Curriculum Enactments Through Poststructuralist Lenses

Viewing curriculum enactments through post-structuralist lenses opens up possibilities for "complexifying practice . . . an incomplete, ongoing, messy process filled with struggles, tensions, challenges, frustrations, unknowns, discomfort, and divergence in positions" (Pacini-Ketchabaw et al. 2015, p. xiii), rather than simplifying understandings and agreeing on "best practice." These approaches do unsettling work, as they challenge complacency by asking teachers to trouble their taken-for-granted assumptions and to provoke questioning of "normal" practice. This entry considers two such theoretical approaches: Foucault's theories of discourse and discursive practices within relations of power and Deleuze's and Guattari's theories of rhizomatic assemblages of movement and becoming, mapping flows of desire and affect.

Foucault

Foucault rejected being labeled structuralist or poststructuralist; however, his theories of power entwined with the knowledge regarded as truth provide valuable tools for poststructural critique: "'Truth' is linked in a circular relation with systems of power which produce and sustain it, and to effects of power which it induces and which extend it" (Foucault 1980a, p. 133). According to Foucault's theories of discourse, ways of being and becoming are shaped within discursive values, beliefs, and assumptions that determine what is regarded as knowledge and truth. Discursive practices of discipline and governmentality and desire for pleasure and power shape subjectivities within networks of power relations: "continuous and uninterrupted processes which subject our bodies, govern our gestures, dictate our behaviours" (Foucault 1980b, p. 97).

Dominant discourses constrain possible ways to be, based on values and beliefs that are taken for granted. In colonized societies such as Canada, Australia, and Aotearoa New Zealand, discourses of colonization continue to privilege colonist perspectives and marginalize or invisibilize indigenous ways of being. Ashton (2015) draws on

Foucault's theories to reflect on critique by an indigenous scholar of a draft New Brunswick (Canada) early years' curriculum framework. She considers how discourses of colonialism continue to be enacted within curriculum statements of diversity and inclusiveness, observing that "Curricula do not occupy spaces outside of politics but are constructed within dominant regimes of governmentality" (p. 85). In the same edited publication, Tesar (2015) draws on Foucault's theories to critique *Te Whāriki* as witnessing and resisting neoliberal and neocolonial discourses in Aotearoa New Zealand. He describes *Te Whāriki* as an assemblage of discourses, including "a bicultural discourse, an educational discourse, a discourse of care, a neo-liberal/neo-colonial discourse, a sociocultural and a developmental discourse" (p. 110). Tesar notes tensions in *Te Whāriki* as an official instrument of neoliberal and neocolonial government policies while resisting neoliberalism and neocolonialism by asserting and advocating indigenous Māori knowledges and worldviews. Foucault's theories of discourse and circulating power provide tools to reconceptualize early years' curriculum and enactments through questioning and complexifying.

Deleuze and Guattari

Deleuze and Guattari focus on movement and change, rather than static ways of being: "lines of articulation or segmentarity, strata and territories; but also lines of flight, movements of deterritorialisation and destratification" (Deleuze and Guattari 1987, p. 4). Complex and multiple ways of becoming are produced within flows of affect and desire. The Reggio Emilia curriculum approach is characterized by Davies (2014) as the capacity and willingness to be open to affecting and being affected by the other, through "emergent" listening to multiple modes of communication ("languages") and openness to difference. She links this way of enacting curriculum to theories of Deleuze and Guattari as she describes "listening as usual" to a subject with a recognizable identity entangled with emergent listening to a 'subject' (under erasure) that is dynamic and relational.

Concepts such as rhizomes, machines, and assemblages emphasize interconnectedness of matter, signs, and language. Rhizomatic thinking provides a poststructuralist challenge to the hierarchies and categories of structuralist meta-narratives, which Deleuze and Guattari characterize as "tree logic": "its object is an unconscious that is itself representative, crystallised into codified complexes, laid out along a genetic axis and distributed within a syntagmatic structure" (Deleuze and Guattari 1987, p. 13). Sellers (2010) likens the "woven mat" central metaphor of *Te Whāriki* to a rhizome: "philosophically re-reading the (structuralist) woven mat of the conventionally structured whariki as (poststructuralist) 'matting', an interconnected rhizo network of stems" (p. 562).

A growing body of writing based in post-structural perspectives focuses on the Australian curriculum framework. For example, Sumsion and Grieshaber (2012) use concepts of assemblages, rhizomes, and lines to explore diverse visions of better childhoods, as they envisage the framework "as a political and pedagogical intervention aimed at creating better childhoods and better futures for children, for communities and for society" (p. 232). They explore the framework as a rhizomatic assemblage where they map flows of desires concerning children's relations with others. They note rigid lines set up by binaries including adult/child and protection/participation, supple lines of possible change such as concerns about power relations among adults and children and whether it is appropriate for children to be active citizens, and lines of flight to new unforeseen ways of being glimpsed in invitations in the framework for children and adults to explore social justice issues together. By paying attention to possibilities for lines of flight that escape constraints on ways of becoming different, new ways of enacting curriculum are affirmed.

Conclusion

Poststructural perspectives on early years' curricula provide valuable opportunities to reconceptualize curriculum and curricular

enactments. These perspectives are acknowledged in some curriculum frameworks and documents that guide implementation and in research and critiques. In many countries, early years' education and care are a matter for government involvement, often informed by neoliberal concerns for economic well-being, accountability, and progress. Poststructural perspectives attend to relationalities and interconnectedness and enable critical reflection illuminating flows of power, desire, and affect in early years' policies, curriculum frameworks, and enactments. Engagement at macro- and micropolitical levels by early years' educators and researchers opens possibilities for challenging hierarchies that marginalize and exclude and for exploring possible lines of escape from some constraints on ways of becoming shaped by early years' curricula.

Virtue Epistemology and Education

Mark Ortwein

University of Mississippi, Oxford, MS, USA

Introduction

Virtue epistemology (VE) is an emerging field of study in the theory of knowledge (epistemology) – one emerging yet hearkening back to the very beginnings of Western theorizing about knowledge, particularly in the works of Aristotle (384–322 BC). In simple terms, VE is an approach to the theory of knowledge that emphasizes the role of persons in formation and justification of beliefs. This is (perhaps surprisingly) decidedly contrary to the “traditional” focus of twentieth-century epistemology – the

exacting analysis of belief, knowledge, and other epistemically relevant concepts. Virtue epistemologists contend this approach leaves out a key ingredient: the individual knower herself. Thus virtue epistemologists generally forego belief-based approaches and direct their analyses to the (variously understood) characteristics of persons. This has prompted some to refer to VE as “person-based” epistemology.

To understand VE’s significance – and ultimately its implications for educational philosophy – it is beneficial to consider the intellectual tumult under which it was first articulated. As such, this entry offers a concise *overview* of epistemology from the mid-twentieth century to the present day – focusing particularly on the debates that fostered the emergence of virtue epistemology. I begin with an explication of the concept of knowledge itself: What sort of thing is it? This is followed by a discussion of Edmond Gettier’s important and provocative observations about the “standard” definition of knowledge and the debates about justification that arose in its wake. Such debates, in fact, provided impetus for the development of virtue epistemology – the final section of this entry. Here I outline two strains of VE that have emerged in the past 30 years. I then make a further distinction between narrow and wide forms of epistemology, followed by a discussion of several commonly cited intellectual virtues. Finally, I conclude with a brief rationale for educational theorizing in virtue epistemology and some areas open to further inquiry.

What Is Epistemology?

Epistemology derives from the Greek word, *episteme*, which translates as knowledge. Thus epistemology is the systematic study of knowledge. Among the central questions that concern epistemologists are: What are the necessary ingredients for knowledge? Does knowledge have a certain structure? What are the various sources of justified belief? Questions of this sort pick out an important feature of traditional epistemology; it is centrally concerned with analyzing various features of justified belief. It does not consider how the character and cognitive traits of persons

might influence our understanding of knowledge and its function in our lives. Rather it restricts its analysis to beliefs; it is belief-based. (I will show a little later that some modern movements in epistemology have redirected this analysis away from beliefs and instead focus on persons as reliable and/or responsible knowers.) Herein, I will refer to this kind of epistemology – belief-based – as traditional epistemology. This term should not be construed as pejorative; it simply serves as a marker for epistemology that focuses primarily on belief analysis.

What Is Knowledge?

Late twentieth-century epistemology can also be understood as reckoning with a particular definition of knowledge – knowledge defined as justified true belief. The justified true belief definition takes the following form (where *P* is a proposition and *S* is a human subject):

<i>S</i> knows that <i>P</i>**	if and only if	<i>P</i> is true <i>S</i> believes that <i>P</i> is true <i>S</i> is justified in believing that <i>P</i> is true
---------------------------------------	----------------	---

Consider an example. Suppose Sarah sees a bird outside her window. She immediately forms the belief that there is a bird outside her window. Her belief is true because there really is a bird outside her widow. Thus Sarah holds a true belief, but she also must meet the *justification* condition. In other words, Sarah should have good reasons for believing she sees a bird outside her window. In this case, she does – she sees the bird. Because she meets all three conditions, Sarah can reasonably claim to know that there is a bird outside her window. But suppose she believes there is a bird outside her window, and there is a bird outside her window, but she cannot see the bird clearly or only caught a movement out of the corner of her eye. She holds a true belief, but we might worry that her reasons for believing are not strong enough. In this case, she fails to meet the justification condition and we might hesitate to count her true belief as a case of knowledge. Justified true belief is a useful definition that explains most ordinary cases of knowledge. As I will show a little later, however, advocates of virtue epistemology do not

believe justified true belief fully explains knowledge. First, however, I sketch out a history of knowledge in the latter half of the twentieth century.

Foundations for Virtue Epistemology

In 1963, Edmond Gettier, an American epistemologist, penned a landmark paper, “Is Justified True Belief Knowledge?” Here he demonstrated that the traditional definition of knowledge – justified true belief – could be problematized through a series of cleverly constructed counterexamples. Gettier argued that a person could hold a true belief, and be justified in doing so, yet not be credited with knowledge. Consider the following examples:

1. *Fake Barn County*. Suppose Mark and Dashiell take a sightseeing trip through Kay County, Oklahoma. Unbeknownst to them, however, the denizens of Kay County have razed all but one barn in the county. They have erected barn facades in their place. From the road these fake barns are indistinguishable from real barns. In fact, on several occasions, the two have mistakenly taken these counterfeit barns for the real thing. At one point, however, as they are driving down a dusty county road, Dashiell points excitedly at a barn and exclaims, “That’s a beautiful barn!” In fact, on this occasion he is correct; he has unwittingly pointed to the only real barn in the entire county. He seems to meet all the requirements for justified true belief. It is true that he sees a *real* barn; he has good reason to believe that it is a barn; and he certainly believes he sees a barn (Adapted from A. Goldman 1976).
2. *The Blue Suit*. Suppose Sarah has seen James wearing a blue suit on numerous occasions and heard him talk about how much he likes it. She agrees that it is a very fine suit and was delighted when he agreed to tell her where he purchased it. Thus, she justifiably believes that he owns a blue suit. Suppose again that she says to herself, “James owns a blue suit, or

Kimberly is in Rome.” She does not actually know where Kimberly is, but correctly reasons that the first half of the proposition entails the truth of the whole. James, however, does not own a blue suit (perhaps he recently sold it or it was stolen) but Kimberly by chance actually is in Rome. Sarah holds a justified true belief.

In each example, these persons meet all the conditions for knowledge. First, their beliefs are justified: Dashiell clearly *sees* the barn, and Sarah exercises excellent reasoning. Second, their beliefs are actually true. And, third, they each hold these beliefs with little or no misgiving. We would hesitate, however, to call their beliefs knowledge because they seem to have been the recipients of a large measure of good luck.

Unsurprisingly, Gettier’s paper prompted a flurry of responses. Solutions were offered and refuted; counterarguments were constructed and new examples composed. Despite this activity (and perhaps because of it) the problem only grew more entrenched. Michael Huemer (2002) claims, “Gettier’s refutation started a cottage industry of knowledge-analyzers” (p. 436). With time, however, it became increasingly clear that he had deeply altered the course of epistemology. According to Roberts and Wood (2007): “Epistemologists appeared to think that salvation from Gettier lay in fastidiousness and technical finery, so that epistemology became increasingly ingrown, epicyclical, and irrelevant to broader philosophical and human concerns” (p. 5). An alternative to traditional, belief-based, epistemology has been proposed – one that places persons at the center of philosophical analysis. In the following section, I explore a particular issue that emerges in the literature on Gettier – the issue of epistemic luck. I illustrate how VE is (in part) a response to this issue.

The preceding counterexamples demonstrate that the conditions of justified true belief can be met, but we might feel reluctant to attribute knowledge to either person. It would seem more a matter of epistemic *luck* than true justification. Consider an analogy offered by Ernest Sosa (2007). Suppose a highly skilled archer takes

aim at a target and shoots. The arrow flies straight and true and is going to strike the bull's-eye. Then, suddenly, a rogue gust of wind pulls the arrow from its course. It is no longer going to hit the bull's-eye. Then, by chance, the same wind reverses its course and puts the arrow back in its original trajectory. Once more, it is going to hit the bull's-eye (p. 22). We may question whether the archer is responsible for his accuracy of his shot; he seems to be merely the recipient of good fortune.

Sosa's example illustrates why some philosophers have defined knowledge as something approximating "nonaccidentally" true belief (Pritchard 2004, p. 193). There are numerous ways of understanding such beliefs. John Greco, for example, holds nonaccidental beliefs to be those for which a person can take *credit*. He writes, "To say that someone knows is to say that his believing the truth can be credited to him. It is to say that the person got things right due to his own abilities, efforts and actions, rather than due to dumb luck, or blind chance, or something else" (p. 111). This is so because having *creditable* reasons for a belief – justification – is thought to improve its worth or standing. If we reconsider the Gettier cases, it appears that Sarah and Dashiell *do not* deserve credit for the accuracy of their beliefs. They were merely lucky or, put differently, they did not obtain true beliefs by virtue of their own intellectual activity. Luck interposed. But suppose Dashiell and his father were driving through an ordinary country landscape – one filled with real barns. In this case, Dashiell's declaration would seem a real case of knowledge – a case believing for which he can take credit. The notion of credit, however, moves us closer to the impulse behind virtue epistemology. First, it illustrates why virtue epistemologists are centrally concerned with persons; to gain credit for a belief, a person should form that belief in the right way, e.g., virtuously. And, second, it demonstrates why VE is concerned with persons. This is because it focuses its analysis on the traits of knowers themselves – on how they form their beliefs and how particular traits contribute to the warrant or justification of beliefs.

Some Prominent Forms of Virtue Epistemology

We are now positioned to engage with VE directly. Here I provide a brief timeline of the conceptual development of VE. In particular, I analyze the work of key scholars in the field. In the process, I roughly divide VE into two major strains: virtue reliabilism and virtue responsibilism. This discussion provides a conceptual map of the VE terrain. Having explicated these positions, I then describe another distinction: narrow and wide forms of epistemology. Here I suggest that wide accounts have expanded the scope of epistemology, and that this opens the door for an applied virtue epistemology – one particularly apt for education.

Virtue Reliabilism

Ernest Sosa inaugurated virtue epistemology in 1981 with his article, "The Raft and the Pyramid: Coherence versus Foundations in the Theory of Knowledge." The aim of this paper was to present a theory of knowledge that could circumvent standard problems in contemporary epistemology. He uses the analogy of a "raft" to refer to coherence theory. Coherentists argue that a justified belief is one that coheres within a larger body of beliefs. Donald Davidson (2000) writes, "What distinguishes a coherence theory is simply the claim that nothing can count as a reason for holding a belief except another belief" (p. 156). The "pyramid" refers to epistemic foundationalism. This is the view that some beliefs are foundational and require no further support or justification. According to Sosa (1980), each system – coherentism and foundationalism – is flawed (pp. 3–26).

Coherentism stresses the logical connections between our beliefs, but fails to account for beliefs at the periphery of our belief network. Foundationalism seems to ultimately fail to provide a solid footing. Rather, Sosa (1991) urges epistemologists to shift their analysis to persons – to those qualities and characteristics of human beings that reliably lead them to true belief. Thus, Sosa's view has been described as

virtue-reliabilism. However, it should be noted that Sosa's virtues are not virtues "in the narrow Aristotelian sense" (Sosa 1991, p. 271). Such virtues would include moral dispositions like intellectual honesty and open-mindedness. Instead, he argues that certain intellectual capacities (e.g., excellent memory and rationality) and perceptual faculties (e.g., eyesight and hearing) are virtue-laden insofar as they position us to attain our epistemic goals. He writes,

But there is a broader sense of "virtue," still Greek, in which anything with a function – natural or artificial – does have virtues. The eye does, after all, have its virtues, and so does a knife. And if we include grasping the truth about one's environment among the proper ends of a human being, then the faculty of sight would seem in a broad sense a virtue in human beings; and if grasping the truth is an intellectual matter then that virtue is also in a straightforward sense an intellectual virtue. (p. 271)

For Sosa, then, faculties like eyesight possess a kind of power or ability, one that is central to belief formation. Importantly, however, the eye's property of being virtuous is contingent upon its power to help persons reliably arrive at truth. When internally flawed – for example, severe glaucoma or blindness – its truth-conducive properties are inhibited. So too is its property of being virtuousness. Furthermore, Sosa defines a justified belief as one that is grounded in the intellectual virtues. This provides a sort of foundation desired by the foundationalist – one rooted in the reliability of the intellectual virtues. It also leaves room for the Coherentist, insofar as justified beliefs are the product of making the right sort of connection – that is, reliable and thus virtuous connections (Sosa 1980). Thus, Sosa inaugurated a VE on the promise that it could succeed where other theories could not.

Others have followed Sosa's lead. John Greco (2002), for example, defines the intellectual virtues in roughly the same way, as "innate faculties or acquired habits that enable a person to arrive at truth and void error in some relevant field" (p. 287). Like Sosa he cites capacities like reliable memory, perception, and good reasoning ability. Greco (2003) also offers an interesting account of justification. He maintains that a person knows a given proposition when he or she believes it out of

an intellectual virtue. This involves three facets. First, a person must be motivated toward the truth and in possession of the right sort of disposition (s) to know. These dispositions are the products of intellectual virtue; they show up when one exercises an intellectual virtue. Second, a person's belief must be the product of intellectual virtue (s) – that is, the epistemic good obtained is the result of exercising an intellectual virtue. And, third, a person's true belief should be creditable to her (p. 311). Both Greco and Sosa advance virtue-based epistemologies that hinge on the possession of reliable cognitive characteristics and both hold that VE has much to offer in the way of addressing standard problems in epistemology.

Virtue Responsibilism

Virtue-responsibilism also draws upon the intellectual virtues but defines them differently. Rather than describe them as characteristics of cognition (like reliabilists), they understand the virtues to be traits of character – things like open-mindedness, intellectual honesty, and conscientiousness. As such, they draw attention to the moral nature of knowing and knowledge. This is not a new idea in the history of epistemology. Indeed, virtue epistemology's, intellectual genealogy is rooted in Aristotle's distinction between moral and intellectual virtue. In this section, I describe the work of two philosophers in this tradition – Lorraine Code and Linda Zagzebski.

In *Epistemic Responsibility*, Lorraine Code (1987) argues for an epistemology based in the recognition that knowledge is a social affair. She believes the chief epistemic virtue is responsibility – recognition that we are responsible for our beliefs and their function in wider society. She writes, "It is only those who, in their knowing, strive to do justice to the *object*-to the *world* they want to know as well as possible – who can aspire to intellectual virtue" (p. 59). Code's account has a strong social justice thread running throughout. As such, her responsibilism begins with the assumption that we all inhabit a knowable world, one in which real problems exist. Knowledge that is gained through intellectual virtue more accurately reflects the true state of affairs in this world. This requires what she calls

“normative realism.” Thus, “Intellectually virtuous persons value knowing and understanding how things really are” (p. 59). And, finally, unlike Sosa and Greco, Code holds little hope for standard methodologies in epistemology. These, she thinks, are too narrow and have too little to do with the experience of being human (p. 254). In other words, a central goal of her book is to provide an account of knowledge that accounts for human characteristics and qualities, and the social dimensions in which knowledge exists.

Like Lorraine Code, Linda Zagzebski believes persons’ cognitive character is central to epistemology. Her approach, however, draws much more explicitly from Aristotle. Her most enduring work (1996), *Virtues of the Mind*, is the most widely cited work of VE in the Aristotelian tradition. A central thesis of this book is that traditional epistemology has taken a wrong turn in its disputes over justification, and argues that epistemology can benefit from a virtue theory in the same way that ethics has. First, she claims that the structures of epistemology and ethics are strongly analogous. In ethics, the historically dominant views have been consequentialism and deontological ethics. She calls these “act-based” theories – a term that operates analogously to belief-based theory in epistemology (Zagzebski 1996, pp. 2–19). Of the former, consequentialism, her comments are particularly relevant.

Consequentialists argue that what makes an action right can be evaluated by its consequences – whether more good or bad results. Zagzebski (1996) links this theory to reliabilism, claiming that they are structurally identical.

In reliabilist theories the epistemic goal is to bring about true beliefs and to avoid bringing about false beliefs, just as on consequentialist theories the moral goal is to bring about good states of affairs and to avoid bringing about bad states of affairs. (Zagzebski 1996, pp. 7–8)

Importantly, Zagzebski (1996) claims that objections to consequentialism can also be leveled against reliabilism. For example, she asks us to imagine two persons, Dennis and Christopher, who share essentially the same set of true propositions. Dennis, however, obtained all his beliefs from Christopher – a perfectly *reliable* authority.

According to Zagzebski, reliabilism stipulates that Dennis is equally justified insofar as testimony is generally considered a normatively acceptable source of knowledge. Here, then, we encounter Zagzebski’s objection. She insists we intuitively ascribe superiority to Christopher. This may be because Christopher’s “mode” of acquiring true beliefs is superior, or it may be that Christopher obtains added “understanding” and “clarity” (pp. 27–28). Reliabilism, argues Zagzebski, cannot explain the simple intuition that we (our motives, intentions, and cognitive character) are somehow integral to the formation of true beliefs. In short, what is lost in both theories (consequentialism and reliabilism) is any consideration of the motives or intentions of the agent. This clearly puts her at odds with the likes of Ernest Sosa, whose intellectual virtues she thinks are hardly virtues at all, or are virtues “only by courtesy” (Zagzebski 2000, p. 172).

The scope of Zagzebski’s project – to bring ethics and epistemology under the same banner of virtue theory – is grand indeed. In her *Précis of Virtues of the Mind* (2000), she writes, “my purpose [...] was to outline a pure virtue theory that is rich enough to include an account of intellectual virtues within the same theory as moral virtues, and to show how such a theory can generate a way to handle both epistemic evaluation and moral evaluation” (p. 172). A central contention is that the boundaries erected between moral and intellectual virtue are a mistake, although each may have different ends in mind (e.g., moral virtues might strive for moral soundness whereas intellectual virtues promote excellent knowing). In particular, Zagzebski understands the intellectual virtues as possessing two main components – a *motivation* component that impels a person to acquire epistemic goods and a *success* component wherein a person gets true belief from having believed virtuously.

Some Commonly Cited Intellectual Virtues

We have seen that reliabilists conceive of virtues as cognitive faculties or abilities that dispose

persons to acquire true beliefs. Responsibilists, on the other hand, take a much more traditional approach. They cite character traits like intellectual honesty, courage, open-mindedness, love of knowledge, and conscientiousness. Such traits describe excellent knowers. Consider the first two intellectual virtues mentioned. The virtue of honesty is a disposition to tell the truth – both as honest self-appraisal and to others. For example, it is a trait that is particularly valued in academic contexts. Most course syllabi at universities contain a passage on plagiarism and academic integrity. Violation of these policies is considered a grave academic offense and is generally punished quite severely. Intellectual honesty also indicates a willingness to be fully disclosed to oneself. In *Being and Nothingness*, Jean-Paul, S. (1956). describes an *akratic* (weak willed) gambler who sincerely commits to quitting his ruinous habit. A day comes, however, when the opportunity to gamble presents. His earlier commitment has faded and he gives into temptation. This is a common scenario. It is easy to imagine, though, that if he had been fully honest with himself from the beginning, he would have acknowledged that his commitment was only halfhearted. This illustrates the intellectual virtue of honesty and it leads us to the second virtue – intellectual courage. Self-evaluation of the sort neglected by the gambler is not easy. It takes courage to face our weaknesses and oftentimes even more courage to do something about them. Intellectual courage describes a disposition to face our fears, to take intellectual risks, to revise deeply held beliefs, and the like.

Narrow and Wide Virtue Epistemology

Those in the VE tradition face a decision with regard to how they choose to relate to the standard problems of traditional epistemology. Some, Ernest Sosa, John Greco, and Linda Zagzebski, for example, have attempted to apply the concepts of VE to these issues with debatable success. Such theorists aim to build systems that can deal with standard problems in epistemology – e.g., the aforementioned debates about justification. For example, both Sosa and Zagzebski have

given a response to the Gettier problem, and both have offered analyses of knowledge that (although different in direction) attend to the historical dilemmas that have characterized post-Gettier epistemology. Furthermore, these theories can be viewed as viable (if contested) entries into the larger project of epistemology. In other words, they recognize and validate the traditional problems. I refer to these forms of VE as *narrow* accounts.

Others, however, have not been so sanguine about these attempts. Jonathan Kvanvig (2010) argues that VE's future looks much brighter outside the domain of traditional epistemology and its controversies. He cites the work of Lorraine Code (1987), James Montmarquet (1993), and newer works by figures like Robert C. Roberts and Jay Wood as prime examples of philosophers who have extended the traditional margins of epistemology. This widening, of course, creates "an expansion of the issues and problems that become the targets of philosophical reflection of a particularly epistemological sort" (p. 200). Those in this camp draw from a much wider array of sources and believe that a wider range of epistemic goods is relevant to epistemology, e.g., understanding, wisdom, and acquaintance. They also refrain from creating narrowly focused epistemologies and stress the importance of flexibility. This widening, I believe, provides educational theorists with new and exciting tools for intellectual discovery. In fact, there are numerous reasons for introducing VE into the theoretical discourse in education. Three are provided in the next section.

Virtue Epistemology and Education: A Rationale for Exploration

In the first place, VE has attracted considerable attention in the discipline of philosophy, some going as far as to suggest that it can overcome certain intractable debates in epistemology (See also Zagzebski 1996; Sosa 1980). Undoubtedly, similar and perhaps analogous debates persist in educational theory, e.g., disputes over the epistemological grounding of educational

research. Virtue theoretic perspectives might recast and clarify these debates. And yet, it appears that little has been written on VE in education. This is somewhat surprising given our (educational theorists') tendency to draw from sources outside education. Perhaps education's inclination to favor "continental" philosophical sources explains this oversight, or perhaps epistemology has previously been too abstracted from educational concerns. Regardless, virtue epistemology – especially the wide form just outlined – is directly applicable to education in a way that traditional epistemological approaches are not.

A second reason for introducing VE concerns the epistemological nature and aims of education. Education (broadly understood) is a deeply "epistemic" concept. Harvey Siegel (2008) explains,

Education is not only rich in epistemological content and relevance; specific epistemological issues – for example, those concerning ultimate epistemic aims and values, and the evidential status of testimony – are helpfully viewed in the context of education, such that thinking about education promises substantial benefit for the pursuit of standard epistemological questions. This is especially true in the current epistemological climate, in which both virtue epistemology and social epistemology are high on the epistemological agenda. (p. 456)

Siegel's *epistemic* aims of education might include the acquisition of a prescribed body of knowledge, the development of relevant skills, or a host of other epistemic goods like understanding (wisdom) and acquaintance through experience. Thus, if virtue epistemologists are right, it follows that intellectually virtuous students are best positioned to obtain these goals. To illustrate, if Sarah is open-minded, conscientious, and intellectually honest, she possess character traits and habits of mind that dispose her to doxastic excellence. She will consider other viewpoints, carefully evaluate her work, and monitor her beliefs for inconsistencies. Conversely, if Johnny is close-minded, intellectually careless, and intellectually dishonest, it stands to reason that he will perform poorly with respect to knowledge acquisition and the ultimate aims of education. Both students will, in effect, approach school *through* their respective intellectual virtues and vices.

Given education's implicit connection to epistemological concepts and the applicability of VE to education, it seems appropriate to consider virtue epistemology and its implications for education.

A third and final reason to pursue a project in VE involves its recognition that belief formation is an important human endeavor. As noted earlier, VE is aptly referred to as *person-based* epistemology. This is because it centers its philosophical analysis on the character traits and qualities of human beings – those traits that dispose persons to successfully acquire knowledge and other epistemic goods. This is significant precisely because education is both an important social institution *and* a central player in the formation of students' epistemic practices. Virtue epistemology can (and does on some accounts) operate as a form of regulative epistemology – that is, an epistemological framework providing noetic guidance. Far from being a new or innovative notion, regulative epistemology has a long history in philosophy. (For a quintessential example regulative epistemology, see John Locke 2007.) For a number of reasons, however, such approaches fell out of fashion in the twentieth century (Kvanvig 2007). Nevertheless, *some* recent work in epistemology signals a return or reclamation of socially conscious epistemology.

Virtue Epistemology and Education: Some Areas for Future Research

In conclusion, I want to highlight some potential areas for future research in education and virtue epistemology, especially with respect to several commonly adopted epistemological frameworks. If VE is to take root in educational theory and philosophy, it will undoubtedly have to contend with these points of view. First, consider the highly influential theory of constructivism. Undoubtedly, constructivists and virtue epistemologists will begin from very different metaphysical starting points. Indeed, constructivism, in its overtly philosophical form, would oppose the notion that any sort of objectivity is possible with respect to knowledge. This is not a position many (if any) virtue epistemologists would adopt. Practically speaking, however, each camp places the locus of responsibility squarely on the

shoulders of the individual. To what extent do these theories overlap and diverge? Is belief *formation* tantamount to belief construction? How might they inform one another? Indeed, I believe constructivist literature in education might be a tremendous (if unexpected) resource for the application of virtue epistemology. Such a study would naturally reveal some interesting differences – especially with respect to more radical forms of constructivism – but also, perhaps, some important similarities. Likewise, attention also might be drawn to critical theories – especially their emphasis on justice – as intellectually virtuous modes of thinking. In other words, does a critical intellectual stance and commitment to justice entail certain epistemic virtues? (Bevan 2009).

