Internationally several projects intend to bring researchers together to comparatively and collaboratively think of best practices to implement and realize particular pedagogical models. For example, bringing inquiry-based learning into the different levels of mathematics education with the purpose of creating more student-centered, scientific practice-inspired ways of working in schools and teacher education has been the aim of several European projects wanting to address the lack of interest of European youth to pursue STEM-related studies, which is a top policy priority for many countries in education (Maaß and Artigue 2013). From detailed design-research projects to large international studies, the view of research and researchers as the devising of technical solutions for the implementation of policy has been productive in advancing educational agendas in mathematics.

An *emancipatory perspective* takes a critical stance toward the systematic negative effects of existing policies on the possibilities of access of certain groups to achieve the desired results in mathematics. It is a fact that in different countries and regions, there exists a differential participation of students to quality teaching and learning, what leads to systematic low school results as measured in comparative national or international measurements (Atweh et al. 2011). Such differences in mathematics school results are distributed in categories such as ability, gender, race, language, ethnicity, religion, nationality, etc. The existence of the differentiation is seen as a threat to individual success, democracy, and social justice. It is also a problem to the active and successful incorporation of people to a qualified labor market and, with it, the possibilities of individual and social economic success. An emancipatory perspective sees the role of mathematics education research as providing evidence on the effects of policy, as well as devising strategies of wealth redistribution, as well as recognition of cultural differences.

This perspective has gained strength since the 1980s when the supposed neutrality of mathematics education started to be questioned. A key example of this view is represented in many of the mathematics education research carried out in post-apartheid South Africa where issues of poverty, gender, race, linguistic difference, and changes in the organization of mathematics education have been strongly conceived in relation to the making of a democratic transition (Vithal et al. 2005). But this is not only a view in the so-called “developing” countries. Indeed, the Introduction and the six chapters that form the section “Policy Dimension of Mathematics Education” of the *Second International Handbook of Mathematics Education* (Bishop et al. 2003) adopt this perspective. Different mathematics education policies around the world are analyzed from a critical standpoint. The policies are questioned in their emancipatory possibilities for those who had/have unequal access to cultural and material goods, thanks to the many discriminations that mark the current globalized world.

A *governmentality perspective* adopts the view that mathematics education is a set of “practices and strategies that individuals in their freedom use in controlling or governing themselves and others” (Besley and Peters 2007, p. 139). The political effects of the assemblages of policy and research are to be traced and uncovered in their productive making of notions of populations and individuals as mathematically (in)competent, (un)able, (un)productive, and thus economically, socially, and culturally (ex) included. Both policy and research, as expert knowledge, “do things” on teachers, students, and school administrators. In connection with the increasing will to policy-regulate education, mathematics education researchers have also built the desire to improve and reform mathematical instruction and to help addressing educational inequalities. At the same time as research brings direction to practice in alignment or critique to policy, it also desires to inform and influence policy and policy makers with better ways of improving instruction for both individuals and populations.

While other perspectives may assume that the connection between practice, policy, and research is weak because these do not seem to align in achieving expressed desired changes of behavior, a governmentality perspective links them tight together in the generation of accepted truths on why it is necessary to be a high mathematics achiever, on how it benefits individuals and national economies, and on why and how certain students are meant or not meant to become mathematically competent.

The take of this perspective has been recent in mathematics education research. The technologies of mathematics education are not simply neutral tools for the betterment of learning, but also and at the same time they contribute to the constitution of learners’ subjectivities and of those of the many other participants in the broad network of mathematics education practices. Some studies direct their gaze to the power effects of research in the fabrication of subjectivities. Valero and Knijnik (2015) describe the set of practices and strategies related to ICT research in mathematics education in the

contemporary neoliberal globalized world. As part of pedagogical practices, the artifacts of ICT are more than mediating tools for cognition and knowledge objectification. They have an effect on the self and research devises effective technologies for governing groups and individuals with and through ICT: “Mathematics education research conducts the conduct of school subjects, in order to fabricate the desired rational, techno-scientific and entrepreneurial subjects of education” (p. 37).

Some other studies focus on the power effects of policies in educational practices. Knijnik and Wanderer (2015) discuss two educational policies in mathematics addressed to rural multigrade schools in Brazil. These policies are connected to different, disputing projects of society: the first is aligned with neoliberal hegemonic logic, while the second is attuned to the struggles of the landless movement, in opposition to World Bank guidelines. In a longitudinal study in New Zealand, Walls (2009) shows how children became mathematical subjects in the assemblage of teaching, testing, and discourses in schools, families, and society about notions of mathematical ability. Diaz (2014) examined the Maths for All reform in the USA since the 1960s and their assumption on the learning of the equal sign. Notions of equality embed notions of sameness, which operate classifications and differentiations among those children who have learned the “right” equality and those who have failed to do so.

With respect to the effects of international comparative assessments on governing countries and managing their educational systems to produce desired national and international levels of achievement in mathematics, Kaner et al. (2014) argue that PISA has formed a regime that has been taken uncritically by researchers who justify their activity as offering insights and solutions to the problems evidenced in its results. PISA, an OECD machinery, and in general the system of reason that they together constitute have produced regimes of veridiction (Foucault 2014) about what counts as mathematical competence and how it connects to global economy and social growth that are hard to challenge.

Concluding Remarks

Conceiving of mathematics education as a matter of policy allows focusing on the governing of populations and individuals toward expected and desired behavior, namely, the acquisition of mathematical knowledge, competence, and expertise, since these are valued as indispensable qualifications of modern, rational, economically productive citizens. Such theorization highlights the operation of mathematics education as part of current dispositives of power in society. The three understandings traced above are not necessarily discrete categories. They can operate simultaneously as analytical perspectives, as well as ways for researchers to engage in and with educational practice and educational policy. Finally, a Foucault-inspired governmentality perspective also opens lines of flight, movements of resistance, or counter-conduct toward new not-yet-imagined possibilities of mathematics education in relation to policy.

Mathematics Education as a Matter of Technology

Nathalie Sinclair

Faculty of Education, Simon Fraser University,
Burnaby, BC, Canada

Introduction

Mathematics education, like mathematics, has always been a matter of technology. Whether it is the compass -and -straightedge or the

blackboard, both the doing and teaching of mathematics have always featured tools or devices of some kind. While much attention is currently given to whether or not contemporary digital technology improves teaching and/or learning, the focus here will be on the changing understanding of technology over time and its relation to ontological, epistemological, and even axiological stances at play in mathematics education. The following three sections thus, respectively, explore the shifting terrain of technology, the ongoing dance between mind and matter in which technology is inscribed, and the evolving functions of technology in mathematics education.

The Shifting Terrain of Technology

As befits this kind of inquiry, it is useful to reflect upon what people mean when they use the word “technology” and how this has changed over time in mathematics education. The ancient Greek etymology suggests that the word, which combines *techne* and *ology*, refers to the study of craft. One online dictionary defines technology as “the collection of techniques, skills, methods and processes used in the production of goods or services or in the accomplishment of objectives, such as scientific investigation” (Wikipedia). Within the scope of this definition, it is entirely defensible to see algebra as technology – albeit a symbolic one – since it contains a collection of techniques and methods for solving equations.

In the French mathematics education tradition, the word “technology” reflects the above etymology as it is seen as the “discourse which is used in order to both explain and justify” a technique, whereas a technique is a manner of solving a task (Artigue 2002, p. 248). In the Anglophone tradition, however, the word is most often used to refer to the thing that solves the task and *replaces* the human being. The pencil can be seen as a technique within the French tradition (as a means of performing a particular algorithm such as long division) and as a technology in the Anglophone tradition (as a thing used to solve a task). One could say the same thing for the

Babylonian square root tables, the abacus, the calculator, and even our fingers (arguably the earliest and greatest technology for calculating)!

In modern usage within the international mathematics education community, the word “technology” would typically be used to refer only to a calculator in the above list. A technology has thus become a digital device of some kind and almost always one that is pedagogical: a thing used to solve the task of teaching and learning mathematics. Indeed, like most non-digital technology found in classrooms (Dienes blocks, Cuisenaire rods, tens frames), the digital technology of mathematics education, such as graphing calculators, the computer language Logo, and most stand-alone software, is often restricted to the mathematics classroom. The framing of technology as pedagogical in mathematics education is part of what makes non-pedagogical technology – like pencils, graph paper, and rulers – more invisible in terms of how it contributes to formatting mathematics.

As the functions of the computer diversified, the phrase “information and communication technology” (ICT) became widely used. Nowadays, with the prevalence of portable, auxiliary devices, the word “technology” on its own is likely to become outmoded, being replaced with “mobile technology” or “Web 2.0 technology” or “virtual technology.” One benefit of such diversification may be the concomitant acknowledgement that the word “technology” – as it is used in mathematics education – may have lost relevance, especially when one considers the ways in which things that run on electricity (an online test, an animation, a word or symbol processor, a 3D pen) may have less in common with each other than the variety of rectangular objects (textbooks, worksheets, screens) that are used in the mathematics classroom. Indeed, one of the most significant insights from mathematics education research is that difference matters: asking the question “does technology work?” makes no more sense than asking “is food good?” It depends not only on the particular technology in question – be it a coding language, a dynamic geometry environment (DGE), a touchscreen app, an educational game, or immersive

glasses – but also on the particular instantiation of it (the teacher, the classroom context), as well as the particular educational aims.

Despite these new names, the word “technology” has become synonymous with the digital, thus obscuring the fact that, as Rotman (2008) shows, mathematics has been engaged in a two-way coevolutionary relationship with devices since its inception. Technology has always mattered in mathematics. In mathematics education, however, post-1970 digital technology is seen as extraneous and epiphenomenal, which may contribute to its relatively slow and greatly resisted uptake (Mullis et al. 2004).

The Ongoing Dance Between Mind and Matter

Mathematics tends to wish away its entanglement with devices. Indeed, the Aristotelian injunction that clearly separates the physical from the mathematical necessitates that what is material and mobile must eventually be extracted from something if it is to become or remain mathematics. This produces invisible technology like the sand in which Greek diagrams were drawn, the compasses with which circles were made, and the pencils with which words and symbols were written. There is invisible technology of the mathematics classroom, such as the blackboard, which is a relatively recent invention (for a history, see Kidwell et al. 2008). The blackboard is a very successful technology for making public and for replacing the oral with the written, one which radically changed mathematics education, but few people consider the blackboard as technology or question how it matters to mathematics education. Similarly, the rectangular piece of paper on which notes are taken, exercises completed, exams written, and journals maintained is a technology whose particular permanence, shape, and dimensionality matter greatly in mathematics education – consider how mathematics education would change with the lack of permanence, the change in shape (not so linear?), and the increase in dimension (not so flat).

Another invisible technology, which Ruthven (2008) examines, is graph paper, a physical technology that almost seamlessly inserted itself into the mathematics classroom, thus providing an ideal case study for understanding the culture of mathematics education, at least in terms of its ontological, epistemic, and axiological natures. When graph paper arrived, a century ago, mathematics education was in the process of “taking over” geometrical drawing from art education and technical drawing and was seen as part of a descriptive, experiential geometry that was not strictly linked to the theoretical geometry of Euclid. In trying to explain why graph paper succeeded as a technology, when so many others had failed, Ruthven proposes the following four reasons: (a) alignment with trends in mathematics (for a more functional approach to mathematics, promoted by Felix Klein), (b) currency both outside of and within the mathematics classroom, (c) alignment with current classroom practices and the curriculum, and (d) the wide range of pedagogical benefits – across a variety of topics including geometry, algebra, and statistics – that considerably outweigh concerns.

In addition to the reasons cited by Ruthven, there is another aspect of the invisibility of both the blackboard and graph paper, which is that they do not change long-standing ontological assumptions about mathematics nor about who is doing it (the mathematician). By contrast, with digital devices, the agency shifts toward the computer, which can calculate, evaluate, render, and so on. As Shaffer and Kaput (1998) have argued, from an evolutionary perspective, if pre-digital technology served to off-load or distribute information, which leaving the mathematician free to act on that information without having to memorize it, the computer off-loads or externalizes the *processing* of information. This leaves the mathematician in a very different position, as the computer not only does the processing faster and more reliably, but also does processing that the mathematician could never do. Computers change mathematics and they change mathematicians. While this situation has caused some concern within the mathematics community, particularly in relation to computer-based proofs, the parallel

implications for mathematics education – how school mathematics might change and how the student might change – have yet to be addressed. Indeed, a computer can carry out most of the standard school curriculum tasks, which disturbs the traditional scope and order of school mathematics, especially the idea that the learning of mathematics *must* begin with (some version of) “the basics.” Current developmental theories, which are still very influential in mathematics, also belong to the technological culture of paper and pencil, further challenging research efforts aimed at understanding what students with technology might be doing and learning in the mathematics classroom.

Returning to the ontological issue, the computer changes the actual and perceived nature of mathematical objects. If the Aristotelian preference – and here there are also axiological issues at play, such as preference for the ideational over the material, the perfect mental image over the imperfect tool – is for abstract, disembodied concepts, then the computer screen pulls the mathematics back into the physical world, albeit a virtual one. This can be exemplified by a dynamic geometry triangle, which can be constructed using three segments that are straighter than any segment drawn in the sand or on a piece of paper, seemingly making it more ideational.

However, the triangle can be dragged into any number of configurations in a continuous way, thus newly inscribing the triangle in time, keeping it connected with the hand that moves, and gesturing toward the infinite generality that is “triangle.” Instead of being separate from the mathematician who contemplates it, the triangle depends on the mathematician in such a way that the agent and the object – and also the screen – are now intertwined. The boundary between the materials thus becomes re-drawn, changing not only what a triangle is but how a triangle might be conceived.

The example above highlights the way in which technology in mathematics education not only changes the mathematics, but also changes the mathematician in terms of her sensory engagement with mathematics. Dynamic geometry environments (DGE) grew out of an interest, both

among mathematicians and mathematics educators, in visualization, which co-opts the eye in new ways, but it also offered the motor system as a new potential organ for mathematical thinking (one DGE, *The Geometer's Sketchpad*, also offers sound as another sensory mode of interaction). The quite recent emergence of touchscreens co-opts the fingers and hands in new ways as well. The resulting sensory practices defy the image of the cerebral, ascetic mathematician by both recruiting and extending the body of the mathematician.

Very few philosophically grounded theories in mathematics education have been made that disturb the ontological assumptions about mathematics. Learning theories related to constructivism, social constructivism, and even constructionism, as well as tool-based theories such as instrumental genesis and the theory of semiotic mediation, are more or less silent on ontological questions, perhaps because they all conceive of mathematics as a fixed endpoint toward which learning aspires to reach. This has circumscribed mathematics education as a matter of technology in certain ways in which the main goal of digital technology is apparently to enable students and teachers to learn mathematics as defined by the hybrid technologies of paper and pencil. Recent philosophical work that insists on the material nature of mathematics, both within mathematics and mathematics education (de Freitas and Sinclair 2013), may provide ontological grounds on which it would be possible to theorize the entanglement of mathematics and matter in such a way that mathematics as well as mathematics education could become reconfigured by and through technology.

Evolving Functions of Technology

Technology has been and continues to be intertwined with mathematics, both by offering new ways to solve problems, but also by providing a source of new concepts and questions. But what is the function of technology in mathematics education? It has long been a vehicle for intuition

and experimentation, which places it primarily in the domain of functioning *for student learning*. This has been true for the early work of Papert (1980) and colleagues (Noss and Hoyles 1996) around the use of Logo, which was certainly a programming language aiming to promote intuition and experimentation. Also for student learning, however, were computer-assisted programs (which started even earlier than Logo and persist today) that aimed for direct instruction and often procedural learning through drill and practice. These very different kinds of digital technologies shared a common, albeit sometimes only implicit, assumption that the computer could replace the teacher.

In their characterization of technology trends in school mathematics, Jackiw and Sinclair (2005) describe first-wave digital technology as being almost exclusively focused on learners' interactions with technology (such as Logo) and second-wave digital technologies, such as spreadsheets, graphing calculators, computer algebra systems, and DGEs, all of which are more transparently related to the school mathematics curriculum. In this shift from first to second wave, the function of the technology was *for student learning of the curriculum*. While dynamic geometry environments and graphing calculators could certainly promote intuition and experimentation, school mathematics content was foregrounded. Indeed, the primitives in these second-wave digital technologies (functions, variables, segments, circles, etc.) are recognizably from school mathematics content.

Second-wave technologies have persisted, though less as vehicles for intuition and experimentation. Indeed, as reported in the ICMI study *Technology Revisited* (Sinclair et al. 2009) and more recently Sinclair and Yerushalmy's (2016) overview of the past 10 years of PME research, a didactic transposition – that is, a transformation of mathematics into school mathematics – has taken place in which the primary function is *for classroom and curricular practices*. Open-ended, exploratory environments have undergone two transformations: (1) toward task embeddedness, which directs the actions with and uses of the

technology toward more specific purposes, and (2) toward *evaluative technologies*, which provide external feedback on students' responses and actions. These effectively serve the teacher or the institution, thereby transforming the function of these digital technologies from being *for learning* to being *for teaching*.

Third-wave technologies again shift the functionality in that they are *for classroom mathematics*. Socially sensitive, third-wave technologies, such as networked calculators, recognize that multiple learners are customarily involved in a classroom, all of whom could be able to communicate with each other, as well as with the teacher, and even beyond the classroom. These technologies, as with the blackboard, help make mathematics public and shared, aiming to encourage collaborative work that can be distributed across different devices and geographical locations. They emerged during a period of time where mathematics education research also shifted focus to the teacher, acknowledging – among other things – that first- and second-wave technologies do not replace the classroom teacher and do not fit easily within existing classroom practices. If first-wave digital technologies foregrounded the digital tool and second-wave digital technologies foregrounded school mathematics, then third-wave technologies foreground interaction. In this third wave, mathematics education as a matter of technology folds into mathematics education as a matter of distributed interaction.

In 2005, third-wave technology was in its infancy, but has in many ways been taken over by social media technology (which has heretofore received scant research attention) and mobile devices such as tablets and smartphones. We might call these fourth-wave technologies, but, more importantly, they are distinctive in their function in that they are *for everyone*. This is obviously true for social media, which, like the internet, is not particularly about mathematics. For mobile devices, however, especially those that enable touchscreen interactions, computer interaction now only requires fingers or gesture-based movements, which are much more widely accessible than keyboards and alphanumeric

interactions. Indeed, Rotman (2008) speaks of cultural *neotony* whereby adults “come to resemble the young of their evolutionary forebears” and in which speech becomes reconfigured, remediated, and transfigured, as it did in the advent of alphabetic writing, “into a more mobile, expressive, and affective apparatus by the nascent gesture-haptic resources emerging from the technologies of motion capture” (p. 49). Interestingly, such new gesture-haptic resources can also minimize the distance between the human body and the mathematics, so that the dynamic geometry triangle describe above – an almost -Platonic object – can literally be at one's fingertips. The assumed boundary between matter and mind thus further shifts and weakens.

Conclusion

Mathematics education as a matter of technology has been caught up in a meliorist view in which technology is expected to improve teaching and learning. This is a reasonable expectation, given the economic impact of purchasing and maintaining new technologies at an institutional level and the concomitant challenges of access and equity. Artigue's (2002) influential paper argues, however, that comparative studies showing how a device such as the graphing calculator was “better” than paper and pencil were fundamentally flawed, not only because comparison is almost impossible (since the measure of success would have to be within the “old” technology), but also because it neglects to account for the pragmatic and epistemic values of technology, where pragmatic values focus on “their productive potential (efficiency, cost, field of validity)” and epistemic values on how they “contribute to the understanding of the objects they involve” (p. 248). But technology is also assessed according to axiological values (especially aesthetic ones). This relates not only to considerations of beauty, significance, and truth, but also to disciplinary decisions about what is to count as mathematics and, indeed, what counts as *good* mathematics. In as much as technology changes

sensory interactions in mathematics education, such as what can be seen, heard, or touched, it also circumscribes how mathematics is made to matter in the world.

Mathematics Education as a Matter of the Body

Elizabeth de Freitas

Manchester Metropolitan University, Manchester, UK

Synonyms

Biopolitics; Body; Embodied; Materiality; Neuron

Research into the various ways that the human body factors in mathematics education has recently expanded, as new theoretical developments and innovative research methods have introduced significant insights about the material dimensions of teaching and learning.

Embodied Mathematics

A catalyst for much of this work was the embodied mathematics paradigm proposed by Lakoff and Núñez (2000), who argued that the semantic content of mathematical concepts can be understood in terms of the way human bodies function in the world. Many scholars criticized this approach to mathematics for how it downplayed the role of the social, political, and material environment more broadly, while treating the body as simply the carrier of the brain and treating the brain as the seat of the mind. Indeed there are problems with the term “embodied” and “embodiment” precisely because they suggest that the body is only the container or vehicle for the thinking/acting self, rather than an active force of its own. For instance, Sheets-Johnstone (2009) criticizes the phrase “cognition is embodied” because of the way it demotes the body to being merely the vessel or container of some higher act of cognition. Such an approach continues to support a mind/body split, even as it attends more carefully to the role of the body in teaching and learning. Such work frequently involves interpreting the material actions of students and teachers as

external “simulations” of some prior or primary *internal* conceptualization.

Theories of material phenomenology (Hwang and Roth 2011) aim to overcome this tendency to split mind/body. They argue that certain phenomena that are usually described as “mental” (in the brain) might be better thought of as “corporeal.” Such an approach dissolves the dichotomy of the mind/body at the heart of the metaphor-based theory of Lakoff and Núñez and follows instead Merleau-Ponty and the tradition of phenomenology. This tradition has strongly influenced many different studies of embodied mathematics education, suggesting that “mathematical insights developed by learners are expressed in and constituted by their perceptuo-motor activities” (Nemirovsky et al. 2012, p. 311). This work shows us how micro-ethnographic facets of experience impact and partially shape the ways we teach and learn. Phenomenological approaches, however, tend to treat the material conditions of learning in terms of the human “body schema” and stop short of a more expansive treatment of the distributed agencies across the learning environment.

Research drawing on complexity theory, enactivism, and systems theory (Davis and Simmt 2003) has attempted to address this tension by defining the body as an ecological system sustained through boundary negotiations. These mathematics education scholars attend to bodily activity as enactments or performances of emergent characteristics of the material-cultural system. More recently, one finds attempts to argue that mathematical concepts be considered a kind of evolving biological species. Complexity theory in this application taps into biological images of the organic body as a dynamic system, as well as cybernetic images of an information-based society organized around goal-oriented behavior and controlling forces. This cybernetic image of the body is newly emphasized in the widespread interest in “computational thinking” in national policy documents, reflecting changes within the field of mathematics itself, as the field turns increasingly to computing techniques.

Some of these trends seem linked to a growing awareness that a systems or network approach to mathematics education can extend studies of the

human body to a more inclusive study of materialism more generally. This direction needs to be further developed using the powerful insights of social theorists in this area. New materialist philosophers pursue this direction, stretching studies of the body into more inclusive studies of the environment or matter more generally (Coole and Frost 2010). Working in this vein, de Freitas and Sinclair (2014) advocate for a more than human “inclusive materialism” in the study of mathematical activity, allowing researchers to address the way that diverse material agencies are at work in teaching and learning. They analyze mathematical activity – be it expert or novice, State-sanctioned, or renegade – as a material practice that produces specific kinds of bodies (or transmaterial assemblages) that incorporate particular kinds of mathematical concepts.

Sense, Sensation, and Perception

The philosopher of science and mathematics Michel Serres (2011) suggests that there is a “material mimicry” that needs to be better studied in teaching and learning. Serres (2011) describes this aspect of learning as unconscious and sometimes trance like: “The teaching body dances its knowledge softly so that the audience will, like it, go into a trance and so that, through virtual mimicry of its gestures, a few ideas will enter their heads via the muscles and bones, which though seated and immobile are solicited, pulled towards the beginnings of movement, perhaps even by the written work’s little jig” (Serres 2011, p. 96).

This is a body that is enmeshed or mixed with other bodies, continuously altering the way it participates in assemblages.

How do we define a body given over to so many poses and signs: when and under which form is it itself? How do we get beyond so many differences according to the person: when and under which form is it us? These multiple postures prevent us from saying. My body and our species don’t exist so much in concrete reality as “in potency” or virtuality. (Serres 2011, p. 52)

Serres (2011) suggests that we study mathematical activity for how it demonstrates the

body's fluidity and "indefinite capacity to transform" its material relations (p. 94). Mathematical activity, he argues, depends on "infinitesimal intuitions" or "petites perceptions" when consciousness submits to the impersonal pre-individual mobility of material entanglements. This approach allows one to study mathematical invention for how the material configuration – of body, word, and technology – is newly configured through bodily activity, opening up new ways of sensing and making sense. He suggests that we attend to the material habits of the human body as it partakes in these mathematical practices, not for justifying (school) mathematics because of its relevance or necessity, but in order to help researchers better understand our convictions about that necessity. Such an approach is both (1) an exploration of the nature of inventive and creative processes and (2) a description of material relationships which condition the emergence of the new. By attending to the body at such moments, and its changing relationship with other moving bodies, we come face to face with the contingency of mathematics.

The focus on the body in mathematics education has led to a proliferation of research on the "multimodality" of mathematical activity. Multimodality, however, often treats each modality (gesture, vision, speech, etc.) as a *language* with coded meanings and thereby imposes a linguistic model on all bodily activity. But the recent "ontological turn" and "affect turn" suggest that language-based models of analysis (such as those that spring from linguistics, Lacanian analysis, and some semiotics) fail to grasp the diverse ways that bodies *matter*. For instance, Massumi (2011) suggests that perception isn't so much packaged or bundled into different modalities, but is a process of suffusion and speculative investment in movement. He suggests that the senses are always already fused – not correlated nor merely coupled, but literally fused together: "The senses only ever function together, fusionally, in differential contrast and coming-together" (p. 75). The radical implication of such work is that a purely fusional sensory system – if examined at the micro level – points to the occurrence of immanent and amodal sensing. In other

words, a great deal of sensing is outside of modality. It is neither this mode nor that one. It is a lived-in sensing that is preperception and pre-apprehension (insofar as these are conceptualized in perception studies or semiotics).

Research on the role of movement in perception has shown that the *proprioceptive potentialities* of the body are continuously reconfigured as one moves, as are the relative locations of objects in the foreground and background. Sheets-Johnstone (2009) argues "not only is our perception of the world everywhere and always animated, but our movement is everywhere and always kinesthetically informed" (p. 113). Kinesthesia refers to the ability of the human body to feel its own movement and states and thereby contributes to the sense that "one-self" is the source of such action. Rather than essentialize this sense of willfulness or intentionality, or attribute it to intuition, more research is needed on how the proprioceptive potentialities of the body are provisional and indeterminate. There is increasing interest in a post-phenomenological approach to the study of perception, so that researchers might better attend to the body as part of a sensory surround environment.

Disability/Ability

We tend to think of bodies as physical objects, some more animate than others. This typically directs our attention to how bodies are individuated and *possess* particular abilities and disabilities. Mathematics ability is profoundly linked to everyday material embodied practices that configure what is taken to be visible, touchable, and sayable. In other words, sensing and making sense in mathematics education are political practices precisely because they are the "common" practices by which "the distribution of the sensible" is made to correspond to what is valued within a community. This distribution has socio-political consequences for how teachers and others conceptualize disability/ability in mathematics classrooms. The human body becomes differently abled when contemporary distributions of the sensible – through technology, curriculum, and other media – are altered.

Thus regimes of perception in mathematics education actually produce the limits of what is sensible and what is potentially embodied for those who are within that elite community of practice. In a mathematics curriculum focused on the alphanumeric rather than the spatial and the tactile, particular bodies will be disenfranchised, and they are likely to be the ones diagnosed as different. The ways in which mathematics is represented, communicated, and explained tacitly privileges certain sensory capacities (Healy and Fernandes 2011).

The literature in critical disability/ability suggests that disability/ability be redefined as “[t]hat in the body which exceeds deterministic efforts to predict a life trajectory” (Snyder and Mitchell 2001, p. 377). Such an approach opens up the question “what is a body?” for discussion. These developments in disability/ability theory are studying how a body becomes individuated with a provisional set of organs open to constant reorganization. Organs are contracted and sustained *over time* and are thus de-essentialized. It is not that the organs themselves are unimportant, but the particular arrangement of the organs known as the organism is not a biological given. Such an approach allows one to study how flows of capital reconfigure the borders around bodies and produce new kinds of laboring bodies. It also allows one to study the way that bodies are provisionally and temporarily enabled, directing our attention to the temporal contingency of disability/ability.

Neuroscience

Brain research is becoming increasingly influential in the field of education policy. “Brain friendly” approaches to education proliferate in the popular press, and funding agencies support large-scale international studies of brain activity in mostly clinical studies of teaching and learning. Within mathematics education, there has been a radical increase in neurocognitive approaches to the study of number sense in the last two decades (Nieder and Dehaene 2009). Popularized by Dehaene’s (2011) book *The Number Sense*, in which the term “number sense” referred to the “sense of approximate

numerical magnitudes,” the concept of “number sense” is now used extensively in neurocognitive research to describe arithmetic skills. Dehaene (2011) traces current cognitive tests of number sense back to 1886 when the American psychologist James McKeen Cattell designed an experiment to test participant’s response time during tasks of enumerating the number of black dots on a series of cards, studying how humans can enumerate *without counting*, which is known as “subitization.”

With the advent of brain imaging technology, cognitive neuroscientists have continued to use these, and similar tests to show that a particular group of neurons in the brain – in the intraparietal sulcus (IPS) – are always “activated” whenever humans, and many other animals, are given a calculation task (Nieder and Dehaene 2009). These scientists are searching for the “number neuron” where they believe number sense resides or, in the least, upon which number sense is “based.” This research is important for how it centers affect, or preconscious perception, and a kind of knowing in the body. But research on brain activity also lends itself to reductionist and deterministic claims about neurobiology as the basis of learning. The impact of this research on education is potentially profound, as many cite it as evidence that number sense and “dyscalculia” are biologically innate.

Through neurocognitive research, and related policy, the student’s body is being reconfigured and reassembled. As number neurons take on a more significant role in assessments of student achievement, the question as to what or who is doing mathematics is raised. There is a need to resist simplistic images of neuronal activity that reduce the capacities and potentialities of the human body to the brain, but also a need to find a way to better understand how neurons participate in bodily activity. Researchers must find new ways of studying how the neuron participates in learning events, not simply as a biomarker of disability/ability. As a counter to such reductionist work, Sheets-Johnstone (2009) underscores the plasticity of the brain and the fact that mirror neurons are contingent on morphology and corporeal-kinetic tactile-kinesthetic experience. Thus the entire activity of mirror neurons is

actually conditional on kinesthetic activity and sociocultural factors. In related efforts, recent work in the social sciences has turned to the study of “biosocial becomings” and “bio-culture” in order to better understand how the social and the biological operate at all scales, beneath and beyond the human (Papoulias and Callard 2010). Recently, de Freitas and Sinclair (2015) have taken on this challenge by exploring how neurocognitive research into number sense neglects the arithmetic concept of ordinality. The aim is to show how particular kinds of mathematics, and not others, are implicated in this research.

Biopolitics

The biopolitics of mathematics education is an important research focus, precisely because the body is the subject of the medical and life sciences while playing such a powerful part in all teaching and learning. Inspired in large part by the philosophy of Michel Foucault, scholars in the 1990s critiqued scientific theories that essentialized the body, especially reductive approaches that explained social behavior with reference to gendered or raced bodies. Feminist philosophers and other scholars fought hard to show how the body was a product of sociocultural forces, directing our attention away from the materiality of the body and toward the performative nature of identity. These approaches to the body pushed the discussion of embodiment beyond the reductive positivism of behaviorist research from previous decades (see for instance the excellent work of feminist philosophers such as Judith Butler and Elizabeth Grosz).

Both Butler and Grosz emphasized the psychological dimension of embodiment and the power of discourse in shaping embodied experience. The body, according to Grosz, becomes a human body when it coincides with the shape and space of a psyche. She argued that bodies become bodies when they are validated or recognized in particular social networks and that there was no *essentialized body* before it was inscribed with socially coded meanings. She emphasizes discursive constructions of dominant body images, whereby the

body is treated as an amorphous material onto which cultural meaning is projected. In the 1990s, this allowed for strong critiques of dominant and normative body images.

Much of the work on gendered and raced identity in mathematics education inherits this kind of stance toward the body, focusing on how mathematical ability is not innate to particular bodies, but instead emerges within particular sociocultural formations through discursive construction. The sociocultural approach to studies of mathematics education has been hugely influential, but it has produced certain blind spots with regard to the body and its role in teaching and learning. A theoretical shift away from “identity politics” and language-based approaches has led to recent attempts to more adequately take up the material dimensions of the body in a more expansive biopolitics (Coole and Frost 2010).

This new materialist development finds inspiration in the work of Gilles Deleuze and Felix Guattari who offer a way of thinking the political at diverse scales, tracking traits and flows of capital across the molecular and the molar. In their claim that “every politics is simultaneously a *macropolitics* and a *micropolitics*,” they shift focus to the molecular and imperceptible forces that operate beneath and beside the human subject. This molecularization of politics has the potential to radically open up our research to new ways of attending to the biopolitics of embodied mathematics. If previous theories of labor and capital reflect previous images of the individuated human body, then there is a need to revamp these theories in order to deal with the emergence of a disassembled human body *becoming molecular*. By attending to processes of *dividuation* (rather than or in addition to individuation), Deleuze and Guattari underscore the way in which advanced capitalism extracts value at all scales and speeds, whether it be from human identities (race, gender, sexual orientation, etc.) or from the labor of nonhuman molecular bodies like the neuron. Precisely for this reason, more research on mathematics education *as a matter of the body* is crucial today, as education policy becomes increasingly global in its reach and increasingly biomaterial in its governance.

Plato in the *Theaetetus*, (1892, 198a) spoke of knowledge as something one could not just possess passively. To retrieve and use knowledge, one needs reason. Philip Phenix (1958) similarly wrote that rote memorization is relatively inefficient if the symbols learned are not significant to the learner. For Phenix, significance depends less on reason than on meaning.

Michael Polanyi (1969) agreed, saying that all human thought comes into existence by grasping the meaning and mastering the use of language. To grasp meaning, one has to interiorize external things or pour oneself into them. Meaning arises either by integrating clues in our own body or by integrating clues outside. We cannot learn to ride a bicycle by memorizing the laws of physics that govern its balance. The laws have to be made meaningful by getting on the bike and trying the different actions that keep it upright and heading in the direction we want it to go. The language of

physics is less necessary to bike riding than is an understanding of balance, which is learned physically and socially at the same time. Helen Keller in 1908 spoke of how meaningless her world was without language. She did not know that she was blind or deaf. She lived in a world that was a no-world. Since she had no power of thought, she could not make the separations and connections that would allow her to compare one mental state with another.

Polanyi illustrates the necessity and insufficiency of language for meaning with an example of how we learn to detect pulmonary disease in X-rays. As the student listens for a few weeks, examining pictures of different cases, a rich panorama of significant details will be gradually revealed of physiological variations and pathological changes, of scars, and signs of acute disease. The X-rays begin to make sense. At the very moment when he has learned the language of pulmonary radiology, the student will also have learned to see the X-rays meaningfully. The immediate experience of the X-ray's meaning is coincidental but not identical with the focal awareness of it that is present in thought. Knowledge is focal awareness, what we are conscious of and can talk about. Knowing is the tacit integration of knowledge. We slide from knowledge to knowing effortlessly.

According to Polanyi, it is our subsidiary awareness of anything that endows it with meaning, with a meaning that bears on an object of which we are focally aware. The tacit knowing that gives us meaning consists in subsidiary things bearing on a focus by virtue of an integration performed by a person.

Without this integration, we could not formulate strict laws for deriving general laws from individual experiences because each instance of a law will differ in every particular from every other instance of it. To form class concepts essential to meaning, we must presume that indeterminate and global process of tacit knowing. In applying our conception of any class of things, whether pains, pronouns or persons, how can we identify objects or feelings which seem to be different in crucial respects?

Tacit knowing cannot be reduced to its explicit articulation because it can be articulated through an indeterminate number of language systems. When the student looks at an X-ray, he may focus on it with an artist's eye and see it in forms of light and shade, or as a psychologist, he may transform it into a Rorschach blot. His medical experiences are part of the subsidiary knowing that will inform his focusing on it as an X-ray.

How do we get meaning from unfamiliar sequences of words and letters such as "Bullets are earnest lullabies" or the "The spot is moving from left to right." We involuntarily make sense of the data, proceeding on the assumption that there is a text to be recovered. We must move beyond the sense stimuli to treat the uttered noises as things people wanted to assert for various reasons. We reason that the utterer wanted to find some way of reinforcing the irony that death, even by gunfire, might be welcomed by some or that they must have meant "left to right."

To understand unusual meaning in language, we have to put the statement into some context, to try to understand why the speaker would have said it. What someone means by an utterance depends not only on what she believes, but also on what she intends and on the rich fabric of experiences from which the intention emerges. We have to adopt a holistic approach that conceives of a speaker as a person, as a single interconnected and interdependent self. Any interpretation requires us to adopt the intentional stance: that is we must treat the noise-emitter as an agent whose actions can be explained or predicted on the basis of the content of his/her beliefs, and desires and other mental and physical states (Dennett 1991).

Similarly when we say we understand other minds or actions or understand an unfamiliar object placed before us, our meaning is dependent on our assumption that the world can make sense, that it can be read in meaningful ways. We recognize our deliberate actions as the product of processes that are reliably sensitive to ends and means. They are thus reasonable, but not necessarily in the sense of being the product of serial reasoning. The reasons might well be the

experiential schema that Lakoff and Johnson (1999) claim lie behind our daily use of metaphor. Meaning could not get off the ground without this principle of charity, as Davidson calls it, without the assumption that the world and other people do make sense.

The requirement of context makes it virtually impossible to locate the meaning of meaning precisely. It cannot be understood by being reduced to some other notion such as that of the speaker's intentions or to reference, nor can the meaning of words be understood in isolation from a language, a speaker, a community, or a world. It can be understood only in terms of its interconnections with other notions.

Donald Davidson (1980) says that meaning forms a basic, interdependent triad with beliefs and truths. In interpreting a speaker, beliefs and utterances are identified, certainly in the first instance, in relation to the objects and events in the speaker's environment – that is, in relation to the world in which both speaker and interpreter are located. But in doing this, the interpreter is also relating those utterances and beliefs with her own beliefs and utterances. The overall truth of our beliefs, and the overall agreement of those beliefs with the beliefs of others, is thus a presupposition of the very possibility of interpretation of meaning – of being able to make sense of ourselves and other speakers.

Dennett warns us that even though meaning requires mind and intention, we should not assume a single Boss that focuses our subsidiary awareness. The ultimate “point of view of the conscious observer” does not have to be a single self in control of organizing meaning, but it is probably a temporary set of highly structured but flexible regularities that give the physical hardware of the brain a huge interlocking set of habits or dispositions that enable it to interact with or make sense of the world, like the doctor or artist viewing the X-ray.

On Dennett's view, the number of selves that provide meaning is indeterminate, as is the number of possible interpretations of meaning. Of course he does not want to assume an organizing mind apart from a physical brain, and it may be

that meaning is more metaphysical and contextually dependent than he believes.

We cannot suppose that we could first determine what a speaker believes, wants, hopes for, intends and fears and then go on to a definite answer to the questions that his words refer to. For the evidence on which all these matters depend gives us no way of separating out the contributions of thought, action, desire, and meaning one by one. Total theories are what we must construct, and many theories will do equally well. (Davidson 1980, pp. 240–41)

Other philosophers, particularly W.V. Quine (1973), agree that truth and meaning are paired, but they approach the problem from a different perspective. They must believe that whatever there is to meaning must be traced somehow back to experience, the given of sensory stimulation, something intermediate between belief and the usual objects our beliefs are about. Once we take this step, however, says Davidson, we open the door to skepticism, for we must then allow that a great many of the sentences we hold to be true may in fact be false. We cannot separate out the world from the way we see it. There is no separation between seeing something and then seeing it as something, the seeing of a fact and then interpreting it. Its significance to us allows us to see it – we see it through its meaning. This means that there is not a separate level of meaning.

There is rather a change in the appearance of written or spoken words when their meaning is established. The meaningful use of a word that causes it to lose its physical character makes us look through the word at its meaning.

An A becomes an A or an H depending on its meaning in the word C_T or T_E. In the sentence “The bag was split so the notes were sour” while the individual words make sense, together they have no meaning outside the context of a Scottish bagpipe.

One of the consequences for teachers is that they need to be sensitive to the tacit connections that construct meaning. For the teacher to know whether students have learnt or understood, he or she must be a very active listener for their unique ways of making connections. A child's hearing of a psalm as “I'd rather be a Dawky Bird” reveals not her inability to make words meaningful, so

much as an ignorance of doorkeepers. And in an open community of inquiry where every student and teacher together are operating on a principle of charity that presumes everyone is making sense, there is ample opportunity for everyone, including the teacher to learn and exchange new meanings.

Mentoring and Decolonization

Mary Jo Hinsdale
Westminster College, Salt Lake City, UT, USA

Introduction

What is the intent of mentoring university students from marginalized groups: students of color, first-generation, low-income, LGBTQ, and disabled students? Is it merely to increase their numeric representation in higher education and atone for past wrongs? This would serve only to assimilate marginalized and minoritized students into academic norms, values, experiences, and dominant knowledge systems that are the heritage of European colonization. However, given that these students can bring unique perspectives to bear on the deeply pressing social and scientific concerns of our times, mentors might take a decolonizing approach that could transform the academy by introducing powerful subjugated knowledges and new research methodologies.

Because mentors teach Eurocentric disciplinary norms and knowledge bases – the rules of the game, so to speak – they risk alienating students from marginalized groups; this is especially so when mentoring occurs across social differences. However, some mentors seem to have an innate ability to develop transformative relationships with their protégés. They help students attain a degree of comfort in the academy, teaching disciplinary content and methods while maintaining students' personal, scholarly, and cultural integrity. These tasks are deeply complicated, but the

answer is not simply for students to seek mentors of a similar background: given the dearth of faculty from underrepresented groups, this is not a practical solution, neither would it necessarily provide the best academic fit for the student.

Decolonial mentoring brings together several areas of study each of which has its own deep and broad literature: decolonial theory, the sociology of education for marginalized groups, and the traditional work on mentoring. Examining these strands of inquiry can reveal fruitful ways forward, especially for mentors who work with underrepresented students.

Colonialism and the Academy

Mary Louise Pratt might describe the contemporary university as a “contact zone” between marginalized students and the dominant academic culture: it is a “[social] space of imperial encounters” (Pratt 2008, p. 8) where “cultures meet, clash, and grapple with each other, often in contexts of highly asymmetrical relations of power, such as colonialism, slavery, or their aftermaths as they are lived out in many parts of the world today” (Pratt 1991, p. 34). Indeed, Sylvia Hurtado, director of UCLA’s Higher Education Research Institute, once wrote that university faculty often act as academic colonizers (Hurtado 1992). This may seem like an unusually strong claim, unless we take a moment to reflect on the scarring legacy of the voyages of discovery (Hinsdale 2015).

Pratt describes how exploratory expeditions of the eighteenth and nineteenth centuries shaped “European elites’ understandings of themselves and their relations to the rest of the globe” (Pratt 2008, p. 15). Scientific travel narratives written by explorer-scientists communicated the results of these expeditions to the European elites, and she reveals how through this form of writing “...science came to articulate Europe’s contacts with the imperial frontier and to be articulated by them” (Pratt 2008, p. 20). By employing the classifying and descriptive methods of natural history to create a new understanding of both knowledge production and global social relations, European

elites organized the world around themselves and to their sole benefit. She suggests that this new consciousness “is a basic element constructing modern Eurocentrism, that hegemonic reflex that troubles westerners even as it continues to be second nature to them” (Pratt 2008, p. 15).

Maori scholar Linda Tuhiwai Smith provides additional insight into the troubling legacy of imperialism and colonialism in our knowledge practices. She writes:

From the vantage point of the colonized... the term ‘research’ is inextricably linked to European imperialism and colonialism. The word itself, ‘research,’ is probably one of the dirtiest words in the indigenous world’s vocabulary... The ways in which scientific research is implicated in the worst excesses of colonialism remains a powerful remembered history for many of the world’s colonized peoples. (Smith 2012, p. 1)

But Smith is also careful to note that “[i]mperialism still hurts, still destroys, and is reforming itself constantly” (Smith 2012, p. 20). Normalized educational practices provide pathways through which imperialism reconstructs itself.

Here, Nelson Maldonado-Torres’ description of coloniality is helpful for understanding the difficulty in creating conditions for minoritized perspectives to thrive in the academy. Coloniality “refers to long-standing patterns of power that emerged as a result of colonialism, but that define culture, ...intersubjective relations, and knowledge production.... It is maintained alive in books [and] in the criteria for academic performance” (Maldonado-Torres 2007, p. 243; Quijano 2001). Resonating with Pratt’s idea of the “hegemonic reflex,” Maldonado-Torres writes that for those who are descendants of colonizers, coloniality is part and parcel of their very being, and it is “characterized by a permanent suspicion” (Maldonado-Torres 2007) toward the colonized. In the context of higher education, academics of any background must guard against what Maldonado-Torres describes as an imperial attitude, because the bodies of knowledge in many disciplines, as well as our academic bureaucracies, developed hand in hand with colonialism. An imperial attitude might lead even well-intentioned mentors to doubt their students’

abilities or the validity of their outsider perspectives. Academic suspicion implicates professors in imperialism's destructive tendencies when they allow the boundaries of "acceptable" knowledge to marginalize or exclude other viewpoints. An unexamined imperial attitude can lead university faculty and administrators to question or outright ostracize the knowledges that outsiders wish to bring into the academy, thus reaffirming and normalizing Western knowledge systems (see, e.g., Margonis 2007).

This problem exists across the curriculum. As Smith explains, the traditional academic disciplines are based on "various classical and Enlightenment philosophies...grounded in cultural world views which are either antagonistic to ... or have no methodology for dealing with other knowledge systems" (Smith 2012, p. 68). The result? When histories and perspectives from indigenous peoples and the Global South do appear in the curriculum, they are generally seen as "add-on" courses that fulfill diversity requirements. The same can be said for academic work that focuses on social class, sexuality, gender, or ability.

Microaggressions

Microaggressions are defined as "brief and commonplace daily verbal, behavioral, and environmental indignities, whether intentional or unintentional, that communicate hostile, derogatory, or negative racial slights and insults" (Sue et al. 2007, p. 273), but microaggressions do not target only racial and ethnic groups. The sociology of education makes clear that they also take a toll on first-generation, low-income, LGBTQ, and disabled students. The pervasiveness and thematic consistency of microaggressions across groups and institutions points to the systemic nature of the problem they pose; they are a living, generally unconscious, expression of the academy's history of actively excluding marginalized students. Coupled with the long and complicated histories of exclusion from, and barriers to, higher education that marginalized students have experienced, it is no wonder they often have inherently tense relationships with the academy (Hinsdale 2015).

The steady streams of microaggressions experienced by marginalized students, as well as the imperial attitude often unintentionally assumed by faculty and staff from more dominant social positions, are contemporary resonances of colonialism. From assumptions that if they are on campus they must be cafeteria workers and maintenance workers to assumptions that they are athletes rather than academic scholars, underrepresented students are given constant reminders that they are outsiders who do not belong.

Most higher education faculty continue to be members of dominant social groups (white, middle class, straight, abled, etc.), even as the population of students from marginalized groups increases. Given this context, it is important to understand that professor/student relationships may be troubled by a number of factors that can become particularly acute in mentorships: the student's personal history of educational barriers and negative interactions; the exclusionary history of higher education that is alive in an institution's campus climate; the mentor's unexamined academic and social expectations regarding her field of inquiry and her own socialization into the field (how does one mentor differently from how she was mentored?); and the mentor's assumptions about students from marginalized groups and relationships with them. Because faculty have been socialized into their academic fields and most have received a Eurocentric training, even faculty with marginalized social identities may not consider what it would mean to decolonize their relationships with students (Hinsdale 2015).

Traditional Mentoring Literature

To better understand what will enhance mentoring relationships, it is first helpful to consider concepts that much of the traditional mentoring literature holds in common. Although this literature often leaves the word "mentoring" undefined, a good working definition is useful: "Mentoring is a personal and reciprocal relationship in which a more experienced (usually older) faculty member acts as a guide, role model, teacher, and sponsor of a less experienced (usually younger) student or

faculty member” (Johnson 2007, p. 20). Commonly, the relationship is based on “some level of mutual interest. . . and endures through several phases or ‘seasons’” (Johnson 2007, p. 21). Over time, a mentor gives “counsel, challenge, and support in the protégé’s pursuit of becoming a full member of a particular profession” (Johnson 2007, p. 20). There is an implied hierarchy in this definition, but relationship and trust are of utmost importance. As opposed to advising, mentoring is “defined by the presence of a bonded personal relationship” (Johnson 2007, p. 21).

Developing trust is acknowledged as the foundation for forming mentor/protégé relationships but doing so is portrayed without its complications. When a mentor follows the advice mentoring handbooks give for nurturing trust (keeping promises, being consistent and reliable, confronting problems with honesty), disconnections between mentor and protégé can still occur. Indeed, mentoring is often reduced to a list of traits and behaviors, and when relational problems arise, they are usually ascribed to a deficiency in the “at-risk” student. If the relationship breaks down, most guides look first to the student: did she fulfill her part of the mentoring contract? If not, is it due to some personal or cultural deficit? Further, diversity is generally viewed as an issue to “handle” (Hinsdale 2015).

Deficit understandings lie at the heart of traditional mentoring programs: the student lacks academic and social skills; the mentor’s work is to teach these and instill confidence. The student is blamed for lack of any success. Mentors seem to be at fault only when they have selected poorly or broken the rules: when the ethical contract between the mentor and protégé as individuals has been breached by an inappropriate sexual action, for example. In the end, the advice for mentors who work across difference is often to encourage underrepresented students to develop secondary mentorships: peer-to-peer and team mentoring relationships or to seek a same-group mentor in a different department or within a professional organization. A same-group mentor in another department may provide vital social and emotional support, but students deserve and need a mentor who can guide them to success in their

chosen field. And just because a person has a similar background, it does not necessarily follow that he or she is thoughtful about mentorship and its effect on the student across the desk.

Traditional mentoring practices rarely recognize the tensions marginalized students feel in the university. Nor do they question the problematic social context that constructs marginalized students in opposition to power and historical norms; diminishes their academic capabilities, their backgrounds, and families; and asks them to assimilate to dominant academic and social norms to be successful. The more powerful position held by faculty implicates all mentors in its history of social and academic violence, even though they may attempt to work against it or they may themselves be newly arrived “outsiders.” By and large, the traditional mentoring literature ignores the complicated historical, social, discursive, and academic contexts that demand a decolonial approach to mentorship, and little attention is given to relational qualities of the mentor/protégé bond.

Toward Decolonial Mentoring

Primary research in which graduate students and young professionals responded to questions about their most meaningful mentoring relationships has yielded some indications for decolonizing mentorship practice. Each of the participants was from a group that has experienced barriers to higher education and they worked with mentors whose identities were different from their own. Many mentor/protégé pairs worked across differences in race, ethnicity, class, or sexuality. Often, there were multiple differences. The importance of this should be clear: there is still a dearth of underrepresented faculty in higher education, and mentors from more dominant backgrounds need to fill in the gaps as a more diverse professoriate develops. Certain themes were apparent from the protégé narratives. Relationship, reciprocity, respect, vulnerability, trust, and confidence were mentioned repeatedly.

The participants with strong, fruitful mentor relationships worked with faculty who took responsibility for deeply reciprocal and respectful

personal and academic relationships. They understood the complicated nature of nurturing trust across difference: even though they did not necessarily understand or share their students' background, they managed to communicate their regard in such a way that the protégés felt strong connections with their mentors. These mentors took, as much as possible in the academic setting, a nonhierarchical approach. They desired not only to understand their students' stories but to honor their knowledge and gifts in a manner that did not reinforce the academic hierarchy. Instead, they offered their own stories and became vulnerable to their students, a very unusual step in an academic setting. The mentors' ability to decolonize the relationships with their protégés grew out of self-reflection, listening, signaling openness, sharing power, and staying connected (see Hinsdale 2015).

Self-Reflection and Listening

Self-reflection and listening are crucial mentorship skills that are deeply interconnected. And although it goes against the grain of most academic training, when the situation calls for it, mentors must share more of themselves than they might generally do in a student/teacher relationship. Thus, they destabilize academic social norms and create openings in which decolonial mentorship can flourish. Mentors must be willing to engage with the discomfort that arises when they reflect on the ways they might be privileged by race, ethnicity, gender, heteronormativity, ability, or by their position in the academic hierarchy. Doing so prepares them to listen across difference by nurturing a disposition toward dislodging comfortable assumptions and attitudes. As Lisa Delpit writes, communicating across difference requires open "hearts and minds. We do not really see through our eyes or hear through our ears, but through our beliefs. To put our beliefs on hold is to cease to exist as ourselves for a moment – and that is not easy" (Delpit 2006, pp. 46–47). She encourages educators to become vulnerable, "to allow the realities of others to edge themselves into our consciousness" (Delpit 2006, p. 47).

It is vital to listen to students' lived experiences, but also to listen for silence and silencing in the classroom or mentoring context. "Listening

for silence includes listening for missing conversations and overlooked perspectives, and . . . for the moments when students are actively silenced by individuals and institutions" (Schultz 2003, p. 109). Disciplinary borders and alienating academic norms are forms of institutional silencing. To open themselves to protégés' experiences and create space for marginalized perspectives and knowledges to enter the academy, decolonial mentors allow their worldviews to be disrupted.

Decolonial mentorship begins with an inquiry stance: listening to the context of a student's life, and the effect this has on her in the classroom. It includes "noticing when students take critical or risky stands and supporting them to articulate these positions" (Schultz 2003, p. 118). The mentors described in the study were self-conscious practitioners in their academic communities, and they accepted the limits of their knowledge. They reflected on the meaning of such moments and maintained an open, responsive attitude. They sought more equitable, reciprocal relationships with students, and although each of these mentors was surely aware of the inherent imbalance of power in the teaching relationship, they worked against it by allowing their students to change them.

Signaling Openness

Research also indicates that mentorship will usually grow out of a meaningful classroom relationship. Students often choose mentors they feel respect and appreciate their questions and classroom contributions, including those that arise from their outsider status. Yet, they may still feel unsure about approaching the professor to ask about deepening the existing relationship into a mentorship. In the classroom, faculty set the scene for their students to feel safe enough to enter a mentoring relationship; therefore, they should openly communicate that they value diverse students and welcome their intellectual contributions. Faculty who have reflected on their own skin, class, and gender privileges can give their students hope enough to trust them by voicing their critical understanding of whiteness, power, and privilege in all its guises. Making a conscious, political decision to try to create a space for something new to arise in the classroom signals

receptivity and openness to students who might be looking for a mentor (see Margonis 2011).

Sharing Power

Decolonizing mentors are able to overlook the accepted boundaries of their fields. They do not rush to judgment when presented with ideas that come from outside their discipline's accepted boundaries. Rather, they share power and encourage students by responding to the student's ideas (see Beyene et al. 2002), teaching her how to put new content into existing academic forms to push their disciplines' traditional limits. This process is harder, perhaps, in the natural sciences, where an apprenticeship model of mentoring still dominates; the same is often true in the social sciences. Students will frequently take up a piece of a mentor's ongoing project through which they learn laboratory procedures and research methods that follow disciplinary norms. Even so, their interests can be included by assisting them to learn the techniques they will need to answer the research questions they might ask in the future that are driven by their outsider status. For example, a psychology mentor might support her protégé through a research project that is informed and driven by the student's social and historical position. The student's research proposal and methodology would follow disciplinary norms, but forge into new content guided by personal experience. Decolonizing mentors assist their students to learn the protocols of their chosen field, but allow them to have an emotional and political connection to the questions they ask.

Staying Connected

A mentor's role is to not merely to guide a protégé through the research protocol, but to stay connected and encourage the student to remain in conversation. In the academy, there is a strong tradition of not developing personal relationships with advisees: maintaining boundaries is considered of great importance, and to do otherwise is inappropriate. Mentors described in this study violated social norms and reached out to their protégés on a personal level; they were emotionally and socially bonded to their students.

The students all tested the relational waters by dropping personal information into conversations.

When their mentors responded with genuine interest and it was clear they wanted to better understand their protégés on more than a scholarly level, the students felt supported. In decolonial mentorship, such relational curiosity goes hand in hand with academic curiosity: the protégé brings something new and unseen, something that calls the mentor to deepen the relational bonds (see Oliver 2001).

Conclusion

Admittedly, decolonial mentoring is difficult. How does one honor the mentor/protégé interconnection and deep mutuality in which each learns from and is bonded to the other, yet provide direction for a successful academic and professional life? Such a relationship has both hierarchical and reciprocal aspects. Students described mentors who were intentional, but who understood that good intentions were not enough. The mentors considered their own social position and educational history before entering the relationship, and they listened to the student in ways that also demanded them to be constantly vigilant and self-reflective. They understood their students' often complicated and painful educational histories, and they acknowledged that developing trust takes time because the relationship was colored by all of the student's previous interactions with more dominant faculty. To decolonize mentorship, faculty must be explicit about the fact that they are asking students to walk in two worlds in order to transform the academy: they do not want students to merely assimilate into dominant academic society but to learn how to navigate it while retaining their own scholarly identities.

Meritocracy

Ansgar Allen
University of Sheffield, Sheffield, UK

Introduction

The term “meritocracy” was coined in a 1958 dystopian novel, *The Rise of the Meritocracy*, written by Michael Young (Young 1958). This novel was intended to serve as a critique of the term it introduced. Much to Michael Young’s chagrin, the term has since become a social and

political ideal (Young 2001). As such, it is used to justify the distribution of jobs, opportunities, and resources in societies claiming to be both liberal and democratic in orientation. Meritocracy has come to represent a positive ideal against which social institutions and societies are judged. They are measured and compared according to how “meritocratic” they have become. Meritocracy is here viewed as a progressive alternative to other more ancient systems of distribution such as patronage, where jobs, opportunities, and resources are allocated according to *who* one knows rather than *what* one knows. A meritocratic society, by contrast, operates with the principle that merit should be rewarded according to the formula: *merit = effort + ability*.

Coinage

In *The Rise of the Meritocracy 1870–2033*, Michael Young combines a more conventional history of the recent past with a history of the near future. Though the book is undoubtedly satirical, it is also a serious, sociological text as indicated by the book’s subtitle: *An Essay on Education and Society*. Written from the perspective of 2033, the book makes a series of predictions. These predictions were intended to warn Young’s contemporaries in 1958 and reflect Young’s sociological understanding of Britain in the 1950s. This context is important, since the dangers outlined by Young in *The Rise of the Meritocracy* may no longer be the only or indeed the most important dangers faced by a “meritocratic” society operating in a different social and historical context.

Confining ourselves to Young’s history of the future (1958 onward), we find that he predicts the eventual defeat of British comprehensive education, an educational movement involving schools that do not select their intake based on academic achievement or aptitude. These “nonselective” schools are accused, in Young’s satire, of encouraging “mediocrity,” of being prey to a sentimental egalitarianism. Instead, a more rigid partitioning of the school-age population is enforced, with intelligence tests so developed and perfected that

they become the principle machinery for enforcing educational and social division. Irrespective of whether or not “intelligence” exists as a distinct entity, statistical correlation between high performance in intelligence tests and high performance in school is used to justify the productivity and pragmatic sense of dividing pupils according to their intelligence quotient, or IQ. Gradually the predictive accuracy of IQ tests is improved so that children can be divided into meritocratic categories at an earlier age. Initially, retesting every 5 years takes place to ensure that placements remain accurate, but eventually this system is abandoned as accuracy improves. By the year 2000, children are reliably and absolutely positioned in the social hierarchy based on tests at 9 years of age. By 2015 they are reliably positioned at 4 years of age. By 2020 this is reduced to 3 years. Segregation according to intelligence is now complete, with children divided into a hierarchy from nursery to university and into their employments beyond. Indeed, segregations by intelligence are so assured that incremental workplace promotion is abandoned. The social and economic order no longer needs to “correct” itself in this way, Young narrates, with talent being recognized late in life and rewarded by promotion. Indeed, competition itself is viewed as an unnecessary evil, as being symptomatic of an imperfect social order. Hence competition between employers for the best employees and between employees for the best jobs is gradually eliminated by better and ever more accurate testing. A highly administered society will eventually remove the need for competition, which is judged to be a wasteful method of social distribution. Once a meritocratic society reaches maturity, so it goes, competitive rivalry together with the ambition it encourages becomes an unnecessary, destabilizing influence.

Despite the considerable effort expended to achieve a fully meritocratic society, Young predicts that such a society, perfected though it may be from an administrative perspective, will not manage to completely eradicate ambition and convince all its members that it is socially just and desirable. A society of this kind would, he suggests, place such absolute judgments on

people that it would be experienced as intolerable by those at the bottom of the social order, however “reasonable” these judgments may be from an administrative perspective. The “lower orders” would not accept an administrative order that confines them without hope of escape to a subordinate position. Hence, *The Rise of the Meritocracy* is followed by its inevitable fall; the book ends with social unrest, insurrection, and the death of its narrator.

Meritocracy and Aspiration

The subsequent history of meritocracy in Britain bears out only some of Michael Young’s predictions. Comprehensive education did indeed fall into decline, and yet, the highly administered society Young foresaw did not arrive. Instead, meritocracy became a social ideal that came to operate in a very different social context, one that had become increasingly suspicious of social engineering (see Allen 2014, 2011).

The transparency of administrative systems in *The Rise of the Meritocracy* arguably resulted in their downfall since meritocracy provided an obvious target against which to revolt. Subsequent to the publication of Young’s book, however, the operations of meritocracy have become far more diffuse. This transformation in the operations of meritocracy is connected to changing patterns of governance in the second half of the twentieth century. Direct intervention from government, of a sort that seeks to administer social issues by way of agencies immediately attached to government, has been replaced, increasingly, by indirect modes of government that operate through multiple agencies enjoying a certain degree of autonomy (and profiteering). Meanwhile, citizens are encouraged to take greater responsibility for functions once reserved for the State. In this context, the meritocratic ideal is serviced more through individual effort than it is through institutional intervention, where the administrative assurance that meritocratic distributions will be perfected has given way to the injunction that all members of a meritocracy must “do their best” to reposition themselves.

Competition for good schools and good jobs remains a decisive factor, and ambition is to be encouraged, as meritocracy becomes a *personal* as well as social ideal. Meritocracy is no longer a simple logic of social administration to be imposed from above. Its principles are to become internalized, absorbed into the practices of aspiring social subjects. Crucially, this personal labor involving self-fashioning, self-improvement, and self-promotion is to become permanent. And it is not only expected of those with “unrealized potential.” The effects of this transition can be observed in today’s university, where even professors no longer feel entirely secure in their personal “chairs.” The selective process that resulted in their esteemed positioning at the top of the educational hierarchy must, increasingly, be repeatedly affirmed by the continued achievements of those professors themselves, in writing papers of continued high esteem (for purposes of institutional ranking), in securing ever more research funding (for the institutional coffers), and in better managing those beneath them. Meanwhile, a little lower in the hierarchy, those aspiring to a “chair,” or tenure, or merely the hope of tenure, must constantly adapt themselves to a changing climate of demands and expectations, proving that they can excel at whatever benchmark is placed before them. This logic operates more widely. Individuals throughout the social order must take up the task of repositioning themselves according to the latest logic of advance. They are to remain optimistic that their dreams of advance may be realized, yet pragmatic in their attempts.

Conclusion

Meritocracies are opposed by default to social orders where there is an explicit commitment to patronage and where talent has no opportunity to rise. Within these limits, however, a term once coined with satirical intent has come to operate as a social ideal. Meritocracy functions as an implicit good to which appeal is made across diverse contexts. This is despite the fact that

meritocracies may operate very differently in practice. The term “meritocracy” may be used to describe societies that are radically opposed in other respects, where, for example, there may be considerable disagreement concerning how exactly “talent” should be allowed, or made to rise, and who has the responsibility, and indeed the right, to make this happen. It would appear that since Michael Young wrote *The Rise of the Meritocracy*, in the British context at least, the political and institutional commitment to achieve social justice and social efficiency through a deliberate administrative repositioning of talent has, through shifts in governance, given way to a situation where the governmental task is now chiefly pedagogic and moral. It is to encourage students and citizens to take up the task of social repositioning themselves, and on an individual basis, as they labor to constantly repackage and reposition themselves in the educational, social, political, and economic hierarchy. As a descriptive term, and as an educational ideal, meritocracy exhibits remarkable and perhaps dangerous fluidity.

Merleau-Ponty and Somatic Education

Charlotte Marcotte-Toale

The New School for Social Research, New York,
NY, USA

Introduction

As a tradition that is explicit about the circularity of philosophy, what is decisive in many ways for phenomenology is entering that circle in what Heidegger calls “the right way” (Heidegger 1962, p. 195). One might pose the following question to that sort of commitment: what, if any, is the descriptively analytical bearing that such an entrance could have on critical perspectives concerning education? This entry is guided by the investigation of a possible answer to that question. Three critical tools concerning the entrance into philosophy are taken from Maurice Merleau-Ponty’s final work, *The Visible and the Invisible*, and their pedagogical benefits are explored (Merleau-Ponty 1968). These critical tools are included in the hyper-reflective process through which what will be called “pedagogical choreographies” reveal his notion of chiasmi and “chiasmic faith.” To illustrate the educational capacity of these critical tools, their pedagogical efficacy is exhibited outside of strict phenomenological research in an example which happens to concentrate on the writing process.

The Phenomenology of Merleau-Ponty

The critical tools that Merleau-Ponty offers can be best understood if his ontological entrance into the circle of philosophy is first expounded and distinguished from the approaches he rejects. The circular nature of philosophy that Merleau-Ponty borrows from Husserl and Heidegger begins with a critique of the predominantly Cartesian philosophy of reflection. For Merleau-Ponty, all

the variations of this approach take judgment as their point of departure in order to establish the philosopher’s domain of tacit, pre-reflective contact with his or her Self. This introduces a partition between being and truth which generates a philosophy that ends in either one of two ways. In the first, the binary uproots the philosopher from being and truth by relegating philosophy to a totally exterior world judged only according to logical criteria. Alternatively, the world is forgotten because it is described only in terms of an experience from within. Thus, the world is reduced to a noema in a transcendental field of representations originated by the subject in whose perception and consciousness these phenomena are displayed. Moreover, thought is equivocated with the reflecting “subject,” imposing a sharp division between every subject’s private representations, and philosophy is left to operate on significations and their relations.

Ultimately, neither the externalization of philosophy into logical judgments nor the internalization of it into a pure language succeeds in recovering the origin of reflection because the origin must be unaware of itself in order to begin, which contradicts the degree of self-awareness that distinguishes reflection. What is more is that if the origin of reflection is itself a reflection, the linearity of the distinction between original and derived is disrupted by the demand for a reflective origin that is supposed to justify the derivation of reflection from it. The linearity bends viciously into circularity, which shows that the reflective reduction is incomplete.

For Merleau-Ponty, the incompleteness of its reduction is indicative of an “origin” in the pre-reflective lived experience that precedes it. What is crucial is that the phenomena that philosophies of reflection take as the “data” for judging between being and truth must first be presupposed at the outset rather than judged. This allows for a fuller appreciation of the symbiotic circularity between the perceived and the exercise of perceiving. Merleau-Ponty describes this pre-reflective unity as “the openness upon the world” in which there is the Gestalt perception of

a whole greater in depth than the summation of its parts (Merleau-Ponty 1968, p. 35). The incalculability of the whole is owed to the prolongation of the profiles which are saturated by the completed totality that exceeds them. This constitutes the transcendence that perception involves, which Merleau-Ponty renames as the “miracle of a totality” (Merleau-Ponty 1968, p. 8).

The miraculous transcendence of perception can be grasped by the body because the body is coextensive with it as a Gestalt itself. The flesh of the body is irreducible to a piecemeal concatenation either materially, substantially, or psychically; rather, it is the transversal of many “little subjectivities” of sensibility, each of which objectifies the other precisely because it is conscious of being For Itself (Merleau-Ponty 1968, p. 141). At the same time, the flesh of the body is not an object; rather, it is the cluster of these little consciousnesses through which one tangibility of experience is constituted, like the “cyclopean vision” of both monocular eyes (Merleau-Ponty 1968, p. 141).

First Critical Tool: Pedagogical Choreographies

He finesses his argument for the body’s coextension with perception as a Gestalt through the first critical tool that he offers emerges: a series of *exercises* of the unity that he describes. In order to emphasize the mobilization of the body, bodies, or physical space that these involve, let these physical thought experiments be called “pedagogical choreographies.” This accentuates the way in which pedagogical choreographies differ from mere examples of physical experiences in that the choreographies gesture toward a chiasmus which cannot be thought by philosophies of reflection or the examples they give. This suggests that the detour through pedagogical choreographies is a necessary condition for grasping the chiasmi.

Before this suggestion can be explained in full detail, his choreographies need to be recounted. Let the first of these that he rehearses be referred to as “the auto-touch.” Here, his first movement is

the touching of his right hand with his left. Next, he decides to apprehend with his right hand his state of being touched. But this “reflection of the body upon itself” never delivers the tactility of touching simultaneous to that of being touched (Merleau-Ponty 1968, p. 9). The sentient and the sensed cannot be apprehended all at once; rather, there is a lag between the two, a fundamental asymmetry. What allows for this asymmetrical lapse between the two otherwise simultaneous exercises is what Merleau-Ponty calls “the untouchable” (Merleau-Ponty 1968, p. 254). The tactility of the right hand cannot touch the tactility of the left because each comprises a reversible side of sensibility.

An example analogous to the auto-touch can be called “the handshake,” in which, unsurprisingly, two people shake hands. The handshake is phenomenologically tantamount to the auto-touch because the reversibility that is active in both cases is qualitatively identical as different tokens of the same type of reversal. In each choreography, the hand that is being touched or shaken is the reversibility of the sensibility of the one doing the touching or the shaking insofar as both experiences involve the lapse of the untouchable.

A similar lapse can also be witnessed in vision. Just as the auto-touch revealed one’s own inability to touch their tactility, so is one unable to see themselves seeing. Without the assistance of any devices, Merleau-Ponty tries and fails to see the entirety of his face under his eyes. His vision of himself is only partial, or, in other words, the entire visibility of his face is invisible. The wholeness of his face is completed only when the profiles that are visible to him are prolonged into the profiles of his body that are seeable from the perspectives of the things or the other seers that he sees. This is no different in principle than the totality of a cube, which is visible despite the hiddenness of some of its faces whose profiles can only be viewed from elsewhere. Because of this similarity, let this pedagogical choreography be named “the cubic face.”

The cubic face shows that vision is scoped by that which surrounds the seer, who visually takes things in with regard to the reference that they cannot help but *be*. For this reason, the seer is in

their own visibility, so that their vision is exercised on themselves as much as it is on the profiles of everything else that they see. Furthermore, each seer reciprocates the visible, so that the recognition of another seer is also an objectification of one's own body as a visible for another so that the encounter with another shows each seer to be a reciprocal horizon of the same Being.

The negativity involved in the untouchable and the invisible is not an inaccessible perceptible that is elsewhere nor is it an opacity of consciousness; instead, it is a *de facto* and a *de jure* pure negativity. There is a *de facto* failure of the two touches to coincide, which implies that embodiment is irreducible *de jure* to mere empirical fact. What exceeds empirical observation here is the way in which the untouchability facilitates an understanding of the sentience of each hand as reverse sides reciprocating the sensibility of the greater fleshy whole to which they belong. When these observables operate simultaneous to one another, they cannot both be perceptible because they are the reciprocals of their whole. The lack of an overlap between the sentient and the sensed results from the fact that the two hands are a part of the same body that is prolonged in the movement from one lived experience, say, touching, to another, that is, to being touched.

The Second Critical Tool: Chiasmic Faith

The purity of the negativity that is discovered through the pedagogical choreographies reveals a type of reversibility distinct from an oscillation between discrete localities. What Merleau-Ponty purports is a notion of reversibility more akin to the reciprocity of a chiasmus in which the process of the differentiation of little sensibilities is generalized as elemental flesh. For instance, he cites choreographies like the cubic face as suggestions of a generality of visibility between seers or between the seer and the seen which prevents any of these from being strictly distinguishable. Thus, the perceptual field is a tangibility that is neither factually body nor world, but rather a general visible “midway between the spatio-temporal individual and the idea, a sort of

incarnate principle” (Merleau-Ponty 1968, p. 139). This midway, elemental generality of the flesh constitutes what he considers to be the miraculous integration of the parts into the whole that transcends them through the prolongation of its perceivable profiles. He crystallizes this by way of an analogy in which two mirrors face each other and indefinitely produce images of reflections that do not properly belong to either mirror. This metaphor shows that for him the generalization of flesh ultimately requires an abandonment of the notion that sensibility can only belong to one (little) consciousness.

In lieu of such isolatable entities, the new point of departure is the “ontological relief” of always already finding oneself in a world that opens upon a positive field of appearances whose negativity is consequently introduced when it is broken up or crossed out by another, apparently truer perception (Merleau-Ponty 1968, p. 88). Yet, even if the perceived whole is reduced to a nothingness, the recognition of illusions implies a registration of a greater truth over and against which the first may be deemed illusory. As a result, the ground of the world can never be completely nullified.

What the ability to make perceptual corrections suggests is that philosophy interrogates the openness onto the world not in terms of the possibility of the existence of the world but rather what it is for the world to already exist. Evidently, the unique world exists for us as “entirely irresistible” in perception (Merleau-Ponty 1968, p. 11). The certitude of seeing the true that it so miraculously produced is an unjustifiable “adherence that knows itself to be beyond proofs” as a sort of perceptual faith (Merleau-Ponty 1968, p. 28). Yet, it is also propositionally “absolutely obscure” (Merleau-Ponty 1968, p. 11) according to its pre-reflective nature as something “taken for granted, rather than disclosed, it is non-dissimulated, non-refuted” (Merleau-Ponty 1968, p. 29).

In conjunction with this perceptual faith, Merleau-Ponty also argues that one's perceptual view is always complemented by a “pseudoworld of phantasms if I let it wander” (Merleau-Ponty 1968, p. 28). The obvious givenness of a world in conjunction with its susceptibility to correction haunts the propositionally obscure certitude of

perceptual faith. However, the wanderer's perceptual agnosticism cannot radicalize into absolute skepticism because doubts concerning the world must postulate one from which it borrows the content for its skepticism. It presupposes a true against which it juxtaposes falsity, thus revealing its implicit faith in the world prior to and throughout its renunciation of it.

At most, skepticism can only go so far as to nominally relegate the world to a linguistic domain in itself, beyond the perception of it, since all the worlds without oneself that one can imagine would still be one's own imaginations and therefore, for that person, a world. Consignment of the world to nominalism employs language in order to resist the inexactitude of openness onto generality by manipulating the opacity of the body into a transparent but empty linguistic presence to oneself. The impossibility of total skepticism means that the type of possibility for doubt that is appropriate to perceptual faith must be rethought as "a continuous interrogation" of the world (Merleau-Ponty 1968, p. 103). The world itself demands the perpetuity of interrogation in that it exists for us in this very mode of questioning according to the miraculous totality witnessed in pre-reflective perception. Furthermore, the interrogative nature of the world generates the circularity of philosophy, which itself requires that philosophers ought not to expect typical answers to their questions, but remain interrogative.

Perceptual faith as the stand-in for typical answers fosters an "internal paradox" that negotiates between the two concurrent yet mutually exclusive impossibilities of pre-reflective certainty and interrogative doubt (Merleau-Ponty 1968, p. 28). Nevertheless, perceptual faith is not a pendulum that swings between two antinomies; rather, it appeals to the phenomenal understanding of the self who *lives* these experiences. This reinforces the necessary role that pedagogical choreographies play in grasping the chiasmus, for when reflection passes through the process of these exercises, it becomes capable of upholding the lived nature of these experiences.

In principle, there is no reason to presume that the chiasmic negotiation of this tension on a

perceptual level could not be applicable to different cases existing on other modalities, just one of which will be proposed at the end of this entry. Ultimately, the pedagogical utility of the chiasmic structure of faith as a critical tool is an open question that could be well worth exploring. Nevertheless, it suffices to say that the chiasmic form of faith as an internal paradox is at least relevant to the entrance into philosophy that Merleau-Ponty describes. For this reason, let this tool be referred to as "chiasmic faith."

Third Critical Tool: Hyper-reflection

Because chiasmic faith in perception is exposed only through pedagogical choreographies, reflection is thus no longer taken as a circuitous thought of seeing or feeling the self with whom one identifies. Rather than establishing identification, the choreographed movement of the chiasmus allows reflection to reiterate the "prolongation of the body's reserve" in which all the profiles of the unthinkable nothingness belonging to perceived, unperceivable wholes totalize as the horizons of a lateral notion of Being (Merleau-Ponty 1968, p. 203). This newfound capacity of reflection maintains the pre-reflective bond between perceptual faith and the perceived without effacing the transcendence of the whole; instead, the whole is registered not as the concatenation of its parts but as a perceivable imperceptibility constituting a pure, negative nothingness. This is what constitutes his third critical tool which Merleau-Ponty calls "hyper-reflection."

Hyper-reflection implies that philosophy cannot enter the circle by one sole entry because the absolute accessibility that that offers effaces the transcendence of the incalculable wholeness of the flesh. Likewise, there cannot be multiple entries all available to the philosopher, as it would amount to there being one sole entry insofar as it offers absolute accessibility. In this case, the copresence of the Gestalt in both the perceiver and the sensible would be neglected. Moreover, hyper-reflection shows that there is no cohesive, static unit called "the Self" who could enter another cohesive, static unit called "the World" by either one or many

entrances completely transparent to the philosopher. In fleshy laterality, the self consists in the non-difference of the self as encapsulated by the generality of the flesh. This amounts to a reconstruction of the “I” according to a more “corporeal schema” in which “I can” contact self with self in the non-difference of the generality of elemental flesh (Merleau-Ponty 1968, p. 255).

All in all, hyper-reflection is relevant to critical pedagogy according to two ways which together go to make up a flat-footed instantiation of Merleau-Ponty’s phenomenological commitment to explicit circularity. First, hyper-reflection marks the articulation of the entrance into the circle of philosophy as an educational experience in and of itself by virtue of the *hyper-reflective movement* through the choreographies into the chiasm. Secondly, a phenomenological education on this entrance as finally achieved through hyper-reflection provides the critical tools discussed herein. Furthermore, these tools may very well be applicable elsewhere, especially given the way in which one’s entrance into philosophy is capable of conditioning how the business of philosophizing gets carried out.

An Application of These Critical Tools

A hyper-reflection exemplifying the pedagogical utility of these critical tools in other discourses may be realized by choreographing the writing process of, say, a piece of academic literature. It is not an outlandish claim to postulate that there is almost always a lapse between the hypothetical suspicions embedded in the first draft of a piece and the much more confident conclusions of the final one. This asymmetry between them which develops during the many phases of editing can be considered as the “untouchable” of writing. More specifically, there is a thickness to the unrefined, bulky hunches of the earlier versions that cannot be grasped at first.

The palpable asymmetry between the first draft and the final is the pure negativity that belongs neither to the first draft nor to the final. This negativity, which can count as a sort of phenomenological “unwritable,” is consistent with the other negativities Merleau-Ponty provides as something

“midway between the spatio-temporal individual and [their] idea, a sort of incarnate principle” (Merleau-Ponty 1968, p. 139). The unwritable accomplishes this by lateralizing for the repetition of the depth of the problem of the first draft with its refinement in the last draft. In this way, the first and the final drafts materialize the strange circularity inhabiting the chiasmic reversibilities between them. Here, the writing process is capable of choreographing the hyper-reflection of the unwritable development of the writeable. The evident physical differences between each draft, when taken as a whole, choreograph the pure negativity of the unwritable as the totality of the development from the first draft to the final. In this way, the unwritable work maintains the lived nature of the experience of writing it.

There are two writers who capture this experience well. First, Flannery O’Connor, compelled by the mass of clumpy speculations belonging to first drafts, admits: “I write [because] I don’t know so well what I think until I see what I say; then I have to say it again” (Flannery 1979, p. 5). Secondly, Annie Dillard maintains O’Connor’s notion of repetition in her description of the choreographic movement toward the final draft, which, to her, is “like something you memorized once and forgot. Now it comes back and rips away your breath. You find and finger a phrase at a time; you lay it down cautiously, as if with tongs, and wait suspended until the next one finds you; Ah yes, then this; and yes, praise be, then this” (Dilliard 1989, p. 76).

Conclusion

In conclusion, the question taken up in this entry explores the extent to which the descriptive analysis of Merleau-Ponty’s phenomenology articulates an entrance into the circle of philosophy in a way that is pedagogically relevant. Three critical tools emerge as both the means to and the results of this articulation. Pedagogical choreographies, chiasmic faith, and hyper-reflection have important functions in the exposure of the entrance into philosophy, which is an educational experience in itself as well as a condition on the way in which one philosophizes. Although the full scope of the

pedagogical potential of these critical tools is not explored here, one example of the applicability of these tools outside of strict phenomenology is offered.

Introduction

As the science of signs, sign systems, signification, and communication, semiotics is integral to contemporary understandings of education, with both discourses converging in the new field of

edusemiotics. Metaphor undoubtedly occupies prime space in this territory, its social dynamics impacting on communication in education, blurring the lines between what we perceive as real and what we consider mere representation.

After a brief introduction to metaphor as a semiotic modality, this entry focuses on representation and interpretation practices in education. It begins with a survey of some common metaphors about education, each suggesting something about education, yet none fully capturing its essence. The word “education” is seen as a semiotic signifier for a concept without an agreed meaning and metaphor as a way of producing new meanings as much as a form of communication.

The entry then explores a number of ways metaphor functions in education. It may assist in reducing complexity as an aid to understanding. It may be used to selectively conceal and/or reveal information. It may be used as a persuasive device – with both positive and negative effects. It may generate new ways of thinking and new knowledge. It may also serve as a form of narrative for categorizing and making sense of information and experiences in the world. Together these functions render metaphor significant in education – significant in all senses of the word.

The entry concludes that a semiotic understanding of metaphor brings to light subtle nuances constantly shaping our social discourse and is thus a strong base for deconstructive critique and for creative reformulations of existing approaches to knowledge.

Metaphor and Edusemiotics

Contemporary theory expands the realm of metaphor from language and thought, to encompass the social dynamics of metaphor and the impact of communication – the way metaphors are developed and processed among individuals and groups within and across discourse events (Steen 2011). Although semiotics is a study of both communication and signification, this entry focuses more strongly on the latter – on the practices of representation and interpretation. Examining the power of metaphor in education, then, is clearly

The original version of this entry was revised: An erratum can be found at https://doi.org/10.1007/978-981-287-588-4_900

Metaphor and Edusemiotics, Table 1 Some common metaphors for education

The metaphor	Represented by
Acquisition	Gaining knowledge, reaching understandings, acquiring skills, achieving qualifications, cultural and social capital (Bourdieu, Putnam)
Art	Teaching as a creative skill (Steiner), creating ideas, expressing individuality, adopting perspectives, artistic connoisseurship and criticism (Eisner), the student as a creation or canvas
Botanical growth	“Kindergarten” as a garden (Froebel), cultivation/nurture of young minds (Rousseau), propagation of ideas, roots of learning, rhizomes (Deleuze)
Building and development	Scaffolding (Vygotsky), stages of readiness (Piaget) and moral development (Kohlberg), progress through various taxonomies, e.g., skills (Bloom), levels of learning (Gagné), stages (Erikson)
Experience	Experiential learning (Kolb), contextual experience (Dewey), skill practice
Food	Students as consumers, being spoon-fed, digesting facts
Imprinting	Memory training, the mind as tabula rasa (Locke), attachment theory (Bowlby)
Initiation	Cultural initiation, study of the great works
Managerial production	Linear models of curriculum planning (Tyler), the objectives movement (Mager), massed lectures for efficiency, standardized testing for quality control, knowledge management (Drucker, Davenport)
Marketplace	Institutions as providers, students as consumers, consumer satisfaction surveys, contestable funding, competition
Preparation	For professional practice, life, work career, adulthood, democratic citizenship
Remediation	Diagnostic testing, remedial teaching, “catch-up” classes; cure for ignorance, poverty, joblessness; correctional treatment for criminals
Searching	Research, discovery, pursuit of truth, seeking higher purpose/universal rules
Shaping and sculpting	Eliciting desirable behavior by rewarding successive approximations (Skinner), modeling (Bandura), Socratic method to shape further analysis and research
Socialization	Respect for authority, compliance with rules, democratic participation, competitive achievement, work habits and attitudes, reward and punishment, gender roles, social skills, acceptable speech patterns
Transmission	Lectures, rote learning, memorizing, passing on traditional skills, cultural competence, curriculum as a body of knowledge to be transferred to learners, traditional education as “banking” (Freire)
Travel	Undertaking a journey, “bridge” courses, accelerated learning, moving up through the grades, embarking on a course, qualification pathways, taking the reins, heading toward a destination

within the field of edusemiotics, in which education is an intentional (or, at times, unintentional) engagement with signs, both linguistic and extralinguistic, both in culture and in nature (Stables and Semetsky 2015).

Before looking at the way metaphors function in education, it is illuminating to traverse some existing metaphors about education (Table 1), each suggesting something about popular conceptions of education, yet none fully capturing its essence.

Many of these metaphors have become so commonplace as to seem literal in describing the process, nature, and purposes of education, although each has a different nuance, emphasis, and prescription. The word “education” is, thus, a semiotic signifier for a concept without a stable or agreed meaning, so its definition is always a

matter of interpretation. This is especially the case in philosophy of education as a discourse that entertains constant redefinition of what counts as education, frequently through innovative metaphorical allusion. A metaphor, then, is not always a way of *communicating* meaning but frequently a way of *producing new* meanings.

Lakoff and Johnson popularized conceptual metaphor theory (CMT), claiming that even our ordinary conceptual system, in terms of which we both think and act, is “fundamentally metaphorical in nature” (2003 [1980], p. 3). Over thirty years later, CMT is still recognized across academic disciplines as the dominant perspective on metaphor, having a major impact in the humanities and cognitive sciences. Significant work in metaphor emanated from the field of cognitive linguistics and

expanded to include a cross-disciplinary exploration of metaphor in language, thought, culture, and artistic expression, in embodied cognition, and specifically in educational discourse.

Set out below are a few significant functions of metaphor in education.

Metaphor as Simplification

Metaphor has the power to reify abstract ideas, assisting with conceptual analysis, drawing our attention to particular features of an idea. It can simplify often complex ideas through the efficient use of medical, engineering, molecular, or computer models, connecting to the familiar to assist with assimilating new ideas to fit within known constructs. Any form of representation does not duplicate or capture the essence of the original – the copy is not the work of art – but frequently serves as a simplification intended to limit, shift, or expand the focus without “cutting away” too much of the original sense. Politicians, for example, talk about “the public” or even about their electorate; transport timetables represent whole transport systems and their destinations; symbols and illustrations are used to aid understanding, logos and icons to symbolize whole organizations, and familiar jargon to speed up communication. For academics, in-text citations and reference lists represent original texts, their authors, and sometimes whole systems of thought. Some of these examples may be more metonymy than metaphor (the use of a specific attribute of something to stand for, rather than being viewed as, the thing itself) but function similarly in focusing our attention on specific aspects of the original. The word “education” has no referent object but signifies a whole set of discursive and changing practices.

Through metaphor, ideas can be condensed and simplified, so that even complex ideas can be made intelligible, when any attempt to explain them otherwise could easily be meaningless. It is a particular strength of metaphor that it can convey the essential without excessive oversimplification, representing complex new ideas in terms of familiar patterns of thought, thus reducing their perceived complexity.

Metaphor as Selective Revelation

Talk of revelation here is not about inspiration or surprise but about disclosure, i.e., revealing, and, by association, concealment or even censorship. Lakoff and Johnson emphasized the selective loading of metaphor as involving a “coherent network of entailments that highlight some features of reality and hide others” (2003 [1980], p. 157). Particular representations, then, impact on what we take to be true, an observation not lost on Foucault in pointing out the economic and political role occupied by a “regime of truth.” “Truth” is portrayed as “a system of ordered procedures for the production, regulation, distribution, circulation and operation of statements” (Foucault 1980, p. 133). Technologies for the governance of people depend on the ability to define what constitutes truth and thus to shape how we become subjects with a certain view of ourselves. In constituting truth, metaphor holds the trump card.

In education, controlling what is revealed and what is concealed is fundamental to the art of expository teaching and various modes of instruction, in the selection and ordering of the most appropriate content, in embellishing imagery for maximum impact, and in the timed release of key ideas to enhance learning by eliminating distractions and intensifying focus. To master the use of metaphor as a form of selective concealment in education may, then, serve to facilitate more effective methods of teaching. But such concealment may inadvertently promote a false sense of harmony, concealing the disparate and the contradictory, masking what in essence may be chaos and disorder – from minor social and political upheaval to explorations of the cosmos. Understanding how metaphor functions, then, allows for deciphering the discursive work done in its name, perhaps as a counter-hegemonic technology. Such motivation underpins much of the work done in educational areas like media studies, discourse analysis, and critical theory, sometimes to the point of political activism.

Metaphor as Persuasion

It was noted above that managing concealment is a legitimate didactic tool – assuming, of course, a

teacher with good intentions, operating without the use of coercion or undue influence. The idea of concealment underpins the persuasive power of metaphor, in generating motivation and enthusiasm for educational endeavor through selective presentation of appropriate significations and models, frequently through the power of poetic imagery.

Persuasion, though, is less defensible in the form of indoctrination or in some forms of advertising. Despite the freedom implied in individual interpretation, metaphors may still be used to assert particular points of view and influence our perceptions, our understandings, and our communication. It is problematic, therefore, for such influence to operate at an unconscious level. Inherent in education is a focus on bringing awareness to our personal and social situations, a focus that may be undermined by the insertion of metaphorical elements in the education discourse, without consideration or evaluation in terms of their possible effects. Just as important as learning the art of persuasion in enriching one's own delivery, then, is the ability to critique the various forms of propaganda posing as information – to decode the metaphorical structures and associations that underpin their effectiveness. Critique might encompass such things as exposing the degree to which OECD-driven policy makers capture the public imagination by representing as educational what is essentially political or economic or the way promoters and advertisers use metaphorical associations to peddle their wares. Metaphor might then be used to deconstruct a given representation to reveal hidden possibilities, leaving the subject in a better position to choose appropriate action and/or meaning. Similar critique may be necessary for learners to unpack the metaphorical baggage underpinning the constant stream of messages received as part of their ongoing educational engagement.

Metaphor as Creation

Ricoeur (1977) argues that metaphors are more than tropes of language; they have the power to redescribe the world. Not just mere substitution of one name for another, metaphors create tension

between literal meaning and attributed meaning. They create new relationships between ostensibly incompatible ideas, combining elements that have not been put together before. Once characterized as merely a linguistic decoration, metaphor is indispensable in generating and understanding discourse, from the poetic through to the scientific. Metaphor can give new meanings to words already in common use, as when a “virus” has infected one's computer system – clearly not a biological virus but an encoded algorithm that behaves like one. Through metaphor, we can attach particular features of our knowledge about real viruses to this new phenomenon, allowing us to reconceptualize a transmitted piece of computer code in terms that apply to a biological virus.

The power to construct creative possibilities through redescription was explained in Donald Schön's notion of the *generative* power of metaphor – a “special version of *seeing-as* by which we gain new perspectives on the world” (Schön 1993 [1979], p. 138). In dealing with social problems, he argues, solutions are very much mediated by the metaphors underlying the stories which frame the problem. Social services, for example, are sometimes described as fragmented (like a vase that was once whole but is now broken), for which the solution has to do with coordination or integration. Yet the same real services could be described differently – as autonomous perhaps, in which case there may be no problem at all. Metaphor is, thus, not always a way to grasp meaning but frequently a way to create it.

In reimagining the future of education, Kieran Egan elaborates on our fertile capacity for metaphor as fundamental to language: all sentences made up of metaphors we have usually forgotten were metaphors. Being able to see these invisible metaphors, he argues, offers a creative tool in that it allows us to play with what otherwise we are constrained by – to enrich both our expression and our understanding, enabling flexible and creative thinking.

One of the costs of failing to develop our metaphoric capacity is the kind of literal thinking that never gets beyond its starting assumptions and pre-suppositions. It is thinking that is closer to calculating than to anything critical or imaginative:

thinking not only condemned to remain “in the box” but not even knowing there is an outside to one’s box . . . one role of education is to least to expand the box and make clear that it does have an outside that may be worth the struggle to occasionally visit. (Egan 2008, p. 57)

Metaphor as Narrative

An interesting theme to explore as the final section in this entry is the relationship between metaphor and narrative, each serving discrete functions in some respects, but both characterized as nonliteral mechanisms for interpreting/constructing experience. Serving as a frame for this brief exploration is the dual depiction of “metaphor as compressed narrative” and “narrative as extended metaphor” (Hanne 1999, p. 35). Bougher further develops the link between narrative and metaphor, suggesting a symbiotic relationship between the two as “structuring guides” for each other (2015, p. 255), sometimes substituting for each other, with metaphor providing a strong frame of reference for subsequent narratives – but only when included early on in a text. So, for example, mention of genocide in stories of war evokes powerful memories of past atrocities, with little need for further elaboration throughout such a story.

Clearly, both narrative and metaphor provide mechanisms for categorizing and making sense of information and experiences in the world – metaphors elaborate particular points in a narrative, and narrative provides meaningful connections between apparently unrelated metaphors. For example, referring to a politician as Robin Hood implies that the candidate is an advocate of the poor. However, Bougher acknowledges the difference between metaphor and narrative, pointing out the need for more research about their relationship – whether metaphor helps citizens deal with political issues, events, and situations; whether narrative helps to link metaphors across different social domains (health, family, work, etc.); and to what extent narrative and metaphor facilitate or inhibit each other’s roles in political learning and comprehension.

Conclusion

Says T. S. Eliot (1982), “There never was a cat of such deceitfulness and suavity.” *Macavity the Mystery Cat* is the elusive trickster responsible for much deception and depravity, but never able to be caught in the act. *You may seek him in the basement, you may look up in the air – but I tell you once and once again, Macavity’s not there!* Such is the elusive quality of good metaphor at work, true to its name, avoiding visibility, resisting literal definition, and capturing our imagination as it diverts attention to specific aspects of the real. Within the process of *semiosis* as the eternal transformation of signs, metaphor is clearly implicated in constructivist theories of learning, establishing meaningful and effective connections between the known and the yet-to-be known, and animating what might otherwise be quite dreary prosaic communication. Metaphor is, thus, a powerful semiotic tool in creating and transforming knowledge.

Over time, metaphors lose their freshness and sparkle and become worn out – clichéd to the point that we no longer recognize their metaphorical nature. To “follow an argument”, to “grasp an idea,” and to “see the point” have all become so commonplace in our daily language as to mask their original metaphorical content and their accompanying entailments. *Understanding* the function(s) of metaphor brings to light subtle nuances constantly shaping our social discourse and is thus a strong base for deconstructive critique and for creative reformulations of existing knowledge.

Methodological Issues in Science Education Research

Keith S. Taber
University of Cambridge, Cambridge, UK

Synonyms

[Methodology](#); [Research methods](#); [Research traditions](#); [Research programmes](#); [Paradigms](#)

Introduction

The selection of research methodology in any field should be principled so that the approaches used allow the development of evidenced knowledge

(Drawing on Taber, K. S. (2014). Methodological issues in science education research: a perspective from the philosophy of science. In M. R. Matthews (Ed.), *International Handbook of Research in History, Philosophy and Science Teaching* (Vol. 3, pp. 1839–1893): Springer Netherlands.)

claims, but in an educational field linked to a teaching subject there may also be an expectation that research methods should match or reflect methodologies used in the parent discipline(s). Research in science education is often conceptualised with reference to how research is undertaken within the natural sciences. Many working in science education would wish to consider research in science education to be “scientific” research. This entry considers the range of research methodologies used in science education and how these might be most productively characterised.

The Range of Educational Methodologies

Educational research encompasses a broad range of methodologies, and many of these have been adopted within science education research (Taber 2014). Common methodologies include:

- Experimental methods: exploring the effects of interventions (or observing “natural experiments” when existing conditions offer the basis of comparisons) to examine the relationship between variables determined in advance
- Surveys: for example, of teacher attitudes or of student knowledge in a topic area
- Case studies: exploring and describing individual cases in some detail (the case could be a lesson, a school, a learner’s understanding of a topic, a textbook, etc.)
- Ethnography: seeking to understand a particular educational context in terms of how those teaching/learning within that cultural context understand it
- Grounded theory: building up a detailed explanatory account of a particular situation using concepts selected or developed to best fit the research focus through an iterative process of data collection, analysis, and conceptualisation

There are also forms of “research and development” such as action research which prioritises practical outcomes over theoretical knowledge claims though cycles of intervention and

evaluation, and design research and lesson study which similarly seek to iteratively improve practice but with a greater focus on formally theorising and documenting the research.

Within these methodologies, a wide range of data collection tools are used. The most common are forms of interview, observation, and questionnaire, but each of these general categories of technique reflects diverse practice, in particular in terms of whether data collection is intended to be open-ended to support inductive research aimed at developing theory or is designed to provide data within predetermined categories to deductively test hypotheses deriving from existing theory.

Characterising Research Methods in Education

The different research methodologies commonly used in educational research can be classified according to a number of characterisations. Introductory research methods texts commonly highlight a distinction between quantitative and qualitative methods, often suggesting the former follow a more scientific model, and sometimes implying that scientific and humanistic approaches offer competing and incompatible notions of truth (a discourse sometimes labeled as the paradigm wars). Unfortunately, these terms are sometimes used to refer to the nature of data collected and sometimes to imply a more fundamental distinction – quantitative restricted to research applying inferential statistics or mathematical models and qualitative to refer to research where the nature of data collected, such as accounts of people's experiences, is considered to necessarily require the involvement of the researcher as an (inherently subjective) interpreter of intersubjective interactions. There is also potential ambiguity in another commonly adopted term: mixed methods, which can variously mean collecting distinct types of data; using a range of methods within a methodology such as case study; or combining fundamentally distinct methodologies in a single study (Taber 2014).

More useful distinctions (Taber 2014) relate to whether research is:

- Nomothetic or idiographic – whether the research purpose concerns identifying general patterns or understanding particular cases
- Objectivist or constructivist-interpretivist – whether it is sensible to see knowledge developed as independent of the observer (e.g., if exploring class sizes or levels of laboratory resource) or inevitably influenced by intersubjectivity between researcher and participants (e.g., in-depth explorations of learners' perceptions of science lessons)
- Confirmatory or exploratory – whether the study is testing a hypothesis based on an established conceptual position or seeking to find out the most productive way to make sense of a research focus and potentially develop new theory

While these approaches may be seen as competing in the context of what is most appropriate in a particular study, they are better seen as complementary (for example, exploratory phases of research precede confirmatory phases) and having compensating strengths and limitations (so nomothetic approaches may miss significant individual differences while idiographic studies have limited generalisability).

Comparing Research in Natural Science and in Education

Social phenomena are often complex, and may need to be studied naturalistically, in situ, when removing them from their context changes them fundamentally. That is quite different from how much research in, for example, physics is undertaken using controlled experimental methods in the laboratory. However, the natural sciences do also encompass studies of complex systems and naturalistic research undertaken in the field.

Another feature of much research in education is that whereas natural science is typically nomothetic, seeking general laws, research in education often explores individual cases for their own sake,

more akin to the idiographic tradition in history. However, even when cases are considered inherently worthy of study (so-called intrinsic case studies), and when direct generalisation to other cases cannot be assumed, and true replication is not possible (due to the idiosyncratic nature of a case), it is usually intended that findings will offer the basis of potential insights into other cases.

One perceived feature of the social sciences that is often considered to make them distinct from the natural sciences is the nature of social phenomena compared to natural phenomena. Educational research often concerns constructs that rely on self-reports of individuals – such as their attitudes to learning science or their degree of confidence in their understanding of subject matter. These constructs are inferred from responses to instruments including items designed to reflect the assumed underlying construct (e.g., self-efficacy).

Most phenomena studied in science – earthquakes, pulsars, the flight of birds, eclipses, etc. – would occur just the same regardless of the presence of people to observe, measure, name, and conceptualise them. This is not the case in the social sciences. Schools, lessons, curriculum, and so forth only exist as social inventions and institutions. *Notions of earthquakes or pulsars, etc.*, are human constructions (where what counts as an earthquake or pulsar and how such concepts are to be understood are decided through the conventional discourse processes of science and are potentially open to review). Yet there are observable phenomena in the world that are labeled earthquakes that would exist despite the label and criteria for class membership.

While there are also phenomena in the world labeled schools (or bullies or successful lessons) which exist regardless of the label and conceptualisation, these observable phenomena could conceivably be changed (albeit indirectly) by changes in the conventional labeling and conceptualisation. As an example, an institution which was recognised as a school and so legally entitled to certain financial support and other entitlements in a particular national context might well cease to exist as a consequence of a decision to declassify it as a school – especially in a context

where children were legally required to attend a (recognised) school.

This may not be an absolute distinction as there are many examples of natural phenomena that might change substantially as an indirect result of human conventions: for example, labeling an organism as an endangered species, or alternatively as an agricultural pest, could well have indirect consequences for its population, range, or even survival. As another example, the scientific case for considering climate change as at least in part anthropogenic (a scientific classification) is considered important for the potential for influencing policy that may in turn actually change the rate of climate change.

This links to another potential difference between scientific and educational research. Scientific research is usually considered to be morally neutral (except in the sense that there is a clear inherent scientific value that knowledge is better than ignorance). Scientists seek to form knowledge of the natural world, rather than judge it. Such a distinction is sometimes less clear in social research as the foci of research are often bound up with ideologically informed policies (e.g., to increase participation in higher education) or axiologically driven research questions (e.g., regarding equity of opportunity, discrimination, transforming lives, etc.). Again, in practice, such a distinction is not absolute – as for example in research to eradicate smallpox, where medical research was guided by a judgment that it was morally good to completely eliminate a naturally occurring virus.

Another potential difference between natural science and educational research is the ethical concern that must be shown to participants in studies in education. A hypothesis that a certain level of stress might damage an aircraft wing can be experimentally tested under laboratory conditions, whereas a parallel hypothesis about the effects of stressing a science teacher can only be considered in terms of observations of existing cases. If one method of protecting metal objects from corrosion is found to be more effective than another under some condition, then this might suggest a programme of research to explore the range of conditions under which this finding

would apply. However, if research suggests that one approach to teaching is more effective than another, it becomes ethically dubious to test whether the same result would be found in another educational context if this requires deliberately subjecting some learners to teaching reasonably expected to be inferior.

Additionally, people (unlike aircraft wings or laboratory rats for example) are considered to have rights of self-determination and can only be included in educational research after offering voluntary informed consent – that is freely agreeing to partake, under no extraneous pressure to do so, and in full knowledge of what they have agreed to. Although this is also true in medical experiments, researchers are often able to use double blind techniques (for example in drug trials) such that neither participants nor researchers directly engaged with them are aware which condition particular subjects have been assigned to.

These types of safeguards are seldom feasible in educational research. In intervention-versus-control design studies, students, their teachers, and observers, will generally find it obvious which group experiences the standard treatment and which is subject to some innovation. This admits sometimes powerful effects due to researcher or participant expectations, as well as reactions (positive or negative) to the contextual novelty of a treatment rather than its inherent nature. In research into teaching approaches, this is exacerbated by the general tendency for teachers to improve in their application of any curriculum or pedagogy after some experience of enacting it in the classroom, so that studies which compare novel and traditional approaches cannot generally be seen as comparing like-to-like.

Educational Research Is Scientific if Systematic

One pertinent question is whether educational research can be scientific, given the difference between natural and social phenomena as foci of interest. Scientific research is commonly associated with experimental methods, although this does not reflect the full range of approaches used

across the natural sciences, where naturalistic, observational studies are common in some disciplines (such as astronomy for example). In education, experimental research tends to be subject to a raft of complexities and potential confounding factors which often compromise its application.

The range of methodologies dawn upon in science education is varied then because different tools are needed to respond to different research questions, and because: (i) educational research foci are often complex and embedded in context, (ii) logically straightforward approaches may be excluded on ethical grounds, and (iii) people are aware of and may react to being subjects of research (regardless of the treatment itself).

It has been argued that selecting from diverse methods “could . . . be considered scientific” providing that “the [research] design directly addresses a question that can be addressed empirically, is linked to prior research and relevant theory, is competently implemented in context, logically links the findings to interpretation ruling out counterinterpretations, and is made accessible to scientific scrutiny” (National Research Council Committee on Scientific Principles for Educational Research 2002, p. 97). This might be considered a systematic perspective – that a scientific research study is a system with internal coherence.

Research Traditions in the Natural Sciences and Educational Research

Another perspective suggests research that is scientific not only links to “prior research and relevant theory” but moreover takes place within clearly established and bounded research programmes. There is currently a strong focus within both policy and scholarship in science education on the nature of science. Curriculum policy in many national contexts has emphasised teaching about the nature of science, teaching science through enquiry approaches, and offering educational experiences that are “authentic” to the nature of science itself. Issues regarding the natures of scientific knowledge, scientific evidence, and argumentation processes in science have received a good deal of attention, as has the

question of how scientific method (or methods) should be understood or taught within science courses.

The demarcation of science – what can and should be considered as a science – has been a key issue in the philosophy of science and some particularly influential analyses have focused on the nature of research traditions. Particular sub-fields of scientific disciplines commonly develop traditions that encompass methodical approaches that have been honed in response to the canonical theoretical account of the subject matter and the recognised epistemological challenges in that area of research. This is reflected in Thomas Kuhn's (1974/1977) notion of the disciplinary matrix, and the idea that induction into the specialism is a form of cognitive apprenticeship involving learning the conceptual framework of a paradigm and the observational and analytical tools conventionally used to solve puzzles in that area of science.

This happens because most scientific activity is focused on convergent research that investigates details of a scheme already posited in outline, rather than offering some completely new conceptualisation that sets up a novel direction for research (Kuhn 1970). Imre Lakatos (1970) argued that what made work scientific was the existence of recognised research programmes (similar in some ways to the traditions Kuhn describes) which on being established posited particular metaphysical commitments (to the nature of what was being studied and to the kinds of knowledge it would be possible to develop about that research focus) that channeled a positive heuristic indicating the way research should proceed.

Arguably this means that induction into scientific research generally sidesteps the explicit focus on ontological and epistemological questions common-place as a prelude to refining research questions and selecting a congruent methodological strategy in the social sciences. In a sense, the disciplinary matrix into which the novice scientific researcher is being inducted, and the experienced scientist has established a career path, already presents the conceptualisation of the research focus and the recognised methods to apply to that problem. Creativity is primarily

limited to making iterative developments within an established framework. As a less mature field, science education research is more often exploratory (divergent) in nature, and this is reflected in the profile of methodologies employed (Taber 2014).

Often in social research, such as in education, there is a range of potentially relevant theoretical perspectives that might be drawn upon to develop a conceptual framework as a starting point for a research project (Taber 2014). These perspectives may sometimes compete for explanatory space but can also be complementary so that the choice is about which perspective is likely to offer most insight in relation to particular research objectives.

For example, research to explore why student learning of some science topic seems to be particularly problematic might be informed by a range of quite different perspectives, including:

- A curriculum perspective considering how the scientific concept is represented (in effect, modelled) in the formal curriculum
- A pedagogic perspective concerned with the way teachers approach the sequencing and presentation of the material (e.g., using examples, narratives, analogies, similes, models, demonstrations, etc.) and the learning activities they set up
- A cognitive perspective considering the “information processing” demands of the topic, such as working memory loading
- A conceptual perspective that explores students' own ideas to see if learners hold suitable prerequisite knowledge to make sense of the topic and whether there are common alternative conceptions that may interfere with understanding and learning the canonical account
- An affective perspective that explores student engagement with the topic in terms of its perceived relevance to them

It is quite possible that a full account would explore all these aspects (so a pluralistic conceptual framework is needed), but in specific curriculum topics, certain factors identified within particular theoretical perspectives may be

especially important. For example, widely recognised difficulties in learning Newtonian mechanics seem to be especially influenced by students' implicit (tacit) knowledge, whereas learning difficulties in some core areas of chemistry (related to bonding, stability, and reactions) seem to be linked to common curriculum models and pedagogic approaches.

As research traditions become more firmly established within science education, it is likely that research in the field will become increasingly programmatic and induction into that work more akin to that found in the natural sciences. However, given the nature of educational research foci, the positive heuristics within research programmes in science education will continue to embrace diverse methodologies that offer complementary strengths and limitations.

Synonyms

Consensus moderation; Consistency of teacher judgement; Professional dialogue; Quality control; Social moderation; Verification

Introduction

In this entry moderation is conceptualized as a social and holistic practice. Moderation is discussed, in particular, with reference to systems of standards-referenced curriculum. In this context, the connection between assessment, curriculum, and standards needs to be understood for moderation to be effective. Significantly, the purposes, roles, processes, and practices of moderation are presented as beneficial to professional learning and necessary as a mechanism of quality control; however moderation viewed as a social practice presents important challenges which are also analyzed and addressed here.

Definition

Moderation involves teachers in discussion and debate about their interpretations of the quality of student work situated within a particular context. These processes require teachers to articulate their interpretations of the assessment criteria and standards in terms of a grade, or a particular standard assigned to student work, or a portfolio of evidence. Consensus or social moderation as opposed to statistical moderation is the focus in this entry which is presented from an interpretivist

perspective. Moderation and assessment viewed as social practice imply an understanding that judgments are mediated by one's cultural context, beliefs, and values.

Linn (1993, p. 97) defined social moderation in terms of “consensus moderation, auditing and verification” which he claimed relied “primarily on judgment.” He went on to describe this type of moderation as “performances on distinct tasks . . . rated using a common framework and interpreted in terms of a common standard.” The descriptor of “social” before “moderation” distinguishes between moderation used for quality control through purposeful discussion, from the statistical understanding of moderation through scaling tests. The enactment of “social moderation” aligned with Linn’s definition involves teachers from different schools, institutions, or classes meeting to discuss and negotiate the judgments that have been made on samples of student work that have been assessed using teacher judgment. It is through discussion and debate that teachers negotiate a shared understanding of the qualities of the work in terms of the standards (Klenowski and Wyatt-Smith 2014). Or as defined by Maxwell (2002, p. 1), social moderation is “a process for developing consistency or comparability of assessment judgments across different assessors, programs and schools.” Maxwell’s definition directs discussion to the purposes of moderation rather than the practice. Maxwell uses the term “social moderation” in a more refined way in terms of “peer moderation” in contrast to “panel moderation.” Both involve discussion among teachers with the latter being a bureaucratic expectation, and the former focused on teacher learning and the development of shared understanding. This shift from a more technical and individual view of moderation has occurred as our understandings of learning have become more focused on the social. While a purpose of moderation is to ensure consistency of judgment decisions as an end-of-semester practice, moderation is also understood as an important part of teacher professional learning that informs future teaching practice. Current views on moderation

perceive it holistically as a practice that commences at the beginning of a teaching period during the planning phase. At this stage, teachers need to develop deep and consistent understandings of the qualities in student work that would provide evidence at different levels of performance. This understanding informs teaching practice where standards are shared with students and are used formatively when feedback to the student can be directed at the standard achieved with further feedback provided about how the student might progress to the next level. Moderation, as an end-of-semester activity upon which understanding of the standards has been developed throughout the semester, is a refined and focused discussion involving complex judgment decisions.

Purposes

In education systems which include teacher-based assessment and teacher professional judgment, moderation is a form of quality assurance, increasing the dependability and comparability of the assessment results. From the various definitions and contexts in which moderation is used, it is possible to organize the purposes into two major categories (Klenowski and Wyatt-Smith 2014). The first of these categories relates to the aim of achieving consistency in the interpretation of the standards and related qualities in the assessment of student work together with the comparability of the judgments made. Comparability refers to the judgments in terms of their consistency, with one another, and with the performance or achievement standards. Assessment against common criteria and standards as provided by a subject syllabus or other frame of reference requires assessors to be consistent in the application of the standards and comparable in the judgments that they make (Maxwell 2007, p. 2).

The second category of purposes involves the function of achieving quality control to improve assessors' assessment and pedagogy for improved learning. Quality assurance is a related function of moderation and refers to the methods for establishing confidence in the quality of

moderation procedures and outcomes. Together these purposes ensure public confidence in the quality, equity, and fairness of an assessment regime. The purpose of moderation is to ensure that assessments align with established criteria and standards and are equitable, fair, and valid and that judgments are consistent, reliable, and based on evidence within the task response or assessed work. To achieve these purposes, teachers are involved in developing a shared understanding of assessment requirements, standards, and the evidence that demonstrates different qualities of performance. This process of moderation involves discussion of assessment tasks, evidence of learning, criteria, standards, and judgment decisions to ensure the validity and reliability of assessments and to improve the quality of the teaching and learning experience. It is from engagement and regular participation in moderation discussions at different phases of a teaching period that has led to a conception of moderation as important professional learning that can help to improve teaching practices to enhance student learning.

Moderation Processes and Practices

Moderation processes provide the basic structure for the enactment or practice of moderation in situated contexts. Education systems that are based on standards-referenced curriculum and assessment often view moderation as a holistic process that commences with the planning phase and continues in differing degrees and ways through the teaching and assessing phases until the final moderation meeting. This is a cyclic process where one phase informs the next with the outcome of the moderation meeting informing the next planning phase.

A shared and deep understanding of the standard is necessary before teaching commences as this focuses the teaching and learning activities and the design of the assessment task. This can be accomplished by teaching team members negotiating evidence of the standard through moderating previous or prepared work samples or through the process of collaborative annotating of a work

sample (Adie and Willis 2014). A clear understanding of the standard ensures that the curriculum, teaching and learning activities, and the assessment are aligned. The assessment task needs to provide opportunities for evidence of the standard at multiple levels of performance (e.g., at, above, and below standard descriptors), and the criteria sheet must be designed to capture critical features of performance at each level. If critical features of the curriculum and achievement standard are not captured in the assessment task or criteria sheet, then the final moderation practice is jeopardized. Questions asked during this planning phase will lead teachers to consider the qualities that they are valuing within the curriculum and as represented in an assessment task and the teaching and learning activities that can explicitly develop these skills and understandings for their students. During teaching, the teacher can then support their students to come to understand the standard that they are working toward and to self-assess their progress. Judging assessed work is based on the common understanding of the qualities that denote the standard developed through discussion from the commencement of the planning phase.

Making judgments and moderating student work come together in a variety of ways that have been described as conference, calibration, and expert moderation. A number of other descriptors for these procedures exist (e.g., consensus moderation and consistency of teacher judgment), as well as variations in performing and combining each basic procedure (e.g., a form of calibration that concludes with an external expert checking and endorsing the awarded grades). Within each procedure, judgments are based on an agreed achievement standard. In conference moderation teachers mark all of their assigned assessments and then select a sample to represent each of the graded levels, whether these be at, above, and below standard, numeric or alphabetic grades. These samples are taken to the moderation meeting. If the consensus in the moderation meeting is that the evidence in an assessment task does not align with the standards and thus the grade awarded, a teacher may need to remark their assessments. Calibration moderation

involves teachers marking a small number of common tasks prior to marking their class set. The standard is negotiated over this common set of graded work samples. At the conclusion of this moderation process, it is assumed that the teachers have a common understanding of the standard which they will then draw from when marking their own class set. Expert moderation describes those situations where one person, the expert, reviews the marked assessments, normally through a sampling process, and agrees, or not, with the judgments.

For moderation to be an efficient and effective practice, it is necessary that there are clear guidelines, dependent on the procedure that is being followed, on how to prepare for the meeting, including collecting and deciding on samples. Some moderation may involve work samples that are representative of the awarded grade, while other meetings may focus on borderline cases or atypical cases.

Expectations and Protocols of Moderation Meetings

Moderation meetings are based on protocols for conduct. These may include expectations such as:

- Participants in the moderation meeting come prepared to the meeting. In some cases this may involve having student work samples marked and annotated to illustrate justifications for the grade; in other cases, the moderation meeting will involve working with clean samples that do not have any annotations or grades.
- Teachers are willing and open to share the rationale for their judgments, as this links to the designated standard.
- Participants remain open and respectful to others' perspectives and are cognizant of the tacit beliefs that can interfere with the judgment phase.
- Only the evidence of student learning contained within the work sample can be considered in judgment decisions, that is, knowledge that teachers have of student

circumstances or previous work outside of the evidence in the student work sample does not bear on the judgment decision.

- When teachers present work from their class within the moderation meeting, the following sequence allows for clarity, critique, and the development of shared understanding of the standard:
 - Accounting of – in which the assessment context is described by the presenting teacher
 - Accounting for – in which an explanation and justification of the judgments are provided by the presenting teacher
 - Critique of evidence – in which other teachers participating in the moderation meeting question to seek clarification of judgment decisions and propose alternate views based on the evidence in the student work sample and the standard descriptors
 - Response to critique – in which the presenting teacher responds to questions regarding their judgment decisions and considers alternative perspectives in terms of the standard descriptor
 - Co-construction of a shared understanding of the standard – the process of negotiation, deliberation, and discussion continues until agreement on the standard is reached
- Teacher reasoning for the awarded grade is recorded based on the critical evidence that is indicative of the standard. Key questions include:
 - What is the evidence in the assessment task that demonstrates a standard?
 - Why this standard?
 - Why not the standard above or below?
 - Is there sufficient evidence to justify a judgment being made?

Often a facilitator is appointed to the moderation meeting to progress the meeting in a timely manner, to ensure that all perspectives are heard, and, at times, to make final judgment calls in cases where agreement cannot be reached.

Of importance for the moderation meeting is that the critical evidence is matched against a standard descriptor. Dialogue in the form of purposeful conversations that critique and interrogate the qualities in student work that denote a standard is the essential component of the moderation meeting. It is anticipated that as a result of such discussions, teachers gain a deeper insight into the standards and the qualities that provide evidence of the standards, as well as knowledge of quality assessment tasks and criteria sheets. This knowledge will inform the next iteration of planning and teacher pedagogic practice. Moderation, in the form presented here, is viewed as a professional learning activity.

Challenges of Moderation

Moderation and judgment making is a subjective process which can result in a number of challenges to reaching consensus among participants. Socio-cultural theories of learning highlight the multiple influences on the reading of any text. Prior knowledge and understanding, cultural and social background, attitudes and beliefs, school culture, work colleagues, and experience are some of the factors that combine to impact on judgment making.

A number of interpretative processes are involved when teachers interact with one another in the social practice of moderation to “deprivatize” their judgment practices. These interpretive processes include “noticing, interpreting, and constructing implications for action” (Coburn and Turner 2011, p. 177) which are affected by a teacher’s beliefs, knowledge, and motivation and by how interaction takes place in the moderation meetings. Too often in the assessment of student work, teachers search for, or notice, qualities in the student work that support their beliefs, assumptions, and experiences which can result in overlooking aspects of the student work that might contradict their judgment. This is why in a moderation meeting explication by a teacher of his or her understanding of how the standard is met is required.

Teachers' perceptions of themselves as an assessor and the interplay of power in judgment making and critique of judgments can impact on participation in the moderation meeting and the co-construction of meaning. Teachers' identity as an experienced or graduate teacher or as a particular type of assessor, for example, as a hard or easy marker of student work, should not be used to justify awarding a grade. An experienced teacher may bring more subject, pedagogic or student knowledge, to the moderation discussion; however, this should not influence the matching of evidence against the standard descriptors. Identity and the differential power of participants should not influence the process of negotiation or impact on judgment decisions.

Teachers' perceptions of the purpose of moderation can also influence their interactions in the moderation meeting. Moderation can be viewed as a mechanism to ensure equity, to justify judgment decisions, and to meet systemic accountability or as professional learning that informs pedagogic practice. One challenge arises as teachers with different purposes for attending a moderation meeting are brought together in the same meeting. This can lead to differences in the interrogation of the standards and time spent on discussion regarding the implications for practice and on reaching a decision. The process of negotiation among all participants within the moderation meeting and the established protocols and procedures for the moderation practice can act to guard against the potential errors and bias that may be evident in individual teachers' judgments and that may be influenced by the challenges of identity, the perception of differential power relations, and the perceived purpose of the meeting.

Within systems of standards-referenced curriculum and assessment, it is important that all stakeholders share a consistent understanding of the standard. However, achieving consistency beyond the local context of the school or district is difficult to achieve. While consistency in judgments may be enhanced through annotated work samples or exemplars, text alone is insufficient to establish shared meaning. This is a challenge for

quality control within particularly large and diverse education systems. Synchronous online social moderation is a possible solution to engage teachers across districts (Adie 2013). Online moderation, which occurs in real time as a dialogic practice, can connect dispersed communities to share their judgment decisions and develop common understandings of a standard. The value in online moderation is in developing an understanding of a construct and the various ways that standards may be demonstrated, across diverse contexts where teachers might not always meet and talk with each other. This is linked to equity issues in terms of supporting teachers in rural locations who often lack colleagues in their year level and discipline to develop shared understandings of the standards. The challenge for education systems is to develop the technological conditions and practices that will enable teachers to view, annotate, and discuss work samples in efficient and effective ways with others regardless of location.

Conclusion

This entry has presented a sociocultural view of moderation in which moderation is understood as a social and dialogic practice that is influenced by and influences context, participants, and participation. While moderation may be performed in a variety of ways, its purpose within systems of standards-referenced curriculum and assessment is to achieve consistency in interpretation of the standards and as a form of quality control that aims to ensure equity and fairness on judgment decisions. Moderation is most effective when teachers are involved in deep engagement and negotiation of the standards. This occurs when moderation is viewed as a holistic and cyclic practice that progresses through each phase of planning, teaching, and assessing. As a social practice, moderation involves challenges that include the interplay of identity and judgment making and the difficulty in achieving consistency across diverse areas and large and dispersed

populations. Synchronous online moderation has been presented as one future option to progress moderation as a social practice involving critique, negotiation, and the development of a deep appreciation of standards as descriptors of quality.

Mollenhauer, Klaus (1928–1998)

Norm Friesen

College of Education, Boise State University,
Boise, ID, USA

Introduction

Klaus Mollenhauer (1928–1998) is one of the most important German theorists of education of the postwar era. Mollenhauer is renowned for his contributions to critical pedagogy and educational social work (*Sozialpädagogik*) in Germany. His late philosophical work, *Forgotten Connections: On Culture and Upbringing* (2014), has been translated into multiple languages including English and deals in a highly original and accessible way with education in its most basic elements.

Biography

Klaus Mollenhauer (1928–1998) was born the son of a prison teacher and a social worker in Berlin. Like others born at the end of the 1920s (e.g., Jürgen Habermas or Niklas Luhmann), Mollenhauer was forced to join the German army in his early teens at the end of the Second World War. After being captured and imprisoned for almost 4 weeks by the British Army, Mollenhauer returned to school in 1946 and then attended the College of Education in Göttingen.

Mollenhauer studied under Herman Nohl and Erich Weniger, representatives of human science pedagogy (*Geisteswissenschaftliche Pädagogik*, sometimes simply referred to as *Pädagogik*, pedagogy, or even “pedagogics”). This tradition can be traced back to the phenomenology of Edmund Husserl and the historical hermeneutics of Wilhelm Dilthey and Friedrich Schleiermacher. Mollenhauer was also greatly influenced by Helmuth Plessner, whose “philosophical anthropology” – the study of the “meaning of being human” – synthesized critical, historical,

and hermeneutic impulses together with the more particularistic possibilities of phenomenology.

In the tumult of the late 1960s, Mollenhauer, working at the Goethe University in Frankfurt, stood out as a rare older ally or “big brother” of dissatisfied youth, providing assistance to the likes of Gudrun Ensslin and Andreas Baader, later key members in the Baader-Meinhof terrorist group. His 1968 book *Education and Emancipation: Pedagogical Sketches* was eagerly taken up by students and activists and is the text for which he is still best known in Germany today.

In 1972, Mollenhauer returned to Göttingen to accept a position at his *alma mater*. Influenced by Habermas and other social and psychological theorists, he published his second monograph in the same year: *Theories of Educational Processes: Towards an Introduction to Educational Problems*. His 36 years in Göttingen were marked by great academic productivity (e.g., the appearance of over 100 articles and anthologies, as well as his third and final monograph, *Forgotten Connections*), as well as by a concern with questions of aesthetics and culture, and by an explicit return to philosophical anthropology and human science pedagogy of his student days. When asked about the underlying theme in his life’s work, Mollenhauer responded by reiterating what one very early human science scholar had identified as the central question of education: “I can only say with Schleiermacher: ‘What does the older generation want of the younger?’” (1991, p. 85).

Frankfurt am Main: Critical Pedagogy, Sozialpädagogik

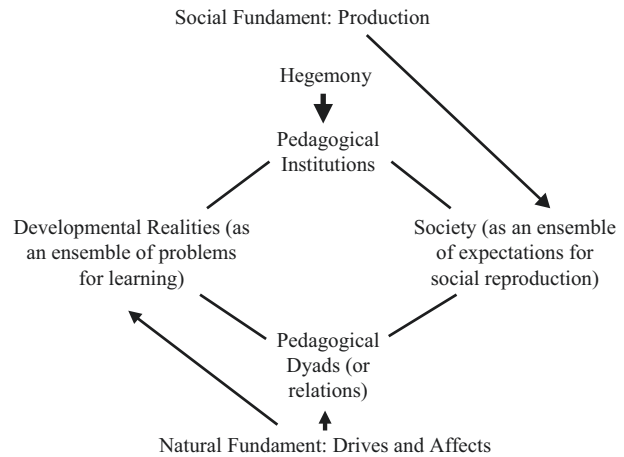

Mollenhauer began his career with a nuanced critical analysis of the tradition of human science pedagogy in the light of the events during and after the Second World War – and also in the context of the subsequent emergence in West Germany of an Americanized consumer welfare State. He famously writes in *Education and Emancipation* that “the years since the Second World War have shown [the tradition of] human science pedagogy

to have limited capabilities to shed light on the situation that is now constitutive of educational reality” (1968, p. 9). Education, in short, could no longer be adequately conceptualized and practiced in terms of traditional, elevated notions such as *Bildung* (formation, cultivation; e.g., see Wilhelm von Humboldt 1998) or the “pedagogical relation” (e.g., see Spiecker 1984).