Roberts and Wood (2007) note that VE shares some thematic similarities with postmodern and existential thought. For example, they discuss the works of Friedrich Nietzsche, Jacques Derrida, and Richard Rorty in great detail, highlighting some interesting (and surprising) points of contact. In an earlier piece, for example, W. Jay Wood (1999) writes, “I propose that postmodern philosophy has not altogether outgrown the need for epistemology, and that an epistemology which takes seriously the notion of intellectual virtues in one alternative very much worth considering” (p. 13). Wood’s main contention is that postmodern intellectual ethics are in a deep sense dependent on the certain habits of minds. These he likens to the possession of certain intellectual virtues, like open-mindedness, love of knowledge, intellectual honesty, and wisdom. He goes on to argue that postmodernism and VE also share important thematic similarities (e.g., a recognition that axiomatic approaches to theorizing warrant scrutiny – indeed, that they might even be misguided). As with constructivism, one must exercise caution with respect to the metaphysical assumptions supporting these two frameworks. Nevertheless, it seems plausible that an interesting dialog might be established between postmodern educational scholars and virtue epistemologists.

Lorraine Code (1987) is another epistemologist whose work draws upon sources not typically associated with traditional Anglo

epistemology – drawing extensively from feminist and continental philosophy. Her willingness to draw upon nontraditional, even conventionally antagonistic, sources illustrates how the concept of intellectual virtue has currency in theoretical orientations well outside the traditional scope of analytic epistemology. This is (to the author) an exciting feature of VE, one that warrants further investigation. Indeed, it suggests that VE and educational theory will find important points of methodological contact.

Visual Methodologies and Latino Cultural Studies: Implications for the Sociology of Education

Uliano Conti
University of Perugia, Perugia, Italy

Introduction

In many academic contexts, from anthropology to sociology, from urbanology to semiotics, many attempts have been made to understand social dynamics with regard to what people observe around them. Advertising, mass media, social networks, photographic archives, family photograph albums, Polaroid, smartphones, and graffiti act on human relations and contribute in defining the sociocultural panorama which surrounds persons (Simmel 1908).

This section proposes the elements that compose visual methodology, defining the area of

application in relationship to Latino cultural identities and illustrating research techniques with which the researcher can approach this sector. The ways in which social investigation is enriched by the use of visual methods are presented, which consist of every collection and analysis technique that uses images. The term visual methodology can be traced back to the scientific field of visual sociology, which in literature can be variously understood as a discipline, a research technique, or a research system (Harper 1988; Pauwels 2010).

The image in social research has traditionally been used to study contexts other than “Occidental” and has contributed, on the one hand, in building and reinforcing stereotypes, as what happened, for example, in the use of images by colonists and explorers; on the other hand, it has contributed in revealing prejudices, as what happened with the studies by Erving Goffman (1976) or by Ariel Dorfman and Armand Mattelart with *Para leer al Pato Donald* (1972), authors who will be discussed further on.

Georg Simmel (1908) is the one who had identified the relationship between visual stimulation and social living. For Simmel, the sense of sight contributes in getting to know those who are different from the one observing, even if only merely from the aesthetic point of view.

Visual Techniques

Visual methodology mainly refers to a qualitative research approach and includes every technique that uses images as information or data. Two areas of visual sociology can be identified: sociology *with* images and sociology *on* images (Harper 1988). In the first case, researchers and/or the people studied produce and analyze images. In the second, researchers and/or the persons studied analyze already existing images. In other words, the areas of social research to be considered are mainly two: (a) the researcher produces images or causes images to be produced as an empirical basis; (b) the researcher analyzes images originally produced not for research objectives. The four techniques of sociology *with* images are

video-photographic research, interviews with photo-elicitation, native image making, and re-photography.

Sociology on images includes the study of photographic archives, home mode communication, and every analysis regarding images as sources that were not originally produced for scientific purposes.

In this perspective, Goffman's *Gender Advertisements* (1976) is a famous example of analysis on images such as those used in advertising. Goffman shows how magazine advertising reveals a model of gender norms, a model that regulates the ways in which men and women are portrayed. Visual appearance is an element that contributes to prejudice and stereotyping toward social groups such as ethnic cultural minorities.

Sut Jhally's work also looks to the discrimination issue, following a critical perspective, both in the ways in which films, video clips, and publicity are made and in the attitudes and reactions of the public. Sut Jhally and Justin Lewis (1992) show, with a study on the audience through 53 focus groups, how *The Cosby Show* proposes racist stereotypes and misleading representations on the daily life of Afro-Americans in the United States.

Photo-Elicitation

The interview with photo-video stimulus is a semi-structured variation of the interview based on pictures and not on a line of questions. Stimulus consists of proposal of photographs or videos to the person being interviewed, who, upon interpreting them, reveals his own life experience and his personal *Weltanschauung*. The heuristic power of the image lies in polysemy, in the weakness of its own code.

Leticia González et al. (2006) study the transmission of racist ideology in baseball, using photo-elicitation as a technique. Pictures of baseball players are shown to a sample of 811 people. The ethnic group, especially black, white, and Latin, influences the opinion people have on the factors that lead a player to success. Similarly, David Lopez (2000) uses photo-elicitation to show the dynamics between Latinos who had

immigrated several years earlier to the Midwest of the United States (*old-timers*) and Latinos who had recently arrived in the same places (*newcomers*). Thanks to the tool of photography, the misgivings the old-timers feel toward the newcomers are revealed.

Visual Discourse Analysis and Visual Content Analysis

Discourse analysis focuses on language and on its power to structure knowledge. One kind of discourse analysis refers to linguistic structuralism, to application of structuralism to the analysis of power. In this perspective, Megan Strom (2015) critically examines, in the United States, the discursive construction of social hierarchy in the local Spanish-language print media, to consider if this construction challenges or not the mainstream one. She considers two patterns of hierarchic representation: in the first one, the Anglo-Americans are hierarchically superior to the Latinos; in the second, however, the Latinos are equal or dominant in comparison to the Anglo-Americans.

The relevance of the visual dimension is also noted in the techniques of content analysis. Quantitative content analysis traditionally consists of techniques of data gathering and analysis in order to systematically analyze *cultural artifacts*.

An example of visual content analysis is Catherine Lutz and Jane Collins' research (1993), which examines how the non-“Occidental” are portrayed in the United States with reference to issues of power and ethnicity, particularly through media images such as those found in the *National Geographic*. Lutz and Collins randomly choose a picture for each of the 594 articles that between 1950 and 1986 deal with non-“Western” subjects. Non-“Occidental” are portrayed as less advanced technologically, closer to nature, less well dressed, more spiritual, and more at ease with their bodies.

Another famous example of content analysis is the work *Para leer al Pato Donald* (a work better known as *How to Read Donald Duck. Imperialist Ideology in the Disney Comic*) by Dorfman and Mattelart (1972), a work which analyzes the latent

content of the American comic strip. The two authors argue that more or less explicit apologetic references of American ideology can be identified, involving aspects relating to emotional life, importance of money, and power over non-Americans, which in particular is at the basis of expansionism in South America.

Analysis of Photographic Album and Archives

The use of image sources and of family photo albums to study social phenomena has a long tradition in sociology. For Pierre Bourdieu et al. (1965), membership in a social class is expressed in different photographic practices. He considers peasant society (*paysans*), urban working classes (*classes populaires*), office workers (*employés*), middle management (*cadres moyens*), senior executives, and upper management (*cadres supérieurs*).

Photographic practices, albums, and photograph collections are meant to affirm the unity of the family group, favoring the integration of the individual into the family, whose cohesion is thus strengthened. Photographic practice therefore reveals the mores that produce it (Bourdieu et al. 1965).

The collections of family photos are “themed” and generally show happy families (Halle 1993). Richard Chalfen explicitly cites constructivism in the analysis of *home mode communication*, understood as participating observation applied to how people create photographs and videos in a family setting and how people arrange photograph albums. The empirical material of *home mode communication* consists of family photo albums and photo keepsake boxes. In this perspective, family albums represent and help build family unity, patriotism, personal success, or rather acceptance of social norms. Photographic images of failed expectations or deviancy from norms do not exist. In this way, a visual dimension of daily life and a sort of *mise en scène* are constructed (Chalfen 1987). We must understand how people try to communicate personal information, narrating stories through their own images, and how they make statements about themselves

meaningful. Photographs are not copies of reality but affirmations of it, as Bourdieu’s research on family albums shows: photographs reinforce people’s integration in the family network. In particular, regarding the analysis of image collections, different kinds of albums have been identified, featured by different themes. The family album is the most widespread. Photo albums, especially family photo albums, are geared toward stable visual patterns (Blanco 2010). Blanco’s originality (2010) is to consider the photo album as a particular *medium*, which is characterized by its own *phatic function*, taking up the term from Malinowski. What distinguishes photography as a medium is the function carried out on the phatic level.

Anna Cristina Pertierra (2012) analyzes, for example, a series of photo portraits taken during the fifteenth birthday celebration of young Cuban girls (*quinceañera*). This occasion marks the passage from girlhood to womanhood in Mexico, Central America, and among Latinos in the United States and is a rite of passage characterized by traditional elements like a tiara, a fancy dress, makeup, floral decorations at home, a classic photo portrait, and contemporary practices like the use of *smartphones* to take pictures.

The use of photography is associated with festive events, which lie outside of the daily routine and must be photographed because they solemnize and reify the image which the group intends to give of itself. The use of photography fulfills its own function completely when it appears in ritualized forms: “First, there are rituals which are to be reported; secondly, there are ways of reporting which are themselves rituals; and thirdly, the medium may itself be a ritual of collective memory” (Chaney 1983, p. 117). The photographic image carries out an activity which preexists its appearance, namely, the solemnization and immortalization of an intense moment of collective life. If one admits that celebrations have the function of vivifying and recreating the group, one understands well that photography finds itself associated, since it provides the means of solemnizing those culminating moments of social life in which the group solemnly reaffirms its own unity (Bourdieu et al. 1965).

Video-Photographic Field Research

Video-photographic field research has characteristics similar to participating observation and uses tools like cameras, video cameras, or other technological devices. Visual field research is used especially for marginal environments that are hardly knowable for non-experts. In sociology, photography establishes itself as a supplement to simple observation. This technique derives from anthropology and is used, for example, by Gregory Bateson and Margaret Mead to document material culture, dances, and rituals of tribal populations (Mead and Bateson 1942).

Bateson and Mead's work is considered the first use of methodologically rigorous visual data. Even before the works of the two aforementioned anthropologists, explorers and colonists from the seventeenth century used drawings to describe anthropological contexts in Africa and Latin America.

Marcia Esparza (2006), for example, uses visual research to document the condition of women in the Mexican prison of Santa Maria Ixcotel. The photographic images are used with other heuristic tools such as statistical data. This allows a greater understanding of the complexity of the studied phenomenon.

Photographic field research has produced original results regarding the comparison between material cultures of different countries. *Material World: A Global Family Portrait* (Menzel et al. 1995) is a research in which families from different latitudes are portrayed in front of their dwellings exposing everything that it contains.

Ethnographies

The aforementioned technique of video-photographic research on the field recalls simple observation, which is an unobtrusive measure par excellence. In the mid-twentieth century, John Collier Jr. uses photography to ethnographically describe Western material culture. John Collier Jr. works for the Farm

Security Administration in New Mexico, studying the conditions, clothing, and material culture of the workers. This tradition of research has produced original results that concern the comparison between the material cultures of different countries. The work *Hungry Planet: What the World Eats* consists of portraits of people from 34 different countries, from Latin America to China, photographed together with the food that they consume in their meals in a typical day (Menzel and D'Aluisio 2007).

Besides material culture, photography and video allow us to observe and study human interactions. Besides their value as a support to field notes, pictures may contribute in the understanding of nonverbal language. A classic example of nonverbal language analysis is the work by David Efron, which betrays an objectivist and racist tone, *Gesture, race and culture: a tentative study of the spatio-temporal and "linguistic" aspects of the gestural behavior of eastern Jews and southern Italians in New York City, living under similar as well as different environmental conditions* (Efron 1941). Applicability of visual techniques emerges from Randall Collins' work *Interaction Ritual Chains* (2004), where Collins presents the situational analysis model to analyze the genesis of cultural processes, a model which he calls *interaction ritual*, also called *focus* or *emotional-entertainment mechanism*. We must consider an international situation and how intense *mutual focus* and *emotional entertainment* are among the participants in the situation. When *mutual focus* and *emotional entertainment* are intense, a *self-reinforcing feedback process* generates moments of shared emotional experience (*emotional energy*). These moments are culturally significant motivational magnets, i.e., they are experiences thanks to which culture is created and reinforced. In other words, the rituals of face-to-face interaction create *first-order* symbols, something which constitutes the starting point for other symbolic circuits, such as those of the media. Once they are infused with situational emotional energy, symbols may circulate through conversation *networks* and be internalized as ways of thinking by people.

Visual Methodologies and Latino Cultural Studies: Implications for the Sociology of Education, Fig. 1 Re-photography: the Navajo Tom Torlino “before

and after” having attended the *Carlisle School*. Richard Henry Pratt Papers, Yale University, ca 1882 (Source: Web)

Re-photography

Re-photography, also called the *before* and *after* technique, is a long-standing heuristic tool. The same person, the same place, or the same situation is portrayed in two different times.

The interest in the visual dimension of social living emerges also from cultural anthropology where photography and then video are used to document material culture and rites in their tribal environment. The photographs of distant peoples and *others* seem to be concentrated on conditions so desperate as to be insurmountable. In the late nineteenth century, photography is used as a tool to propagandize the effectiveness of Anglo-Saxon education on Native Americans. For example, at the *Carlisle Indian Industrial School* in Pennsylvania, Captain Richard Pratt, superintendent of the institute, orders the taking of *before* and *after* photos, calling this

activity explicitly *propaganda*. In this case as well, the pictures have been touched up, for example, to lighten the color of the skin of the Native Americans (Margolis and Rowe 2004). The Navajo Tom Torlino is photographed before and after the “cure” of the Carlisle School (Fig. 1).

Introduction

Whakapapa is central to Māori perceptions of knowing and is at the very core of what it means to be Māori. The literal translation of whakapapa is to place in layers. It involves multiple layers and interpretations that form the basis of Māori values and beliefs. Whakapapa is a way of thinking and knowing which is fundamental to almost every facet of a Māori worldview. The importance of whakapapa within Māori culture cannot be overestimated. It acts as a basic form of knowing an epistemological template. This entry explores the centrality of whakapapa to Māori of knowing, learning, and ways of being in the world.

Māori Ways of Knowing and Being in the World

Māori ways of knowing and being are fundamentally different to those of non-Māori, influenced and shaped by historical and contemporary interpretive systems. It is these interpretive systems or worlds that Māori learners inhabit, enact, and reflect in their learning. Being Māori can be viewed through a number of interpretive systems. These interpretive systems are not distinct or separate from each other, but rather are interrelated components of a dynamic weaving that encompasses Māori identities both historical and contemporary. Historical ways of knowing and being in the world stress the centrality of relationships with the land (whenua), with people – past and present including the extended family/subtribe/tribe (whānau/hapū/iwi) – and with the spiritual dimension and universe (wairuatanga). The importance of whakapapa to these relationships cannot be overstated. The impact of colonization, assimilation, land loss, language loss, urbanization, and twenty-first-century global and national conditions has worked in different ways and combinations to shape and transform historical Māori ways of knowing and understandings of what it means to be Māori. Contemporary ways of knowing and being Māori therefore are the result of individuals and groups weaving specific combinations of realities, understandings, and experiences. However the critical point is that if one wishes to identify with one's Māori heritage and has whakapapa, that person is Māori.

Key differences also exist between the Māori and non-Māori perceptions of knowledge and rights to knowledge. Māori, knowledge is perceived as a taonga (precious gift), passed down from ancestors, therefore to be taken seriously, treated with respect and preserved intact. Knowledge does not belong to individuals, neither is the property of the hapū (subtribe) and iwi (tribe). Individuals are the repositories of the group's knowledge and have the responsibility to use it for the benefit of the group and not for personal gain. Whakapapa is not only a means of passing down knowledge from generation to generation

but is also important in structuring Māori perceptions of knowledge, knowing, and knowers.

Whakapapa

Whakapapa has many meanings but is generally viewed as genealogy and history.

“Papa” is described as something that is broad and flat such as a board or slab and “whaka” can be translated as “to enable” or “make happen.” Whakapapa relates to the idea of placing in layers or laying one on another. It operates at various levels but is most commonly concerned with genealogical narratives, stories that are recounted layer upon layer and ancestor upon ancestor up to the present day, a genealogical layering of one generation of ancestors upon the previous. Whakapapa is a continuous lifeline from those who existed before to those living today. It encompasses everything that is passed from one generation to the next, from one ancestor to the next and, from the deceased to the living. Whakapapa connects Māori to ancestors; history; the environment, Ranginui (sky father) and Papatūānuku (earth mother); birthrights; whenua (land); tūrangawaewae (place to stand); whānau (extended family), hapū (subtribe), and iwi (tribe); and moana (sea), awa (river), maunga (mountain), and waka (ancestral canoe).

Whakapapa also denotes the genealogical descent of Māori from the divine creation of the universe to the living world. It outlines the genealogical descent of all living things from the gods to the present day and provides a basis for the organization of knowledge in relation to the creation of the universe and the development of all things. Māori are descendents of the heavens and through whakapapa can trace lineage back to the very beginning of time and the birthing of the universe. This birthing is normally told using a whakapapa format which outlines the process of creation from the beginning of time to the primal parents Ranginui (sky father) and Papatūānuku (earth mother) and their children including Tāne, from whom Māori descend. The following is an example of the creation whakapapa:

I te tīmatanga, ko te kore—In the beginning there was a void.

Ko te pō—Within the void was the night.

Nā te pō—From within the night, seeds were cultivated.

Ka puta kō te Kukune—It was here that movement began—the stretching.

Ko te Pupuke—There the shoots enlarged and swelled.

Ko te Hihiri—Then there was pure energy.

Ko te Mahara—Then there was the subconscious.

Ko te Manako—Then the desire to know.

Ka puta i te whei ao—Movement from darkness to light, from conception to birth.

Ki te ao mārama e—From the learning comes knowing.

Tihei Mauri ora—I sneeze and there is life.

(Ministry of Education 2009, p. 48)

Ranginui (sky father) and Papatūānuku (earth mother), the primal parents, were next in line followed by their children. There are variations in the accounts of the numbers of children born to Ranginui and Papatūānuku. There were approximately 70 children; however there were six main atua (guardians or gods) who received authority over certain domains of life. They include Tūmataurangi (atua of war), Tangaroa (atua of the oceans), Tawhirimatea (atua of the weather), Rongomātāne and Haumia tiketike (atua of food), and Tāne (atua of the forests). Māori trace their lineage to Tāne and therefore back to the creation of the universe.

Whakapapa and Ways of Being

Whakapapa identifies who one is and where one is from and thus identifies the place one belongs to. Whakapapa connects Māori to the land providing a sense of unity and harmony with the environment. It has been viewed as verification of the continued existence of Māori not only as a people but also as tangata whenua (people of the land) in Aotearoa. It affirms kin ties to iwi, hapū, and whānau and to tūrangawaewae (tribal lands). It reifies connections to past generations and those generations to come and asserts that Māori will continue to exist as long as the land continues to exist.

Whakapapa informs relationships and provides the foundation for inherent connectedness and interdependence to all things. From a traditional Māori perspective, it is your whakapapa that makes you who you are. Reciting your whakapapa is a way of shaping your identity. Through telling and retelling whakapapa, the connections to ancestors, to the land, and to the deities become apparent. Whakapapa is fundamental to being Māori. It is the connection to people and the land, past, present, and future, and to the spiritual world and the universe. It is key to Māori ways of structuring and knowing the world and ones place in it:

Whakapapa identifies who I am, where I am from and in doing so identifies a place that I can proudly call my tūrangawaewae (place to stand). It is this whakapapa knowledge that gives an individual or collective a sense of purpose that... grounds us to Papatūānuku (earth mother)... my whakapapa and iwi (tribal) affiliations are my biological and kinship credentials that form my Māori identity. (Graham 2009, pp. 1–2)

Whakapapa provides a continuum of life from the spiritual world to the physical world and from the creation of the universe to people, past, present, and future. Not only does whakapapa permit Māori to trace descent through past generations, it also allows movement and growth into the future. Identity, past, present, and future, comes from whakapapa links – to the past through ancestors, to the present through whānau, and to the future through children and grandchildren. Spiritual beliefs are a central feature of a person's overall well-being and identity. The spirits of the dead are accepted as real as the living. Life is a movement, passing and moving from generation to generation and person to person. Key to this concept is the understanding that time has no boundaries, being both past and present. From a Māori perspective, the opposite is the case and the past is ahead not behind. It is therefore in the past that one finds one's models, inspiration, and guides. As only the past and present are knowable, they are viewed as “mua,” or at the front of consciousness. The future which cannot

be seen is therefore behind or “muri.” We are from this viewpoint traveling backward in time, and the present unfolds in front, linking to the past.

This conceptualization of history, time, of the continuous cosmic movement does not leave the past behind; rather one carries one’s past into the future. The past therefore is central to and shapes both present and future identity. The strength of carrying one’s past into the future is that ancestors are ever present, and one’s place in the kin group is acknowledged and affirmed. Whakapapa is therefore not only about personal identity but also connects to whānau, immediate family grouping, as well as hapū and iwi, who share a common genealogy. Through these connections whakapapa establishes personal, collective, and whānau identities, positioning, and connectedness.

The creation stories with its layering of metaphor and symbolism provide the backdrop to the interrelatedness and indeterminacy of the natural, spiritual, social worlds. From a Māori perspective, people are not superior to other entities in the wider world but related through whakapapa to all aspects of the environment, themselves imbued with spiritual elements. Māori are part of the environment, connected to everything in it; therefore it requires respect. In this sense man belonged to the earth, and although man could use the resources of the earth, man did not own them:

In Māori cosmology, the gods (ngā Atua) are the origin of species. For example, the offspring of Tāne, Tū, Tāwhiri, Tangaroa, Rōngo, Haumia (and some 70-odd others) eventually populated the universe with every diverse species known. Under this system, humans are related to both animate and inanimate objects, including animals, fish, plants and the physical environment (land, rocks, water, air and stars). Thus there is no separation between the physical and spiritual worlds; in the holistic Māori worldview they are continuous. (Cheung 2008, p. 3)

Whakapapa and Ways of Knowing

The whakapapa of the universe is understood in terms of a movement, from nothingness or potential to the world of light. An example of this is the way the creation whakapapa is utilized to

represent the process of conception and birthing, not only of the world “*te ōrokohanga*,” but the birthing of the child “*te whānau tangata*” and the birthing of learning of the child “*te āhuetanga o te tamaiti*” (Ministry of Education 2009, p. 50). These birthing concepts emphasize evolving consciousness and learning rather than a physical evolving of matter. The child can be viewed as moving through realms of learning to a space of realization and understanding which expresses Māori ways of knowing, being, and doing.

Whakapapa is acknowledged as a way of thinking, a way of storing knowledge, and a way of debating knowledge. This holistic, outward-looking perspective of knowing is intimately connected and continually developing. These can be viewed as a double spiral on three levels. The first level is the level of the human person, where we move from nothingness through different stages and experiences into the night, then the world of light, to a state of oneness with others. The second level is the level of the cosmos. This movement and unfolding from the “nothingness, to the night, to the world of light” on this level symbolizes the unfolding of the cosmos and the universe. The third and final level, that of Io (the supreme god), is the core, the source of all energy (Shirres 1997).

This unfolding and continuously evolving world has also been linked to the growth of a plant “*te pu, te more, weu, aka, rea, waonui, kune and whe* meaning primary root, tap root, fibrous roots, trunk, tendrils, massed branches, buds and fronds” (Marsden 1992, p. 134) and the conception, gestation, and birth of a child. The child is viewed as moving from “*te kore, ki te po, ki te ao mārama*,” from nothingness or potential, to the world of light, from conception to birth:

The miracle of childbirth was equal in importance to the creation of the world to our tohunga mystics. The power of the child being born in our tradition cannot be stressed enough. The child is Tāne, a very real representation of Tāne, the god who brought light into the world. The child follows the entire path of Tāne during the Night ages, from its conception, its occupation in the heated darkness or womb, to the struggle for daylight during childbirth. Therefore the whole Māori scheme of creation actually coheres to the process of a child being born. (Robinson 2005, pp. 307–308)

This understanding of the universe and the evolution from “nothingness, into the night, into the world of light” connects strongly to the unfolding of consciousness and thought as well as an unfolding of matter. The development of the physical world therefore paralleled understandings of the development and emergence of patterns of human thought. This concept of creation and the gradual development of full awareness and understanding are expressed in the following whakapapa, as translated by Taylor (1855):

Na te kune te pupuke	<i>From the conception the increase</i>
Na te pupuke te hihiri	<i>From the increase the thought</i>
Na te hihiri te mahara	<i>From the thought the remembrance</i>
Na te mahara te hinengaro	<i>From the remembrance the consciousness</i>
Na te hinengaro te manako	<i>From the consciousness the desire</i>

(cited Shirres 1997, pp. 24–25)

The creation whakapapa provides a three-dimensional perspective of the world Māori. The first dimension or realm is te korekore, the realm of potential being and energy; the second, te po, the realm of becoming; and finally te ao mārama, the realm of being. An important point in this unfolding world is that it related to continuity, where the world is continuously being created and recreated. This relates strongly to children’s learning, and therefore assessment, in that like the universe, children’s ideas and understandings are continuously being created and recreated, defined, and redefined. Like the universe there is no end point to children’s learning, thinking, and understanding; rather it is an ongoing lifelong process. Another point is that the universe is dynamic. It is a stream of processes and events that are lineal rather than cyclical. This lineal movement is a two-way process, with the spirits of the departed descending to Hawaiki and those in a state of becoming ascending to the world of light. This idea also strongly links to the dynamic nature of knowledge acquisition and learning and the two-way traffic of ideas, thinking, and understandings. Some ideas ascend from potential

being into the world of becoming where they challenges and stretches thinking and into the world of being, of enlightenment and clarification. Other knowledge and understandings descend from the world of being, from a place of knowing and certainty, to a world of becoming, or uncertainty. It is here that once firmly held views and opinions may be challenged and interrupted and, if unable to stand up to the critique of becoming, are relegated to the world of potential being, or nothingness. In this way learning is not just an accumulation of ideas and understandings but a dynamic process of continuous germination, cultivation and pruning.

Whakapapa and Learning

The realms of “te korekore, te po, te ao mārama” provide a frame from which to view Māori learning, one that is deeply embedded within a Māori worldview and which expresses Māori ways of knowing, being, and doing.

- *Te Korekore: Potential Being*
Te korekore is the realm of potential being, between nonbeing and being. This realm is where all things gestate, where there is endless potential for learning and growth. This is a time of potential and possibilities, a time of openness to new ideas and growth. It is the seedbed of learning and development.
- *Te Po: Becoming*
Te po is the period of becoming, of stretching, of challenge, and of growth. There are many sub-realms within te po, “te Po te kitea, te Po tangotango, Po whawha, Po namunamu,” meaning “the night of unseeing, the night of hesitant exploration, night of bold groping, night inclined towards the day” (Marsden 1992, p.135). These nights provide an insight into the realm of te po, which is marked with uncertainty, hesitancy, apprehension, and negotiation. It does however also have a sense of stretching and swelling and unfolding potential and consciousness. This is the growth period of the seed of learning and development. Learning can occur simultaneously on different

levels; on different topics or subjects; on different planes including physical, emotional, and spiritual; and in different intensities. Like the contractions of birthing a child, the birthing of ideas and understandings is challenging, very rarely without pain, and comes in waves, surging and ebbing.

- *Te Ao Mārama: Being*

Te ao mārama is the realm of being, the realm of realization, enlightenment, and clarification. It is not, however, viewed as the end point, but rather as part of a continuously unfolding stream. The universe is likened to a stream of processes and events never static. Furthermore Māori did not develop the idea of a goal of history, so not only was there no end point, there was no final objective or goal. Each element is an integral part of the whole. So to know something is to locate it within space and time. Knowledge of whakapapa is critical to this.

Teaching, learning, and the learner are located within the context of Ranginui, the sky father, and Papatūānuku, the earth mother, their children, and their descendents. Whakapapa situates the learner within this world. Learners can place themselves in the world and so are able to relate to any aspects of life or nonlife including mountains, the rain, the sea, and all creatures and things in the world.

Where the Learning Sciences Need Philosophers

Carl Bereiter

Institute for Knowledge Innovation and Technology, University of Toronto, Toronto, ON, Canada

The learning sciences comprise a relatively new disciplinary community (commonly dated from 1991) that has largely taken over that part of educational psychology concerned with learning and thinking (Sawyer 2006). Although the learning sciences draw on a number of disciplines, their most direct line of descent is from cognitive science. Cognitive science, however, has had philosophers in its midst from the beginning – several of its leading figures are also leading philosophers – but this has not been true of the learning sciences. Such philosophical work as goes on in this field, and there is actually quite a lot, is done by amateurs. This article is aimed at identifying useful roles philosophers could play in the advancement of scientifically grounded efforts to improve educational practice. It makes no effort to present a coherent framework for philosophical contributions to the learning sciences. Instead, it touches on an assortment of possibilities, mainly in the hope of arousing philosophers of education to take the kind of active role that philosophers already take in cognitive science and in the many disciplines and professions that have a branch called “philosophy of. . .”

One way philosophers could be of value to people engaged in learning research and innovation is by helping clarify ubiquitous but fuzzy concepts. Take *literacies*, for example. In popular educational usage, the plural form of the term embraces things like “economic literacy” and “geographical literacy.” Does “literacy” mean anything special here or is it just a pretentious synonym for “knowledge”? And then there is *skill*, as in “higher-order thinking skills” and “twenty-first-century skills.” Is this term also used mainly for rhetorical effect or is it to be understood as claiming that “critical thinking,”

“problem solving,” “creative thinking,” and the like are actual teachable skills that can be widely applied, much like arithmetic skills? There are empirical issues here about learnability, teachability, and transfer, but there are also issues of what people mean, or think they mean, or fail to think about what they mean when they use these and many other trendy terms that fill the literature of teaching and learning.