However, this did not lead Mollenhauer to an uncritical embrace of the psychologies of learning or sociologies of management and efficiency coming from Anglo-America. In a 1961 essay simply titled “Adaptation” (*Anpassung*), Mollenhauer teases out the various meanings of “adaptation” and its derivatives (e.g., adjustment, assimilation, accommodation) in biology, cognitive psychology, and sociology: It is the response of an organism to its environment, the adjustment of an environment to one’s needs, and a change purposefully brought about by oneself, upon oneself (as in today’s self-regulation and metacognition). Mollenhauer insists that education must go well beyond these conceptions, saying that as it is conventionally defined, “adaptation is entirely one-sided; its pedagogical obverse is *autonomous subjectivity*” (1961, p. 359, emphasis added). Apparently harking back to both Kant’s notion of enlightenment (as the emergence from self-imposed dependency) and Romantic understandings of reflection (as a progressive transcendence of perceptual immediacy), Mollenhauer emphasizes that the educated person is by necessity *not* adapted or that, “paradoxically” in our modern “cultural context, only a reflective [i.e. maladapted] person can really be said to be ‘adapted’” (p. 357).

Education and Emancipation clearly betrays the influence of the Frankfurt School or Institute for Social Research, while still referencing more conservative notions of human science pedagogy. This is evident in Mollenhauer’s definition of *Bildung* in this context; Mollenhauer was led to define this historically-charged term specifically as “political *Bildung*” and as “political enlightenment,” with a clear urgency and specificity: “*Bildung* – as opposed to education – is enlightenment regarding the conditions of one’s own existence and the concretization of singular

Mollenhauer, Klaus (1928–1998), Fig. 1 The “pedagogical field” *pace* Bernfeld (Mollenhauer 1972, p. 26)

individuality to the degree that it is possible under such conditions” (1968, p. 65). A second central concern in *Education and Emancipation* is the “problem of authority” in both educational theory and practice: “Pedagogical authority,” Mollenhauer emphasizes, “is in reality the authority of domination” (p. 62). Citing the canonical figures of “pedagogical thinking” in Germany – Rousseau, Pestalozzi, and von Humboldt – Mollenhauer invokes critical rationality and empirical verification as *the* criteria for a pedagogy that would be emancipatory not only for those thus educated, but for society in general:

If it is true that our society is not simply the product of its own reproduction, this means that [existing] social determinations are not simply to be reproduced through education. [It further follows that] ... as both theory and practice, pedagogy has the task of *producing in the new generation the potential for social change or transformation (Veränderung)*. (1968, pp. 66–67)

Harking back to his paper on adaptation, Mollenhauer underscores priorities and examples that could readily be regarded as “maladaptive” – all the while drawing from canonical figures of pedagogy and pedagogical thinking.

Göttingen: Culture and Upbringing and the Science of Examples

Mollenhauer’s second monograph, published shortly after his arrival in Göttingen, offers a curious mixture of the psychoanalytic educational

theory of Siegfried Bernfeld (1973), the theory of communicative action of Jürgen Habermas (1984), human science pedagogy (again), as well as critical theories of social reproduction and hegemony. This book has been characterized as a “theoretical explication along the lines only coarsely sketched in *Education and Emancipation*” (Aßmann 2015, p. 158) and also as an investigation – using a new sociological “terminology” and complex “social models” – of “the pedagogical relation” beloved of human science pedagogy (Hopmann 2014, p. 58). The conceptual vocabularies of sociology, psychology, and the human sciences are combined to form models of social reproduction through intergenerational educative processes (Fig. 1).

The pedagogical relation is recast in this model as the “pedagogical dyad,” which – in opposition to traditional insistence on its social “autonomy” – is very explicitly interrelated with social and institutional factors. The intergenerational dynamics central to Schleiermacher’s question about “what the older generation wants of the younger” are expressed here in the form of “an ensemble of expectations for social reproduction.”

However, as the 1970s progressed, Mollenhauer came to see that he could not integrate the pedagogical relation and other concerns of human science pedagogy to form a grand sociological synthesis. Mollenhauer realized that any person’s experience of their own upbringing and *Bildung* is not just the result of indifferent

sociopolitical structures and processes, but is particular and embedded in one's own biography, culture, and history, often decisively shaped, for example, through a relationship with an especially engaged teacher, parent, counselor, or grandparent. This understanding of *Bildung* as a biographical and experiential "way of the self" (Mollenhauer, as quoted in Winkler 2002, p. 7) means that Mollenhauer's attention in his third monograph, *Forgotten Connections* (1983/2014), is directed to particular instances of these ways of and toward selfhood – and it articulates them using a language clearly different from that of the social sciences:

In order to find another language, I had to realign my object of study. I found I was able to arrive at a better language for studying education and upbringing when I read more, say, of Franz Kafka's educational text [*Letter to his Father*]. Or the extraordinary care that Augustine takes in his writings. These are exercises in the *Bildung* of the self [*Selbstbildung*]. (Mollenhauer 1991, p. 81)

When considered in this very general way, this type of language allows Mollenhauer to powerfully illustrate some of the most basic commonalities and patterns relevant to education and upbringing (*Erziehung*): that it is, as Schleiermacher suggests, a confrontation between older and younger generations, about which the older should be reflective; that adults "educate" both involuntarily and unsystematically, through their ways of life, and also quite deliberately, through curriculum and instruction; and, paradoxically, that adults should passively give space to a child while actively engaging with the emergence of his or her individual character and *identity*. Mollenhauer brought such insights into connection with key notions from human science pedagogy. The result can be described (Wivestad and Andersen 1997) in terms of six foundational questions and keywords that also form the overarching structure of *Forgotten Connections* and its six chapters:

1. Why do we want (to be with) children? Theme: *Erziehung* and *Bildung*
2. What way of life do I present to children? Theme: Presentation (everyday "upbringing")

3. What way of life should we systematically represent to children? Theme: Representation (formal "education")
4. How can we respect and draw out a child's inherent character? Theme: *Bildsamkeit*
5. How can we give children space to be active and solve their own problems? Theme: Self-Activity
6. Who am I? Who do I want to be, and how do I help others with their identity problems? Theme: Identity

In these questions, keywords, and organizational structures, *Bildsamkeit* refers to the inherent willingness and readiness of the child to learn and to the process of drawing the child into the world through adult engagement; Self-activity refers to projects and activities taken up by children and youth, from learning to walk to learning to paint or play basketball. These projects, in turn, also manifest the development of children's *identities* as emerging autonomous adults (see Friesen 2014, pp. xxvi–xlvi).

Mollenhauer not only uses biography or biographies to explore these questions and concepts but also develops a kind of hermeneutic and phenomenological "science of examples" (a phrase from van den Burg 1955, p. 54). This is an examination that focuses on cultural documents, on artifacts, and, above all, on *works of art*, as Mollenhauer's biographer, Alex Aßmann (2015), explains:

[It] amounts to the hypothesis that educational thought, through the examination of [literary, visual and other] works of art, can. . . read and understand how the self-formative and embodied relationship of the individual [engaged in learning] . . . is given sensually. After all, art is the representation of aesthetic figurations in which the embodied relationship of the forming self to itself is symbolically expressed. (p. 268)

Art, illustration, and historical accounts provide examples which at once preserve their historical independence and also offer an embodied immediacy and even intimacy. From Renaissance portraits through early modern engravings to medieval diaries and legal records, all of these are used in *Forgotten Connections* to richly illustrate the relation of the expressive and formative

self to itself (and to others) in a context that is concrete, not only in social and historical terms but also aesthetically and phenomenologically. In addition, Mollenhauer explores these examples in such a way as to delimit what might be regarded more generally or even cross-culturally as “pedagogical” – bursting the cultural bounds of the traditional conceptions of human science pedagogy. Aßmann asks:

Had any pedagogical author engaged in this way with the embodied structures of education and upbringing? Through aesthetic perception, embodiment shows itself not only to be something [*pace* Plessner] that we as humans both *have* and *are*, but also shows that in every experience of embodiment. . . there hides a memory of “the pedagogical” as something common to all peoples. Our entire culture [Mollenhauer showed] is pedagogical. (p. 280)

Mollenhauer develops the considerable possibilities offered by this method further in a late collection of essays titled *Detours: On Bildung, Art and Interaction*. He also provides a very general outline of this method in a 1997 paper that invokes a particular kind of pedagogical “seeing:”

Pictures that show explicit educational constellations are not the only ones of pedagogical interest. Pedagogy is concerned with the way that [all] adults see those who are being brought up, and also with how adults see themselves. This is the starting point for engagement with children and youth. As “educators,” we cannot erase ourselves, and we necessarily bring our own narrative self-understanding (*Lebensentwurf*) into play. . . .consequently, one can say that serious engagement with the widest variety of images and their worlds is a necessary part of educational research. (1997, p. 253)

Although many were inspired by Mollenhauer’s work to make use of examples and images (see below), no detailed explication of this method, and exploration of the broader, “anthropological” interpretive possibilities it presents, has yet been undertaken.

Scholarly Reception

The influence of Mollenhauer’s earlier work in critical pedagogy and *Sozialpädagogik* is palpable in a range of important but untranslated

publications by critical educationists in Germany. These include Wolfgang Klafki’s (1996) *New Studies of Theories of Bildung and Didaktik*, former student Andreas Gruschka’s (1988) *Negative Pedagogy: Introduction to Pedagogy Through Critical Theory*, and Katarina Rutschky’s (1977/2003) *Black Pedagogy: Sources for a Natural History of Bourgeois Upbringing*. However, it should be noted that Mollenhauer’s influence on his numerous student followers from his time in Frankfurt was neither unproblematic nor uninterrupted. Many viewed his later turn toward culture and tradition as a “retreat” or, worse, as personal abandonment (Aßmann 2015, pp. 260–261).

However, this did not prevent some of these same students (and many others) from taking up the “science” of cultural and aesthetic “examples” that Mollenhauer developed later in Göttingen. This is betrayed in many important works in the philosophy of education, ranging from the image on the cover of Max van Manen’s *The Tact of Teaching* (1991, taken from the cover of *Forgotten Connections*) through the acknowledgments and examples in Dietrich Benner’s book, *General Pedagogics* (2005, *Allgemeine Pädagogik*) and extending to a 2004 book-length study by Andreas Gruschka of the eighteenth-century French portraiture: *Determinate Indeterminacy: [Jean-Baptiste-Siméon] Chardin’s Pedagogical Readings*.

Conclusion

Any discussion of Klaus Mollenhauer must address what in the opinion of many remains the key theme or even mystery of his career: his almost obsessive concern with human science pedagogy and specifically with the pedagogical relation. As mentioned above, this relation can be interpreted the central theme of *Theories of Educational Processes* – a book which itself is seen as an elaboration of earlier sketches in *Education and Emancipation*. Finally, according to Aßmann (2015) and also Benner (2012, personal communication), Mollenhauer’s *Forgotten Connections* itself presents an attempt to work out the issue of

the pedagogical relation still further (Bas Levering [1987] goes so far as to render the title of Mollenhauer's text in English as *The Forgotten Relation*). "In this sense, *Forgotten Connections* recapitulates earlier versions of the pedagogical relation as well as [seeking] its current whereabouts, asking for what seems to be unavoidable, namely [the] anthropological ingredients for responsible education" (Hopmann 2014, p. 48).

Introduction

In its early years as an academic field, philosophy of education distinguished “childraising” from “education,” and little was said about mothers, fathers, and the part they play in education. In the 1970s and 1980s, mothers and motherhood were important topics in a flourishing feminist conversation about aspects of children’s education that had previously been treated by philosophers of education as unworthy of the field’s attention. By the late 1980s, this conversation was being subjected to criticisms that it essentialized and romanticized women, reiterated problematic gender binaries, and ignored relevant differences among women. Mothers and motherhood remained a live topic for some, but a scan of journals that publish philosophical work on education shows relatively few articles directly concerned with motherhood/mothers in the past decade. Yet questions about mothers and mothering are alive and well in the popular media, with

cover articles in magazines and best-selling books dedicated to the enduring question of how gendered aspects of work and homelife can be arranged to support the flourishing of children, who need to be raised, and their parents, who have claims on meaningful engagement with both the public world of work and citizenship and the private world of the home. Philosophy of education has recently taken up some of these issues under the subject of “parenting,” a language shift which acknowledges that any conversation about mothers needs also to involve fathers yet obscures the extent to which “parents” are gendered subjects.

In claiming to address “you, . . . tender and foresighted mother,” Jean-Jacques Rousseau’s *Emile* (1799) broke from previous philosophical writing about education by placing mothers at the heart of his educational and philosophical project. Earlier educational treatises addressed to parents, such as John Locke’s *Some Thoughts Concerning Education* (1693), treated education as properly the concern of fathers. Locke’s book, addressed to Edward Clarke of Chipley, Esquire, follows the practice of the early modern era in presuming fathers responsible for children’s moral and intellectual education. This education was distinguished from the physical care of the body deemed the province of mothers. In treating education and childcare as a seamless whole and designating it the responsibility of mothers even more than fathers, *Emile* opened an ongoing modern conversation about motherhood, parenthood, and education. Among the questions *Emile* raises about mothers and education are these: Does women’s ability to give birth and breastfeed infants give them a special intimacy with their children that leads to a unique, invaluable perspective on their own children’s education? If it exists, does this maternal good judgment extend to other children? Does women’s socialization into caretaking roles as mothers and wives also, or alternatively, give them a unique and invaluable moral perspective on their own children’s education, and/or on the education of children generally, and/or on broader issues of human well-being? Does the romanticization of the maternal role inflict harm on mothers? On other women? On

fathers and men? On children? If elite mothers turn over the care of their children to paid employees, do their children suffer? Who else suffers from this practice? Should children be educated in a family-like environment, or does education properly lead children out of their families into the public sphere? And what are the political implications of the answers to all of these questions?

In the early years of philosophy of education as a distinct academic field, these questions received little attention. The analytic approach of most postwar Anglo-American philosophy, including philosophy of education, lent itself to making sharp conceptual distinctions between “education” and “childraising” rather than to considering how such terms might be fruitfully run together. Because analytic philosophy eschewed the relevance of personal experience to philosophical inquiry, it could disregard the fact that in the nineteenth century, schoolteaching had been re-gendered as women’s work, in part through the popular construction of teaching as a job-like motherhood. Schoolteaching, like being a mother, was considered a task that required expansive capacities for love and patience but limited knowledge and skills. Over the course of a century and a half of industrialization, as public schooling expanded, as the home was more starkly divided from the world of paid employment, and as the family was romanticized as a haven in a heartless world, motherhood was idealized as the most admirable project for a woman to undertake as a full-time occupation, even as children spent more of their time than ever before in schools, under the care of teachers. The analogy between mothers and teachers was ideological insofar as it legitimated material circumstances and reinforced gender, social class, and racial hierarchies. It was widely accepted, even as it was mostly ignored by philosophers of education.

By the 1970s, however, with the feminist movement attending to issues of gender in new ways, inside academia and out, philosophers brought motherhood back into the spotlight. Susan Moller Okin argued in *Women and Western Political Thought* (1979) that women’s association with motherhood and family had, throughout

the history of Western philosophy, been the grounds for philosophy’s exclusion of women from the rights and responsibilities of citizenship. Sara Ruddick argued, in *Maternal Thinking* (1989), that raising a child was a practice with associated aims, skills, and values, rather than the series of low-skilled tasks it had generally been taken to be. Furthermore, Ruddick suggested that the practice of mothering qualified those who engaged in it – men as well as women, if and when men served as primary caretakers – for citizenship because it gave them an understanding of the importance of the lives and flourishing of other human beings. Maternal thinking, she claimed, was the basis of a politics of peace.

In philosophy of education, two seminal texts were Carol Gilligan’s *In a Different Voice* (1982) and Nel Noddings’s *Caring* (1984). Gilligan’s book, a work of psychology but influential in philosophy of education due to its implications for moral education, was inspired by Nancy Chodorow’s argument in *The Reproduction of Mothering* (1978) that girls, through their gendered identification with their mothers, develop a relational perspective that contrasts to boys’ development of autonomy. At the time, Lawrence Kohlberg’s stage theory of moral development, which treated an impartial, justice-oriented perspective as the pinnacle of moral maturity, dominated research on moral education. Gilligan’s research challenged this approach. She argued, on empirical grounds, that girls and women frequently treat the maintenance of relationship, rather than impartial standards of justice, as the sine qua non of ethical problem-solving. The relational ethics many girls and women espouse, rooted in the relationship between mother and child, are as central and valuable an aspect of morality as the impartiality Kohlberg celebrated, she contended.

In *Caring*, Noddings provided specifically philosophical grounds for treating care as the basis of ethical decision-making and action. Like Gilligan and Chodorow, Noddings considered the relationship between a mother and an infant a powerful precursor of ethical development, but she built her argument using the resources of existentialism and John Dewey’s progressive

pedagogy. *Caring* abstracted the mother-infant relationship, making it an analogy for the ethical relationship of one caring to cared for. The one caring, like a mother, attends to the needs of another person in order to support the other's growth, personhood, and well-being, always with an interest in maintaining relationship. The cared for, like an infant, responds with joy and growth. In reciprocal and egalitarian relationships such as friendship, Noddings says that the positions of one caring and cared for overlap, such that each person both acts with care and responds to the care enacted by the other. In the pedagogical relationship, however, the teacher must be exclusively the one caring, while the student is cared for. Through such caring relationships with their teachers, Noddings argued that children are best able to learn the subject matter and to become ethical adults. Noddings emphasized that care, in her analysis, is an ethical stance, rather than a feeling or the provision of material resources. It involves an attunement to the other and the demands of relationship, rather than to particular needs of a dependent. As such, it differs from the kind of loving care a mother would offer a child. Because human beings experience care first as infants, however, and because she considers the mother-child relationship the paradigm instance of caring, Noddings used motherhood as an analogy throughout *Caring* and her subsequent writings.

Gilligan's and Noddings' work gave rise to a flurry of debate about care as the basis of ethics. Gilligan's critics and supporters considered the empirical merits of her claims. Did mothers' relationships with their sons and daughters in fact cause boys and men to reason from a position of autonomy, while girls and women grounded their reasoning in relationships? (Gilligan herself argued for a less polarized account, in which both autonomy and relationship represent moral maturity and are accessible to men and women.) Noddings' argument coincided with a new interest in virtue ethics, and philosophical scholarship examined the possibilities that care was a virtue, that care was the most important virtue, that care was not a virtue but was the basis of ethics, and that care was, in spite of Noddings's arguments,

ultimately commensurable with a deontological ethics of justice.

However those questions are resolved, the foundation of care ethics on the mother-infant relationship gave rise to a different set of critiques from philosophers thinking about race and social class. Women of color had criticized the mainstream feminism of the 1970s for assuming a hegemonic White perspective, and women attuned to the dynamics of working class life had charged feminism with privileging the concerns of middle- and upper-class women. In philosophy of education, care ethics, with its celebration of an idealized mother-infant dyad, was an important focus of this general charge. The mother-child relationship that served as a crucial trope in philosophical work on care ethics, critics argued, represented a white, middle- and upper-class idealization of maternity. Full-time motherhood, and the intensive immersion in the experience of caring for a growing child that it made possible, had only ever been available to privileged mothers, these critics pointed out. Working class mothers, immigrant mothers, and mothers of color had had to work for pay, sharing the care of their children with others, including grandmothers, sisters, and paid childcare providers. (Often, lower-class women worked as the unacknowledged care providers for the middle- and upper-class women who were, nonetheless, proclaimed the angels of the house.) The dispersed responsibility for childcare that typified working class families and families of color, these scholars proudly claimed, was a benefit to all concerned, rather than an inadequate version of care ethics' tight dyad.

A related charge came from philosophers in the growing area of queer theory and LGBTQ studies. Not only did care ethics devalue cultural diversity in childraising, but it also reiterated the long-standing association of female personhood with maternity. Two related problems were raised. For one, care ethics was charged with devaluing the femininity of women who are unable to bear children, who choose not to, or who simply define their personhood in terms unrelated to motherhood. In other words, it essentialized womanhood and characterized women's essence as motherhood. Second, care ethics had promised to

reconfigure gender by placing mothers and children at the center, rather than the bottom or periphery, of ethical discourse. But in doing so, some scholars contended, it maintained the hegemony of a heterosexual perspective on family life. Supporters of care ethics have responded to the charge that early care theory neglected family diversity by affirming that care celebrates relationships of all sorts, not just those between mothers and infants. In any case, care ethics, an important arena of ethical discussion in the 1980s and early 1990s, has since become a less prominent subject in philosophy of education journal publications and conference proceedings.

Newly prominent in philosophy of education is scholarship that turns to continental theory. Contemporary conference presentations and journal publications on the topic of relationships and education have, in the past 10 years, been more likely to cite Levinas and Derrida than explicitly feminist theorists of relationality. Yet the new French feminism of Helene Cixous, Luce Irigaray, and Julia Kristeva contain resources for scholarship on motherhood and education that philosophers of education have recently started to tap. Drawing on Freud, Marx, and post-structural linguistic analyses, these feminist philosophers place women's embodied experiences, including the experience of motherhood and mother/daughter relationships, at the center of philosophy, but with nuanced attention to the ways language functions. In philosophy of education, scholarship based on their ideas is a new and exciting field open for further exploration.

The above approaches to motherhood and education, from Gilligan and Noddings to Cixous, Irigaray, and Kristeva, all derive argumentative force from post-Freudian interpretations of mother-child relationships. Another approach is to bring into philosophy the insights of sociology, empirical and theoretical. Sociologists of family life have drawn attention to several currents of change directly relevant to education. As women, including mothers with small children at home, increased their presence in the workforce in the 1970s and 1980s, fathers picked up some of the tasks of childcare and housework. Women continued to work a second shift at home,

however, and in fact *increased* the amount of time they spent with their children, even as their total work hours outside the home increased. Sharon Hays explored what she calls "intensive mothering," i.e., the notion that mothers bear primary responsibility for their children's care and that therefore a mother's life needs to be structured around the best interests of the child, in *The Cultural Contradictions of Motherhood* (1998). Hays found widespread popular support for this notion, which perhaps explains why mass market books about mothers and education, as well as articles about motherhood in newspapers, magazines, and blogs, continue to attract readers, even as philosophers of education have turned away from motherhood as an important topic. As Hays and other sociological scholars, especially Annette Lareau, have pointed out, maternal commitment to children plays out differently along lines of social class, with elite mothers able to perpetuate (and even expand) inequalities by channeling cultural, social, and financial capital to their own children. Meanwhile poor mothers struggle in an age of decreasing federal support for mothers and children. At the same time, marriage rates are declining, and therefore many children, including well over half of all Black children, are being raised in single-parent households, which sociological research suggests puts children at an educational disadvantage. When mothers of small children work for pay, either by choice or necessity, someone else needs to pick up the work of raising children, and this labor has been shifted to immigrant women who are often forced by economic necessity to leave their own children thousands of miles away. Few fathers have taken up the slack by committing themselves to full-time fatherhood, though in spite of popular campaigns that criticize fathers (especially poor fathers of color) for their neglect of children, fathers are more involved in childraising than they had been for several generations. In sum, the sociological picture is complicated, with many cross-cutting trends that increase equality between mothers and fathers in some respects but simultaneously increase inequality among children whose families are unequally privileged. Given the connections between family life and inequality, there is

still much for philosophy of education to say about mothers, fathers, and education. The question Rousseau raised two and a half centuries ago is as relevant as ever: What are the political implications of family arrangements? In particular, how do the childraising and educational practices of mothers and fathers perpetuate or counteract existing inequalities?

In order to avoid essentializing women, neglecting or seeming to discourage paternal engagement in childraising, and falling into the culturally blinkered and heteronormative assumption that all families include a mother, contemporary scholars tend to speak of “parents” rather than “mothers.” In their recent book *The Claims of Parenting* (2012), for instance, Stefan Ramaekers and Judith Suissa discussed “parenting” and explicitly included fathers and mothers within diverse family arrangements as their subject. Ramaekers and Suissa criticized the discourse of “parenting” that is currently widespread in educational policy rhetoric, as it tends to overlook the deeper meaning of raising a child. Whether philosophers of education select the gender neutral language of “parents” or directly engage with the ongoing issues of gender and sexuality by using “mothers and fathers,” the raising of children remains an important topic for philosophers of education interested in the ethical, political, and educational aspects of family life.

Multiliteracies

Mary Kalantzis and Bill Cope
University of Illinois at Urbana-Champaign,
Champaign, IL, USA

Definition and Introduction

The term *Multiliteracies* refers to two major aspects of communication and representation today. The first is the variability of conventions of meaning in different cultural, social, or domain-specific situations. These differences are becoming ever-more significant to the ways in which people interact in a variety of social contexts. As a consequence, it is no longer sufficient for literacy teaching to focus, as it did in the past, primarily on the formal rules and literary canon of a single, standard form of the national language. Rather, the sociolinguistic conditions of our everyday lives increasingly require that we develop a capacity to move between one social setting and another where the conventions of communication may be very different. Such differences are the consequence of any number of factors, including, for instance, culture, gender, life experience, subject matter, discipline domain, area of employment, or specialist expertise.

The second aspect of language use highlighted by the idea of Multiliteracies is multimodality. Multimodality arises as a significant issue today in part as a result of the characteristics of the new information and communications media. The asynchronous meanings across distance that

were once the principal preserve of the written word are now made in conditions where written linguistic modes of meaning interface with recordings and transmissions of oral, visual, audio, gestural, tactile, and spatial patterns of meaning. For these reasons, the Multiliteracies case is that we need to extend the range of literacy pedagogy so that it does not exclusively privilege alphabetical representation and communication. In today's learning environments, we need to supplement traditional reading and writing with these multimodal representations and particularly those typical of the new, digital media.

Background

By the mid-1990s, the singular connotations of the term "literacy" were beginning to work not so well. The mass media and then the Internet spawned whole new genres of text which meant that narrowly conventional understandings of literacy were fast becoming anachronistic. Also, the forces of globalization and manifest local diversity increasingly juxtaposed modes of meaning making that were sharply different from each other. The challenge of learning to communicate in this new environment was to navigate the differences, rather than to learn to communicate in the same ways. Moreover, it was becoming obvious that traditional literacy pedagogy was not working to achieve its stated goal to provide social opportunity. Inequalities in education were growing, suggesting that something is needed to be done in literacy pedagogy to address this.

It was in this context that the New London Group came together to consider the current state and possible future of literacy pedagogy. Convened by Mary Kalantzis and Bill Cope, the group also consisted of Courtney Cazden, Norman Fairclough, Jim Gee, Gunther Kress, Allan Luke, Carmen Luke, Sarah Michaels, and Martin Nakata. The group's initial deliberations – a week-long meeting in September 1994 – produced an article-long manifesto (New London Group 1996) and then an edited book (Cope and Kalantzis 2000) which included the original article. In 2009, in consultation with other members of the

group, Cope and Kalantzis published a paper reflecting on subsequent developments (Cope and Kalantzis 2009); then in 2012 they produced a book outlining the theory and the practice in greater detail (Kalantzis and Cope 2012; Kalantzis et al. 2016). This encyclopedia entry draws upon several more recent iterations of the Multiliteracies argument (Cope and Kalantzis 2015c; Kalantzis and Cope 2011, 2015).

To capture the essence of the changes that the group felt needed to be addressed, we coined the term "Multiliteracies." A Google search 20 years later shows 196,000 web pages that mention the word. Google Scholar says that 12,700 scholarly articles and books mention Multiliteracies. Amazon has 193 books with the word in their title.

The broader context for the Multiliteracies work was the development at the same time of the New Literacy Studies, prominently involving Brian Street (1995), James Gee (1996), and David Barton (2007). The idea of Multiliteracies also represents a coming together of related ideas developed before and since by members of the New London Group: Courtney Cazden (1983, 2001, "Gee, James Paul. (2014). *A unified approach to the discourse analysis of language, worlds, and video games*: Unpublished Ms."); Luke et al. 2004), Mary Kalantzis and Bill Cope (Cope and Kalantzis 1993; Kalantzis and Cope 2012), Norman Fairclough (Fairclough 1995a, b, 2001), Jim Gee (2003, 2004, "Gee, James Paul. (2014). *A unified approach to the discourse analysis of language, worlds, and video games*: Unpublished Ms."), Gunther Kress (1993, 2003), Allan Luke (1994, 1996a, 2008), Carmen Luke (1995, 1996b; Luke and Gore 1992), Sarah Michaels (2005; Michaels et al. 1993, 2005), and Martin Nakata (2001a, b, 2007). A burgeoning literature has also emerged in the area of multimodality, most prominently in the work of Gunther Kress (2009; Kress and van Leeuwen 1996), Theo van Leeuwen (2008), and Ron Scollon (2001). Our own account of multimodality is to be found in our forthcoming book, *Making Sense: A Grammar of Multimodality* (Kalantzis and Cope 2017 (forthcoming)). This encyclopedia entry draws upon a number of publications, some recent, others in press (Cope and Kalantzis

2015a, c; Kalantzis and Cope 2011, 2015, 2017 (forthcoming); Kalantzis et al. 2016).

Design

In Multiliteracies theory, we use the word “design” to describe the patterns of meaning and action that constitute representation, communication, and interpretation. We use this word because it has a fortuitous double meaning. On the one hand, any meaning that is made has a design. Its parts can be identified, and these parts fit together in distinctive ways – nouns and verbs, hyperlinks and navigation paths, and visual frames and focal points. Design in this sense is the study of form and structure in the meanings that we make. This is “design” used as a noun.

On the other hand, design is also a sequence of actions, a process motivated by our purposes. This is the kind of design that drives representation as an act of meaning for oneself, message making as an act of communication oriented to others, and interpretation as a process of making sense of communications. “Design” now refers to a certain kind of agency. It is something you do. This is “design” used as a transitive verb.

In this conception of meaning as design, we move away from meaning as artifact, either intrinsic to the world or attributed to it by persons. Rather, it is about making-making as an activity. It is an act of agency. In this activity, we use our minds as well as our bodies (for instance, to speak, to see, to move, to use media). We use socially inherited cognitive tools (for instance, language, imagery, gestures, spatial movement). And we use physical media (for instance, voices, text-entry tools, cameras). The result is an effect on the word, a transformed meaning, and a transformed world.

These meaning-making activities can serve a range of purposes. One is to communicate – we are by nature social creatures. Another is to represent without necessary communication – to undertake these activities and use these meaning-making tools as a kind of cognitive prosthesis, either as a preliminary to communication or simply to provide support for our thinking. Still

another activity is to interpret or to add re-represent communicated meanings so they make sense to oneself. Still another is to refigure oneself as an agent, as someone who can change the world in small ways and participate with others to change the world in larger ways.

A Grammar of Multimodality

What, then, are the designs of multimodal meaning, in both these senses – design (n.) as morphology and design (v.) as agency? In creating a “grammar of multimodality,” we revise Halliday’s three semiotic metafunctions – ideational, interpersonal, and textual (Halliday and Matthiessen 2004), extending them with two more. All meaning making, across all modes, operates at five levels, with five purposes. We *refer* to things, events, processes, and abstractions (Halliday’s “ideational” function). We *dialogue*, with ourselves and others (Halliday’s “interpersonal” function). We *structure* our meanings in ways which are both conventional and always innovative to the extent that every remaking is uniquely modulated (Halliday’s “textual” function). We *situate* our meanings in contexts or at least find that they are situated by default (what we call a “contextual” function). And we *intend* when we position and/or encounter meanings in webs of intention or agency (a metafunction we call “interest”). We frame these levels as “five questions about meaning.”

What do meanings refer to? Referring may delineate particular things, in writing or speaking in the form of nouns to represent things or verbs to represent processes. In images, particular things may be delineated with line, form, and color, in space by volumes and boundaries, in tactile representations by edges and surface textures, and in gesture by acts of pointing or beat. Referring may also be to general concept for which there are many instances: a word that refers to an abstract concept, an image that is a symbol, a space which is characterized by its similarity with others, or a sound that represents a general idea. Referring can establish relations: prepositions or possessives in language or collocation or contrast in image. It can

establish qualities: adjectives or adverbs in language or visual attributes in images. It can compare, including juxtapositions or metaphors of all kinds, in words, image, sound, or space.

These are some parallels. “The mountains loomed large,” says the sentence; then the image provides an entirely similar yet entirely different expression of the same thing – complementary, supplementary, or perhaps disruptive. However, we also want to highlight the irreducible differences that account for the variations and disruptions and offer evidence of the complementary value of multimodality. Writing, for instance, consists of sequential meaning elements, moving forward in English one word relentlessly at a time, left to right, line to line. It requires of us a composing and reading path that prioritizes time, because the progression of the text takes us through time. The image, by contrast, presents to us a number of meaning elements simultaneously. Its viewing path prioritizes space. When we do both, we may attain a fuller, more nuanced meaning or, for that matter, a less settled meaning.

How do meanings connect the participants in meaning making? Here we establish roles: speaker/listener, writer/reader, designer/user, maker/consumer, gesturer/observer, and sound-maker/hearer. We direct or encounter orientations: in language, first/second/third person and direct/indirect speech; in image, placement and eyelines; and in gesture, pointing to self, others, and the world. We also encounter agency: in language, voice, mood, and transitivity; in image, focal planes of attachment and engagement; and in space, openings and barriers. And we discover a range of interpretative potentials: open and closed texts, realistic and abstract images, directive or turn-taking gestures, spaces which determine flows deterministically, and others that allow a range of alternatives.

How does the overall meaning hold together? In response to this question, we analyze the devices used to create internal cohesion, coherence, and boundedness in meanings. Each mode composes atomic meaning units (morphemes, picture elements, physical components, structural materials in the build environment, strokes in gesture) in a certain kind of order. This order is both

conventional (using what we call “available designs” for meaning) and inventive (the process of “designing”), a consequence of which no two designs of meaning are ever quite the same. There are internal pointers: pronouns or connectives in language, keys and arrows in images, wayfinding markers in space, and cadence and rhythm in sound. There is idea arrangement: sequence in text, positioning of picture elements in images, and the functional mechanics of tangible objects. And there are the tangible forms of media: handwriting, speaking, drawing, photographing, making material objects, building, making music, or gesturing. Here we also want to highlight some of the enormously significant and underplayed differences between the grammars of speaking and writing, as well as the hybrid forms of speaking-like writing and writing-like speaking that emerge in the new media.

Where is the meaning situated? Meaning is as much a matter of where it is, as what it is. To the extent that context makes meaning, it is a part of the meaning. A label on a packet points to the contents of the packet and speaks to the supermarket where it is for sale. A text message speaks to the location of the conversants and the images that are posted with it. A kitchen relates to living areas in a house which in turn fits into larger patterns of everyday suburban life. Bells and electronic “dings” can mean all manner of things, depending on their context. Across all modes, meanings are framed. They refer to other meanings by similarity or contrast (motif, style, genre). They assume registers according to degrees of formality, profession, discipline, or community of practice.

Finally, whose interest is a meaning designed to serve? Now we interrogate the meanings we encounter or make for evidence of motivation. How does rhetoric work, in text, image, or gesture? How does subjectivity and objectivity work in written and visual texts? In these and other explorations of interests, we might interrogate meanings for their cross purposes, concealments, dissonances, or a variety of failures to communicate. We can explore the dynamics of ideologies, be these explicit or implicit or propagandistic or “informational.” For this we need critique, or the methods used to uncover interests that may have

Multiliteracies,

Fig. 1 Multiliteracies pedagogy: knowledge processes

been left unstated or deliberately concealed in text, image, gesture, sound, or space.

This multimodality also involves process of mode shifting or transitions in our meaning-making attentions from one mode to another: oral, written, visual, audio, gestural, tactile, and spatial. We use the word “synesthesia” to describe this mode shifting, defining the word in broader sense than is commonly the case in psychology or neuroscience (Ramachandran 2011). We conjure up an image, and then we say the word for the same thing. We describe a feature of the natural world in scientific language, and then we show a diagram of that process. Each time, the meaning is both the same and irreducibly different by virtue of the affordances of each mode (and to that extent, each mode supplementary or complementary to others). Mode shifting is an integral part of our thinking. It is also an invaluable thinking tool when used in support of learning.

If the cognitive business of switching modes is to be called synesthesia, then the practical process of transferring meaning from one mode to another is called “transliteration.” To be practical, the logistics of transliteration are now central for

students reading and writing in science, designers creating products that “speak to” their users, teachers who want to develop and implement contemporary academic pedagogies, web designers and web users, etc., indeed, in all manner of meaning-making situations in today’s deeply multimodal communications environment.

A Pedagogy of Multiliteracies

Pedagogy is the design of learning activity sequences. Two key questions arise in the process of pedagogical design: which activities to use? and in what order? The Multiliteracies pedagogy suggests a classification of activity types or the different kinds of things that learners can do to know. It does not prescribe the order of activities, nor which activity types to use. These will vary depending on the subject domain and the orientation of learners. Multiliteracies pedagogy makes several gentle suggestions to teachers: to reflect up the range of activity types during the design process, to supplement existing practice by broadening the range of activity types, and to plan the sequence carefully.

In the original formulations of the New London Group, the following major dimensions of literacy pedagogy were identified: *situated practice, overt instruction, critical framing, and transformed practice*. In applying these ideas to curriculum practices, we have reframed these ideas somewhat and translated them into more immediately recognizable “Knowledge Processes”: *experiencing, conceptualizing, analyzing, and applying* (Cope and Kalantzis 2015b; Kalantzis and Cope 2010; Fig. 1).

Experiencing:	<i>The known</i> – learners bring to the learning situation perspectives, objects, ideas, ways of communicating, and information that are familiar to them and reflect upon their own experiences and interests. Human cognition is situated. It is contextual. Meanings are grounded in the real world of patterns of experience, action, and subjective interest. Learners bring their own, invariably diverse knowledge, experiences, and interests into the learning context. These are the subjective and deeply felt truths of lived and voiced experience. Cazden and Luke call these pedagogical “weavings,” such as between school learning and the practical out-of-school experiences of learners (Cazden 2006)
	<i>The new</i> – learners are immersed in new situations or information, observing or taking part in something that is new or unfamiliar. This entails immersion in new information or situations, careful observation, and reading and recording of new facts and data. Learners encounter new information or experiences, but only within a zone of intelligibility and safety, of what Vygotsky calls a “zone of proximal development,” sufficiently close to the learners’ own lifeworlds to be half familiar but sufficiently new to require new learning (Vygotsky (1978 [1962]), p. 86)
Conceptualizing:	<i>By naming</i> – learners group things into categories, apply classifying terms, and define these terms. In child development, Vygotsky describes the development of concepts in psycholinguistic terms

(continued)

	(Vygotsky (1986 [1934])). Sophisticated adult thinking equally involves naming concepts (Luria 1976). Conceptualizing by naming entails drawing distinctions, identifying of similarity and difference, and categorizing with labels. By these means, learners give abstract names to things and develop concepts. Expert communities of practice typically develop these kinds of vocabularies to describe and explain deep, specialized, disciplinary knowledges based on the finely tuned conceptual distinctions. Conceptualizing by naming is not merely a matter of teacherly or textbook telling based on legacy academic disciplines, but a knowledge process in which learners become active concept creators, making the tacit explicit and generalizing from the particular
	<i>With theory</i> – learners make generalizations by connecting concepts and developing theories. This requires that learners be concept and theory makers. It also suggests weaving between the experiential and the conceptual. This kind of weaving might be characterized as a movement backward and forward between Vygotsky’s world of everyday or spontaneous knowledge and the world of science or systematic concepts or between Piaget’s concrete and abstract thinking
Analyzing:	<i>Functionally</i> – learners analyze logical connections, cause and effect, structure, and function. This includes processes of reasoning, drawing inferential and deductive conclusions, establishing functional relations such as between cause and effect, and analyzing logical connections
	<i>Critically</i> – learners evaluate their own and other people’s perspectives, interests, and motives. For any piece of knowledge, action, object, or represented meaning, we can ask the questions: Whose point of view or perspective does it represent? Who does it affect? Whose interests does it serve? What are its social and environmental consequences?

(continued)

Applying:	<i>Appropriately</i> – learners try their knowledge out in real world or simulated situations to see whether it works in a predictable way in a conventional context. Such action could be taken to meet normal expectations in a particular situation. For instance, objects are used in the way they are supposed to be, or meanings are represented in ways that conforms to the generic conventions of a semiotic or meaning-making setting
	<i>Creatively</i> – learners make an intervention in the world which is innovative and creative, distinctively expressing their own voices or transferring their knowledge to a different context

Introduction

While literacy in its most narrow sense has always meant learning to make sense of language, there is so much more to literacy than simply an acquisition of language skills. With many diverse ways of communicating, literacy researchers have expanded their definitions and interpretative frameworks for literacy work by applying a *multimodal literacies* perspective to literacy teaching and learning. Multimodality maintains that communication is a combination of modes of representation and expression within text designs (with the term *text* referring to communicative acts beyond but including print or writing). Modes can be oral through talk or public speaking; modes can be dramatic through role-playing and improvisations; modes can visualize content in drawings, paintings, and film; and of course modes can exist in print in books, newspapers, and magazines. Modes serve a variety of functions and speak to audiences in different ways. Expanded definitions of communication to account for multiple modes of expression and representation are certainly not a new perspective within disciplines like media studies, rhetoric, composition, and digital humanities, but the notion of multimodal literacies in education remains a nascent way of thinking about meaning making within institutional contexts like schooling. Though it is fairly obvious that there is great and rich diversity of modes in the textual landscape, it is challenging to shift curricular

frameworks. This entry presents the field of multimodal literacies starting with historical perspectives and concluding with a look ahead to the future of this productive and generative research area. To structure our account of multimodal literacies, this chapter is framed around the following key multimodal concepts: the motivated sign, modes, timescales and the multiplicative effect of modes, transmodality, synesthesia, modal density, and transduction, and we conclude with some future trends evolving within the field of multimodal literacies.

For the purposes of clarity, modes are units of meaning that inherently carry certain affordances and constraints. Affordances represent the possibilities or what is unrestrained based upon the materiality of a mode, whereas constraints indicate what may be difficult or impossible to express. Speech carries the affordance of sequence as sounds are produced sequentially – becoming words, which make up sentences to ultimately form a speech or monologue. Though not impossible, a single image can say things that language finds hard. Consequently, the use and selection of modes are governed by their affordances and constraints, influencing what we choose to value and express.

History of Multimodal Literacies

The roots of multimodality come from a few disciplines; prominent among these are linguistics and semiotics. Within linguistics, there have been a number of linguists who have taken up the challenge of dealing with tremendous shifts in the communicational landscapes by providing broader interpretative frameworks for meaning making. Linguists like Halliday (1979) have argued convincingly that language is often used to fulfill actions or practices that serve a particular function such as directive language or analytical language or instructional language and the list goes on. This functional language falls naturally into three core metafunctions that he describes as ideational, textual, and interpersonal. The ideational metafunction inherent to language use and embedded in semantics of texts concerns the

ideas, meanings, and thoughts that circulate as people engage with the world across different contexts. This can occur in the physical world as well as in digital worlds. For instance, a child who designs particular types of buildings and environments while playing *Minecraft* is engaging with the world and composing a text design built around a particular set of ideas, thoughts, and beliefs. This is an example of the ideational function enacted within the everyday. The textual metafunction accounts for design choices that are made and understood within language use and the semantics of texts. Keeping with the *Minecraft* example, a player will make specific, deliberate choices about materials to use in their design and what kinds of tools to use to fulfill a task such as a diamond pick ax or a wooden shovel. These representational choices that he or she makes represent the textual metafunction. Finally, the interpersonal metafunction describes the audience or viewer dimension of communication. Texts communicate with a desired audience, and the thought devoted to the ideas and designing of texts tailored to an audience represent the interpersonal metafunction. Once again, with *Minecraft*, a player might be designing a world with an audience in mind and making choices dictated by the needs, interests, and habits of the audience. Halliday's three metafunctions were fundamental to the evolution of multimodal literacies to what it has become today. Theorists like Kress (1997, 2010) drew significantly from Halliday's work to develop a language of description and a framework for multimodal literacies.

Much of the history of multimodal literacies relies on semiotics and social semiotics. Linguists and semioticians who explored how signs are used to convey meaning worked on the principle that anything can be a sign as long as one derives meaning from it. There are a variety of semioticians who developed theories which argue that people use semiotic resources at hand to communicate. Semiotic resources can be viewed as modes that mediate and navigate meanings implicit to text content and designs. In the late 1980s, a variety of theorists elaborated on the intricacies of social semiotics as a more nuanced way of thinking about communication. That is, signs do not exist

in a vacuum, without an audience or context; signs are contextualized units of meaning that speak across an audience and that are shaped by the contexts in which they exist. While accounting for how modes of communication are actually used, a number of researchers working in linguistics and social linguistics developed flexible terms and concepts for ways that people use different materials and invest parts of themselves in their text making. Across contexts and situations, individuals choose which modes to privilege. This kind of intellectual work and writings opened up the field of literacy studies to research that accounted for subjective and social mediation of content.

Key Concepts to Multimodal Literacies

Implicit to multimodal literacies are a series of concepts and design properties that require extrapolation to fully understand the nature and substance of multimodal literacies to the field of literacy studies. In this section, core components of a multimodal literacies paradigm, will be presented.

The Motivated Sign

To account for the subjective and social mediation of content, Kress (1997) developed the concept of the *motivated sign*. A child's drawing, a Facebook page, an advertisement, and endless other types of texts are all motivated signs as within texts that people design and produce which are motivated by the subjectivities of the sign maker. Texts carry the traces of the text designer/sign maker, and the pathway that a designer takes and the materialities that they embed can reveal important information about how they learn and understand the world. Focusing on the processes behind sign making first followed by the meanings presented in the signs, Kress (1997) refers to the motivated sign as the process by which individuals must decide which modes to privilege in sign making. At any given moment in sign creation, individuals are faced with a myriad of choices, as there are countless options that can be decided upon. It is in this moment that they must focus on the specific

features deemed essential and most appropriate for the given situation. Kress built on these ideas when he talked about sign making as a metaphor for the ways that meanings are multiplied in texts. Offering quite radical (for the time) conceptions of composition and meaning making, such as motivated signs, Kress maintained that when a child or meaning maker composes a text, the text design and content are driven by the interests and the motivations of this sign maker. This process is complex, as it is shaped at the individual and social levels, informed not only by prior experience but also by the immediacy of the moment. Additionally, psychological, emotional, cultural, and physiological factors also influence and direct the process, and they strongly inform sign production.

Modes and Timescales

Given that signs are motivated and come to fruition through subjectivities that can be emotional, cultural, and even physiological, their design sometimes draws on what Lemke (2000) calls longer and shorter timescales. Connected more with the objects or artifacts that people value, Lemke posits that semiotic signs and/or objects may have a longer timescale for meaning makers because they have had them or been familiar with them since childhood. Take, for example, an individual who has drawn since he or she was a small child and then eventually becomes an illustrator; images and image creation for this individual would carry longer timescales. In contrast, someone might have just learned how to play the guitar and there is a shorter timescale with the guitar and the act of playing the guitar. Lemke has argued that the semiotic potential of an artifact is linked to its timescale. By linking objects to timescales, the links from the local to the global can be brought to life. Stories can emerge from these links – for example, explaining why a child would need to describe his mother's country of origin using a bead map (Pahl, 2004). This child might not have the language to talk about his mother's birthplace, but he can use the resources that he has at hand to show the shape of the country and perhaps another signifier that carries a longer timescale for him.

Multiplicative Effects of Multimodality

In combining modalities, such as text and image, the combination represents one possibility out of any number of possible combinations. Since each modality has unique affordances (i.e., text cannot produce the exact same set of meaning as image and vice versa), the combination results in new, enhanced meaning that is deeper and more complex than that conveyed by the text or image alone. This represents the multiplicative effects of multimodality; as modalities are combined, more enhanced and greater meaning is possible (Lemke 2002). An image can be combined with text, which in turn can be further integrated with music or sound. Each added modality adds depth, and combinations can take advanced, layered forms. Digital texts strongly illustrate the multiplicative effects of modes because there are usually a number of modes in play when working in digital environments.

There are varied combinations of modes that change the meaning of texts. To be specific, there are instances when modes exist as separate units of meaning in texts, but there are links between modes. For instance, in film, sound or music can exist as separate modes to work alongside visuals. In *The Godfather Part 1*, there is a well-known scene when Al Pacino shoots Sollozo and McCluskey, and sound is fundamental to the scene. Resurrecting the scene, there is a train in the background with the sound of the train leading up to the shooting and the sound of the train on the tracks builds suspense. This kind of *intermodal* work navigates meanings and viewer/reader/audience interpretations. In addition, there are *intramodal* designs where modes combine to create an effect. For example, clothing designers can combine color with the texture of fabrics to create a visual and aesthetic effect in clothing designs. Finally, there are *transmodal* texts where there is more interdependence between modes. The next section elaborates on transmodal work within the area multimodal literacies.

Transmodality

Even before Lemke's (2002) analysis of the multiplicative effect of modes, Siegel (1995) focused early on in her career on the generative

possibilities when moving across modes (e.g., from writing to drawing). She relied heavily on semiotic interpretative frameworks to explain how sign use is an expansion of meaning, which elucidates the organizational rules of different sign systems. One of her greatest contributions to the field has been her ability to explain and illustrate how meaning makers, particularly children, move across two or more sign systems (e.g., from words to images and then to gesture) and, importantly, how meaning makers invent relationships between modes which enrich their understandings. Siegel argued that children use these generative potentials more fully as they move more easily across modes in their early play, until they learn how to work within more valued modes such as print. She connects the potential of transmediation, or cross-modal movement, with the turn in educational arenas, toward inquiry rather than transmission models of formalized learning. By complicating and nuancing meaning making in this way, she demonstrated how young children represent agency in their learning.

Synesthesia

Common assumption regarding sense modalities is that each one is concerned with a specific and isolated faculty. From this perspective, hearing would only be concerned with sound and sight with color. Howes (2006) challenges this notion through discourse on synesthesia, an extremely rare medical condition in which individuals have crossed or combined senses. Synesthetes may perceive letters or numbers to have colors and find that shapes have a taste or that sounds have texture. He positions this condition as a more effective model for conceptualizing sense modalities, providing a blended, unified approach. In this perspective, we may blend sound and color, when referencing the intense yellow jolt of a sharp clap. A child blends taste and color when indicating a particular candy tastes blue. Additionally, cultural practices and technologies may produce different blended modes based on what may be valued across particular cultures and history. For instance, color-grapheme synesthesia may be more common in traditional Western cultures where visuals/literacies are more highly valued.

Modal Density

In social situations, individuals are often involved in constructing multiple higher-level actions. Norris (2009) refers to this construction as modal density, involving both the intensity and complexity of modes individuals construct during higher-level social interactions. Modal density is linked to the amount of attention paid and awareness given by the individual performing actions and cannot be separated from his/her conscious mind or actions. For example, a teenager may text a friend while simultaneously conversing with family members at a gathering. In this situation, the teenager may be utilizing high modal density involving modes related to texting (i.e., object handling, gaze, language) and medium modal density related to the conversation (i.e., posture, language, gesture). More attention is given attending to texting than to the conversation, though both occur simultaneously. This attention is not fixed and the amount paid may shift throughout the interaction. At any point the teenager may shift focus, giving more attention to the conversation than texting. Consequently, modal density is configured through the investigation of simultaneous actions taking place in social interactions. There is also the issue of modal separations such as performances whose modalities are restricted such as miming or texting. It is important to acknowledge modal density when working with students to ascertain the complexity of some literacy practices that are less visible in school and equally, when there is sustained attention during modally dense actions. These kinds of everyday happenings point to competencies that may not be present within a schooling paradigm, but which are sophisticated, complicated, and should be accessed more formally.

Transduction

Meaning making is seldom confined to a single mode, and Kress (1997) coined the term *transduction* to refer to the process of transferring meaning-making processes from one mode to another. As indicated earlier, modes carry certain affordances and constraints and unique materiality associations. This could prompt meaning makers to transfer to alternate modes. Ultimately,

a rearticulation of meaning is necessary; the materiality changes as meaning shifts from one mode to another. If the written word eventually becomes gesture, as may be the case in a stage direction in a screenplay, certain decisions regarding movement and expression accompanying the gesture would need to be considered by the actor for the meaning to stay consistent from page to stage.

Future Trends

Future understandings of multimodality need to continue to be grounded in both offline and online worlds (without dichotomizing these) and need to consider the affordance of modalities (e.g., visual vs. auditory modes). As well, future understandings and applications of multimodal literacies need to explore in finer ways, the complexity of modes that come together in multimodal literacy moments, events, and representations. Over the past decade, multimodal scholars have broadened the ambit of their research to combine with other, related fields.

Multimodality and Immersive Worlds

With digital worlds research, there will be more and more research studies that focus on how, why, when, and with whom people engage with immersive worlds. Gee's work features prominently in immersive worlds research. Gee (2006) highlights the strength of video games in fostering new literacy practices. There is a large repository of gaming research that examines wide-ranging topics that are profoundly multimodal from convergence to role-play and identity to gendered assumptions about video game play. Researchers are devising different methodologies for conducting microanalysis of video segments that slow down the passage of time and embodied participation in virtual worlds.

Multimodal Literacy, Emotions, and Embodiment

Contemporary research has emerged, exploring the role of emotion and embodiment that come alive during identity production. The work of Lewis and Tierney (2013) explores emotion as

an action, how it is mediated by language, and how language, in turn, can mobilize emotion in a racially and ethnically diverse high school setting. They also explore the affordances and constraints involved in production of identity, as it relates to emotion and embodiment. In addition, Leander and Boldt (2013) explore youth identities, investigating emotionally saturated multimodal literacy-related activities. With the physicality of embodiment, these researchers draw upon the perspective that the human body not only produces signs but can also function as a sign system. With emotion so closely tied to humanity, and notions of what it means to be human, the role it plays in identity formation and sign transformation can be critical. Multimodal literacies as a field of inquiry have been moving in more of a phenomenological direction as in studies that examine the essence of a multimodal experience. For instance, in Leander and Boldt's article, they meticulously detail and theorize several hours in middle schooler Lee's day at home with a friend. Leander and Boldt describe digital play, physical movements, gestures, drawing, writing, and then more moving – in other words, Lee's meaning making is very much “in the body” drawing out a host of emotions, materialities, and different timescales.

Multimodality and the Materialist Turn

Work that closely examines materials and artifacts accessed and used as resources during meaning making can be viewed as having a life and presence of its own. That is, materials are entangled with humans and activities and practices that take place are intra-active. There are growing numbers of studies that adopt a post-human, materialist perspective on multimodal meaning making, and this kind of work will become more prominent in the coming years. Research situated within a materialist paradigm is the notion of artifactual literacies (Pahl and Rowsell 2010) which focuses on artifacts as signaling identities and as laden with stories and contexts as well as with an increased focus on modes, materials, and technologies post-human work by researchers like Kuby (2013) who look at children's material worlds in sophisticated ways theorizing through new

materialism and embodiment with the work of Barad (2007) and Deleuze and Guattari (1980). The focus of this work is on what humans do to materials in literacy learning.

Concluding Thoughts

One of the most important facets of multimodal literacies as a lens for research and practice is its capacity to uncover aspects of identity and epistemology. Often, within more formal contexts like schools, aspects of identity get hidden from view. A final thought that we wish to add is that a view of multimodality that keeps critical perspectives, equity, and social justice at the forefront is one that can potentially lead to educational change and considers how multimodal perspectives allow for one to see what is happening differently and for one to recognize and value the potentialities of various modes and modal compositions.

Introduction

Conceptions of ethics lay claim to offering both a reasoned and reasonable account of actions constituted either along a continuum of right and just action or along a continuum of wrong and therefore reprehensible action. Using practical reasoning – that is, the ability to think and act with compassionate imagining – it would be apposite to conceive of and distinguish between that which is morally good and that which is morally bad. Muslim education, as shaped through the sources and teachings of the Qur’ān and the life and practices of its Prophet Muhammad (*Sunnah*), offers particular guidelines and preferences around which those who lay claim to being Muslim ought to conduct themselves – morally, as an individual, and as part of a collective community (*ummah*) Schweiker (2005). And yet, as is evident in the multiplex interpretations of Islam, as depicted in the (often questionable) actions of Muslims, questions need to be asked about what Islam is and does, what it advocates and cultivates through its foundational sources, and how it conceives of and delineates between that which is right and just and that which is not. Indeed, what constitutes an ethical framework of Muslim education?

Ethical Concepts as Enunciated Through Muslim Education

Ethical theory, explains Fakhry (1991, p. 1), is a reasoned account of the nature and grounds of right actions and decisions, as well as the principles underlying the claim that they are morally commendable or reprehensible. What is morally commendable and reprehensible is generally understood by Muslims to be coherently encapsulated in the revealed text of the Qur’ān as enacted through the life experiences of Prophet Muhammad (the *Sunnah*). As such, the Qur’ān is understood to offer the basis and the medium through which to understand and practice all moral, religious, political, and social obligations. Al-Hasan et al. (2013, p. 11) explain that because the Qur’ān generally speaks about universal concepts, the

specificity of conduct and behavior expected of Muslims is reflected in the life example of the Prophet Muhammad. To this end, Muslims consider the *Sunnah* (lived example of the Prophet Muhammad) as a critical factor in the sustenance of their faith and the preservation of their identity. Similarly, Ramadan (2001, p. 78) clarifies that the Qur'ān, together with the lived example of the Prophet Muhammad, defines the points of reference for all Muslim spheres of life – the individual, the social, the economic, and the political. In Islam, differentiation between what is right and what is wrong cannot be left to a particular society, because society or the individuals, who constitute a society, have inherent weaknesses and might be inclined toward behavior which is convenient, regardless of whether it is right or wrong (al-Hasan et al. 2013; al-Qaradawi 1985). From a Muslim perspective, state al-Hasan et al. (2013, p. 2), ethics is related to several Arabic terms, such as *ma'ruf* (approved), *khayr* (goodness), *haqq* (truth and right), *birr* (righteousness), *qist* (equity), *'adl* (equilibrium and justice), and *taqwa* (piety), as well as most commonly *akhlāq* (virtuous conduct). They continue that ethics in Muslim education can be understood and categorized in relation to the individual (acting with integrity, modesty, and restraint), family (relations between spouses, caring for the elderly, regard for parents), and society (acting fairly, justly, and compassionately) (2013, p. 11). That is, ethics has both an individual and social dimension.

To Muslims, the Qur'ān is considered as an ethical text par excellence as the need to validate any human practice is invariably connected to a Qur'ānic injunction. To illustrate the ethical impetus of the Qur'ān, we refer to chapter 49, verse 13: "O humankind, indeed We have created you from male and female and made you peoples and tribes that you may know one another. Indeed the most noble of you in the sight of Allah is the most righteous of you. Indeed Allah is Knowing and Acquainted." This verse explicates, firstly, gender equality (humanity having evolved from male and female); secondly, it intimates that human equality and coexistence depend on how humans engage with one another; and thirdly, the verse advises humanity to discern people by piety rather

than by any other criterion such as status, wealth, or lineage. As an ethical text, this verse lucidly accentuates the Qur'ān's preference for an ethical code that is commensurate with equality and diversity, pluralism and dialogical engagement, and moral virtue – all aspects of religious ethics that invoke the virtues of recognizing otherness, tolerance, peace, and dialogue. Moreover, the Qur'ān is replete with verses that prioritize consciousness of the Divine Creator (*īmān*) and the enactment of good actions (*al-sālihāt*) as significant ethical practices that should become the priority of humanity. To this end, God consciousness coupled with good actions are considered as Muslim ethical dispositions and enactments as enunciated in the Qur'ān and expressed through the *Sunnah*.

And yet, says Fakhry (1991, p. 1), although the Qur'ān embodies the whole of the Muslim ethos, it does not, strictly speaking, contain any ethical theories. Likewise, Hourani (1985, p. 25) contends that one cannot speak of Qur'ānic theories because the Qur'ān by its nature and purpose is not a book of theology and therefore does not presume an explicit position on a number of questions. There are, however, explains Hourani, assumptions presupposed in the way that the Qur'ān expresses ethical messages, which govern the conduct and behavior of the individual in relation to him or herself and to others. In this regard, Muslims are initiated into codes of belief, which include, fundamentally, a belief in the oneness of God (*tawhid*), belief in the Prophets and their revealed Books (Torah, Bible, and the Qur'ān), and belief in the Day of Judgment. In turn, Muslims are expected to fulfill specific obligations relating to prayer (*salāh*), fasting in the month of Ramadan, or giving charity (*zakāh*). Underscoring these foundational constructions of Muslim identity is a thematic emphasis on the responsibility of Muslim vicegerency – as God's trustee on earth. In this sense, Muslims enact their responsibilities to God and embody the virtues of God – as encountered in the 99 names of God (*asma-ul-husna*) by treating themselves and all those around them with respect, love, kindness, fairness, compassion, empathy, and justice.

In order to gain insight into how Muslim education is constituted, it is necessary, states Fakhry (1991, p. 11), to take cognizance of Qur'ānic passages that have bearing on three fundamental categories. These relate to the nature of right and wrong, divine justice and power, and moral freedom and responsibility. Of particular interest to us, in this entry, it is the construction of moral freedom and responsibility. While Muslims, on the one hand, are encouraged to live their lives, based on the primary source codes of the Qur'ān and the *Sunnah* (the example of Prophet Muhammad), they are, on the other hand, implored to contemplate and reflect on what they believe and do. In this regard, Wadud (1999, p. xv) explains that the Qur'ān 1999, p. xv) "is not just descriptive; it is prescriptive, with a goal of achieving some response from readers as part of the process of surrender and belief. This responsive efficacy increases in proportion to the complexity and totality of human motivation, which extends beyond mere rational cognition to include emotive impact." In this regard, Muslims are instructed to not only seek knowledge as a moral injunction but are implored to use their intellect (*'aql*), to contemplate and reflect (*fakara*) so that they might come to their own conclusions about God, their existence, and their existence in relation to God and others: "Why do they not reflect on themselves? God did not create the heavens and the earth, and everything between them, except for a specific purpose, and for a specific life span" (al-Qur'ān 30: 8). Significantly, the Qur'ān deplores those who do not use their faculties, since it would imply a blind and unquestioning submission to God, rather than an informed and reasoned response: "The worse creatures in God's eyes are those who are (willfully) deaf and dumb, who do not reason" (8: 22). The Qur'ān's numerous appeals for contemplation clarifies that when it speaks of, and to, a "Muslim," it has in mind someone who subjects both the Qur'ān and him or herself to critical thought and reflection, which, in itself, is considered to an ethical practice. And because the Qur'ān advocates that Muslims ought to be reflective, contemplative, and attuned to critical judgment, it clearly distinguishes between "those who know" and "those who reflect" from the heedless people.

Now that we offered some insight into a few ethical enunciations which inform Muslim education, we turn our attention to individual or autonomous moral action intertwined with communal action in order to achieve goodness and justice – which, to our minds, is the foundational purpose of Muslim education.

On Autonomy, Community, and (Dis) agreement

Generally, autonomy is commonly associated with conceptions of independent thought and action. As an ethical principle, it speaks to the individual's inherent ability and right to think and decide for him/herself – without the interference of others. In terms of Qur'ānic exegeses, the principle of individual autonomy is made apparent in chapter 95, verse 4: "We have indeed created man (and woman) in the best of moulds." And again in the decisive verse, "Let there be no compulsion in religion: Truth stands out clear from error. . ." (al-Qur'ān, 2: 256), which exemplifies the paradigmatic foundational ethic in Islam that the decision to be Muslim and to accept the trust of the covenant is entirely an individual's decision. Because coercion undermines human freedom and advocacy and cannot be associated with just action, just human action implies that non-coercion – *Lā ikrāha fī al-dīn* – is a condition of such relations. As we shall show, the provision of *ijtihād* (individual autonomy) in Islam is not only in relation to the individuals' right to make his/her own choices but also sets the context for measures of engagement and deliberation. Inasmuch as the notion of individual autonomy is aimed at affording a Muslim her positive right to exercise her freedom in the pursuit of knowledge, such autonomy cannot be left unconstrained.

Unconstrained individual autonomy invariably undermines the concept of community (*ummah*). A Muslim community (*ummah*) constitutes individuals who advance socioeconomic and political aspects of life on the basis of mutual cooperation, coexistence, and active deliberative engagement. The Qur'ān in chapter 4 verse 95 admonishes that

passivity cannot be deemed equivalent to striving actively and deliberatively in Allah's course. The Prophet Muhammad also elucidated in the *Hadith* (statements of the Prophet) that a person becomes a renegade if he/she fails to engage in community (al-Rahim 1987, p. 10). And, if individuals act indifferently and unresponsively to societal affairs, their autonomy to act passively ought to be constrained. In this regard, Muhammad al-Ghazali (1961, p. 157) cautions individuals not to remain passive toward injustice and iniquity (*fusuq*). Instead, as noted by Abu Hamid al-Ghazali (in Musalam 1996, p. 177), individuals should exercise their *hisba* or inalienable right and responsibility to oppose oppression, tyranny, and offensive displeasures. In other words, unconstrained individual autonomy whereby people passively fail to act against injustices is not only deeply offensive for a Muslim community but also ethically irresponsible. By implication, Muslims are obliged to exercise their responsibility to criticize. Consequently, the Prophet advocated that "The best form of *jihad* [striving] is to utter a word of truth to a tyrannical rule" ('Abd al-Baqi n.d., p. 1329). What follows from the aforementioned is that constrained individual autonomy is connected to the notion of opposing forms of societal injustice.

Moreover, opposition to injustice on the grounds that individual Muslims' actions should not be left unconstrained should also be validated in relation to communal action, more specifically mutual consultation (*shura*). In this sense, practicing *shura* becomes an act of community. Rahman (1986, p. 91) posits that *shura* among Muslims is a Qur'anic procedure that obliges them (Muslims) to act with critical judgment and mutually informed deliberation. Central to *shura* is the notion that ethical concerns in Islam ought to be resolved on the basis of deliberative engagement and an attenuation to justice. Muslims are consistently encouraged to seek clearer understandings on the basis of exercising their individual autonomy as a positive pursuit for critical judgment and reflection and finding out things through mutual consultation – a matter of acting with collective understanding. And, considering that ethical concerns require intensive

deliberation and critical judgment (*ijtihad*), it is not inconceivable that disagreement (*ikhtilāf*) might ensue. In this regard, al-Alwani (1994) posits that disagreement is an acceptable practice in deliberative engagement among Muslims – for the very reason that it takes into account the different opinions of individuals. It is important to note that while a consensus of ideas (*ijmā*) is a desirable outcome of engagement, it is not necessarily an enabling condition for engagement. In this way, the possibility is always there that others' thoughts can interrupt one's independent judgments on the grounds that more credible arguments perhaps ensue that in a way urge one to reconsider an individual's ideas derived through *ijtihad*. In this regard, Kamali (1997, p. 215) clarifies that "The essence of *ijmā* lies in the natural growth of ideas. It begins with the personal *ijtihad* of individual jurists and culminates in universal acceptance of a particular opinion over a period of time. Differences of opinion are tolerated until a consensus emerges and in the process, there is no room for compulsion or imposition of ideas upon the community." In this sense, *ijmā* is a form of autonomous collective action that requires interruptions from others.

Individual autonomy in community, therefore, is constitutive of an ethics of Muslim education with the aim to achieve justice in human affairs. Described by Fakhry (1998), along Platonic lines Mahdi (1969), as the "harmony" of the three corresponding virtues of wisdom, courage, and temperance, the ethical pursuit of justice of all kinds is indeed the *raison de trait* of Muslim education – "Be just; that is nearer to righteousness" (al-Qur'ān, 5: 8). And, the attainment of justice is underscored by a deep form of critical judgment, consensus, and disagreement. In our consideration, individual autonomous action will only be enhanced through collective action, as judgments will be reconsidered in light of what is more tenable and even desirable. For instance, the existence of different jurisprudential schools of thought in Islam, namely, Hanafi'ism, Shafi'ism, Hanbali'ism, and Maliki'ism, is a testimony of the presence of disagreement (*ikhtilāf*). In this regard, both the leaders of Shafi'ism and Hanafi'ism, respectively, purported "My opinion

is right, and may yet be proven wrong; while the opinion of my opponent is wrong but may yet be proven right” (Imam Shafi’i) and “This knowledge of ours is a matter of opinion, but is the best we could come up with; and whoever comes with something better we will accept it” (Abu Hanifah) (in Al-Majid 1962, p. 82). Hence, the pursuit of Muslim education is inextricably connected to the ethical manifestations of disagreement, critical judgment, and autonomy vis-à-vis the notion of communal action. And, communal action, as a form of merging individuals in acts of justice and intellectual autonomy (*ijtihad*), offer tangible ways through which various manifestations of dystopias can be counteracted. In turn, communal action, governed by ethical ways of thinking and being, is fervently oriented to cultivate justice in every sphere of human experience in quite an unbounded fashion – so that an individual does not have to remain bounded to a community when he or she is in disagreement with that community.

Introduction

While the contentious positioning of Muslim women is not necessarily new within Islamic paradigmatic discourses, the increasing debates surrounding their (expressed) identity has, by all accounts, placed Muslim women at a (in)hospitable intersection of belonging and assimilation. That traditional/normative Islam has historically recognized Muslim women by largely *not* recognizing them in terms of their agency and autonomy has, in many instances, offered irrefutable sanctioning of the non-visibility and invisibility of Muslim women in most of the Muslim-majority countries. What is relatively new, however – if only, in its political institutionalization – are the

parallel discourses emerging from Muslim-minority countries. In what appears to be a juxtaposed argument against the veiled invisibility of Muslim women comes the call for an unveiled visibility. Any (mis)conception that the continuum between veiling and unveiling is a divergent one should immediately consider that, in both instances (i.e., of veiling and unveiling), Muslim women are subsumed into subjective descriptors of their religion – whether by the Taliban or by the Parisian police. As such, embedded in both discourses of veiling and unveiling is the suffocated silence of Muslim women, who are subjectified by, on the one hand, normative traditions (which are not to be confused with Islam) and practices of liberation (which are not to be confused with democracy). Who, then, are Muslim women, and what makes her so important to both foundational paradigms of Islam, and liberal democracies? Secondly, what would a just narrative of Muslim women – not in relation to the interpretations by and from others – but from themselves, look like?

On Interpretations of Muslim Women from a Qurānic Perspective

I would like to start this discussion by clarifying that the often conflated understandings between conceptions of Islam and Muslim are located in the fusion between the revealed text (i.e. the Qurān) and the interpretation thereof. The impression created from such understandings is that interpretation is somehow objective, and Islam is therefore a monolithic religion. Yet, any advocacy of a monolithic Islam is immediately brought into contention by its foundational source, in which it is clearly stated, “O humankind, indeed We have created you from male and female and made you peoples and tribes that you may know one another” (Chap. 49, verse 13). The Qurānic recognition of diversity contextualizes, as Moosa (2003, p. 114) observes, the proposition of a multiplicity of “Islams,” and hence many discursive traditions through which Muslims imagine themselves – that is, how they understand themselves and how they enact those understandings. In this regard, Moosa (2003, p. 115) and Wadud

(2006, p. 19) are in agreement that Islam is what Muslims do, and Islam therefore cannot be imagined without Muslims. In this sense, if Islam is manifested through what Muslims do, then Muslims ought to take responsibility for and respond to any disjuncture which might arise between the foundational text and its interpretation.

Muslim women, for instance, are not only centrally positioned in the Qurān but are described as equal participants within the prophetic traditions (Ahmed 1992; Barlas 2002; Wadud 2006). To this end, as Wadud (2002) points out, the fact that there are more passages in the Qurān that address issues pertaining to women, than all the other issues combined, provides some insight into not only the Qurān’s response to a deeply patriarchal Arabian society but ensured the reformation of women’s status in relation to marriage, divorce, and inheritance (Esposito and DeLong-Bas 2001: 4). It is therefore significant to note that the far-reaching changes ushered in by the foundational text of Islam are seemingly irreconcilable with patriarchal, hegemonic interpretations thereof. According to Wadud (2006, p. 22), not only are women and women’s experiences mostly excluded from historical and current methods of interpretive reference, but the applications of Qurānic interpretations when constructing laws to govern personal and private Islamic affairs, as well as public policies and institutions, are based on male interpretive privilege. As such, it becomes imperative to consider historical accounts of Muslim women – of engaged and active participation – in relation to the contemporary discourses of disengaged subjectivity. Ahmed (1992, p. 47) explains that a number of accounts of the Prophet Muhammad – that subsequently came to constitute the Sunnah (the example of Prophet Muhammad) – were recorded and related on the authority of women. Ahmed continues (1992, p. 72) that the women of the first Muslim community were not “docile followers but were active interlocutors in the domain of faith as they were in other matters.” Historical accounts of Muslim women attending study circles and institutions of learning, while studying with men and other women, bring into contestation, states Afsaruddin (2005, p. 164),

constructions of sexually segregated spaces that are commonly presumed to be a defining feature of medieval Muslim society.

Seemingly, the above depiction is notably incompatible with normative constructions and associations of Muslim women in relation to ideas and images subjugation, seclusion, domesticity, and hence passivity (Stowasser 1994). And perhaps this incompatibility is acknowledged (albeit unknowingly) in contemporary debates that continue to locate questions about Muslim women in relation to parameters of the greater search for Islam's identity and role in the modern world (Stowasser 1994, p. 5). To this end, Stowasser (1994, p. 7) describes Muslim women as fighting a "holy war for the sake of Islamic values where her conduct, domesticity, and dress are vital for the survival of the Islamic way of life. Religion, morality, and culture stand and fall with her." Similarly, Okin (1997, p. 12) points out that the personal, sexual, and reproductive spheres are commonly centrally located in cultural or religious groups. As such, states Okin (1997, pp. 12–13), the defense of these spheres is likely to have a much greater impact on the lives of women than on men, since much more of women's time and energy goes into preserving and maintaining the personal, familial, and reproductive side of life. How these spheres are defended are through her conduct, her domesticity – symbolizing her commitment to her family through her seclusion – and her dress code, and more specifically, a dress code that conceals and secludes. That this same dress code of Muslim women has become the dominant focus in which liberal democracies have chosen to engage, some would say disengage, with Islam might remind one of Michael Walzer's prudent observation that the "gender issue" would prove to be the most "divisive" in multicultural theory and politics (Walzer 1997, p. 60).

On Reinterpretations of Muslim Women from Other Perspectives

While Moosa (2003, p. 115) and Wadud (2006, p. 19) are in agreement that Islam is what Muslims do, Manji (2004, p. 204) observes how the Qurān

"is allowed to be interpreted – and how it isn't – has become everybody's business." In this regard, liberal democracies have taken it upon themselves to offer their own interpretation of the Qurān – certainly insofar as it has deemed the specific dress code or *hijāb* (head-covering) as oppressive to Muslim women. Underscoring this judgment is an implicit argument that Muslim women would not willingly choose to wear *hijāb* and that they must be doing so under duress and is therefore symbolic of their repressed identity and role within Islam. Ironically, by assuming the role of the emancipatory voice of Muslim women, liberal democracies seemingly slip into same monolithic discourse of patriarchal-normative Islam – that is, they treat Muslim women as a monolithic collective. In this sense, says Okin (1997, p. 12), the attention is on the differences between Muslim women, as the minority group and the majority group of liberal democracies, rather than on differences among Muslim women. Consequently, argues Okin (1997, p. 12), little or no recognition is given to the fact that, inasmuch as Muslim women occupy gendered communities, liberal democracies are themselves deeply entrenched in gendered constructions and practices – with substantial differences of power and advantage between men and women.

If the argument, therefore, is that patriarchal-normative interpretations of the Qurān have been undermining of Muslim women, then one has to ask whether what liberal democracies are attempting to do is any less undermining. If normative/traditional interpretations of Qurānic exegeses have ensured the exclusion and seclusion of women through layers of veiling – private or public – then what is different about a liberal democratic insistence that Muslim women unveil in order to access the public sphere? While not the focus of this submission, liberal democracies might also wish to consider how the suppression of religious/personal rights reconciles with its own liberal principles. For the purposes of this discussion, however, it remains important to understand why liberal democracies, which are in principle committed to equal representation, have chosen to focus their agendas of integration, participation, and democratization on Muslim

women, and not on Muslims. And to address this we have to consider the “gender issue” (Walzer 1997). In this regard, Wolf (1994, p. 75) submits that while the predominant demand for recognition in multicultural contexts is one of the cultural identity recognitions, the question of whether, how significantly, and with what meaning one wants to be recognized as a woman is itself a matter of deep contention. The recognition or misrecognition of women, therefore, is problematic partly because there is not a clear, or a clearly desirable, separate cultural heritage by which to redefine and reinterpret what it is to have an identity as a woman. The failure to recognize women as individuals, with ideas, talents, skills, and values of their own has meant, maintains Wolf (1994, pp. 76–77) that “The predominant problem for women as women is not that the larger or more powerful sector of the community fails to notice or be interested in preserving women’s gendered identity, but that this identity is put to the service of oppression and exploitation.” In this sense, the deliberate regulatory responses by liberal democracies to the dress code of Muslim women reveal a misplaced fixation on that which is visible, while simultaneously discounting, on the one hand, Muslim women’s autonomy in deciding their own dress code and, on the other hand, the reality of differences among Muslim women.

Toward a Just Interpretive Narrative

In the Qurān, issues of gender and gender equality are implicitly tied to concerns about justice and just action:

Indeed, the Muslim men and Muslim women, the believing men and believing women, the obedient men and obedient women, the truthful men and truthful women, the patient men and patient women, the humble men and humble women, the charitable men and charitable women, the fasting men and fasting women, the men who guard their private parts and the women who do so, and the men who remember Allah often and the women who do so – for them Allah has prepared forgiveness and a great reward. (Chap. 33, verse 35)

Ahmed (1992, p. 64) describes the above verse, in which the essence of equality between

men and women is clearly expressed, as balancing not only virtues and ethical qualities in one gender with the precisely identical virtues and qualities but also as emphasizing the common and identical spiritual and moral obligations placed on all individuals regardless of gender. In turn, the recognition of the autonomy of Muslim women is made apparent not only in the Qurān’s emphasis on *ijtihad* (individual autonomy) but also in its enunciations, explains Stowasser (1994, p. 21), that a woman’s faith and righteousness depend on her own will and decision. The advocacy of *ijtihad* is, however, immediately connected to the Qurānic injunction that to be just is to be nearer to righteousness (Chap. 5, verse 8). Following on this, it becomes apparent that any subversion of notions of gender equality is intrinsically incommensurable with Qurānic exegeses.

As to whether normative Islam is wrong about insisting that Muslim women should veil or whether liberal democracies are erring in its call for them to unveil serves only to further submerge the real concerns about Muslim women’s autonomy. While normative Islam constructs veiling as the preservation of Islamic values, liberal democracies construct it as backward and counter-accessible to modern democracies. And this is not the only ironic collision between normative Islam and liberal democracies. Because normative Islam constructs domesticity as the primary domain of Muslim women, they are more likely to experience oppression within that private space. And because liberal democracies insist upon unveiled Muslim women within public spaces, those Muslim women to whom veiling matters might be less likely to leave their private space. What neither normative Islam nor liberal democracies take into account is that meaning does not reside in what is visible or not; meaning derives from interaction and engagement. On the one hand, therefore, the decision by Muslim women to veil is not synonymous with oppression, seclusion, or exclusion. On the other hand, the decision not to veil is not a refutation of Islamic values. How Muslim women choose to enact their identity, and whether they consider wearing the hijāb as a necessary expression of that identity, is, in terms of Qurānic exegeses, their reasoned prerogative.

What the tug-of-war between what and how the identity of Muslim women is constituted reveals is an undermining and curtailment of Muslim women's rights to autonomy and, hence, human dignity. If one, therefore, were to consider a just narrative of gender equality in relation Muslim women, then such a narrative would have to take its cues from Muslim education, which, in turn, is derived from the source code of the Qurān. In this regard a just narrative has to take into account Muslim women in relation not only to their gender but also in relation to their spirituality. This is because when the Qurān addresses and clarifies the issue of gender equality (Chap. 33, verse 35), it does so not only by establishing equilibrium between men and women but also, more importantly, by embedding gender equality within similar and equal spiritual and moral obligations. To this end, gender equality is not understood only in relation to what is obviously evident – that is, the physical condition of men and women. Rather, gender equality takes into account the spiritual dispositions of women, inasmuch as it does men. As such, the equality of the corporeal nature of men and women are created equal, because both have been brought forth through the grace of one God.

In conclusion, gender equality, as enunciated through Muslim education, necessarily finds its conception and articulation within the interrelated epistemological practices of Muslim education itself – that is, *tarbiyyah* (socialization), *ta'lim* (critical engagement), and *ta'dīb* (social activism). Firstly, to understand the equality between men and women is to be immersed into particular social practices (*tarbiyyah*), which discount any notions and practices of prejudice based on gender. Whatever socialization practices and obligations are placed on Muslim men are placed on Muslim women. Secondly, to recognize that Muslim men and women face equal obligation and equal accountability for their actions is to critically engage (*ta'lim*) with the fundamental refrain of the Qurān, which is to enact justice. Any critical considerations of practices, which promote the prejudicial or oppressive treatment of another, are irreconcilable with the Qurān and, hence, Islam. Thirdly, it is not enough to lay claim to

being socialized into particular practices of ways of being and thinking, if one is not prepared to enact what one knows (*ta'dīb*). In this regard, Muslims are obligated to act when they witness a wrong. In fact, to merely bemoan the condition of something, without endeavoring to actively change it, is considered as the weakest form of faith. Following on this, it becomes evident that the cultivation of gender equality, in terms of Muslim education, is not a separate endeavor in need of remedial or political reform. The issue of gender equality emanates from the same source as all other forms of just and equal regard for oneself and others. To advance gender equality, therefore, is to advance not only the ethical enunciations of the Qurān but to act as an ethical human being.

My Perspective on Philosophy of Education and Educational Practice(s)

Nesta Devine

Auckland University of Technology, Auckland,
New Zealand

Introduction

I studied Philosophy of Education with Professor James D. Marshall at the University of Auckland at various times during my teaching career, and Philosophy of Education became an integral part of my approach to education. I think of myself not so much as a philosopher of education so much as a member of a community of philosophers of education. My understanding of the discipline has evolved, but it still reflects family influence and the input of my teachers and others. This (requested) paper is a personal view and does not pretend to be anything more than that.

When I talk about “education,” I do not limit the point of reference to schools, or other formal institutions of learning, but include the whole complex arena of human interactions which have educative intent or results. So fishing in Kiribati or visiting New York, or indeed piracy off Somalia can all be included (to the extent that someone learns something) in my understanding of “education,” and consequently the philosophical field appropriate to education is vast indeed.

For me the charm of philosophy of education is its ambivalent position between the world of “pure” philosophy and the world of practice. I’m not claiming that this is unique – there may well be other institutions or disciplines which can claim the same. But to the extent that they mediate between theory and practice, I suspect that most of

these institutions would have an “educational” role – like science advisors, or, at their best, art critics; so they too perhaps could be taken into the vast hall, that is, philosophy of education.

We could well interrogate that “of” in philosophy of education: not because we will learn anything decisive but because such an interrogation might well add an anteroom to our structure. When we talk about “philosophy of education,” we do not mean that we are necessarily examining educational practice, in order to find out what philosophy informs it, although that is a valuable (and too seldom done) exercise. We are also likely to be talking about “philosophy for education,” that is, about philosophy which might be useful if it were applied to educational practice.

Note that I insist on “educational practice.” I do not think that “philosophy of education” extends to philosophy as a curriculum subject, at any level of schooling, although I do think that it is legitimate to include philosophical concerns in the content of teaching and learning and that the content, like the content of any subject area, should be subject to intense (and philosophical) scrutiny. My interest in philosophy of education and its relation to practice is more to do with pedagogy than with curriculum. Why do we teach the way we do, and are there other ways of engaging students in learning? What traditions can we call on, what traditions should we reject? In order to answer such a question, even tentatively, we need to define the practices we use in terms of the traditions they represent. To use a crude example, strapping children relates to a primitive form of Christianity – “spare the rod and spoil the child.” So long as we are unaware of this tradition we are likely to assume the efficacy of the practice, as built up over years of “experience” rather than to question it as an artifact of a particular way of seeing the world and of a particular ontology based on a notion of sin. Practice is already informed by, structured by, understood through, theory, even if the theory is implicit, unspoken, and perhaps not recognized. So philosophy of education in this sense is about making explicit bringing to light, existing theory already embedded in practice. This is the “deconstructive” role of philosophy of education, illustrated at its best

by Michel Foucault's genealogies of practice and Jean-Jaques Derrida's careful definitions and philosophical/etymological analyses of the origins of many of our practices and their supporting assumptions.

When I deconstruct my own priorities in relation to philosophy of education, as laid out above, I'm struck by the fact that although I do not use the term, the idea is essentially Marx's idea of "praxis." This notion of the expression of theory in practical form takes on life in the work of Freire and Patti Lather, and it brings with it several other ideas: that of "emancipation" and the idea that the theory – generally Marxist theory – comes first, and appropriate educational practices can be developed from there. I am a little bit shy of "emancipation" and even more so of the Freirean term "empowering," but at heart, I think that my games with philosophy in the educational field are meant, in some way, to free the student/teacher/thinker/myself from the psychic or intellectual ties that bind us to ways of thinking that no longer serve us well – that is, to "empowerment," "emancipation," or "agency," depending on which of the Marxist/post structuralist discourses seem to work best at the time. And to me, this "emancipation" is largely about shaking off, in my own mind and practices, the assumptions of the academic world about ways to practice learning and teaching, and the way I go about this is to use, as Foucault calls it, "submerged knowledges": the knowledges of those who have not become assimilated to the western project and who can therefore cast a critical doubt on my own way of seeing things. I am very grateful to the thinkers and writers I have met from Pacific countries and the Maori communities of New Zealand for some insights which allow my own assumptions to be thrown into high relief, to become visible, and therefore to become subject to critique.

Philosophy does provide ideas for educational practice: for instance, teachers still use forms of Socratic questioning. Applied Behavior Analysis and Behavior Modification stem from a positivist form of thought epitomized by Ernst Mach – that science should deal with things that can be measured and counted, not the ineffable. Unfortunately, such a process of actualizing ideas tends

to be associated with a certainty of thought that sits uncomfortably in the varied, diverse, pragmatic arena of education even though the ideas may be, at least in their originary form, very useful. Behavior modification for instance was originally quite humanitarian in its intentions but became associated with the kind of individualism and contractualism of neo-classical economics, so that what had been a psychological theory of association and conditioning became a bargaining theory of behavior, results, and consequences.

Philosophy of education then is about learning processes, about the ontology of learners (and educators), about knowledge and knowing, and also a study of the politics and ethics which surround and are inherent in the practices of education. To be able to account for these with an informed, critical eye is also to perform the work of philosophy of education, with – I confess it – emancipatory aims.

Narrative Assessment: A Sociocultural View

Bronwen Cowie and Margaret Carr
The University of Waikato, Hamilton,
New Zealand

[Evaluation](#); [Formative assessment](#); [Story](#)

Introduction

From our earliest time stories have played a critical role in recording events, providing insight into ideas, rallying support, and entertaining us. In different ways, all stories serve a purpose, even if to simply relay a message. We can think of examples from, for example, the paintings in the Lascaux Caves in the Pyrenees mountains in southern France (15,000 and 13,000 BC), to the Epic of

Gilgamesh carved on a stone pillars (700 BC), to the oral traditions that kept Aesop's fables alive (Aesop lived in 500 BC and his stories were written down in 200 BC), the parables in the Bible, Shakespeare's plays (as text and performed), Martin Luther King's speeches, and Steve Jobs' keynotes to launch new products. As this selective overview reminds us, stories can be communicated and passed from person to person through a variety of modes and media, often in combination. Their power lies in their capacity to capture complexity, evoke emotion, and create empathy, drawing us into a situation and helping us to see ourselves and to see others in new ways. It is this diversity of representational means, purposes, and consequences that underpins the use of stories as assessments in narrative format.

The essence of a narrative assessment is that it belongs to and is embedded in a particular context – national and local community, families, school, and early childhood center. However, a thoughtfully crafted assessment narrative can transcend the original context or place through the way it affords engagement and perspective taking in another place, particularly when it is shared with families at home. Assessments in narrative format can offer plotlines that are designed to resonate with other situations and circumstances and to illustrate multiple possible actions and futures. Sociocultural views of learning and assessment enable us to take account of this complexity.

In this entry we set out the possibilities that narrative assessment offers in documenting,

supporting, and reporting the breadth of children's learning. We ground these possibilities in a sociocultural view of learning and assessment. Sociocultural views of learning acknowledge the extent to which learning is entangled with, and made possible through, the material, social, cultural, and historical features of the context for learning. This view of learning highlights the need for assessment to focus on the learner in context and over time (Gipps 1999; Moss 2008). This view, as Gee (2008 p. 200) reminds us, expands what counts as knowing to include the special ways of acting and interacting a community uses to produce and use knowledge and their special ways of seeing, valuing, and being in the world.

Sociocultural views of assessment also acknowledge that assessment shapes learner identity – how learners come to see themselves as learners and knowers and how they are seen by others. In Stobart's (2008) terms, assessment plays a crucial role in "making up people" (p. 1). Thus, a sociocultural view of assessment includes consideration of the development over time of a person's knowledge and expertise, of their affiliation with a particular domain of interest, and of their dispositions and strategies for learning. This breadth of foci is important when the goal is to foster the development of people who can learn and participate productively in society as an individual and as a productive member of the various communities they encounter across the course of their home life, work, and leisure activities. If all these various aspects of learning and being an effective learner are not reflected in assessments, then we can be sure that the enacted curriculum will not pay attention to them.

In the remainder of this entry, we pursue the implications of a sociocultural understanding of assessment through a focus on (i) narrative assessment as a way of acknowledging the distributed nature of learning, (ii) narrative assessments as improvable objects and opportunities for developing a learning journey, and (iii) narrative assessments as boundary-crossing objects that mediate conversations across interested communities:

Narrative Assessments as a Way of Acknowledging the Distributed Nature of Learning

Assessments as narratives can represent, conscript, and engage all the various resources and people who are entangled in the context of an episode of learning. When learning and knowing are understood as distributed (Salomon 1993), the context is not just a source of stimulation and guidance, but a genuine part of the learning – in terms, the unit of analysis is the "person-plus." Recognizing this, Gee (2007) describes three interlinked elements as involved in a sociocultural-situated view of language, learning, and the mind: an acculturated, socialized, embodied *actor*, within a *situation*, coordinating him- or herself with other people and objects, tools, or technologies (*mediating devices*). He adds that no element in this triad can be defined or dealt with in isolation, because "each simultaneously and continuously transforms the others throughout the action or thought" (p. 367). Wertsch's (1991) notion of the learner as a person-acting-with-mediational-means provides a complementary perspective on the distributed nature of learning with similar implications for assessment. Barab and Roth (2006) propose the notion of an *affordance network* as a means of conceptualizing what supports and provides opportunities for learning. Affordance networks can include helpful resources, sensitive adults, friendly peers, and technology of various kinds. The inclusion of the mediational means or affordance network in the assessment narrative is valuable for formative assessment. The learner who reads the assessment story is privy to both what is being learned and how the surrounds supported this learning. They can use this knowledge to help them recognize and seek out these supports on other occasions and contexts.

A narrative assessment itself can be distributed across different modes and media. Enhancing the text, digital narratives in particular frequently include photographs (of children's work and interactions with others and of the context), audio, video, blogs, and examples of children's drawing and writing. In practice, an assessment in narrative format offers distinct opportunities to engage the

learner. Learners from a young age can be supported to coauthor stories of learning (Carr and Lee 2012). This capacity for learners, including young children, to story what they have achieved is central to the twentieth-century goal of developing citizens who are able to learn throughout their lives (Gordon Commission 2013). Storying by the learner not only demands that learners analyze what they have accomplished, but it also produces an artifact that can act as a mediational means. Thus, the task of assessing can be distributed across stakeholders – learners, teachers, and, often, families – who add a comment to a portfolio from home. Learners can use narratives of learning, in portfolios, to revisit and review their understanding in ways that inform their reflection on the context of and resources they have employed to accomplish this learning and to consider what they could do next.

Narrative assessments can tell an individual story, a collective story, or the story of an activity. Individual stories about learning can be tucked inside a collective story of a group of learners, the school/early childhood center, or the community. Narratives as wall displays, exhibitions, and/or performances of group work are a feature of many early childhood and schooling settings. These displays can include children's three-dimensional constructions (e.g., clay, wire, and paper) and panels of photographs, drawings, paintings, and writing. Teachers may choose to construct a narrative about how a group/class/community participated within an activity. Here the assessment goal is not necessarily formative or summative but rather to make visible, value, and share what has been achieved. Such documentation also acts to acknowledge the people and resources that have contributed to this achievement.

We summarize here an example from an early childhood center in which a 4-year-old dictated a story about photographs of her block building. This story became a co-constructed narrative assessment for her assessment portfolio when the teacher added a commentary entitled "What learning is happening here?" The co-construction was accompanied and inspired by ten photographs of the block-building episode (Carr and Lee 2012,

p. 50). Emma's dictation is of the construction of the block building as a volcano, describing the assistance of two other children and a book on volcanoes as well as the storyline of the block-building event. The teacher added comments on the contribution of Emma's prior knowledge: her interest in lava rocks during a recent visit to the local mountain. She also notes the assistance that an adult, a book, and other children gave and adds an acknowledgment of Emma's curiosity on this occasion; her confidence to express her thoughts, ideas, and theories; and her display of the dispositions to think critically and imaginatively.

Narrative Assessments as Improvable Objects and Opportunities for Developing a Learning Journey

A narrative assessment has the potential to support learning over time. As Bruner points out:

Our self-making stories accumulate over time, even pattern themselves on conventional genres. They get out-of-date, and not just because we grow older or wiser but because our self-making stories need to fit new circumstances, new friends, new enterprises. (Bruner 2002, p. 65)

Here Bruner highlights the role of stories in identity work, highlighting that these stories are tentative and soon become out-of-date. The implication of this for assessment is that any judgment of what children know or can do should not be based on a one-off snapshot. What a child can achieve in one setting with one set of resources (people, ideas, and physical artifacts/tools) will not necessarily be the same or look the same as that achieved in another setting at another time. Consequently, a key challenge for teachers is to provide varied opportunities for children to develop and use what they know already in a different setting and to ensure that any assessment sets up further opportunities for children to learn.

A formative view of assessment (Black and Wiliam 1998) is consistent with the notion that any one narrative assessment, by a learner or teacher, needs to be understood as a moment in time and as "an improvable object" (Bereiter and

Scardamalia 1996). Wells (1999) has observed that teachers often encourage students to construct representations that capture something of what is being said and suggested that these representations can function as improvable objects or objects that are in state of development and always being negotiated and renegotiated. Narratives that document learning can play this role because they can be reviewed, rethought, and revised through discussion (Wells 1999). A series of stories can construct a narrative about both continuity and change – the development and expression of a quality or a skill in different situations and over time. The compilation of a cumulative narrative in a portfolio can offer a way for children to appreciate and connect together what they have already achieved, the relevance of the current achievement, and what might be desirable and possible in the future: recognizing and re-cognizing their learning as a journey that takes place over time. It is these connections that transform a sequence of stories into a learning journey. These sequences illustrate an individual student's efforts, progress, and achievements across time and contexts for those interested in and responsible for his or her learning.

In a learning story entitled *Practice Makes Perfect*, the early childhood teacher writes the following comment to the child:

Charleeh-Blu, the arts of drawing, collage, writing and painting are all continuing to be a big interest for you. . . . It was awesome to hear you again link practice to learning to get better at drawing more detailed whales. It's taken a while, Charleeh-Blu – learning can and does take time and practice – however, your words “...Because I PRACTISE and PRACTISE. Because I couldn't do it at home. And then I PRACTISE and PRACTISE . . . now I can draw a whale”. The latest whale drawing is included, together with the child's explanation of each of the parts. (Carr and Lee 2012, p. 107)

Narrative Assessments as Boundary Crossing Objects that Mediate Conversations across Interested Communities

Narrative documentation about learning, including that collected in portfolios, can travel between

a center or school and the home providing a forum for teachers, parents, and children by themselves or in consultation with others to recall learning events and author possible pathways for learning. Seen this way, assessments as a physical or virtual object create a need and a forum for various stakeholders to come together and talk. That is, they serve as boundary objects through the way they enable communication and cooperation across the different stakeholders in children's learning (Moss, Girard and Greeno 2008). Star and Griesemer (1989) introduced the concept of boundary objects, defining them as objects that are plastic enough to adapt to the needs and constraints of several different communities but robust enough to maintain a common identity across settings. When narrative documentation as a collection of records and artifacts moves between and is contributed to by children, teachers, and parents, it not only depicts the multiple perspectives of children and teachers; it also offers a democratic possibility for informing the public of what is happening in a school/early childhood center. More than this, as part of acting as a boundary object, narrative assessments can provide opportunities for agency and coauthoring between children and between families and children as well as teachers. When narrative assessments are shared across communities, this provides an opportunity for additional comment, explanations, and collaborative discussions about forward planning. It also enables the construction of a sense of belonging in the new community. Emma, a teacher in a new-entrant school classroom, writes the following about the use of a portfolio of narrative assessments as an object that crossed the boundary between kindergarten and school:

(This boy) didn't speak a word for probably a week or so and then he brought his Kindy book [*portfolio of Learning Stories*] in and it was like a new child emerged and it was like ‘This is me and this is who I am’ and even though I don't necessarily have the language to tell you, I can show you with pictures. And I would turn around at all times of the day and hear little murmurings and laughing and there would be pockets of children sitting around with this little boy with his Kindy book. (Carr and Lee 2012, p. 83)

Assessment as narrative has resonance across cultures. It can reference the wider cultural values and norms while at the same time telling a personal, local, and/or collective story. In New Zealand, for instance, Māori cultural valuing of the collective and viewing the child always in a web of relations are richly reflected in cultural traditions and stories. This worldview is reflected in the assessment narratives that are developed by teachers in Māori immersion educational settings in New Zealand (New Zealand Ministry of Education 2009). *Te Whatu Pōkeka* was the name given to the project that developed this narrative approach.

We have named this project “Te Whatu Pōkeka”. A whatu pōkeka is a baby blanket made of muka (fibre) from the harakeke (flax) plant. Carefully woven into the inside of the blanket are albatross feathers to provide warmth, comfort, security, and refuge from the elements. The pōkeka takes the shape of the child as it learns and grows. It is a metaphor for this project, the development of a curriculum that is determined and shaped by the child. Our principle focus in this project is the assessment of Māori children in a Māori early childhood setting. (p. 1)

Concluding Comment

Like the paintings in Lascaux Caves, assessments as narratives communicate messages about learning, achievement, and contexts; they make visible what is valued in a community. We have argued here that this visibility can engage all the players in an education practice, enabling a sharing of the authoring and an expanding of the perspective. Furthermore, when stories add up to more than a summary of the parts, they describe a learning journey that can be revisited and reviewed; they take on assessment’s role of “making up people” in a transparent way. Assessments as narratives can initiate conversations about learning and a learner self. These stories about learning insist on a sociocultural interpretation of learning, one that adds context and facilitates resources to an assessment of the learner’s endeavors and achievements; this lens enhances a “built-in” formative purpose, one that provides some direction to the learner and the teacher (and the interested wider community of family) about the

mediational means that were useful so far and some suggestions about the way forward.

Introduction

Following the eighteenth-century political revolutions in North America and Europe – which were followed by the emergence of modern constitutional States – public education has been seen as a *conditio sine qua non* for integrating a linguistically and ethnically heterogeneous population into one nation. In 1792, for example, the French politician Louis-Michel Lepeletier de Saint-Fargeau (1760–1793), in his plan for national education, stated that the immortality of nations is ensured by three “monuments”: a constitution, the rule of law, and public education. A constitution and laws were important because they established the State on a formal level, defined its organizational form and institutions, and set the rules for peaceful domestic coexistence. Certain eighteenth-century philosophers and politicians argued that being a citizen was more than simply having legal status

and following laws; being a citizen also meant being intellectually and emotionally attached to the cultural and ethnic entity called the nation. In this sense, it was – and still is – public education’s task to make individuals into national citizens.

Nation and Nationalism

There is no comprehensive definition or theory of *nation* or *nationalism*. Phenomenologically, nations appeared over time in different forms and in various places, as did nationalism. In medieval universities, nations were groups of students speaking the same language who sat together at the dinner table. The notion that multilingual Switzerland is a federation of nations still exists. Other concepts of the nation focus on ethnicity (e.g., the First Nations in Canada), religion (e.g., Zionism), or cultural homogeneity (e.g., the German *Kulturnation*). Accordingly, notions of nationalism also differ. Certain theorists such as the Germans Johann Gottlieb Fichte (1762–1814) and Johann Gottfried Herder (1744–1803) suggested an “ethnic” nationalism by tying the nation to allegedly objective facts such as race, faith, and language. Others such as the French writer, historian, and philosopher Ernest Renan (1832–1892) understood nationalism as a shared national identity. This so-called “civic” nationalism is more integrative than “ethnic” nationalism in that the former is open to everyone, whereas the latter is based on a shared heritage, language, and faith. In a famous address to the University of Paris in 1882, Renan stated that a nation is constituted by citizens’ desire to live together: a nation is “a large scale solidarity” (Renan 1990, p. 19). A nation’s existence, in Renan’s famous words, is “a daily plebiscite” (ibid.). Nationalism is therefore not only based on a preexisting nation (i.e., a country and its population) but is also the ongoing construction and self-reassurance of the existence of a nation, whereas in the absence of nationalism, no such thing exists. Or, in Ernst Gellner’s (1925–1995) words, “Nationalism is not the awakening of nations to self-consciousness: it invents nations where they do not exist” (Gellner 1964, p. 168). Reflecting on Renan’s and

Gellner's thoughts, the Irish historian and political scientist Benedict Anderson (1936–2015) suggested that nations be understood as “imagined communities” (Anderson 1983). According to Anderson, a modern nation-state is an imagined community because as a community it is not based on personal experiences and relationships. Due to the nation-state's large territory and population, it is likely that most citizens will never meet one another nor will they see all regions of the nation with their own eyes. Anderson therefore argued that the nation, of which the individual citizen only knows a small part from his or her own experience, is largely imagined. This idea of nations as abstract communities that are the result of (intentional or unintentional) imagination, interpretation, and even invention has proven very fruitful for understanding the complex relationships between nations, nationalism, and public education (e.g., Sobe 2014).

National Identity, Curriculum, and the Making of Citizens

Citizenship in legal terms is acquired by birth (or naturalization), whereas national identity is not. The latter results from learning processes such as enculturation, socialization, and – last but not least – informal and formal education. The building and safeguarding of nations have been seen as a political, a juridical, and a pedagogical task. From early on, modern nation-states have established symbols to prove their existence and sovereignty against the outside and to provide their citizens with symbols to identify the nation and themselves. Although national currencies, national weights and measures, and postage stamps, for example, were first and foremost introduced for economic and administrative reasons, there was always a pedagogical agenda also. Through national symbols, people are expected to become emotionally and intellectually attached to the nation. This process was also the reason for building national libraries, national museums, and national theaters and ballets and for establishing national flags and anthems, holidays, and memorial days. Throughout the nineteenth and

twentieth centuries, the nation became the most important point of reference for answering the question of who “we the people” are. Today, national symbolism remains a part of the concepts of national teams, national histories, and even national license plates.

Since the nineteenth century, public schools have been viewed as particularly good institutions for familiarizing children with national symbols and evoking national sentiments. Integrating as many national symbols into the curriculum as possible has been viewed as the most promising way of making children from various social, cultural, ethnic, religious, and linguistic backgrounds into national citizens. However, the curriculum had to be primarily secular and under public control so that other points of reference would not interfere with nation building.

One Nation, One Language

One of the most important school subjects has been language instruction. Language, both spoken and written, is the basis of most human communication. Language is also a very important part of the concepts of the nation and the nation-state. Long before the emergence of the nation-state, nations were identified with people speaking a single language. However, most modern States included more than one language group or, in the case of the United States, were confronted with immigrants speaking many languages. If a country wanted to be a “true” nation-state, it needed to harmonize the use of languages within its borders. France is an early example where this ideology of “one nation, one language” found its way into the curriculum. As early as 1794, Abbé Grégoire (1750–1831) asked the National Assembly to introduce French as the standard language in the new republic. Throughout the nineteenth century, French curricula were based on the maxim that every student should learn to use the *langue d'oïl*, i.e., standard French. However, Eugen Weber (1976) noted that it took more than a century to accomplish this task. Although it took some time, linguistic adjustments via schooling were viewed as one of the most-promising integration

measures. Stephen Harp (1998) noted that in Alsace-Lorraine, a region whose national affiliation changed between Germany and France several times in the nineteenth and twentieth centuries, integrating the population into France or the German Reich mostly meant teaching French whenever Alsace-Lorraine was part of France and teaching German whenever it was part of Germany.

However, teaching children to use the national language was not the only task language education had to fulfill regarding national integration. In reading and writing classes, children were also familiarized with national idiosyncrasies regarding spelling, vocabulary, and typography. These idiosyncrasies distinguish two nations that share a single language. For example, the letter ß is used in Germany but not in German-speaking Switzerland; British English and American English differ in grammar and spelling as do French and Québécois.

Throughout the nineteenth and twentieth centuries, most nation-states adopted the “one nation, one language” ideology in their curricula, and many of them have retained it to this day. Therefore, the right to teach a local or regional language or to use such a language for instruction is a strong symbol of local autonomy (e.g., the use of Catalan in Catalonia). In many nations, minorities still strive for the acceptance of their language as a language of instruction. However, not all modern States adopted the “one nation, one language” ideology. Some States, for example, Canada, Belgium, Luxemburg, Finland, Afghanistan, and Switzerland, deliberately chose not to adopt one national language. In many cases, this situation is also mirrored in the curricula in different languages and in their content regarding language education. National identities apparently can also be multilingual (e.g., in Switzerland and Canada), although this multilingualism can also be a cause of internal friction (e.g., in Belgium).

Civics, History, and Geography

Language instruction was not the only subject that was intended to shape the students’ identity as

national citizens; civic education was another important subject matter in that regard. In many countries, one of the first actions to make individuals into citizens was to publish a new type of textbook: the civic catechism. Religious catechisms were well established in early modern schools and were often the only textbooks that children used. Books of this type, which were initially intended to make children into devout and obedient Christians, were revised with the goal of creating citizens who possessed basic knowledge of the constitution, State institutions, civic virtues, the rights and duties of citizens, and the moral principles and values that were held in high esteem in a State (e.g., Tosato-Rigo (2012) and Viñao (2011) describe instances in Switzerland and Spain, respectively).

History is another subject that has been greatly involved in shaping national identities. National histories began to appear at the end of the eighteenth century and flourished in the nineteenth and twentieth centuries. These histories traced the origins of nations back to ancient times and legitimized their existence through an allegedly long development. Narratives related the actions of heroic figures whose patriotism, virtue, courage, and self-sacrifice were expected to ignite readers’ love of the fatherland or motherland. The narrative centered on how the nation was forged in heroic and mostly victorious battles against oppressors or invaders (e.g., the “German” Arminius against the Romans, the Swiss William Tell and Arnold Winkelried against the Habsburgs, and the Frenchwoman Joan of Arc against the English). Such stories were often folk myths rather than documented historical events, and given the rising standards of academic history, many of them were deconstructed by professional historians over time. Nevertheless, the stories long remained the centerpieces of history textbooks. History as a school subject was not so much about “how it really was” in the past as it was about the assertion of a proud national heritage.

Another important subject was geography. Geography textbooks and maps were intended to provide children with an image of what their nation looked like. Textbooks were organized in the form of a tour of the nation. Through

descriptions of various regions and their inhabitants, children were familiarized with their compatriots, whom they probably would never meet in person. State borders were also important for imagining the nation. They were often depicted as natural borders such as seashores, rivers, and mountain ranges to give students the impression that the national territory was a product of nature (or perhaps God even) rather than one of men. Geography was also connected to history by showing that heroic historical deeds had occurred in a particular place that could therefore also become a place of remembrance. Finally, geography placed the nation among other (neighboring) nations and assigned it a place on the map of the continent or the world. Maps published in a particular nation always showed this nation-state in the center.

The Whole Curriculum

However, important language, civics, history, and geography allegedly were in the process of making citizens; all other subjects were also involved in the task. To give but one example, mathematics teaches students to think logically and rationally, as the French philosopher and mathematician Marie Jean Antoine Nicolas de Caritat, Marquis de Condorcet (1743–1794), noted at the end of the eighteenth century. In contrast to the early modern period, when people acquired mathematical skills and knowledge regarding specific tasks such as buying or selling on a farmer's market, measuring timber for construction, or keeping the accounts of a warehouse, mathematics was introduced into modern curricula in the nineteenth and twentieth centuries as a tool to train the students' mental abilities in general. Rational thinking was purportedly the basis for acting as a modern citizen. Furthermore, in mathematics lessons, children learned to use national currencies and weights and measures, which were – as mentioned above – important symbols of national sovereignty and identity.

The rationale of the rational citizen was stressed again in the 1960s and 1970s, when many countries introduced “new math” into their

curricula. New math aimed to teach students the modern ways of mathematical thinking (such as set theory, Boolean algebra, and bases other than 10) instead of the old-fashioned, decimal elementary arithmetic. The main agenda of new math, however, was no different from Condorcet's plan, which was to generate logical-thinking, rational, virtuous citizens who were well equipped for living in a modern democratic State (see Phillips 2015). Although the introduction of new math was anything but a success story (actually new math disappeared from the curricula after a few years), the intentions behind this endeavor clearly show that mathematics is not a neutral subject. Mathematics conveys, as any other subject, an idea about the learning child, the (future) citizens, and the (moral order of the) State.

Nations at Risk

The alleged importance of public schooling to the nation has been a particularly prominent topic of discussion during times of national crisis. Most modern nation-states have experienced several crises. They were threatened either by other nations or States or by internal friction such as ethnic, religious, linguistic, or social tensions that could have led to turmoil, revolution, civil war, or secession – in short, to national collapse. Indeed, most modern nations were born from wars of liberation (or wars of secession, depending on the point of view) and revolutions (or rebellions). Throughout the nineteenth century, nation-states became increasingly involved in national rivalries, competitions, and belligerent confrontations. These conflicts also led to changes in the notion of nationalism. Nationalism was increasingly meant to spread and consolidate the idea of a “we” among the people of a nation-state. This “we” was contrasted with a “they”: people in other nations and those within the particular nation-state who did not share what was commonly viewed as the national identity. When nation-states faced war or internal turmoil (e.g., the Revolutionary War and Civil War in the USA, the French Revolutionary Wars, the Austro-Prussian War, the Franco-Prussian War,

World War I, World War II, and the Cold War), this sense of national identity more than ever was distilled down to patriotism, allegiance, and the willingness to serve (and to risk one's life for) the fatherland or motherland. Two institutions were charged with making young men into citizen-soldiers (*soldat-citoyen*): military and public schools. Although the idea of the citizen-soldier disappeared in most nations during the twentieth century, the tight connection between national security policy and public schooling (or public investment in schooling) remained because nation-states – whether presently at risk or not – wanted to foster patriotism and allegiance through informal and formal education. They also were – and still are – interested in providing students with advanced scientific knowledge that could one day be useful in defending the nation through advanced civil and military technology. Several examples demonstrate this motive. Following the Franco-Prussian War of 1870–1871, a rumor in European newspapers held that as a result of superior public education in Prussia, German soldiers were better oriented on French territory than the French themselves. It is no wonder that nation-states such as Switzerland increasingly emphasized geography and map reading in public schools in the late nineteenth century. Additional examples from the twentieth century illustrate this relationship between education and national security. Only a year after the Soviets launched their satellite Sputnik in 1957, which revealed a technological gap between the Eastern and the Western Blocs, the US Congress passed the National Defense Education Act. In 1983, a report of the US National Commission on Excellence in Education argued that national security depended on the educational system. However, the threat this time did not come from outside but rather from within: “If an unfriendly foreign power had attempted to impose on America the mediocre educational performance that exists today, we might well have viewed it as an act of war” (National Commission on Excellence in Education 1983, p. 5). Following the report, the allegedly poor American education was not only threatening the well-being of individual Americans but also threatening the State itself by

weakening the nation's main source of strength, i.e., its well-educated, loyal, and competent citizens. Although the twentieth century has been labeled the “century of the child” – with education focusing primarily on children's physical and psychological needs – this example shows that the making of virtuous citizens remains one of the basic tasks of public schooling in modern nation-states.

Nature of Science in the Science Curriculum

Derek Hodson
University of Auckland, Auckland, New Zealand

Introduction

The earliest example of nature of science (NOS) focus in school science education is Henry Armstrong's heuristic approach, published in

1898, which involved students conducting the experiments, making the observations, and following the reasoning of the scientists who first generated the scientific knowledge being studied. It is important to note that Armstrong's promotion of NOS was mainly pedagogical and motivational; the real purpose was to acquire and develop scientific knowledge. In contrast, John Dewey argued in *Democracy and Education* (published in 1916) that familiarity with scientific method is substantially more important than acquisition of scientific knowledge, particularly for those who do not intend to study science at an advanced level. Some 45 years later, similar rhetoric formed the basis of Schwab's (1962) advocacy of a shift of emphasis for school science education in the United States away from the sole concern of learning scientific knowledge towards an understanding of the processes of scientific inquiry and the structure of scientific knowledge – a line of argument that eventually led to a string of innovative curriculum projects such as PSSC, BSCS, and CHEM Study. Parallel NOS-oriented developments in the United Kingdom included the Nuffield Science Projects (with an emphasis on “being a scientist for the day”) and the Schools Council Integrated Science Project. Mainly because of their reliance on an impractical pedagogy of naive discovery learning, these courses failed to deliver on their initial promise, prompting a shift to the so-called process approaches to science education such as *Warwick Process Science* and *Science in Process*, both of which envisaged scientific inquiry as the application of a generalized, all-purpose algorithmic method. Similar shifts had occurred earlier in Australia and the United States, with the publication of the *Australian Science Education Project* and *Science – A Process Approach*.

Interest in NOS continued to grow throughout the 1980s and 1990s, with the publication of numerous opinion pieces and commissioned reports, culminating in the incorporation of NOS into the National Curriculum for England and Wales and the publication of the highly influential *Science for All Americans* and *National Science Education Standards*, both of which promoted NOS as a key element of scientific literacy.

Later, NOS became firmly established as a key component of the *Programme for International Student Assessment* (www.pisa.oecd.org) and the *Next Generation Science Standards* (www.nextgenscience.org) and is now a major explicit focus in the science curriculum of most countries around the world.

Establishing NOS Priorities

Throughout the long battle to establish NOS in the school science curriculum, concern was often expressed by researchers and educators about distorted or over-simplified views of science, scientists, and scientific practice promoted by science textbooks, sometimes explicitly and sometimes implicitly – notably, observation provides direct and reliable access to secure knowledge; science always starts with meticulous, orderly, and exhaustive gathering of data; scientific inquiry is a simple algorithmic procedure comprising discrete, generic processes; experiments are decisive; science is procedural more than creative and its methods can answer all questions; science is a value-free activity; scientists are driven solely by logic, rational appraisal, and the pursuit of truth; and science is an exclusively Western, post-Renaissance activity. By the end of the 1990s, the urgent task for teachers and science curriculum developers keen to implement NOS in the science curriculum was to produce a consensus view of science that avoids these myths and falsehoods. According to McComas and Olson (1998), the authors of important reform documents such as *Science for All Americans* and *National Science Education Standards* are in reasonable agreement on the elements of NOS that should be included in the school science curriculum: scientific knowledge is tentative; science relies on empirical evidence; observation is theory laden; there is no universal scientific method; laws and theories serve different roles in science; scientists require replicability and truthful reporting; science is an attempt to explain natural phenomena; scientists are creative;

science is part of social tradition; science has played an important role in technology; scientific ideas have been affected by their social and historical milieu; changes in science occur gradually; science has global implications; and new knowledge claims must be reported clearly and openly.

Seeking to shed further light on this matter, Osborne and colleagues (2003) conducted a Delphi study to ascertain the extent of agreement among 23 participants drawn from the expert community (scientists, historians, philosophers and/or sociologists of science, science educators and teachers, and science communicators) on ideas about science that should be taught in school science. With minor variation, there was broad agreement on nine broad themes: scientific method and critical testing, scientific creativity, historical development of scientific knowledge, science and questioning, diversity of scientific thinking, analysis and interpretation of data, science and certainty, hypothesis and prediction, and cooperation and collaboration. A comparison of these themes with those distilled from the science education standards documents in McComas and Olson's (1998) study reveals many similarities.

A broadly similar but shorter list that has gained considerable currency among science educators can be found in Lederman and colleagues (2002): scientific knowledge is tentative, empirically based, subjective (in the sense of being theory dependent and impacted by the scientists' experiences and values), socioculturally embedded, and, in part, the product of human imagination and creativity. Moreover, there is a distinction between observation and inference; there is no universal recipe-like method for doing science, and there are key differences in the functions of and relationships between scientific theories and laws. This view, reinforced by a purpose-built assessment regime (the *Views on Nature of Science* Questionnaire), has become very influential and has gained ready acceptance in many countries around the world as a template for curriculum building and research into students' and teachers' NOS understanding.

Some Problems with the Consensus View

A disarmingly simple specification of NOS items, especially when allied to an assessment protocol, can quickly become established as the norm for building a curriculum and designing teaching and learning materials. Items in the approved list can become oversimplified by busy teachers and taught as truths about NOS. In consequence, criticism of the so-called consensus view of NOS has been mounting.

At a general level, the decision to restrict the definition of NOS to the characteristics of scientific knowledge and exclude consideration of the nature of scientific inquiry is highly problematic, given that the status, validity, and reliability of scientific knowledge are inextricably linked with the design, conduct, and reporting of the scientific investigations that generate it. At a more specific level, there are several items in the consensus list that are problematic. First, the naïve proposition that there is a crucial distinction between observation and inference is singularly unhelpful to students trying to make sense of investigative work. When theories are not in dispute, when they are well understood and taken for granted, the language of observation is infused with theoretical assumptions. Terms such as reflection and refraction, conduction and non-conduction and melting, dissolving and subliming, all of which are used regularly in school science as observation terms, carry a substantial inferential component rooted in theoretical understanding, without which further progress is impossible.

Second, too literal an interpretation of statements about the tentative character of science can be counterproductive. There is little value in encouraging students to doubt every scientific proposition they encounter. While it is sensible to regard quantum theory, string theory, and accounts of dinosaur extinction (one of the items in VNOS) as tentative, it would be absurd for students to regard the heliocentric view of the solar system or our understanding of the human circulatory system as tentative. Much of the

scientific knowledge that students encounter in class is no longer tentative. Rather, it is well established, taken for granted and used in building further knowledge. Indeed, if scientists did not accept some knowledge as well established, they would be unable to make further progress.

A further concern is that the consensus view fails to acknowledge some very substantial and significant differences among the day-to-day activities of scientists in different subdisciplines, including the kind of research questions asked and the investigative methods employed to answer them, the kind of evidence sought, the technologies used for its collection, the standards by which investigations and conclusions are judged, the kinds of arguments constructed to justify those conclusions, and the extent to which mathematics is deployed. In practice, the specifics of scientific rationality change between subdisciplines, with each playing the game of science according to its own rules.

A number of critics conclude that it is time to replace the consensus view of NOS, useful though it has been in promoting the establishment of NOS in the school science curriculum, with a philosophically more sophisticated and more authentic view of contemporary scientific practice.

Alternatives to the Consensus View

Matthews (2012) argues that we should consider NOS “not as some list of necessary and sufficient conditions for a practice to be scientific, but rather as something that, following Wittgenstein’s terminology, identifies a ‘family resemblance’ of features that warrant different enterprises being called scientific” (p. 4). To that end, he advocates a shift of terminology and research focus from the “essentialist and epistemologically focussed ‘Nature of Science’ (NOS) to a more relaxed, contextual and heterogeneous ‘Features of Science’ (FOS)” (p. 4). Such a change, he argues, would avoid many of the pitfalls and shortcomings of current research and scholarship in the field – in particular, the confusing conflation of

epistemological, sociological, psychological, ethical, commercial and philosophical aspects of science into a single list of items to be taught and subsequently assessed, the avoidance of debate about contentious issues in HPS, the neglect of historical perspective, the failure to account for significant differences in approach among the sciences, and the assumption that students' NOS understanding can be assessed and judged by the capacity to reproduce a few declarative statements about scientific knowledge. Features of science included in the consensus list should be elaborated, refined, and discussed, not simply learnt and assessed. A number of additional features should be addressed: experimentation, idealization, modeling, mathematization, theory choice and rationality, realism versus instrumentalism, and values and the impact of world views.

The great strength of the family resemblance approach is that there is no one definition of science; rather, a cluster of related features that many sciences share, although a particular scientific discipline may lack one or more of them. In elaboration of the family resemblance notion, Irzik and Nola (2014) draw a distinction between "science as a cognitive-epistemic system of thought and practice" and "science as a social-institutional system." They describe the former in terms of four categories: (i) *activities* (planning, conducting, and making sense of scientific inquiries); (ii) *aims and values*; (iii) *methodologies and methodological rules*; and (iv) *products* (scientific knowledge). They address key historical, social, cultural, political, ethical, and commercial dimensions of scientific practice also in terms of four categories: (i) professional activities; (ii) the system of knowledge certification and dissemination; (iii) the scientific ethos; and (iv) social values. Recently, Erduran and Dagher (2014) have provided a detailed discussion of the implications of Irzik and Nola's theorizing for curriculum content, pedagogy, and learning outcomes.

For Allchin (2011), the key to a broader and more functional view of NOS is the ability to judge the trustworthiness of scientific knowledge, that is, knowing whom to trust and why. His version of NOS curriculum priorities, which he calls "Whole Science," is designed as a

framework to guide students as they investigate socioscientific issues, conduct scientific investigations, and engage with case studies. It seeks to specify the dimensions of reliability and trustworthiness in science in terms of three major dimensions: *observational evidence* (issues of accuracy, precision, investigative procedures, and instrumentation), *issues of conceptualization* (patterns of reasoning, historical dimensions, and human dimensions), and *sociocultural aspects* (institutional characteristics, biases, economics, and effective communication). There is a very strong echo here of Ford's (2008) research examining differences in the ways scientists and non-scientists react to scientific claims. Scientists scrutinize the ways in which data were collected and analyzed and focus strongly on whether the evidence is sufficient to justify the conclusion(s). Non-scientists rely less on how the claims are constructed than on personal anecdotal experiences that reflect their opinion of the claim (i.e., whether they agree with it or not). They are also much more inclined towards uncritical acceptance of authoritative statements by scientists. Ford's conclusion is that the key to confident and successful evaluation of scientific claims is "a firm grasp of practice".

Hodson (2009) uses the similar term *Understanding Scientific Practice* to describe the NOS knowledge and the understanding needed to achieve satisfactory levels of cultural and civic scientific literacy: the distinctive language of science and ways of thinking about, investigating and explaining phenomena and events (especially the linguistic conventions for reporting, scrutinizing, and validating knowledge claims); the capacity to access and interpret information conveyed through symbols, graphs, diagrams, tables, charts, chemical formulae and equations, 3-D models, mathematical expressions, photographs, computer-generated images, body scans; the characteristics of scientific inquiry (including its range of subdisciplinary variants and strategies for generating new knowledge and solving problems relating to further development); the role and status of the scientific knowledge generated and the modeling that attends the construction of scientific theories; the community-regulated and

community-monitored rationality for scrutinizing and evaluating all new knowledge claims; the social and intellectual circumstances of significant scientific achievements and developments; and how scientists work as a social group (including the conventions and underlying values guiding the continuing practice of science) and the ways in which science impacts and is impacted by the social context in which it is located.

Other NOS-Related Developments

Argumentation and modeling are two aspects of scientific practice that have been subject to remarkable growth in research attention and curriculum development in recent years. Both raise important questions about students' knowledge of how these processes are used by scientists and how students can develop the ability to use them appropriately and productively for themselves. There has also been a substantial growth of interest in engaging students in addressing socio-scientific issues (SSI), which has precipitated the need for a much richer and more robust understanding of NOS.

Because scientific literacy entails a robust understanding of a wide range of scientific ideas, principles, models, and theories, students need to know something of their origin, scope, and limitations; recognize important differences between speculative models and well-established theoretical structures; understand the role of models in the design, conduct, interpretation, and reporting of scientific investigations; and recognize the ways in which a complex of cognitive problems and factors related to the prevailing sociocultural context influenced the development of key ideas over time. They also need to experience model building for themselves and to give and receive criticism in their own quest for better models. Current research interest can be categorized into three principal areas of concern: the particular models and theories produced by scientists as explanatory systems, including the history of their development; the ways in which scientists utilize models as cognitive tools in their day-to-day problem solving, theory articulation, and theory revision;

and the role of models and modeling in science pedagogy.

Students need to understand the standards, norms, and conventions of scientific argumentation in order to judge the rival merits of competing arguments. In particular, they need a robust understanding of the form, structure, and language of scientific arguments; the kind of evidence invoked; how it is organized and deployed; and the ways in which theory is used and the work of other scientists cited to strengthen a case. In recent years, a vigorous research agenda has been developed, focusing on why argumentation is important, its distinctive features, how it can be taught, the strategies available, the extent to which particular strategies are successful, the problems that arise, and how difficulties can be overcome. Much of this research utilizes variations on Toulmin's (1958) description of the structure of an argument in terms of six components: claim, data, warrant, qualifier, backing, and rebuttal.