Beyond conceptual problems, however, are more substantive problems that need collaborative, interdisciplinary work.

Different Conceptions of Knowledge and Their Different Uses

The traditional epistemological conception of knowledge as “true and justified belief” is far too restrictive for use in the behavioral sciences. Because learning scientists generally take knowledge development seriously, the field is awash in different conceptions of knowledge coming from neuroscience, semiotics, sociology, organizational theory (where knowledge creation is an important theme), and philosophy of science, where conceptions of knowledge become entangled with conceptions of the nature of science and scientific practice.

Perhaps a unified framework can be produced that ties all the various conceptions of knowledge together, or perhaps what learning scientists need is a way to move between conceptions as the situation requires without getting into tangles about what knowledge *really* is or is not. In any case, philosophers could help fend off the anti-knowledge forces that impinge on education from several directions. Most prominent among these at present are technology enthusiasts who parade the notion of “just-in-time” knowledge and whose line of argument is that schools should not be filling students’ heads with knowledge (which they believe becomes obsolete very rapidly) and should instead teach information search skills (as if the mechanics of Internet search do not also become rapidly obsolete). Throughout the 1960s and 1970s, evidence accumulated that the main determinant of reading comprehension is

what the reader already knows (Anderson and Pearson 1984). Those findings have not suddenly become irrelevant. Added to them is increasing recognition of the importance of knowledge in creative thinking. Yet it is understandable that knowledge should be downgraded, if knowledge is understood to be the contents of a mental filing cabinet. That is a notion traceable back to the hugely influential *Taxonomy of Educational Objectives* (Bloom 1956). The *Taxonomy* treated knowledge as inert stuff that is acted upon by mental skills. Even to this day, movements such as the “twenty-first-century skills” movement treat knowledge and mental skills as disjoint categories, ignoring knowledge domains such as systems theory and probability and statistics, which demonstrably instrumental value in effective thinking. Yet anyone who has done web searches seeking answers to questions of any complexity must surely have found that success in this very “twenty-first century” activity depends crucially on the domain knowledge one can bring to the search.

Knowledge Creation

It seems that until recent decades, scientists and other scholars referred to their creative achievements as discoveries rather than products or creations. Recall Newton’s likening his accomplishments to finding pretty stones on a beach and to his seeing farther than others by standing on the shoulders of giants. Perhaps the shift to a knowledge creation conception began with what A. N. Whitehead identified as the professionalization of invention in the nineteenth century. Steam engines and electric light bulbs are obviously invented, not discovered, and so why should a theory not also be recognized as an invention?

The idea of corporate knowledge creation took hold readily when Nonaka and Takeuchi (1995) published *The Knowledge-Creating Company*. Some universities also began advertising themselves as creators of knowledge in the same sense – that is, as producers of new technology, new theories, new strategies in health care, and so forth. They were referring, however, to their research programs, not their educational functions.

In education, the idea of knowledge creation has had a much harder time gaining a foothold. Since the 1980s, however, “Knowledge Building” has gained increasing recognition in the learning sciences as an approach that makes students’ collective responsibility for knowledge creation and idea improvement central to the educational process (Scardamalia and Bereiter 2014).

In process terms, Knowledge Building means bringing design thinking – a generalization of the kind of thinking designers do (Brown 2009) – into work with disciplinary subject matter. This is in contrast to a kind of thinking that has, with considerable backing from philosophy, gained high status in contemporary science education: argumentative thinking, concerned with the justification of knowledge claims (Andriessen et al. 2003). In the actual process of creating new public knowledge, activity in both design thinking and argument to justify claims will typically occur and in close conjunction, but this does not obviate the distinction. The distinction has practical relevance in education, because to the extent it is valid, it implies that there is a serious imbalance in pedagogy. Since ancient times, design thinking has played almost no role in formal education. The advent of constructivist pedagogy has not changed this, in as much as constructive activities such as “guided discovery” mainly engage students in testing the truth value of propositions (e.g., testing which variables do and do not affect an observed phenomenon). The obvious way to introduce design thinking within the framework of formal education is to engage students in theory building. It is easy to invoke criteria according to which young students’ efforts along these lines are not “real” theories. More challenging is to identify in what respect children’s explanatory efforts are theoretical and to suggest what would constitute a next step up toward mature theory building. This is a matter on which philosophers could make a significant contribution to curriculum development.

What Constitutes Depth of Learning?

No one argues in favor of superficiality over depth in learning, but depth falls into that

category of qualities people feel confident they can recognize yet find it impossible to define. That schooling often falls short in promoting depth of learning is also widely recognized, but critics tend to focus their attacks on a caricature of direct instruction that has virtually no advocates. Good direct instruction goes well beyond rote memorization and reproduction to the point where students can explain, offer evidence, and even apply the acquired knowledge in limited contexts. What research on students’ concepts suggests, however, is that learners can do all this – pass tests of comprehension and application – without the new knowledge having much effect on their mental lives on the way they apprehend the world about them. Students may know that the earth is round like a globe, but in all their experiencing and thinking concerning the earth, it remains flat; knowledge that the earth is round plays no role in their conceptions of up and down, tides, the changing of the seasons, and all the many understandings that depend on thinking of the earth as a sphere. For educated adults, everyday practical thinking may also treat the earth as a flat surface over which the sun passes, but, in the background, knowledge of the earth’s shape and relation to the sun will inform their thinking – in varying degrees depending on their depth of knowledge. Although the fact that the earth is round may rise to consciousness only when needed, cosmology may be said to be continually present in what Wittgenstein called the “scaffolding of our thoughts.” We represent the earth mentally *as* a globe, even when we are not actively thinking of it as such.

Comparisons of understanding with misunderstanding are abundant, but studies of differences between shallow and deep understanding are rare. To the extent that depth is measured at all, it is measured by extent of agreement with experts or ability to apply knowledge. However, in line with the preceding discussion, a more learner-centered criterion of depth could be applied: *You have not understood something deeply unless it alters the way you apprehend the world.* This criterion opens up a field for practical and scientific inquiry that could well engage philosophers as investigators.

Teaching People to Think

Teaching people to think is a long-standing educational mandate and one in which philosophers have played a role that reaches back as far as classical times. However, treating thinking ability as a set of general skills separate from content is an innovation that appears to have originated in the 1950s and to have been embodied if not actually conceived in the aforementioned *Taxonomy of Educational Objectives*. Earlier conceptions of teaching to think are better characterized by a quotation attributed to Bertrand Russell that has appeared on homeschooling websites:

When you want to teach children to think, you begin by treating them seriously when they are little, giving them responsibilities, talking to them candidly, providing privacy and solitude for them, and making them readers and thinkers of significant thoughts from the beginning. That's if you want to teach them to think.

Here, teaching children to think is treated as a sort of character development – helping children become thinking people. There is no mention of skills, but there is of content: “significant thoughts.” A. N. Whitehead even more strongly emphasized the dependence of process on content:

Nobody can be a good reasoner unless by constant practice he has realized the importance of getting hold of the big ideas and of hanging on to them like grim death. (1929, p. 91)

In historical perspective, the “twenty-first-century skills” movement may be seen as an evolution or a revival of the “higher-order skills” movement of the 1970s. Within the thinking skills movement, “Philosophy for Children,” led by Matthew Lipman (2008), has been ahead of the curve in shifting from an emphasis on skill acquisition to thoughtful treatment of important questions. A number of other philosophy-based initiatives around the world also bring a measure of sanity to what, despite its “twenty-first century” label, is a movement grounded in obsolete psychology and wishful thinking. It could help greatly if more philosophers, like Lipman, got involved not merely as commentators but as working contributors to experiments in twenty-

first-century pedagogical reform. This means on one hand applying a heavy dose of critical thought to the utterances of thinking skills enthusiasts and on the other hand moving outside the comfort zone of argumentative thinking and applying design thinking to problems of improving student thought. A direction this creative work might take is suggested in the next section.

Children as Natural Philosophers

As every philosopher knows, philosophy used to encompass the entire rational pursuit of understanding. Then natural philosophy branched off, specialization ensued, and continued apace until today you may meet a neurophysiologist who specializes in research on one nerve. But children are where philosophy used to be. Given enough opportunity and supportive conditions, they will set about trying to understand the whole world. This may or may not imply that philosophy itself should become part of the curriculum. Philosophy as a discipline might well be deferred until secondary school, but a philosophical vocabulary could permeate classroom discourse at a much earlier age. In so far as young students become builders, critics, and improvers of theories about the world, they become through their own enterprise “natural philosophers” in the old sense. The natural world for them will encompass the subject matter of not only the physical sciences but also the biological and behavioral sciences; with no sharp internal breaks or breaks between them and the humanities.

This does not imply rolling all the disciplines into one “big ball of wax” nor a celebration of whatever ideas pop into children’s heads. It does, however, suggest that theoretical rigor is a gradual development and that it should not unnecessarily impede the growth of understanding. In science classes around the world, children are being guided in use of the “scientific method” (i.e., control of variables) to discover that the period of a pendulum depends on the length of the cord and not much else. But do they acquire any understanding of why this should be the case? Or do they in fact pursue explanations of any of the

lawful regularities revealed to them through “guided discovery”? If they do not, if instead they are rushed on to the next topic, they are clearly not being encouraged to function as natural philosophers.

Every child an Aristotle? Not quite. Children cannot be expected to have Aristotle’s fineness of conceptual discrimination, but on the other hand, they can be expected to have a more modern approach to theory building. The practical problem for educational designers is how students are to acquire modern competence in theory building. It cannot be assumed they will get it from their teachers, because there is evidence that teachers themselves have little sense of the productive role of theory in scientific progress (Windschitl 2004). And they will surely not get it from the mass media. An extensive bootstrapping operation seems required. If school students are to become genuine creators of enlightened and research-grounded understanding of their world, it will take sustained cooperation among a number of parties – teachers, administrators, teacher educators, learning scientists, technology developers, and school students themselves. Philosophers of education could play an active role in such collaborative bootstrapping. It is not necessary to specify the nature of that role: It should be enough that philosophers of education bring their distinctive knowledge and talents to the transformative effort and figure out for themselves how best to use them.

Conclusion

Philosophers can contribute significantly to progress in the learning sciences by performing their traditional role of clarifiers. To do this, however, they need to get into the substantive problems learning scientists are trying to solve. The everyday or ordinary language meanings of terms like “skill” and “understanding” are not at issue. They should become an issue, however, when educational designs and policies make consequential use of such terms without looking beyond their squishy everyday meanings. Philosophers in the learning sciences can also play active roles that go beyond

clarifying. They can take part in collaborative design thinking in projects concerned, for instance, with educating for deeper understanding or for knowledge creation. This article has said nothing about the role of philosophers of education as critics of the learning sciences. Criticism from philosophical perspectives could be valuable, as it is in other disciplines. However, it needs to be well informed about actual practice and the state of knowledge in this field. Learning scientists generally do not, for instance, need to be reminded that human beings are different from computers.

Wikilearning

Juha Suoranta and Tere Vadén
University of Tampere, Tampere, Finland

Synonyms

[Collaborative knowledge production](#); [Networked learning](#)

Introduction

Wikilearning refers to learning activities people have *together* on the Internet, where people do not only share their ideas, information, and opinions but also cooperate, create, and evaluate things with each other. Researchers, educators, teachers, and other cultural workers are building wikis and forming alliances globally with their peers and like-minded people. They are parts of informal networks and “invisible colleges” and have joined forces in creating new forms of interaction and knowledge production outside closed educational systems. To paraphrase philosopher J. L. Austin (1911–1960), wikilearning is not only about how to do things with words but also how to do things with edits, saves, uploads, downloads, histories, revisions, and discussions.

Wikilearning is self-organized and self-determined by nature and has a common goal – editing a wiki page. By utilizing the power of wiki technologies, participants can engage in shared projects in various wikis. It is part of the “collaborative turn” and the associated participatory cultures, which are characterized by voluntary participation, altruistic sharing of ideas and resources, and anonymous collectivism. It exceeds the orthodox boundaries of formal schooling and other exclusive practices of education. Wikilearners do not need credentials, degrees, or diplomas to be involved and committed to learning together.

Wikilearning is an openly normative concept. It contains an ideological and political message: it highlights peoples’ knowledge (sometimes

referred to a contested concept of the wisdom of the crowds) and promotes a world in which knowledge production has been made equal among the people of the nations, and democracy prevails. Obviously, these ideals have their problems, including digital divide, gender bias of the learners, and censorship of the Internet in some parts of the world, which restricts the open educational process.

Wikilearning and Wikiworld

Ideally, wikilearners are autonomous and voluntary learners who self-organize participation in *shared* learning tasks on the Internet. Depending on the task, their number can be small or large, and their ages differ. Wikilearners act together locally (i.e., classroom students working on a wiki project) or globally (i.e., in a shared wiki page or a wiki project). Wikilearning presumes that all materials (i.e., texts, audios, and videos) are freely available on the Internet on the basis of open access (content is created under copyleft licenses, if licenses are needed at all). Everybody has in principle equal opportunity for contributing, commenting, and working on such materials. Of course, this is an idealized picture of the situation rather than an account of current state: not everyone has access to the Internet, let alone the skills necessary to participate, although doing wikis does not demand more than basic literacy and brief introduction to the basic functions of a wiki page.

Wikilearning is the learning model of the Wikiworld. The notion of Wikiworld refers to both the technical and the social spheres of the Internet. The prefix “wiki” – a Hawaiian language word for “quick” – comes from the characteristic software tool, that of wiki software, that has made collaboration on a webpage relatively fast and easy. The first wiki software and correspondingly the first wiki website were developed by Ward Cunningham in 1995. The idea was to provide users a fast way to edit a website without the need for extensive computer literacy. At the same time, Cunningham was aware of the social effects of the fact that anyone – without

registration or preapproved credentials – could provide content. As the “Welcome Visitors” page of the world’s first wiki, WikiWikiWeb puts it:

Welcome to WikiWikiWeb (...) We always accept newcomers with valuable contributions. If you haven’t used a wiki before, be prepared for a bit of CultureShock. The beauty of Wiki is in the freedom, simplicity, and power it offers. (...) Wiki content is WorkInProgress. Most of all, this is a forum where people share ideas! It changes as people come and go. Much of the information here is subjective. (<https://en.wikipedia.org/wiki/WikiWikiWeb>)

In outline, wiki software makes it possible to edit a webpage “live,” without leaving the page or using specific editing software. One just pushes the “edit” button, and the page appears in an editable version. After the edit, one can save and publish the page, and the new content is immediately visible. New pages can be created simply by adding a link to a new page. In addition, wiki software typically supports the possibility of two or more people working on the same page at the same time and provides a complete history of the changes made to the page.

The preserved history gives the freedom to tinker; it is impossible to accidentally destroy a wiki page, as it can always be easily restored. Moreover, there is often a separate discussion page connected to a wiki page (like in Wikipedia) promoting the “public use of reason.” These software features provide a low-threshold tool for collaboration without preexisting hierarchies, with space for deliberation, and with accumulated cultural memory. In general, the Wikiworld includes relatively low barriers to civic engagement and activism, artistic and other sorts of expression, easy access for creating and sharing one’s outputs with others, peer-to-peer relations and informal mentorship, as well as new forms of socialization, social connections, collectivism, and solidarity (see Jenkins et al. 2006). A case in point in the collaborative turn is Wikipedia and its sister projects such as Wikiversity.

However, the Wikiworld cannot be sufficiently scrutinized outside the larger sociopolitical context and without using the lens of radical political economy. From this angle, the Wikiworld is also

an ideological battlefield: the very ways in which the digital sphere and its physical counterparts are conceived are contested and defined by everyday actions (Suoranta and Vadén 2010, p. 2).

A growing number of researchers, educators, and other workers in the fields of science, education, and culture are forming alliances with their peers in global blogospheres and wikispheres and thus becoming parts of global informal networks and “invisible colleges.” As wikilearners, they are involved in an open digital knowledge production, often outside their home institutions (Suoranta and Vadén 2010, p. 2). In allowing and enhancing local and global collaboration, wikilearning can be thought of as a form of “commons-based peer production” (Benkler 2006) – a new modality of organizing production and learning. Commons-based peer pedagogy implies a form of learning that is

radically decentralized, collaborative, and non-proprietary; based on sharing resources and outputs among widely distributed, loosely connected individuals who cooperate with each other without relying on either market signals or managerial commands. (Benkler 2006, p. 60)

The use of noncommercial wikis, such as Wikipedia and its sister projects, is often a conscious action against corporatization and commodification of knowledge in profit-oriented universities and privatized schooling systems. Noncommercial wikis, as additions to educators’ conceptual and practical toolbox, facilitate the aim of border crossings, dialogues, and outreach. A crucial feature of wikis, in the light of these objectives, is their emphasis on collective, collaborative, and open approach to learning along with the belief in, and respect of, “the commons of culture, the immediately socialized forms of ‘cognitive’ capital, primarily language, our means of communication and education” (Žižek 2009, p. 91).

Wikilearning and Formal Learning

Wikilearning differs from formal, traditional view of learning in several ways. In this section, we follow comparison made by Suoranta and Vadén

(2012, pp. 105–109). Wikilearning is radically open and free in the sense that it is not regulated by educational laws or policies. It is an independent activity, which is not a part of the nation state and its educational system. Wikilearning does not exist in a written curriculum, although it can be incorporated into school settings as part of formal classroom learning. Whereas wikilearning is radically open and characterized by disorganization, formal school learning is politically and economically regulated by top-down, ready-made curricula.

Formal school learning is not only compulsory but also governed and regulated by many actors. The State has its say in general educational policies as well as funding and administration of educational systems. Teachers and their interest groups act as “disciplinary experts” who do not only decide what and how students ought to learn but also shape standards for curricula and assessment (Greenhow et al. 2009, p. 248). Wikilearning occurs in free spaces of civil society and voluntary participation, and voluntarism extends to all levels of the learning process: the decision to participate or not, to learn or not, and to be involved or not and the intensity and mode of participation.

However, one should keep in mind that “free” must be seen in relation to the more critical questions such as: who is paying for the hi-tech and the servers, or who is controlling and harvesting the data? In this respect, wikilearning does not exist in a totally “free space” but is determined by the political economics of the global technological industry and media markets. Although the flagship of all the wikis, the Wikipedia, lives with donations and does not allow advertising, the Wikiworld would be free if, and only if, there were not only open wikis and access to the Internet available as commons, but uncommodified natural resources controlled by the community of users (see Suoranta and Vadén 2010, pp. 158–162).

Wikilearning occurs in a peer-to-peer mode, that is, by learning from each other and helping each other to learn. Importantly, the peer-to-peer structure also allows giving without taking and taking without giving, i.e., it is not reciprocal.

Thus, due to the wiki technology itself, peer pressure is kept to a minimum. In schools, learning “technology” is utilized according to the habits and traditions of didactics and pedagogy (teacher-centered and student-centered pedagogy and so forth) and also embodied in school buildings and classroom designs. On the contrary, wikilearning is based on voluntary self-aggregation of participants and their immaterial and material productive assets. Immaterial assets include brainpower and cooperation (or “participatory processing”) with other users, and material assets include access to computers and digital networks (Bauwens 2009, p. 123).

An important feature of wikilearning is reflective uncertainty. Wiki information should not be taken for granted, because wikis are editable and the current edit may be erroneous if not outright malicious. However, the history of edits can, at least in principle, be traced back to the beginning. This, of course, is a dramatic difference between wiki information and printed information as well as Web 1 information. In comparison to textbooks’ qualities that often augment unreflective certainty, the “edit” and “history” buttons in every wiki page potentially increase learners’ skills in media literacy. Gradually, by using wiki pages, users learn to mentally expect and anticipate the structures of editability and genealogy also on other pages, including those of books. Thus, the reflective uncertainty of wikified information leaks to other areas of knowledge, in which learning is commonly defined by unreflective certainty. Reflective uncertainty also implies that the materials are not organized through preexisting taxonomies, but with dynamic “folksonomies” of tagging, linking, and categorizing.

In contrast to orthodox school learning, or what Freire (1993) called banking education, which emphasizes hearing, listening, and rote memorizing, in wikilearning it is crucial to negotiate on information and knowledge (e.g., in wikis’ discussion areas and so-called coffee rooms). As opposed to textbook approach, wikilearning includes searching information and comparing different sources of information.

In wikilearning, communication is not based on the model of sender and receiver (Shannon’s

transmission model of information), but on suggestion and evaluation. From an ethnographic perspective, traditional classroom activities are speaking, listening, making notes, and filling workbooks. The wikilearners are widely distributed, and their activities are typically computer mediated. At the level of cognition and experience, however, the difference grows bigger. Speaking, listening, and making notes correspond to the cognitive activities of conveying information and memorizing. When a wikilearner (or correspondingly an open source developer) receives a piece of new information (a code or a patch), the point is not to memorize or even to use it, but to evaluate it and synthesize it with possibly several versions of the existing database.

Ideally, all activities in wikilearning have this quality of evaluation and integration, rather than mere delivering and memorizing. Wikilearning thus entails that learning has not so much to do about rote learning, but everything to do about making connections bit by bit, even and often with strangers in the shared wiki project. As Greenhow et al. (2009, p. 251) point out, this quality of learning can be seen especially in young people's learning:

Contradicting traditional pedagogical models in which students submit their works to one authoritative source (the instructor) and receive feedback from that source, today's learners expect to participate in evaluating as well as in being evaluated and to share work and feedback among their peers. (Greenhow et al. 2009, p. 251.)

It is also noteworthy that in the hacker world, there is a militant ethos of evaluating the patch, the hack, and not the submitter, the author of the patch. The same applies to the Wikiworld: the question of who did it can be less important than the principles of anonymity and impersonality inherent in working with wikis (Suoranta 2010, p. 511).

Wikilearning is based on doing and creating together, with the underlying idea that no one can achieve alone what can be achieved together. Individual learning achievements are not measured, and criteria external to learning activities are not used. Participants judge the value of a learning activity based on own motivation for

participation (utility, fun, communality, etc.). The evaluation of learning extends also to formal educational systems and their learning techniques: even though traditional transmission models of knowledge die hard, they are nevertheless reinterpreted and remixed in the Wikiworld by the young and old wikilearners.

A wiki page aggregates the common pool of information by page editors. It is not the property or achievement of any one participant in the group and could not be written by any one editor. The software is built for aggregation, rather than publication or dissemination of preexisting knowledge. The process of aggregation does not have a predefined endpoint, as the aggregate is always freely available and subject to further uses, editions, modifications, and additions. Compared to the gated or closed forms of expert information often relied on by formal education, this promotes radical plurality of information.

Consequently, the artificial boundaries between academic subjects (such as math, literature, etc.) need not be replicated. In one way or another, motivation of each participant is *internal* and based on the desires and problems in everyday life. Again, this lies in clear contrast to formal education which is often compulsory and where individual learning tasks are often externally motivated (by the need to get good grades, to be a good pupil, etc.).

Wikilearning responds to local and contextual needs. As one of the earliest groups that have embraced wikilearning to the full, open source software developers call this phenomenon "scratching your own itch": developers typically develop software that they themselves need or want to learn about (see Raymond 1999). Similarly, unlike in formal schooling (where pre-existing goals have to be achieved and learning performances are evaluated with regard to preset benchmarking), engagement in wikilearning is based on real-world needs.

Wikilearning makes and takes all participants radically equal – the starting point is everyone's freedom to participate, create, and use the materials. Wikilearning is not regulated by academic degrees and does not intend to produce neither hierarchies nor competition between participants. In fact, typical

hierarchy in disorganization is task based, contextual, informal, and susceptible to rapid changes.

Perhaps the most important examples of wikilearning are various projects maintained by the Wikimedia Foundation, including Wikipedia and Wikiversity. They operationalize the key ideas of wikilearning, namely, participation, collaboration, commitment, and solidarity. For instance, Wikiversity consists of three core principles. First, no one controls the content of learning and no faculty decides about courses or granting diplomas. Second, Wikiversity is based on self-organization of users and editors, Wikiversitarians, who – regardless of their age, social status, gender, ethnicity, or religion – have the ability to contribute to the learning process. Third, Wikiversity is about mutual learning cultures, equal participation, and collaborative editing.

In lieu with these principles, the Wikiversitarians use models of learning-by-doing model and ideas of participatory action research. Thus, Wikiversity “is devoted to learning resources, learning projects and research for use in all levels, types, and styles of education” (Wikiversity: “Wikiversity”). It is a new global and collaborative infrastructure for knowledge production and also a potentially revolutionary learning environment in that it gives the users a chance for direct collaboration and sharing of their ideas and insights (Suoranta 2010, pp. 508–509).

From teacher’s and students’ point of view, the power of Wikiversity is precisely in its collaborative and public mode of communication. Wikiversity encourages participation in the public learning sphere and provides an uncensored and direct public arena for pedagogical and sociological communication to everyone – whether inside the university or elsewhere. It can be argued that Wikiversity abolishes the banking model of education as “an act of depositing, in which the students are the depositories and the teacher is the depositor” (Freire 1993).

Conclusion

Wikilearning may be a necessary (but by no means sufficient) concept for developing new

insights on the future of education and democracy. It opens up opportunities for developing peoples’ knowledge, for collective defiance, for popular insurgency through common knowledge building, and, for that matter, learning different positions and argumentation. At best, wikilearning creates passionate and responsible collaboration among teachers, students, colleagues, and other fellow human beings. At the same time it brings up critical questions such as: how is wikilearning being practiced in the real world where such qualities as collaboration and commitment, so crucial to wikilearning, are not widely acknowledged and immediately apparent?

Therefore, it is important to keep in mind the obvious issues of wikilearning. One concern has to do with technology and the digital divide. What used to be a question of having or not having a computer and Internet access has, during the 1990s, turned into relative inequality of having devices or wireless and broadband Internet access. Another issue has to do with gender gap among the users of Wikimedia. Some estimates suggest that less than 20% of all the active contributors of Wikipedia are women (Glott et al. 2010). The third problem seems to be the number of Wikipedians, which is slowly decreasing while the hierarchy of Wikipedia is actually increasing; thus, it is rather difficult for a newcomer to become an active contributor (see Simonite 2013). Contributing is even harder if altogether impossible if, and when, the Internet is being censored. In spite of these issues, the modes of learning in the Wikiworld might present a manifestation of radical openness, democracy, and free education. And as such, they can show in practice what people are able to do and possible to achieve in cooperation with others locally and globally.

Wittgenstein and Philosophy of Education: A Feminist Reassessment

Claudia Schumann

Department of Education, Stockholm University, Stockholm, Sweden

The sickness of a time is cured by an alteration in the mode of life of human beings, and it was possible for the sickness of philosophical problems to get cured only through a changed mode of thought and of life, not through a medicine invented by an individual.

Wittgenstein, Remarks on the Foundations of Mathematics

It is naïve to assume that the inferiority of women's moral voice can be overcome simply by asserting its equality. Several millennia of subordination are unlikely to be overcome by little more than a proclamation.

Susan J. Hekman, Moral Voices, Moral Selves

Introduction

Why should feminist philosophers of education take an interest in Wittgenstein? In 2006, Toril Moi diagnosed feminism and feminist theory alike as having been befallen by a “feeling of exhaustion” (Moi 2006, p. 1735). Today, in times when Beyoncé and Emma Watson publicly (re)claim the title of feminist and mainstream pop stars as Miley Cyrus and Lady Gaga easily play with fluid gender expressions, feminism appears to be alive and thriving again. Above and beyond the question of how relevant these popular media examples actually are for furthering feminist politics and how deep their respective analyses cut, the impasse that Moi so poignantly described in her essay “‘I am not a feminist, but. . .’: How feminism became the f-word” is still not overcome, and her urge for feminist theory to reengage with “women who struggle to cope with everyday

problems” (Moi 2006, p. 1739) is as timely as ever. Wittgenstein’s philosophy of the ordinary offers surprising tools for moving feminist theorizing into exactly this direction. Nevertheless, I chose to open this entry with two rather humbling quotes. They are fitting insofar as the task I will undertake in the following is a humbling endeavor, too. Both Hekman and Wittgenstein caution us against overweening expectations for the transformative work we can expect theory or, more specifically, philosophy to accomplish in relationship to practice, and they also caution that it is not through one singular or individual effort that such change will come about. The relationship between Wittgenstein’s philosophy and feminism is a difficult one. It is in no way obvious or straightforward how the two hang together. Wittgenstein himself was not a feminist, neither did he explicitly reflect on issues of gender equality and the like; yet, if approached with care, reading feminist philosophy and Wittgenstein together can prove extremely fruitful and can lead to challenging results for both Wittgenstein and feminist scholarship. Out of the multitude of stimulating discussions of Wittgenstein’s work from feminist perspectives, I have selected a few central and recurring themes which are of particular relevance to the kind of questions, problems, and challenges feminist thinking faces in educational contexts.

Philosophy, Theory, and Social Change: Wittgenstein on the Place of Theory and Critique

Education has not only named the processes of transformation of the life of an individual, but educational institutions have often been created and are continuously confronted with the public hope and expectation of delivering positive transformation for whole societies. It is therefore no surprise that the field of education and pedagogy has provided a welcome and important playground for critical feminist analysis as well as practical interventions for furthering girls’ and women’s empowerment. One apparent discord between Wittgenstein and feminist theorizing might be

found in the way in which his analyses appear to draw attention to the limits rather than the possibilities of effecting change through theorizing, as when he proclaims that philosophy “leaves everything as it is” (Wittgenstein 1968, PI I, §124). Yet, this picture is not quite correct. Even if the limits of human knowledge and individual action are distinctly Wittgensteinian topics, a feminist reading of his writings can help us understand why it is so important to make a place for these limits in educational theorizing in order to avoid naïvely overestimating the powers of feminist educational interventions and in this way undermine or even reverse their own best intentions.