Because much of the information needed to address SSI is of the science-in-the-making kind, rather than well-established science, and may even be located at or near the cutting edge of research, it has to be accessed from the primary literature rather than textbooks. Hence, students need to know how to evaluate the quality of scientific reports and research papers, including the validity of a knowledge claim, how it was generated, communicated and scrutinized by the community of scientists, and the extent to which it can be relied upon to inform critical decisions about particular SSI. They need to know what constitutes a well-designed inquiry and a well-argued conclusion. They need to be able to interpret reports; make sense of disagreements; evaluate knowledge claims; scrutinize arguments; distinguish among facts, arguments, and opinions; make judgments; and form personal views on issues. Because of the social, political, and economic dimensions of SSI, students also need the capacity to access material from magazines, newspapers, TV and radio broadcasts, publications of special interest groups, and the Internet, thus raising important issues of *media literacy*.

One final point relates to equipping students with some intellectual tools for addressing and

resolving contentious issues that cannot be solved solely by scientific or economic considerations, those situations in which students ask “What is the *right* course of action?” or “What *ought* we to do?” Recent developments in biotechnology, for example, raise many important questions and concerns about whether certain lines of research should be permitted. This is not to suggest that students be required to follow a rigorous program in moral philosophy, but it is to suggest that they need some basic understanding of egoism, consequentialist notions (including utilitarianism), deontological ethics, social construct theory (or social contract theory), and virtue ethics if they are to get to grips with such problematic issues.

More detailed discussion of issues arising in the long struggle to establish NOS as a key component of the school science curriculum is provided by Hodson (2014).

Neoliberal Discourses: Toward a Deeper Understanding and a Global Latino Education

Luis Mirón

Loyola University New Orleans, New Orleans, LA, USA

Introduction

David Harvey, the political economist and geographer, has written that neoliberalism is not a recent social phenomenon, dating at least to the

policy eras of Thatcher/Reagan in the 1980s. Although not explicitly suggesting that the current fascination with neoliberalism is linked to the promises and perils of globalization, a close reader of Harvey might reasonably infer this. writings on the subject *contextually* link neoliberalism as a “hegemonic discourse” to global capitalism or what the author refers to as the world economic system (Mirón 2016; Wallerstein 2011; Featherstone 1990). In what follows this entry hopes to establish that, analytically, globalization and neoliberalism are separate and distinct social-economic phenomena. As such, researchers need to carefully keep these analytic categories separate, keeping in mind that within the social imaginary, they are frequently conflated.

Harvey (2007, p. 146) defines neoliberalism as a “theory of economic practices proposing that human well-being is best advanced by the maximization of entrepreneurial freedoms within an institutional framework. . . .” Furthermore, Harvey asserts that such a framework is characterized by the following: (1) private property rights, (2) individual liberty, (3) unencumbered markets, and (4) free trade. The text below will illustrate these institutional properties of neoliberalism with examples taken from a mini case study of New Orleans’ (see Mirón 1992, 2016) post-Hurricane Katrina. In particular the social analysis focuses upon the intentionality of one social sectors and the reforms they aggressively advanced the semi-private education sector (or charter schools). First, this encyclopedia entry proceeds with an elaboration of Harvey’s depiction of the social practices and institutional properties (design elements) of neoliberalism and then illustrates these with concrete social practices in the US context – and the consequences for marginal groups left behind in the midst of these two phenomena.

Neoliberal Discourses

At the outset one should note that Harvey’s conception of neoliberalism as a dominating, common sense discourse (“creative disruption”) suggests that State actors, and indeed the State apparatus overall, *intentionally* exact these

discourses to serve specific, dominant class and State interests, for example, political and financial elites, as well as State bureaucrats. These multiple discourses – neoliberalism does not constitute a monolithic, abstract narrative – play out in concrete contexts that restore a perceived loss of “class dominance to sectors that saw their fortunes threatened by the ascent of social democratic endeavors in the aftermath of the Second World War” (2007, p. 145). In the sphere of post-structural discourse practices, this restoration does not proceed overnight. Specific State actors and members of the heretofore disaffected classes launch a hegemonic narrative to accomplish this goal. Put differently, varying actors across the economic sector generally, and within the State apparatus in particular, coalesce to form a hegemonic social movement (Laclau and Mouffe 2001) to ingrain an everyday, common sense understanding: neoliberalism is “good” for society as a whole. The hegemonic ideology, which elites launch, entails a profound nostalgia over the loss of individual freedoms, allowing State bureaucrats to impose taxes upon middle- and upper-income groups and, in the process, to administer social benefits to lower social-economic groups. A sense of entitlement among the lower classes results purportedly in slowing economic growth and curtailing individual freedom and liberties.

Design Elements

Private Property Rights

Perhaps the single most historically significant design element advancing the restoration of class stature among the groups designated above is the preservation of private property rights. In political-economic terms, the designation of “property” extended, globally, to slaves who provided free labor to subsidize profits in the British Empire, as well as in the antebellum South in the USA. Following the Civil War, in the abstract, slaves no longer constituted the “property” of their plantation-owning masters. In actuality, however, “Free People of Color,” emancipated slaves (Lincoln 1862), or constitutionally protected US citizens, blacks, did not enjoy full rights

of citizenship in the USA until the passage of the *Voting Rights Act* in 1965.

Although the above is an extreme example of the historical context of the concept of private property rights – the entitlement by virtue of global colonization and subsequent auctioning, to purchase and to trade slaves in the USA and globally prior to the Civil War – contemporary practices of “entrepreneurial freedoms” are only slightly less pernicious when situated in local contexts (see below). These hegemonic discourses include the perceived entitlement of the ownership of private space to open new markets and exploit the social-economic space of the Internet for private consumption and profit. In a digital age, what might be branded “consumer slavery” holds the possibility of extending social bondage for a lifetime owing to potential financial losses in the stock market and beyond. The point is that the protection of individual property, when placed in a global economic context, has its historical roots in both modern forms of neoliberalism, as well as in the institution of slavery. Indeed one need look no further than human trafficking/slavery to grasp the reality of modern-day slavery, a practice far astray from Harvey’s concept of (economically centered) entrepreneurial freedoms. The present discourses have roots in the distant past. Both discourses help construct social practices that are connected to globalization, but neoliberalism is a relatively new political-economic category.

Individual Liberty

Doubtlessly, the emotional and materialistically driven protection of private property could not proceed in the absence of the assumption of individual liberty. Taken in its most fundamental terms, individual liberty (or freedom) is the taken-for-granted notion that in a free and open democratic society, individuals – translated: voting, tax-paying citizens – have the legally protected right to live life as she or he chooses – the enjoyment of protection from the intrusion of government. In common sense, everyday terms, “I” as an individual is free to do what I want – provided I do not interfere with another human being’s autonomy and freedom to

act as well. What does this mean at the level of social practice?

Across the globe but especially acute in the USA and Western Europe contexts, gentrification provides an apt example. The Brooklyn neighborhood of Williamsburg, the Gold Coast of Chicago, London’s North End, the Mission District of San Francisco, and post-Katrina New Orleans, working-class neighborhoods replete with the lack of affordable housing, public transportation, and amenities such as accessible grocery stores, pharmacies, and, prior to the suburbanization of US cities, retail shopping – all have apparently given way to upscale redevelopment (The “New Urbanism”). Within this discourse practice, economic development means that urban planners and private-public partnerships incorporate design elements including upscale condominiums. For example, in Chicago and Williamsburg, fewer than 1,000 ft² units can easily range in the \$1 million + purchase category. The analysis of gentrification as social practice sheds light on the meaning of individual liberties in the local urban context, which arguably is a direct consequence of “global flows” (Inda and Rosaldo 2008). The two phenomena are linked, although distinct depending on place. And in the mini case of post-Katrina New Orleans, gentrification occurs in the broader context of the downsizing and decline of the public sector (government) under the hegemonic umbrella term of the remaking of the city for the purported benefit of all of its citizens. As the discussion below will illustrate, however, this rebranding may have unintentionally exacerbated inequalities.

Unencumbered Free Markets

Related to the social practice of gentrification, unencumbered markets arise “naturally,” that is, organically, when common sense suggests that strategies to help the economy such as economic development render possible the occupation of market space, heretofore unavailable. The Airbnb entrepreneurial initiative is a prominent case in point. Recently introduced in New Orleans, and now flourishing in the newly opened Cuban housing market, it enables visitors traveling to new destination sites such as New Orleans, Brooklyn,

Havana and Shanghai, Singapore, and New Delhi to enjoy hotel-style occupancy at times at rates far lower than the standard in these cities. Clearly Airbnb is both a global economic practice of world economic system (witness the global markets cited above), as well as emerging local social phenomena that are embedded in globalization. Although space does not permit a discussion of the local-global dialectic, suffice to say that in the case of New Orleans (below), the unique local context, arguably, is perhaps a mere reflection of the discourses of globalization, namely, neoliberalism.

On balance, this is a positive aspect of entrepreneurial freedom, as it allows a potentially larger number of travelers to engage in short-term stays (rentals) at lower prices. On the other hand, the wealth that entrepreneurs such as the founders of Airbnb rapidly reap is startling, currently valued at \$24B, according to the *Wall Street Journal* (2015). (It is worth noting that this multi-billion company start-up began operations in 2009.) Such profits, computer engineering, and marketing resources are rendered possible only to the top 1% of the economic class spectrum. The rest are left behind, metaphorically “enslaved” through a dilemma: garner the financial resources necessary to enjoy their short-term stay in previously closed international social environments and artistic havens, such as Havana – or stay home. Although theoretically, such a dilemma constitutes freedom of consumer choice, in effect it operates as an ethical quagmire, either reluctant resignation for fear of being denied freedom of mobility or seemingly undue harsh punishments in taking a lonely ethical stand. The choice does not bode equivalent ethical consequences. To live as a global citizen implies, at least temporarily, turning away from the economically downtrodden.

In summary, this cursory review of neoliberalism as “creative destruction” has generally examined the major tenets, or intellectual properties (design elements) in the context of the processes of globalization generally, and the world economic system of capitalism in particular. To repeat, these two concepts, though closely related,

are not equivalent: globalization provides the economic context and descriptive processes of capital accumulation for a host of discourse practices embedded in Harvey’s theory. In the paragraphs above, what this author characterizes as the “design elements” of these socially constructed practices are concretely highlighted, thus rendering the possibility that human and political agency can exploit the potential economically constructive aspects for the common good (furthering equity and the equality of social classes). This is best accomplished intentionally, for example, placing progressive constraints upon the displacement of affordable housing owning to gentrification (see Mirón 2016).

In the remainder of this entry, a vignette in the context of post-Katrina New Orleans – universal school choice (charter schools) – serves to capture a social “portraiture” of the distinctive social practices characterizing the centrality of *place* in the unfolding of actual neoliberalism hegemonic ideology, an unfolding that renders this ideology visible, as well as “disaster capitalism” (Klein 2007). The purpose in analyzing this vignette is to argue that although embedded in globalization, neoliberalism indeed manifests itself locally, at times with staggering unintended consequences as in when societies recovering from disasters such as Haiti, Detroit, and New Orleans. For example, disparities in health outcomes indicate that minority residents in neighborhoods recovering from disaster have an average life expectancy of 57 years, while similarly recovery neighborhoods that are overwhelmingly white have a life expectancy of 80 years! This is shocking disaster capitalism in its extreme.

The Privatization of the Public Interest in New Orleans

Following previous writings from this author (Mirón et al. 2015; Mirón 1992) and subsequent theorizing on the effects of hegemonic neoliberal ideology (Kamat 2004), the microlevel social analysis presented below vividly foretells how discourse practices matter. Hegemonic ideologies

(Laclau and Mouffe 2001) have material, concrete effects on everyday lived experience. In the case of New Orleans and elsewhere as other scholars have identified (Kamat 2004), public goods such as education and affordable housing are commandeered by State actors and entrepreneurial elites who engage in privatization, a hallmark of neoliberal ideology. Put simply, private interests are able to use public goods to further an unrestrained free market, whether the market is the global free flow of goods and services or public education. Clearly, Latinos and other poor people of color, who have previously benefited from public education, are impacted by the move toward privatization in the name of school choice (charter schools and vouchers). For example, in New Orleans, though the Latino population has nearly doubled post-Hurricane Katrina, charter schools do not routinely employ bilingual teachers or guidance counselors (Faust 2016).

A Case for Microlevel Social Theory and Analysis

In New Orleans, there is a congruence of discourse practices that are decidedly neoliberal in character, both in their hegemonic formations and their material (economic) impact on marginalized populations who are already economically hurting from global inequalities stemming from the world capitalist system. The most visible of these is school reform/choice, which in the analysis that follows moves the meta-theoretical abstractions summarized above to the microlevel of everyday lived experience. Moreover, it is an assertion of this entry that without an existential connection to lived experience, macro-level abstractions such as globalization are simply that: unspecified concepts that appear remotely related to ordinary lives. This vignette seeks to bring to everyday life these meta-abstractions.

Universal school choice began in 2005 with the unilateral dismissal of approximately 4,500 classroom teachers, the majority of whom were African-American. Coupled with the governing school board's dissolution of collective bargaining – in effect, ending insurance coverage, pension benefits, and other labor rights – discursively treated school

employees (overwhelmingly black and lower m an example of neoliberalism *par excellence*.

The Free and Open Educational Marketplace: Exemplifying Privatization of a Public Good

At well over 90% “market share,” the educational landscape in New Orleans constitutes, by far, the largest percentage in North America of independently operated and semiautonomous, charter schools. No city nationally comes close. Its entrepreneurial leaders characterize the neoliberal discourse in the city, which flows directly from neoliberal ideology in the form of the abolishment of traditional neighborhood schools in favor of charter schools that are often located far from students' residences. Within the configuration of multiple charter schools populating the city, the shared meaning of universal school choice is such that, in theory, any student in the city of New Orleans enjoys the personal freedom to enroll in any public school of her or his choosing. Put simply, place of residence (neighborhoods) need not determine the educational and economic future of the citizens of New Orleans. In the rhetoric of charter school leaders, “students should not be limited by their zip codes.”

Practitioners of school choice have largely realized this ideal. That is to say, by and large, parents and their children enjoy the relative freedom to select schools of their choice, unencumbered by where they live. With few exceptions – and there are significant policy constraints – students may choose from a plethora of school organizational configurations, ranging from the arts, to math and science, to military-style academies. Although families are free to choose any school using the centralized enrollment system, there are a few, highly ranked charter schools that, to date, have opted not to abide by the school enrollment methodology, which is known as *OneApp*. Indeed the highest performing charter schools admit very few Latinos as they are viewed as in special need of language services and even remedial instruction. These attributes, charter leaders fear, would drag down student achievement.

Lusher Charter School, which enjoys a reputation as one of the highest student achievement rankings in the State, has, along with a few other select high-performing schools, have steadfastly resisted the centralized open enrollment system, arguing that in so doing it would be forced to lower academic standards. For the most part, however, the OneApp process enjoys success and, while cumbersome to many parents (see Mirón and Boselovic 2015), appears fair and equitable. The majority of white families who participate in the system consistently succeed in landing a school in their list of top three choices. On the other hand, Latinos and families of undocumented Central American immigrants often struggle to navigate the fairly cumbersome application process in a language they have not mastered. Speakers of Spanish are often left behind in the reimagined public school system.

Finally in 2016, most school-level administrators enjoy professional and individual liberties – hallmarks of neoliberal design elements. For example, they can hire and fire school employees at will and setting customized teacher salaries a marked difference from collective bargaining contracts that protected person rights. As a neoliberal discourse practice, *autonomy* for school-level administrators means the liberty to set their own budgets, unrestrained from the central office, or micromanagement from the perceived corruption of the locally elected school board. Widely known charter operators, such as KIPP (Knowledge is Power Program), are able to operate mission-driven school organizations, in effect functioning like private schools. They are quasi-private in operations yet remain State funded. KIPP and other charter schools are publicly funded schools whose only accountability is to standardized tests that are used to renew operating licenses. Their mission remains void of the common good in the form of racial equity.

Conclusion

In conclusion, this entry has asserted that neoliberalism and globalization are separate analytical

categories, the latter a disruptive hegemonic ideology in Harvey's conceptualization. Although related, globalization characterizes the economic and social contexts in multiple societies wherein neoliberal discourse practices are embedded. What is needed, this author suggests, is a deeper understanding among marginal groups, especially Latinos, of these complex phenomena. Latinos now constitute the fastest growing population in the USA, its language spoken by nearly 6% of the world's population. In the vignettes above, Latinos represent one fourth of the student enrollment in suburban New Orleans and, in Orleans Parish (county) proper, approximately double previous levels (Foust 2016). Latino education, thus, is best understood globally, with this population in clear need of both a theoretical understanding of the twin concepts of globalization and neoliberalism. It is only within this paradigm shift that a relevant praxis and politics to address the inherent inequities, and the historical enslavement and racism of minority populations may effectively proceed.

Neoliberal Globalization and Educational Administration: Western and Developing Nation Perspectives

[Ideology of neoliberalism](#); [Political theory of neoliberalism](#)

Introduction

The political philosophy of neoliberalism has become pervasive, both in its effects in government and on societies, and in the academic literature. Equally, globalization has reshaped political agendas, the configuration and practices in social institutions, and is a common topic in several disciplines, currently reshaping both the university systems providing education in the West and those in the developing world receiving their services. However, there is considerable controversy over their positive and negative attributes, spawning a large and widespread critical literature. Most of the discussion originates in the West, but increasingly critique of neoliberalism and globalization are emerging from the developing

world, which has been the recipient of these socio-economic and political developments, ones that have also had an impact on the cultural-educational sectors internationally.

This entry provides an overview and discussion of the origins and characteristics of neoliberalism and its economic expression through globalization as well as the effects they have had on education and its administration. Just as neoliberalism affected the entire public sector and, in turn, influenced the private sector, globalization leaves untouched no aspect of society – its influence is pervasive through all social institutions, including social welfare, health, education, including causing issues of sovereignty through internet technology and multi- and transnational corporations (Held 2004). The entry also identifies critiques that have been raised in Western and developing parts of the world, especially as they affect education in the inequalities produced and the cultural (re)colonization taking place in many countries creating dependence and the silencing of intellectual traditions.

Neoliberalism and globalization will be traced from their theoretical origins to the forms they take in restructuring and reshaping educational organizations, their governance, roles and patterns of social interaction, curriculum, and pedagogical practices, including the values that are promoted, their effect on knowledge and its creation through research, reshaping of policy, and the institutionalization of neoliberalism through think tanks, institutes, and intellectual movements promoting its application globally. Both have been approached through a variety of disciplines – history, political science, sociology, cultural studies – therefore the definitions and critiques vary depending on the disciplinary focus used, but all of these have significance for the interdisciplinary fields of education.

The Nature of Neoliberalism

Neoliberalism is the term applied to a shift to the political right asserting economic ends, in the form of free markets, over political ends that began in the early 1980s in the UK, the USA,

Canada, Australia, and New Zealand that was accompanied by a public administration ideology called the New Public Management (NPM) which was inspired by private-sector practices consonant with the neoliberal return to market principles as a fundamental approach to government. The general change is the abrogation of the State's responsibility for education by abandoning it to the market-place and the introduction of corporate "universities". The historical origins, though, originate in eighteenth-century "cameralism" which was aimed at economic efficacy and scientific management, followed by the international scientific management movement in the 1910s, 1940s economic institutionalism theory, led primarily by Friedrich Hayek and Milton Friedman, and accompanied in its NPM formation by the 1980s corporate culture doctrine and a political embracing of public choice theory based on economic maximization of self-interest (Saad-Filho and Johnston 2004).

Throughout the 1980s and 1990s, the NPM was systematically applied to all public sector areas, although primarily aimed at privatizing, deregulating, and downsizing of public bureaucracies in social welfare, education, and healthcare along market principles, in other words, rationalizing through the following main changes in practices:

1. From senior administrative responsibility grounded in policy development to a managerial style typified by cost-consciousness producing a "scientized" managerialism ideology affecting role, structure, and staffing
2. Decentralizing organizations based on a monopoly system into corporatized units, internal markets, and rivalry, accompanied by a more centralized control over policy and civil service monitoring
3. From planning and public service welfarism to cost-cutting and labour discipline, producing deregulation and downsizing
4. From administrative processes adhering to policy initiatives to an emphasis on output through control and accountability mechanisms, producing quantitative methods of performance and efficiency measurements
5. Turning over permanent public bureaucracy provision of services to the private sector production of public services for "consumers" through term contracts, the use of consultants, contracting out, quasi-governmental organizations, and privatization

A broad-based critique of neoliberalism is its persistent erosion of the welfare state (see Bourdieu and Chomsky), the commodification of human activity, and the reduction of human experience to economic value (Peters 2011). Foucault's concept of governmentality is a more effective critique of neoliberalism, since this concept is not confined to formal governmental or governance structures but includes all discourses and practices (intellectual technologies) that regulate human activity – reflect particular modalities of speaking, how "truth" is formed, who is authorized to speak the "truth" (epistemological structures), who generates it, moral forms, and which consonant actions are legitimated, together constituting the exercise of power. In this broadened conception, all organizations yielding to neoliberal practices are implicated.

Globalization

To many, globalization is seen as a benign, or even positive, development in which transnational connections and interactions have been formed on civic levels, between companies, and between nations that are primarily an economic phenomenon aimed at increasing international trade and investment. It is also associated with, or seen as dependent upon, advances in information technology that allows for its characteristic broadened and more rapid interconnectedness (Held 2004). Its scope is far beyond that of manufactured goods, extended to include social, cultural, and education "production" evident in the many branch campuses of Western universities in developing parts of the world. The less benign view, from an international perspective, regards globalization as the dominance of Western nations over much of the rest of the world in which the human and material resources of the developing world are used to feed Western economic development, resulting in greater exploitation, a growing gap

between rich and poor nations (Bourguignon 2015), and in the spread of a world “culture” predicated upon Western, mostly American, values and norms.

Implications for nations and their sovereignty vary from accounts that globalization is eroding and fragmenting nations’ political integrity, to those who argue that global connections are not historically unprecedented and that the greater international intensity reinforces or even strengthens State powers, and finally to those who regard globalization as a new set of economic, political, and social circumstances that are transforming the nature of the State. Many negative effects of globalization include structural unemployment, social exclusion, increased urban and national insecurity, and the proliferation of drug and weapons trafficking (Held 2004). These changes are accompanied by higher levels of human migration, asylum seekers, refugees and displaced persons, as well as labor migration and higher degrees of multiculturalism in part caused by the rise of international and transnational corporations, branch operations in foreign countries, and, in the case of education, larger numbers of foreign students from transitional and developing countries to Western university systems.

The nature of national and international structures is changing with the emergence of transnational governing bodies (e.g., the EU) and the increase in intergovernmental organizations and international non-governmental organizations, many of which have strong policy making influence such as the World Trade Organization, the OECD through establishing international standards and rankings, the International Monetary Fund, and the World Bank, all of which have influenced the cultural and educational sectors of countries through the spread of neoliberalism (Hoogvelt 2001). Transnational regional bodies also have influence like the GCC, APEC, ASEAN, etc. and the emergence of cosmopolitan law out of twentieth-century international law developments. Globalized neoliberalism also shapes social institutions through its structural and operational formal rules that use Western principles and standards. These developments are reshaping national powers, policy making,

governance structures, and organizational practices (Burbules and Torres 2000). Social institutions, including the educational sector, are also affected by increasing militarization and securitization as actors in the research and development of systems and as sites of surveillance are linked through multilateral arrangements and increasing export markets.

The Western Educational Critique

The Western critique of neoliberalism focuses mostly on the impact of neoliberalism on their own educational systems examining how corporate capitalism and its competitive free market model has changed the nature, role, and aims of higher education to a handmaiden of the politico-economic sector as a source of economic strategy development, first explored in depth by Slaughter and Leslie in *Academic Capitalism*. For many jurisdictions, higher education is intended to assist in the transition from a manufacturing to a “knowledge” economy. Effects of neoliberalism on universities are associated with market practices as they are applied to a reshaping of the institution: rational management; performance assessment (often quantitative and positivistic) that is not adapted to university teaching and scholarship; and deregulation, which has been applied to raising tuition levels in more regulated environments and allowing for a greater range of private universities and online services. These include the increasing commercialization and commodification of education, changing roles of faculty, through proletarianization, from semi-independent professionals into employees with an entrepreneurial character, in competition with one another (e.g., through bonuses), the privatization of scientific and technical research, removing barriers to university-industry alliances through changes in legislation and government policy, change of curriculum into an emphasis on labor preparation in programs and courses, and the increasing role of think tanks and institutes with a strong capitalist focus that are used to research and justify the neoliberalization of the educational sector by governments (Burbules and Torres 2000). From a Weberian perspective, disenchantment is well underway in this model, contributing

to an even tighter “iron cage” modernization, and in Habermasian terms, it is a further and more comprehensive technical rationalization of the university, in other words, a further colonization of lifeworld by system.

These initiatives have been accomplished through the proliferation of “Centres of Excellence” and science parks to host university-industry collaboration, the use of patents to privatize knowledge (where intellectual property policies in some universities require the assignment of the patent to the university and not individuals), and a shift from foundational and primary discipline programs to applied studies, marketable product development, and a constant emphasis on innovation oriented towards the economic sector. Universities also have been transformed into revenue-generation machines, one effect of which is the commitment of significant university resources in attracting a lucrative foreign student recruitment, where disciplines like engineering and sciences are heavily dependent and an importance placed on faculty and university time and resources spent on marketing activities and spin-off firms.

The main problems associated with this transformation of higher education is a concern about academic freedom and the capacity for civil society activism, increasing student numbers with declining funds, the emergence of technologies in the form of networks that bind the university to “triple helixes” of university-industry-state linkages, including the military-intelligence-industrial complex. Of importance to the university as an institution is its declining role as a distinctive institution to protect and promote intrinsically-valued knowledge, free intellectual inquiry, and the community of scholars, with its own collegial governance system. Universities are increasingly being restructured to operate under university administrations that are built on a Chief Executive Officer model rather than as a scholarly leader who is first among equals. Universities now have divisions that structured to pursue the private sector, do market modeling, and which are staffed with people who are recruited from industry without the values, sensibilities, and social interaction knowledge of higher education organizations,

changes that deeply transform organizational culture. The stresses and strains of these factors have also increased the intensity of organizational politics and conflict leading to a widespread phenomenon of academic mobbing. At the same time, the scholarly actors in this process are not wholly victims of an externally imposed change, but many themselves are complicit, ontologically complicit in Heideggerian and Merleau-Pontyan terms, or strategic game players in Bourdieuan terms.

The Non-Western Educational Critique

The globalization of Western education has resulted in a transmobility of scholars and the creation of branch or off-shore campuses, some through affiliation agreements, and “liaison” offices in foreign countries (although the last has raised concerns about free access to Western science and technology). These developments also contribute to fierce competition among Western universities in “penetrating” foreign educational markets.

There are many issues for non-Western countries in the globalization of Western educational programs, practices, and teaching staff modeled on a neoliberal agenda. The influence of corporate capitalist mentality creates many of the same commercializing and commodifying effects; however, there are also some differences in degree if not kind (Bauman 1998). In many developing and transitional countries, there is a low level of public funds invested in building a higher-education capacity, both forcing even public universities to operate as revenue-generating enterprises with few resources to invest in the building, libraries, laboratories, and highly qualified academic staff necessary in quality education but also creating an unregulated market-place in which business operators with no higher education experience set up inexpensive operations expecting to receive a return on investment in a short turn-around time.

One of these is the assumption, on the part of Western organizations and many in developing countries, that their values and practices are a norm to which developing countries must strive, regardless of the institutional arrangements in the country, legal and political system, and economic

system. This effect is part of a general homogenization of culture occurring under globalization – a “world culture” (and neo-institutionalist) model based predominantly on American norms as a global ideal (Bauman 1998; Spring 2014; Zajda 2005). One example is the “knowledge” society model that is predicated upon transferring manual labor activities to the developing world while reserving “knowledge work” for the West, a model that often developing countries adopt without an understanding of its logic and without national capacity to change from a necessary production economic sector to that of a knowledge-based one. One feature of this is using “benchmarking” from Western universities in evaluating a developing country still in an institution- and nation-building mode and which has different social patterns and culture, and which also may have very different security requirements. These principles are enforced through credentialing instruments like accreditation that privilege Western knowledge, structures, and roles, requiring that non-Western educational systems conform to a unified neoliberal model (Burbules and Torres 2000; Saad-Filho and Johnston 2004) in order to qualify, not only through so-called “quality assurance” regimes but also in enforcing Western curricular models and intellectual traditions, which, under neoliberalism favor positivistic knowledge traditions over many critical and interpretive ones. These features are also part of a “world systems” perspective that examines “core” global zones like the USA, the EU, and Japan who attempt to legitimize their power and domination of “periphery” nations by actively inculcating its values into them (Appelbaum and Robinson 2005; Spring 2014).

Contrastingly, a postcolonial critique views globalized education as a cultural imperialist vehicle for imposing economic and political agendas on other nations by wealthy nations to increase their power and privilege (Appelbaum and Robinson 2005; Hoogvelt 2001). These practices constitute a new form of colonialism from that of nineteenth-century and early twentieth-century forms through IGOs, multinational corporations, trade, and globalized education through corporate

publishing, research and professional organizations, and international testing. A related critique is that of culturalist theory which takes an equality position that all nations can benefit from borrowing and lending educational values and practices and emphasizes local borrowers rather than externally imposed education (Appelbaum and Robinson 2005; Spring 2014).

There are also underlying values that are contrary to many systems of thought and belief, not wholly those from outside the West: a materialist orientation that follows from a consumerist view of the world; secularization; a progressivist fallacy that Western, more particularly American, development is inherently superior; an anti-historical disposition that excludes shared traditions and beliefs, for example, the reliance of several Western intellectuals traditions on classic Islamic scholarship through a number of transmissions into Europe; and a dualistic view of the world (instead of, for example, a dialectic view of human history) – the “clash of civilizations” concept that permeates much more than just security and political oppositions that have spawned negative stereotyping and overgeneralizations about Islamic values and standards of social practice, the role of women, etc. One of the consequences of importing foreign curriculum and professional training is a loss of culture by affecting negatively cultural and national identity formation, for example, in providing leadership models that are contrary valuationally from many Western models (Zajda 2005). All of these effects can be seen as cultural imperialism (Appelbaum and Robinson 2005). Even though supporters of globalization see it as a force of democratization internationally tend to ignore democratic features of other systems, for example, the representative and consultative practices of Islamic administration inherent in its leadership model, or even many European configurations of democracy, assuming often that American-style democracy is a “default” position.

The main areas of critique include the impact on institutions in home countries where it began, in other developed countries where it migrated to, and the developing world where it serves as a recolonizing force. It is also associated with the

rise of multinational and transnational corporations and the increasing role for international organizations like the OECD and UNESCO in spreading globalization, for example, the IMF and the World Bank through conditions attached to loans requiring the adoption of neoliberal-type austerity measures (Hoogvelt 2001). This is accompanied by an increasing political influence by foreign powers and multi- and transnational corporations over politics in developing countries, and direct influence in shaping educational policies and practices.

One of the major problems, not only for developing countries but also for Western countries most involved in globalization is the way in which it privileges education predicated upon market values and the forms of managerialism that come with it, over both a traditional Western university ethos and that of other rich and deep traditions of the developing world. For many critics, business-style management and efficiency models are diametrically opposed to the life of the mind, of the humanistic development of the human being, the pursuit of knowledge of intrinsic value, and even the quality of education itself.

Neoliberalism and Education Policy

David Hursh

University of Rochester, Rochester, NY, USA

Educational choice; Free markets; Market fundamentalism

Introduction

Neoliberalism and the neoliberal social imaginary have become the dominant way in which people conceptualize society and, in particular, the economy and education. Its dominance reflects the ability of the wealthy to assert their power to restructure society and government to their benefit (Harvey 2005). They have transformed the political decision-making process from one which was primarily public and hierarchical to one in which the distinction between the public and private decision-making processes is now blurred and where private interests influence the political process through various means. In education, for example, Bill Gates, the world's wealthiest individual who heads the largest philanthropic organization, the Bill & Melinda Gates Foundation, uses his wealth to promote his neoliberal vision of corporate control over education, to place people in influential governmental and nongovernmental positions, and, not coincidentally, to increase Microsoft's earnings and his own wealth. Similarly, Teach for America and its 36 franchises in 25 other countries prepare teachers and promote policies that undermine teachers' professionalism, teachers' unions, and public schools. Lastly, Pearson, the world's largest education corporation, aims to control education globally, from curriculum development to assessment and professional development. Neoliberals have changed the nature of governance and, therefore, transformed who and how education policy is made to the advantage of the rich and powerful and the detriment of everyone else.

A Brief History of Neoliberalism

Neoliberalism has become the dominant economic policy across the globe, while remaining a term unknown to many people. However, people are more likely to be familiar with the notion that we have no alternative than to embrace the neoliberal principles that economic and other decisions should be market rather than government based and that public services should be, as much as possible, privatized. These ideas have

become so dominant that they now compose the social imaginary, the way in which people look at the world not based on theory, but their lived experience regarding the role of government and the nature and scope of political authority. Many perceive that there are no alternatives to free markets and privatization, to neoliberalism.

Neoliberalism, as a term, is less well known among the public, in part, because neoliberalism differs by place and time, continues to evolve, and is contradictory and contested. Therefore, we need to begin by asking: what is meant by *neoliberal*? In the United States, but less so elsewhere, the term neoliberal is often confusing because it is often thought of as a new version of liberalism in the tradition of Franklin Roosevelt and the rise of governmental social welfare policies in North America and Western Europe following World War II. In that form of liberalism, often referred to as social democratic liberalism and sometimes as the welfare State, governments intervened to direct the economy through spending and tax policies and increased spending on social welfare, including education at all levels. In addition, laws were passed to promote social equality, such as voting rights, and protect individuals from harm, such as environmental protection (Harvey 2005).

Instead, *neoliberalism* harks back not to the social democratic liberalism of the 1930s but to the liberalism of the seventeenth and eighteenth centuries in which the working and emerging middle classes pushed back against the power of the monarchy and the church. Liberalism, then, stood for the individual's right to own property and freedom from religious and political constraints. Neoliberalism, then, more closely resembles conservative ideologies emphasizing individualism and economic freedom (e.g., see Locke's *Two Treatises of Government* and Adam Smith's *The Wealth of Nations*) than the postwar social democratic liberalism that elevated the common good over the individual.

However, neoliberalism emerged partly in response to the social democratic liberalism of the 1930s and the economic theories of John Maynard Keynes, the most influential economist of the Great Depression. For Keynes, government

had three functions: to supply the goods and services that could or should not be supplied privately (education, utilities, law enforcement, the military), to alleviate and regulate the failures of the market, and to arbitrate between competing groups and social classes. Keynesian policies are reflected in Roosevelt's policies increasing federal spending during the Great Depression by increasing employment through projects such as the Works Progress Administration and the Civilian Conservation Corps, initiating social security to protect the elderly and regulating the banks through acts such as the Federal Deposit Insurance Company and the Glass-Steagall Act. Keynesian economic policies sought to increase the economic resources of the unemployed and poor, in part so that they could purchase goods and services and contribute to economic growth, but also as an issue of social justice (Peck 2010).

Neoliberal thought emerged during the Great Depression, expanded after World War II, was first put into place in Chile in the 1970s under the dictatorship of Augusto Pinochet and was realized during the Reagan and Thatcher administrations in the 1980s. The two centers for neoliberal theorizing were in Europe and the United States. In Europe, the center of the neoliberal movement was what came to be known as the Mont Pelerin Society, named for the city in Austria where its proponents met. In the United States, neoliberalism's center was the economics department at the University of Chicago, which subsequently became known as The Chicago School of Economics.

Of the scholars who met in Mont Pelerin, the most renown was Frederick von Hayek, an Austrian and British economist and philosopher best known for his defense of classical liberalism. Hayek feared that the rise of democratic socialism and Keynesian economics in Europe as it rebuilt after World War II was the first step toward tyranny and totalitarianism. Therefore, in Hayek's 1944 book, *The Road to Serfdom*, he extolled the virtues of markets and competition and warned of government intervention undermining the efficiency of markets. Hayek assumed that markets were inherently more efficient at allocating resources and goods than individuals. In fact,

Hayek described markets as having knowledge that individuals could not possibly possess and as knowing better than any individual what is best for them.

Hayek also viewed social democratic liberalism as dangerous because it aimed to reduce inequality. For Hayek, economic and political inequality is not only necessary but also beneficial. He understood inequality is a necessary characteristic of the market system and any effort to alter the outcome would violate the natural order of the market and, therefore, be counterproductive. For neoliberals, individual competition within unregulated markets is the best way to promote efficiency and social welfare.

In the United States, Milton Friedman, from the University of Chicago, was the most vocal and well-known proponent of neoliberal thought. Like Hayek, he promoted markets, privatization, competition, and individualism. Unlike Hayek, his ideas were well promoted by the political and economic elite and well received by the public as indicated by the sales and ubiquity of his publications, *Capitalism and Freedom* (1962) and *Free to Choose: A Personal Statement* (1980).

Friedman was also vocal regarding the policy implications of his economic theories. He argued that the purposes and processes of education should not be decided through public discussion but should be determined through competitive markets. He proposed eliminating public schools, which he denigrated as "government schools," and suggested that students' parents/guardians be provided with vouchers so that they could choose the private or religious school that best reflected their values. Consequently, people would be free to individually choose what kind of education they wanted and, therefore, "vote with their feet." The market would determine what kind of education to provide as those schools that best responded to the public's demands would thrive while those that attracted too few students would close.

The emphasis on individual choice has, for neoliberals, the further advantage of shifting responsibility for the individual's welfare away from society and onto the individual. Under neoliberalism, if an individual falls short

of his or her goals – if they end up in less- or ineffective schools or un- or underemployed or underpaid – they have no one other than themselves to blame and cannot demand that government alter the situation.

Neoliberalism, then, changes the relation between the individual and society. It conceptualizes the individual as not only making choices, but as an autonomous entrepreneur responsible for his or her own self, progress, and position and responsible for his or her own success and failure. Individuals are transformed into entrepreneurs of themselves and those who succeed are seen as successful entrepreneurs.

The *neoliberal social imaginary* has become so dominant that for most people, it is natural and unquestioned. Under neoliberalism, the welfare of the community has been replaced by the welfare of the individual, democratic deliberation by market choices, and qualitative messiness by quantitative “certainty” (Ball 2012).

Moreover, and perhaps more insidious, neoliberalism has become dominant while at the same time, it is often not even recognized or named. Rather, neoliberal theories are often referred to as free markets or market fundamentalism, which, while similar, vary in meaning. In the United States, “free markets” is the term more likely to be used by the general public, including journalists, politicians, and some academics. The term “free markets” may be preferred because it emphasizes freedom, as in free trade and choice, and references some, but not all, of the other characteristics of neoliberalism, in particular, decreasing the size and role of government in society and privatizing public institutions and agencies, such as prisons, airports, highways, and, of course, schools.

Market fundamentalism (Block and Somers 2014) is heard less often, but refers to what is described as an unfounded faith in markets as the best and most efficient way to make decisions. However, markets are hardly self-regulating and cannot account for values or input that are other than monetary. A moment’s reflection that the lack of regulation almost caused, in 2008, the collapse of the financial system reminds us that not only does self-regulation not work but also minimal

regulation is required. Furthermore, the rise of neoliberalism and the dominance of markets are neither natural nor inevitable.

Neoliberalism and Education Policy

Education has been profoundly transformed under the ascendancy of neoliberal principles. The emphasis on markets transforms how government’s role is conceived and policy is made. Neoliberals aim to decrease the size of government by, as much as possible, privatizing governmental services, including education. Furthermore, since government’s role is decreased and local control undermined, corporations, nongovernmental organizations, and philanthropic organizations play a larger role in setting policy. Lastly, education and other governmental organizations are to be transformed into market-based institutions.

Moreover, how schools are administered is transformed as the new public management replaces the older bureaucratic structures that are deemed to be too slow to respond to market pressures. New public management shifts the focus from inputs and processes, including funding and standards, to output and performance, to be achieved efficiently through standardized exams and other quantifiable measures. New public management provides the rationale and means for using standardized exams to hold teachers and students accountable, what is sometimes referred to as “governance through numbers.”

Neoliberals also aim to replace government, which is hierarchical and carried out through bureaucratic methods, with governance, which is the authority of diverse and flexible networks. Hierarchical public policy making had been replaced by the rise of networks and heterarchical and often private policy making. Moreover, decision-making has shifted from the local and the provincial scales to the national and international scales, making it easier for the wealthy and connected to impact and benefit from the decision-making process (Ball and Junemann 2012).

The rise of heterarchical networks has enabled a shift in how and where policy decisions are

made, advantaging individuals and organizations that are economically and politically powerful. For example, in the United States, up until the turn of this century, policies were generally made at the lowest levels appropriate, generally either the local, community, or the State, with the federal government intervening only where necessary. However, policies now tend to be formulated and made at the national and international levels not by citizens or elected representatives, but by officials from organizations that are unelected and unaccountable, including philanthropists, such as the Bill & Melinda Gates Foundation; corporations such as Pearson; nongovernmental organizations, such as Teach for America or Teach First; and global organizations, such as the Organization for Economic and Cooperative Development (OECD).

The Gates Foundation, which may have the greatest influence of any individual or organization over US policy, achieves their influence through who and what they choose to fund, their access to people in powerful places, and their ability to place their own personnel in administrative positions elsewhere. As one example, Bill Gates is largely responsible for the development and adoption of the Common Core State Standards by providing billions of dollars to nongovernmental and educational institutions who support Common Core. They also fund numerous nongovernmental organizations that support creating more charter schools and have managed to place administrators from those programs in senior positions in the US Department of Education.

Likewise, nongovernmental organizations like Teach for American (TFA) do not merely train and place teachers in positions to teach for 2 years. TFA often contracts with urban school districts to replace the more highly paid unionized teachers with TFA teachers who are underprepared, unorganized, and underpaid. TFA's influence does not stop there as TFA organizes their alumni to lobby governments to expand school privatization and support standardized testing and other neoliberal reforms.

In addition, Pearson Inc., which is now the world's largest education corporation, aims,

according to their web page, to be an "integrated education company" that provides digital content and service globally. Their business portfolio provides textbooks, texting and assessment products, online learning and software solutions, and customizable and integrated services. They currently operate in more than 80 countries and have more than 40,000 employees. In the United States, they own most of the textbook companies and produce and administer most of the standardized tests. Pearson's goals include dominating the education market by collaborating with Microsoft to deliver the Common Core curriculum and assessment on Microsoft technology.

Using standardized exams to hold teachers and students accountable shifts the way in which teachers are controlled. Rather than controlling teachers directly through rules and regulations enforced at the local level, teachers are controlled indirectly from a distance. Teachers do not need to receive specific directives but, instead, know that their task is to prepare the students for the standardized exams.

Lastly, neoliberals aim to privatize or eliminate services, such as transportation, healthcare, and education and, where possible, subject them to the discipline of the market. Therefore, as Friedman advocated decades ago, neoliberals seek to privatize public schools by converting them into charter schools or eliminating them altogether in favor of private and parochial schools or providing vouchers to pay for part of the cost of tuition to a private school. The Obama administration, under Race to the Top regulations, has required that States support the creation of charter schools and increase their number by eliminating any limits (Hursh 2011). New York State's Governor Andrew Cuomo, echoing Friedman, "aims to end the public school monopoly" by increasing the number of and funding for charter schools (Hursh 2016).

However, charter schools are increasingly supported not only or even mostly because they might improve educational outcomes for students but because they are perceived as places in which administrators receive exorbitant salaries and investors' excellent monetary returns. In New York, ostensibly philanthropic organizations, like

the Gates and Walton Foundations, have worked with hedge fund managers to develop a lobbying strategy to increase the number of and funding for charter schools. Other groups, such as Education Reform Now, Students First NY, Families for Excellent Schools, and NY for a Balanced Albany, have contributed millions of dollars to Cuomo's election campaigns and the campaigns of other legislators with the aim of influencing legislation (Hursh 2015).

Neoliberals claim to desire reducing the size of government, in part by privatizing much of what the government does. However, many of their policies result in increasing the size of government. For example, charter schools would not exist if the government did not create a process to award charters and a means to divert public funds to charter schools. Furthermore, while standardized testing provides a means for governments to control teachers and steer schools from a distance, developing and administering the standardized tests and assigning scores to schools and implementing disciplinary measures require a large bureaucracy and significant funding.

Therefore, neoliberalism is less about reducing the size of the State and more about reorganizing the State in the service of capital. Therefore, we can investigate how and what education policy is made in terms of who gains power and benefits financially. As described above, the beneficiaries have been large corporations and philanthropists who use their philanthropic wealth as investments, heads of nongovernmental organizations, hedge fund managers and other Wall Street brokers, and politicians willing to implement the policies. At the same time, educators, parents, students, and community members are increasingly marginalized and teaching becomes de-professionalized.

While neoliberals claim that markets, high-stakes standardized exams, and privatization will improve education, there is little evidence to support their claim. Charter schools perform no better than traditional public schools. Moreover, since privatization is touted as the solution to improving education outcomes, underlying societal problems such as poverty, lack of meaningful and

decent paying work, and inadequate healthcare are dismissed as irrelevant.

Further, high-stake testing as required under No Child Left Behind and Race to the Top has reduced the curriculum to what can be measured on a standardized test. Subjects like science, social studies, and the arts are slighted and interdisciplinary learning becomes nonexistent. Topics that are complicated, which have no one right answer, such as how should we respond to climate change, are unlikely to be addressed because they will not be tested. Education is reduced to what is known, eliminating what is unknown but crucial to explore.

That neoliberalism favors the already rich and powerful and results in schooling that fails to examine central social and environmental questions is becoming increasingly apparent to parents, students, teachers, and community members who are pushing back against standardized curriculum, testing, and schooling. Critics of neoliberal policy are also working to implement social democratic processes encouraging dialogue and debate over the purposes and methods of education, which results in the process of developing education policy becoming educative in itself.

Neoliberalism and Environmental Education

Robert Fletcher

Introduction

While environmental education (EE) has long been framed by proponents as a challenge to the type of mainstream economic thinking contributing to ecological degradation, increasingly such education has begun to integrate the very logic of neoliberal economics to achieve its aims. This entry summarizes a small but growing body of research that has recently arisen to document this trend. The genesis and characteristics of neoliberalism in general, understood both as a historical political-economic project (see esp. Harvey 2005) and associated form of discourse or ideology (Peck 2010), have been described at length elsewhere, including in other entries of this volume (see [Cross-References](#) below). The growing influence of neoliberalism in educational policies around the world, consequent to widespread cut-backs in State funding and increasing emphasis on accountability and quantitative measurement in student performance, has been thoroughly discussed both in this volume (see [Cross-References](#)) and elsewhere as well. Researchers

have also documented a growing trend toward neoliberalization within global environmental politics as a whole in recent years, expressed in promotion of so-called market-based instruments such as ecotourism and carbon markets to address ecological degradation in terms of which non-humans are primarily valued as providers of “ecosystem services” and repositories of “natural capital” (see esp. Büscher et al. 2014).

This entry builds on these discussions to describe the ways in which neoliberalization has gained increasing traction within EE and closely associated education for sustainable development (ESD) fields in particular. It draws on recent research characterizing neoliberalism as a confluence of a neoliberal political economy pursuing accumulation through dispossession (Harvey 2005) and a neoliberal governmentality that seeks to influence stakeholders’ decisions throughout the social sphere via creation and manipulation of external incentive structures (Foucault 2008; see also [Cross-References](#)). These two dynamics come together in environmental education and related mechanisms that seek to harness neoliberal forces in the quest for sustainability.

Neoliberalizing Environmental Education

Essentially, EE seeks to encourage “pro-environmental behavior” on the part of program participants in support of environmental protection and sustainable natural resource management. The closely associated ESD approach pursues this same aim within the framework of sustainable development specifically. As with the overarching global environmental movement, researchers describe a general historical trajectory within EE whereby what originated as a largely oppositional practice challenging dynamics of industrial capitalism contributing to environmental degradation has been increasingly superseded by the more recent trend to incorporate elements of neoliberal capitalism and discourse into EE curricula and delivery. The rise of ESD in

particular is seen as part and parcel of this trend in its promotion of a sustainable development perspective that many view as itself an expression of neoliberalization within the global environmental governance apparatus.

In part, this transformation is attributed to the need to attract financial resources within a neoliberal climate in which approaches conforming to the dominant paradigm are privileged in funding decisions. In addition, a neoliberal perspective within EE delivery has been increasingly promoted by organizations whose overarching missions have themselves become progressively neoliberalized, particularly so-called big non-governmental environmental organizations (BINGOs) such as The Nature Conservancy (TNC) and Conservation International (CI) as well as private sector firms pursuing corporate social responsibility (CSR) agendas. Further, however, neoliberalization within EE is viewed as part of a more general process whereby neoliberal reason has so permeated the global political imaginary that it has become conventional wisdom in many spheres (Peck 2010). As Hursh and coauthors describe, “neoliberal ways of thinking about and acting in the world have become so prevalent, naturalized, and internalized that we are often unaware of how neoliberalism constrains our thinking and practice, such that it is difficult in both thought and deed to imagine a society proceeding on different principles” (Hursh et al. 2015, p. 300). Within this climate, indeed, “neoliberal ideology is so pervasive that Margaret Thatcher’s truism ‘there is no alternative’ takes on new dimensions as alternative projects literally (re)produce neoliberalization” (Weissman 2015, p. 361). From this perspective, environmental educators may unwittingly adopt elements of neoliberalism in their very efforts to advance an ostensibly oppositional practice.

As previously noted, an extensive body of research has documented how “neoliberal tenets have formed the core principles for primary, secondary, and higher education reform in many countries over the last two decades” (Hursh et al. 2015, p. 306). Assessing this trend from a Foucaultian perspective, one could conclude with Pierce that:

What has clearly emerged over the past 30 years is a distinct model of neoliberal governmentality of education where, through state and corporate strategies and practices, schools are increasingly in the business of disciplining and regulating the nation’s educational resources (as human capital stock) in order to maximize potential for high-yield crops of twenty-first century skilled students. (2015, p. 461)

Within EE in particular, neoliberalization has been identified in various forms of delivery, both formal and informal, at different levels from postgraduate through preschool, including such diverse modalities as teacher training workshops, business school curricula, university sustainability policies, rural development projects, incarcerated student programs, ecotourism excursions, and urban farming initiatives. Discussion of this trend in terms of EE reflects the core neoliberal principles – decentralization, deregulation, privatization, marketization, and privatization – standard to all work on the theme yet are seen to be expressed in particular ways within EE specifically. As with most studies of neoliberalism, researchers are sensitive to processes of “variegation” in how general neoliberal principles are expressed in different contexts and forms of practice (Peck 2010). Notwithstanding such variegation, elements of neoliberalization commonly identified within EE include the following:

- Emphasis on individual rather than collective action as the basis for pro-environmental behavior
- Promotion of entrepreneurship as the economic and social form appropriate to sustainability
- Endorsement of a model of environmental citizenship centered on privatized and individualized activities
- Advocacy of economic growth to address both poverty alleviation and environmental protection
- Promotion of new public management (NPM) strategies in both educational and environmental governance
- Emphasis on quantitative measurement as the basis for transparency and accountability in environmental management
- Related promotion of standardized testing for learning assessment

- Embrace of rewards systems to incentivize participation and learning
- Advocacy of superficial participation without concrete decision-making power or equitable resource sharing
- Focus on the economic value of “ecosystem services” as justification for environmental protection
- Promotion of market-based instruments for environmental governance

The Dangers of Neoliberalism

Overwhelmingly, researchers express strong reservations concerning the implications of this trend. In explaining his approach to social analysis, Foucault once stated, “My point is not that everything is bad, but that everything is dangerous, which is not exactly the same as bad” (1984, p. 343). In this sense, researchers view the trend toward neoliberalization within EE as dangerous for a number of reasons. First and foremost, this perspective commonly promotes, either explicitly or implicitly, a growth-based capitalist economy that many consider antithetical to the sustainability that EE ostensibly champions. In so doing, consequently, it turns away from problematization of this very economy as one of the principle obstacles to environmental protection. Consequently, neoliberal approaches to EE threaten to “reduce the political to the personal” (Hursh et al. 2015, p. 309) and thereby “help to form neoliberal subjects who will not challenge the status quo but instead focus on individual responsibility” (Weissman 2015, p. 360). In this way, “Under neoliberalism, failure to achieve environmental sustainability is equated with the aggregate failure of individuals to incorporate rationality into their private sphere environmental decision-making rather than with a failure of the state” (Schindel Dimick 2015, p. 394) or of capitalist markets.

Essentially, in sum, critics contend that neoliberal capitalism is itself largely responsible for much of the environmental degradation the system is now increasingly called upon to correct within a neoliberal governance framework (Büscher et al. 2014). By neglecting to address

(or even more directly obfuscating) this dynamic, “neoliberal environmental education fails to question neoliberal ideologies and structures that promote an unsustainable economy, individualism, entrepreneurialism, and consumerism” (Hursh et al. 2015, p. 313). Hence, a neoliberal approach to EE may end up reinforcing the very problems it seeks to address.

Alternatives and Future Directions

In leveling critiques of this nature, researchers advocate forms of EE that not merely depart from but directly confront neoliberal processes and their consequences. Huckle and Wals summarize the general consensus on this issue in calling for EE that:

encourage[s] students to consider issues of justice and the desirability of sustainability citizenship. They should learn about structures of power and the processes at work in the capitalist world economy; the rise of neoliberalism and its social, environmental and cultural impacts; and the contemporary ‘crisis’ and the need for more sustainable forms of development. Such development requires public/collective as well as private/individual actions, and students should recognize that a focus purely on individuals’ values and lifestyles serves to depoliticize and privatize a very political and public issue, and thereby contributes to the reproduction of the status quo. (2015, p. 494)

In addition to such confrontational critique, commentators call for alternative forms of pedagogy and practice that embody progressive principles contrary to neoliberal doctrine, focused on inspiring collective and directly political action that pursues decommodified and common pool resource management and commonly drawing on Freirian philosophies of grassroots conscientization and organizing (see [Cross-References](#)). In this spirit, researchers have identified a variety of current and potential practices that can serve as models for such alternatives, from conscientization activities among campesino organizations in Brazil to urban renewal programs in the US city of Detroit. This research is just beginning, however, and constitutes a particularly fruitful avenue of future investigation and activism in this field.

Other potentially productive directions for further research include devoting more attention to exploring how participants understand and respond to neoliberal forms of EE, given that to date analysis has focused primarily on delivery rather than reception. In particular, examination of the ways participants (as well as educators) may resist and/or subvert such practices would be quite interesting. Similarly, rather than treating neoliberal EE as wholly and uniformly negative, researchers might explore how ostensibly neoliberal perspectives and approaches are or could be productively employed in the service of alternative projects as well. As is clear from an all-too-brief review of this emerging field, investigation of the relationship between neoliberalism and environmental education is only just beginning and will likely pursue these and many other fruitful new directions in the coming years.

Neoliberalism and Globalization

João M. Paraskeva

UMass Dartmouth, Dartmouth, MA, USA

Introduction

The last three decades of the last century – especially with the advent of Reaganism/Bushism and Thatcherism/Majorism in the United States and England – may well be considered profoundly structural for the transformations that were about to occur in the world (Harvey 2005; Steger 2005; Sousa Santos 2006; Apple 2009; Giroux 2004; Conversi 2010; Torres Santome 2005; Paraskeva 2009, 2010). The staggering economic experiences in post-Allende Chile, the great *contemporary* revolution in the People's Republic of China (who took the *Xiapingian* formula *one nation two states*), and the elections of Margaret Thatcher and Ronald Reagan in the United Kingdom and in the United States, respectively, coined the emergence and development of a “new world economic configuration—often subsumed under the term [neoliberal] globalization” (Harvey

2005, p. 2). Neoliberal globalization needs to be understood within a complex ideological framework that hegemonically stabilized a new radical center, paving the way for a new conception and praxis for the State and in so doing naturalizing the economic crisis and the subjectification of debt.

Neoradical Center

Given the inefficiency and inoperance of the political and economic architecture determined by the Bretton Woods agreements achieved after World War II, which established a kind of *embedded liberalism* that imposed inconvenient restrictions and regulations to a greedy market, the succession of non-accidental social events described above must be seen as the harbinger of a new world order that advocates the liberation of the market and its mechanisms from the shackles of State dynamics. As Harvey (2005) accurately claims, neoliberalism is a creative destruction “not only of prior institutional frameworks and powers, but also of divisions of labour, social relations, welfare provisions, technological mixes, ways of life and thought, reproductive activities, attachments to the land and habits of the heart” (p. 3). The survival of capitalism depended on a new model of internationalization and, in this context, globalization as well as the consequent unregulated and senseless internationalization that calls into being, the newer financialization of capital, as Foster (2008) coined. Žižek (1989) is quite insightful here:

Far from constricting [capitalism limits] is the very impetus of its development. Herein lies the paradox proper to capitalism, its last resort: capitalism is capable of transforming its limit, its very impotence, in the source of its power—the more it ‘putrefies’ the more its immanent contradiction is aggravated, the more it must revolutionize itself to survive. It is paradox that defines surplus enjoyment: it is not a surplus which attaches itself to some ‘normal’ fundamental enjoyment because *enjoyment as such emerges only in the surplus*, because it is constitutively an ‘excess’. If we subtract the surplus we lose enjoyment itself, just as capitalism, which can survive only by incessantly revolutionizing its own material conditions, ceases to exist if it ‘stays the same’, if it achieves an internal balance. (p. 52)

Such pretentious limitedness fuels a very concrete ideological (and cultural) battle(s) that is the very DNA of what Sousa Santos (2008) calls globalizations. That is an intricate multifarious social terrain in which nonmonolithic hegemonic and counter-hegemonic forces – or what Sousa Santos (2008) calls insurgent cosmopolitanisms – collide vividly before, among other issues, social and cognitive justice, equality, freedom, democracy, human rights, and common good. Whereas the first is usually understood as “neoliberal, top-down globalization or globalization from above” (Sousa Santos 2008, p. 396), the latter consists of “the transnationally organized resistance against unequal exchanges produced or intensified by globalized localisms and localized globalisms” (Sousa Santos 2008, p. 397).

Neoliberal globalization involves the “intensification, and acceleration of social exchange and activities [that] does not occur merely on an objective material level [and] involves the subjective plane of human consciousness” (Steger 2009, p. 12). Neoliberal globalization – in its multiple forms – did (and it is) not happen(ing) in a social vacuum. Actually, “it is precisely in its oppression of non-market forces that we see how neoliberalism operates not only as an economic system, but as a political and cultural system as well” (McChesney 1999, p. 7; Olssen 2004), which creates endless intricate tensions between cultural homogenization and cultural heterogenization (Appadurai 1996).

In analyzing the latest metamorphosis of *New Rightist* policies, Mouffe (2000, p. 108) stresses that both Blair and Clinton were able to construct a “radical center.” Unlike traditional political groupings, the “radical center” is a new coalition that “transcends the traditional left/right division by articulating themes and values from both sides in a new synthesis” (Mouffe 2000, p. 108). However, Fairclough (2000, pp. 44–45), unlike Mouffe (2000), stresses that the “radical center” strategy does not consist only in “bringing together elements from these [left and right] political discourses” but also in its ability to “reconcile themes which have been seen as irreconcilable beyond such contrary themes, transcending them.” Fairclough (2000) also argues that this

strategy is not based on a dialogic stance. That is to say, the “radical center” achieved consent within the governed sphere “not through political [democratic] dialogue, but through managerial methods of promotion and forms of consultation with the public; [that is to say] the government tends to act like a corporation treating the public as its consumers rather than citizens” (Fairclough 2000, p. 129). While such radical centrism targets the State, it is actually the State that has been paving the way for the market (Sommers 2000; Paraskeva 2003, 2009, 2015). Recent bailouts to banks, insurance companies, and car industry bore testimony to our claim. Such State actually fosters “new privatized legal regimes [and it is] a state that has itself undergone transformation and participated in legitimizing a new doctrine about the role of the state in the economy” (Sassen 2000, p. 59).

State sovereignty has never been in jeopardy within the contemporary global cultural flows (Appadurai 1996). In fact, such radical centrism, while searching for the dissolution of old contradictions between “right” and “left” (Fergusson 2001), was able to lay the solid foundation for the gradual emergence of a new concept of the State (especially with regard its role) anchored in a need to modernize government at almost at any cost. Democratic forces have been colonized by managerial insights in such a way that governments end up being weak executives of a *Res plc* (Ball 2007), which operates with the blessing of an anemic popular vote (Fergusson (2001).

We argue that such mercantilist neo-fundamentalism has paved the way for what Agamben (2005) called a “State of exception” – the embryo of what I have called neoradical centrism. While radical centrism claims to offer a broad managerial concept for the public good by showing new managerial dynamics in and of itself (Newman 2001, p. 46), *neoradical* centrism actually refines the entire commonsense cartography edified and sutured by radical centrism (Hall 1988). What is at stake nowadays for the neoradical centrists is not the rapacious need for modernizing forms of governments but precisely the unbalanced tension between force and law. In short, force transcends

law, paradoxically, in the so-called democratic nations. In fact, neoliberal globalization “is having pronounced effects on the exclusive territoriality of the nation state, that is its effects are not on territory as such but on its institutional encasements” (Sassen 2000, p. 50).

Nowadays the issue goes well beyond the creation of mixed economies of welfare, or the emergence of a new public management, of transforming citizens in consumers, or even the emergence of forms of entrepreneurial government (Clarke et al. 2001); it goes beyond the tension(s) welfare without a State (Clarke and Newman 1997).

In the midst of nowadays *welfarecide* – orchestrated and paved by the so-called radical centrism policies – neoradical centrism emerges as an answer to a compound framework of needs prompted precisely as the consequence of such *welfarecide*. While radical centrism cannot be seen as a crises but an answer to the crises (Apple 2000), neoradical centrism cannot be seen as a need but the only answer to address ever more pressing needs. As Agamben (2005) argues – anchored in Schmitt’s approach (1922) – “the necessities transcends the law” (p. 1). In this way, and to rely on Agamben’s approach (2005), neoradical centrism is able to overcome the multifarious tensions prompted by “state of exception vs. state sovereignty” and edifies a “point of imbalance between public law and political fact” (p. 1). In fact, Agamben (2005) claims the state of exception “appears as the legal form of what cannot have legal form” (p. 1). Neoradical centrism is “ambiguous, uncertain, borderline fringe, at the intersection of the legal and the political” in its layout, making it conveniently well situated in coded no man’s land and quite juicy for marketers (Agamben 2005, pp. 1–2).