One of the prominent thoughts, which have inspired feminist philosophers, is Wittgenstein’s critique of the philosophical pursuit of an ideally transparent, abstract, logical language which is supposed to reveal and represent the true structure of reality beyond ordinary language: “We have got onto slippery ice where there is no friction and so in a certain sense the conditions are ideal, but also, just because of that, we are unable to walk. We want to walk so we need friction. Back to the rough ground!” (Wittgenstein 1968 PI I, §107). In a similar vein, feminist materialist Donna Haraway states, “Cyborg politics is the struggle for language and the struggle against perfect communication, against the one code that transmits all meaning perfectly, the central dogma of phallocentrism. That is why cyborg politics insist on noise and advocate pollution” (Haraway 1991, p. 176). Already in 1933, Wittgenstein suggests in *The Blue Book* that the philosopher’s “craving for generality” produces confusions for which we need a cure. His late philosophy then understands itself as a form of therapeutic method which leads us back to the rough ground of the ordinary. The language games within which our words acquire their meaning have no ultimate, perfect, and unchangeable foundation, but they are nevertheless solidly grounded in our life forms. This has led some conservative philosophers, for example, J. C. Nyíri and Ernest Gellner, to interpret Wittgenstein as saying that since it is impossible to determine any ultimate rational foundation for human practices beyond “*that’s how we do it*”

(Wittgenstein 1956, RFM II §74), we should cultivate a conservative attitude towards our own practices, and a nonjudgmental, tolerant attitude towards others' traditions. However, also non-conservative authors such as Richard Rorty subscribe to a similarly relativist interpretation of Wittgenstein's late philosophy only that here it is used to defend the possibility of radical social and political change (cf. Crary 2000).

Feminist philosophers do not necessarily lean on Rortyan relativist interpretations in order to argue for social and political change from a Wittgensteinian perspective. Even if Wittgenstein's analyses lead him to point to the ultimate "groundlessness of our believing" (Wittgenstein 1977, OC §166), this is not to say that there is no place from which to raise or justify critique. His point is rather that there is no place above, beyond, or outside of language from which we can launch such criticism of established practices. He turns our heads back on those cases in our ordinary linguistic practices in which we successfully manage to raise legitimate, justified criticism, even if there is no ultimate safeguard which allows us to secure that our critique will be heard, that our justifications will be accepted as legitimate. When we avoid, what Naomi Scheman following Cavell calls the "Manichean reading of Wittgenstein on rules" (Scheman 1996, p. 386), we can understand Wittgenstein as revealing the apparent choice between a narrow objectivism on one side or embracing relativism on the other, between "super-idealized guidance or caprice" (David Pears in Scheman 1996, p. 386), as misleading.

Wittgenstein's therapeutic endeavor to cure us from the idea of philosophy as developing theories which can then be "applied" is instead taken as an urge to understand philosophical theorizing as an effort to achieve clarity about contextualized examples and concrete situations of the infinitely varied, embodied, and lived experiences of women (cf. Moi 2015; Crary 2000; Scheman 1996). As Linda Zerilli states, the craving for generality is something that feminists are not immune to neither:

This craving is a product of centuries of philosophical and political thinking; it is a disposition to generalize against which feminists, working with

and against that inheritance, are by no means invulnerable. What drove some feminists to produce unified categories that did not attend to the particular case was in part this craving for generality, a craving that animated the hegemonic strand of the feminist theoretical enterprise through the 1980s and into the 1990s and that continues to haunt it even today, if only in the form of its nemesis, the refusal of theory, be that skepticism or radical particularism. (Zerilli 2005, p. 35)

When we now take a look at some central debates within feminist epistemology between feminist objectivists and feminist skeptics, we will find that Wittgenstein's broadening of our notions of objectivity and rationality offers a fresh perspective in steering these debates out of stilted and stifling oppositions.

Wittgenstein's Philosophy and Feminism: Between Epistemology, Ethics, and Politics

It is well known that for Wittgenstein epistemological, moral, and political reflections overlap and intersect in his writings. They are not neatly separated from each other as they have been in more traditional systematic philosophies, but for the present purpose, it seemed useful to try to disentangle some of the various lines of thought. In the following, I will mostly focus on Wittgenstein's later work in relation to which the feminist discussion has been most prolific, even if some interesting work on the *Tractatus* can also be found (e.g., Tanesini 2004, pp. 53–88; Cohen 2002). I will give some examples, respectively, for how central Wittgensteinian ideas have been useful to think about feminist epistemology, ethics, and politics. While this is by no means a comprehensive summary of the feminist discussion of Wittgenstein's philosophy, I nevertheless hope to highlight some interesting points of overlap and mutual inspiration so as to encourage further engagement with his work by feminist philosophers of education.

Feminists have significantly drawn attention to how the traditional exclusion of girls and women from educational opportunities and institutions has led to limitations and biases in our scientific

and historical bodies of knowledge almost exclusively produced by men and from male perspectives. Beyond claiming equal rights to education, striving to rectify the canon by lifting women's voices and contributions, and showing how women scientists and scholars cannot only produce equally valid and interesting research and scholarship as men, but broaden, enhance, and improve our knowledge by actually taking women's bodies, lives, and experiences into adequate account, feminists have also thought about knowledge in a philosophical sense. Early feminist standpoint epistemology drew on György Lukács' idea that the structural conditions of workers' lives afford them an epistemologically privileged position to gain an adequate picture of social relations in capitalist society, and argued that women similarly inhabit an epistemologically privileged position from which we can shed light on the objective reality of life in sexist societies. Hartsock's (1983/1998) initial approach has been criticized by postmodernist, black, Latina, lesbian, and more recently queer theorists for building her theory on an essentialist idea of the category of "woman" thus overlooking and potentially excluding women who experience their lives in radically different ways due to differences in class, gender identity, sexuality, ethnicity, race, or religion. Later feminist standpoint theorists such as Sandra Harding (1991) have therefore moved away from the idea of a unified women's standpoint to embrace a plurality of situated knowledges. In the debates between feminists who argued for the outright rejection of any claim to objectivity since they considered it tainted by flawed male ideals and those feminists who wanted to hold on to objectivity, in a reworked, broadened rendering, in order to be able to solidly ground their political demands for change, Wittgenstein has often been taken to align with the feminist skeptics and invited the charge of reducing epistemology to questions of power and politics. As Alice Crary shows, however, Wittgenstein can also be read differently, so that his "attack on an abstraction requirement is intended not to discredit the concept of objectivity per se but rather to correct what he sees as an inaccurate conception of it" (Crary 2007, p. 25).

An objective and rational account of reality is not available from an ideal, abstract standpoint that disregards all subjective endowments. On the contrary, it might require the active and conscious cultivation of certain sensitivities, not least through education: "I want to say: an education quite different from ours might also be the foundation of quite different concepts. For here life would run on differently. [...] In fact, this is the only way in which *essentially* different concepts are imaginable" (Wittgenstein 1967, Zettel §§ 387–8).

The postmodern emphasis on the internal complexity of the category of "woman," the idea that gender is socially constructed rather than a biologically given binary identity and that "the gendered body is performative" (Butler 1990, p. 136), even if considered convincing on an ontological level, has prominently been contrasted with the need for a unified category of "woman" in order to advance feminist politics. Wittgenstein's thought can provide helpful tools for rethinking the identity category of "woman" as a subject of and ground for feminist epistemology, ethics, and politics and for exploring the feminist foundations debates of the 1980s and 1990s from an angle which anticipates and aligns with contemporary conceptions. Hilde Lindemann Nelson (2002), for example, provides an insightful discussion of Wittgenstein's concept of "family resemblance" in that regard. When we look at different instantiations of a concept, so Wittgenstein, we "will not see something that is common to all, but similarities, relationships, and a whole series of them at that" (Wittgenstein 1968, PI §66). As feminist biologists and trans theorists have importantly brought to our attention, even the biological criteria for which kind of bodily and genetic constitutions count under the category of "woman" are much more diversified than previously thought. Of course, it is always possible to dismiss any divergences from a stipulated norm as a clinical aberrance to be dismissed as a mere exception. But current research has pushed even the medical community to take a more respectful stance towards the wide variety of intersex bodies and the interests of trans people.

The complexity increases even further if we leave these merely biological considerations and

turn to feminism as concerned with the whole variety of women's experiences. The kind of kinship relations which the idea of family resemblances invokes can help conceptualize a nonessentialist notion of "woman" not based on any core identity or fixed, exclusionary boundaries, and open to continuous change of the language game (cf. Nelson 2002). Linda Zerilli (2005, pp. 33–65) uses Wittgenstein's concept of aspect-dawning in her discussion of Butler's ideas on gender performativity and the question of the boundaries of the category "woman." She takes his thoughts on aspect-seeing to explain that while "under ordinary circumstances we do not doubt" (2005, p. 58) whether the woman that I see in front of me on the train actually "is" a woman, it does not imply that we can never see the same person or situation under a different aspect. She interprets Butler's account of drag as an "imaginative exercise" (Ibid.) which can provoke us to question the ways in which we have been introduced to the language game of distinguishing between men and women. The discussions put forth by queer theory in the last decades provide distinct examples for the relevance of Wittgenstein's thinking to current social and political issues beyond a purely academic discourse. Following his philosophical critique carries the potential to unhinge the complete architecture of how we think about gender, sex, and sexuality.

Concluding Remarks: Refocusing the Character of Feminist Critique with Wittgenstein

When Wittgenstein writes about his own role as a critic: "It came into my head today as I was thinking about my philosophical work and saying to myself: 'I destroy, I destroy, I destroy —'" (Wittgenstein 1980, CV p. 21), it evokes interesting parallels to Sara Ahmed's figure of the "feminist killjoy":

Let's take this figure of the feminist killjoy seriously. Does the feminist kill other people's joy by pointing out moments of sexism? Or does she expose the bad feelings that get hidden, displaced, or negated under public signs of joy? Does bad

feeling enter the room when somebody expresses anger about things, or could anger be the moment when the bad feelings that circulate through objects get brought to the surface in a certain way? (Ahmed 2010, p. 65f.)

Beyond Ahmed's point to not shoot the messenger, what unites both Wittgenstein and feminist negative-critical analyses is not only that they are undertaken with an earnest intention to reveal something correct about the reality we live in, but that they ultimately open new ways of understanding and living in this world in a thoroughly positive sense. Examples of the positive, constructive side of Wittgensteinian feminism can be found in Hekman's (1995) extension of moral theory to embrace a multiplicity of moral voices, in Zerilli's "freedom-centered feminism," which, "after all, is concerned not with knowing (that there are women) as such, but with doing – with transforming, world-building, beginning anew" (2005, p. 65), in Cray's (2000, 2007) urge to take the cultivation of our sensitivities as an integral part of objective moral judgment, in the refocusing of the role of embodiment (Tanesini 2004, pp. 114–121) and the "radical entanglement of affect and conceptual rationality" (Zerilli 2015, p. 282). What remains important in Wittgenstein's destructive gestures, however, in my view resides mainly in the fact that it is not only "students [who] often think change comes easily" (Stickney 2014, p. 209), but also educators and educational theorists who underestimate the "complexity" (Ibid.) of transforming practice. If nothing else, then what Wittgenstein can help demonstrate is why formal, top-down educational reforms are insufficient to realize gender equality in schools. While it is important to incorporate lessons into the curriculum which actively engage with women's struggle for emancipation and social and political equality, classes on diverse gender roles and sexualities beyond the heteronormative matrix, and courses on what constitutes sexual harassment and why it is more than a trivial offense, and while it is important to change the legal frameworks and school's policies for gender equality, it is not enough. Ultimately, what we have to aim at is a change of our form of life together, a change in the kind of culture which

we cultivate in our educational institutions, the kind of gender norms which we practice, enact, embody, and perpetuate together in our everyday lives as teachers, students, and administrators in schools, universities, and beyond.

Wittgenstein and the Learning of Emotions

Steinar Bøyum

Department of Education, Faculty of Psychology,
University of Bergen, Bergen, Norway

Introduction

It is a methodological precept of Wittgenstein's later philosophy that greater clarity may be obtained by looking at how words are taught and learned: "One thing we always do when discussing a word is to ask how we were taught it. Doing this . . . destroys a variety of misconceptions" (Wittgenstein 1966, I, §5). Looking at how we learn psychological concepts can therefore be a way to break the hold that certain pictures of psychological states have on us. It may also be a way to break the hold that certain pictures of learning have on us.

Yet learning is not a uniform phenomenon. In his work on the foundations of mathematics, Wittgenstein talks about the *motley* of mathematics (Wittgenstein 1956, III, §48). Likewise, the concept of learning covers a motley of processes, and we should resist the impulse to force them all into a single mold or two. The aim of this chapter is accordingly to dip into the great variety of things that learning can be, concentrating mainly on some of the characteristic ways in which we

learn emotional concepts. In doing so, light will also be thrown on what Wittgenstein may have meant when he compared the learning of emotions to the learning of musical styles (Wittgenstein 1992, pp. 42–43).

Asymmetry and Expression

A good place to begin is the so-called asymmetry between first- and third-person statements about mental states. This asymmetry has two aspects. First, I am the authority on my thoughts, feelings, and emotions. If you want to know what I think or feel, then, normally, I am the one to ask (Finkelstein 2003, p. 9). You may also ask someone who knows me well, but the validity of that person's judgments will ordinarily be conditional on my acceptance of them. Second, I do not usually need to back up my claims about what I think and feel with behavioral evidence (Wittgenstein 1967, §472). When someone says that she is angry, we might very well ask why, but not how she knows. In special cases, we may think she is wrong, but if so we have to adduce quite strong evidence, and even then her sincere avowal may cancel out the evidence.

When we are in a certain philosophical frame of mind, this asymmetry might seem puzzling. How can we be said to know something simply on the basis of our saying so, without citing any evidence and sometimes even against the evidence? I do not know anything about my brain, but even when I am in an fMRI-machine I am the one to ask about what I feel and think, not the neuroscientist. And even though my wife seems to attend more carefully to my behavior than what my distracted self does, I still get to have the final say on what I feel and think. Why?

According to what Finkelstein (2003) calls *detectivism*, I have direct knowledge of my thoughts and feelings because I, unlike others, am able to *detect* them. Analogous to our perception of the outer world, we perceive (or “scan” or “monitor”) our own inner world and report on what we “see” there. Other people do not enjoy this special access to my inner states, and therefore, they have to deduce them from more or less

unreliable behavioral clues. This kind of view is a prominent target of Wittgenstein's criticism in his remarks on psychology, including the private language argument. A common thread in these remarks is Wittgenstein's juxtaposition of detectivism with *expressivism*: we dissolve many of the philosophical problems about first-person ascriptions of mental states by seeing them as expressions rather than reports (Wittgenstein 1967, §472).

Wittgenstein's target here is just as much a view of the body as a view of the mind. It is not only the picture of the inner world that creates problems but the corresponding picture of the body as a mere body, according to which bodily expressions are really only physical movements, devoid of significance, and in need of interpretation to invest them with meaning. Against this, Wittgenstein maintains that there is a literal sense in which we make emotions visible (or audible) by expressing them. Crying makes sadness manifest, and saying that you are sad can do the same (Finkelstein 2003, p. 93). When we talk about *seeing* what other people feel, this should not be dismissed as merely a metaphor for interpretation. Indeed, a child that had to learn how to interpret these expressions with the help of rules like “If people cry, they are sad” would be missing something.

“We *see* emotion.” – As opposed to what? – We do not see facial contortions and make inferences from them (like a doctor framing a diagnosis) to joy, grief, boredom. We describe a face immediately as sad, radiant, bored, even when we are unable to give any other description of the features. – Grief, one would like to say, is personified in the face. This belongs to the concept of emotion. (Wittgenstein 1967, §225)

This “expressivism” should not be understood as a general theory, but as an illuminating analogy. If we are puzzled about first-person authority, bodily expressions can function as helpful objects of comparison (Wittgenstein 1953, §130; Kuusela 2013). Seen in that light, it should be no more puzzling that I am the best one to ask than that “my face is the best one to look at” if you want to know how I feel (Finkelstein 2003, p. 101). Likewise, if we are mystified by the fact that we do not normally need evidence for our claims about how

we feel, it may help to note that neither do we need evidence for our smiling or crying. Yet since Wittgenstein's view is that psychological self-ascriptions are *akin* to expressions, there are differences, too. Unlike a smile, for instance, an avowal can be said to be true or false, as Finkelstein (2003) emphasizes. Moreover, psychological self-ascriptions can be used like reports in some situations, for instance, in the therapist's office.

Natural Expressions

The most famous and controversial of Wittgenstein's ideas on the learning of psychological words is his suggestion that they are learned as replacements for natural expressions:

Here is one possibility: words are connected with the primitive, the natural, expressions of the sensation and used in their place. A child has hurt himself and he cries; and then adults talk to him and teach him exclamations and, later, sentences. They teach the child new pain-behaviour. "So you are saying that the word 'pain' really means crying?" – On the contrary: the verbal expression of pain replaces crying and does not describe it. (Wittgenstein 1953, §244)

Wittgenstein's remark is on pain, but it seems reasonable to extend it to emotions like anger or sadness. Certainly, learning emotions involves being taught to use words instead of reacting "primitively": to say that one is angry instead of raging, or to go from screaming to crying to speaking. There is here both a gradual calming (or disciplining) of bodily expressions and a partial replacement of those expressions with words. This partial replacement allows for both reflection on and refinement of emotions: reflection, in the sense that language enables the child to think and talk about emotions, and refinement, in the sense that the child's space of expression becomes infinitely more nuanced and complex with language. Hence, learning emotions also involves coming to have *new* emotions – hope is often cited as an emotion that can only be had by those who possess a language.

Many have been critical to this picture of learning. To note just one problem, it does not seem to be valid for all mental states, not even all

emotions. More complex emotions, like guilt, do not even have natural expressions in the same sense as more elementary emotions like anger or sadness. They may have characteristic expressions, like a "guilty look," but these are more symbols of guilt than they are natural expressions of it. Hence, the replacement thesis looks incomplete and without empirical support. The question is what kind of thesis it is and whether it is a thesis at all. After all, Wittgenstein introduces it by calling it a mere possibility. In a similar discussion of language learning, Wittgenstein asks, "Am I doing child psychology?", and he answers, "I am making a connexion between the concept of teaching and the concept of meaning" (Wittgenstein 1967, §412). Hence, it is a logical point rather than an empirical one about the actual genesis of concepts.

That emotions like fear and joy have natural expressions is one of those general facts of nature without which "our normal language-games lose their point" (Wittgenstein 1953, §142). Children's learning of the language of emotion thus rests on these natural expressions: without them, the grammar of emotion would be very different; indeed, there is a sense in which there would be no such thing as fear and joy in that event. There is, that is to say, an internal connection between these natural expressions and the emotions that they express: knowing what sadness is involves knowing that crying is typically a reliable basis for ascribing sadness to others (and if they fake, then it is sadness they fake). The logical point can also be formulated temporally: we do not first know what sadness is and then make the empirical discovery that there is a connection between crying and sadness. In the words of Lars Hertzberg (2014), the account in Wittgenstein 1953, §244 is "an account of what might be termed a logical order: an indication of the circumstances in which we would be prepared to say that someone has learnt verbal expressions of pain" (p. 368).

Patterns of Life

One simple way to understand the philosophy of the later Wittgenstein is to say that it involves a

widening of the contextual principle of Frege and the *Tractatus* (Finkelstein 2003, pp. 107–109). The meaning of words must be seen not only in light of the sentences they form part of but also in light of the particular situation and narrative to which they belong (Wittgenstein 1953, §525; Wittgenstein 1953, II, §ix). The same applies to all emotional expressions: only in the context of a “far-reaching particular manifestation of life” is there such a thing as the expression of, say, sorrow (Wittgenstein 1967, §534).

In Wittgenstein’s later writings, the contextuality of emotions comes out most sharply in his idea of *patterns in the weave of life*. In this perspective, emotions are seen as constituted by complex and dynamic configurations of words and gestures, actions and reactions, appearing within the stream of life. Emotions like love and grief are more like such patterns than they are like feelings in the narrower sense:

“Grief” describes a pattern which recurs, with different variations, in the weave of our life. If a man’s bodily expression of sorrow and of joy alternated, say with the ticking of a clock, here we should not have the characteristic formation of the pattern of sorrow or of the pattern of joy. “For a second he felt violent pain.” – Why does it sound queer to say: “For a second he felt deep grief”? Only because it so seldom happens? (Wittgenstein 1953, II, p. 174)

The importance of context is not at odds with the importance of immediacy mentioned above. Dialectically put, an expression is only immediate when mediated by context. A smile is only a smile in a face, which again is only the kind of smile it is as part of a situation (Wittgenstein 1953, §583). Wittgenstein remarks that if we are to imagine a kind smile or a malicious smile, we typically imagine the face or, rather, the human being as a whole, within different contexts, smiling at playing children or at suffering enemies (Wittgenstein 1953, §539). Still, within those contexts we can *see* the kindness in the kind smile and the maliciousness in the malicious smile.

Acquiring concepts of emotions can therefore be understood as learning how to recognize certain patterns in the weave of life. These can be of an almost endless variety. No two patterns of grief are exactly alike – they may even be completely unlike each other. Moreover, “one pattern in the

weave is interwoven with many others” (Wittgenstein 1967, §569). The plasticity of emotional concepts, the variety of patterns they cover, as well as their being intricately intertwined with each other make it hard to understand how we can learn to recognize them. Wittgenstein suggests that we tend to learn the simple figures first and then proceed to the more complicated, “the way I learn to distinguish the styles of two composers” (Wittgenstein 1992, pp. 42–43).

Early on we learn what typically makes people happy or sad, whereas later in life we come to understand that one can become sad by happy events. Still, the concept of sadness would be very different from ours if we learned the concept of sadness in these latter circumstances. Hence, the intricate variety of emotional patterns is rooted in simpler connections. Analogously, even if we are inclined to call the letter “e” yellow, as Wittgenstein notes in his discussion of secondary sense (Wittgenstein 1953, II, p. 216), our color concepts would not be what they are if we learned them in connection with letters. As a matter of logical grammar, children will have to learn the concept of sadness in the context of sad things and may later learn to transfer it to very different cases (Wittgenstein 1982, pp. 966–967).

Imponderable Evidence

Agreement is part of the grammar of mathematics in the following sense: if we arrive at different results, then at least one of us is doing something wrong, and usually we will find out who (Wittgenstein 1976, p. 107). Now it would be an exaggeration to say that disagreement constitutes psychological concepts, since conflicting judgments are quite exceptional in the face of raw expressions of elementary feelings. In modern adult life, however, such raw expressions are almost the exception, and concerning judgments of subtler, verbal expressions, disagreement is nearly the norm (Wittgenstein 1953, II, p. 227).

Wittgenstein (1953, II, p. 228) remarks that judgments about sincerity and pretense are often backed up by *imponderable evidence*, which includes “subtleties of glance, of gesture, of

tone.” These nuances may be difficult to describe except in the vaguest of terms: “something about his smile,” “the way he looked at her,” or “as though a shadow came over his face.” This is a kind of evidence, but not the kind that any rational being has to see or accept (indeed, in many such cases seeing *is* accepting). True, we do not judge the sincerity of an expression merely on the basis of what is given to us in the moment but also by the surroundings, in particular our past dealings with the person in question. Moreover, pretense will have different consequences than sincerity, and these *may* decide the issue, for instance, if we hear her laughing after she thinks we have left. Then again, the question may arise again: wasn’t there something hollow about her laughter? The consequences may be just as hard to agree on as the original expression and the imponderable evidence just as ineradicable.

The pervasiveness of imponderable evidence means that learning emotions involves learning to appreciate this kind of evidence, although the skill with which we do so varies widely. Wittgenstein suggests that there is a connection between the judging of imponderable evidence and being a “Menschenkenner,” an expert judge of character (Wittgenstein 1953, II, p. 227). There is a striking illustration of this kind of knowledge in a novel by his Austrian contemporary Robert Musil, where “Menschenkenntnis” is translated as “knowledge of human nature”:

Keeping company with the prince thus became a source of refined psychological pleasure for Törless. Dawning within him was the kind of knowledge of human nature that teaches us to know and appreciate another person by the fall of his voice, the way he picks something up, even the timbre of his silence and the expression of the physical posture with which he occupies a space; in short, by that agile way, barely tangible and yet the only truly complete way, of being something spiritual and human, which is layered around the tangible, effable core as around a bare skeleton, and by means of that appreciation to anticipate his mental personality. (Musil 2001, p. 8)

One can learn to master the art of judging character, Wittgenstein adds, but only through experience, perhaps accompanied by an expert judge who can teach us by hints and tips. Here, we do not first learn a method and then arrive

at whatever results or judgments that the method leads to. We learn, Wittgenstein says (Wittgenstein 1953, II, p. 227), correct judgments (“Mummy looks a bit worried today”), perhaps helped by a few hints (“Isn’t there something distant in her eyes, as though she’s not *really* listening?”). There is no method or technique involved apart from seeing for yourself, guided by the verdicts of the more experienced. Gradually, one comes to formulate judgments of this sort oneself, autonomously, as it were, judgments that may serve as guides for others: the novice has then become a teacher. “This is what “learning” and “teaching” are like here” (Wittgenstein 1953, II, p. 227).

Summary

A nice way to summarize is by returning to Wittgenstein’s comparison between learning emotional concepts and learning styles of music (Wittgenstein 1992, pp. 42–43). The analogy highlights several interconnected similarities. First, primitive reactions and natural expressions play a corresponding role in the two fields, as has been well explored by Simo Säätelä (2002). Second, recognizing emotions and distinguishing musical styles involve perceptual discernment rather than rule-based reasoning. One may see the difference between real and feigned sorrow, and one may hear the difference between Beethoven and Brahms. Third, the analogy suggests that an emotion is more like a piece of music as a whole than a single note within this piece. And the character of a single note depends on its place in the piece, like the character of a single expression depends on its place in a pattern of life. Fourth, in both fields we learn by moving from simpler to more complex examples. We are shown the simplest and most typical cases first, and then, when recognizing these has become a matter of course, we proceed to more complex and less typical cases. Fifth, imponderable evidence is vital in both psychology and music: quite often we are not able to justify our judgment in any other way than by gesturing to the most delicate of nuances.

In this way, emotional concepts and musical styles function as objects of comparison for each other, highlighting similarities (and differences) in order to clarify their grammars and destroy misconceptions of them by attending to how they are learned.

Wittgenstein and the Path of Learning

Michael Luntley

Department of Philosophy, University of
Warwick, Coventry, UK

Introduction

The teacher/pupil relationship is ubiquitous in Wittgenstein's writings, but quite how he understood it and what goes on in the transactions that enable learning is not clear. The key to understanding Wittgenstein on learning is to understand the characteristics and skills that his remarks require of the pupil qua individual. Most commentators read Wittgenstein as endorsing a social model of the teacher/pupil relationship: the pupil learns by being initiated into a social practice by the teacher (Stickney 2008; Williams 1994, 2002, 2011; Smeyers and Burbules 2006; Bakhurst 2011).

The first section sketches four reasons for challenging the social reading of Wittgenstein. The second section outlines the shape of an individualistic account of the path to learning.

Challenging the Social Reading of Wittgenstein

1. Training. The English word "training" is elastic in meaning. It covers all sorts of learning schedules from simple Stimulus–response (S-R) conditioning to initiation into complex activities that require sophisticated thoughtfulness, from learning nuanced craft skills to intellectual pursuits such as chess. Wittgenstein's word for "training" is *Arbriechung* and this has none of the elasticity of the English word. It applies only to crude S-R conditioning. It's a word suitable for conditioning "dumb brutes" – for whipping horses. It is not a word that is suitable in German for human training (Huemer 2006). At the very least, this means that we must treat Wittgenstein's talk of training with extreme caution and would do well to assume that it means

only simple conditioning. If learning involves training in Wittgenstein's sense, it must include a good deal more too. Learning cannot consist simply in training; it must involve training plus something else (Stickney 2008, Luntley 2008, 2012).

2. Wittgenstein nowhere endorses a social account of practices; he nowhere says that a practice is *constituted* by being a shared activity. As David Pears pointed out long ago, in the one passage where his interlocutor directly raises the question, Wittgenstein ducks the issue, for he focuses on the need for repeatability over time, not across persons. In PI 199, his interlocutor says,

Is what we call "following a rule" something that it would be possible for only *one* person, only *once* in a lifetime to do?

to which Wittgenstein replies:

It is not possible that there should have been only one occasion on which only one person followed a rule. It is not possible that there should have been only one occasion on which a report was made, an order given or understood, and so on.

3. Wittgenstein's speaks of practices, habits, and customs as part of our "natural history" (PI 25, 415), but he nowhere says of these things that they are normative, nor does he speak of norms. These terms are not part of Wittgenstein's vocabulary. He speaks of rules – *Regln* – but this word is, of course, from the same root as *Regularitie*. What Wittgenstein is interested in are regularities (PI 208). The idea that the regularities or word use are normative or involve "grasp of norms" is a fiction of the secondary literature that has dominated much writing on Wittgenstein since Kripke's seminal work on rule-following. Furthermore, the idea that word use – linguistic meaning – is normative seems to be flatly false. To be interesting, the idea that word use is normative involves norms that are not reducible to mere causal regularities; that's the "space or reasons/space of causes" dichotomy that has become *de rigeur* for many scholars (McDowell 1994; Bakhurst 2011; Huemer 2006). But that requires categorical

norms, and not merely conditional norms, for the latter are easily handled in a teleological reduction. However, the idea that linguistic meaning imposes categorical norms on our word use is hard to sustain (Hattiangadi 2007). Some writers on Wittgenstein have accepted the point (Boghossian 2003), but most commentators from Baker and Hacker through to more recent studies continue to repeat the claim that meaning is normative without engaging with the substantive literature that has challenged the very coherence of Kripke's supposed insight (Williams 2010; McGinn 2013; Child 2010; Stern 2004).

4. The idea that learning involves a social model of initiation is incoherent. Assume that learning involves real cognitive development, e.g., the acquisition of new concepts. This is a challenging assumption, one that invites us to consider how learning so conceived is so much as possible. The invitation is to provide an explanation of how there can be a process by which one acquires new concepts. Many Wittgensteinians think the invitation to explain how learning is possible should be avoided (Bakhurst 2011), although some take the invitation seriously (Williams 1994). Williams' response is instructively clear and well argued.

Williams endorses a social model of how concept acquisition is possible in which the key ingredient to the model is outsourced to the social. Williams accepts that Wittgenstein's concept of training is, on its own, an insufficient resource to make learning possible – point (1) above. For Williams, learning = training plus X and her extra ingredient is outsourced to the learner's teachers, elders, and others. The learner acquires a new concept by being extended the "courtesy" of being treated as having acquired the concept by her "others." But that simply begs the question and cannot begin to be a coherent model of concept acquisition without an account of what it is about the individual that renders them apt to accept the courtesy extended by the others if they do not already have the concept in question. In short, such social outsourcing of the ingredient that makes learning possible is

either incoherent or it collapses into a form of nativism in which the individual already possesses the concept in question.

The threat of nativism, if one takes the invitation to explain the possibility of learning, is often taken as good reason to avoid the attempt to provide an explanation and to rest content with a description of learning. But the descriptivist strategy fares no better than Williams' bold attempt at explanation.

To advocate description in favor of explanation is, in effect, to agree with Baker and Hacker that all explanations of meaning are "internal" or "intra-linguistic." But that is a form of nativism, for it means that one can only explain/teach the meaning of a word to someone who already has the conceptual space for understanding the meaning. If all teaching (compare all ostension) only works "within language," then it can only work for those already equipped with the resources for understanding the word. And that's a disguised nativism. Here are two ways of seeing this point.

First, assume that learning is acquiring a new concept C by analysis; e.g., it's introduced as the word that attaches to things that are F, G, and H. For this to work, the conceptual slot for C must already be there in the combination of those concepts that provide the analysis. So it's not really a new concept, it is simply a new label for a way of thinking that was already available by combining simpler concepts.

Second, a more subtle version of this would be to introduce "C" by saying "it's one of those," or "it's like this. . .," or "it's similar to these. . .." These locutions are Wittgenstein's favored expressions when he is talking about learning, e.g., PI 69: "*This and similar things* are called 'games.'" There are two ways of understanding what is on offer here. Either these open-ended expressions pick out concepts that analyze the target concept C, or they provide something less than a conceptual encounter from which the learner must then build the new concept C. The latter would be a model in which Wittgenstein has an answer

to the invitation to explain how meaning is possible. It is my preferred reading of Wittgenstein. The former is the descriptivist position, but this is still analysis and it is no better than the analysis of C in terms of a combination of simpler concepts, F, G, and H. The descriptivist has analysis in terms of concepts that do not, until the learning encounter, have clear linguistic labels. But to understand these explanations – "it's like this. . ." – one must already have the conceptual space into which these words fit. This is a more sophisticated nativism, but fully compatible with Fodor's well-known version. The mind has a stock of innate concepts and learning is simply the transaction by which one acquires labels for these concepts. No learning as such, in the sense of acquiring concepts, takes place.

An Individualist Reading of Wittgenstein

If we take the descriptivist approach and eschew the invitation to explain how learning is possible, then we forego any answer to what seems to be a fundamental question:

What differentiates the subject with a capacity to learn (acquire concepts) from those that do not?

This question needs an individual answer. It asks for an account of what makes the individual apt to be a learner, for no matter how much scaffolding from others might support learning and provide important platforms that speed up the process, without an account of the individual's resource by which they access the social support, the social has nothing to support.

To be clear: the social is important. It is a powerful resource for learning, but it is not the key constitutive element to answering the invitation to explain how learning is possible. That has to be something about the individual. It has to be something about the individual that explains how by giving them less than a conceptual encounter with things – it's like this, go this way, these and similar things, etc. . . . – we can provide them enough whereby they come to grasp a new concept. But this means that we need an explanation,

an account of how encounters that are less than conceptually shaped encounters can provide the material from which conceptually shaped encounters can arise. This is a staging solution to the invitation to explain how learning is possible. Something of this form has to be available if we are to respond to the invitation to say how learning is possible. The basic form of a staging solution has to be like this: an individual who lacks the conceptual resources for encountering *F*s (lacks the resources for encountering *F*s in patterns answerable for truth and falsity) has the resources for encountering *F*s in patterns that are not answerable to truth and falsity. You might call these non-conceptual patterns, but the label tells us nothing about what sort of patterns they are, other than that they are not answerable to truth and falsity (i.e., they fail the generality constraint constitutive of conceptual content).

Any account of such a form will meet an obvious response from descriptivist readers of Wittgenstein: surely the dualism inherent in a staging solution inherits the problematic divide in the dichotomy between reasons and causes? The conceptual is the normative realm of reason-giving and the non-conceptual the causal realm of brute encounters. Set up the staging solution as outlined and we'll never get the two to meet; the space of reasons is distinct to the space of causes. But that riposte simply repeats the fiction that Kripke got Wittgenstein right in saying that meaning is normative. As I have suggested above: (a) Wittgenstein nowhere speaks of rules as norms, (b) Good job too! For there is good reason to think that the idea that there are irreducible norms governing how we use words meaningfully is simply false. Wittgenstein's own discussion of regularities in word use is much more relaxed than the somewhat fevered normativism found in many commentators.

We use words in patterns that are regular. Rules are like garden paths (BT 240, 243). Paths are natural, they are part of our natural history. They are, in many respects, quite unremarkable things. Our fondness for paths is a natural aspect of our being that we share with many creatures; even sheep manifest a sense of belonging to paths in their heftedness to their pastures. Paths are a

natural feature of how we are in the world. They are things we follow with a sense of allegiance that can provide a feeling that we are being led although we would be hard-pressed to say exactly what leads us. It is certainly not a platonic ideal path that guides us and it is difficult to countenance the bare grass leading us. The source of the feeling that we are following the path is not strictly external at all. Wittgenstein remarks:

When I follow the rule, I do not choose. I follow the rule blindly. (PI §219)

The same applies to the garden path. If we ask, "Why blindly?" the right answer is the one Pears gives. We follow "blindly"

because the constraint comes from within – from our own natures – and not from any external force, and so there is nothing to be seen, and it is even questionable whether what we feel should be called 'constraint.' (Pears 2006, p. 29)

Note, this is not the "blindly" that comes from internalizing a social norm (cp. Meredith Williams). This is a use of "blindly" that is part of our natural history of our being the kind of creature that has a sense of allegiance to ways of going that reflects something deep about our nature – the kit with which we confront things that, in themselves, give us no guidance whatsoever. Is there more we can say about this apparent "constraint" from within, something that would help make palatable the outline staging solution sketched above? One option would be to see this constraint as a subjective sense of "ought"; see Ginsborg (2011) on "primitive normativity" and Luntley (2015). We want an account of the individual's mindedness that has them engaged by patterns that are not conceptual and which give them the resources to acquire new concepts (cf Luntley 2015, 2016 for more).

A clue to how to begin lies in Wittgenstein's core metaphor for meaningful word use – language games. One of the hardest things to do justice to in reading Wittgenstein is the open-endedness of the regularities in our use of words. It provides a radical occasion-sensitivity to meaningful word use that is rarely fully acknowledged, although Travis (2008) is the key exception here.

The fact that Wittgenstein's central metaphor for these patterns is "game" can be hard to keep in focus. The concept of game serves many purposes. It says something about how the regularities in word use, however well-formed or flaccid, are in an important sense *our* regularities. They are not regularities sourced in Platonic abstractions; they are regularities in our uses of words, uses that are natural. The point is clear in a key metaphor for Wittgenstein – the garden path. Regularities are like garden paths (BT 240, 243). They are patterns we respect, to which we have some sense of allegiance, but which lay down no prescription about the way to go. The paths we walk with a clear sense of the way to go are also the paths we create as we go. How can this be? And how does this bear on what we add to training to get learning? Here's a speculative and tantalizing answer.

The patterns found in games are oftentimes not conceptual patterns. Our earliest games with words (the games we play when we understand very little) are games that pick up on formal patterns of language, patterns of rhythm, rhyme, and repetition. These are the sorts of patterns appreciation of which figures large in our aesthetic experience. These are the patterns we naturally (it is how we are) amend and improvise with. We play with these patterns. Why? Perhaps because we are animals that make and enjoy patterns. We are, first and foremost, animals with imagination and the capacity to make and enjoy, indeed relish, patterns. These are not patterns answerable to truth, but they might become such. And although the sheep responds to patterns in their sense of heftedness to a place (a response we share with them), they do not engage in that distinctively natural human practice of playing with patterns. They lack the imagination to leave the path; their paths do not display the elasticity of ours. So what's distinctive about us *qua* learner? The answer is that our paths are natural, but bendy! And they bend because we have the imagination to bend them, they are the patterns we make and shape in the service of the aesthetics of experience. In other words, it is the capacity for play and imagination that characterizes the patterns that provide our first encounter with things where that encounter is not one answerable to truth and

falsity. The shape of the non-conceptual is aesthetic. That's the extra to training that gives the start to learning.

It is instructive to think of this in term of Wittgenstein's Cartesian inheritance, an individualistic account of our mindedness based on an insight due to Descartes. In the *Discourse de la Methode* §V, Descartes says that what distinguishes an intelligent, or rational, animal from other beasts is the un-boundedness of his capacity to place himself under the sway of reason. That, of course, sounds like the outcome of learning, a sophisticated end point to education. Understood in the context of Wittgenstein's naturalism about paths, I suspect it can be the starting point.

Generalize Descartes's thesis: what distinguishes the animal with a capacity to learn, rather than merely be trained, is the un-boundedness of the animal's capacity when presented with a pattern to place it under another pattern. Animals that make patterns, that enjoy patterns, and that have a sense of allegiance to patterns respond quite differently to training to the so-called dumb brutes. Animals that relish patterns are subjects with imagination. They are richly resourced individuals. They do not carry the nativist's burden of a mind full of concepts, but they do carry a basic drive to respond to patterns with play – they make a game of the patterns. They "go on" when told "do it like this. . ." etc. (cp. PI 208) These phrases do not necessarily express fully conceptual encounters with things; they can be markers for patterns of aesthetic engagement that we can adapt free from the constraint of truth. When playful pattern-makers are subjected to S-R conditioning, the result is quite different to subjecting brutes to S-R conditioning. And when our pattern-making hits the distinctive recalcitrance of that which is non-negotiable (the material rather than the social environment), pattern-makers make first contact with the idea of patterns that are not merely imaginative, but which represent. Then the "do it like this" is answerable to truth. Then you start to move from an aesthetic un-boundedness in patterns to the un-boundedness of reasons that Descartes took as the hallmark of *res cogitans*. We find Wittgenstein's naturalism in the *res imaginatio*. It is part of our natural history

(we might as well say *res animus*). The point is simply this: the subject that responds to training with learning does so because they are creatures of the aesthetic, creatures with an innate capacity and drive to make and live in patterns. Training a *res imaginatio* means providing affordances that engage their sense of aesthetic patterns. It requires a pedagogy framed by playful encounters with the patterns of the aesthetic.

Wittgenstein and the Philosophy of the Subject

Michael A. Peters

University of Waikato, Hamilton, New Zealand

Introduction

Ludwig Wittgenstein (1889–1951) is considered by many to be one of the most important philosophers of the twentieth century. His work in the philosophy of logic, mathematics, mind, and language established him as one of the founders of two movements – logical empiricism (the Vienna Circle) and Oxford-style ordinary language analysis. The impact of his work has been felt in the arts, humanities, and social sciences and strongly influenced the directions of both analytic and post-analytical philosophy. His work is difficult to read and interpret, and there are many competing interpretations of his philosophy. This brief introduction is designed to introduce students to the man and his work through a reading that emphasizes a broadly cultural approach to his intellectual background, context, and life, recording the influence his thought has exerted on the disciplines, including education and pedagogy.

The analytic revolution in philosophy of education, what Stefaan Cuypers and Christopher Martin (2009) call “a singular analytical paradigm for puzzle-solving in the philosophy of education,” was conceived by R. S. Peters as “conceptually

foundational” in the sense that it involved “the analysis of concepts [constitutive of education] and with questions about the grounds of knowledge, belief, actions and activities” as a “necessary preliminary to answering other philosophical questions” (p. 5). In the same volume dedicated to a sympathetic rereading of R. S. Peters, Lavery (2009, p. 33) maintains, “Peters was clearly influenced by the revolution of post-war philosophy, particularly Wittgenstein’s original contribution; but he also strove to establish the revolution’s continuity” with the history of philosophy. Lavery (2009, p. 30) indicates that “Peters rarely theorized his analytic approach to philosophy of education” and that although he appealed to Wittgenstein on linguistic usage and the concept of games, “Peters held that Wittgenstein was wrong to overlook the possibility of a ‘general principle’ that distinguishes all games.” Peters’ contribution to the analytic paradigm was based on a commitment to a form of conceptual analysis that implied a view of philosophy as a second-order discipline that casts philosophers of education as “underlabourers in the garden of knowledge” (Peters 1966, p. 15).

The argument is that R. S. Peters’ analytic paradigm was based on an appeal to Wittgenstein that was misplaced and represents a gross mistaken misreading of Wittgenstein. By contrast, this entry proposes a reading of the work of the later Wittgenstein which both unsettles the view of Wittgenstein as a placeholder in the analytic tradition and provides interpretive grounds for viewing him closer to the tradition of Continental philosophy and as a thinker deeply influenced by Krauss, Spengler, Nietzsche, and Freud who embrace the notion of philosophy as a form of cultural criticism (Peters and Marshall 1999; Peters 2002a, b; Peters et al. 2008). The “post-modern” appropriation of the later Wittgenstein marks him out as a philosopher who anticipated central aspects of the reevaluation of the culture of modernity. This entry broadens this interpretation to outline a view of subjectivity, knowledge, and representation “after” Wittgenstein, a position that provides a more appropriate platform for philosophy of education in the age of globalization, preserving a link to Wittgenstein and his philosophy while investigating the sources for a

notion of education as openness, engagement, and *copoiesis*. The entry provides an account of the Cartesian philosophy of subjectivity and Wittgenstein’s attempt to provide a break with the Cartesian worldview that is much more important for contemporary philosophy of education than reference to a method of conceptual analysis that views philosophy as a meta-discipline. In the next section, Wittgenstein’s anti-Cartesianism is explored as a basis for deconstructing Descartes’ view of mind, human beings, and modern philosophy.

Descartes and the Philosophy of Subjectivity

The philosophy of subjectivity has been one of the crowning achievements of Western philosophy that has helped to shape and define modern philosophy, the foundations of science, liberal political and education thought, and the culture of modernity. Of all philosophers responsible for the subjective turn and for the subsequent epistemological foundations and direction of modern philosophy, René Descartes deserves special mention. In his own lifetime, his reputation rested on his contributions to mathematics and cosmology and only in the nineteenth century did his metaphysics and epistemology contribute to the Kantian project of reconstituting the nature of philosophy. His skepticism becomes important in the revival of Anglophone empiricist epistemology in the twentieth century, and his idea of the self as a locus of subjectivity independent of the world – its ethical and political implications – began to impact French and German philosophy from the 1930s with philosophical engagement of his work by Husserl, Heidegger, and Wittgenstein, among others (Gaukroger 2008).

Descartes’ “epistemological turn” (after Bergmann) is one of the centers of his works that lead him to counter skepticism by locating certainty in subjective consciousness and set modern philosophy on a path intimately connected to theory of knowledge and later embellished by Kant’s transcendental argument concerning synthetic a priori knowledge. Barry Stroud (2008, p. 513)

suggests, “The philosophical, mathematical and scientific of Descartes is now so deep and so pervasive in our culture that its full extent can no longer be measured with certainty or precision.” Descartes’ philosophy of mind embraced a mind/body dualism, individualism about mental contents and adherence to a strong doctrine of privileged first-person access that holds introspective judgments about one’s own mental states enjoy the privileged epistemic status of infallibility and immunity to error. Descartes was acknowledged by Husserl as “the genuine patriarch of phenomenology” and christened his own phenomenology a new Cartesianism. Heidegger, by contrast, saw the Cartesianism as a fundamental wrong turn and rebelled against its legacy suggesting that the *cogito sum* had to be “phenomenologically destroyed” (see Martin 2008, p. 496).

The words “subject” and “subjectivity” have many different meanings. The word “subject” comes from the Latin word “subjectum” which means something under or constituting the foundations of other things. In Aristotle “subject” is not a philosophical category that belongs to human beings and does not function as a philosophical category nor is it considered to take any kind of precedence to the concept of substance. “Subject” in addition to the use that Descartes firms up as a metaphysical dominant category as the mind, ego, or agent that sustains or assumes the form of thought or consciousness also carries the medieval political meaning of “vassal” – someone who owes fealty to a monarch one who lives in the territory and owes allegiance to a sovereign power. This is the political and ethical meaning of subject that Michel Foucault exploits in his studies of subjectivity. Subjectivity has been used to mean many things: consciousness, intentionality, the will, individual volition, and introspection.

An understanding of the significance of Wittgenstein’s work as *breaking with* and offering a critique of the Cartesian model of subjectivity is more significant to philosophy of education than the method of conceptual analysis that R. S. Peters and other analytical philosophers of education extract in an appeal to the work of Wittgenstein. It is both more fundamental and provides a basis

for a critique of various claims of essentialism in the philosophy of the subject, which is so important in the age of globalization when claims to identity and difference have come to the fore. The Cartesian model of subjectivity arises out of a certain picture or image of the knowing subject deeply embedded in the medieval culture of theology and scholastic philosophy (even though it tries to break with these influences) and a mathematical conception of certainty that is seen as providing appropriate foundations for knowledge. As Wittgenstein (1953, §115) suggests (speaking of the “picture language” and the general form of a proposition in the *Tractatus*), “a picture held us captive, and we could not get outside it, for it lay in our language and language seemed to repeat it to us inexorably.” The question so important to philosophy and the nature of education is how to dissemble this metaphysical Cartesian world picture that comprises the foundations of modern philosophy through the binary oppositions from mind/body, subject/object, inner/outer to word/object, signifier/signified, self/other, and male/female. On this view Wittgensteinian philosophy of education is an approach in part dedicated to the unpacking and critique of the Cartesian dualist theory of mind and the foundational epistemology that appeals to “certainty” and to accurate representation. On a Wittgensteinian approach, the dualist theory of mind gives way to the study of subjectivity as a result of cultural and historical influences, and both knowledge and learning are not seen as wedded to foundations in any sense. The Wittgensteinian view is thus both anti-foundational and antirepresentational (of an independently existing reality).

In the *Investigations* and later works, Wittgenstein wrestles with the Cartesian picture of subjectivity and its implications for knowledge and representation, providing us with an alternative vocabulary to discuss the Cartesian picture of mind as objects which possess properties and as a non-physical substance that thinks, famously referred to as *the ghost in the machine* (Gilbert Ryle’s expression). Wittgenstein takes on this philosophical struggle to unseat Descartes’ view of mind as both an essentialist and dualist conception – internalist, private, and nonphysical – that arises from his view of

nature and science as proceeding from mechanistic (“mechanics”) principles and a view of knowledge that embraces a form of epistemic internalism that holds that “the difference between true belief and knowledge consists in some form of justification and, crucially, that justification consists in factors that are, in some sense, internal to the subject of the belief” (Rowlands 2008, p. 6). The Cartesian picture of mind involves many different threads, not just a conception of mind, but also a view of knowledge and representation, an image of philosophy, and a view of the nature of human beings. Dislodging this picture by disassembling it and describing it as *mythology* (as legitimating a certain world picture) requires something more than argument or conceptual analysis. Wittgenstein demonstrates that dislodging the deeply embedded culture of Cartesianism is not a matter of proposing better arguments or of argumentation per se but rather rests on a variety of other rhetorical strategies. This point has a clear set of implications for Wittgensteinian pedagogy – teachers must engage with the emotions and imagination of students.

It is worth noting in passing that the appeal to Wittgenstein by R.S. Peters on the “revolution in philosophy” does nothing to justify the method of conceptual analysis he advocates but rarely spells out: Wittgenstein contra Peters does not see philosophy in any way as a foundational, second-order activity based on the clarification of concepts. While the early Wittgenstein of the *Tractatus* may have seen philosophy as a critique of language using logical analysis to reveal the general form of the proposition “in order to see the world rightly,” it does not result in linguistic hygiene or the ultimate meaning of concepts. His later conception of language games, family resemblance, and “meaning as use” further distances Wittgenstein from anything like Peters’ conceptual analysis: first, we must look to the variety of uses to which the word is put which is purely descriptive rather than explanatory or prescriptive; second, we must be aware of the diversity and multiplicity of uses that only have life within a language game and form of life; third, a concept or word only has meaning in the context of a sentence and sentences within the network of judgments; fourth, while language games have

rules, these cannot be learned theoretically but only in practice; fifth, by following the use, we discover only “a complicated network of similarities, overlapping and criss-crossing” (*Investigations*, 66), a family resemblance, that resists all explanation and definition in terms of necessary and sufficient conditions; sixth, the rules of grammar liberated from the bounds of strict logic express the norms of language and tell us what kind of object anything is (*Investigations*, 371, 373) for they are embedded in the culture and “the *speaking* of language is part of an activity, or of a form of life” (*Investigations*, 23). No reading of Wittgenstein validates or justifies anything like Peters’ version of conceptual analysis. Wittgenstein would only accept a form of analysis as a kind of therapeutic activity of “assembling reminders for a particular purpose” (*Investigations*, 127). As he writes in the *Investigations*, “there is not a philosophical method, though there are indeed methods, like different therapies” (133). The aim of philosophy is “to shew the fly out of the fly-bottle” (*Investigations*, 309).

It is significant that for Wittgenstein language is not the foundation – words and justifications come to an end (*On Certainty*, 192) on the base of “hinge propositions” which are neither true nor false but “remain firm” for us. When Wittgenstein writes: “Giving grounds, however, justifying the evidence, comes to an end; – but the end is not certain propositions’ striking us immediately as true, i.e., it is not a kind of seeing on our part; it is our acting, which lies at the bottom of the language-game” (*On Certainty*, 204), Wittgenstein is suggesting that there is only cultural practice at the bottom of our language games, an ungrounded way of acting. Contrary to Descartes’ starting point of the indubitability of the self-reflecting cogito as offering the foundations of knowledge based on a mathematical model of certainty that ultimately leads to a self-stultifying solipsistic self, Wittgenstein both naturalizes and socializes cognitive processes locating them first in language and then as part of the activity of a culture. He is thus not a foundationalist in any accepted definition of the term. For him certainty and the very possibility of meaning lie in the background context without which propositions

could not even be enunciated: "...I want to conceive [certainty] as something that lies beyond being justified or unjustified; as it were, as something animal" (*On Certainty*, 359).

The notion of philosophy as a kind of therapy has a set of link and references that take us back to the beginnings of philosophy and certainly to the Stoics who held "that emotions like fear or envy (or impassioned sexual attachments, or passionate love of anything whatsoever) either were or arose from false judgements and that the sage – a person who had attained moral and intellectual perfection – would not undergo them" (Baltzly 2014). The therapeutic notion of philosophy was intimately tied to the pursuit of the good life and philosophy as a therapy of emotions. Gordon Baker, among others, provides a therapeutic reading of *Investigations* that positions Wittgenstein as attempting to break us free of the impulse to metaphysics through an elaborately structured dialogue where the reader is encouraged to think for himself or herself. The work of Stanley Cavell, James Conant, and Cora Diamond regards Wittgenstein's philosophy as entirely therapeutic, rather than as having any theoretical or metaphysical aspects. Certainly there are a range of comments by Wittgenstein scattered throughout his work where he uses the notion of therapy to describe his activity of doing philosophy such as "In philosophizing we may not terminate a disease of thought. It must run its natural course, and slow cure is all important" (Zettel, 382). Wittgenstein also extends this conception to education when he says, "I trot out all the problems that education represses without solving. I say to those repressed doubts: you are quite correct, go on asking, demand clarification" (*Philosophical Grammar*, p. 382). The justification of R.S. Peters' approach to philosophy of education by means of a distinctive and foundational method of conceptual analysis does not hold water, and its justification cannot be found in Wittgenstein.

By contrast, the "new Wittgenstein" coalesces around a series of common interpretive protocols: Wittgenstein is not advancing theories in philosophy but rather employing a therapeutic method to deconstruct philosophical puzzles; he is helping us to work free of the conceptual confusions that become evident when we begin to philosophize;

at the same time, Wittgenstein is disabusing us of the notion that we can stand outside language and command an external view and that such an external view is both necessary and possible for grasping the essence of thought and language. On the new reading, Wittgenstein encourages us to see that our intuitions about meaning and thought are best accommodated "by attention to our everyday forms of expression and to the world those forms of expression serve to reveal" (Crary and Read 2000, p. 1). This new schema for reading Wittgenstein puts less emphasis on the decisive break in his thought, represented by the *Tractatus* and the posthumous *Investigations*, to emphasize, by comparison, significant continuities of his thought centering around his therapeutic conception of philosophy. The new reading that emphasizes the therapeutic character of Wittgenstein's philosophical aims and method is sympathetic to and consistent with the "postmodern" view of Wittgenstein (Peters and Marshall 1999) which explicitly provides an emphasis on a literary, cultural, and (auto)biographical reading of Wittgenstein's works, their intertextuality, the expression of the spirit of European (Viennese) modernism in the *Tractatus*, and the anticipation of certain "postmodern" themes in his later works which, on the one hand, cast him in close philosophical proximity to Schopenhauer, Nietzsche, and Heidegger and, on the other hand, project his writings into an interesting engagement with poststructuralist thought (Peters and Marshall 1999, pp. 19–20).

This cultural reading, in part, was inspired by Cavell's work, which serves as an exemplar both in reading Wittgenstein in relation to the movement of *modernism* and against Wittgenstein's Viennese cultural background where the influence of Nietzsche, Schopenhauer, and Freud is evident. Cavell's writings draw widely upon the philosophical tradition and emphasize the parallels between Wittgenstein and many contemporary thinkers, including both Derrida and Foucault. It is a view that sits well with Wittgenstein as a pedagogical philosopher (Peters et al. 2010). In the "postmodern" reading, the *Tractatus* is seen to be *modernist in its formalism*, while the *Investigations* anticipates certain "postmodernist" themes including anti-foundationalism and

antirepresentationalism (Peters and Marshall 1999). The distinction is principally a matter of the style of *doing* philosophy, and it is reflective of the impact of larger cultural forces upon Wittgenstein and, significantly, also the 7 years of Wittgenstein as an elementary schoolteacher in rural Austria. It does not deny that there are significant continuities in his thought, say, for instance, in his view of philosophy. In this reading it is possible to argue that the therapeutic aim became more manifest in Wittgenstein's "pedagogical" style and in a view called "philosophy as pedagogy" (Peters and Marshall 1999). This view does not entail necessarily an account of "social constructivism" or imply that "postmodernism" (whatever that elusive term means) necessarily entails social constructivism in any of its versions. In one sense "postfoundational" is a better term that serves to provide a general philosophical direction in epistemology, learning, and ethics.

The cultural and postmodern reading of Wittgenstein, like much of postmodernism, considered as a whole, tends to emphasize a number of overlapping cluster concepts that emphasize its openness and lack of essentiality, including the following:

- Anti-foundationalism
- Anti-essentialism
- Anti- or post-epistemological standpoint
- Anti-realism about meaning and reference
- Suspicion of transcendental arguments and viewpoints
- Rejection of the picture of knowledge as accurate representation
- Rejection of truth as correspondence to reality
- Rejection of canonical descriptions and final vocabularies
- Suspicion of metanarratives

The list is taken from Bernd Magnus' (1989) discussion of Nietzsche in relation to postmodern criticism. To Magnus' list it is relevant to add what Rorty calls "antirepresentationalism" and also to add, alongside "suspicion of metanarratives", the turn to narrative and narratology, more generally – *petite récits* pitted against metanarratives by Lyotard (1984) who significantly

makes central use of Wittgenstein in a creative misappropriation to emphasize the conflictual or dissensual nature of language games. We might add an emphasis on linguistic use and *therapeutic view of philosophy* – that is, an embodiment of many of the features of the list above and an ethos, above all, concerning philosophy as a critique of language summed up best in the famous quotation from the *Investigations*: "Philosophy is a battle against the bewitchment of our intelligence by means of language" (#109). This is a view that underlies the development of social sciences and cultural studies in the latter half of the twentieth century, perhaps, sloganized in the twin methodological imperatives, the linguistic turn, the significance of representation, and the turn to social practices, on the one hand, and the attempt to overcome the dualistic thought, the search for certainty and essences, and the subjectivism that are the legacies of the Cartesian thought, on the other hand. Encouraged by Wittgenstein's expert disassembly of the Cartesian world view and model of subjectivity, we might entertain a model of education as openness, engagement, and *copoiesis*, one that is more suited to the global, networked, and digital environment we live in.

Wittgenstein as Educator

Jeff Stickney

University of Toronto, Toronto, Canada

I cannot describe how (in general) to employ rules, except by teaching you, training you to employ rules. (Z §318)
Any explanation has its foundation in training.
(Educators ought to remember this.) (Z §419)

Synonyms

Causation; Education; Empirical science; Orthography; Philosophical grammar; Wittgenstein

N.b. Following convention, titles for Wittgenstein's works are abbreviated (PI = *Philosophical Investigations*), with section (§) or page number (p.), with full citation and initials (RFM) in the References.

Introduction

Sage advice is not to look for educational theory in Wittgenstein's writing but to see his later philosophy as pedagogical (Peters 1995; Peters and Marshall 1999; Peters et al. 2008) or as therapeutic (Smeyers et al. 2006). Accepting established boundaries, here I set Wittgenstein's later remarks on training against the background of his own elementary-school teaching in rural Austria (1920–26), sorting empirical matters related to education from his philosophical concern with the acquisition and judgment of meaning. Interested in securing learning in his elementary classroom, he later came to distinguish such causal inquiries from philosophical inspection of grammatical problems (PI §122). In this move, training is the avenue leading us into felicitous performance of language games (including math and music notation), but meaning (an ontological concern with significance) is socially governed in terms of our usage and judgment and is neither reducible to its prerequisite nor closed from change.

As Glock (1996, pp. 111–112) explains, in his later philosophy Wittgenstein attends to how words are taught not to “engage in armchair learning theory” or to offer any “empirical genetic theory” but to show conceptually that teaching by explanation presupposes basic linguistic skills we are not born with, but acquire by means of training. Early training provides a (nonrationalist) foundation for explanations as well as our basis for judging whether explanations are clear or not. Hunter (1985) illustrates this beautifully through the case of a frustrated mathematics teacher struggling with the problem of “retelling” (not merely repeating) instructions in such a way as to clarify intended rules for the perplexed student. How does the teacher know when the pupil “gets it”? Adeptly employing words or rules within their appropriate connotative, axiomatic, and grammatical ranges of usage, the pupil demonstrates learning achievement as a criterion for successful initiation into conventional practice or mastery of techniques (PI §199). Attention to training as the basis for judgment (PI, p. 227) sidesteps the vicious circularity, leaving

shared practice as our “ground” in an otherwise post-foundational epistemology.