The state of exception reinforces the conditions that anchor societal development to a pale economic equation. In fact, “the state of exception is not a special kind of law (like the law of war) [quite conversely] it is a suspension (in our understanding *ad eternum*) of the juridical order itself” (Agamben 2005, p. 4; Todorov 2003). Territorial sovereignty, Falk (1999) claims, “is being diminished on a spectrum of issues in such a serious manner as to subvert the capacity of states to

govern the internal life of society and non-state actors hold an increasing proportion of power and influence in shaping of world order” (p. 35). We are experiencing a process that entails

much ‘creative destruction,’ not only of prior institutional frameworks and powers (even challenging traditional forms of state sovereignty) but also divisions of labour, social relations, welfare provisions, technological mixes, ways of life and thought, reproductive activities, attachments to the land and habits of the hearth. (Harvey 2005, p. 3)

Why then, despite almost three decades of distressing effects on society and attacks on “the even more localized rest” (Bauman 2004, p. 3), does a hegemonic bloc continue to dominate? As Jessop et al. (1984) and Apple (2000, p. 23) remind us, one must question, “How is such an ideological vision legitimated and accepted?” It is undeniable that neoradical centrism is not exactly a pure detour from the orthodoxies laid out by the radical centrism. It is actually a moment of complexities, and in some ways it is a platform that, as Hall (1992) would put it, goes toward radical centrism by taking advantage of particular kind of contradictions within the very marrow of neoliberal globalization. Neoradical centrism should be seen as the latest capitalist metamorphosis of righting the left. Such aim cannot be detached from the politics of the commonsense and the role that the media plays in building a particular yarn of meanings.

Such state (of exception) (Agamben 2005) and the need to marketize everything (Harvey 2005) are two sides of the same coin, a devastating currency for sectors such a public education, a currency that pushes societies to a state of permanent economic emergency, functioning as part of a neoliberal praxis.

Permanent Economic Emergency

One cannot understand a neoliberal philosophy of praxis without viewing it as an attack on the State and its resultant deregulation and austerity policies. Austerity policies and practices play within the very core of the wrangle Fordism-post-Fordism-neoliberalism; they are cause and consequence.

Rationales about neoliberalism’s crisis-driven modus operandi by Žižek (2010) as well as Foster

and McChesney’s (2012) deserve to be highlighted. While the former places the emphasis on state of permanent crisis, the latter focuses on the need to understand the crisis between the pendulum of financialization and stagnation as the tout court framework of the current economic havoc. Foster and McChesney (2012) subscribe that “the world capitalist economy is facing the threat of long-run economic stagnation” that fuels conditions for slow economic growth, high unemployment, and financial instability (p. 1). Moreover, “the defining characteristic of such depressions was not negative economic growth, in the trough of the business cycle, but rather protracted slow growth once economic recovery had commenced” (Foster and McChesney 2012, p. 2). One of the reasons for such a puzzled state is what Foster and McChesney (2012) refer to as the explicit “denial of history” and in particular the history of economic crisis, a denial that supports models that positively excluded the very possibility of a crisis (p. 4).

It is actually such take that we see in Amin (2013) when he argues that the current monopoly-financial capitalism is imposing ever-demanding yet unsustainable changes within the civil archeology that puts the system in a kind of self-destruction mode since it is incapable to find the right formula to address its owns unsuitable demands. The system is exhausted because it exhausted its very social matrix. Needless to say, the impact of such conflictive state has serious implications on education. Education and educators are under the gun to come up with answers for a problem that is beyond their jurisdiction. Education and educators are kept with a permanent tourniquet on them in order to maintain and revitalize an economy that shows daily signs of unsustainability, which is beyond their power of saving. More than ever before, education is playing a crucial part in the new equation of the current political economy (Lipman 2011). The best way to address such crisis is to unravel the rampage of austerity politics. Disconcertedly, the idea is to rescue the system, not the people.

Žižek (2010, p. 85) presents a similar position when he describes the current crisis as “a permanent economic emergency.” Relying on the Eurozone as

plus qui parfait scenario to examine austerity politics, Žižek (2010) argues that the draconian measures imposed on nations, such as Greece, Italy, Ireland, and Spain (and we would add Portugal), deepened the unfathomable abyss between two complex perspectives. The first is the self-proclaimed neutral mainstream that “proposes a de-politicized naturalization of the crisis [that is] the regulatory measures are presented not as decisions grounded in political choices, but as the imperatives of a neutral financial logic—if we want our economies to stabilize, [then] we simply have to swallow the bitter pill” (Žižek 2010, p. 85); and second is the position led by social groups, such as “protesting workers, students and pensioners, [that] see the austerity measures as yet another attempt by international financial capital to dismantle the last remainders of the welfare state” (Žižek 2010, p. 85).

As the stagnation (Foster and McChesney 2012) or permanent economic emergency (Žižek 2010) keeps growing, or as we would say instability stabilizes, democracy keeps shrinking to a point that, for instance, in the case of Europe, “the true message of the Eurozone crisis is that not only the Euro, but the project of the united Europe itself is dead” (p. 86). While identity is at stake here, such challenges need to be seen as an opportunity for new utopias or, as Sousa Santos (2006) would argue, alternative ways to *build* more coherent *alternatives*. That is, in the face of all the de-politicizing attempts, the current social terrain frames the strategies to address the crisis as “neutral” or, as Žižek (2010) argues, “a re-politicized Europe, founded on a shared emancipatory project” (p. 86). Such a trend needs to “avoid the temptation to react to the ongoing financial crisis with a retreat to fully sovereign nation-states, easy prey for free-floating international capital, which can play one state against the other. More than ever, the reply to every crisis should be *more* internationalist and universalist than the universality of global capital” (Žižek 2010, p. 86). This is the best way to address the new period facing dominant and counter-dominant trenches.

I am not claiming here an economic reductive approach. In fact, neoliberal globalization is much more than economics. Thus, it would be a critical mistake to deny globalization as a form of cultural

politics, thus producing greater cultural and economic rewards (Strange 1996; Mennell 2009) for the globalized few, as Bauman (1998) would put it. To think that all of these economic, cultural, and social transformations would not interfere and affect the consulate of the public policies and politics is a mistake. In fact, education is one of the crucial apparatuses that have been used to foster one of the key arguments developed by neoliberal global policies, especially after the fall of the Berlin wall – the fading of the “iron curtain of ideology and the vigorous emergence of the velvet curtain of culture” (Žižek 2007).

Thus, “far from condemning people to ideological boredom in a world without history, the opening decade of the twenty-first century has become a teeming battlefield of clashing ideologies” (Steger 2005, p. 4). As Žižek (2007) adamantly claims, “the (Huntington’s) clash of civilizations is politics at (Fukuyama’s) the end of history” (p. 2). Neoliberal globalization, as the practice of corporate populism, carries in itself an ideological scaffold – neoliberal globalism (cf. Kaplinsky 2005; Rapley 2004; Conversi 2010). No one has unmasked in a better way the ideological backbone of neoliberal globalization than Harvey (2005):

[neoliberal globalization] is particularly assiduous in seeking privatization of assets. The absence of clear property rights . . . is seen as one of the greatest of all institutional barriers to economic development and the improvement of human welfare. Enclosure and the assignment of private property rights is considered the best to protect against the so called tragedy of the commons. Sectors formerly run or regulated by the state must be turned over to the private sphere and be deregulated. Competition—between individuals, between firms, between territorial entities—is held to be a primary virtue. Privatization and deregulation, combined with competition, it is claimed, eliminate bureaucratic red tape, increase efficiency and productivity, improve quality, and reduce costs both directly to the consumer through cheaper commodities and services and indirectly through reduction of the tax burden. (p. 65)

Privatization and deregulation policies paved the way for the crisis and for the answer for the crisis in the form of austerity politics, and, in so doing, it ferment a state of bewilderment and rusty perplexity gradually normalizing debt as a new form of cultural politics.

The Subjectification of Debt

Neoliberal answers to the current fabricated global crisis that Varoufakis (2011) claims “put even Lenin’s post 1927 exploits to shame” (p. 2). We are living a collective *aporia* – that is, a “state of intense puzzlement in which we find ourselves when our certainties fall to pieces; when suddenly we get caught in an impasse, at a loss to explain what our eyes can see, our fingers can touch, our ears can hear . . . At those rare moments, as our reasons valiantly struggle to fathom what the senses are reporting, our *aporia* humbles us and readies the prepared mind for previously unbearable truths” (p. 1). This violent attack on an educational system that promotes well-informed and critical citizens has been taking place over the last four decades and has fostered a school system that produces uncritical citizens and an apathetic citizenry that has contributed greatly to the current global *aporia* described by Varoufakis (2011). In fact, one of the most lethal dimensions of this *aporia* is that schooling is profoundly engaged in promoting and endorsing a particular coloniality of being, power, knowledge, and labor (Quijano 1992; Mignolo 2000, 2011; Maldonado-Torres 2003, 2008; Grosfoguel 2010, 2011).

Lazzarato (2011) approach helps us understand neoliberal economy as a process of subjectification. Neoliberal economy, Lazzarato (2011) argues, is a “subjective economy” (p. 37) framed within the wrangle “creditor-debtor,” a wrangle that relies at the very core of social relations. Such relation(ship)s objectively subjectifies “everyone as a debtor” (Lazzarato 2011, p. 7) within a finance matrix increasingly dominated by the totalitarianism of the concubinage creditor-debtor. Lazzarato (2011) states:

Viewing debt as the archetype of social relations means two things. On one hand it means conceiving economy and society on the basis of an asymmetry of power and not on that of a commercial exchange that implies and presupposes equality. On the other hand, debt means immediately making the economy subjective, since debt is an economic relation, which in order to exist, implies the molding and control of subjectivity such that labor becomes indistinguishable from work in the self. (p. 33)

Needless to say that such wrangle “creditor-debtor” is a power relation – or fuels and it is fueled by power relations – “since it is itself a power relation, one of the most important and universal of moder-day capitalism” (Lazzarato 2011, p. 30), thus “intensifying the mechanisms of exploitation and domination at every level of society” (Lazzarato 2011, p. 7).

The neoliberal economy is not a finance economy but a debt economy. To be more precise, within the complex neoliberal global mantra, “what we call finance is indicative of the increasing force of the relation creditor-debtor relation” (Lazzarato 2011, p. 22). The *subjectification of debt*, Lazzarato (2011) claims, is cultivated daily and it is ultimately an ideological position (p. 31).

Neoliberalism and Power in Education

Noah De Lissovoy and Stacia Cedillo
University of Texas at Austin, Austin, TX, USA

Introduction

At the same time that it restructures education policy and narrows prevailing forms of pedagogy and curriculum, neoliberalism enacts a specific set of power relationships with important consequences for the meaning and experience of schooling. These are continuous with wider effects of neoliberalism beyond the field of education. This entry considers how power in the neoliberal context is articulated through processes of control, ideology, subjectivity, and punishment. Meanings and implications of school-based resistance to these processes are also considered.

Power as Control

In the neoliberal context, power is articulated in the first instance through the process of control. Specifically, neoliberalism works to shift decision-making over schooling from teachers and local administrators to business and political elites. This shift away from democratic forms of educational governance participates in the larger global wave of neoliberal deregulation, privatization, and demolition of social welfare systems beginning around 1980. Just as the spread of neoliberalism writ large was articulated as a counter to postwar Keynesian forms of governance and institution building, neoliberal control in education pits itself against State bureaucracies, teacher unions, and “impractical” progressive school projects. Neoliberals gain control over schools by positioning them in the following ways: (1) as rigid State institutions lacking streamlined management allowing for efficiency and accountability, (2) as failing markets in need of modernization, and (3) as economic institutions tasked with producing human capital in the context of globalization.

On this basis, control over public schools is transferred into the hands of political and business elites whose expertise at turning a profit is seen as transferable toward the goal of raising student achievement. From the federal to the local level, neoliberalism gains control of education through accountability-based compliance systems and school choice initiatives. The decision-making power of teachers and administrators is appropriated by reorganizing schools around standardized curriculum and high-stakes testing, ostensibly governed by principles of scientific management. Neoliberal policy uses testing outcomes to promote school takeovers, often through the expansion of charter schools. Under the No Child Left Behind Act, for example, public schools in the USA that fail to make “adequate yearly progress” (AYP) for 5 years are eligible for charter conversion. These “failing” schools, marked as inefficient institutions, are then effectively repossessed and relocated into a quasi-market system. In this way, forms of organization granting communities, teachers, and school administrators local power over school decisions are dismantled as new

forms of governance and test-based accountability systems threaten once-guaranteed forms of public support, such as federal funding.

As neoliberals take power over school management, they reframe local schools as economic sites expected to cultivate globally competitive human capital. Elite businesspeople, politicians, and technocrats in the public and private sector have aggressively implemented school management models designed to foster global economic competitiveness, individual accountability, and consumerist logics of choice and free markets. It could be said that these models rely on a process of neoliberal *structural adjustment* (which generally refers to the reorganization of national economies) when schools fail to produce high returns in the form of student achievement. This process of structural adjustment can include the dismantling of traditional forms of school governance, the imposition of merit-based pay systems for teachers, increased surveillance, diminished worker protections, teacher layoffs, and school closures.

Neoliberalism also views entrepreneurial control of schools as a modernization project. This project places urban areas and communities of color with high concentrations of poverty most at risk for takeover, as they are often labeled as in greatest need of improvement. Under the rubric of “conscious capitalism,” local political and fiscal crises are framed as legitimate reasons for top-down restructuring of districts and schools (Buras 2011). The rhetoric of elite reformers exploits the difficult educational conditions in schools serving students of color and poor students, casting the neoliberal agenda in terms of social justice, and in this way seeking to rationalize the restructuring of these communities and their schools. In the USA, these opportunistic corporate reform projects have targeted urban public school systems in Chicago, New Orleans, Philadelphia, and elsewhere.

Power as Ideology: Common Sense and Ritual

The processes and practices of neoliberal power were established as a counter to the Keynesian

consensus that had previously dominated US and global forms of governance. The recasting of social, political, and economic life in market terms under neoliberal ideology imagines public schools, students, and knowledge as private businesses, consumers, and products, respectively (Saltman 2014). The prevailing common sense of neoliberalism suggests that as free persons, individuals are responsible for securing their well-being by making good choices, developing marketable skills, and competing to accumulate personal resources and property. Neoliberal institutional frameworks mirror these ideological principles, generally viewing State intervention in markets as an authoritarian infringement upon civil liberties. In the educational context, power works through neoliberal ideology to (1) rationalize market-oriented common senses that place the State and public under suspicion and situate the corporate model as the only viable design for education and (2) enact new practices and rituals of accountability that impose market discipline within everyday aspects of education, orienting social relationships in schools around individual responsibility and economic competitiveness.

Viewing State management as inherently corrupt and inefficient, neoliberal educational reform justifies the transfer of power from the public to “experts” and corporate turnaround specialists. Centralized observation, measurement, and evaluation are said to increase objectivity; above all, standardized assessments that test student knowledge of common curricular objectives are valorized. Redirecting attention from the inherent contradictions of a process of neoliberal deregulation that ultimately produces a new centralization of power, this *audit culture* reorients individuals to only consider valid those forms of evidence that indicate whether schools are operating “efficiently.” In this process, community solidarities are eroded as the corporatization of education is celebrated for its ability to eliminate or reorganize schools, districts, and teachers who do not cohere with business-friendly norms. Exploiting anxieties about student performance on international assessments that quantify differences in national achievement rates, neoliberals argue that corporate-style school management is

necessary to meet the demands of global competition (Hursh 2007).

Power in neoliberalism also asserts itself by constructing an enclosed ideological universe which is maintained through everyday rituals and practices (De Lissovoy 2013). In this process of *enclosure*, a competitive and entrepreneurial determination of education is secured through the very structure of the experience of school, even before the promotion of market-oriented forms of common sense. The basic identities of teachers and students, and the limits of collective imagination, are in this way set by the rituals of test taking, the pervasive monitoring of behavior, and the application of labels, such as “failing” and “at risk.” Individual scores on standardized tests are used to rank students among their peers, and the aggregate scores of student populations are used to position schools in competition with one another. Regimes of testing and accountability also encourage the development of scripted curricular programs that reduce teaching and learning to a set of prescribed tasks and performances. Ideologies of efficiency, accountability, and productivity, as they are encoded in standardized curricula, often require teachers to enact stripped-down and behaviorist pedagogies. In all of these processes, human creativity and potential are captured and absorbed by the neoliberal imperative to produce and perform. In sum, ideologies of accountability drastically narrow the range of types of social relationships that are allowed to flourish in contemporary schools and classrooms.

Subjectivity: Performativity and Responsibilization

Power in neoliberalism works not only through ideological processes proper but also through the forms of subjectivity within which individuals become intelligible to themselves and others. In the first instance, neoliberalism divorces senses of self from forms of social solidarity and insists on an individual versus a collective frame for understanding experience and identity. Furthermore, neoliberalism cultivates an entrepreneurial and

competitive relationship to the self. In this regard, Michel Foucault's (2008) analyses of neoliberalism and governmentality have been very influential for scholars investigating forms of neoliberal subjectivity. Foucault explains that for neoliberalism all aspects of life can in principle be understood in terms of an economic calculus. This is best exemplified in the notion of human capital, which seeks to comprehend the range of human capacities within the context of economic processes of investment, production, and competition. Power in neoliberalism reaches in this way to the most intimate levels of the self, constructing not only shared understandings but even ways of being. Neoliberalism also encloses and commodifies the shared creativity which links together individual subjectivities in common social spaces. In this way, neoliberalism works to capture the potential of both individual and collective imagination.

In schooling, neoliberal governance has important effects on the subjectivities of both teachers and students. For teachers, neoliberal reforms have led to a proliferation of processes of review and assessment, within which there is an important emphasis on self-evaluation. In the first place, this has produced a generalized condition of anxiety, as teachers' skills and knowledge are incessantly interrogated. In this way, the broader social and economic precariousness which characterizes life in the neoliberal era expresses itself in increasing insecurity for teachers, not just with regard to continuity of employment but also in relation to senses of professional competence. Furthermore, studies have shown that as the accountability regime is internalized by educators, their senses of self may come to be characterized by a condition of *performativity* to the extent that they must embody values and identifications that cohere with the entrepreneurial ethos of neoliberalism, a process in which they simultaneously identify with and are alienated from the goal of maximizing learning as measured by standardized assessments (Ball 2003).

The recasting of education as the production of human capital has deep effects on students' experiences and subjectivities. Not only is learning reconceptualized as accumulation as opposed to

inquiry, but in addition students are made responsible for managing and optimizing their developing portfolio of skills. Education in this way is linked to the process of *responsibilization* in neoliberalism, in which social purposes and problems are individualized. This deeply embeds an entrepreneurial relationship to the self in the learning process, a relationship which must be preserved beyond schooling itself, since work life increasingly demands continual learning in the form of investment in one's own stock of skills – that is, one's own human capital.

However, this process works differently for differently positioned students. In schools serving affluent communities, in which rich curricular offerings and a range of extracurricular activities are made available, the entrepreneurial spirit that students are invited to internalize helps them to market the academic capital they acquire in school in the transition to higher education. On the other hand, for those attending schools in low-income communities, there are fewer opportunities for the acquisition of high-status skills and experiences, and so students' identification with neoliberalism's entrepreneurial ethos may be troubled. In this case, the moral pedagogy of neoliberalism generally constructs these students as responsible for their own marginalization. Thus, the same principle of governmentality, in the context of the stark material inequalities characteristic of neoliberal society, has different effects on the subjectivities of different students.

Power, Punishment, and Racism

Neoliberalism has been marked by a turn to punishment in schools and society more broadly. As the social welfare functions of the State have been deemphasized and downsized, the coercive arm of the State has been strengthened. Globally, and in the USA especially, the prison population has grown dramatically in the neoliberal era. In the context of the global war on terror and as a reactionary response to increasing immigration from the Global South, new categories of detention and detainees have been created. Abuse and torture have been normalized and in many cases

rationalized, both in international conflicts and in domestic incarceration.

In education, the stigmatizing of “low-performing” students and schools on accountability measures works as an implicit form of punishment. In addition, recent decades have seen the proliferation of zero-tolerance disciplinary systems, in which students are suspended or expelled for minor infractions, the expansion of security and surveillance infrastructures in school facilities, and a tightening of the links between schools and law enforcement. The turn to punishment in schools, and its connections to the prison system, have been described in terms of a *school-to-prison pipeline*. In education and beyond, the targets of penal and disciplinary actions are disproportionately people of color.

Some theorists consider the turn to punishment in neoliberalism as a means of disciplining workers to the difficult conditions of the post-Fordist economy. On this view, the prison system works to intimidate (and contain) a potentially restive surplus population faced with persistent poverty and insecurity (Wacquant 2009). In the same way, aggressive disciplinary policies in schools have been understood as both socializing students toward submission to authority and as increasing their vulnerability in relation to the State and capital. On the other hand, scholars have also analyzed the punitive character of contemporary society in terms of *biopolitics* or the politics of population management. From this perspective, the material and symbolic violence experienced by marginalized communities marks them as disposable, as representing a kind of “bare life” (Agamben 1998). The biopolitical dimension of punishment can be seen both in its official rationales, aimed at the defense of society from putatively dangerous elements within both populations and individuals, and in its persistent racialization.

Indeed, stark racial disparities argue for a centering of race in analyses of the turn to punishment and neoliberalism broadly. For instance, in the USA, African-Americans are incarcerated at a rate many times greater than that of Whites; likewise, Black students are expelled at rates far out of proportion to the percentage of the school population that they represent. In addition, scholars

have pointed to the punitive texture of instruction that is experienced by many students of color, which is immediately demoralizing at the same time that it reduces their long-term economic competitiveness (Duncan 2000). In this context, it is important to consider the way that forms of material and psychic exploitation intersect in the structural racisms of the present. Neoliberalism sharpens these effects, as a result of its marked polarization of wealth and life chances as well as through the masking of racism produced by the color-blind discourse that it privileges in public life.

Resistance

Against the reconstruction of education that power has undertaken in the neoliberal era, teachers, students, and communities have initiated a variety of forms of resistance. Globally, there have been important movements of protest against the privatization and marketization of educational systems, including the mass movement of Quebec university students in 2012 against tuition hikes and the long-standing struggle of high school students and allies in Chile for greater support for public education. Many urban centers in the USA have seen protests by students and teachers against local school closures and chartering. Movements against high-stakes testing have also grown. In some cases, teachers have refused to administer standardized tests that they consider harmful to students. Likewise, a call to opt out of standardized assessment has found increasing numbers of followers, as parents organize groups promoting this message and as students refuse to submit to persistent testing. These movements are often explicit in noting the link between the effects of the top-down reforms that are the target of their protests and the broader neoliberal turn in society. In addition, teachers and teacher educators have experimented with a range of critical pedagogies in response to neoliberal reforms, aimed at preserving spaces of dialogue and critique in the classroom. Furthermore, as neoliberalism’s effects have become more widely felt, it has become a topic that is often explicitly

confronted in teacher education classrooms and by teachers themselves in their work with students.

Traditionally, critical educational scholarship has understood movements of resistance on the terrain of pedagogy, curriculum, and policy as representing incipient forms of *counter-hegemony*, or counterpower, locked in a struggle with dominant forces over basic understandings, practices, and resources. From this perspective, contemporary conflicts in education can be seen as renewing an age-old battle between conservatives, liberals, and radicals over the purposes of schooling. On the other hand, some contemporary theorists have argued that the enclosure of spaces of work and education in late capitalism calls for a process of *exodus* that does not aim to democratize these spaces but rather to depart from them and to build new pedagogical forms outside of familiar systems and struggles (see Lewis 2012). These theorists are less hopeful that existing public institutions, including schools, can respond to the needs of communities in the era of globalization. Finally, some scholars and activists argue that the public sphere and public schools remain indispensable and must be protected from privatization and marketization, as contemporary educational movements argue, but that they must at the same time be reimagined as a shared *commons* built from the collective imaginations and desires of the people they serve. From this perspective, State support and infrastructure around education should be preserved, but in the context of a larger struggle against neoliberalism that would transform the State itself.

Neoliberalism, Hayek, and the Austrian School of Economics

Michael A. Peters

University of Waikato, Hamilton, New Zealand

Introduction: Hayek and the Austrian School

Friedrich von Hayek (1899–1992) is probably the single most influential individual economist or political philosopher to shape what is now understood as neoliberalism, although he is best regarded, and considered himself, as a classical liberal. Hayek's own theoretical direction sprang out of the so-called Austrian School established by Carl Menger, Eugen Boehm-Bawerk, and Ludwig von Mises during the first decade of the early twentieth century. What distinguished the Austrian School from the classical school of political economy pioneered by Adam Smith and David Ricardo was their "subjective," as opposed to the "objective," theory of value. Leon Walras (1834–1910) of the French Lausanne school presented economics as "the calculus of pleasure and pain of the rational individual," and Carl Menger,

developing the “subjective” theory of value, launched what some have called a “neoclassical revolution” in economics (see Moser 1997). Menger questioned the notion of perfect information that was seen to underlie *homo economicus* by both classical and neoclassical economists.

It was Mises’ strong anti-socialism that informed the corpus and theoretical direction of Hayek’s work, particularly his work on business cycles. Hayek became the director of the Institute for Business Cycle Research, which he and Mises set up, in 1927. Shortly thereafter in 1930, Hayek was invited to the London School of Economics (LSE) to lecture on trade cycles, where he was soon after appointed to a chair in economics and statistics. While at the LSE, Hayek was involved in two famous debates, first, with Keynes over interventionism (and, in particular, Keynes’ alleged failure to understand the role that interest rates and capital play in a market economy) and, second, during the early 1920s, with Oskar Lange and others over the nature of socialist planned economy. However, Keynes star was on the rise during the 1930s and Hayek’s criticisms were downplayed by the international economic community.

Hayek addressed himself again to the problems of the nature of the planned socialist economy in one of his most famous and populist works *The Road to Serfdom* (1944), a book that suggested that the absence of a pricing system would prevent producers from knowing true production possibilities and costs. It also warned about the political dangers of socialism, in particular, totalitarianism, which he thought came directly from the planned nature of institutions. After the Second World War in the year 1947, Hayek set up the very influential Mont Pelerin Society, an international organization dedicated to restoring classical liberalism and the so-called free society, including its main institution, the free market. Hayek was concerned that even though the Allied Powers had defeated the Nazis, liberal government was too welfare oriented, a situation, he argued, that fettered the free market, consumed wealth, and infringed the rights of individuals. With the Mont Pelerin Society, Hayek gathered around him a number of thinkers committed to the “free market,” including his old colleague Ludwig von Mises as well as

some younger American scholars who were to become prominent economists in their own right – Rose and Milton Friedman, James Buchanan, Gordon Tullock, and Gary Becker – and went on to establish the main strands of American neoliberalism: the Chicago School (see, e.g., Friedman 1962), public choice theory (see, e.g., Buchanan and Tullock 1962), and human capital theory (e.g., Becker 1964). Hayek’s liberalism was also very influential in Britain, especially with the Institute of Economic Affairs and with Margaret Thatcher, who came to power as the leader of the British Conservative Party, in 1979. We might say that neoliberalism, historically, was at its strongest during the era of the transatlantic partnership between Ronald Reagan and Margaret Thatcher, during the decade of the 1980s, and its dominance began to wane in the 1990s.

In 1950, Hayek moved to the University of Chicago, where he wrote *The Constitution of Liberty* (1960), his first systemic treatise on classical liberal political economy. In 1962, Hayek moved to the University of Freiburg where he developed his theory of spontaneous order. The market, he argued, was a spontaneously ordered institution that had culturally evolved in the same way that the institutions of language and morality had evolved. They were not the product of intelligent design; such social institutions, like their counterparts in the physical world (crystals, snowflakes, and galaxies), had evolved as spontaneously ordered institutions. The market, then, while the result of human actions over many generations, was not the result of human design.

Hayek, then, emphasized the limited nature of knowledge: the price mechanism of the “free” market conveys information about supply and demand that is dispersed among many consumers and producers and cannot be coordinated. In addition, Hayek’s liberalism emphasized methodological individualism; *homo economicus*, based on assumptions of individuality, rationality, and self-interest; and the doctrine of spontaneous order.

It was during the decade of the 1980s that Hayek’s political and economic philosophy was used by Thatcher and Reagan to legitimate the neoliberal attack on “big government” and the bureaucratic welfare State with a policy mix

based on “free” trade and the establish of the “open” economy: economic liberalization or rationalization characterized by the abolition of subsidies and tariffs, floating the exchange rate; the freeing up of controls on foreign investment; the restructuring of the State sector, including corporatization and privatization of State trading departments and other assets, “downsizing,” “contracting out,” the attack on unions, and abolition of wage bargaining in favor of employment contracts; and, finally, the dismantling of the welfare State through commercialization, “contracting out,” “targeting” of services, and individual “responsibilization” for health, welfare, and education. On this view there is nothing distinctive or special about education or health; they are services and products like any other, to be traded in the marketplace.

These policies, sometimes referred to as “the Washington Consensus,” were designed to “restructure” or adjust national economies to the dramatic changes to the world economy that have occurred in the last 20 years: the growing competition among nations for world markets, the emergence of world trading blocs and new “free trade” agreements, an increasing globalization of economic and cultural activities, the decline of the postwar Keynesian welfare State settlement in Western countries, the collapse of actually existing communism and the “opening up” of the Eastern bloc, and the accelerated worldwide adoption and development of the new information and communications technologies.

Martin Carnoy (1995, p. 653) comments that “structural adjustment is normally associated with the correction of imbalances in foreign accounts and domestic consumption. . . and with the deregulation and privatization of the economy.” He suggests that, therefore, such policies are identified with a fiscal austerity program designed to shrink the public sector and, in some countries, with growing poverty and the unequal distribution of income. Yet, as Carnoy observes, the practice of structural adjustment followed by the high-income OECD countries and the newly industrializing countries (NICs) of Asia does not conform to this picture. He suggests that the focus in these countries has been on

...increased exports, reduced domestic demand, various constraints on government spending and some privatization; with a few notable exceptions, it has not entailed policies that greatly increase inequality or poverty. Rather, many of the richer economies have focused on “self-adjusting” mechanisms to rationalize production and the public infrastructure that serves productive and social functions. Their educational systems have not suffered and, in general, their education professionals have made income gains. In the best of cases, education has improved and teachers have participated in making that improvement happen. (Carnoy 1995, p. 654)

Drawing upon this difference in practice, Carnoy surmises that there are several categories of structural adjustment and that in the case of the richer nations, the term stands for *a set of policies* which originated in the USA during the 1970s as the dominant view of how economies in crisis, typically those of developing countries characterized by high indebtedness, should reorganize to achieve growth. Such policies called for cuts in public expenditure on services, including education, precisely at the point when a shift to a global information economy required massive public investment in an information infrastructure – with an attendant emphasis on mass education – necessary to take advantage of changes in the nature of the world economy.

Carnoy attributes the emergence of the dominant view to two factors: the richer nations of the OECD already enjoyed favorable conditions which allowed them to self-adjust and to respond positively to rapidly changing technology, and the paradigm shift from Keynesianism to neoliberal monetarism led to “a dramatic increase in real interest rates to reduce inflationary tendencies. . . and to sharp cuts in foreign loans” (p. 655). The neoliberal monetarist paradigm also became the dominant view at the international level, shaping the outlook of world institutions such as the International Monetary fund (IMF) and the World Bank (WB), which imposed structural adjustment policies (SAPs) on developing countries as a response to their continuing and exacerbating debt problems.

Neoliberalism has been associated most in the popular imaginary with policies of privatization. Indeed, it is privatization that has provided the

basis for strategies to reduce the size of the State (while, paradoxically, often strengthening its constitutional powers), to reduce the accumulated national debt, while at the same time encouraging foreign investment and, advocates claim, inaugurating the age of popular capitalism. Privatization can be a complex phenomenon. Le Grand and Robinson (1984, p. 3) comment, "... any privatisation proposal involves the rolling back of the activities of the state." Privatization, thus, involves three main kinds of activity which parallel the three main types of State intervention: a reduction in State subsidy, a reduction in State provision, and a reduction in State regulation. Privatization can take many forms: schemes differ not only in the type of State intervention whose reduction or elimination they require but also in what is proposed in its stead and the replacement of the State by the market, by another form of State activity, or by nonprofit-making organizations such as charities or voluntary organizations which are neither private firms nor State enterprises (Le Grand and Robinson 1984, p. 6).

A number of commentators have pointed out privatization does not take only the form of the sale of State-owned assets and enterprises: other parallel forms include contracting out, deregulation, user fees, voucher systems, and load shedding. Others (e.g., Heing et al. 1988) have concluded on the basis of comparing recent experience in Britain, France, and the USA that privatization is more of a political strategy than an economic and fiscal technique. While the case for privatization is based upon well-known theories, the drive for privatization is more complex and often involves political factors such as reducing public sector borrowing or reducing government financial risk. Pitelis and Clarke (1993, p. 6) note that the case for privatization policies is often strong on a priori theorizing and weak in empirical confirmation.

The Main Elements of Neoliberalism

For neoliberals the commitment to the free market involves two sets of claims: claims for the efficiency of the market as a superior allocative

mechanism for the distribution of scarce public resources and claims for the market as a morally superior form of political economy. Neoliberalism as a political philosophy involves a return to a primitive form of individualism, an individualism which is "competitive," "possessive," and construed often in terms of the doctrine of "consumer sovereignty." It involves an emphasis on freedom over equality where freedom is construed in negative terms and individualistic terms. Negative freedom is freedom from State interference which implies an acceptance of inequalities generated by the market. Neoliberalism is both anti-state and anti-bureaucracy. Its attack on big government is made on the basis of both economic and ethical arguments (see Peters and Marshall 1996).

In the following list, I have identified 12 features of neoliberalism from a viewpoint heavily influenced by Michel Foucault's (1979) notion of governmentality. Foucault uses the term "governmentality" to mean the art of government and, historically, to signal the emergence of distinctive types of rule that became the basis for modern liberal politics. His starting point for the examination of the problematic of government is the series *security, population, and government*. He maintains that there is an explosion of interest on the "art of government" in the sixteenth century which is motivated by diverse questions: the government of oneself (personal conduct), the government of souls (pastoral doctrine), and the government of children (problematic of pedagogy). Foucault says that the problematic of government can be located at the intersection of two competing tendencies: a State centralization and a logic of dispersion. This is a problematic that poses questions of the *how* of government rather than its legitimation and seeks "to articulate a kind of rationality which was intrinsic to the art of government without subordinating it to the problematic of the prince and of his relationship to the principality of which he is lord and master" (Foucault 1991, p. 89). It is only in the late sixteenth and early seventeenth centuries that the art of government crystallizes for the first time around the notion of "reason of state," understood in a positive sense whereby the State is governed

according to rational principles that are seen to be intrinsic to it. In charting this establishment of the art of government, Foucault thus details the introduction of “economy” into political practice (understood as “the correct manner of managing goods and wealth within the family”). In line with this analysis, Foucault defines governmentality in terms of a specific form of government power based upon the “science” of political economy, which over a long period, he maintains, has transformed the administrative State into one fully governmentalized and led to the formation of both governmental apparatuses and knowledges (or *savoirs*). In elaborating these themes, Foucault concentrates his analytical energies on understanding the pluralized forms of government, its complexity, and its techniques. Our modernity, he says, is characterized by the “governmentalization” of the State. He is interested in the question of how power is exercised, and, implicitly, he is providing a critique of the contemporary tendencies to overvalue the problem of the State and to reduce it to a unity or singularity based upon a certain functionality. This substantive feature – the rejection of State-centered analyses – has emerged from the governmentality literature as it has become a more explicit problematic.

In outlining the main features of neoliberalism, it is important to realize that there are affinities, continuities, and overlapping concepts as well as differences and theoretical innovations with classical liberalism:

1. Classical liberalism as a *critique of State reason*: A political doctrine concerning the self-limiting state; the limits of government are related to the limits of State reason, i.e., its power to know; and a permanent critique of the activity of rule and government.
2. *Natural versus contrived* forms of the market: Hayek’s notion of natural laws based on spontaneously ordered institutions in the physical (crystals, galaxies) and social (morality, language, market) worlds has been replaced with an emphasis on the market as an artifact or culturally derived form, and (growing out of the “callaxy” approach) a *constitutional*

perspective that focuses on the judicio-legal rules governing the framework within the game of enterprise is played (see Buchanan 1991).

3. The politics-as-exchange innovation of public choice theory (“the marketization of the state”): The extension of Hayek’s spontaneous order conception (callactics) of the institution of the market beyond simple exchange to complex exchange and finally to *all processes of voluntary agreement* among persons (see Buchanan and Tullock 1962).
4. The relation between government and self-government: Liberalism as a doctrine which positively requires that individuals be free in order to govern; government as the community of free, autonomous, self-regulating individuals; “responsibilization” of individuals as moral agents; and the neoliberal revival of *homo economicus*, based on assumptions of individuality, rationality, and self-interest, as an all-embracing redescription of the social as a form of the economic.
5. A new relation between government and management: The rise of the new managerialism, “New Public Management”; the shift from *policy* and *administration* to *management*; the emulation of private sector management styles; the emphasis on “freedom to manage”; and the promotion of “self-managing” (i.e., quasi-autonomous) individuals and entities.
6. A “degovernmentalization” of the State (considered as a positive technique of government): Government “through” and by the market, including promotion of consumer-driven forms of social provision (health, education, welfare), “contracting out,” and privatization.
7. The promotion of a new relationship between government and knowledge: “Government at a distance” developed through relations of forms of expertise (expert systems) and politics, development of new forms of social accounting, an actuarial rationality, referendums and intensive opinion polling made possible through the new information and computing technologies, privatization and

- individualization of “risk management,” and development of new forms of prudentialism.
8. An economic theory of democracy (“the marketization of democracy”): An emerging structural parallel between economic and political systems – political parties have become entrepreneurs in a vote-seeking political marketplace; professional media consultants use policies to sell candidates as image products; voters have become passive individual consumers. In short, democracy has become commodified at the cost of the project of political liberalism and the State has become subordinated to the market.
 9. The replacement of “community” for “the social”: The decentralization, “devolution,” and delegation of power/authority/responsibility from the center to the region, the local institution, and the “community”; the emergence of the shadow State; the encouragement of the informal voluntary sector (and an autonomous civil society) as a source of welfare; and “social capital.”
 10. Cultural reconstruction as deliberate policy goal (“the marketization of ‘the social’”): The development of an “enterprise society,” privatization of the public sector, the development of quasi-markets, marketization of education and health, and a curriculum of competition and enterprise.
 11. Low ecological consciousness (Anthony Giddens): “Green capitalism,” “green consumerism,” linear as opposed to ecological modernization, “no limits to growth,” and market solutions to ecological problems.
 12. Promotion of a neoliberal paradigm of globalization: World economic integration based on “free” trade; no capital controls; and International Monetary Fund (IMF), World Bank (WB), and World Trade Organization (WTO) as international policy brokers.

By the 1980s neoliberalism both as a political philosophy and policy mix had taken deep root. During that decade many governments around the world supported the modernizing reform thrust of neoliberalism, particularly the exposure of the State sector to competition and the opportunity

to pay off large and accumulating national debts. By contrast, many developing countries had “structural adjustment policies” imposed upon them as loan conditions from the IMF and WB. The reforming zeal soon ideologizes the public sector per se and ended by damaging key national services (including health and education). By the mid-1990s, the wheel had turned again – this time toward a realization that the dogmatism of the neoliberal right had become a serious threat to social justice, to national cohesion, and to democracy itself. Large sections of populations had become structurally disadvantaged, working and living, on the margins of the labor market; rapidly growing social inequalities had become more evident as the rich had become richer and the poor, poorer; companies were failing and underperforming; public services had been “stripped down” and were unable to deliver even the most basic of services; many communities had become split and endangered by the rise of racism, crime, unemployment, and social exclusion. National governments throughout the world looked to a new philosophy and policy mix – one that preserved some of the efficiency and competition gains but did not result in the forms of social splitting and exclusions.

One model advocated by the current British prime minister, Tony Blair, and the US president Bill Clinton, called the “Third Way,” aims to revitalize the concern for social justice and democracy while moving away from traditional policies of redistribution, to define freedom in terms of autonomy of action, demanding the involvement and participation of the wider social community. Some commentators see nothing new in the “Third Way,” regarding it as a return to the ethical socialism of “old labor.” Other critics see it as a cover for the wholesale adoption of conservative policies of privatization and the continued dismantling of the welfare State. Still others suggest that the “Third Way” is nothing more than a spin-doctoring exercise designed to brand a political product as different from what went before. Sloganized as “market economy but not market society,” advocates of the “Third Way” see it as uniting the two streams of left-of-center thought, democratic socialism and classical liberalism,

where the former is said to promote social justice with the State as its main agent and the latter said to assert the primacy of individual liberty in the market economy. Understood in this way, the “Third Way” is a continuance of classical liberalism, born of the same political strategy of integrating two streams as the New Right (neoliberalism and neo-conservatism), but this time the “other” stream is social democracy rather than conservatism.

Edification; Holism; Instrumentalism; Problem-centered view; Redescription

Introduction

Neo-pragmatism refers to the developments of pragmatism of the early twentieth century originated by Charles Pierce, William James, and John Dewey. These developments are introduced by people like Nelson Goodman, Willard Van Orman Quine, Richard Rorty, Donald Davidson, Hilary Putnam, and Richard Bernstein. Neo-pragmatism shows an important development of the early pragmatism because of the emphasis that neo-pragmatism puts on language, which shows its accommodation to the linguistic turn in the philosophy of the twentieth century. While according to pragmatism action is what should be at stake, neo-pragmatism shows the importance of language in dealing with action. Thus, neo-pragmatism draws our attention to the roles description and redescription play in the actual change of problematic situations.

What makes neo-pragmatism important for education is the very emphasis it puts on language in addition to action as the language is a pivotal point in educational relationships. While the early pragmatist philosophy of education put action at the center and analytic philosophy of education replaced it by language, neo-pragmatism can be considered as a middle way in integrating both action and language. Among the abovementioned figures, Quine and Rorty are chosen exactly because of the importance language has found in their views even though in different ways. This is not to say that the other figures' views do not have

significant implications for philosophy of education. Even though I use the famous term “philosophy of education,” it should be noted that the term turns to be rather infamous in the hands of Quine and Rorty. This is because both of them oppose the view that philosophy, philosophy of education included, is a distinct branch from science or other human interests. As Wain (2001, p. 173) aptly points out, we should take it that Rorty (and Quine as well) talks about education philosophically: “The important distinction needs to be made here between writing about education philosophically and having this discipline called philosophy of education.”

Rorty has been at the center of attention in philosophy of education compared to Quine (e.g., Peters and Ghiraldelli 2001). However, Quine’s ideas have also been inspiring in the realm of philosophy of education (e.g., Walker and Evers 1988). In what follows, implications of Quine’s and Rorty’s versions of neo-pragmatism will be explored briefly.

The Main Concept of Education

Each one of the two philosophers would have his own insight on what education is. In dealing with Quine’s view, it is better to say first what education is not. Regarding Quine’s rejection of analytic/synthetic distinction, as well as his dissatisfaction of necessity in modal logic, one can conclude that any kind of definition of education in terms of some necessary components will not be acceptable in neo-pragmatism. Thus, essentialist and quasi-essentialist definitions of education should be excluded from a neo-pragmatist philosophy of education. Such definitions can be found in the works of analytic philosophers of education such as Richard Peters. Looking for some necessary conditions of using the word education, he states that it would be a logical contradiction to say that a person is educated while no positive change has occurred to him or her (Peters 1966, p. 25). In other words, Peters considers the positive change as a necessary condition for a true usage of the word education.

Quine, however, would not accept such a definition because, on the one hand, it rests on the analytic/synthetic distinction since Peters is looking for a priori characteristics of education. On the other hand, he appeals to the modal logic where he talks in terms of necessity.

Now, what definition would a Quineian suggest for education? Quine’s holistic stance requires that a definition is understood in terms of the theory that includes the definition. Even though, accordingly, a particular definition can be compatible with more than one theory, it does not follow that the definition is theory-free; rather, one should only conclude that the definition can have more than one theoretical position.

According to Quine’s holism, the analytic adequacy in defining education is dependent on the empirical adequacy of the theory in which the definition is advanced (Evers 1979). For instance, the behaviorist theory defines education in terms of “shaping” behavior by means of the so-called conditioning laws. One cannot decide about the adequacy of this definition independent of the fate of the behaviorist theory as an empirical theory.

Rorty’s contribution in defining education is inspired by Gadamer’s (1989) concept of *Bildung*. According to Rorty, while it was a dominant view in the Western philosophy to consider knowledge as the aim of thinking, Gadamer takes the aim of thinking as *Bildung* or education and self-formation. Even though speculation about *Bildung* dates back to the eighteenth century, Gadamer, following Hegel who has had special influence on Gadamer, gave an epistemological dimension to *Bildung*; what, according to Gadamer, thinkers of that century were “unable to offer any epistemological justification for it” (Gadamer 1989, p. 15). Gadamer brings *Bildung* to the same point where he makes horizons meet (“fusion of horizons”) and thereby opens up a less biased sphere for human thought:

That is what, following Hegel, we emphasized as the general characteristic of *Bildung*: keeping oneself open to what is other — to other, more universal points of view. It embraces a sense of proportion and distance in relation to itself, and hence consists in rising above itself to universality. To distance oneself from oneself and from one’s private purposes means to look at these in the way that others

see them. This universality is by no means a universality of the concept or understanding. This is not a case of a particular being determined by a universal; nothing is proved conclusively. The universal viewpoints to which the cultivated man (*gebildet*) keeps himself open are not a fixed applicable yardstick, but are present to him only as the viewpoints of possible others. Thus the cultivated consciousness has in fact more the character of a sense. (Gadamer 1989, pp. 15–16)

This Gadamerian step toward opening up ways for closed minds in order to relate to one another provides Rorty with a new glass to look at education in terms of “edification”:

Since “education” sounds a bit flat, and *Bildung* a bit too foreign, I shall use “edification” to stand for this project of finding new, better, more interesting, more fruitful ways of speaking. The attempt to edify (ourselves or others) may consist in the hermeneutic activity of making connections between our own culture and some exotic culture or historical period, or between our own discipline and another discipline which seems to pursue incommensurable aims in an incommensurable vocabulary. (Rorty 1979, p. 360)

Thus, by suggesting edification, Rorty intends to consider education as a process by which we can save ourselves from a dominant paradigm and its normalcy and approach other paradigms and thereby innovate ourselves. Rorty holds that Gadamer rightly differentiated instruction from education because the former by looking for objectivity goes under the dominance of normal science, whereas the latter by taking distance from objectivity can save us from normalcy:

Gadamer’s attempt to fend off the demand (common to Mill and Carnap) for “objectivity” in the *Geisteswissenschaften* is the attempt to prevent education from being reduced to instruction in the results of normal inquiry. More broadly, it is the attempt to prevent abnormal inquiry from being viewed as suspicious solely because of its abnormality. (Rorty 1979, p. 363)

Rorty’s drive in embracing Gadamer’s view is due to Rorty’s pragmatist tendency to undermine representation in knowledge and to look for communication, understanding, and solidarity as the aim of knowledge. When communication, rather than truth, becomes the aim of knowledge, then risk taking in approaching other paradigms turns to be a component of education as edification.

That is while Rorty (1989) takes the first phase of education as socialization, he considers the second phase, namely, the period of university, as an opportunity for individuation and irony in undermining current norms. Rorty considers the two elements of solidarity and individuation as two parallel aspects of education that need to be taken as incommensurable. In the meantime, the first element is a necessary background for the second element. According to Rorty, irony and critique requires that something is assimilated and accepted in the first place. Thus, along with Gadamer, he would consider the initial biases and prejudices during the first phase of education, namely, socialization, as inevitable. However, when it comes to the second phase, the educated person would be expected to take an ironic standpoint against the very norms assimilated in the first phase. In the second phase, Rorty is somehow different from Gadamer. While Gadamer talks about “fusion of horizons,” Rorty’s ironist is subversive and ruthless in undermining the norms assimilated in the first place.

Educational Research

One of the questions a philosopher of education should deal with concerns the natures of educational research. Walker and Evers (1988) state that a Quineian would reject both “oppositional diversity thesis” and “complementary diversity thesis.” By the former, they mean the research strategy inspired by Thomas Kuhn in which paradigms, being incommensurable, are the bases for doing a research. The latter is an integrative research strategy in which different views are accepted side by side as complementary. Integration of quantitative and qualitative research strategies is an example.

However, according to Walker and Evers, a Quineian would embrace a “unity thesis” as the research strategy. This is due to Quine’s holistic view according to which the unit is the total of science. For Quine, philosophy, logic, mathematics, physics, etc., are interwoven as a “seamless web.” Quine’s view, as a pragmatist orientation, puts the emphasis on problem-solving capability of a theory. Being a materialist, Quine tends to

naturalize any mentalist conceptualization as it is clear in his tendency to naturalize epistemology. In this way, however, any belief can in principle be used in the structure of a theory in so far as it can lead a theory to a more capable one in solving problems. According to Quine, Homer's Gods and electrons are "posits" and in this regard are at the same bar. The vital point is whether a theory being inclusive of its own posits becomes more capable in dealing with problems.

These general lines of Quineian view pave the ground for realization of the characteristics of educational research. Accordingly, there is no basic difference between an educational and non-educational research. What is important is to use the guidelines such as providing coherence within a theory as well as between a theory and evidence in a bilateral way (adjust the theory to evidence and vice versa) and, at the top priority, empirical adequacy in problem solving.

This top priority for problem solving is also acceptable for Rorty. As a pragmatist, he also tries to get rid of representation as the aim of research and, instead, evaluate beliefs in terms of their consequences in providing a better condition for living.

As far as research "method" is concerned, Rorty takes the stance of "against method" along with Gadamer and Feyerabend. Rorty prevents us from the obsession of objectivity and invites us exclusively to communication and solidarity and looks in it for every desirable thing expected in doing research. Thus, while epistemology undermines the usual dialogue, Rorty undermines epistemology by emphasizing on research as a usual dialogue: "From the educational, as opposed to the epistemological or the technological, point of view, the way things are said is more important than the possession of truths" (Rorty 1979, p. 359).

Curriculum

Quine's holistic view of knowledge has also implications for curriculum. While an analytic philosopher of education can talk about curriculum in terms of forms of knowledge that leads to providing distinct subject matters for curriculum,

a Quineian neo-pragmatist would reject it by relying on Quine's view on the web of knowledge as a seamless web. A neo-pragmatist can of course accept different subject matters in so far as they fulfill a pragmatic purpose, but this would be no more than a division of branches of knowledge that a librarian uses in providing a practically useful library. However, any kind of essentialist view on knowledge branches will be rejected in a neo-pragmatist curriculum:

Names of disciplines should be seen only as technical aids in the organization of curricula and libraries; a scholar is better known by the individuality of his problems than by the name of his discipline. (Quine 1981, p. 88)

Even though ironically Quine talks about the organization of curricula in terms of disciplines, this should be understood as referring to the current way of organizing curricula. However, taking note of the neo-pragmatist's conception of knowledge, one can conclude that what is preferable for a neo-pragmatist is to organize the curriculum around problems without committing oneself to disciplines. By putting problems at the center, a neo-pragmatist would recommend more an interdisciplinary approach than a disciplinary one.

Rorty will surely support this preference for problem solving in organizing curriculum because he also understands subject matters in terms of practical matters:

The line between novels, newspapers articles, and sociological research get blurred. The lines between subject matters are drawn by reference to current practical concerns, rather than putative ontological status. (Rorty 1982, p. 203)

But what is notable in the case of Rorty's view is his suggestion for providing a new language in the second phase of education, namely, in university:

One way to change instinctive emotional reactions is to provide new language which will facilitate new reactions. By "new language" I mean not just new words but also creative misuses of language—familiar words used in ways which initially sound crazy. Something traditionally regarded as a moral abomination can become an object of general satisfaction, or conversely, as a result of the increased popularity of an alternative description of what is happening. Such popularity extends logical space by making descriptions of situations which used to seem crazy seem sane. (Rorty 1994, p. 126)

Examples of Rorty here are homosexuality and extirpation of minorities. While the description of homosexuality as expression of devotion was considered crazy in the past, the scene changes in the present. Likewise, the description of extirpation of minorities as purification is taken at most times as crazy, but at certain times, e.g., under the Nazi, it sounds sane by using a new language. Rorty's emphasis on providing a new language in education is in line with his insistence to include individuation and irony in education.

Conclusion

To conclude, neo-pragmatism pushes the early pragmatism toward either a stronger holism, as is the case with Quine, or a more linguistic orientation in dealing with action as Rorty urges us to believe. The holistic trend in the realm of education lessens the entire emphasis on changing "the world" during problem solving and shows the importance of "the word" in line with Quine's "semantic ascent." The holism invites us to understand the concept of education in terms of the encompassing theory, as it shows the vital role the coherence between theory and evidence plays in educational research and blurs the boundaries among subject matters in curriculum. The linguistic trend, in its turn, undermines any "final vocabulary" and embraces redescriptions and "new languages." Thus, the concept of education needs to be understood in terms of edification, as educational research should be carried out in the way of a dialogue and consensus and curriculum should be saved from rigidity due to the illusion of objective differences among subject matters.

Introduction

Networked learning is a research area concerned with the relationship between digital, networked technologies and education and learning. The depth and range of ideas informing networked learning can be explored in a number of

publications (Steeple and Jones 2002; Goodyear et al. 2004; Dirckinck-Holmfeld et al. 2012; Hodgson et al. 2014; Carvalho and Goodyear 2014; Jones 2015; Jandrić and Boras 2015).

Networked learning is:

...learning in which information and communications technology (ICT) is used to promote connections: between one learner and other learners, between learners and tutors; between a learning community and its learning resources. (Goodyear et al. 2004, p. 1)

The key term in this definition is connections and the emphasis is on the technology-mediated interactions between people and between people and resources. Connections include interactions between people and material technologies and resources. However, interactions with technologies and resources are not sufficient in themselves to constitute networked learning. Networked learning requires some element of human-human interaction even when mediated through digital networks.

There are differences of emphasis about the nature of the field and how networked learning should be defined (see, e.g., Dirckinck-Holmfeld et al. 2012, Chap 17); however the definition has provided a consistent point of reference for an international conference and a book series. The papers from the international ► [Networked Learning](#) Conference are freely available in an online archive from the first conference held in 1998.

Synonyms for Networked Learning and Related Areas

An alternative term that has greater currency in North America has been learning networks (Hiltz et al. 2007). Originating in the work by Hiltz and Turoff in the late 1970s, learning networks and asynchronous learning networks have developed into an area that overlaps with networked learning but has its own distinct approach. Learning networks and networked learning are both terms that have informed the development of the idea of connectivism and cMOOCs in the work of Siemens and Downes from Canada (Jones 2015, p. 65). A useful distinction has been drawn by

Carvalho and Goodyear (2014) who use the term learning networks to identify specific instances of networked learning. These can be investigated and analyzed to inform future designs with the aim of generating a repertoire of properly understood examples illustrating the complex processes and assemblages in which networked learning takes place. This distinction suggests that networked learning can be used as the term describing the general phenomenon and learning networks to describe with greater precision the various ways that networked learning is enacted.

Connected learning is another term that covers a similar area to networked learning, but it is largely focused on young people of school age (Jones 2015, p. 7). In contrast networked learning has traditionally focused on adult learning, higher education, and professional or lifelong learning. The difference between connected learning in compulsory school age settings, even where these involve informal learning, is important. Networked learning has generally been applied to adult learners who are learning in formal settings that are generally voluntary and not as prescribed as school age activities. Adult learners can also be considered as being different in character to those who are school aged. In terms of informal activities, school-aged learners are often more free to engage in a range of voluntary activities than adult professional learners who are more often constrained by their primary work activities.

Networked Learning

A distinctive feature of networked learning is its clear research focus and a willingness to draw on a wide range of disciplines for theoretical inspiration. Networked learning can easily be confused with other approaches, but networked learning is not simply another term that equates with e-learning or technology-enhanced learning (TEL). For networked learning the connectivity enabled by digital networks and the potential for interactions between people, and between people and their resources, is absolutely central. Learning technologies are a means to this end rather than the primary focus of research. Although

networked learning does not subscribe to one particular learning theory or pedagogy, networked learning is an approach underpinned by a set of pedagogical values, whereas TEL or e-learning is a broader area with multiple and heterogeneous theoretical views and pedagogical practices. Furthermore networked learning is not restricted by the normative position suggested by terms such as “enhancement.”

Networked learning has a close relationship with computer-supported collaborative learning (CSCL), in that both fields have a keen interest in collaborative orchestrations of learning. However, CSCL tends to focus on smaller groups, including dyads, whereas networked learning extends to medium- to large-scale groupings. Also CSCL has a strong connection with formal learning in education, whereas networked learning has been picked up in a wider context, for example, lifelong learning, professional development, and organizational learning.

Social learning and communities of practice are other areas close to networked learning. Although communities and networks are often thought of as two different types of social structure, networked learning thinks of community and network as two aspects of social structures in which learning can take place (Wenger et al. 2011). Network refers to the set of relationships (see below) such as information flows, helpful linkages, joint problem solving, and knowledge creation. Community is a special case of networks and refers to the development of a shared identity around a topic or set of challenges. It represents a collective intention – however tacit and distributed – to steward a domain of knowledge and to sustain learning about it. Networked learning differs from other related fields because of its research focus on networks, critical pedagogy, and learning.

Networks

Networked learning understands networks specifically in relation to digital technologies and the networks associated with them. In mathematical terms networks can be described as nodes (vertices) connected by links (edges). A basic

Networked Learning, Fig. 1 Simple network of nodes and links (Source – <https://commons.wikimedia.org/wiki/File:6n-graf.png> – Public Domain. Created by User: AzaToth)

representation is included below (Fig. 1); vertices or nodes are the numbered circles and the edges or links are the straight lines.

The mathematical approach to network analysis can provide a number of tools for the analysis and description of large networks and flows of data, such as those generated by large online and distance courses and massive open online courses (MOOCs).

Social networks can be described in various historical periods and differing social contexts, but networked learning is concerned with learning in relation to the digital and networked technologies developed in the late twentieth and early twenty-first centuries. Networked learning draws on several different theories and intellectual traditions concerned with networks including social network analysis (SNA). SNA builds on the principles of analysis from network or graph theory and on sociology and communications theory. SNA explores how relationships between people and organized groups of people form networks and how these networks affect access to opportunities such as jobs, knowledge, and information. Haythornthwaite and De Laat (2011) identify the basic building blocks of SNA as actors, ties, relations, and networks. An actor in these networks can be organized groups and they are not necessarily individual people or even people at all. Actors in SNA can sometimes be computer agents and relationships can be mediated forms of human-human interaction or hybrid human-machine configurations. Currently there is no settled position in networked learning on this question. Haythornthwaite and De Laat (2011) are cautious about the inclusion of inanimate and

hybrid actors because currently there has been little work that has applied SNA to include objects or to develop interpretations of the social aspects of networks to include hybrid actors and/or inanimate objects. To settle this question further, analysis drawing on actor-network theory and related sociomaterial and post-human approaches will be needed to examine the role of these kinds of actors in SNA (Jones 2015).

Learning

Networked learning has no unique theory of learning but it is not neutral with regard to existing theories. Networked learning argues that learning cannot be understood in isolation and that it has to be appreciated in its social and material (technological and physical) context, as well as from an organizational and policy-level perspective. Networked learning researchers argue for a relational view of learning which suggests that learning cannot be reduced either to the person and individual cognition or to a social view of learning that ignores the already established characteristics of the learner (Haythornthwaite and De Laat 2011; Carvalho and Goodyear 2014). Networked learning theorists argue that networked learning pedagogies are closely affiliated with critical theory, critical pedagogy, dialogical learning, and inquiry-based or problem-based orchestrations of learning (Hodgson et al. 2014; Jandrić and Boras 2015). Emerging from this broad theoretical landscape, Dirckinck-Holmfeld et al. (2012, p. 295) have outlined a set of pedagogical principles they argue most networked learning practitioners value:

- Cooperation and collaboration in the learning process
- Working in groups and in communities
- Discussion and dialogue
- Self-determination in the learning process
- Difference and its place as a central learning process
- Trust and relationships, weak and strong ties
- Reflexivity and investment of self in the networked learning processes
- The role technology plays in connecting and mediating

From a pedagogical point of view or a design perspective, networked learning takes an indirect view of learning and argues that learning can be designed *for* but never directly designed (Jones 2015; Carvalho and Goodyear 2014), i.e., that there is no direct and causal relationship between teacher's or designer's intentions and what will then happen in actual practice or the learning that might result from that practice. Goodyear's work (Fig. 2) establishes a set of relationships between tasks and activities, space and place, and organization and community. The elements (tasks, space, and organizations) open to design have a distinct if indirect relationship to those aspects which can be designed for but are not open to direct design: activities, places, and communities. While organizational principles to facilitate community building can be designed (e.g., by a teacher), the community that emerges cannot be designed. Likewise tasks can be set up, but the activities that will emerge from students' interactions with the set tasks are not directly designable.

This view of learning is in sharp contrast to the tradition of instructional design and various forms of learning design which assume that learning is open to more direct interventions. Although learning itself cannot be designed, existing learning networks can be analyzed so that they can inform the future designs of those elements (tasks, spaces, tools, and organizations) open to design activity (Carvalho and Goodyear 2014).

Issues and Trends

Initially networked learning studies were preoccupied with various forms of open distance online learning in higher education, e.g., in courses where students would sit at home and connect and discuss resources with tutors and other students mediated by conferencing systems or virtual learning environments (Hiltz et al. 2007). This was how and when networked learning technologies entered higher education (Steeple and Jones 2002; Goodyear et al. 2004). It is now clear that networked technologies are much more than the desktop computers we use to connect to virtual classrooms. Education today is saturated with omnipresent and pervasive access to digital networked technologies, via various devices

Networked Learning,

Fig. 2 Indirect approach to learning (Adapted from Goodyear in Steeples and Jones 2002, p. 65)

(phones, tablets, etc.) and in various locations (at home, on public transport, on campus, or in the lecture hall). Contemporary networked learning actively crosses the boundaries of traditional settings to understand how mobile and ubiquitous technologies can allow learners to couple learning and everyday lived contexts and how participants though colocated (face to face) can simultaneously collaborate online.

A major issue for networked learning is the relationship between technologies understood as material entities and the social life and learning related to these material forms. Technology is generally understood in networked learning as a complex sociomaterial entity involving a history of design, a social pattern of adoption, and a complex hybridity of humans and machines (including code and software) in technologies, such as the Internet, the Web, and a range of local networks and infrastructures such as a learning management system (LMS). The idea of affordance has proved useful to understand these socio-technical relationships between technologies and those that make use of them, but this term is slippery and there are continuing debates about how best to use it, and indeed whether to use the idea of affordance at all (Jones 2015). Because technologies are designed with

purposes in mind, they embed properties and features that are intended to be taken up in particular kinds of use. Some argue that technologies “possess” affordances, but networked learning theorists argue that the properties of technologies are not determinant of the uses made of them, even though they act as limits to them. Thus, affordances can be thought of as relational properties that emerge from the interactions between different elements, and they are not essential characteristics of any object, technology, artifact, or system.