Elementary School Teaching

When Wittgenstein moved to rural Austria to teach elementary school (1920–26), his sister Margarete protested that this “was like using a precision instrument to open crates,” to which he replied that it was a better alternative to suicide – the unfortunate demise of two of his older brothers (Bartley 1985, p. 37). Perhaps taken on as an escape from the world, like his subsequent gardening work in a monastery, he nevertheless embraced the challenge to become an educator and even wrote with enthusiasm to Russell about being “happy in my work at school” (Monk 1990, p. 193). The difficult task often proved to be frustrating, however, partly because the cultivated aristocrat was out of place among rural, poor folk who found him “strange” (Monk 1990, pp. 194, 197). His teaching career ended after 6 years with an inquest into his well-documented use of corporal punishment (see Monk 1990, pp. 194–195, e.g., accounts of pulling girls’ hair and cuffing boys’ ears). Wittgenstein’s rather Nietzschean views of education appear untimely now.

I think the way people are educated nowadays tends to diminish their capacity for suffering. At present a school is reckoned good ‘if the children have a good time’. And that used not to be the criterion. Parents moreover want their children to grow up like themselves (only more so), but nevertheless subject them to an education quite different from their own. – Endurance of suffering isn’t rated highly because there is supposed not to be any suffering – really it’s out of date. (CV, p. 71e)

Despite strict discipline, students later described Wittgenstein as a highly devoted, if demanding, teacher (see Bartley 1985; Monk 1990). In his elementary classroom, Wittgenstein assiduously compiled words students used, forming a reference dictionary. Edmonds and Eidnow (2001, p. 61) note that “his dictionary was in keeping with the [reform] movement and the position in the Investigations that rural

dialects could be in perfect order as they are.” Phillips (1977, p. 8, citing Bartley 1985, p. 117) claims that by keeping their own dictionary Wittgenstein’s students gained an appreciation of “the ambiguity of their own usage of the language.” In this sense, Wittgenstein was conservator of the child’s quotidian language: pedagogy congruent with his later philosophy – meaning-as-use (OC §61).

Wittgenstein’s practical approach to teaching was somewhat in keeping with child-centered movements in Austria, in vogue while attending Vienna’s teacher training college (1919–20; Philips 1977, pp. 7–10; cf. Savickey 1999). Bartley, however, recalls Wittgenstein joking about these reforms: perhaps embracing the anti-scholastic spirit and practices but amused by campaign rhetoric. Edmonds and Eidnow (2001, p. 61) also recall that “Wittgenstein poked fun at the programme’s ‘more vulgar slogans and projects’.” Wittgenstein was cautious about “language gone on holiday” (PI §38): “. . . Don’t let yourself be seduced by the terminology in common currency” (CV, p. 74e).

That early teaching experience influenced later thinking at Cambridge is apparent from Wittgenstein’s use of orthography as a paradigmatic case.

One might think: if philosophy speaks of the use of the word “philosophy” there must be a second-order philosophy. But it is not so; it is, rather, like the case of orthography, which deals with the word “orthography” among others without being second-order. (PI §121)

Remarks on orthography adduce Wittgenstein’s general attitude toward foundations and our later flexibility within rules and practices – some of which may be arbitrary and open to revision.

Just as in writing we learn a particular basic form of letters and then vary it later, so we learn first the stability of things as the norm, which is then subject to alteration. (OC §473)

Appealing to his superintendent’s attention, Wittgenstein says his *Dictionary for Elementary Schools* (1993) has the goal “to fill an urgent need with respect to the present teaching of

orthography” (PO, p. 15). Prefacing the dictionary “to make intelligible his general plan,” he justifies violating standard rules of alphabetical order, recognized for efficiency and logic. As though making a philosophical refutation, he argues it reduces slippage in learning:

But if the purely alphabetic order inserts a heterogeneous word between two closely related ones, then in my opinion the alphabetic order demands too much from a child’s power of abstraction. Thus, because of the comprehension of words and the highly important saving of space, the purely alphabetic order often cannot be recommended. Equally, each instance of clinging to a dogmatic principle leads to an arrangement that does not suit our purpose and has to be abandoned – even if this would make the author’s work much easier. Rather, it is necessary to compromise again and again. (PO, p. 23)

Acknowledging age-appropriate ranges for demanding, abstract concepts, Wittgenstein’s pedagogy sought to reduce what we may see through *On Certainty* as failure to concretize or erosion of *bedrock* (OC §94–98). Breaking convention, simplifying better secures learning, showing that teaching technique is not arbitrary. From what he refers to as his “subjective view” it was pedagogically better to group families of words sharing etymological roots, even if this method “clashes with the generally held principle of alphabetic order” (PO, p. 21). Under alphabetic order the words *alt* and *Alter* are broken up by a heterogeneous word, *Altar*:

alt, das Alter	old, old age
der Altar	altar
D[<i>d</i>]as Alterum, altermülich	Antiquity, antique

Pondering students’ learning slippage, he later remarked (1940):

A teacher may get good, even astounding, results from his pupils while he is teaching them and yet not be a good teacher; because it may be that, while his pupils are directly under his influence, he raises them to a height which is not natural to them, without fostering their own capacities for work at this level, so that they immediately decline again as soon as the teacher leaves the classroom. Perhaps this is how it is with me; I have sometimes thought so. (CV, p. 38e)

Philosophically Questioning Certainty

Wittgenstein later (c.1950) reflected on his certainty when professing the validity of his pedagogic techniques.

I myself wrote in my book that children learn to understand a word in such and such a way. Do I know that, or do I believe it? Why in such a case do I write not “I believe etc.” but simply the indicative sentence? (OC §290)

Weighing grammatical suitability in applying the concept “believing” versus “knowing” when no doubt occurs in *the flow* of teaching, Wittgenstein distinguishes his philosophical from pedagogical remarks. Repeatedly, Wittgenstein notes that reflections on students “taking things together” in arithmetic or learning the multiplication table are observations or “remarks about concepts, not about teaching methods” (PI, pp. 208, 227).

How does one teach a child (say in arithmetic) “Now take these things together!” or “Now these go together”? Clearly “taking together” and “going together” must originally have had another meaning for him than that of seeing in this way or that. – And this is a remark about concepts, not about teaching methods. (PI, p. 208)

“We all learn the same multiplication table.” This might, no doubt, be a remark about the teaching of arithmetic in our schools, – but also an observation about the concept of the multiplication table. (PI, p. 227)

Am I doing child psychology? I am making a connexion between the concept of teaching and the concept of meaning. (Z §412)

Philosophically, he was concerned at Cambridge with ontological problems of meaning instead of earlier training in pedagogy. It is highly unlikely that Wittgenstein saw teaching as a legitimate “science” (Standish 1995); his philosophical methods aver scientific approach, employing instead ethnography and attending to enculturation (Smeysers 1995, 2008).

When I write down a bit of a series, that you then see this regularity in it may be called an empirical fact, a psychological fact. But, if you have seen this law in it, that you then continue the series in this way – that is no longer an empirical fact. (RFM VI.26; cf. PI §109)

Adumbrated here, (empirical) science and (grammatical) philosophy are like passing trains:

The existence of the experimental method makes us think we have the means of solving the problems which trouble us; though problem and method pass one another by. (PI, xiv, p. 232)

Answering his interlocutor's accusation that emphasis on training amounts to operant conditioning Wittgenstein again shifts attention from science to grammar.

"Are you not really a behaviourist in disguise? Aren't you at bottom really saying that everything except human behaviour is a fiction?" – If I do speak of fiction, then it is of a grammatical fiction. (PI §307)

Not throwing out empirical studies on the basis of this distinction, Wittgenstein advises not waiting for a future science of "mental states" to answer our questions about what makes sense philosophically or pedagogically:

Sometime perhaps we shall know more about them – we think. But that is just what commits us to a particular way of looking at the matter. For we have a definite concept of what it means to learn to know a process better. (The decisive movement in the conjuring trick has been made, and it was the very one that we thought quite innocent.) (PI §308)

Deflating expectations, waiting for educational psychology to solve our problem of what constitutes "sound" teaching is like anticipating "science" to explain what is beautiful or tasteful.

You might think Aesthetics is a science telling us what's beautiful – almost too ridiculous for words. I suppose it ought to include also what sort of coffee tastes well. (CV, §2, p. 11)

Equally, however, Wittgenstein is not anti-etiological; recall that he came to Manchester to study aeronautical engineering (see Monk 1990). Demonstrating that interpretations of rules seem to "hang in the air," unable to support or determine meaning, Wittgenstein draws an illustrative connection.

"Then can whatever I do be brought into accord with the rule?" – Let me ask this: what has the expression of a rule – say a sign-post – got to do with my actions? What sort of connexion is there here? – Well, perhaps this one: I have been trained

to react to this sign in a particular way, and now I do so react to it.

But that is only to give a causal connexion; to tell how it has come about that we now go by the sign-post; not what this going-by-the-sign really consists in. On the contrary; I have further indicated that a person goes by a sign-post only in so far as there exists a regular use of sign posts, a custom. (PI §198)

His distinction shifts emphasis from etiological inquiries into learning to inspection of training into culturally sanctioned practices and customs.

"How am I able to obey a rule?" – If this is not a question about causes, then it is about justification for my following the rule in the way I do. (PI §217)

Here we are not asking ourselves what are the causes and what produces this impression in a particular case. (PI, p. 201, on seeing something *as*, say, a triangle)

Pragmatic learning theory as inquiry into causal processes (e.g., "teaching by means of indirection") attends, fallibly but instrumentally, to causal learning conditions. Contrast Dewey's interest with Wittgenstein's:

Growth in judgment and understanding is essentially growth in ability to form purposes and to select and arrange means for their realization. The most elementary experiences of the young are filled with cases of the means-consequences relationship. . . . The trouble with education is not the absence of situations in which the causal relation is exemplified in the relation of means and consequences. Failure to utilize the situations so as to lead the learner on to grasp the relation in given cases of experience is, however, only too common. (Dewey 1938, pp. 104–105)

Although Wittgenstein too appears to have been rearranging conditions to effect learning in his elementary classroom and dictionary, his later philosophical pursuit concerns how – once meaning is secured through training – it ranges "sensibly" within our grammar. For Wittgenstein, causal relationships securing learning – an educational psychology topic of possible importance in teaching – is not a philosophical (ontological) issue, whereas degrees of arbitrariness and grammatical entanglement in educational language is ostensibly "philosophical" (PI §§124–126).

Medina (2002, p. 158) notes this separation from causes was made too insistently in the early 1930s,

softening in Wittgenstein's thinking after 1938. Contrast his 1930s Cambridge lectures with 1940s emphasis (*RFM* and *PI*) on training securing rules.

The process of learning does not matter; it is history and history does not matter here. . . . This laying down of a rule is exactly analogous to learning language. The laying down of the rule is not contained in following the rule; the laying down is history. (CL #2, p. 55)

When we learn the meaning of a symbol the way in which we learn it is irrelevant to our future use and understanding of it. The way in which I learned my A B C and learned to read is irrelevant to my future understanding of written symbols — it is a matter of purely historical interest. But something does as it were adhere to the symbol in the process of my learning its meaning, and this becomes part of the symbol. (CL #3, p. 117)

Meredith Williams (1999, p. 216) explains that “The normativity of our practices involves non-causal necessity, that is, logical or grammatical necessity.” By this curious phrase she means to say that learning to follow directions (ostension or rule following) presupposes a common background of what is “obviously the same” for all participants in the learning. This common background for judgment is acquired in the process of training, or in mastering techniques, making the process of learning techniques constitutive of what is learned and enabling learners to recognize sameness and carry on in the same way as others do.

Medina (2002, p. 159) concurs, noting that in Wittgenstein's later reflections on learning, “He emphasizes that, through training processes, our behaviour becomes, not causally determined, but normatively structured; that is, we acquire the ability to engage in self-regulating behaviour”.

So, for Wittgenstein, our training into techniques is more than an inductive process or a process of conditioning: it is a process of structuring behaviour until it becomes self-regulated. Learning processes of this kind endow us with more than behavioral dispositions or empirical certainties. These processes lead to the adoption of normative standards. . . . (Medina, p. 159)

Addressing this normative aspect of training, Medina recalls Wittgenstein's descriptions of cajoling students during training: “The words ‘right’ and ‘wrong’ are used when giving instruction in proceeding according to a rule. The word

‘right’ makes the pupil go on, the word ‘wrong’ holds him back” (*RFM*, VI.39; cf. Medina, pp. 164–165). Through drilling and instilling students acquire, blindly, the normative attitude of their mentors.

When I obey a rule, I do not choose. I obey the rule blindly. (PI §219)

Our children are not only given practice in calculation but are also trained to adopt a particular attitude towards a mistake in calculating.

What I am saying is that mathematics is normative. But “norm”: does not mean the same thing as “ideal.” (*RFM*, VII.61)

Medina (p. 164) notes that for Wittgenstein, the teacher must treat the child with “courtesy,” as though he/she is capable of making correct usage of the rules. “The teacher treats the pupil's correct responses as indicative of an incipient competence and her incorrect responses as ‘mistakes’” (cf. *RFM*, VII.61). But the learner's reactions to the training are invested with normative significance only when viewed against the background of the whole rule-governed practice (cf. *RFM*, VII.47). The teacher checks and corrects the students responses until self-correction takes over, thus normatively structuring the pupil's behaviour. But this inculcation into norms is not simply what liberal-analytic philosophers have eloquently opposed as the ‘suppression of reason.’ Medina offers important qualification: that the higher goal of initiate-training is to open possibilities rather than merely fix them. Training students into normative attitudes, teachers create regularities, a “consensus of action” leading toward mastery of techniques (PI §199); adept pupils, however, show more autonomous, self-corrective behavior within the rules.

Gradually through normative training we respond “naturally” as most others do (PI §185). Specific techniques of training in different *language games* lend nuance and relative “degrees of certainty” (PI, p. 224) to words like “prediction”: for example, anticipating moves in gymnastics routines versus chemical reactions (PI §630). Wittgenstein reminds educators that we know a pupil has mastered the technique for using the word “red” when he/she responds “spontaneously” after seeing something we agree is red.

Customarily, showing something red affirms its meaning, though calling anything “red” doesn’t make it so (OC §429). Rather silly, Wittgenstein thinks, to begin the teaching process this way with school-age children: pointing to things and saying “That looks red” (Z §418). Infants absorb concepts from their surroundings, regularly coming to see spoons *as* “cutlery” (PI, p. 195). Pupils indicate uptake of such immersive training by reacting appropriately and fluently, but “this reaction, which is our guarantee of understanding, presupposes as a surrounding particular circumstances, particular forms of life and speech” (RFM, VII.47).

Musing on how “one belief hangs together with all the rest” and how it either accords or breaks with “our whole system of verification,” he remarks:

This system is something a human being acquires by means of observation and instruction. I intentionally do not say “learns”. (OC §279)

Similarly, we pick up background context needed to interpret facial expressions and pain behavior, but we do not explicitly learn this through formal instruction nor can we easily impart expert judgment to others (PI, pp. 227–228). Needed background for making inferences and judgments comes through tacitly in the process of instruction, rather like learning the significance of “making a mistake” in the course/flow of normative training in mathematics (RFM VII.6). In this post-foundational epistemology, the rational, autonomous subject of enlightenment and analytic philosophy is reimmersed in the flow of life, where background and training set the stage for meaning.

What determines our judgment, our concepts and reactions, is not what one man is doing now, an individual action, but the whole hurly-burly of human actions, the background against which we see any action. (Z §567-69)

Sharing a *form of life* means being socialized into accepting certain customs or commands (PI §206; PI, p. 226), giving us also shared “agreement in judgments” (PI §§241-2) upon which we can also challenge and advance claims, including the suitability of explanations delivered in the course of teaching.

“We are sure of it” does not just mean that every single person is certain of it, but that we belong to a community which is bound together by science and education. (OC §298)

Wittgenstein, Language, and Instinct

Paul Standish

UCL Institute of Education, London, UK

Synonyms

Animal; Cause; Instinct; Language; Norman Malcolm

Introduction

The piece has been designed to draw the reader in with this opening paragraph. I don't want to set out an introduction along the lines of “I shall address the topic of X. I shall first do A, then B, then C.” The reason is that I want to lead the reader more carefully into seeing the connections here.

Causation and Thinking

One thing causes another. This simple thought is basic not only to science but to our ordinary understanding of the world. But where does the concept of a cause come from? It has become mainstream to the philosophy of science that causation is not something discovered through experimentation but rather a principle according to which phenomena are interpreted. What, then, is its basis? Clap your hands in front of the face of the baby and her eyes will shut. The same happens with the adult. This is not the application of the concept of a cause. It is an instinctive reaction, and causation is inherent in this. One can build up from such examples to the developing infant's being pushed off balance by someone and naturally pushing back, or to her noticing that the piece of string that is wriggling on the floor in front of her is being pulled at the other end by the cat.

“That this is the case is at the heart of “Wittgenstein: the relation of language to instinctive behaviour,” an influential paper by Norman Malcolm, Wittgenstein's student, interpreter, and friend” (Malcolm 1982). The fallacy that Malcolm identifies is that of thinking that there must be a universal rule, in conjunction with which, at each instance of its application, a potential doubt arises as to whether the rule is satisfied by the events in question, and that this rule must be present from the start in our use of causal expressions. The target is, more or less, the fantasy that in our thinking we are like super-scientists, meticulous in removing any doubt that might jeopardize the identification of a causal process in any particular instance. In fact, not even meticulous scientists operate like this – not

because they are not meticulous enough, but because thinking in terms of causes could not operate in this way. And we could scarcely think *without* a notion of causation.

How, then, are we otherwise to account for what is happening? The crucial move for Malcolm is to put emphasis on instinctive or primitive reactions, and this achieves two things: first, it shows that, in seeing things in causal terms, there is “no uncertainty, guessing, conjecturing, conferring, concluding,” and, second, it drives home the point that such reactions are *actions*, with causal expressions such as “He knocked me down” grafted onto these immediate reactions. In other words, our ordinary perceptions of the world are not of pixelated instants seen cumulatively such that they add up to a picture or snapshots grafted together after the event. They are instead holistic from the start, such that perception is thematized or given a certain narrative structure, minimal though this may well be: the cat is pulling the string. In fact, to see the cat is already to react in thematized or narrative terms: cats are playful; they are living creatures capable of pain; they are pets to be cherished and stroked, etc. Something similar could be said of the string. Moreover, one cannot give any coherent account of action without this structure being, as it were, built in. There are occasions, perhaps many, where we are uncertain how to act. But all this occurs on the basis of a vast range of reactions in which hesitation and doubt play no part. “The primitive form of the language-game is certainty, not uncertainty,” Wittgenstein writes. “For uncertainty could never lead to action. The basic form of the game must be one in which we act” (Wittgenstein 1969, §421; hereafter referenced as OC §). So it is also with names. At the start of the *Philosophical Investigations*, Wittgenstein quotes from St Augustine’s *Confessions* where the idea is expressed that initial language learning takes place through ostensive definition: someone points to the cat and says “cat,” and the child picks up the expression; the child associates the name with the thing. Now this is indeed what partly happens – more obviously in second-language learning. But in first language learning it can be at most part of the picture: so much else

needs to take place, for without this how can the child begin to know what the point is of pointing and naming (how can they learn what pointing, etc., is?). Wittgenstein’s answer, as is well known, is that the child must be initiated into a variety of language games, where “language game” is taken to refer not only to the language but to the actions into which it is woven (Wittgenstein 1968, §7; hereafter referenced as PI§, or PI, pg.): the basis of the language game lies in action. It is worth reflecting on the fact that the small child does not learn words such as “cup” and “spoon” first as names for objects but rather in a more imperative form – that is, as compressions of “bring me the cup,” “use the spoon,” and so on. The holistic nature of this, in the broader context of eating, for example, is such that it is far from being a frozen moment but is dynamic and structured already by assumptions of causation. The differentiation and refinement progressively achieved with language emerges from prelinguistic reactions.

Language and Instinct

Malcolm’s discussion of causation constitutes an important element in his broader account of language’s emergence from instinctive behavior. Let me summarize the argument. A recurrent theme in Wittgenstein’s later writings is that language did not emerge from reasoning (OC, §475) but rather from simple reactions – reactions, for example, to pain. First-person pain *expressions* (“ouch!” “it hurts”) constitute new pain behavior (PI, §244). They are not the result of reasoning or of thought but are to be understood rather as immediate. This thought is extended in relation to the pain of others, such that tending another’s wound or saying “he’s in pain” is also to be seen as the refinement of instinct: “it is a primitive reaction to tend, to treat, the part that hurts when someone else is in pain, and not merely when oneself is” (Wittgenstein 1967, §540; hereafter referenced as Z §). Such behavior is the prototype and not the result of thinking. Reports of and responses to pain plainly become further refined as language advances, from the advent of temporal

expressions (“it hurts less than yesterday”) to the development of precision instruments such as thermometers, which themselves must be calibrated in some way to human natural reactions.

At the heart of Malcolm’s account is a discussion of causal expressions, which stresses the fact that a reaction to a cause can be immediate. It is not a matter of the “second-order” conjecturing, etc., referred to above: it is action. Moreover, it is misleading to say that the child will acquire “*the* concept” of cause-and-effect: the idea of an “essence of causation” would obscure the variety of uses of causal expressions. Furthermore, instinctive reactions would be one source of the learning of causal expressions. The child does not learn that there are books and armchairs but learns to fetch books and sit in armchairs (OC, §476). *Belief* in these things’ existence is to be construed in terms not of some kind of conceptual or primarily cognitive grasp but of *this* behavior in *these* circumstances. The belief is not a “source” of the behavior.

This account of language that emerges contrasts sharply, then, with such influential theories as those of Noam Chomsky and Jerry Fodor, and indeed with more recent ideas developed in neuroscience. While it is true that the nervous system of a human being is innate, it is a fallacy and ultimately vacuous to suppose that neural processes constitute a “language of thought” or a “representational system” (see also Williams and Standish 2015). No doubt it is true also that the position developed here is at odds with a vast range of thinking in psychology and linguistics that has contributed to ideas of language development.

But Malcolm’s purpose goes beyond this. It is not just that the child’s early language is grafted onto instinctive behavior. In fact, the adult’s complex employment of language embodies, strange though it may seem, something resembling instinct. A step forward can be made with this apparently extraordinary claim if we pause over the Pascalian thought that our nature is convention. If human beings are understood in purely biological terms, this will not begin to approach what it is that constitutes human life. We shall understand human beings on a par with the way we understand other life forms in biological terms. To understand the human being beyond this

involves attending to language and culture, and these are matters of convention: biologically, a human being without some kind of initiation into these things is scarcely recognizable as human. This helps to show that the human being cannot be understood in purely naturalistic terms. It shows also, perhaps, that while so much of this will be learned, it later becomes woven into a fabric of reactions and responses that have the spontaneity of instinct. Malcolm’s way of moving the discussion forward here is to focus on such claims of G.E. Moore as that he knows he is wearing clothes or knows he is in a room presenting a paper. The fact that Moore is wearing clothes – given the culture he is in, etc. – might be understood as something of which he has instinctive awareness: it is not something that, under normal circumstances, he could reasonably be said to check. If he were to check, this would be interpreted a sign not of conscientiousness but of mental disturbance. In this sense, then, as Malcolm argues, echoing Wittgenstein, it is not something that he can be said to “know” or to be “certain of.” It is not something he could ordinarily be mistaken about. And here distinctions between the empirical and the conceptual begin to break down. Does our use of words have an empirical basis? In a sense, yes, because we have learned them, and the particular language we learned was a contingent matter. But our relation to that background is not anything we would need to check. Our words are there for us in a way that we cannot ordinarily doubt, as close as our skin, as it were. The words stand fast for us.

In fact, as Malcolm goes on to say, such absence of doubt is there in any learning: there is necessarily this background of spontaneous reaction to a cause. Contra Jerry Fodor, for example, one does not need to form a hypothesis before one acts. You learn words (“Sit on the chair”) before you can employ them. The absence of doubt can be called instinctive because it is not learned. Standing on two feet was something that at one time one learned, but when one rises from a chair, one does not first check that one has two feet. Hence, there is an outgrowth from unthinking behavior that permeates and surrounds all human acting.

Animal and Beyond

Wittgenstein conceives of the absence of doubt as “something that lies beyond being justified or unjustified; as it were, as something animal” (OC, §358–359). To speak of knowledge or conviction or acceptance, etc., is not really appropriate in these circumstances as these expressions have their roles within specific language games: they are not appropriate when it comes to explaining the basis of *all* language games. In fact all such psychological terms lead us away from what is important here, from this “unthinking, instinctive behaviour” that, as Malcolm puts it, underlies all language games (p. 17). Wittgenstein makes the point in terms at once more stark and more graphic: “The fact that I use the word ‘hand’ and all the other words in my sentence without a second thought, indeed that I should stand before the abyss if I wanted so much as to try doubting their meanings – shows that the absence of doubt belongs to the essence of the language-game. . .” (OC, §370). This instinctive behavior is like the squirrel’s gathering of nuts or the cat’s watching a mouse hole. Can the child who is told to sit on a chair and responds appropriately be said to know what a chair is? What of the dog that is told to sit? Learned discriminative behavior does not depend upon mental states that “explain” the response: mental states are not the basis of mastery of language, for all psychological concepts have their basis in ways of acting.

It is plain, then, that Malcolm’s Wittgensteinianism militates against the Cartesian legacy – against mentalistic accounts of human being and against cognitivism as it has been found in psychology and education for most of the past century. There is every reason to support the broad direction of this critique, and certainly the emphasis on reactions and on the animal is a powerful driving force. But this position is open to question on grounds of a quite different kind.

It was suggested earlier that the above account gains plausibility if it is acknowledged that, paradoxical though it initially sounds, the nature of the human being is convention. But the account naturalizes convention. In its sustained attack on

mentalistic thinking, it frames language within the terms of the animal – that is, as a refinement of natural reactions, from the blinking of an eye and the adjustment of one’s balance to primitive reactions of sympathy when others are in pain. There is some truth to this, perhaps especially in phylogenetic terms. It understands the rule-following of language and so much ordinary behavior in terms of knowing how to go on in the same way; there is truth to this too, especially in the light of the vast background of consistency in our linguistic and social behavior. But there is no need to deny this in order to recognize something else – something that is of unique importance for education but also, in fact, for the understanding of human lives as a whole. This is that the signs human beings produce, with which and through which they live, are of a different order from those made by other animals. The signs of animals in general (and clearly we are speaking primarily about the higher animals) operate with a kind of push-pull regularity, sophisticated in varying ways but limited in the range of their possibility. Lions roar at one another in different ways, and their young learn this behavior. It is passed on from generation to generation. The lions roar, reproduce, eat, and sleep, and over time things remain the same. Human beings communicate through signs also, but their signs are of a quite different order. Human signs – words and gestures – are such as to admit open possibilities of response: chains of association and connection, and infinite possibilities of interpretation. The human sign is not of the order of a here-and-now but depends upon a distancing from things that can refer precisely to what is not present here and now, which in turn conditions what “here” and “now” can mean. And it is crucial that it can refer: language is generated where it is possible to say things about the world. Indeed, it is through language that the world comes into view. World, in the sense that we ordinarily mean it, is language dependent, and so too, of course, is the human being. Being open to association and connection in the way indicated, words do not remain within a closed circle of exchange: On the contrary, they become the engine of culture, the very possibility of new

departure, and in a sense the essence of education; and such can be seen in ordinary conversation, which can take directions that are not anticipated and produce effects as yet unknown.

The world the child comes into is not a world of similar beings, all making early moves in the refinement of natural reactions. It is a world where there are grown-ups with language full-blown. A consequence of this is that when the child is told to sit on a chair, their early understanding, which produces the correct behavior, occurs against a background that is at present, so to speak, above them. It occurs against refined cultural practices of sitting on chairs and having dinner or watching television or attending to a lecture... Without this framing from the top down, as it were, how could such practices be rightly understood? On this account then, the child's developing reactions, behavior, and language can be understood only in limited terms from below. This is not so much the case for the lion-cub for which the relevant signs are finite and circumscribed in their usage, as are the activities to which they relate. Not to mark this distinction between the animal and the human is to submit to a naturalism that falls short of what it is to be a human being. It is certainly the case that Wittgenstein said much in his last writings that would support such a view – perhaps because of the vehemence of his condemnation of Cartesianism and of the mentalistic philosophy of mind that persisted so stubbornly during his lifetime. But it is a mistake to confine the interpretation of his work to these passages, and there is much elsewhere in what he says that gestures towards a less naturalistic view. “My attitude to him is an attitude towards a soul. I am not of the *opinion* that he has a soul” (PI II, iv, p. 152). “The human body is the best picture of the human soul” (Ibid.). What is to be made of remarks such as these, or of the following from a few pages earlier in the same text?

One can imagine an animal angry, frightened, unhappy, happy, startled. But hopeful? And why not?

A dog believes his master is at the door. But can he also believe his master will come the day after to-morrow? – And *what* can he not do here? – How

do I do it? – How am I supposed to answer this? (PI II, i, p. 148).

In the face of such questions, the emphasis on language as a refinement of natural reactions seems of limited use, to say the least. In fact, however cogent its rejection of mentalistic pictures of psychological states, it seems here to miss the point.

Saying Things

A further question can also be raised against Malcolm, and perhaps against Wittgenstein, about how far the overemphasis in the account teeters on the brink of being wrong. Our everyday relation to words is such, it is said, that they stand fast for us and we do not call them into question. Yet this is plainly not true for everything we say. It is a common experience to find oneself at times unable to choose one's words well or simply at a loss as to what to say. Moreover, there is the eerie experience of repeating a word over and over again until it becomes difficult to connect it with its usual reference or at least until that connection no longer seems as natural as it did. Not to acknowledge this is to fail to recognize a degree of violence that exists in our coming into language, which both distances us from our animal-like, prelinguistic, seamless involvement in things present and opens for us a kind of alienation, the condition for entry into the world of human beings. Wittgenstein surely had some sense of this, with his remarks, for example, about the physiognomy of words (PI, §568; p. 155, 179, and 186), strange and surreal as these to some extent are, and with his respect for the human tendency to run up against the limits of language. But the philosopher who has most extended this line of thought is surely Stanley Cavell, whose purpose is other than the skeptic's but whose concern is with the all too human tendency to call into doubt the human condition. Language seems as close as one's skin, but at times one can feel oneself to be in the wrong skin, or perhaps find that the clothes one is no doubt wearing are not in fact one's own.