Networked learning is an emerging perspective in the area of professional development that aims to understand social learning processes by asking how people develop and maintain a “web” of social relations used for their learning and development (Goodyear et al. 2004; Haythornthwaite and De Laat 2011; Steeples and Jones 2002). The reasons for this development are the increasing complexity of work and the constant change of knowledge and procedures that stimulate professionals to work together to actively cocreate and innovate their domain and practice. This is related to the take-up of social (business) media which allows professionals to connect and interact with peers inside and outside their organizations to learn, to solve work-related problems, and to

innovate. A networked learning approach helps organizations and professionals to understand knowledge management from a learning perspective and provides ways in which professionals can be supported.

A developing area of research in networked learning concerns ways that digital world is different because it relies on code, the lines of instructions, and algorithms that combine and generate complex digital functions which produce real and tangible effects. Code is the “governing power” of digital networks because it makes things happen and shapes future actions through self-governing feedback loops which give code a co-constituting and shaping role in networked learning (Jones 2015, p. 141). Networked learning research is interested in tracing activity within educational settings and it is interested in these at various levels of scale. Interactions within small groups, modules, and courses have previously been studied using a number of different methods. The newer kinds of data, often summarized as “big data,” are being subject to various kinds of analytics, including learner analytics or learning analytics. This means that there are new opportunities for insights into levels of activity of significantly larger groups, in institutions, large organizations, and dispersed social networks. The use of this kind of data will require careful development by ethically informed researchers who will need to explore the detail of data collection and data manipulation to ensure that the data they use is fit for research purposes and does not harm participants. This also requires close scrutiny from a critical perspective and a continuous questioning of: Who will benefit? Who will such analytics empower? And who – or which understandings of learning – might be marginalized? These are the kinds of questions that have been asked within networked learning in the past – and will be in the years to come.

[New Literacies Theory](#)

Introduction

How new literacies are defined and perceived, and how they are addressed, has important implications for both how to educate and what to include

in educational curricula. This entry explains how definitions of literacy have changed, provides views and definitions of new literacies, and argues for a need to see new literacies from the perspective of a dual-level theory.

Defining literacy has always been challenging and controversial. For example, earlier definitions related to literacy have defined reading as a psycholinguistic guessing game (Goodman 1976), a transaction between reader and text (Rosenblatt 1994), a building up of skills-based, mechanical processes (Flesch 1981), or a fusion between readers and writers (Shanahan 1990). While these and other definitions can be applied to our changing world of literacy, they come largely from a predigital time when literacy was conceptualized within static, print-based environments. They do not adequately address the personal role one now has in manipulating and merging different media as authors and readers, communicating in digital environments that require skills beyond those required in traditional texts, and necessitating search and evaluative strategies in electronic environments.

Individuals no longer interact mainly with static print materials when reading and writing. Rather, they interact with moveable text, images, audio files, links, digital search engines, virtual keyboards, touch screens, motion-based and haptic interfaces, and other input and output devices as they communicate, create, and consume information. This is true even for very young children across socioeconomic status demographics. In a cross-sectional study of 350 children aged 6 months to 4 years in an urban, low-income, minority community, Kabali et al. (2015, p. 1044) found that 96.6% used mobile devices, and most started doing so before age one. Most 3- and 4-year-olds used devices without help, one-third engaged in media multitasking, and child ownership of device, age at first use, and daily use were not associated with ethnicity or parent education. Clearly, what it means to be literate, and how literacy is defined, continually changes based on available technology, social needs, and expectations surrounding communicative and collaborative practices. This has caused some to call “literacy” a deictic term – one that

changes continually depending on the frame of reference in which it is used (Leu 2000).

Links from Old to New Literacy Practices

Simply reading alphabetic text on a computer screen does not appear to require “new literacies.” However, new literacies would be required to bring the to-be-read text to the screen, to save the text if a return to it is desired, to extract parts of the text and move it into a new document, to highlight and insert comments within the text, to send a message about the text, perhaps with a copied section, to someone else, to add video to the text based on someone else’s suggestions, to post the text to a social network, to allow the text to evolve as others add information and links to the original post, and so on. While the actual processing of the alphabetic or image-related information on screen is not substantially different from its processing on paper, the new literacies required to find and use a text, to author multimedia documents, and to communicate about texts through online and digital tools is different from the literacies required in earlier times when copying parts of the message or communicating about it required a different set of literacies than needed in digital environments.

New literacies are, in a sense, unique to an individual. The high school student who has grown up with and is facile in using social software and social media, the Internet, and video on their personal digital devices would not feel that they are using new literacy skills and practices in their lives. These skills *are* part of their lives. The young child, however, who is unfamiliar with the letters and sounds that make up words or the toddler who is trying to create an audio-voice message for the first time are learning new literacy skills, as those are as yet unfamiliar communicative practices to those individuals and, once learned their lives change. While based in individual practices, however, the term “new literacies” is generally used to describe how digital technologies and environments are used, and how these technologies have changed individuals’ lives and society as a whole.

New literacies are also related to the specific devices and software tools within which they function. Each device has its own demands, features, and affordances. Each device and software, when upgraded, provides a new set of affordances and results in new practices and skills. For these reasons, functioning within a new literacies perspective requires the ability to adapt to these continuous changes.

Wilber (2012) reinforces and discusses the notion that new literacies should be both ontologically and paradigmatically new. They should allow individuals and groups to do things that were not possible before, and establish a new ethos or “ways of being,” (Lankshear and Knobel 2011), perhaps in how personal and academic identities or social networks are formed and differ both in scope and application of social capital. Yet, definitions of new literacies must also acknowledge that people often act alone in such spaces, and that new literacies encompass an individual’s knowledge, acquisition, and use of skills and abilities in communicating and understanding the various digital modes that are common in developed countries.

Accepting the view that new literacies allow us to do things that were not possible before (Lankshear and Knobel 2011; Wilber 2012) leads to acknowledging that devices, interfaces, software, and their changes and upgrades influence what we do and how we do them. For example, the literacies required to search for and access content with a mouse linked to a desktop computer rather than a multitouch screen on a small-screen mobile phone result in different Internet search capabilities, how search results are displayed, and how they can be manipulated. Even within a given technology category, different features result in different possibilities and experiences. When force touch became available on Apple mobile devices, more sophisticated users could access searched-for content more quickly and efficiently, thus separating their experience and the amount of information they could access in a given amount of time from less knowledgeable users or those with older touch-interface devices. Of course, as we discuss later, evaluating and using searched-for items requires different,

higher-level literacies than those required to simply use a device.

Literacies, Then and Now

One might say that the impetus for thinking about new literacies came from the seminal publication of the New London Group (1996), who recognized that the world and literacy landscapes were changing and argued for new pedagogies to address teaching and learning within the “multi-literacies” that were required for communication and the demands of the shifting workplace (e.g., see Cope and Kalantzis 2009). Yet the term “new literacies” is itself deictic – the multiliteracies that the New London Group highlighted have changed dramatically, as have the pedagogies needed as technologies evolve.

Studies relating to new literacies have often examined the skills and dispositions required to use, interact with, create, and understand messages largely through the Internet (e.g., Castek et al. 2014; Coiro and Dobler 2007). Other researchers have examined what various age or demographic groups do with digital technologies and tools (e.g., Black 2005; Ito et al. 2009; Leu, et al. 2015b). Still others apply new literacies to the study of new discourses or semiotic contexts (Kress 2003; see also Abrams 2015) or literacy practices in various text genres, from traditional books to comics, to videogames (Gee 2007; Kinzer et al. 2011; Kinzer et al. 2012). Thus, new literacies means different things to different people and has been used to describe research and perspectives that, while different, are all informative and important.

To resolve the important yet diverse conceptions to which the term new literacies is applied, Leu et al. (2013) have proposed a dual level theory of new literacies in an attempt to resolve the difficulties in conceptualizing a single theory of new literacies. They argue that explanatory theories have difficulty keeping up with and encompassing all that “new literacies” implies at any given point in time because new literacies has become a deictic term. Thus, definitions and perspectives relating to it can’t be pinned down for all

time. A dual level theory addresses this problem and, in doing so, does not privilege one framework, methodology, research context, or perspective over another, while acknowledging the importance of multiple perspectives and lines of work in the area.

This dual level theory consists of lower case new literacies and uppercase New Literacies. Lowercase new literacies encompass research that addresses specific areas of new literacies or new and emerging technology, such as examining new literacies and social implications of Twitter use (Greenhow and Gleason 2012) or Internet search and comprehension strategies (Leu et al. 2015). Lowercase new literacies also includes research and scholarship focused on specific disciplinary foundations such as the semiotics of multimodality in online media (Kress 2003), the formation of identities and youth cultures (e.g., Moje 2015), the ethos and materiality of new literacies pedagogy (e.g., Vasudevan 2014; Skinner et al. 2014), conceptual approaches to new literacy studies (Street 2003), or studies that explore specific populations or underrepresented groups (Black 2005; Warschauer and Matuchniak 2010). Lowercase new literacies thus allows the inclusion of many perspectives, methods, and contexts within which new literacies are studied and applied and allows an inclusionary perspective to bear on the field. It also provides the flexibility to encompass research and conceptions of new literacies that will change as new technologies and their applications appear and evolve, thus acknowledging the deictic nature of new literacies while providing the flexibility to include future research in areas yet unknown. Each of the studies, methodologies, and perspectives within lowercase new literacies is important, because they provide a piece of the puzzle as we learn about new literacies in all of its present and future contexts and connotations. These diverse foci allow learning from each other as the field grapples with what might become the core or prototypical features of a general theory.

Uppercase New Literacies theory allows looking across the new literacies studied in various contexts and from different lenses. It facilitates recognition of consistent patterns that evolve

from the many new literacies that are being studied and has the potential to ultimately lead to what might be called core features of New Literacies theory. Uppercase New Literacies theory includes the consistent findings from many lowercase new literacies studies. Such a dual level approach allows scholars from different fields and perspectives to study literacy as technology changes while informing New Literacies theory, facilitating the study of alternative and competing theories of new literacies while continually modifying New Literacies theory as consistent findings emerge. As stated by Leu et al. (2013, p. 1158)

By assuming change in the model, everyone is open to a continuously changing definition of literacy, based on the most recent data that emerges consistently, across multiple perspectives, disciplines, and research traditions. Moreover, areas in which alternative findings emerge are identified, enabling each to be studied again, from multiple perspectives. From this process, common patterns emerge and are included in a broader, common, New Literacies theory.

While consistent patterns from lowercase new literacies have begun to emerge and inform an uppercase theory of New Literacies, a complete theory of New Literacies is not yet possible. Indeed, because of the changing nature of technology and the literacy uses that these provide, a static, “complete” New Literacies theory may never be appropriate or completed because new literacies will continue to be studied within new contexts and technologies, continually providing new results and insights over time. Yet, at any given point in time, the patterns across available new literacies research can provide general principles within New Literacies theory that are based on consistencies seen from new literacies research at that time. At present, several principles of New Literacies appear to be common across the research and theoretical work currently taking place (Leu et al. 2013, p. 1158):

1. The Internet is this generation’s defining technology for literacy and learning within our global community.
2. The Internet and related technologies require additional new literacies to fully access their potential.

3. New literacies are deictic.
4. New literacies are multiple, multimodal, and multifaceted.
5. Critical literacies are central to new literacies.
6. New forms of strategic knowledge are required with new literacies.
7. New social practices are a central element of New Literacies.
8. Teachers become more important, though their role changes, within new literacy classrooms.

Uppercase New Literacies and Implications for Pedagogy

While many researchers have discussed new literacies in terms of behaviors exhibited by users of digital technologies, or the social networks and possibilities that results from such uses, discussion around teaching the practices, strategies, skills, and dispositions required within a new literacies framework is less visible. Yet, there are differences in the abilities across children who come to school in their knowledge about digital technologies, how such technologies might be used, and how to position oneself in relation to digital technologies in ways that result in a continuum of learning within the technological space as new technologies appear. These differences and the understanding that principle seven in New Literacies theory notes that new forms of strategic knowledge are required with new literacies mean coming to understand the necessary knowledge and how to teach it.

This is not to suggest teaching a narrow use of a specific tool, except to facilitate understanding of what using such a tool allows. That is, learning about the specifics of a given tool is less important than knowing what the tool “buys” – what power it might provide for the user, whether it be for information gathering, constructing and communicating a message, collaborating to solve a need, or networking for social change. For example, teaching the use of a keyboard or touch interface may be required, but done in combination with teaching that an interface allows one to search the Internet, how to conceptualize search strategies, how to evaluate the content that comes back from

a search request, how to merge information from search “hits” into a document, how to transmit that document to others, and so on.

Teaching the technologies available and how to use them, as a lower-level goal to meet higher-level goals, addresses both the technology and the ethos of new literacies as discussed by Knobel and Lankshear (2014). But doing so requires new ways of teaching and materials of instruction (Kinzer 2010; Watulak & Kinzer 2012). Classroom spaces need to be reorganized to facilitate uses of technology. Classroom management that enables working groups within and beyond classrooms, linked through digital tools, needs to be conceptualized and implemented. Digital spaces where learners can try out and rapidly prototype their ideas – from drafts of writing to simulations of experiments – and iterative discussion and feedback on those ideas require sharing and networking spaces. Assignments that demand the use of technology, and the technology to do so, need to be provided. In short, children cannot learn about digital tools and new literacies by talking about them – they must be able to try them, experiment with them, apply them, and work in social spaces.

One must acknowledge, however, that placing digital technologies and the social spaces and dynamics created in such spaces into schools and school curricula do not automatically parallel (or have the same motivational value) as out-of-school uses. Leander and Bolt (2013), in a study of Lee, a 10-year-old who engages with manga throughout a day, remind us that emphasizing texts (broadly defined) produced and designed in school through teachers’ well-intentioned strategies and intervention perhaps “does little to address the reality that children . . . may well be resistant to such teaching, no matter how well intentioned, how thoroughly it is argued that it is for his own future good. Even if manga had been one of the resources used in school, it would not have been the raucous, playful excessive manga he loves. It is likely that . . . in that domestication of manga, something key is lost.” (p. 43). However, Jacobs (2013) points out that Leander & Bolt’s criticisms of multiliteracies as applied in schools could be viewed best as a criticism of

schools and their current structures and restrictions rather than as a criticism of providing a multiliteracies curriculum in schools. Reconceptualizing those structures and restrictions, however, is difficult, although there are some promising efforts underway attempting to do so (e.g., Rose 2012; Salen 2011).

Core pedagogies now take into account the multimodal nature of communication and social interaction, and the pedagogies involved to find information and to think critically about it continue to evolve as well. For example, Leu et al. (2015) point out specific teaching strategies within new literacies to enhance Internet search and comprehension strategies, as well as approaches to writing within digital environments. Also, and at minimum, schools may need to provide the following components in their classrooms, in order to educate individuals to be literate in today’s and, hopefully, tomorrow’s world:

- Opportunities to use and learn about the affordances and challenges of a variety of digital tools that are linked to curricular goals by allowing a variety of digital tools into the classroom. These tools might include wikis, search engines, podcasts, productivity software, games and media. This can facilitate learning and prepare for future learning (Bransford and Schwartz 1999; Reese 2007; Dede 2009).
- Opportunities to share knowledge and respond to each others’ work through experiences that maximize social practices in digital spaces. Distributed problem solving and collaborative activities through technology tools allow children to learn that digital tools can be powerful, and that they allow collective knowledge and effort to solve problems or complete assignments in ways that move beyond individual efforts alone.
- Opportunities to showcase ideas in multimodal forms and with multimodal tools. Assignments that use video and audio, mash-ups, and remixes of a variety of sources to communicate a message or opinion can provide opportunities to teach the use of such tools and also teach effective ways to structure messages across multimodal texts.

Conclusion

This entry has argued that definitions of literacies, including “new literacies,” has evolved and should be considered deictic. With this in mind, definitions and perspectives of literacy were presented, showing how these definitions as well as initial conceptions of “new literacies” have changed as technology and its uses have evolved. It provided arguments that a dual level theory consisting of lowercase new literacies that encompasses different perspectives, methodologies, and contexts leads to guiding principles within an uppercase theory of New Literacies and argued that a dual level conception is best able to adapt to studies of current technologies and literacies, as well as studies yet to come, based on technologies as yet unimagined. It concluded with general recommendations for teaching based on New Literacies guidelines.

New Literacies and new literacies remain in constant flux, and the affordances of technology, including the Internet and the increasingly social nature of digital environments, present challenges to educators. However, studying new literacies within a framework of New Literacies has the potential to facilitate understanding and reconceptualizing pedagogy within an increasingly digital world. Knobel and Lankshear (2014, p. 101) remind us that “Ultimately, a concern with “new literacies” is a concern with preparing students as best we can for a world in which there are few constants and the near future will involve artifacts, social relations, processes, routines, and practices barely imaginable now. Studying new literacies offers useful footholds for thinking about how and why extant literacy practices are changing and new ones emerging in the present, why others are remaining constant, and what’s to be done about it.”

Introduction: Media and New Media

While the Merriam-Webster online dictionary traces the first known use of the word *media* in the English language to 1841, tools that facilitate the storage and delivery of human expression have existed for 40,000 years. From Pleistocene-era cave drawings to texts produced via movable type, to on-demand video content accessed via personal mobile devices, the means of message production and distribution has expanded from exclusive and local to inclusive and international. During the same period, media have evolved from one-way monomodal communication to interactive, multimodal, social experiences (Kress and Leeuwen 2001).

Though media differ in terms of the types of discourse they support, the way they can be designed, and the means of their production and distribution, it is the extent to which they bridge distance and support multidirectional interaction that largely determines if they are counted as *new media* or not (Flew and Smith 2011). Media that primarily transmit in one direction (e.g., academic journals, broadcast radio and television, printed novels and newspapers) constrain access to the means of designing, producing, and distributing expression and generally exist outside the umbrella of new media. Digital platforms that simultaneously facilitate the democratized design, production, and distribution of interactive expression over networks are counted as new media (Beavis 2013). This, however, is not to suggest a rigid binary. While, in some ways, new media have supplanted other forms of media, their emergence has also led to multiple levels of convergence and overlap among the range of media platforms wherein features, users, and content are shared within and across groups, modes, and platforms (Jenkins 2006).

Print Media Literacy and New Media Literacies

Historically speaking, an ability to decode and encode the standardized form of print media is said to make an individual literate (New London

Group 1996). In languages like English, literacy is commonly characterized by an awareness that written symbols correspond to spoken sounds which, when combined and read from left to right, create words, phrases, and sentences.

This traditional view of literacy often operates from the standpoint that there is a central, singular mode of expression used by those who are literate. Communicative practices that don't follow the rigid conventions of schooled texts are often positioned as informal, less important, or incorrect (Gee 2004). This can affix a deficit perspective and/or transgressive value judgment to the literacy practices of individuals who – despite being active members of other discourse groups engaged in complex expressive practices – struggle with or reject schooled literacy as inauthentic (Steinkuehler et al. 2005).

Researchers and philosophers have recognized that the societal practices of different groups rely on different literacies (Kress 2003). Thinking of literacies as overlapping sets of fluid multidimensional meaning-making abilities, relationships, and identities aligns with the ways groups and organizations continually cocreate communicative practices that follow unique conventions based on the needs of the group and the affordances and constraints of the expressive platforms available to them (Kalantzis and Cope 2012).

Participating in groups that exist for the purpose of planning and executing World of Warcraft raids, grassroots organizing for social justice in South Texas, staying connected with a sibling living abroad, or writing and reviewing federal US NSF or IES grants each requires a different combination of understandings and practices about how to interact and communicate using a range of expressive channels – many of which happen over new media platforms. These combinations of understandings and practices each constitute a literacy (Kalantzis and Cope 2012). These literacies overlap in many ways, yet differences between social groups, the communicative tasks they undertake, and the platforms and modalities they use to interact produce variations in communication, understanding, and participation.

Acknowledging the fluidity and multidimensionality described above shifts the

perspective from thinking of literacy as a set of general skills related to a fixed body of words and rules toward a multiplicity-of-literacies perspective wherein each discursive context requires a set of communicative abilities – each with overlapping discursive practices, new and old media networks, social groups, and identities (Gee 2004).

Growth and Convergence in New Media Literacies

While not all literacies use networked digital platforms, a large portion of groups employing new literacies do so via new media. The growing ubiquity of networked devices and the rapid emergence, low cost, and inclusive nature of new media have supported unprecedented growth in literacies (Gee 2004; Kalantzis and Cope 2012).

Though new discourse groups with their own practices and new media with their own affordances are both emerging at such a rate that one cannot hope to learn to successfully engage with all of them, several factors support the development of an individual's new media literacies (Gee 2004). A focus in the last 20 years on human computer interaction, particularly interface usability as well as the stabilization – if not market-driven standardization – of how emerging communication technologies support the design, manipulation, and exchange of a range of modal artifacts has created a level of portability or interchangeability of new media literacies practices (Thomas et al. 2007). Understanding how text, image, and video are created and used by a group on one platform typically affords users translational insight into the communicative conventions of how text, image, and video are created and used by distinct groups or on distinct new media platforms.

In the ways described above, participation within and between multiple discourse groups that use new media platforms builds a sort of *funds of [new media literacies] knowledge* (Schwartz 2015) based on the discrete features of the digital platforms and the interactional practices of the discourse groups of which one is a

member. For instance, joining a group that advocates for refugee rights via memes, videos, and public Twitter chats may require one to develop an awareness of a specialized subset of content knowledge and communicative conventions, as well as multimodal design and new media dissemination practices in order to successfully participate in the group. However, for many people living within networked societies, their current and past social experiences often act as bridges toward learning to successfully participate with new groups such as the refugee rights advocacy group or via new technologies.

For example, a junior at the University of Nebraska-Lincoln who interacts over the mobile messaging app WhatsApp with fans of the British soccer team Chelsea FC and also interacts with members of a Facebook climate change awareness group by creating environment-related memes and infographics would be able to leverage a number of her existing literacies in support of the refugee rights group. Specifically, her existing practices related to identifying reliable sources, making sense of the data and information in those sources, and creating messages based on her synthesis would transfer from her work with climate change awareness to the refugee rights group. While she may have to learn a great deal about specific challenges faced by refugees as well as the international, national, and local support to which refugees are entitled by law, her new media literacies include practices for learning about and navigating within new domains of knowledge. Furthermore, even though she may be new to Twitter, her literacies of multimodal instant messaging via WhatsApp and her Facebook status updates would support her in learning how to use the unique affordances of Twitter. Finally, interaction with other groups, including the climate change awareness group, would support her in picking up on and adapting to the nuances associated with interacting with members of the refugee rights group.

Marshaling technical and discursive literacies in order to successfully participate in new groups, use new digital platforms, or move fluidly between both groups and platforms represent the type of multiliteracies, metaliteracy, and/or

transliterations necessary for full participation in early twenty-first-century communication environments (Kalantzis and Cope 2012; Thomas et al. 2007). Not only does prior interaction with new media-supported groups facilitate successful interaction with other groups – and thus the acquisition of additional literacies – but also the asynchronous interaction patterns that characterize much of new media combine to create dozens of gateways toward literacies acquisition.

For example, a plumber living in Western Nebraska in the mid-1980s diagnosed with kidney disease who wanted to better understand his illness would be limited to brief conversations with his doctor, a trifold pamphlet, and whatever his public library had on the subject – most likely a few children's books on kidneys, a general anatomy book, some encyclopedia entries, and, possibly, Seldin's 1985 book on the physiology and pathophysiology of the kidney. While his plumbing literacy could potentially support an understanding of the urinary system and his print media literacy would support his general use of books and pamphlets, he would be on his own in terms of making sense of and making connections between the specialized communicative practices found in the medical and reference sources he could access. In other words, with no kidney disease or kidney-related groups with which to interact, he would likely feel shut out of even the modest level of information available to him.

Conversely, in an environment that includes networked new media, developing literacy around kidney disease would be a much different experience. In 2016, a plumber in Western Nebraska would likely have a touchscreen smartphone with some level of Internet access. He may also be a part of social or professional groups that interact via new media. Even a modest level of new media literacies would serve as a bridge to using his phone, tablet, computer, or a computer in the public library to connect with and discern from among any of dozens if not hundreds of online support and affinity groups. Additionally, identifying reliable sources is a more distributed endeavor between increasingly aware new media users and more sophisticated search engine algorithms than was the case 15–20 years ago.

A Google search of *kidney disease* offers the [US] National Kidney Foundation, the Mayo Clinic, and WebMD as three of the top four links. These organizations offer information via text, images, and video designed to help the uninitiated develop their understanding of kidney disease and interact via new media (e.g., message boards, meet ups, video and image repositories).

The asynchronous collaborative nature of these and other groups results in a stream of multimodal artifacts that persist through time and are accessible via apps and Internet searches. Instead of 1985s five-books-and-a-pamphlet bootstrapping approach, the gateways for developing literacy around kidney disease in the early twenty-first century include scores of groups that have generated hundreds of relevant community forum threads, thousands of graphics and images, tens of thousands of videos, and millions of webpages – not to mention webinars, simulations, and virtual reality experiences. In other words, with an abundance of groups interacting over new media – resulting in a wide range of multimodal artifacts – the twenty-first-century plumber would have a spectrum of groups and a host of accessible, familiar gateways over which to interact with others who care about understanding kidney disease.

New Media Literacies in Schools

Options for social interaction in the early twenty-first century look very different from the options of 30 years ago. Over the past decade, rising levels of new media access among youth and adults within *massively networked societies* (Steinkuehler et al. 2005, p. 99) have increased the likelihood that members of such societies spend considerable time involved in a number of affinity-based social groups that use new media to express themselves and interact (Perrin 2015). The frequent, multifaceted, and voluntary nature of new media-supported interaction not only facilitates youth development of new media literacies but also is recognized as a potential source for increasing youth engagement in, and understanding of, school-based literacy.

New media platforms are often identified as opportunities for schools to leverage the popularity and features of technologically mediated networks for educational purposes. Since the late 1990s, teachers have worked to integrate new media and aspects of new literacies into the curriculum. The range of integration rationales includes an interest in leveraging platform affinity and novelty to inject excitement into content areas (Olmanson and Abrams 2013), rethinking student participation in learning spaces (Vasudevan 2010), encouraging the expression of student identities (Rust 2015), closing the digital divide, and mirroring collaborative ecologies of the twenty-first-century workplace and better facilitating the inclusion of multimodality in academic texts to fulfill evolving State and national expectations (Olmanson et al. 2015).

These integration efforts have historically forefronted academic literacies without meaningfully incorporating the social practices of outside groups that use new media platforms (Sims 2014). For example, a middle school English teacher in South Chicago might integrate new media into a lesson plan that has students analyze and respond to texts and videos that describe Abraham Lincoln's place in history as emancipator, opportunist, and white supremacist. She might have her students use a blog platform to create and display a 1000-word analysis wherein students individually evaluate each author's claims, share their perspective, and, in a sidebar, consider the affordances and constraints of the different mediums used. She might require her students to respond to the analysis of their peers via the blog post commenting feature and invite history majors at a local university to read her student's posts and make comments. In completing this assignment, students would likely be able to leverage aspects of their new media literacies such as an understanding of the affordances and constraints of blogs, the design of multimodal texts, and the technical side of how to give and receive peer feedback on their ideas.

While the scenario described above supports the development of critical literacy, improves evaluative authenticity, integrates new media, aligns with the US Common Core State

Standards, and allows student work to become part of the global networked conversation about history, the use of youth new media literacies is constrained to elements that directly align with developing academic literacies in academic ways (Greenstein 2016). In other words, the affordances of the digital platform – but not students' new media practices, artifacts, identities, and affiliations – are valued and seen as the target for classroom integration (e.g., Alvarez et al. 2013). Though all discourse groups adapt the platforms they use to their needs, the experience of new media in support of academic literacy often looks very different from typical new media literacy practices undertaken by youth (Sims 2014). This tendency toward the teaching of academic literacies on new media platforms via a leveraging of student technical literacies without meaningfully engaging the range of new media practices used by youth leaves the role identity plays in literacies development unutilized (Gee 2004).

While the explicit instruction of academic literacies via new media has had some success in terms of increasing authenticity, ensuring a baseline exposure to twenty-first-century skills, and improving attitudes toward academic literacy, new media use in the classroom has not led to a viral increase in youth engagement with academic literacies outside of school. Pressure to ensure that students acquire academic literacies creates dynamics wherein pedagogies of direct instruction are selected over other approaches based on the perceived likelihood that they will lead to incremental, measureable gains. Similar to Ladson-Billings' (1995) critique of how educational institutions try and inject cultural elements of marginalized groups into the curriculum instead of working to connect curricular elements to practices within non-dominant cultures, schools largely assimilate new media toward their purposes. The multitudinous, heterogeneous, shifting, voluntary, affinity-driven nature of youth new media-supported discourse groups creates a great deal of curricular potential but is often seen as incongruous with instructional practices that rely heavily on uniformity of purpose, process, product, and outcome.

Making the effort to meaningfully connect the school curriculum to learner literacies – many of which take place over new media – requires a commitment on the part of teachers to allow in, learn from, and integrate a range of nonacademic discourses into the classroom curriculum as a way to meet learners where they are. For example, students in a high school social studies class in North Omaha might be invited to offer up examples of texts from within their out-of-school interactions and group affiliations. For a teacher to identify a student-submitted transcript of an emoticon-rich adolescent group-text interaction about Beyoncé as an example of an argumentative text about systemic patriarchy requires that the teacher understand Beyoncé's impact on youth culture, her lyrics, videos, and comments regarding women and society, the practices of adolescent group SMS chat, and the conventions of emoticon use. Additionally, using the group chat as the sole in-class text would require not only the teacher to build her understanding but also confirm that the other students in the class were familiar with Beyoncé so as to meaningfully participate from the interaction.

Furthermore, a willingness to embrace learners' new media literacies in non-reductive ways seems to align with nonlinear pedagogies that accept the gap between academic literacy and the literacies learners experience at home and in their peer groups (Schwartz 2015). In schools the rationale for focusing on conventional literacy skills includes the notion that such cognitive practices support all forms of communication and underpin future academic and societal success. While these effects may be real – with skills such as an ability to make sound-symbol connections enabling a wide range of communicative interactions – alternative pathways toward becoming literate and developing literacies exist within a spectrum of sociocultural practices (Gee 2004; Orellana and D'warte 2010).

Conclusion

Unlike schooled literacy, which is explicitly instructed, new literacies are acquired via

interaction, affiliation, and identification with others within particular discourse groups – many of which take place over new media. Though institutions of education tend to position an individual's academic literacy as an internally held measurable cognitive asset, sociolinguistic ways of framing literacies involve understanding how an individual interacts and exists within particular communicative contexts. A capacity to interact with a wide range of social groups does not emerge from an instructed source but rather from engaged experience within authentic discursive contexts that align with how individuals see themselves or would like to see themselves in terms of group affiliations and identities (Gee 2004).

New media platforms provide educators with the means to connect academic literacy with learner literacies. A growing body of new media literacies research highlights some of the ways educators have integrated new media literacies into learning spaces without colonizing learner practices to align solely with conventional literacy goals and neoliberalism (Alvarez et al. 2013; Orellana and D'warte 2010; Schwartz 2015; Sims 2014). For these educators, the challenge comes in designing ways for learners to meaningfully use their new media literacies within educational systems that continue to privilege psycholinguistic skills and particular print media practices as the source of academic capital.

New School in Brazil

Marcus Vinicius da Cunha

Universidade de São Paulo (USP), Ribeirão Preto, Brasil

Synonym

Progressive School

Introduction

New School is an expression that usually means ideas and practical principles identified with renovation of mentality and pedagogical practices of educators. To make a more accurated definition, with cronological limits, we must remember that there were projects like this since the beggining of Brazilian Republic; but our researchers consider that New School was introduced in Brazil through School Reforms made in some States in 1920s. In that period, the new educational ideas grew up; they became solid in 1930s, when other important Reforms were made (Nagle 1974).

Relevant facts in this process were the foundation of Associação Brasileira de Educação (Brazilian Association of Education) in 1924 and the IV Conferência Nacional de Educação (IV National Conference of Education) in 1931, when there was the dissidence between liberal and catholics leaders. The first group, in which Fernando de Azevedo, Lourenço Filho, Anísio Teixeira, and others were, published in 1932 a document with their political, social, philosophical, and educational ideas – the Manifesto dos Pioneiros da Educação Nova (Manifesto of the Pioners of the New School) (Cury 1988).

A definition of New School must consider it was a movement, whose dinamyc nature do not let us make any final characterization, just like some New School leaders admitted. According to Lourenço Filho, New School is not “an only kind of school or method of teaching but a whole principles against the traditional school.”

It arises in Europe and EUA in the end of XIX century, under the influence of scientific progress in biology and psychology that revealed “a new comprehension of the childhood.” These knowledges were increased by a lot of principles about “the functions of school in face of the new social demands” (Lourenço Filho 1974, p. 17).

According to Fernando de Azevedo, New School – or New Education – includes “a whole projects and experiences with new ideas and techniques (like active methods, psychological and pedagogical tests, adjustment of pedagogy to individual development and variance) or new plans to remodel the school administration.” The expression New School is “vague and inexact” because it can include any “modern pedagogy based on the child development.” In this variety, it is possible to delineate two tendencies, at least: the first was “inspired by the new biological and psychological ideas about children and by the new functional education” and put the student in the center of school and the second, “linked to the evolution of social theories and to the definition of school like a social institution,” put the society requirements above the individual freedom (Azevedo 1958).

In Brazil, the New School ideas were grouped in this last tendency. The history of Brazilian New School was developed inside projects that included modernization, democratization, industrialization, and urbanization of society. Individual would be inserted in the rising society process by school. Knowledges about individual and society, resulting from various fields, especially from psychology and social sciences, were transposed to pedagogical practices. The New School common ideas emphasized intensive use of the scientific and rationality resources in school administration and in pedagogy. Their goals were to increase the efficiency of teachers’ work, to discipline, and to normalize the school physical space (Cunha 1995; Mate 1988).

Meanwhile, in this history there was a great variety of discourse. Side by side the trend above, there was a mentality in which the situation of man in society was considered and the socialization means was discussed too. These ideas look out for the relevance of individual in the social

order – not the individual like a psychological and abstract being but the individual like a collective and participative one. In this tendency, the moral and social problems were put in order to guide the modernization of society (Cunha 1995; Cunha 1988).

So, the era of New School can be characterized like the one in which these two orders of questions were present: to insert individual in a modern society and, at the same time, to respect the individual singularities. On the one hand, functionality ideas predominated; the school was inspired in an industrial efficiency model. On the other hand, the society was considered like a building process; the school was guided by democratic and free experiences.

This era finished in the end of 1950s, beginning of 1960s, when the pedagogic ideas resigned the conciliation of this two poles and the planning theories predominated (Horta 1982).

Nietzsche

► Nietzsche and Morality

Nietzsche and Acoustics

David L. Mosley

Bellarmine University, Louisville, KY, USA

Introduction

Friedrich Nietzsche's interest in acoustics, auditory perception, and musical experience – while not pedagogical in the conventional sense – lead to some of the philosopher's most trenchant critiques of institutional education and proposals for its reform. The most extended discussions of education are contemporaneous with his tenure at the University of Basel from 1869–1879. In works from subsequent years, focusing more generally on German culture and the quality of German scholarship, his observations are often framed in terms of acoustics and musical experience. And shortly before his collapse, Nietzsche's acoustical thinking assumes a material form with his proposal to philosophize with a hammer.

Sources for Nietzsche's Acoustics of Education

Many of Nietzsche's early reflections on education depend on the appropriation, adaptation, and extension of the German word *Stimmung*. In the study of acoustics, *Stimmung* refers to vibration, frequency modulation, and oscillation. In the musical lexicon, it designates resonance, voice, and intonation. And in psychology it denotes mood or disposition. Out of the varied meanings of *Stimmung*, including suggestive associations among various fields of knowledge, Nietzsche forges a hermeneutic constellation – as versatile as it is incisive – for his critique of education.

By the middle of the nineteenth century, *Stimmung* already occupied a prominent position in German thinking and was frequently associated with the topics of education [*Erziehung*] and

maturation [*Bildung*]. In his *Critique of Judgment* (1790), Kant describes the free play of imagination and intellect characteristic of aesthetic judgment as the proportionate attunement [*proportionierte Stimmung*] of the higher faculties (2002, p. 197). Schiller, in the *Letters on the Aesthetic Education of Man* (1794), explains that only those with an aesthetic disposition [*aesthetische Stimmung*] can apprehend the “revelation of reason in the sphere of the sensuous” (2004, p. 97). And in the essay “Thinking for One's Self” (1851), Schopenhauer describes an active education growing out of the student's experience and reflection, rather than the passive reception of words read aloud by the teacher. The indispensable mediator between experience and understanding, in Schopenhauer's view, is the formative power of the student's disposition [*Stimmung*]. Moreover, all subsequent reflection is guided by principles analogous to those governing melodic invention and elaboration (Schopenhauer 1974, p. 22).

Jacob Burckhardt, professor of history at the University of Basel and friend to Nietzsche during his time there, frequently uses musical terminology in thinking about history and historiography. Burckhardt formulated these ideas in lecture courses, attended by Nietzsche, on “The Study of History” (1870) and “Greek Cultural History” (1876). In these, Burckhardt described the history of the ancient world as “a fundamental chord [*Grundton*] heard in all fields of learning.” Furthermore, only the study of ancient history can dispel the “acoustic illusion [of] thought and argument multiplied to ubiquity by the press [...] whose noise drowns out any voice of the past” (Burckhardt 1965, p. 91).

A fourth source for Nietzsche's acoustic evaluation of education is Hermann von Helmholtz who, in *On the Sensation of Tone* (1863), describes the ear as a mechanism whose cilia vibrate, in sympathy, with the frequency modulations produced by the sounding object. Additionally, Helmholtz argues that our perception of differences in timbre when the same musical tone is sung by different voices or played on different instruments, results when auditory perception combines the fundamental pitch and the

harmonics, or overtones, idiomatic to the different sources of production. While we apprehend the result of this combination rather easily, hearing the individual harmonics is more challenging however, by withdrawing one's attention from other parts of the combination one can learn to hear them (Helmholtz 1954, pp. 65–74).

Nietzsche, Education, and Acoustics

In a series of public lectures on education delivered in 1872, subsequently published as *On The Future of Our Educational Institutions*, Nietzsche finds the curriculum and pedagogy in contemporary gymnasia unacceptable. Echoing Schopenhauer, Nietzsche champions an acroamatic, or spoken, pedagogy through which students are connected to the educational institution “by the ear alone,” instead of one where the teacher, who reads when speaking, aims to reach as many students as possible. Nietzsche believes the “strange speaking-and-listening procedure” of an acroamatic pedagogy constitutes an “education toward culture” and exemplifies true academic freedom, inasmuch as “even the listening and the selection of what is listened to is left to the independent decision of the liberal student” (2007, p. 96). A fuller discussion of acoustics in these lectures may be found in my “Nietzsche’s Acoustic Philosophy of Education and the Designation of Genius.”

A similar concern with the deficiency of contemporary education, and the consequent impoverishment of German scholarship, is found in all four of the *Untimely Meditations* (1873–76). In “David Strauss the Confessor and the Writer” (1873), Nietzsche considers the erosion of scholarly standards in the midst of a “philistine” culture. In the prose style of Strauss, Nietzsche detects an ear no longer able to hear “the aesthetically subtle and powerful laws of tone that govern the life of the writer indentured to good models and strict discipline” (1990, p. 63). Strauss is esteemed because in his work fellow scholars find a reflection of themselves. Even a reader who might disagree with Strauss, nevertheless “feels so certain he is hearing the echo of his *own voice*, that a false sense of unity is created” (1990, p. 45).

The second *Untimely Meditation*, “On the Advantages and Disadvantages of History for Life” (1874), includes a devastating critique of contemporary historiography and the teaching of history. Throughout, Nietzsche argues for an understanding of history and a reform of its pedagogy in acoustic and musical terms. Nietzsche describes the typical historian as “an echoing passivity” from whom only the “overtones” of “the original, basic historical tone” can be heard. In short, the contemporary historian is nothing more than “an echoing passivity” (1990, p. 114). This especially acerbic characterization results from Nietzsche’s wedding of Burckhardt’s metaphor of history’s *Grundton* to Helmholtz’s explanation of sympathetic vibration.

As a remedy, Nietzsche posits a “republic of genius,” an idea borrowed from Schopenhauer, where great historical voices of the past speak in tones audible only for the true historian, one with an appropriately tuned and sympathetic disposition. The scholarship of those possessing such a disposition “reformulates a well-known, perhaps common-place theme, an everyday melody, [. . .] making the familiar sound like something wholly new” (1990, p. 118). As an educator, the true historian transforms the student’s “unconscious resistance” to “traditional education” into an “outspoken and loudly sonorous awareness” (1990, p. 145). For an extended discussion of musical acoustics in this *Untimely Meditation*, see my “Nietzsche, Beethoven, and the Composition of History” (Mosley 2014, pp. 24–40).

In the third *Untimely Meditation*, “Schopenhauer as Educator,” Nietzsche recounts how reading Schopenhauer introduced him to education as the cultivation of genius. However, Nietzsche finds a fundamental contradiction in the “two educational precepts in vogue today.” One he calls inner education, “the recognition of the powers of each student,” while the education of the outer demands “all of a student’s abilities be brought into a harmonious relationship.” He finds a resolution to this opposition in the figure of Benvenuto Cellini – the sixteenth century goldsmith, sculptor, draftsman, soldier, musician, and poet – in whom “everything – all insight, desire, love, hatred – converge in a single career.” Like a

composer, the “radical strength” of Cellini’s character shapes the strains of inner and outer into “a polyphonic unity” (Nietzsche 1990, p. 167).

The contribution of music to a vibrant culture is the topic of the fourth *Untimely Meditation*, “Richard Wagner in Bayreuth” (1876). For Nietzsche, the reciprocity of tone and word in Wagner’s *Gesamtkunstwerk* is an answer to a “crisis which by now spread throughout the civilized world,” namely, “language is everywhere diseased [and] as far removed as possible from the strong emotions it was originally able to arouse with greatest simplicity” and “express in the domain of thought”. To bridge the gap requires the “inspiring soul of music.” However, education in music is “most shameful lack” of contemporary education (Nietzsche 1990, p. 270). Nietzsche believes the disposition of those who experience Wagner’s combination of tone, word, and gesture – like Athenian citizen whose disposition relied, to a significant extent, on the cultivation of musical taste – might once again be fit for responsible participation in matters of State (1990, p. 278).

From Nietzsche’s first years in Basel to his collapse in Turin, the contrasting character of Apollo and Dionysus, and the genius of their uneasy “marriage” in Attic tragedy, was central to Nietzsche’s thought. If *The Birth of Tragedy out of the Spirit of Music* (1872) is concerned, to some degree, with the pedagogical significance of Greek tragedy, then the same can be expected from the rebirth of tragedy in the music-dramas of Richard Wagner. Central to each, according to Nietzsche, is the “aesthetic listener” attuned to the primal dissonance heard in the Dionysiac dithyrambs (Nietzsche 1999, p. 108). Moreover, just as the critical human beings belonging to the Socratic community signaled the end of Greek tragedy, the “critical historical spirit of contemporary education” has produced abstract and “mythless” human beings “deaf to tragedy’s music” in Wagner’s music-dramas (Nietzsche, 1999, p.109).

Human, All too Human (1878), Nietzsche’s first book length work since *The Birth of Tragedy* took shape in the years just before deteriorating health ended his academic career. During this time, Nietzsche reassessed his earlier works and

found in each the same unexamined idealism responsible for the decline of contemporary culture. In *Ecce Homo* (1888), Nietzsche describes the book as a “monument to a crisis [. . .] I used it to liberate myself from things that did not belong to my nature. Idealism is one of them: the title says ‘where you see ideal things, I see – human, oh, only all too human!’ [. . .] The tone, the sound, has completely changed” (1995, p. 6).

As might be expected, *Human, All too Human* includes Nietzsche’s rejection of music as the most adequate representation of the will he found so attractive in Schopenhauer and, along with it, his loss of faith in Richard Wagner’s aesthetic vision. Nevertheless, acoustics and musical experience remain essential to education and the creation of a vibrant culture. For example, in §242 Nietzsche explains that the exceptional student is formed not so much by institutional education, but in spite of it. For such students, “the greatest disorder, confusion of objectives, and unfavorable circumstances” are harmonized by “an inborn, indestructible strength” whereby “the individual is set in place within the counterpoint of private and public culture” (Nietzsche 1995, p. 6)

The acoustic properties of language and its rhetorical formulation are essential features of *Thus Spoke Zarathustra* (1883–1884), regarded by Nietzsche as his most important book. Here Nietzsche recounts the life of an *acroamatic* teacher who speaks and sings with the voice of a prophet. When Zarathustra announces the coming of the “overman” his words are met with silence because of the audience’s pride in German education. Zarathustra concludes, “I not the mouth for these ears” (Nietzsche 2006, p. 9). Later, when Zarathustra enters the so-called Land of Education he encounters beings “baked from colors and paper slips glued together” and “written over with signs, and even these are written over with signs.” Zarathustra’s response, seemingly the only response he finds appropriate, is to laugh (Nietzsche 2006, p. 94). And later, tired from travelling in foreign lands, where “everyone talks” and “no one knows any more how to understand,” Zarathustra retreats to a “home in solitude.” There, “being wants to become word” and

“becoming wants to learn from me how to speak” (Nietzsche 2006, p. 146).

In the *Gay Science* (1882–87), which is contemporaneous with *Thus Spoke Zarathustra*, Nietzsche joins laughter – a vocal expression without semantic content – to poetry and dancing in the attempt to reframe philosophy as a *gaya scienza*. However, so Nietzsche contends German education lacks this “one great means of education; the laughter of higher men; for in Germany, these do not laugh” (2001, p. 137). When assessing the quality of German speech, the philosopher makes the hauntingly prescient observation: “Just listen to the shouted commands that positively surround German cities [...] what presumptuousness, what raging sense of authority, what scornful coldness reverberates from this roar! [...] The Germans are becoming militarized in the sound of their language” (Nietzsche 2001, pp. 101–103).

Nietzsche provides a brief phenomenology of musical experience when he describes how we learn to love. At first, he explains, we must simply “learn to hear a melody or figure at all”. Then, with “effort and good will” we “stand it despite its strangeness”. Finally “comes the moment when we are used to it; when we expect it; when we sense we would miss it if it were missing [and] it continues to compel and enchant us until we become its humble and enraptured lovers, who no longer want anything better from the world than it and it again [...] It is in just this way that we have learned to love everything we now love” (Nietzsche 2001, p. 186).

In works from 1886–1888, Nietzsche frequently alludes to philosophizing with a hammer. This is not, however, his first use of the metaphor. It first appears, some 25 years earlier, in *Philosophy in the Tragic Age of the Greeks* of 1873, followed by references in *The Gay Science*, *Thus Spoke Zarathustra*, *Beyond Good and Evil*, and *The Genealogy of Morality*. Nietzsche uses the hammer for new tasks and it yields more refined results in *Twilight of the Idols, or How to Philosophize with a Hammer* from 1888. In the Preface to *Twilight*, written three months before the philosopher’s collapse, Nietzsche’s speaks more definitively about his philosophical hammer.

Forged from the complementarity of musical acoustics and philosophical judgment, it is a hermeneutic-pedagogic instrument. Just as the physician determines health or illness according to the sounds elicited by tapping the patient’s body – a procedure known as auscultation [*Abhören*] – Nietzsche’s hammer taps the most revered thinkers and influential ideas of the past to sound out [*aushorchen*] their resonance in the present. The hammer also acts as a tuning fork [*Stimmgabel*] in reference to which instruments are tuned prior to a performance. In the same way a pleasing performance relies on members of the ensemble playing in tune with one another, Nietzsche’s tuning fork tests the attunement of one mode of thinking with another (2005b, pp. 135–136).

Conclusion

While Nietzsche’s acoustic critique of education borrows from earlier sources and adapts ideas from other domains of thinking, his (re)formulation and deployment of them is both novel and incisive. As a consequence, Nietzsche introduces new values for the appraisal of teaching, learning, and thinking about education. These include sympathy between the speaking voice and the listening ear; a musical disposition informed, in part, the acoustic properties of language; the deafness induced by critical-historical scholarship; laughter as the most adequate response to philistine culture; and the necessity of an education in music for a living connection to myth, an aesthetic attitude toward life, and the creation of a vibrant culture.

Nietzsche and Atomism

Greg Whitlock
Parkland College, Champaign, IL, USA

Introduction

Although he was not a systematic philosopher in the mold of Kant or Hegel, Nietzsche worked toward developing a theory of will to power. Nature, man, and society served as important dimensions of the will to power in his theory. He recognized higher and lower forms of this will to power. The highest expression of will to power is the will to knowledge. And science is the highest expression of will to knowledge. Of special interest among the sciences, for Nietzsche, stood physics, which he interpreted to be the will to

knowledge about nature. Physics expresses a will to power by attempting to reduce all things to atomistic explanations. Physics would be, then, the will to atomism. As science, the will to atomism is a type of honesty, an intellectual honesty. Consequently, the spirit of science marginalizes morality as an explanation of the world. And so Nietzsche exclaimed, long live physics! All forms of education in the atomistic sciences, physics, and chemistry, among others, possess the greatest potential for a breakthrough in the understanding and utilization of new forms of *Macht* (Ger., energy, power, or force).

Nietzsche had very specific recommendations for programmatic research and education in physics and atomism in particular. He advised that physicists abandon Newtonian atomism and investigate the point-particle theory developed by Roger Joseph Boscovich.

Boscovich's Theory of Natural Philosophy

Boscovich's theory may be expressed in a relatively brief set of distinct principles:

- (1) Matter is composed of perfectly indivisible, non-extended, and discrete points.
- (2) No two material points can occupy the same spatial, or local, point simultaneously.
- (3) Nothing happens per saltum.
- (4) Between all points of matter, there is a mutual force depending on the distance between them, and changing as this distance changes, so that it is sometimes attractive, and sometimes repulsive, but always follows a definite continuous law ("Boscovich's law").
- (5) There is conservation of force rather than entropy.
- (6) Macro-objects are composed of centers of force.
- (7) Perception relies on relations of force.
- (8) Centers of force are absolutely nonpersistent.
- (9) There is no "rest" for centers of force.
- (10) There is no "empty space."

- (11) Time and space are relative in a Leibnizian sense.
- (12) "Laws of physics" are abstractions.
- (13) Science aims at a unified theory rather than "laws of nature."
- (14) Properties are dynamic, not mechanical.
- (15) There are a definite number of centers of force at any one time.
- (16) Centers of force have a definite magnitude
- (17) There is no matter, only force.
- (18) Centers of force are separated off into pairs.
- (19) A center of force cannot be represented "in itself."
- (20) Physicists project their own properties onto matter.
- (21) There is no continuum.
- (22) The substratum of force is space.
- (23) There is no movement in mechanical sense.
- (24) Effects of force must be distinguished from force itself.
- (25) The total amount of force in the universe is finite.

Boscovich's revolution against the senses maintains that one of the most common phenomena of macroscopic objects, collision, does not occur at all at the particle level of reality (Boscovich 1922). Instead repulsive force increases exponentially to infinity as the atomic particles draw closer. Despite all appearances with visual objects, the objects at atomic scales do not come directly into contact whatsoever. Instead all physical action is at a distance. Boscovich's revolution is paired with an equally counterintuitive notion that ultimate particles of matter are not corpuscular extended atoms at all but rather unextended points of force. Boscovich's atoms were not atoms at all but rather point particles. According to Boscovich, atoms are mathematical points with atmospheres of force. The atoms of common materialist imagination are corpuscular extended chunks of matter not unlike billiard balls. The materialist notion generally teaches that such atoms undergo direct contact and collision. It accepts for its atomism the common sense notion embedded in perceptual macroscopic objects and their interactions. Newton, Locke, and Dalton accepted such atoms in different

forms, but Boscovich went against material atomism by suggesting that the billiard ball image of atoms was incorrect in general and specifics. He rejected the sensible judgments of collision, contact, and corpuscle with his notions of non-compenetration, action at a distance and force points. Even though phenomena of the senses appear to validate collision and so on, Boscovich denied any direct contact between ultimate particles, which for him again, are mathematical points, not solid chunks of matter. What could be more certain and common to the senses than that bodies have contact and collide, like, when we release our shot with the cue stick, the force it imparts to the cue ball seems to roll into direct contact with another ball, colliding violently enough to set off a complex set of further collisions? So all sorts of bodies collide with each other in the world of experience. Yet Boscovich denied the senses in this fundamental way. Of course macroscopic objects appear to collide or even destroy each other through impact, but this does not occur whatsoever at the point-particle level of reality. And this Boscovich could prove by rational and analytical geometric proofs.

Boscovich in Beyond Good and Evil

The most extended public pronouncement Nietzsche made on Boscovich occurs in section 12 of *Beyond Good and Evil*:

As for materialistic atomism, it belongs among the best-refuted things there are: perhaps no scholar in Europe today is so unlearned as to still grant it serious meaning other than as a handy device (namely, as an abbreviated means of expression) – Thanks above all to the Pole Boscovich, who, along with the Pole Copernicus, has been the greatest and most victorious opponent of appearances. While Copernicus has persuaded us, against all senses, that the Earth does *not* stand still, Boscovich taught us to renounce belief in the last thing of earth to "stand fast," belief in "substance," in "matter," in the last remnant of Earth, the corpuscular atom [*Klumpchen-Atom*]: it was the greatest triumph over the senses achieved on Earth to this time.

The Dalmatian natural philosopher is credited here with refuting the "earth residuum" or

corpuscular atom of the “older atomism,” from Democritus to Newton:

... It was pretty much according to the same schema that the older atomism sought, besides the operating ‘power,’ that lump of matter in which it resides and out of which it operates – the atom. More rigorous minds, however, learned at last to get along without this “earth-residuum,” and perhaps someday we shall accustom ourselves, including the logicians, to get along without the little “it” (which is all that is left of the honest little old ego). [Section 17]

Atomism and the logicians share a superstition: the object. Boscovich refuted the object of atomists; the logician’s belief in an object suffered the same fate. Yet belief in a logical subject still stands as a widespread superstition. The belief “it thinks” encapsulates the subjective model of consciousness, but it misinterprets the process of thought in which thoughts come to the thinker, not the reverse. A thinking “subject” is part of the misinterpretation of the process. Even those revolutionary thinkers against materialistic atomism preserved the fiction of a logical-psychological subject. Grammar hypostatizes the subject and establishes the superstition firmly in mind – even Boscovich maintained a naive belief in minds and souls. It proves easier to dissuade the mind from belief in solid particles of earth than from belief in the ego (this being no surprise to Cartesians). Yet the ego is as much superstition as matter; taking this step beyond the Boscovichian revolution presents us with the very origin of will to power as a theory. Boscovichian “force” must, through criticism, give way to the force of will and more exactly the “will to power.”

It is not long in *Beyond Good and Evil* after the first mention of Boscovich before Nietzsche deduces his own theory of reality distinct from Schopenhauer, Berkeley, and Boscovich: the primacy of neither mind nor matter but rather *drives*. This notion of drive has as much to do with Boscovich as Schopenhauer and perhaps even more to do with Spinoza than Schopenhauer; for while Boscovich lent Nietzsche a physics of force not requiring matter, even Schopenhauer’s notion of will was directly borrowed from Spinoza’s idea of *conatus*. Boscovich did not go quite far enough in his inversion of Spinozism: for he did not give

conatus to his force points and quite explicitly boasted of not doing so (Whitlock 1996; Whitlock 1999). Leibniz did not refrain from attributing thought to force points, however, and this presents us with a moment in which Boscovich more closely resembles Newton’s position than that of Leibniz. Boscovichian force points do not think, requiring the strained admission of minds and souls into his new model of the world. Nietzsche found his own position when he drew the necessary conclusion that points of force must also be points of will (having *conatus*); thinking becomes a relation of the drives exerted from these points. They do not exert a Spinozist-Schopenhauerian will to live, but a will to power. Will power depends on active force. Will can act only upon another will, never on matter (as Schopenhauer would have will directly acting on the thing-in-itself). *Beyond Good and Evil* 36 is decisive as an introduction of the theory of will to power; it namelessly evokes Boscovich’s theory of force as the parent notion while then showing the birth of “my proposition,” as Nietzsche calls the theory of will to power; it also calls for the performance of a thought experiment previously carried out in the “time atomism fragment” of 1873, which can be shown to synthesize the ideas of Boscovich, African Alexandrovich Spir and Johann C.F. Zöllner (Schlechta and Anders 1962; Whitlock 1997; Whitlock 2000). That thought experiment leads directly to his theory of will to power and the idea of eternal recurrence.

Time Atomism

Ironically, Nietzsche’s time atoms are sensate monads, centers of time perception, rather than true atoms. Time atoms are more monads, the smallest point of subjectivity, but open to all other centers. Centers of force are points of sensation, which are simultaneously centers of time perception and points of conation. Time atoms are instants of observation occurring so rapidly as to be virtually instantaneous in ordinary experience. Since light travels at a finite speed, observation always takes a finite quantum of time. Temporal comparisons require a subject capable of judging

simultaneity or succession. Time exists only relationally. At its most infinitesimal level, it exists as the finite instantaneous observation at the speed of light between two relatively closest points of force. Quantum observations allowed Nietzsche to consider centers of conation as points of perspectival interpretation. Dynamic time points can be points of sensation only if they are centers of time perception, that is, time monads. Time atoms are not in time; time is in them. In time atomism, there are temporal particles, clocks, and minds. Each particle is a mind, and every mind is a clock.

Crucially, Nietzsche did not believe in objective duration nor in objective time as a continuum (Nietzsche 2001). Time atoms exist for an observer but not in themselves. While we can never completely leave the naive metaphysics of natural language, retaining any amount of it lands a thinker in contradiction. Every quantum of force/time/observation constantly actualizes its potential, expressing its power. Time atoms are atomic clocks with rhythms that are thermodynamic in origin. Time is not a continuum comprising points. Rather than the recurrence of moments of objective continuous time, centers of time perception recur with definite, finite, but ever-fluctuating quanta of power. There is no absolutely smallest moment. Every perspective has its limiting points. Rates of perception determine what is called “real.”

These points of time perception, or time atoms, are centers of will to power. Further, time atomism is Nietzsche’s special theory of time, while eternal recurrence is his general theory of relativity. Thus time atomism developed into his theories of will to power and eternal recurrence. Boscovich, advancing on Newton in some regards, delivered a unified single theory of force; Nietzsche argued that all force is will, and further, will to power. *There is no matter, only force*, Boscovich declared against Newton, but Nietzsche continued, *all force is will to power*. In his own time, Boscovich was eclipsed by Newton and Leibniz, even though he enjoyed a widespread reputation in the sciences.

Boscovich had become obscure by Nietzsche’s time, though, due to the rise of experimental and instrumental sciences. Even though the Dalmatian contributed to instrumental science in astronomy, Boscovich himself witnessed only the early

moments of the scientific revolution. “Natural philosophy” was quickly forgotten. Mechanistic physics came to hold sway, with its powerful discoveries of electricity and chemistry. Many of the leading scientists of the mechanistic sciences lauded Boscovich and understood his place in the history of science, but in the scientific community at large, names like Faraday, Maxwell, Davy, Lord Kelvin, and others obscured the figure of natural philosopher Boscovich.

After Nietzsche’s time, Boscovich’s point-particle physics was eclipsed by the De Broglie-Schrödinger wave-particle theory. The problem plaguing science for some time had been the nature of light, and Boscovich’s points did nothing toward a solution. Wave-particles washed away his sand castle of homogenous grains. Point-particle theory did not enjoy a long day in the sun, located between Newtonian corpuscularism and wave-particle theory.

Nietzsche lived in a brief period of time when the distinct advantages of point particle theory could be appreciated by speculative types disinclined toward mechanistic physics, without knowledge of the imminent solution to a problem unsolved by force points, i.e., the dual behavior of light as wave and particle. He was hardly the only thinker who sought out Boscovich as an advance over Newtonian corpuscular atomism and Spinozistic metaphysics; Herder the mystic did so, just as did Vogt, Priestley, Faraday, Davy, and others. Each approached Boscovich’s particle theory in a mood of pragmatism, if not opportunism. For the hard scientists, the advent of De Broglie and Schrödinger robbed the motive to research Boscovich’s theories. To some philosophers, metaphysicians, mystics, and rationalists, Boscovich still maintained importance vis-à-vis Leibniz and Kant, but only as a footnote. To historians of science, the importance of Roger Joseph Boscovich, however, was not lost.

Many of Nietzsche’s views on education and atomism have come about. Atoms are no longer thought of along Newtonian lines, meaning the corpuscular atom. Dynamism won over mechanics, for a while. Boscovich and zero-dimensional force points became part of Slavic science and atomic research. Quantum mechanics and even

string theory have a Nietzschean flavor, as they are rather Dionysian insights behind appearances. Naive realism is forever gone. And educational institutions are no longer medieval in the way he had lamented. Experimentation has replaced speculation.

Introduction

For a philosopher who has widely been regarded as bad, or mad, or even dangerous to know,

Nietzsche has a surprisingly wide and rich variety of things to say about education. In his early career as a professor of philology at the University of Basel, Nietzsche saw himself first and foremost as an educator; after retiring (on grounds of ill-health) from education after only 10 years, he pursued different strategies of education through his philosophical writings. The purpose of this entry is to trace Nietzsche's view of education throughout his writings and, in conclusion, to link it with the German tradition of *Bildung* and, beyond that, to the Greek concept of *paideia*.

Nietzsche as Professor of Philology

On 12 February 1869, Nietzsche learned from the Cantonal Government of Basel that, 2 days earlier, the Small Council of the City of Basel has decided to appoint him as Extraordinary Professor of Classical Philology at the University of Basel. This appointment was a remarkable achievement: at the age of only 24, Nietzsche had attained a professorial status which, for most others, it took many years to reach. So it is even more remarkable that, as critics and biographers are usually quick to point out, after about 10 years in post, Nietzsche tendered his resignation from his professorship at Basel in 1879.

What critics and biographers frequently overlook, however, is the extent of Nietzsche's hands-on, practical educational activity during his tenure at Basel, at least in the years immediately following his appointment. For his teaching duties included responsibility not just for lectures at the University but also courses at the Gymnasium in Basel, the Pädagogium located on Münsterplatz. So in the summer term of 1869, Nietzsche gave lectures at the University on Aeschylus and on the Greek lyric poets, as well as classes at the Pädagogium on Plato's *Phaedo*, Homer's *Iliad*, and the development of Greek drama, Greek meter, and Greek grammar. As Nietzsche wrote on 10 May 1869 to Friedrich Ritschl, his former tutor in Leipzig, he had "enough to do to stop him getting bored": every weekday at 7 o'clock in the morning, he gave a three-hour-long lecture (from Mondays to Wednesdays on the history of Greek

lyric, from Thursdays to Saturdays on *The Choephoroi* by Aeschylus); on Mondays there was a seminar as well, while on Tuesdays and Fridays, he taught two classes at the Pädagogium, on Wednesdays and Thursdays, just one. These classes, which Nietzsche taught “with pleasure,” operated at a high pedagogical level. When reading the *Phaedo* with his students, he told Ritschl, he tried to “infect” his students with philosophy: “through the technique, unheard of here, of extemporalia” – a teaching method, whereby a teacher reads out a text, which the pupil must immediately translate into Greek – “I am shaking them very roughly from their grammatical slumber” (Nietzsche 1986, vol. 3, p. 7). True, the number of students involved was, by today’s standard, often small: around seven students in his lectures, for instance, “with which I am told I should be content,” he told Ritschl.

At the same time, there is evidence of deep personal engagement on Nietzsche’s part as a teacher. In his seminars on Nietzsche’s *Zarathustra*, the psychoanalyst C.G. Jung alluded twice to a story he had heard about Nietzsche and one of his students:

In one of his lectures [Nietzsche] was talking about Greece and Graecia Magna in most enthusiastic terms, and after the lecture a young man who had not understood something he said [...] went up to the professor to ask him about it. But before he could put in his request, Nietzsche said: “Ah now, you are the man! That blue sky of Hellas! We are going together!” And the young man thought: “How can I go with this famous professor and how have I the money to do it?” — and he receded further and further, Nietzsche going at him and talking of the eternal smile of the skies of Hellas [...], till the young man backed up against the wall. Then suddenly Nietzsche realized that the fellow was frightened by his enthusiasm, and he turned away abruptly and never spoke to him again. (Jung 1989, vol. 1, pp. 16–17; cf. vol. 2, pp. 1361–1362)

As well as doing a lot of actual teaching, Nietzsche did a lot of reflecting on teaching. The fruit of these reflections was a series of lectures which Nietzsche gave to the Academic Society in Basel in the winter and spring of 1872 under the title *On the Future of our Educational Institutions* – or has it has been recently retranslated, on *Anti-Education*.

The text of these lectures nearly became Nietzsche’s second book, after *The Birth of Tragedy*; in the end, Nietzsche abandoned the plan to rush them into print and the lectures appeared posthumously.

In these five (of an originally planned six) lectures, Nietzsche presents a sobering and, in some respects, devastating critique of education – in his day and in our own. In his introduction, Nietzsche states as his central thesis the view that two opposing drives rule contemporary educational institutions: first, “the drive toward the highest possible *widening of education*” and, second, “the drive toward the *diminution and watering-down* of education”; these drives, he argues, succeed in producing “a culture founded on lies” (Nietzsche 1999, vol. 1, p. 647). What this kind of education ends up producing is, Nietzsche says, a specific kind of “barbarism,” a kind of barbarism that makes nineteenth-century Germans – and, by extension, us today – “different from the barbarians of other ages.” From the outset, Nietzsche makes it clear that, in these lectures, he does not propose a discrete set of policies or curriculum plans. Rather, he is trying to reactivate the notion found in Aristotle’s *Nicomachean Ethics* (1123a34 – 1125a35) of *megalopsychia* or “high-mindedness” (*Hochsinnigkeit*) (Nietzsche 1999, vol. 1, p. 650).

His correspondence with, among others, Erwin Rohde strikes a similar note of disappointment in regard to something that became a constant theme in Nietzsche’s writings: the relationship between scholarly, academic activities and the tasks of the “real world,” ultimately, the relation of knowledge to life. His answer to this problem both returns Nietzsche to the tradition of philosophy conceived as *exercices spirituels*, as Pierre Hadot has called it, and marks him out as inaugurating, along with Schopenhauer, the body of thought known as *Lebensphilosophie*. For the wrong answer to the knowledge-life problem lay, so Nietzsche believed, in scholarly activity *for its own sake*. As he put it in one of his *Untimely Meditations*, “I consider every word written to be useless, unless it contains a call to activity” (Nietzsche 1999, vol. 1, p. 413), and in *Ecce Homo*, he was even more trenchant, describing “the scholar” as “a decadent”: “His instinct of self-defence has become soft; otherwise he would defend himself

against books”; time and again, Nietzsche emphasized that his reflections were based on what he had himself seen: “Gifted, generously and liberally disposed natures ‘read to ruins’ in their thirties, mere matches requiring to be struck to make them emit sparks – or ‘thoughts’” (Nietzsche 1999, vol. 6, p. 293).

Indeed, in his notes for a never-completed essay, provisionally entitled “We Philologists,” Nietzsche went further: “Classical philologists are people who use the hollow feeling of inadequacy among modern people in order to earn money and put bread on their table. I know them, I’m one of them” (Nietzsche 1999, vol. 8, p. 76). The reverse side of this dissatisfaction was his ideal of a secular monastery; a plan to build one of these in the Swiss *canton* of Graubünden came to nothing (but the idea survived in Nietzsche’s mind.) In contrast to the sad figures of conventional academics (of which, as he acknowledged, he himself was one), he opposed two men, a philosopher and a composer – Schopenhauer and Wagner.

It was to these figures that Nietzsche dedicated the third and fourth (of what had been planned as a series of thirteen) essays under the umbrella title, *Untimely Meditations*. In his second *Untimely Meditation*, “Schopenhauer as Educator” (1874), Nietzsche’s encomium demonstrates the principle enunciated in his essay: “I profit from a philosopher only inasmuch as he can be an example” (Nietzsche 1999, vol. 1, p. 350). It is also an essay that contains in nuce Nietzsche’s theory of education, not least because it is clear that what Nietzsche says about the genius is intended to apply to himself.

The principle underlying Nietzsche’s argument about education is that “your true being does not lie hidden in you, but immeasurably high above you” (Nietzsche 1999, vol. 1, pp. 340–341). On this basis, Nietzsche argues that “your educators can be nothing other than your liberators,” consequently defining education precisely as “liberation,” that is, as “the clearing away of weeds, debris, and vermin that want to attack the tender buds of plants, a pouring-forth of light and warmth, the gentle patter of rain at night” (Nietzsche 1999, vol. 1, p. 341).

Nietzsche distinguishes between two approaches to education, one of which involves recognizing the real strengths of pupils and trying to help that one excellence attain full maturity, the other of which involves developing and cultivating *all* the pupil’s faculties in order to bring them into a harmonious relationship (Nietzsche 1999, vol. 1, p. 342). Yet in the end, he concludes, these two approaches are not opposites but rather complementary: “That educating philosopher of whom I dreamed would not just discover the central power, but also know how to prevent it from acting deliteriously on the other forces,” and he uses the following striking image to capture the task of education: “To transform the entire human being into a living, moving solar and planetary system and to discover the laws of its higher motion” (Nietzsche 1999, vol. 1, p. 343).

By contrast, however, Nietzsche cannot suppress his lament for the reality of education as it is practiced: he offers a searing critique of tutors (“what sort of people will do, even among our noblest and best-instructed people”), of grammar schools (“what a hodgepodge of warped minds and antiquated institutions”), and of universities (“what are they not content with – what leaders, what institutions”) (Nietzsche 1999, vol. 1, p. 343)! In short, Nietzsche was looking for “the ethical exemplars and people of distinction” among his contemporaries “to serve as the visible embodiment of all creative morality” – and searched in vain (Nietzsche 1999, vol. 1, p. 344).

Nietzsche’s Middle Period

On 2 May 1879, Nietzsche resigned from his post as professor at Basel and, supported by a pension from his former university employer, began a new life – as a philosopher in exile from his home country and from academic institutions. Yet the topic of education remains central to Nietzsche’s thinking. Indeed, the entire question of “disciplined schooling” is closely bound up with the emergence of the notion of “free spirit” in his thought (Mintz 2004).

For instance, in *Human, All Too Human*, vol. 1, §265, in an aphorism entitled “Reason in school,”

Nietzsche suggested that “schools have no more important task than to teach rigorous thinking, cautious judgement, and consistent reasoning” (and hence would have no time for religion) (Nietzsche 1999, vol. 2, p. 220). Subsequent aphorisms noted the “undervalued effects of grammar school-teaching” (§266) and questioned the value of “learning many languages” (§267). In the second half of the second volume entitled *The Wanderer and His Shadow*, Nietzsche denied there were any real educators (§267) and argued that, “as a thinker, one should only talk of self-education,” going so far as to talk of the teacher as a “necessary evil” (§282): he blamed “the surplus of teachers” for the fact that “one learns so little and so badly” (Nietzsche 1999, vol. 2, p. 677).

Then again, in *Dawn* (§297) Nietzsche suggested that “the surest way one can ruin a youth is to teach him to respect those who think the same as he does more highly than those who think differently from him” (Nietzsche 1999, vol. 3, p. 221), and in *The Gay Science* (§366), he offered an excoriating critique of academic writing in an aphorism entitled “Faced with a scholarly book” – “I closed a very decent scholarly book, gratefully, very gratefully, but also with a sense of relief” (Nietzsche 1999, vol. 3, p. 614).

Thus Spoke Zarathustra marks a stylistic break, but there is a strong thematic continuity between Nietzsche’s early and later thought; correspondingly, in this work the long-standing concern of education is treated in a new way. For while critics have disagreed about the attitude toward education in *Zarathustra*, the work’s central (and prophetic) figure is explicitly presented as pedagogical in his mission. After all, as Martin Heidegger pointed out (Heidegger 1985, p. 65), Zarathustra presents himself as “the advocate of life, the advocate of suffering, the advocate of the circle,” the circle being a symbol for a doctrine of which Zarathustra is “the teacher” – “eternal recurrence,” while at the outset of the work, Zarathustra declares: “I teach you the Superman” (Nietzsche 1999, vol. 4, pp. 271 and 275 and 14). While such chapter headings as “Of Reading and Writing” (in Part 1) and “Of the Land of Education” and “Of the Scholars” (in Part 2) gesture

toward the theme of education, it is clear that Zarathustra’s ambitions as a whole should be understood in the light of Nietzsche’s earlier writings. When Zarathustra says of himself, “And this is all my creating and striving, that I create and bring together into one what is fragment and riddle and dreadful accident” (Nietzsche 1999, vol. 4, p. 179), and when in his *Nachlass* notes Nietzsche says that Zarathustra is “the great synthesis of the creative, the loving, the destroying” (Nietzsche 1999, vol. 11, p. 360), it is evident that Nietzsche is restating his great theme of totality. Seen in this light, his remark made in his essay on Schopenhauer about a human being who “feels himself perfect and boundless in knowledge and love, in vision and power, and in his completeness is at one with nature as the judge and yardstick of things” (Nietzsche 1999, vol. 1, p. 385) can be seen as an anticipation of the later ideal of the *Übermensch* or Superman.

Later Writings

In the texts written in the final few years of his philosophical activity before his collapse in 1890, Nietzsche continued to offer a vigorous critique of education in his day. In *Twilight of the Idols*, Nietzsche summarizes his entire outlook in an aphorism entitled “From the military school of life”: “What does not kill me makes me stronger,” while he repeatedly returns to the theme of education in the sections entitled “What the Germans Lack” and “Expeditions of an Untimely Man.” What the Germans lack, it turns out, is above all education – in the Nietzschean sense (§4; Nietzsche 1999, vol. 6, pp. 60 and 107). He laments (in §6) the absence from education of a sense of “noble culture,” reflected in learning to see, to think, and to speak and write (Nietzsche 1999, vol. 6, p. 108). As for learning to think, he believes (in §7) that “schools no longer have any idea what this means,” while in universities “logic as theory, as practice, as a *craft*, is dying out” (Nietzsche 1999, vol. 6, p. 109). The German universities arouse some of Nietzsche’s strongest condemnation: “What an atmosphere prevails among their scholars,

what a barren, what a self-contented and lukewarm intellectual outlook! [...] For 17 years I have not grown tired of exposing the intellect-stripping influence of our contemporary scholarship” (Nietzsche 1999, vol. 6, p. 105). That exposure found its most memorable expression in the following dialogue presented as part of a doctoral viva:

“What is the task of all higher education?” — To turn the human being into a machine. — “By what means is this done?” — He must learn how to be bored. — “How is this achieved?” — Through the concept of duty. “Who serves as a model?” — The philologist: he teaches how to *graft*. — “Who is the perfect human being?” — The state bureaucrat. — “What sort of philosophy provides the best formula for the state bureaucrat?” — Kant’s: the state bureaucrat as thing-in-itself set up as a judge over the state bureaucrat as phenomenon. (Nietzsche 1999, vol. 6, pp. 129–130)

Were it not for the fact that Nietzsche had been an academic *Wunderkind*, it would be easy to read this criticism of education as an expression of resentment or bitterness. It is not; rather, it is the conclusion Nietzsche reached after having gained access to the inner sanctum of academia. At the same time, one does not have to regard Nietzsche as a case study in “suffering and self-cultivation,” as “a man who, heroically, continued to transform his physical torments and spiritual abysses into what is one of the most life-embracing and ‘yea-saying’ philosophies in the Western world” (Hillesheim 1986, pp. 177–178). Instead one can read Nietzsche as returning to the conception of education as *Bildung* promoted by, among others, Wilhelm von Humboldt (1767–1835). Common to this tradition and to Nietzsche alike is an emphasis on the potential holistic totality of the individual. In its turn, this conception of *Bildung* draws on the older ancient Greek notion of *paideia*. This frankly aristocratic conception of *kalos kagathos*, “the beautiful and the good,” placed an emphasis on the excellence of perfection as a combination of ethics and aesthetics. So while it may at first glance seem surprising that the multivolume study of *Paideia: The Ideals of Greek Culture* (1933–1947) published by Werner Jaeger (1888–1961) does not draw more frequently on Nietzsche, this is largely because Jaeger views Nietzsche through the prism of *The*

Birth of Tragedy’s anti-Socratism and not in the light of Nietzsche’s critique of education.

Conclusion

As early as 1900, one critic expressed dismay that so little notice had been taken of Nietzsche’s contribution to pedagogics (Havenstein 1900, p. 93), and it remains the case that such other themes as the Superman, eternal recurrence, and will to power tend to obscure Nietzsche’s work in this area. Yet is his critique still valid? Or could it be even more valid now than it was in Nietzsche’s day? At a section on teaching philosophy to teenagers at a philosophy conference held in Cilli in 2000, one speaker argued that “this watering-down in the name of equality and the utilitarian submission of school education to the demands of a moral-political correctness legitimized by the state” is “the situation as we find it today” (Zeder 2001, p. 13), and in 2006 and 2014, the Austrian philosopher Konrad Paul Liessmann strongly confirmed this analysis (Liessmann 2006, pp. 60–64, 2014, pp. 8 and 127–128). Nietzsche, who declined in his lectures on educational institutions to produce new timetables and statistics (Nietzsche 1999, vol. 1, p. 648), would doubtless reject any utilitarian approach embodied in teaching objectives and learning outcomes of the kind found in pedagogical theory and practice today.

Nietzsche and Education

Rosa Maria Dias

Departamento de Filosofia, Universidade do Estado do Rio de Janeiro, Rio de Janeiro, Brazil

Friedrich Nietzsche was born on October 15, 1844, in Röcken, Prussia. After excellent studies at Pforta College, known for its teachings inspired in the humanist tradition, Nietzsche took up theology at the University of Bonn. In 1865, he abandoned theology and took up philology at the University of Leipzig. Recommended by his professor, Ritschl, Nietzsche was nominated professor of classical philology at the University of Basel, in Switzerland, where he taught from 1869 to 1879. In 1879, he was forced to resign from his post due to a serious illness. From then on, he lived an errant and lonely life, living in small boarding houses and always searching for more favorable climates due to his delicate health. The books *Thus Spoke Zarathustra* (1883–1885), *On the Genealogy of Morality* (1887), and *Ecce Homo* (1888) were written at this time. In 1889, after a mental breakdown in Turin, Nietzsche ended his activities. He died on August 25, 1900, in Weimar.

Nietzsche's lifetime concern was education and culture, but it was during his first years as a professor at elementary school, and at the University of Basel, that he began to look into the concrete problems of elementary and university

schooling. He observed that the system had abandoned the humanist outlook in exchange for the scientific. Education was consequently vulgarized, its objective having become to form useful and profitable men, not harmoniously matured and developed personalities. Alert to everything regarding education, Nietzsche decided to denounce the “unnatural methods of education” and the tendencies that undermined it.

Before we approach Nietzsche's thoughts about education, we must make a series of observations. As this is the study of a philosopher that joins thought to life, that has his own way of philosophizing, and that finds joy in search and in transitoriness and therefore does not fear to see, from different points of view, the contrasts that life offers so as not to lose the coherence of his thoughts, we will limit our analysis to the moment in which Nietzsche explains in greater detail the problems regarding education and culture. We will therefore favor his work produced between 1870 and 1874, especially his lectures *The Future of our Educational Institutions* (1872), *Untimely Meditations – On the Uses and Disadvantages of History for Life* (1874), and *Schopenhauer as Educator* (1874).

In Nietzsche's thoughts, education and culture are inseparable. There can be no culture without an educational project nor education without a culture to support it. Education in German schools springs from a historicist conception and gives origin to a pseudoculture. Culture and education are synonyms of “selective training,” “the formation of the self”; for the existence of a culture, it is necessary that individuals learn determined rules, that they acquire habits, and that they begin to educate themselves against themselves or, better, against the education forced upon them.

In his lectures on *The Future of Our Educational Institutions*, Nietzsche examines the entrails of the educational system of his time. He perceives that the State and businesspersons are primarily responsible for the impoverishment of culture. They block the slow maturation of the individual, the patient formation of the self – that should be the finality of every culture – demanding a rapid formation so as to have efficient employees and docile students at

their service, youngsters that will learn how to earn money rapidly. But this is not all. When they demand a more profound education, allowing for in-depth specialization, they do so in order to make even more money. But this is not all. This indecorous haste leads students, at an age when they are not mature enough to ask themselves which profession they should pursue, to make bad choices.

Nietzsche detects, in the educational system of his time, two tendencies that do nothing but work for the impoverishment of culture – the “maximum amplification of culture” and the “maximum reduction of culture.” The first tendency, “maximum amplification,” intends that the right to culture be accessible to everyone and demands that the dogma of economic policy be followed: “as much knowledge and culture as possible; hence, as much production and demand as possible; hence, as much happiness as possible: this is more or less the formula” (*Ueber die Zukunft unserer ildungsanstalten*, p. 667). The second tendency, “reduction of culture,” intends that individuals devote their lives to the defense of the interests of the State and demands that its servants seek specialization that they be “faithful to little things” and to the State.

Linked to these two tendencies, according to Nietzsche, there is the journalistic culture. It is the confluence of the two previous tendencies, the place where they meet and hold hands. Amplified culture, specialized culture, and journalistic culture complete one another to form one “unculture.” The journalistic culture, according to Nietzsche, gradually substitutes true culture. The journalist, “the master of the moment,” is a slave to the present, the ways of thinking and fashion. He touches topics quickly and lightly. He writes about artists and thinkers and slowly takes their place, destroying their work. But, while the journalist lives off the moment, thanks to the genius of other men, the great works of great artists emanate the desire to survive and surpass time though the power of their creations.

With the purpose of restoring German culture, Nietzsche examines the educational institutions responsible for the different stages of scholastic formation – gymnasium (the equivalent to

junior – school and high school), technical school, and university – and denounces the evil that poisons them and indicates remedies to combat this evil.

Nietzsche has a lot to say about the gymnasium. In his mind, nothing was done for this stage of the students’ formation – possibly the most important one of all – for it reflects in all the coming stages of learning. Therefore, the renovation should begin in the gymnasium. He acknowledges the need for a greater investment in the learning of the native language and in the art of writing – the most essential chores of secondary school. The German language, at that point in time, was contaminated with the “deceptively elegant style” of journalism. The access of the semi-literate to power had provoked a drastic reduction in the wealth and dignity of the language. The question, however, was not only the poverty of vocabulary but also the ill use of the resources offered by the language. The chore of a high-quality school should always be to lead the student to understand the importance of studying his native language in depth, for if it loses its vital strength, culture itself will tend to degenerate. If the professor is not able to impress on his young students, a physical aversion to determine words and expressions which journalists and bad novelists have grown them accustomed to, it is better – according to Nietzsche – to renounce culture. Therefore, it is imperative to analyze the classics – line by line, word by word – as well as to stimulate the students to try to express the same thought several times, improving this expression each and every time.

Education begins with habit and obedience, with discipline. To discipline the youngster linguistically does not mean to overburden him with historical knowledge about the language but to make him build determined principles from which he can build on, both internally and externally. It means to turn the student into the master of his language and to give him the possibility to construct an artistic language, starting from the works that preceded him. This, according to Nietzsche, is the only way to revive German education and culture.

The growing disregard for the humanistic formation and the increase in the scientific tendency

in school; schooling guided by historical and scientific questions and not by practical teachings; the abandonment of teaching that aims to form an individual in an artistic sense of language, in favor of a doubtful journalistic style; and the emphasis given to professionalization that aims at forming people prepared to make money – all of this prevents the educational system from turning itself toward culture.

One must point out that Nietzsche is not hostile toward the implementation and proliferation of technical schools in Germany. There, individuals learn to calculate conveniently and to dominate the language of communication. They acquire natural and geographical knowledge. In a way, these schools accomplish their objectives: to form businessmen and women, civil servants, officers, agronomists, doctors, and technicians. What Nietzsche censors when he states that culture is not a servant of livelihood and need is the fact that the gymnasium and university have turned toward professionalization, even though they continue to believe that they are temples destined to teach culture, when in fact they are not much different from technical schools and their objectives.

Nietzsche also spares no criticism for university schooling: “A mouth that speaks, many ears and less than half the hands that write – this is the apparent academic mechanism, this is the culture machine of university put into activity.” The professor speaks. The student listens and writes as he listens. “These are the moments when he is linked to the umbilical cord of university. He can choose what he is going to hear, he does not need to believe what he hears, he can cover his ears when he pleases” (Nietzsche 1988, p. 740).

“Academic liberty” is the name given to this double autonomy: on one side, the autonomous mouth; on the other, the autonomous ears. Behind these two groups, a relative distance away, is the ever-present State, reminding the student that the State is “his final objective, the end and the essence of these proceedings of speech and hearing” (Nietzsche 1988, p. 740).

The “achromatic” style of teaching that privileges the oral exposition of the professor and the students’ hearing is the opposite to what

Nietzsche understands should be university education. There, where one ought to demand rigorous training from the student, autonomy was invented. This autonomy is nothing but the domestication of the student, to turn him into a docile creature, one that submits himself to the interests of the State and the rich bourgeoisie.

It is necessary, according to Nietzsche, to contain this historical, scientific, and professionalizing tendency in the university – a tendency that demands swift teaching, deep enough only to transform individuals into efficient servants. These institutions should turn their attention to the problems of culture or, better, the essential questions posed by the human condition.

Nietzsche and Morality

Peter Durno Murray
Athens, Greece

[Dionysian](#); [Earth](#); [Ethics](#); [Life](#); [Morality](#); [Nietzsche](#)

Introduction

Friedrich Nietzsche developed a morality based in the earth and life in an attempt to overcome the devaluation of life by religious belief. As a grounding for his new morality, he advocates emphasizing the value of the senses of immediacy and eternalization which he associated with Dionysianism.

Nietzsche is well known for his critique of religiously based morality; however, it is less

well known that he also produced a naturalistic morality grounded within life and which is completely affirmative of life. As the grounding of his affirmative morality, he identifies a “shuddering” or “shivering” moment of intoxication which he calls a “Dionysian” event, occurring as an overwhelmingly powerful compulsion originating outside consciousness to acknowledge the priority of articulate otherness. He chooses the name of the Greek god of intoxication, symposia, and festivals as a figurehead for his morality due to the overpowering nature of the event. In doing so he joins a line of philosophical thought which has recognized the importance of “Dionysian” or divine “madness” (ASC 4 reference to Plato, *Phaedrus*, 244a–d), referring to a powerful affective event considered as an obsession or possession. This event is found to be the limit and ground of thinking and to give consciousness its dynamic force, and as such it is considered to be of the highest value for humanity. Plato described the event as beginning with an engagement with another person, considered in terms friendship, with its ultimate goal being a capacity for the love of wisdom, but understood as a consolation for the finitude of life. The intoxicating engagement is taken by Plato to signify the possibility of the “soul” encountering a supersensible essence beyond the flux of earth and life, but accessible to reason within life, similar to later philosophical descriptions of the experience of the sublime.

Unlike Plato and others, Nietzsche argues that an interpretation of the event as signifying a transcendent or immanent principle or essence – and on this basis attributing the highest value to gods, metaphysical substances, essential human qualities, or essential qualities in nature – is a denial of the value of life. In particular, he argues against attributing any negative moral quality to natural existence as a whole, especially that of “evil” and also argues against those who consider that abandoning transcendent or immanent truth will leave nothingness as the only alternative grounding for thinking. He proposes a complete revaluation of all European values in terms of the “Dionysian” event considered as a rejection of the grounding of philosophy in the thought of death. Instead, he turns to the preeminence of

articulate otherness and sees the value of this moment of engagement as an expression of a form of life that affirms both the finite present and the infinite future of the earth and life. In doing so, he rejects the argument that moral values could be derived from an intuition of a transcendence of life and instead grounds moral values in the interactions of finite human beings. The necessary preeminence of otherness in the Dionysian event is found to occur as the articulate resistance that another person presents to our interpretation of their own unique interpreted world.

The requirement for those who would like to take up this morality is that the empirical and theoretical aspects of the event become instinctively felt and thought at the highest level possible at the time. In this way, the affirmation of the resistance that others pose to our interpretation of existence, considered as underlying all aspects of each person’s unique interpreted world, can be developed into a personalized ethos or practice of life considered as an affirmative engagement with life. In developing this ethos, Nietzsche is guided by two fundamental imperatives: to “be true to the earth,” which is to restrict interpretational responses to the sensible world and to “create beyond oneself,” which is to create for others beyond our own lives (Nietzsche 2006a 1, Prologue, 3). In addition, Nietzsche advocates a number of virtues, especially straightforwardness (or honesty) (*Redlichkeit*), truthfulness (*Wahrhaftigkeit*), and the love of wisdom (*Liebe der Weisheit*), each associated with a sense of the need to develop the courage and consistency required for generosity or “gift giving” in any thinking (Nietzsche 2008a, p. 295). On the basis of this dynamic ethical force, Nietzsche claims to provide a “healthy morality” which is “governed by an instinct of life” (Nietzsche 2006b, “Morality as Anti-Nature,” 4). He argues that his morality thinks through an “optics of life” (Nietzsche 2006b), with the naturalistic life-affirming ethos particularly concerned with the creative expression of one’s unique ethical perspective on friendship and community.

In relation to ethical generosity, Nietzsche requires a broadly inclusive ethics, which affirms all humanity and is true to the materiality of the

earth and life. The trials undergone by Nietzsche's character Zarathustra provide an extreme example of someone who dedicates their life to the advocacy of such a morality, believing in the universal worth of living and dying well on earth, struggling and suffering from himself and others in order to achieve ethical integrity, and undertaken as the practice of one's own life as an ethical educator. This is an extremely difficult role to take on, and Zarathustra has problems developing the courage and the coherence required to communicate a teaching which undermines the logic and sense of truth associated with both the scientific and religious values of modernity. In this context, he uses the analogy of the sun as an example of the selfless giving of a being which must also one day pass away. In another example in his early work, he discusses the "heat death" of the sun as a future limit for human life itself, but argues that apocalyptic theories only have logical force in the context of particular cosmological interpretations projected over incredible time spans which could lose their sense of certainty with any new discovery (Nietzsche 1997). He decides that such theories predicting destruction harbor a religiously based pessimism and nihilism concerning human existence and need to be reevaluated using the optics of life to determine the underlying moral choices in play. He ultimately adopts the cosmology of eternal recurrence as a model best suited for the affirmation of an eternity of life and material existence. In this way, he argues for an expansive ethico-critical view of scientific materialism and an ethically based naturalism for our interpreted worlds in order to overcome the belief in scientific or religious grounds for human certainty.

Despite using many naturalistic metaphors associated with the earth, sea, sky, and life to evoke a sense of the resistance to interpretation occurring in the Dionysian event, Nietzsche warns against projecting our capacity for articulate resistance onto other life or material forms or locating a connatural essence or principle in life or matter which we share and which could be articulated by us as a first principle in moral theory. He differentiates humanity from nature on the basis of the capacity for articulate resistance using gestures

and language. In relation to human beings, he finds powerful examples of the Dionysian event in aesthetic experience, especially in performances of drama and music. However, these aesthetic performances are found to imitate or draw upon the gestures and language that occur preeminently in compelling articulate engagements with other human beings. In such engagements the other person is found to resist the interpretation which has been presented to them, whether on the grounds of its content, intention and/or logical coherence. The experience of the resistance to one's interpretation is followed by an attempt to broaden the interpretation to compensate for its lack of inclusiveness. This expansive attempt at inclusion is found to be the fundamental dynamic force of thinking behind the development of consciousness, understood as each person's interpreted world (Nietzsche 2007, p. 354).

Such interaction – the articulation of resistances to interpreted worlds – is considered to mark all human engagements, but with differing degrees of straightforwardness and acceptance. In any case, an interruptive force exerts constant pressure on the interpretation, occurring most simply as the articulation of a combination of "yes" and "no" by the other person – an articulation which can range from shared laughter with friends to harsh censure and which can be ambiguous or crystal clear (Nietzsche 2006c, p. 6). In other words, the articulation of resistance can be felt by the self as an affect of pleasure and/or displeasure. For Nietzsche, these are fundamental and simultaneous forms of compulsion experienced in the shuddering event. In all cases, the resistance can be attributed to the incommensurability in time and space of the self "present" as interpretation and the other person, who withdraws from this presence into their necessarily unique space of difference. Nietzsche thus refers to the recognition of a "pathos of distance" and a "great separation" between people which cannot be overcome by a reductive interpretation.

We cannot establish precisely what is unique about the other person, and there are also problems with our capacity to accurately communicate our response in words. However, reflecting on this inability to comprehend the other leads to the

consideration in general terms the conceivable extremes in perspectives within the ethical or moral context. It is possible to describe our response as an instance of the affirmation of “alterity” – insofar as this is an attempt to do justice to the other person as necessarily different and unique – at a fundamental level of immediacy and, at the same time, involving an affirmative sense of naturalistic eternity. The other person questions our capacity to provide an ethically sound interpretation of their existence, or in other words, asks that in our response we do justice to their unique existence within our interpreted world.

As well as the separation from others and their resistance to our interpretation, the event can be interpreted in general terms as our response to the impossibility of being indifferent to the other person, who thus also offers *irresistible resistance* to our interpretation. It is possible to reject or try to ignore the event, but only after the fact. For Nietzsche, this irresistibility is central to the identity of Dionysus. The unavoidable affective undergoing of resistance can be affirmed as a sense of a shared undergoing of life, including its senseless suffering, and a working in the present (of immediacy) and, at the same time, for eternity, considered not as a promise of an afterlife in which I participate, but as an indeterminable future of humanity after one’s death. As such, the Dionysian event can be considered as a *compulsion to ethics* (opposed to and rather than a desire for metaphysical truth), which is found to remain operative even when one is faced with life’s sternest problems, but which favors the affirmation of the existence of others despite any suffering this might entail, for the sake of a future for humanity.

There is a compulsion to acknowledge that, beyond the uniqueness of another person, incommensurable differences in space, time, and interpretation are also communicated by all others. In relation to the legislator, creator, and educator, the consideration that in one’s engagement with an actual other person one is apprehending a universalized sense of human otherness forces the creative self to remain aware of the necessary injustice of all interpretation and communication. In this way, one is led to question how it is possible to be

just to all others without an all-encompassing concept of justice and, on that basis, how it is possible to be ethical or just at all. Once again, such a thought is found to be similar to the notion of reason’s capacity to engage with the sublime, precisely that which exceeds it, in this case, to remain open to the infinite possibilities of human identity. Thus, if this event is to be used as a basis for the legislation of ethical laws, one’s own uniqueness as an ethical creator who can endeavor to assume responsibility before this infinite becomes the basis for acting justly. Nietzsche uses the mythological figure of Atlas holding up the universe (Nietzsche 2008a 9) to indicate that responsibility to create a just future must be able to accommodate such an infinity of otherness. On this basis, the work of philosophy for the future is found to encompass, as a goal, the capacity to envisage these extremes of justice and the extent to which one is responsible for one’s interpreted world.

For Nietzsche, there is a need to be true to the dynamic play of resistance and response and to give it the highest value in terms of the earth and life. It has been argued that responsibility for creating beyond oneself extends to the temporal extreme of eternity. In addition, in examining to the fullest extent the significance communicated by the other person through their resistance to our interpretation, we can assume that they ask for justice to be done to an integrated sense of existence at the immediate and eternal extremes of the earth and life, which includes reflective consciousness, pre-reflective consciousness (which could be called “psyche” or “soul”) and, in addition, every aspect of their bodily existence. The latter can be extended in accordance with modern science to deeper levels at which interpretive engagement may be effective. Nietzsche’s term for existence at this extended bodily level of self in its resistance to others is called “will to power,” which can be extended to neuronal levels of the body, where language first forms (Nietzsche 2008c, p. 144), but also to one’s interpretation of external forces, such as gravity, which are thought to affect the body at subatomic levels but exist in the broadest scope. On this basis, other people can be said to evoke, exhibit, and articulate, in each

moment, the empirical immediacy of the earth and life.

The parameters of one's responsibility to the other person are stretched to a breaking point in this expansive spatiotemporal model of human signification, while also fully applied to the unique historical existence of the other person. One's theoretical guarantee of respect for the uniqueness of the other person and sense of a need to articulate a perspective with the broadest temporal framework are insufficient as an ethics if it is not also possible to guarantee the well-being of others in relation to one's projection of a future for humanity in general on earth beyond one's own unique physical life.

The Dionysian event transmits an underlying veracity concerning the worth of life that can be called an "ethical sensibility." This demands a thinking that has evaluative strength and questions from the outset the truths associated with objective knowledge. It is also possible to translate the requirements for ethics presented by the other person into a responsibility to act for nature. The Dionysian event can be seen as an affirmative thread running through relational human existence and, as will to power (occurring as justice), substantiating the net of consciousness (Nietzsche 2007, p. 354) with respect to both earthly and eternal justice. The request for justice made by the other person is a dynamic force in thinking – like a thread or a trace of meaning that guides responsibility – to which Nietzsche gives the highest value. As such, the other person can be seen to be speaking for the infinite otherness of the immediacy of the natural earth and life and at the same time requiring that the highest level of practical empirical justice are incorporated in ethical decision-making with a sense of working for a future beyond our era. In relation to all fields of knowledge, there is a need to consider which logical and scientific hypotheses best suit an ethics which is affirmative of life in the context of such a future.

Since Nietzsche, the recognition of the problems associated with European-Christian ethical thinking in modernity has continued through the generations,

with a process of secularization combined with eco-ethical concerns, along with various calls for the rethinking of the neoliberal economic model, which advocates a dynamism arising principally from first-world consumption. The priority of an ethical mode of thinking found in Nietzsche's work can be utilized to achieve greater levels of justice for others, the earth and life. Rather than seek to limit or even annihilate the encroaching-expanding difference which is faced, it is possible to begin to seek in others this irresistible resistance – as what is valuable in any attempt to expand our own historicizing interpretation – and which, in resisting domination, offers the promise of higher levels of self-reflection and creation for the sake of others. It has been argued that the affect undergone by the self is for the other, considered in terms of both aspects of the Dionysian scale of affectedness, and that, on this basis, the other person, through their resistant questioning of one's right to be a creator of meaning, lifts one out of an ambivalence felt toward justice, into ethical and political activity.

Nietzsche and Rhetoric as Self-Education

Tracy B. Strong

University of Southampton (UCSD Distinguished Professor, Emeritus), Southampton, UK

It is well known that the secondary literature on Nietzsche covers the widest possible range. It goes from Nietzsche as a proto-Nazi to Nietzsche as aristocratically and aesthetically apolitical to Nietzsche as a possible constitutionalist and democrat. This spectrum of interpretations is often said to be consequent to inconsistencies or confusions or mistakes in his thought. One might, however, also note that it seems to be the lot of great thinkers to permit such a wide range of interpretations – one thinks of Plato or Rousseau.

How and by what are we to be educated in reading Nietzsche if no one can say finally what he means? This diversity leads one to ask if one can – or should – take all of Nietzsche's writings seriously. Are there not what one might call "rhetorical" exaggerations? It is clear that no one can fail to recognize the rhetorical quality and concerns of his work. Aside from his published writings, he lectured regularly about rhetoric and related matters; it is worth noting that Nietzsche is explicit that this work forms a "background" to the *Birth of Tragedy*, even if, as he notes in a letter to his friend Rohde in February, 1872, he had consciously left it out of that book. (These lectures are in the second set of volumes from *Werke Kritische Gesamtausgabe* (Berlin: de Gruyter, 1966ff), henceforth *WKG* (and are not in the paperback *Studienausgabe*). Other citations from this edition.) The analysis of rhetoric underpins the argument of his first book as it does the rest of his work.

Some scholars have taken his rhetoric very seriously and find Nietzsche's style to be the source of political danger. Heinz Schlaffer has argued that Nietzsche's style has had the effect of hyperbolizing contemporary political

understandings. Thus, after Nietzsche, when one speaks of leadership in a political context, one thinks of a "super"-leader, a leader of leaders. Nietzsche may have thought of such a person as a philosopher (as Heidegger was shortly to do), but when that possibility fades away, Schlaffer remarks, the "word is unbound" but the rhetorical idea of what a leader ought to be remains. This can have, he argues, deleterious political consequences (Schlaffer 2007).

Schlaffer's is a serious argument, but it is notably *not* that of most of those who take note of his rhetoric and style. Most of those who do generally point to his rhetoric as a way to *excuse* Nietzsche from one or another claim or to point out a philosophical "mistake," an "unacceptable" political stance. This is often phrased as his "rhetorical excesses." The general presumption of this claim is often that behind or besides such rhetoric there is an argument that one should reconstruct: an attempt to get something "out" of Nietzsche. This has led to a multitude of readings that seek to *excuse* him from some apparent implications of his writings on the grounds that "Nietzsche certainly did (really) not believe X."

After the Second World War, Walter Kaufmann was the first great master of the apology based on rhetoric. Aside from interpretive choices, there were political-historical reasons for his approach: not only had the First World War been tagged by British journalists as "Nietzsche's War," not only had a copy of *Zarathustra* been standard issue to each soldier in the *Wehrmacht*, but the subsequent appropriation of Nietzsche by the Nazis required a rehabilitation for him to be granted admission to the philosophical host. Nietzsche could appear to be responsible (in some sense of the term) for the horrors of the century. To distance him from these events, Kaufmann generally proceeded by suggesting that when Nietzsche praised, for example, war, he only meant a war like the Franco-Prussian war: his praise was "just rhetoric." To his apparently derogatory remarks about Jews, Kaufmann adduced counter anti-anti-Semitic quotations with the explicit or latent assertion that any offending words elsewhere were

consequent to youth, the spirit of the times, or Wagner's baleful influence.

This approach lead to much work that sought to present what Nietzsche *would have said* had he been writing to publish in a contemporary philosophical journal. We are given what *would have/should have* been Nietzsche's arguments, which are then subjected to the kind of critical analysis that philosophers are good at. While there is sometimes material of interest in such work, it generally skirts the question of the importance of rhetoric.

Relatively few commentators have taken his rhetoric seriously and positively, denying that Nietzsche's style and rhetoric are centrally important to his philosophical teaching. Although he is far from the only one, exemplary here is Brian Leiter who argues in his contribution to the *Stanford Encyclopedia of Philosophy* that Nietzsche's "penchant for hyperbolic rhetoric and polemics often leads him" to "overstate" his case. Such a judgement is, I think, seriously wrong.

To start with, Nietzsche does not separate "rhetoric" from language itself. In a 1874 lecture course he writes: "There is obviously no unrhetorical 'naturalness' of speech to which one might appeal: speech itself is the result of nothing but [*lauter*] rhetorical arts [,] the power – which Aristotle names rhetoric – to discover and make expressive [*geltend*] that which works and makes an impression on each thing and this is at the same time the essence of language [*Sprache*] . . . it does not wish to instruct but rather to transmit a subjective arousal [*Erregung*] and acceptance to another person." If language is then ineluctably rhetoric(al), what does that mean in terms of one's inevitable use of language?

Nietzsche's concern with rhetoric is continuous. Aside from his courses, in 1872, for instance, he sketches an outline for a book "Considerations on Reading and Writing." In 1875 he prepares a document on style for two of his students. The most important elaboration, however, comes in "The Doctrine of Style," ten notes or commandments presented by letter to Lou Salomé in August, 1882. Nietzsche sends her this:

1. The first necessary matter is life: Style must *live*.
2. Style must in retrospect be appropriate for you in relation to precisely the particular person with whom you wish to confide. (The law of *double relation*).
3. One must first be quite clear about this: thus and thus do I wish to speak and *express* myself – before one has the right to write. Writing must be an impersonation (*Nachahmung*).
4. Because many of the means of those who speak (*Vortragenden*) are missing to those who write, the person who writes must have an overall highly developed expressive ability to present speech as a model: the presentation of that which is written must necessarily turn out as much paler.
5. Wealth in life betrays itself as *wealth* in *gestures* (*Gebärde*). Everything, the length and brevity of sentences, punctuation, the choice of words, pauses, the sequence of arguments – must be learned to be understood as gestures.
6. Be careful about the use of periods [full stops – TBS]. Only those beings that have a lengthy breath in speaking have the right to periods. For most, periodizing is an affection.
7. Style should show (*beweisen*) that one believes in ones thoughts and does not only think them but rather *feels* them.
8. The more abstract is the trust that one wishes to teach, the more must one bring (*verführen*) sense (*Sinne*) to it.
9. In the choice of its means, the rhythm of a good writer of prose (*Prosaiker*) approaches that of poetry, however, without ever surpassing it.
10. It is neither proper nor intelligent to anticipate the small objections (*leichteren Einwände*) for ones readers. It is very proper and very intelligent to leave it to ones readers to express themselves the essential point of our wisdom.

Each commandment is worth pondering. To pick out a few: "Style must in retrospect be

appropriate for you in relation precisely to the particular person with whom you wish to confide (*der du dich mitteilen willst*).” He calls this the “law of the double relation.” This is an educational concern: one must shape what one says according to the particular qualities of the person or persons one is addressing and the circumstance. One recalls a phrase of Emerson’s: “Eloquence is the power to translate a truth into language perfectly intelligible to the person to whom you speak.”

At the end, he urges that it is the reader (in each case the person for or with whom the writer wishes to speak) who must come to express for himself or herself these claims; they must, that is, become part of the assessment the reader has of the world. He had insisted: “Wealth in life betrays itself in a wealth of gestures. Everything, the length and brevity of sentences, punctuation, the choice of words, pauses, the sequence of arguments – must be learned to be understood as gestures.”

What this “everything” entails is that Nietzsche *crafted everything that he published with great and purposive rhetorical care* and with central attention to its educational impact. If one takes this claim seriously, it means that *everything* in his published texts is there for an educational or therapeutic purpose, including that which appears as “excessive.”

This is a strong claim – it is a bit like saying that there is *nothing* in da Vinci’s *La Gioconda* (the “Mona Lisa”) that is not essential to that painting and that there is nothing that is not there that could have been part of that painting. It is like saying that *every* word in Robert Frost’s “Stopping by the Woods on a Snowy Evening” is exactly necessary to the poem. Or it is like Schumann’s response when asked, upon finishing a piece, as to its meaning. His response was to play it again, every note. Presumably not even Nietzsche was able to attain perfection in all of his writing, but it is significant that this is what he sought to do and this means that dismissing some aspect of his writing as “overblown rhetoric” will most likely proceed from an unrecognized prejudice.

In the *Phaedrus* (274e–275b), calling upon the story of the presentation of the art of writing by the

god Theuth to the Egyptian king Thamus, Socrates instantiates Thamus’s distress with the written word: writing reminds but does not remember; it gives the simulacrum but not the reality of wisdom. As if responding to Plato, the reading of one commandment (the fourth) indicates that Nietzsche is pressing Lou Salomé on how to write in order that one’s writing *acquire the quality of speech* – with all its hesitations, gestures, embodiments, and so forth. This is the importance of rhetoric. In analyzing Nietzsche’s work, one must then proceed very carefully and slowly – one must *listen* to it – for writing is always a temptation to conclude. Note for instance number six above: the point about periods means that you have to have done a lot to be entitled to put an end to a thought.

As such his work is also meant to be a temptation and to be experienced as such: the rhetorical tropes are of utmost importance, of a necessity embedded in our very use of language. In the 1874 lecture course “Presentation [*Darstellung*] of Ancient Rhetoric,” he continues with “there is in fact no unrhetorical ‘naturalness’ of speech to which one might make appeal. . . . To sum up: tropes do not attach themselves now and then to words, but are their most particular nature.” Tropes are not a “special meaning” applying only in special cases. “In fact all that is called ordinary speech is figuration.” It is worth noting here that this does not mean that Nietzsche thought that “everything is metaphor” – which would make the idea of metaphor impossible – but that the concept of metaphor allows him to deal in a complex manner with the relation between language, mind, the natural world, and the body.

Importantly, he calls rhetoric “an essentially republican art,” because one has to be “used to bearing the strangest opinions and outlooks and even be able to feel a certain pleasure in their conflictual play (*Widerspiel*).” He indicates that rhetoric was the culmination of the education of the men of Antiquity: “the highest spiritual activity of a well-educated (*gebildeten*) political man.” This is, he says, an “odd notion for us,” and proceeds to quote Kant’s *Critique of the Power of Judgment* to

the effect that “the speaker gives notice of a matter to be considered and, in order to relate to (*unterhalten*) his listeners, presents it as if it were a play with ideas.” Rhetoric permits thoughts to be addressed to a wide range of individuals, with different formations and understandings – it is thus educational and political.

What difference then does it make to pay attention to rhetoric? Here is an example where a translator has paid insufficient attention to a rhetorical trope (I borrow and extend this example from Babich 2006). In the Kaufmann edition of the *Genealogy of Morals*, one finds that all of the sections in the first essay begin with a capital letter. If, however, you go to the German edition, you will find that sections 1, 4, 7, 8, 9, 12, 13, 14, and 17 begin with a dash, in German a *Gedankenstrich* – a “thought-stroke.” Just to make matters more complex, Kaufmann does give the dashes at the *end* of several paragraphs (8 has a double dash) but does not give the two dots at the end of 6, nor the three at the end of 7, 10, 11, 12, and 16.

What to make of this? From the strictures to Lou von Salomé one can say that the dots indicate an *ellipsis*, the rhetorically intentional omission of something from an original thought. I am unclear why there is an ellipsis with only two dots. The dashes, however, mark an *aposiopesis* – the word means “becoming silent” and is a rhetorical device indicating the presence of something has not been made explicit, as in Darth Vader’s “I sense something, a presence I have not felt since—.” Here at the *beginning* of a section, they seem to me to indicate that what follows is addressed to a particular person and that the following text is a response to this person. (A clue comes from the fact that sections 14 and to some degree 15 are in fact explicit dialogues.)

To what it is a response is for us to determine. In section seven Nietzsche appears, and is often taken, to contrast the noble with the base. Larry Hatab, for instance, speaks of it as providing the oppositional framework between the warrior and the priestly. Brian Leiter reads it as the “marked” contrast of “the values of ‘the warrior caste’ with the ‘priestly caste.’”

Nietzsche writes in the first part of the section:

You will have already guessed how easily the priestly way of evaluating can split from the knightly-aristocratic and then continue to develop into its opposite. Such a development receives a special stimulus every time the priestly caste and the warrior caste confront each other jealously and cannot be one with the other as to the prize. The premise of the knightly-aristocratic value-judgments is a powerful physicality, a radiant [*blühende*: Diethe (Cambridge University Press) gives “blossoming”; Kaufmann, “flourishing”], rich, health that overflows the self [*selbst überschäumende*: D, “even effervescent”; K, “even overflowing”], which includes all that it needs to maintain itself, war, adventure, the hunt, the dance, combat games [*Kampfspiele*: D, “jousting”; K, “war games”] and above all contains in itself all that is strong, free, happy activity.

This sounds pretty much like the standard vision of Nietzsche’s master/aristocrat. Yet what about that little dash (omitted from Kaufmann, unmentioned in Hatab or Leiter)? Rhetorically the passage as addressed to someone. To whom? One answer would be to Christian anti-Semites. They might read the part of the section quoted in the passage above and respond with something like: “Yeah! That’s us knights! *Jüden ‘raus!’*” Yet what one finds later in the section is that these Jews give rise to the Sermon on the Mount. Much of the last half of the section is in fact a paraphrase of Matthew 5.13. “We know now,” says Nietzsche – who here is the “we”? – “*who* became heir to this Jewish revaluation.” Those who became heir to the “Jewish revaluation” are the Christian anti-Semites who had been lapping up the first part of the section. So: apparently Christian anti-Semitism is itself consequent to the “Jewish revaluation.”

The next section (eight) begins with another dash, now presumably the voice of the author of the above paragraph responding to the readers. He writes there: “But don’t you understand that? You don’t have eyes for something which needed two millennia to achieve victory?” “Two millennia” and “you” obviously orient the designation to contemporary Christianity and Christians, thus confirming that the addressees are in fact Christian anti-Semites. One should continue through all sections asking who is talking to whom. In anticipation of and in an improvement on Sartre’s *Antisemite and Jew*,

Nietzsche is telling us here that the distance between anti-Semites and Jews is constructed by Christian anti-Semites to serve their advantage. The passage first seduces that group and then turns back on it.

Nothing in Nietzsche (at least in what he published) can be read properly without hearing the rhetorical resonance that any section of a sentence sets up, both with the rest of the sentence and with the rest of the entry of which it is a part, and with those that are around it. (You cannot just pick passages at random as some commentators have averred.) Nietzsche's writing thus calls up (or can call up) a *critical relation between what the reader wants and what the text makes available and requires of the reader*. His writing calls into question precisely the desire to assume that one's understanding is correct. Nietzsche's rhetoric reverses the traditional picture of the reader and the text: *it is as if the text has become the analyst and the reader the analysand*. We are not to interpret the text but to allow ourselves to be available to the text for nothing should stand between. (In a like manner, Tynedale and other early Protestants urged a direct ["literal"] engagement with Scripture.) In reading Nietzsche or any (philosophical?) text, one should/can come to call into question precisely what one wants to make of it – and that teaches one something about oneself. The rhetoric of the text is intended to produce a "self-critique" – an education of one own self by one's self. This critique is what Nietzsche in his preface to *Twilight* calls "sounding out idols," idols which function here as "eternal truths," that is, as truths that claim for themselves a permanent moral standing. To "sound out an idol" means rather to produce a *dissonance*, the contrast between the tuning fork and the sound the idol makes when struck. An understanding of the role of his rhetoric shows why, at the end of his first book, Nietzsche says that the human being "becomes dissonance."

Introduction

Friedrich Nietzsche's *Human, All Too Human* contains a striking statement about education: "The school has no more important task than to teach rigorous thinking, cautious judgment and consistent reasoning" (Nietzsche 1986, p. 125). Can this be Nietzsche that most radical and iconoclastic of thinkers, one wonders? Yes, it is. At any rate, it is the Nietzsche of 1878, the year that begins what commentators call the "middle" period of his published work. Whether it is the Nietzsche of poststructuralist citation and interpretation is another matter. The passage points toward a tension between two aspects of Nietzsche's thinking relevant to education, that is, between a radical vision of personal development and chosen means that seem to imply a far more conservative agenda. The following discussion locates this problem within a broader context, not in order to eliminate the tension but rather to show that, for Nietzsche, it can act as a productive force within education.

Human, All Too Human is the manifesto of Nietzsche's commitment to thinking that is both naturalistic and historical in its approach to philosophical themes. A common view among interpreters has been that this was an untypical phase, preceded and followed by periods in which his individual voice and mode of thinking were far more in evidence. In fact, Nietzsche was a "realist" before this time and remained a realist after it ended, despite the apparently skeptical character

of his thought (Small 2009–10). One piece of supporting evidence is the consistency of his thinking about education. Its general drift is best expressed in a sentence placed at the head of his most thoughtful essay on the subject, *On the Uses and Disadvantages of History for Life*. It is not his own formulation, but a remark of J. W. von Goethe: “In any case, I hate everything that merely instructs me without augmenting or directly invigorating my activity” (Nietzsche 1983, p. 59). The relation between knowing and living is the concern that is central to all Nietzsche’s thinking on the problems of education (Small 2016), and we can see in surveying his writings how this concern becomes steadily more radical in its effects.

What Nietzsche Seems to Say About Education

In considering Nietzsche’s views on education, should we focus on what he says about schools or universities? Not necessarily. For one thing, most of his explicit opinions on the subject occur within a particular project which occupied him for several years. Its aim was to reconsider the nature and meaning of one discipline: classical philology. To do this was to question the school whose curriculum centered upon the learning of ancient languages and literatures. It was also to undermine his own situation as both university professor and school teacher, since his responsibilities at Basel University included teaching at senior level in the city’s *Pädagogium* (i.e., high school for boys). For a successful young scholar, identified as a future leader in his academic discipline, to query its value so publicly was rather unusual. Part of the motivation was a weakening of Nietzsche’s commitment to an academic career by the attraction of a broader mission of cultural reform. Education was an important aspect of German culture and, given his starting point, a readily accessible one.

During his middle period, Nietzsche often attacks the prevailing model of education. In *The Wanderer and His Shadow*, the role of the teacher is simply denied: “Now that self-education and

fraternal education are becoming more general, the teacher must, in the form he now normally assumes, become almost redundant. Friends anxious to learn who want to acquire knowledge of something together can find in our age of books a shorter and more natural way than ‘school’ and ‘teacher’ are” (Nietzsche 1986, p. 353). But hopes for establishing such study groups (or “secular monasteries,” as he sometimes put it) proved hard to realize. Outside educational institutions, personal factors tended to exert greater influence than idealistic intentions. In default, Nietzsche took pride in his capacity for self-education. Writing in this vein of rejection, he even states categorically: “There are no educators.”

As a thinker one should speak only of self-education. The education of youth by others is either an experiment carried out on an as yet unknown and unknowable subject, or a levelling on principle with the object of *making* the new being, whatever it may be, conform to the customs and habits then prevailing: in both cases therefore something unworthy of the thinker, the work of those elders parents and teachers whom a man of rash honesty once described as *nos ennemis naturels* [‘our natural enemies’: a remark attributed to Stendhal]. – One day, when one has long been educated as the world understands it, one *discovers oneself*: here begins the task of the thinker; now the time has come to call on him for assistance – not as an educator but as one who has educated himself and thus knows how it is done. (Nietzsche, 1986, p. 374)

The teacher, he explains further on, is at best a necessary evil. He stands between the creators of knowledge and those who need it and, like every middleman between producer and consumer, acts for his own profit at the cost of both sides. Thus the teacher in the present system can only damage those he purports to serve. The problem with schools and universities, Nietzsche concludes, is not that we have too few teachers but that we have too many: “It is on their account that so little is learned and that little so badly” (Nietzsche 1986, p. 379).

These reflections add up to a highly skeptical attitude toward education in the usual sense. Is there such a thing? Can the development of an individual person be affected in anything but a harmful way by interference from outside?

Certainly Nietzsche considers that claimed benefits are generally debatable and that education as usually practiced is indeed bad for the individual:

The environment in which he is educated seeks to make every man unfree, inasmuch as it presents to him the smallest range of possibilities. The individual is treated by his educators as though, granted he is something new, what he ought to become is a *repetition*. If a man at first appears as something unfamiliar, never before existent, he is to be made into something familiar, often before existent. (Nietzsche 1986, p. 110)

Education in general is “the means of ruining the exceptions for the good of the rule” (Nietzsche 1968, p. 492). In Nietzsche’s eyes, mass societies are dominated by the principle of democracy in one or another form, whether they acknowledge it or not. Modern culture, with its government bureaucracy, its money system, its mass press, and its public education, is in every way an example of this tendency. According to Nietzsche, it displays a drive for more education in the sense of a wider distribution of schooling – but also a drive for *less* education, since that provided is narrowly defined by aims which are not those of education itself but of some different “way of life” (*Lebensform*). They belong to forces which intervene in education for their own purposes and in their own interests: the State, business, “good society,” and scholarship (Nietzsche 1983, pp. 164–174). For Nietzsche, as for most conservatives, “more means worse.” These two tendencies, toward a widening of education and a narrowing of its content, are inseparable from each other, and each reinforces the harmful effects of the other.

Nietzsche’s discussion takes on a more individual character when it turns to “science” (*Wissenschaft*, a word that here means scholarship). By now, his academic career was already past its peak. He had moved away from his academic discipline, making no further contributions to classical philology, and was trying to redefine himself as a cultural commentator. His attacks on scholarship are largely an attempt to imitate a completely different model, provided by his friend Richard Wagner, always a dangerous example for others. Wagner was not only uneducated

(and blamed his Leipzig school teachers for the gaps in his knowledge) but positively hostile to academic culture, although happy to have a university professor as a prominent supporter. Hence, the many passages like this in Nietzsche’s writing of the period:

As long as what is meant by culture is essentially the promotion of science, culture will pass the great suffering human being by with pitiless coldness, because science sees everywhere only problems of knowledge and because within the world of the sciences suffering is really something improper and incomprehensible, thus at best only one more problem (Nietzsche 1983, p. 169).

The pointed reference to the “great human being” reflects Nietzsche’s efforts to recruit supporters for Wagner’s ambitious Bayreuth Festival project. The passage does touch on a genuinely Nietzschean problem, one that remained central to his thinking to the very end, well after its departure from any Wagnerian model. It is the problem of learning and life, prefigured in the words of Goethe. The scholarship Nietzsche is describing is a withdrawal from real life, where knowledge is – or should be – no impersonal and abstract matter but rather a passionate cause, even an adventure. In *The Gay Science*, he speaks of “the age that will carry heroism into the search for knowledge and that will *wage wars* for the sake of ideas and their consequences” (Nietzsche 1974, p. 228). This search for knowledge is never disinterested. Rather, it involves a deeply personal commitment; and instead of being a withdrawal from real life, it is a determination to participate in it as fully as possible – to “live dangerously.”

What Nietzsche Really Says About Education

But how do we get from living dangerously to rigorous thinking, cautious judgment, and consistent inference? These look like the virtues of a conventional or traditional form of education. As an individual’s dispositions, they suggest the typical personality of the self-disciplined professional scholar, who is “orderly, parsimonious and obstinate,” to borrow an often quoted formulation of Freud (1953–75, vol. 9, p. 169). Freud was describing what he called the “anal” personality, and, as that label implies, his account of

these traits is rather different from Nietzsche's analysis of academic culture. Even so, the picture is quite similar.

Nietzsche's later writing takes this emphasis even further. It tends to refer not to education but to "training" (*Züchtung*). He chooses to use a simplified vocabulary, with a strong bias toward biological concepts, including a version of evolutionary epistemology. As a result, the schooling that he advocates looks more like a course of conditioning than of education. At times military discipline is proposed as an apt model for the scholarly vocation. "The same discipline makes both the good soldier and the good scholar," he writes (Nietzsche 1968, p. 483).

One late note surveys the conditions for good learning. Nietzsche suggests that unforeseen circumstances might provide a kind of training: through the need to overcome sickness, for instance, or some other challenge to the powers of the individual.

The most desirable thing is still under all circumstances a hard discipline *at the proper time*, i.e., at that age at which it still makes one proud to see that much is demanded of one. For this is what distinguishes the hard school as a good school from all others: that much is demanded; and sternly demanded; that the good, even the exceptional, is demanded as the norm; that praise is rare, that indulgence is nonexistent; that blame is apportioned sharply, objectively, without regard for talent or antecedents. (Nietzsche, 1968, p. 482)

What about education *for philosophy*? This is arguably the theme of Nietzsche's most important single discussion of education. It occurs in *Twilight of the Idols*, one of the last books that he completed. There he strips the aims of education down by specifying "the three tasks for which educators are required. One must learn to *see*, one must learn to *think*, one must learn to *speak* and *write*: the goal in all three is a noble culture" (Nietzsche 1954, p. 511). He then spells out each "task" in turn. One can say that Nietzsche is speaking of education for philosophy in these explanations, because they consistently emphasize the most universal aspects of thinking. He confirms this reading by remarking that learning to think is not found "even in the universities, even among the real scholars of philosophy" (Nietzsche 1954, p. 512).

The first of his three tasks for educators is the most unexpected one. Philosophers of education often consider the need to learn to think and write, but few mention "learning to see." So, what does it involve? First and foremost, Nietzsche explains the strength of will that enables one *not* to follow any impulse or react immediately to any stimulus but instead to postpone judgment about the content of one's experience. Doing this enables one to consider it from different and opposing perspectives, a capacity that Nietzsche particularly prizes. "Learning to see" is also a promotion of truthfulness or integrity, although the link is not self-evident. In another work from that final year, *The Antichrist*, Nietzsche writes, "By lie I mean: wishing *not* to see something that one does see; wishing not to see something *as* one sees it" (Nietzsche 1954, p. 640). Clearly he means what we call self-deception. Lying to oneself, he suggests, is more common than lying to others. He identifies its immediate cause as having "convictions" – that is, as being tied to particular interpretations of the world and of past history in particular – convictions being, as one of his best-known aphorisms puts it, far greater enemies of truth than straightforward lies (Nietzsche 1986, p. 179).

"Learning to see" also has a positive sense: it is identified with *objectivity*. Now, one might argue that this term is so compromised by careless use and idle talk that it may be wiser simply to give it up and use a different vocabulary for issues of epistemic validity. Still, Nietzsche makes an attempt to reclaim the concept, although he undermines his own case at times by using the same word for something that he altogether rejects: a passive approach to knowledge that simply accepts any fact that presents itself to observation, however trivial. No doubt this is an exaggerated picture, even for the routinized kind of academic research that Nietzsche repudiates. Still, it provides a sharp contrast with his declared approach to knowledge, which involves actively testing ideas and theories: "I favour any *skepsis* to which I may reply: 'Let us try it!' But I no longer wish to hear anything of all those things and questions that do not permit any experiment" (Nietzsche 1974, p. 115).

Such experimenting is what “learning to think” consists in, with the suggestion of a playful and creative use of concepts. The clue provided by the allusion to “scholars of philosophy” points to a convergence of thinking about education and a conception of philosophy or at least of philosophizing. Hence, to know what Nietzsche has to say about education, one has to focus on his conception of education *for philosophy*, because that is where he thinks the central purpose of education is seen most clearly.

Conclusion

An education for philosophy is, if not the essence of education in general – for there is no such thing if, as Nietzsche puts it, “only that which has no history is definable” (Nietzsche 1969, p. 80) – the key to understanding education in terms of three basic tasks: learning to see, learning to think, and learning to speak and write. Within each of these, the tension between self-discipline and creative freedom is a central feature and even a driving force. Any impression of a conservative position given by Nietzsche’s remarks on education comes from their emphasis on self-discipline, and from his bold simplified curriculum for types of learning which at first sight resemble the three Rs. What makes this a radical vision, looked at more closely, is its connection with