There is, however, a further, more powerful reason to resist the above account, and here the criticism may be leveled not only at Malcolm but at Wittgenstein himself. Rush Rhees, also himself a student, interpreter, and friend of Wittgenstein, took issue with Malcolm over the paper that has been the main subject of this discussion but also criticized Wittgenstein more broadly in respect of his account of language. For all the brilliance of his understanding of language, Wittgenstein had failed to pay attention to the fact that, when the child learns to speak, she can say *things*. She discovers that she can say things about the world. In a sense, as was indicated earlier, it is only through this that the world comes into view. In learning that she can say things, she learns also that this is something she can share with others. She participates, perhaps clumsily at first, in this possibility: she can make judgments and test them against others; through this she comes to see that we have a common world, contested though its nature will continually be. No amount of attention to “knowing how to go on” or to what it is to follow a rule will account for this aspect of language, which Rhees understands as something that conditions language as a whole and makes it a whole. The emphasis on language games rightly stresses the variety of things we do with words, but it risks hiding this unique importance of language for human beings. Overemphasizing the basis of language in the primitive reaction can only hide this some more.

Wittgenstein's Pedagogical Metaphors

Nicholas C. Burbules
University of Illinois, Urbana-Champaign,
Champaign, USA

Ludwig Wittgenstein's *Tractatus Logico-Philosophicus* (1961) is an argument for an austere, literal view of language. This core argument can be summarized by the following propositions:

(TLP 2) What is the case – a fact – is the existence of states of affairs.

(TLP 4.1) Propositions represent the existence and non-existence of states of affairs.

(TLP 4.11) The totality of true propositions is the whole of natural science. . .

The Logical Empiricists of the Vienna Circle took this argument as the basis for *positivism*: the view that language is a means for offering true statements about the world. Their “verification principle” asserted that a statement is meaningful only if there is a procedure for verifying whether it is true or not. Statements that do not fit this criterion are “nonsense.” Under such a definition, virtually all statements outside the realm of pure logic, mathematics, and empirical science are nonsense.

Wittgenstein believed, in fact, that a good deal of philosophy *was* nonsense (TLP 4.003), and that philosophy, by this definition, does not offer “propositions”:

(TLP 4.112) Philosophy aims at the logical clarification of thoughts. Philosophy is not a body of doctrine but an activity. A philosophical work consists essentially of elucidations. Philosophy does not result in “philosophical propositions,” but rather in the clarification of propositions. Without philosophy thoughts are, as it were, cloudy and indistinct: its task is to make them clear and to give them sharp boundaries.

Philosophical mistakes occur, Wittgenstein believed, when problems are phrased in ways that are not answerable, as formulated. The book ends with a simple assertion that reads like a koan from Zen Buddhism:

(TLP 7) What we cannot speak about we must pass over in silence.

As many commentators have pointed out, however, this austere view of language is not supported by the *Tractatus* itself (Gill 1979, 1996; Maruta 2003; Nyiri 2010). Several of the key claims in the text are phrased in figurative language: one might call them analogies or similes, but here the author will use the most commonly used term, *metaphors*.

This fact suggests that the picture of language in the *Tractatus* is seriously incomplete, that even on its own terms it is not possible to maintain a purely literal language, and that the philosophical task of “elucidation” or “clarification of propositions,” as Wittgenstein carries it out, still relies on metaphors.

Here are three examples from the text. The first is Wittgenstein’s famous “picture theory” that a proposition is true if and only if it offers an accurate representation of the world:

(TLP 2.1) We picture facts to ourselves.

(TLP 2.11) A picture presents a situation in logical space, the existence and non-existence of states of affairs.

(TLP 2.12) A picture is a model of reality.

Here the most basic function of language – its essential function, on Wittgenstein’s account – can only be explained by comparing it to a nonlinguistic example. The following sections go into great detail about the way in which a picture (*Bild*) represents the world. At this crucial point (the question of truth), Wittgenstein relies on yet a further metaphor, a ruler:

(TLP 2.1511) That is how a picture is attached to reality; it reaches right out to it.

(TLP 2.1512) It is laid against reality like a measure.

(TLP 2.15121) Only the end-points of the graduating lines actually touch the object that is to be measured.

Finally, in the penultimate passage of the book, another famous metaphor:

(TLP 6.54) My propositions serve as elucidations in the following way: anyone who understands me eventually recognizes them as nonsensical, when he has used them – as steps – to climb up beyond them. (He must, so to speak, throw away the ladder after he has climbed up it.) He must transcend these propositions, and then he will see the world aright.

Here Wittgenstein acknowledges, in a strikingly self-referential way, that the very endeavor of elucidation, as he practices it, relies on the “nonsensical” (including, it appears, the use of language that directly violates the theory of referential truth argued for in the text). Even here, he relies on a metaphor, the ladder that, once it has served its purpose, we must “transcend” or throw away. Or can we? Jerry Gill summarizes this apparent paradox as follows:

Wittgenstein’s well known way of treating this difficulty is to take back with his left hand what he had offered with his right hand. . . . Clearly the main feature of the difficulty is that metaphorical expression is the necessary foundation for more explicit expression. The ladder that enables us to move from no expression to explicit expression is metaphoric expression. Thus it is not the sort of ladder which can be kicked over. For we are still and always standing on it! (Gill 1979, pp. 273–274)

In his later work, Wittgenstein relies even more extensively (and, one might say, more unapologetically) on metaphors of many types. He says, in the *Philosophical Investigations*, (1958) “A simile that has been absorbed into the forms of our language produces a false appearance, and this disquiets us” (§112). And he writes in *Culture and Value*, (1980) “A good simile refreshes the intellect” (p. 1) and “What I invent are new similes” (p. 19). So it appears from these comments that certain similes (or metaphors) inhibit thought; The author regard PI §112 as closely linked with PI §115, “A picture held us captive. And we could not get outside it, for it lay in our language and language seemed to repeat it to us inexorably.” Certain figurations in language become clichéd, so familiar that their original intent becomes invisible to us (some call these “dead metaphors”). A cliché becomes an encumbrance to thought, whereas a new or fresh metaphor can cause us to view the familiar in a new light. Wittgenstein’s goal, he says, is to invent new similes. This suggests an indispensable role for figurative language, such as metaphor.

In Wittgenstein’s famous metaphor (PI §309), “What is your aim in philosophy? – To shew the fly the way out of the fly-bottle,” the fly-bottle is both a trap from which one is trying to escape, but also – because we are *inside it* and because it is

transparent – a trap that we must first of all *recognize as such*. Here again there is a self-reflexive moment: you draw people's attention to the fly-bottle they are in by using a metaphor; the novel figuration highlights the clichéd, static language that “holds us captive.” Whereas the conception of language laid out in the *Tractatus* suggests that figurative language is an aberration from the representative function of propositions (because as a proposition, a metaphor is – literally speaking – false), in the *Investigations* figurative language is just another “language-game,” one that operates by different rules from the literal – and constitutes an important, complementary, corrective to it.

Many have commented on the plethora of metaphors (analogies, similes, etc.) Wittgenstein uses in his later work. Although all of them will not be reviewed here, two aspects of these metaphors will be focused here: the first is the frequent use of *tools* as his metaphorical objects; the second is the way in which these metaphors frequently are used to depict *educational* processes (see also Peters et al. 2008).

Christopher Benfey, in a wonderful essay entitled “Wittgenstein's Handles” (2016) draws attention to the work that Wittgenstein did in helping to design his sister Gretl's house in 1926. Benfey quotes from Ray Monk's biography of Wittgenstein:

His role in the design of the house was concerned chiefly with the design of the windows, doors, window-locks and radiators. This is not as marginal as it may at first appear, for it is precisely these details that lend what is otherwise a rather plain, even ugly, house its distinctive beauty. The complete lack of any external decoration gives a stark appearance, which is alleviated only by the graceful proportion and meticulous execution of the features designed by Wittgenstein. . . The details are thus everything, and Wittgenstein supervised their construction with an almost fanatical exactitude. (Monk 1991, p. 236)

It is not very surprising that Wittgenstein, trained as an engineer, would have an imagination that turned toward metaphors of handles, hinges, rulers, hammers, ladders, and spades. This much more pragmatic world view is captured in his famous aphorism (PI §43), “For a large class of cases – though not for all – in which we employ

the word ‘meaning’ it can be defined thus: the meaning of a word is its use in the language,” and the less well-known (PI §97): “Whereas, of course, if the words ‘language,’ ‘experience,’ ‘world,’ have a use, it must be as humble a one as that of the words ‘table,’ ‘lamp,’ ‘door.’” Wittgenstein makes the analogy of words with tools explicit:

(PI §11) Think of the tools in a tool-box: there is a hammer, pliers, a saw, a screw-driver, a rule, a glue-pot, glue, nails and screws. – The functions of words are as diverse as the functions of these objects. (And in both cases there are similarities.)

The last parenthetical comment is significant, because even the term “use” in the case of tools is not unambiguous. There is more than one way to use a tool, and more than one purpose to which a tool can be put; likewise, different tools can be used in similar ways. In *On Certainty* (1969), Wittgenstein asks, (OC §351) “Isn't the question ‘have these words a meaning?’ similar to ‘Is that a tool?’ asked as one produces, say, a hammer? I say ‘Yes, it's a hammer. But what if the thing that any of us would take for a hammer were somewhere else a missile, for example, or a conductor's baton? Now make the application yourself.” Therefore, describing meaning as use does not straightforwardly settle the matter, since we still need to ask “What use?” and “For what purposes?” Wittgenstein highlights this problem with yet another tool metaphor:

(PI §12) It is like looking into the cabin of a locomotive. We see handles all looking more or less alike. (Naturally, since they are all supposed to be handled.) But one is the handle of a crank which can be moved continuously (it regulates the opening of a valve); another is the handle of a switch, which has only a brake-lever, the harder one pulls on it, the harder it brakes; a fourth, the handle of a pump: it has an effect only so long as it is moved to and fro.

The handles all look alike, but they work in different ways and they accomplish different things. And here is the key point: the only way to learn these differences is by handling them and seeing the way they work. So if it is true that the meaning of a word is its use, then a corollary is that we learn the meaning(s) of a word *by* using it, and the same word can be used in different ways, for different purposes.

This discussion introduces the second theme the author want to highlight about Wittgenstein's metaphors: they often have a pedagogical component, they ask us to reflect on how we learn something or learn to do something. In fact, the *Investigations* famously starts with a passage from Augustine about how he learned language – an account that Wittgenstein goes on to question.

Here again we encounter a range of metaphors. The best known from the *Investigations* is the idea of a “language-game”:

(PI §23) There are *countless* kinds: countless different kinds of use of what we call “symbols,” “words,” “sentences.” And this multiplicity is not something fixed, given once for all; but new types of language, new language-games, as we may say, come into existence, and others become obsolete and get forgotten....Here the term “*language-game*” is meant to bring into prominence the fact that the *speaking* of language is part of an activity, or of a form of life.

Review the multiplicity of language-game in the following examples, and in others:

- * Giving orders, and obeying them—
- * Describing the appearance of an object, or giving its measurements—
- * Constructing an object from a description (a drawing)—
- * Reporting an event—
- * Speculating about an event—
- * Forming and testing a hypothesis—
- * Presenting the results of an experiment in tables and diagrams—
- * Making up a story; and reading it—
- * Play-acting—
- * Singing catches—
- * Guessing riddles—
- * Making a joke; telling it—
- * Solving a problem in practical arithmetic—
- * Translating from one language into another—
- * Asking, thanking, cursing, greeting, praying.

—It is interesting to compare the multiplicity of the tools in language and of the ways they are used, the multiplicity of kinds of word and sentence, with what logicians have said about the structure of language.(Including the author of the *Tractatus Logico-Philosophicus*.)

In this summary we see the key elements of Wittgenstein's view of language: that whereas in the *Tractatus* language is for making propositional assertions about the world, and in which the aim is to state the truth (and where all else is “nonsense”), here language has an enormous

variety of uses and purposes – *games* – each governed by different rules and criteria of success. The “language-game,” Wittgenstein says, consists of (PI §7) “the whole, consisting of language and the actions into which it is woven” – not just words, but activities in which language plays a part (what is sometimes termed in other contexts discourse or *parole*). Learning the “language-game” entails learning not only words but their uses in the context of human doings.

How does this learning occur? Here, not surprisingly, we encounter another metaphor. We learn to participate in a language-game, as with any game, by learning the rules. But what does it mean to follow a rule?

(PI §85) A rule stands there like a sign-post. – Does the sign-post leave no doubt open about the way I have to go? Does it shew which direction I am to take when I have passed it; whether along the road or the footpath or cross-country? But where is it said which way I am to follow it; whether in the direction of its finger or (e.g.) in the opposite one? –And if there were, not a single sign-post, but a chain of adjacent ones or of chalk marks on the ground– is there only *one* way of interpreting them?– So I can say, the sign-post does after all leave no room for doubt. Or rather: it sometimes leaves room for doubt and sometimes not. And now this is no longer a philosophical proposition, but an empirical one.

A sign-post is, like other tools and objects, something that can be used in different ways, some of those uses straightforward, others ambiguous. One might say, “just follow the sign-post” (or follow the rule), but Wittgenstein says, there might be more than one way of doing that. This is one consequence of viewing language-games in the context of human doings. One might say that in order to engage successfully in an activity one must follow the rules – but it is sometimes just as true to say that we learn what it means to follow the rules from learning to engage in the activity successfully. And to add a further layer of complexity, Wittgenstein says (PI §83): “And is there not also the case where we play and make up the rules as we go along? And there is even one where we alter them-as we go along.” The key, for Wittgenstein, is to be able to say “Now I can go on” (PI §179), that is, to *show* through successful participation in the activity that one has learned and understands the rules.

A key part of this view of rule-following is that, for Wittgenstein (PI §1), “Explanations come to an end somewhere.” This is not a model of learning like direct instruction, in which all steps can be made explicit and learned sequentially (Burbules 2008). Indeed even the successful practitioner of an activity may not be able to fully articulate how they are doing it:

(PI §217) “How am I able to obey a rule?” – if this is not a question about causes, then it is about the justification for my following the rule in the way I do. If I have exhausted the justifications I have reached bedrock, and my spade is turned. Then I am inclined to say: “This is simply what I do.”

My spade is turned. Another tool metaphor. And another moment of reflexivity, because figurative language also exceeds the boundaries of explanation: to attempt to fully explain a metaphor is to kill it. Figurative language is open-ended, suggestive. A metaphor is not a proposition that makes an assertion, but an invitation to consider the ways in which a comparison opens up an exploration of similarities and differences that shed light on the objects of comparison. Metaphor does not come with instructions, and there are different ways to use it and understand it. This open-endedness and indeterminacy is its virtue.

And that, the author is arguing here, is why Wittgenstein uses metaphor, especially in his later work: because it exemplifies a key point about language use as a kind of doing, and as directed to other important purposes than just the assertion of propositional truths. His tool metaphors especially highlight these questions of uses, purposes, and doings; and these in turn raise the question of how we learn these uses, purposes, and doings – an exploration which, again, itself relies on a series of metaphors (games, sign-posts, and ladders that need to be thrown away after one has climbed them).

Introduction

As one of the most influential philosophers of the twentieth century, Ludwig Wittgenstein (1889–1951) has impacted a variety of scholarly disciplines, including education theory and research. Wittgenstein's later works are often cited for their insights into a wide variety of philosophical topics, including meaning and understanding, rule following, the “inner” and “outer” realms of human activity, and certainty about knowledge. In contrast to the representationalist view of language expressed in his earlier work, these writings identify the meaning of an expression as its rule-governed use in language, inextricably tied to its use in our lives.

Wittgenstein's name has been invoked with increasing regularity, especially since what might be termed the “social turn” in research on learning in (science) education, including interest in the role of discursive interaction in human development and in sociological studies of scientific practice. Less understood but no less significant in education research are the implications of Wittgenstein's vision of an alternative orientation for philosophy and, in turn, the impact of this vision on theory and research in the various human sciences. Wittgenstein claimed that frustration with psychology should not be mistaken for problems related to its being an underdeveloped science. Rather, he faulted “conceptual confusions” in which prescribed methods are thought to deliver solutions to problems but instead miss the mark entirely.

Extending these Wittgensteinian points, philosopher Peter Winch argued that social science is much more conceptual than empirical and that the proper understanding of meaningful human action involves dialectical examination of language use. Producing empirical evidence to satisfy an essentially conceptual question – for example, concern with identifying the “most effective instructional method” or even “what was learned in a laboratory exercise” – results in begging the question, regardless of the depth of care we take in specifying operational definitions. Most theories that get adopted in education research end up simply replacing the answers given to the perpetual problems of educational

practice while leaving central analytic orientations intact; Wittgenstein's and Winch's notions force us to examine whether education researchers should instead fundamentally change the questions that are asked.

Wittgenstein's Philosophy

Numerous summaries of Wittgenstein's biography and philosophical contributions exist; only broad arguments related most directly to the uptake of his work in science education are given here. As outlined in *Philosophical Investigations* (Wittgenstein 1958) and other posthumously organized collections of his vast notes and dialectical exemplars, Wittgenstein's later work was concerned with pointing to the unrelieved role of grammar in philosophical puzzles. Wittgenstein proposed time and again that philosophical difficulties were often the result of a lack of clarity surrounding our concepts; certain expressions (e.g., “to be” or “to exist”) continually lure us into supposed philosophical crises, whereas examining the expression's logic in use suggests a “therapeutic” alternative analysis and resolution.

The analysis of the meaning of an expression relies on examination of its ordinary use in our lives, use that is embedded in what Wittgenstein referred to as “language games.” A language game is essentially a grammar of practice, rule governed, and knowable to competent speakers of a language. It is sometimes assumed that philosophy's task is to produce solutions to puzzles of meaning and existence, akin to the natural sciences' aim to produce causal explanations of observed patterns and relationships. Again, however, for Wittgenstein, the goal of philosophy properly conceived is to produce clarifying descriptions of the rule-governed use of concepts in our various language games.

One question raised by Wittgenstein's philosophy concerns the source of the aforementioned rules: is it in fact the case that the origin of these rules is what is in need of explanation? And if it is not the task of philosophy to produce this explanation, perhaps this is the rightful role of

linguistics or social science more generally? Although some have certainly advanced this interpretation of Wittgenstein, a more common response is to point to his numerous references to the commonly perceived but sorely misguided need to secure the foundations of all knowledge. Rather than suggesting a skeptical interpretation of his discussions of rule following, Wittgensteinian philosophers such as Peter Hacker (1999) and Cora Diamond (1989) urge us to understand his writings as pointing to the way that rules exist against a background of modes of living in and talking about the world; rules and contexts are mutually constitutive rather than causally emergent and in need of explanation.

Wittgenstein's insistence on the rule-governed nature of our lives may also be heard as validation of scholars who insist on the primacy of social, rather than psychological, explanations of human behavior. It is the case that Wittgenstein discusses and rejects the idea of a "private language" – the notion that an individual attaches unique names to individual experiences, and this creates an "inner world" known only to himself (e.g., see Hacker 1999). Typically, however, Wittgenstein should be interpreted not as "taking sides" in a familiar battle but as resetting the terms of the debate; in this case, it is not so much the triumph of "social" over "individual" worlds that is noteworthy but, rather, the way in which the "inner-outer divide" itself can be seen as illusory and a product of our ways of speaking rather than a conundrum in desperate need of resolution.

Related to this critique of the mind-body (or more contemporary brain-body) dualism, Wittgenstein is largely seen as having dismantled a representationalist view of language. "Representationalist" refers to the notion that language ties to and names the world, such that its use is indicative of something lying behind it; language "stands for" or "points to" something, in the way that announcing "I am hungry" is sometimes thought to imply that the speaker is translating introspection into words, orienting to her inner condition in order to communicate with others. Alternatively, stating "I am hungry" can be seen simply as a rule-governed behavior we engage in (rather than, e.g., crying or enduring the pain of an

empty stomach). It is a subtle distinction to talk of language as expressing rather than representing. And of course, language *can* be used to represent, or to name – Wittgenstein challenges us to see that representing is but *one* use for language, not a fundamental, singular, or universal relationship between language and the world.

Influence in Science Education Research

In order to appreciate the influence of Wittgenstein's writings in science education research, it is helpful to have a general outline of studies of student learning in the field. While consensus on the approach to research or even the goal of inquiry is not readily apparent, the overwhelming focus has been on *students' understanding of scientific concepts*. Conceptual learning has been and is often still thought of as the acquisition or restructuring of individual mental representations. Increasingly, though, language and social interaction have been viewed as critical in shaping these mental representations; in some cases, the notion of concept-as-mental-representation has been called into question. Attempts to determine the causal relevance of other factors such as motivation, attitude, elements of individual identities, learning environments, or other "internal" or "external" characteristics have also been undertaken.

In relation to research on students' learning in science, Wittgenstein's philosophy has been invoked in at least four broad ways over the last several decades (Heckler 2014). Early dissenters to the emerging "conceptual change" theory of cognitive learning in science as analogous to rational theory replacement in the discipline of science argued against the plausibility of novice students' ability to logically justify and appropriate scientifically superior counterparts to their naïve and unworkable explanations of the world. Wittgenstein's writings were used to emphasize the nonrational aspects of human interaction (persuasion versus reason; learning by imitation and training) or to point to multiple and local rationalities as more relevant to the student's task than a universal scientific logic.

A second strand of research has enlisted Wittgenstein in the project of theorizing student learning as a sociocultural rather than individual-psychological process. Students' acquisition of scientific concepts was characterized as successful participation in a scientific language game. Most theorists argued for a picture of learning that involved a combination of "individual" and "social" elements, for example, appropriate language performance as evidence of a scientific concept correctly internalized. However, occasionally Wittgenstein's philosophy has been used in science education to argue for rejecting the individual-social dichotomy and any sense of a uniquely individual cognition.

The introduction and use of the science studies literature – broadly, sociological, historical and philosophical inquiries into scientific practice as it occurs in particular settings, on particular occasions – in science education provided a third opening for the use of Wittgenstein's philosophy. An interest in science studies grew out of the sociocultural in research on science learning; rather than imagine logical scientific theory change as a cognitive development, investigators studied science classrooms as sites of scientific practice (and concept development), inspired by methods and arguments from science studies. The path to Wittgenstein here is somewhat indirect, but emanates largely from the writings of David Bloor, who as spokesperson for the "Edinburgh Strong Programme" in science studies argued (following Saul Kripke) that Wittgenstein's discussion of rule following licensed a skeptical interpretation: that if we can't point to empirically derived, natural causes for the rules we follow in various forms of practice (including rules for language use), the explanation must lie in social consensus, the formation of which should be studied and understood theoretically. This social-constructivist approach to explaining how students come to understand science in classroom settings was embraced by science education researchers beginning in the mid-to-late 1990s.

Finally, Wittgenstein's writings have inspired discussion of new methodologies in researching students' science learning. The most robust of these has been known as "practical epistemology

analysis," which involves analyzing transcripts of science learning activities, in order to pinpoint where students have difficulty understanding and how that difficulty is resolved via known concepts. Wittgenstein's notion of meanings that "stand fast" in relation to their surroundings was combined with the notion of "family resemblance" across language games in order to reimagine and investigate students' acquisition of new conceptual understanding in science. Such analysis was used to describe what students learned from various laboratory practicals and how student-teacher interaction guided learning, to identify metaphors as important connectors between students' established knowledge, and to illustrate students' use of aesthetic judgments in negotiating their participation in a school science classroom, among others.

The Problem of Scientism

Although Wittgenstein's philosophy has been cited in service of studying student learning in science in various ways, the claim has been made that ultimately these references miss the point of his arguments (Heckler 2014). To understand why, it is important to appreciate the undercurrents of anti-scientism (not *antisience*) at work in Wittgenstein's writings. In this context, "scientism" refers to the tendency to lift up scientific methodology as the preferred (if not sole) source of certain knowledge in all human practices. Many academic disciplines beyond the natural sciences model their modes of inquiry on the empirical methods of the natural sciences. However, we could ask whether some endeavors – for example, aesthetics, ethics, or philosophy more generally – need to emulate this methodology or whether they might rightfully pursue other approaches to generating knowledge. In part, the answer depends on how we think about what is *real*: must the concepts covered by epistemological or metaphysical questions be empirically observable to count as "real?" Lyas (1999) explains how Peter Winch draws from Wittgenstein in examining just these questions, asking, for example, should empirical linguistics replace

philosophy as the source of truth about our use of concepts? Winch's and Wittgenstein's philosophies suggest they would oppose such a conclusion for the study of much of human social life. However, the prevalence of scientistic tendencies across a vast swath of contemporary academic work may suggest a lack of familiarity with the argument – or perhaps, the common, scientistic assumptions behind the current plethora of “methods” and “theories” at play in the social studies are concealed by their seeming differences (Hutchinson et al. 2008).

Education research is not immune to these pressures. In fact, the desirability of a scientific approach to studies in education has been codified by laws such as the *Every Student Succeeds Act* (ESSA) of 2015 (which recently replaced the *No Child Left Behind Act* of 2001). ESSA specifies that educational initiatives deserving of federal funding for implementation and further study must be “evidence based,” defined as derived from experimental, quasi-experimental, or correlational studies that have demonstrated a statistically significant effect on student learning outcomes or from rationales for approaches that show promise of scientific validation.

This evidence-based orientation has affected traditional norms of educational practice, as well. For example, curriculum was once idealized as an expression of values or of an educational philosophy tied to its ultimate purpose: educating for individual development, social efficiency, social reform, vocational training, participation in democratic society, social mobility, knowledge replication and production, proof of status, transmission of cultural heritage, exposing and transgressing oppression and injustice, and so on. But increasingly today, curriculum is seen as necessarily tied to “models of student learning”; the curriculum itself must be “evidence based.” In a field where research traditions have been summarized as possessing “no rules that everyone follows, no beliefs that everyone shares, no findings that everyone agrees on” (Anderson 2007, p. 3), the assumption that research should set curricular policy might reasonably be called into question.

Wittgenstein spoke against the analytic tendency to reduce our human understanding of the

world to universal concepts and causal relationships – what he called a “craving for generality.” But the overwhelming imperative in contemporary education research is indeed to satisfy such a craving. To suggest otherwise invites charges ranging from naiveté to professional incompetence. With occasional exceptions, the use of Wittgenstein's philosophy in science education has *not* been to call for an alternative analytical orientation but, rather, to appropriate singular concepts or notions in service of the familiar ways of seeking to provide explanation for students' learning (or lack thereof) in educational settings. “Language games,” “standing fast,” “family resemblance,” and other Wittgensteinian notions have been used to provide new ways of characterizing students' learning in science, when what is needed instead is an inquiry into whether it makes sense to investigate learning as a process or a causal phenomenon in the first place.

Wittgensteinian Alternatives for Educational Inquiry

Peter Winch, in drawing upon and extending Wittgenstein's philosophy in his book, *The Idea of Social Science and its Relation to Philosophy* (Winch 1990), argued that the study of people is more akin to philosophical than to natural scientific inquiry. One way to summarize it might be this: philosophy (e.g., epistemology) is fundamentally concerned with the nature of human social life but not empirically so. Empirical study (in Winch's sense) reveals something new about the world and in particular about (causal) relationships between objects. But philosophy's interest is in conceptual truths – or how our concepts are related to the world – and typically, this is not new information but information that any competent user of a language knows and can recognize (Lyas 1999). Philosophers remind us of the various ways that concepts are used meaningfully in our lives (Diamond 1989).

To say that the study of social life is more often conceptual than empirical is to assert that such study takes interest in meaningful behavior, and following Wittgenstein, meaningful behavior is

rule-governed behavior, dependent on occasion and purpose. We expose and uncover social concepts and relationships by examining what we know about our rule-governed forms of life. Empirical investigation, on the other hand, depends on settling the criteria of what is to be observed. When social concepts are operationalized in order to perform experimental investigations of them, we can give the illusion of discovering new information or of exposing causal generalizations. But the act of operationalizing concepts in order to observe human interaction often masks myriad ways that rules are meaningfully followed and the choices people have in social life. Empirical analysis ends up begging philosophical questions about the occasion- and purpose-bound use of concepts in our lives (Hutchinson et al. 2008).

What might conceptual analysis look like in education research? One example is given in Francis (2005); this critique of radical and social constructivism relies on insights from both Wittgenstein and Winch, as well as analysis of the logic inherent in von Glasersfeld's "radical constructivism" and Bloor's "social constructivism" to illustrate the nonsensical elements of these research agendas. Francis observes that both theories are essentially philosophical arguments purporting to be empirical research programs. Similar critiques might be undertaken of the various theoretical traditions existing in science education research today.

A different approach, no less informed by Wittgensteinian philosophy, guides Macbeth's (2000) analysis of a recorded interview between a young student and a conceptual change researcher. Rather than using the analysis to suggest new theoretical understandings of science learning, Macbeth essentially exposes the logic of alternate "language games" at play during the interaction and foregrounds the way in which the professional analytic practice of a "diagnostic interview" both relies on and simultaneously disavows the student's everyday orientation to questions and answers in order to ascribe to her various levels of conceptual (mis)understanding.

The difficulty of resisting the urge to theorize, of ignoring the weight of expectations to produce

causal explanations of students' learning, or of eschewing the idea that social study should aspire to anything like prediction or control of interactional outcomes should not be underestimated. But the promise of clear and penetrating descriptions of education as rule-governed practice and of useful insights into our understanding of meaningful behavior will perhaps ultimately inspire fidelity to Wittgensteinian perspectives in researchers' future analytic undertakings.

Wynter and Decolonization

Elisabeth Paquette

Department of Philosophy, York University,
Toronto, ON, Canada

Sylvia Wynter: An Introduction

Sylvia Wynter is an Afro-Caribbean theorist, born in Cuba in 1928 and raised in Kingston, Jamaica. Growing up in Jamaica, she witnessed anti-colonial mass movements during the early 1940s. In 1947, Wynter moved to London, England, to study modern languages at the University of London, King's College, majoring in Spanish with a minor in English. She taught at the University of West Indies in Jamaica before moving to the USA and teaching at the University of California, San Diego, and then Stanford University, where she is currently Professor Emerita. While at the University of West Indies, Wynter taught in the Hispanic Literature Department, and then, in San Diego, she taught primarily in the Department of Literature. She also served as the Chair of the African and Afro-American Studies Department as well as Professor of Spanish in the Spanish and Portuguese Department at Stanford University (Wynter 2000). Prior to her employment at the University of West Indies, Wynter was a performer, both as an actor and a dancer. It was not until she left England and returned to Jamaica in 1957/1958 that Wynter began writing. Her first publication is a play entitled *Under the Sun*, coauthored with Jan Carew, which she later turned into her one and only novel entitled *The Hills of Hebron* (1962).

Wynter on a Western Conception of Man

A critical turn in Wynter's writing took place in the late 1960s. A central feature of this critical turn, and in her decolonial project more generally, was her reconceptualization of what it means to be "human." In "Unsettling the Coloniality of Being/Power/Truth/Freedom" (2003), Wynter offers a

critique of the concept of "Man" that has its origins in the Enlightenment era. Her critique is focused in part on a Judeo-Christian concept of the "human" that preceded the Copernican Revolution and a concept of "Man" that followed during the Enlightenment period, as well as the differences that mark these two eras. According to Wynter, following the Copernican Revolution, we find in the Enlightenment era a concept of Man that presupposes reason – via the new role of science – as its founding idea while purportedly assuming a kind of universality. Both the conception of the human and the conception of Man are representations of what it means to be human within these specific geopolitical contexts. At the same time, these geopolitical contexts – constituted by the fluctuating influence of religion and science – are sites of knowledge production. Thus, for Wynter there is a connection between the representation of the experience of being human (or what it means to be human) and the production of knowledge (or what counts as knowledge). The Enlightenment conception of Man is particularly important for our considerations because, according to Wynter, it continues to dominate a Western geopolitical context. For this reason, much of Wynter's discussion of pedagogy and her decolonial critique interrogate this conception of "Man."

In "Unsettling the Coloniality of Being," Wynter demonstrates the various ways in which Man is problematic. Broadly speaking, for Wynter Man is constructed through a binary that presupposes the existence of, and simultaneously the creation of, its negation. We can think of this as the concept of Man as constituted through a conception of nonMan, or similarly put the rational subject is premised on the existence of a non-rational subject (see also McKittrick 2015, Chapter 4, and Wynter 1995). As a result, the experience of what it means to be human, reified in the representation of Man, is founded upon the presupposition a group of persons that are *excluded* from the category of human and rationality. The implication is, therefore, that the rational characteristic of this Enlightenment concept of Man is in fact not universal, as it purports to be, rather it is dependent upon an Other that is effaced

from humanity. In addition, Wynter argues that the construction of the rational subject (Man) is bound up with European expansionism and colonization of parts of Africa and the Americas (Wynter 1995).

Wynter's Methodological Practice and Decolonization

Notably, a methodological practice is also intrinsic to Wynter's project of reconceiving what it means to be human. As noted by Katherine McKittrick in *Sylvia Wynter: On Being Human as Praxis* (2015)

[Wynter's] work speaks to a range of topics and ideas that interweave fiction, physics, neurobiology, film, music, economics, history, critical theory, literature, learning practices, coloniality, ritual narratives, and religion and draw attention to epistemological ruptures such as the secularization of humanism, the Copernican leap, Darwinian modes of biological representation, Fanonian socio-geny, the 1960s (pp. 1–2) (Fanonian socio-geny is in reference to the works of Frantz Fanon (1925–1961))

This interweaving of topics forms the backdrop of Wynter's methodology, a key proponent of her performance of the decolonization of pedagogical practices. Her method is dependent upon two central features: epistemic disobedience and a disenchantment of discourse. "Epistemic disobedience" is a pedagogical practice of engaging in a critical analysis of academic knowledge production both in terms of the content produced and the method through which the content is produced. Second, "a disenchantment of discourse" refers to an alternate method of knowledge production. Both of these concepts will be developed below in relation to Wynter's overall decolonial theory. It is important to note that while many of Wynter's writings revolve around a reconception of humanness, she does not provide her readers with the content of this category. Rather, for Wynter the experience of being human is a practice. This entry will culminate with a brief account of how these concepts are relevant to a theory of pedagogy.

Epistemic Disobedience

According to Walter Mignolo, in "Sylvia Wynter: What Does It Mean to Be Human?," Wynter is not attempting to overturn existing systems of knowledge. Rather, through her critique she is attempting to change the way in which knowledge is produced and knowing is constituted. At the same time, however, Mignolo claims that "Wynter is not proposing to contribute to and comfortably participate in a system of knowledge that left her out of humanity (as a black/Caribbean woman), but rather delink herself from this very system of knowledge in order to engage in epistemic disobedience" (McKittrick 2015, p. 106). Thus it would seem that for Wynter, in addition to offering a critique of how knowledge is produced, she is also attentive to her own positionality (as an academic) in relation to systems of knowledge production.

While epistemic disobedience is not a concept Wynter herself employs, it nonetheless provides a manner through which one can understand Wynter's methodology. Generally, epistemic disobedience refers to an approach to the study of knowledge; more specifically it addresses questions pertaining to how knowledge is produced, what counts as knowledge, and what certain constructions of knowledge perpetuate.

There are various ways in which Wynter performs epistemic disobedience of the production of knowledge. In "Unsettling the Coloniality of Being" and "1492: A New World View" (1995), two of Wynter's most foundational essays, Wynter investigates specific representations of what it means to be human, and the structure that gives rise to, or produces, such representation. For instance, the production of Man (or the rational subject) discussed above already presupposes what counts as knowledge. In a circular fashion, "Man" presupposes that knowledge can only be produced by rational subjects, yet rationality is attributed only to select groups of persons (ex. colonizers, persons with property, men). Accordingly, groups of people who are not considered rational are thereby excluded from humanity and are thus considered incapable of producing knowledge. As a result, knowledge has a very

specific structure that Wynter claims is bound up with colonial conquest (see Wynter 1995, 2003).

Epistemic disobedience is evident in Wynter's methodology as well. In "Sylvia Wynter: What Does It Mean to Be Human?," Mignolo states:

Under the rules of the epistemic cannon, and according to its racial mandates, if you have been classified in/as difference, then you are required to submit and to assimilate to the cannon or remain outside. Wynter does not follow either of these pathways. She instead engages what I call the decolonial option, a practice of rethinking and unraveling dominant world view that have been opened up by Indigenous and black and Caribbean thinkers since the sixteenth century in América (with accent) and the Caribbean. The decolonial option does not simply protest the contents of imperial Coloniality; it demands a delinking of oneself from the knowledge systems we take for granted (and can profit from) and practicing epistemic disobedience. (2015, pp. 106–107)

Methodologically speaking, Wynter pushes against disciplinary boundaries, challenging the establishment of such boundaries. For instance, in "But What Does Wonder Do?" (1994), Wynter emphasizes the importance of developing a relation between what she calls "scientific language" and "literary language." For Wynter, literary texts and cultural contexts inform and impress upon the biological and neurobiological process of the human animal. Drawing upon the words of David Bolm – who states that "meaning directly affect[s] matter" – Wynter underscores the importance of interdisciplinary discussions in order to provide a richer understanding of the human experience (1995, p. 3). (One way to conceive of the way that meaning can affect matter is to consider the manner in which the body becomes more rigid when racial slurs are uttered at a person of color, or how a glare in the crowd causes one to hunch over or stand up straighter.)

In many cases, scientific and literary disciplines are brought into conversation in her work. For instance, in "Columbus, the Ocean Blue, and Fables that Stir the Mind" (1997), Wynter provides an account of the role of literature in neurobiology. In addition, in "Ethno or Socio Poetics" (1976), Wynter draws from the work of Humberto R. Maturana and Francisco J. Varela, two Chilean

cellular biologists, who offer a method through which to understand cellular identity as self-enclosed and self-constituting. Wynter utilizes Maturana and Varela's discussion for the purpose of reconceiving what it means to be human as an identity that is similarly self-enclosed and self-constituting. In this same essay, Wynter draws upon the work of philosophers, critical theorists, and statesmen, such as Martin Heidegger, Theodor Adorno, and Léopold Sédar Senghor, for the purposes of achieving a reconceptualization of being human.

Demetrius L. Eudell's essay, "Come on Kid, Let's Go Get the Thing," advances a similar conclusion. According to Eudell, Wynter adapts Fanon's thesis in *Black Skin, White Masks*, whereby what it means to be human cannot be determined solely through natural sciences and physical laws alone. Rather, the experience of being human is a process that is "culturally and socio-situationally determined, [while also having] physicalist correlates" (McKittrick 2015, p. 236). This method of weaving together what are often thought of as radically distinct disciplines, as well as distinct systems of acquiring and producing knowledge (here the socio-cultural and the scientific), is evident in almost all of Wynter's essays. The desired effect of both the subject of investigation and the method employed by Wynter is to resist, destabilize, and offer an alternative to the ways in which knowledge is produced.

A Disenchantment of Discourse

A disenchantment of discourse could be considered as one of the primary aims motivating epistemic disobedience. In "On Disenchanting Discourse" (1987), Wynter provides an account of what it means to disenchant discourses and the manner in which such work is possible. Briefly, she states that to disenchant discourses is to disrupt the "episteme or fundamental arrangements of knowledge," insofar as knowledge practices perpetuate a specific world view (p. 208). If we recall the discussion of Man noted above, we can

think of world view as here referring to a rational world. Or, prior to the Enlightenment, Wynter notes that the world was organized via a conception of the human that was based in a belief in a Judeo-Christian god. In both cases, there is a strong connection between not only discourse and knowledge production but a world view as well. In fact, discourse, knowledge, and world view, according to Wynter, are in many ways mutually constituting.

In line with her method of epistemic disobedience, Wynter aims to “disenchant” discourse, which means “to introduce and integrate. . . several ‘new objects of knowledge’ which cannot meaningfully exist within. . . our present ‘fundamental arrangements of knowledge’” (1987, p. 207). In other words, to disenchant discourses is to open up the production of knowledge to “objects of knowledge” that might not obviously fit with the already existing structure of knowledge.

At the same time, these new objects of knowledge cannot emanate from the arrangement of knowledge they seek to unsettle, they must come from what is distinct from this arrangement. For this reason, a “disenchantment of discourse” is dependent upon what she calls the “liminal” position or similarly what she calls “minority discourse.” Wynter states “The role of Minority Discourse. . . is [a] calling in question which impels our going beyond the boundaries of our present episteme into a new constitutive domain of knowledge that we have called a science of human systems” (1987, p. 240). Her concepts of minority discourse and liminality are developed in a number of essays. For instance, in “The Ceremony Must be Found” (1984), Wynter defines liminality as ones “experience [of] a fundamental contradiction between their lived experience and the grammar of representation which generate the mode of reality by prescribing the parameters of collective behaviors that dynamically bring that ‘reality’ into being” (p. 39). But in addition, in “Beyond Liberal and Marxist Feminisms” (1982) (drawing upon the work of Asmaran Legesse), Wynter states that “it is the liminal category who ‘generates conscious change by exposing all the injustices inherent in structure’” (p. 36) (see also

Wynter 1984, p. 39). The new objects of knowledge through which the disenchantment of discourse is possible cannot arise *sui generis*; instead it is the liminal category or the liminal position that makes such objects of knowledge possible. In what way is this position locatable? Liminal refers to a subject position that exists outside of or at the limits of what can be thought from a dominant subject position. For instance, in the example above of what it means to be human in the geopolitical context that followed the Copernican Revolution, humanness was represented as the rational subject. The rational subject is, therefore, the dominant subject position. In addition, in “1492” Wynter describes the manner through which indigenous populations of the Americas or those persons who were enslaved and brought to the Americas were attributed non-rational or less rational subject positions. These subject positions are held in opposition to the dominant subject position (the rational subject) existing as outside to the fundamental arrangement of knowledge and as such are liminal subject positions. That said, according to Wynter, liminality can provide a view from which to both understand a fundamental arrangement of knowledge and to disenchant them.

Minority discourse refers to a kind of knowledge production that can emanate from these liminal positions. At the same time, minority discourse cannot disenchant discourses if it is held at the margins of discourses. Correspondingly, a “‘minority discourse’ can *not* be merely another voice in the present ongoing conversation or order of discourse” (Wynter 1987, pp. 207–208). In other words, the advantage of a liminal subject position, over and against a dominant subject position, is that the liminal provides a point of view which can serve to shift/disenchant a fundamental arrangement of knowledge that produces these liminal positions by introducing new objects of knowledge.

Summation

While Wynter does not provide an explicit account of pedagogy, both the form and the

content of her work provide useful insights for theories of pedagogical practices. For instance, Wynter's discussion of minority discourse provides an explicit account of how departments that are currently marginalized (such as African and Afro-American Departments) *should* be located within a university. Epistemic disobedience can also be understood as a pedagogical practice to the extent that disciplinary boundaries should be not considered static, but should continue to be challenged. In addition, Wynter's decolonial critique of knowledge production continues to be important for educational institutions. Not only are these institutions accountable for what counts as knowledge and who is capable of providing such knowledge (i.e., the figures of study and faculty/instructors) but, in addition, educators should also be attentive to the manner in which academic knowledge production can limit valuable expressions of the experience of being human.

Youth, Debt, and the Promise of Critical Pedagogy

Tyler J. Pollard
McMaster University, Hamilton, ON, Canada

Introduction

Critical pedagogy is a progressive mode of education influenced by approaches to knowledge and culture developed by The Frankfurt School and by Brazilian educator Paulo Freire. Critical pedagogy emphasizes that to be meaningful and transformative, education needs to connect the knowledge learned inside the classroom to students' lived experiences outside the classroom. Drawing on Freire, Henry A. Giroux (2011) describes critical pedagogy as a progressive educational movement that provides students with a consciousness of freedom and an ability to identify authoritarian tendencies and make connections between knowledge and power. Critical pedagogy aims to cultivate in young people the capacity and desire to take action in the real world by challenging oppressive and antidemocratic structures of power. In this sense, critical

pedagogy is the opposite of the majority of contemporary neoliberal approaches to education, which see teaching primarily as the delivery of methods, skills, and predefined subject matter. For Freire and Giroux, education is always about the production of particular forms of subjectivity, identity, and desires and thus needs to be directed towards developing young people's critical faculties and a passion for social responsibility. Unfortunately, education in the neoliberal era is characterized by technical and instrumental approaches to teaching and learning and the banishment of critical thinking from corporatized and commercialized classrooms (Saltman 2012; Giroux 2011). One manifestation of this approach to education, and the primary focus of this entry, is the production of a generation of young people lacking an understanding of the violent ways in which neoliberalism and debt in particular are bearing down on their everyday lives and devastating their collective futures.

This entry briefly discusses the increasingly central role of financialization and indebtedness in the present moment. It then outlines some of the neoliberal and corporatizing forces bearing down on young people in their roles as students. The entry then addresses the role that education specialists and policy makers believe that financial literacy can play in protecting students and society from the pitfalls of credit and debt as well as the kind of violent financial crisis witnessed in 2008. Ultimately, the entry suggests that without a critical pedagogical approach to knowledge, which

has the potential to inspire hope and to provide young people with a language for connecting structural problems associated with free market fundamentalism to the daily, ordinary challenges of those in debt, even the most well-intentioned financial literacy will remain wedded to neoliberal capitalism. Critical pedagogy needs to be a fundamental component of the struggle against debt and indebtedness.

The Decline of the Social and the Emergence of Debtfare

Neoliberalism has entered a new phase, one no longer characterized by the expansion of markets and economic growth but rather one defined by intensifying austerity, debt, and authoritarian punishing and surveillance states. In response to the 2008 financial crisis, neoliberal power has insisted on reductions in public spending and ushered in what Giroux has called *the twilight of the social*. In this new age, the social no longer signals necessary democratic protections for vulnerable populations, but rather, handouts for lazy and unmotivated individuals who, the common neoliberal refrain goes, lack in character, self-reliance, and grit. With public debts soaring and the corporate elite benefiting from tax levels that harken back to the gilded age of the early twentieth century, austerity now provides the ideological support for public cuts, as well as the political rationale for poor and working poor peoples' skyrocketing dependence on predatory financial service industries.

In accounting for the collapse of the social and the increasing centrality of financialization and debt in peoples' lives, Michael Hardt and Antonio Negri (2012) argue that there has been a shift over the past several decades from a welfare to a "debtfare" society. Debtfare refers to the centrality of credit and debt in procuring what once were – or at least were considered potential – democratic public goods. Education, health and dental care, prescriptions, childcare, housing, and so on are now fixed in the popular imaginary as private goods and are accessible for the growing underclass only through credit and

debt. Higher education, as Jeffery Williams (2006) argues, has been coopted by a "pedagogy of debt," which sees young people entering their adult lives with massive debt loads in addition to their degrees, which may or, as is increasingly the case, may not, lead to well-paying and meaningful work. This means that the power to determine the values that inform our collective modes of life has shifted: if the welfare State was designed with the purpose of redressing the inequality that results from capitalism, debtfare refers to an economic and political formation in which the State's role is simply to guarantee the protection of markets so as to provide consumers – the only category left for thinking about citizenship (Bauman 2005) – with access to (often predatory) credit. The result is that credit, many peoples' only recourse to (fleeting) economic security, or for many people, survival, is causing obscene levels of financial and affective precariousness and suffering. Austerity and debt are part of an affective and subjective mode of violence percolating just beneath the surface of working and poor peoples' everyday struggles.

Debt, like poverty, unemployment, or really any social problem, has been individualized, rendered private by neoliberal power. Contemporary liberal discourses about education and the economy often view debt as the result of poor character traits or, at best, of a lack of the right financial literacy skills. In all cases, no matter the larger contributing factors to their troubles, individuals are deemed responsible for their failures. An individual who does not pay back debt is considered to be both economically and morally culpable; they are assumed to lack respect for him or herself and for the creditor. In the neoliberal moment, you alone "are responsible for your debts and guilty for the difficulties they create in your life" (Hardt and Negri 2012, p. 10). The effect of this moral liability is that subjects learn "to keep [their] nose to the grindstone" of the present, rather than learn to think in more imaginatively and politically empowering and hopeful ways about the future. Indeed, in the context of the neoliberal "war on youth" (Giroux 2013), debt and its individualizing morality are about the production of subjects with sympathies that align with the larger neoliberal

project and the new austerity and debt economies: unimaginative and depoliticized subjects, who anticipate no assistance from the State, are disposed to predatory financial technologies and expect punishment and exclusion should they fail in their roles as financial subjects. Ultimately, these are subjects who accept the suffering inherent to their indebted conditions without fundamentally trying to alter them.

Debt, as Gilles Deleuze first argued, is about control, not simply repayment. The debtor is not necessarily “expected to reimburse in actual money but rather in conduct, attitudes, ways of behaving, plans, subjective commitments, the time devoted to finding a job the time used for conforming oneself to the criteria dictated by the market” (Lazzarato 2012, p. 104). Debt, Lazzarato rightly argues, “directly entails life discipline and a way of life that requires ‘work on the self,’ a permanent negotiation with oneself, a specific form of subjectivity: that of the indebted man” (p. 104). Central to this “work on the self” has been a mode of neoliberal education that has eliminated the space for critical thinking.

Neoliberal Education and the Resiliently Indebted

Education has been transformed to align with permanent austerity and debt. Standardized testing, charter school and privatization schemes, corporatization, dehistoricizing and depoliticized curricula, the deskilling of teachers, and the collapse of carceral logics into public schools have combined to create an educative environment characterized by the production of youth tuned into the punitive logics of indebtedness and precariousness (Giroux 2013; Saltman 2012). Education in the age of debt and austerity is increasingly being stripped of its mandate to cultivate thoughtful democratic subjects with a sense of the importance of ethical and collective obligations and the public or common good. Education has lost its capacity to cultivate subjects with critical and ethical imaginations insofar as its primary aim has been transformed to the production of isolated subjects whose obligations to society are defined solely by their roles as

consumers. Indeed, informed largely by the values of the market, education today is quickly losing the capacity to provide young people with the critical skills necessary to resist the structural conditions of neoliberalism and the bonds of perpetual debt. Instead, education has abandoned its critical and democratic dimensions and become one of the primary apparatuses for disposing young people to a future defined by permanent debt and economic instability.

If the Foucaultian notion of “‘human capital’ was the logic of neoliberalism in its expansionist periods, austerity is its logic in periods of decline and public disinvestment” (Breu 2014, p. 30). In times of growth, neoliberals bank on educating entrepreneurial subjects, while in times of decline, such as we are experiencing now, they pour millions into educative and cultural apparatus meant to produce a “resilient” mode of subjectivity (Evans and Reid 2013). Resilient young people learn to do their part not by fundamentally resisting larger structures of capital, but rather by learning strategies to deal with unstable and precarious financial and social realities. Neoliberal educative efforts bear down with particular intensity on young people both in school and through powerful forms of “public pedagogy” outside of school (Giroux 2011, 2013). Neoliberal financial pedagogy teaches youth that *resilience* is synonymous with *resistance*; that debt and diminished opportunity is inevitable (Evans and Reid 2013). Ultimately, dominant neoliberal power uses education to teach young people that violent capitalist structures are to be mediated rather than transformed, and, worse still, that the only viable way to do this is through individual rather than collective techniques. Financial and economic resilience, rather than political and social resistance, and bare financial literacy, rather than a critical literacy informed by an empowering language of critical pedagogy, have become the dominant educational techniques of the contemporary moment.

Neoliberal regimes of power operate by convincing populations that a market society is synonymous with democracy and that the fundamental obligations of citizenship are commercial. This ideological influence works on young people at multiple points throughout

society: through corporatized curricula in schools, as well as through a larger educational culture steeped in corporate and commercial values. Addressing neoliberalism as an educational project which produces particular forms of subjectivity is important for recognizing the degree to which questions about subjectivity, identity, and morality, as well as the limits of political possibility and political imagination, are, in the current moment, also necessarily questions about debt and indebtedness.

Highly commercialized and corporatized forms of life are both cause and effect of a dominant mode of education that fails to teach young people to think politically and socially. Taken over by business interests and markets, public education teaches students about what life dominated by corporations looks and feels like. In urban centers across the country, funding cuts to public education are matched by “turnaround” and “leadership” schemes which result in the stripping of public schools’ capacities to defend themselves from privatization and to generate critical citizens (Saltman 2012). Instead, corporate education has introduced a set of conditions in which subjects are produced to conform to a corporate type of citizenship for an increasingly corporate kind of sovereignty. As Saltman (2012) argues, neoliberal corporate education reformers “champion private sector approaches to reform including, especially, privatization, deregulation, and the importation of terms and assumptions from business, while they imagine public schools as private businesses, districts as markets, students as consumers and knowledge as a product” (p. 1). Youth indebtedness is intensified by the assault on unions and teachers, the closure of dozens of public schools in impoverished neighborhoods, the expansion of charters and Educational Management Organizations, and the market-friendly developments of the new Common Core Curriculum. The modus operandi of public education has become indistinguishable from that of business and corporations, both demand the activity of consumers willing to rely on predatory financial service industries and to go into debt, whether for education, healthcare, or simply to eat. Education, much like market society more generally, has become primarily an

indebted space. The result is not only an education saturated in commercial and corporate values, but also a dominant mode of subjectivity dangerously disposed to the swindle of consumerism and, ultimately, the misery of indebtedness.

The increased domination of public education and culture by corporate and commercializing forces is part of a shift towards what Bauman (2005) calls a “society of consumers.” Bauman (2005) uses sociological analysis to argue that as the social state and the production base waned throughout the 1980s and 1990s in the West, a new neoliberal society emerged that resituated consumerism from the periphery directly into the center of a new form of social, political, and economic life. According to Bauman, consumerism has radically altered contemporary notions of work, ethics, and time. If work was once the determining factor of a productive economy, or productivity more generally, consumerism now fills that role. Consequently, notions of freedom and what it means to be a citizen in the company of others have been reconceived according to the narrowly circumscribed logic of consumerism.

If, as Bauman argues, there is a morality of consumerism, there is an inverse morality of debt. In fact, consumerism and debt are two intimately related vehicles driving the financialized violence at the heart of neoliberalism. So much of neoliberal education is about learning to live in the moment, to take risks, to be bold. Consumerism is about desire, pleasure, and, temporally speaking, the present moment. Debt, on the other hand, is about discipline, self-restraint, and the future. The short-termism that defines all facets of life in the neoliberal conjuncture is responsible for subjects’ incapacity to think clearly and collectively about the long-term consequences of debt and indebtedness. Neoliberal subjects are well versed in the lingua franca of consumerism, while being exceptionally poorly versed in the lexical complexity and perpetual obligations of debt and indebtedness. Indeed, young people learn to not see debt and its consequences by seeing the world through consumerism. Debt is the perpetual blind spot of neoliberal consumerism. And if consumerism has become an alibi for indebtedness, it has also impoverished the political imagination.

Neoliberal education and bankrupt notions of financial literacy have played a key part in this impoverishment.

Financial Literacy and the Promise of Critical Pedagogy

In the aftermath of the 2008 financial crisis, the US government established the Consumer Financial Protection Bureau (CFPB), part of the larger Dodd-Frank and Consumer Protection Act, in an effort to prevent reckless financial practices they deemed responsible for the subprime mortgage crisis. In April 2013, the CFPB's office of financial education policy published policy recommendations for advancing K-12 financial education called "Transforming the Financial Lives of a Generation of Young Americans." The white paper "aims to advance secondary financial education" through "a comprehensive strategy to impart personal financial-management skills to young people while they are in school." The paper proposes that the best way to "transform the financial lives of youth" is by cultivating more "resilient" financial subjects who are able to "take more control over their economic lives" by making sound decisions regarding what they define as "necessary" and "unnecessary" debt.

"Transforming the Financial Lives of a Generation of Young Americans" offers five recommendations, which, the authors insist, have the potential to provide young people with the knowledge and skills to avoid "repeat[ing] the financial mistakes made by earlier generations." The first recommendation is to "[i]ntroduce key financial education concepts early and continue to build on that foundation consistently throughout the K-12 school years." Second, to "[i]nclude personal financial management questions in standardized tests." Third, to "[p]rovide opportunities throughout the K-12 years to practice money management through innovative, hands-on learning opportunities." Fourth, to "[c]reate consistent opportunities and incentives for teachers to take financial education training with the express intention of teaching financial management to their students." And finally, to "[e]ncourage parents and guardians to discuss money management topics at home."

In seeking to provide young people with the tools to avoid another economic crisis, and completely ignoring the larger structural causes of the crisis, the document effectively reinforces many of the core values of neoliberalism. Moreover, the recommendations are symptomatic of a methods- and skills-based approach to education and are void of a critical pedagogic dimension that would make matters of justice, equality, and collective freedom part of the conversation (Giroux 2011; Saltman 2012). The document asks schools to introduce the disciplinary logic of the market to kids at a younger age; to further corporatize the curriculum and the delivery of education by including financial literacy on standardized Common Core testing; and to incorporate "money management" and "learning opportunities" by private financial companies and corporations, many of which were directly responsible for the structural conditions leading to the 2008 crisis. Moreover, it suggests incentivizing underpaid teachers to do even more volunteer work under the guise of "educational training." And finally, it recommends extending conversations about financial self-management into students' homes, where, for low-income families, for whom no amount of financial management will ever offer "transformation," such exchanges are likely to become a source of shame and anxiety for both parents and students.

The point of my critique is not to suggest that young people should not be taught about the differences between responsible and irresponsible financial choices. Indeed, cultivating sustainable consumer habits is an important part of the larger project of resisting capitalism. That being said, the document and neoliberal education more generally fails to contextualize the role of consumerism and credit and debt in young peoples' lives and offers inadequate individualized solutions to what are far more complex and collective issues. While ostensibly an attempt to give youth valuable and "transformative" financial tools, financial literacy in this case means educating financially literate but politically and socially illiterate students. With no understanding of the overarching logics of capitalism, and no real sense that a different kind of society could be possible, financial literacy at best provides subjects with basic financial tools

for survival, but certainly not the vision or skills to achieve social or political transformation. Meaningful collective transformation requires a critical approach to financial literacy that “take[s] young people beyond the world they are familiar with and makes clear how classroom knowledge, values, desires, and social relations are always implicated in power” (Giroux 2011, p. 6).

Schools and the larger educational culture are increasingly turning to this kind of financial literacy as a viable method for managing debt. Yet financial literacy, to use a distinction made by Paulo Freire, focuses on the *words* of finance at the expense of the often unhealthy, painful, shameful, and isolating *worlds* created by violent structures of capital. As a result, financial literacy without a critical pedagogic dimension paradoxically empowers youth individually at the same time as it disempowers them collectively. Seeing the *world* of debt and indebtedness requires critical pedagogy’s emphasis on empowerment, agency, imagination, and radical hope. Educators need to be given an opportunity to struggle over the conditions that would allow them to more clearly connect financial literacy skills to a critique of capitalism in the classroom. Ultimately, we need to transform not only the “financial lives of a generation of young Americans” but more importantly, the larger set of conditions that make those financialized forms of life available in the first place. Doing so will require introducing young people to a far more critical form of financial literacy, one that foregrounds critical pedagogy in order to teach students about the fundamental links between consumerism and indebtedness, on the one hand, and on the other, the violent ideology of finance capitalism (see Arthur 2012).

Conclusion

Resisting the educative forces teaching youth to learn to accept an indebted form of life is central to the struggle against neoliberal capitalism. This struggle requires strengthening the democratic formative cultures and the critical modes of pedagogy that Giroux argues are essential for young

people to reimagine and rebuild a way of living in common outside of the cruel economic and psychic privations of austerity and debt. And for that to happen we need activists, public intellectuals, artists, working people, and democratic citizens from all walks of life to come together to fight for education as a free and accessible public good. To develop the knowledge and skills to challenge the violence of neoliberal debt and austerity regimes, young people need to have the opportunity to be engaged in their role as students as public and critical citizens, and not as private consumers and resilient debtors. Education must be made hospitable to critical pedagogy so as to make financial literacy speak to the structural conditions of neoliberalism’s ongoing financial and ideological crises and thus to make it “meaningful” in order to make it “critical,” and, ultimately, “transformative” (Giroux 2011).
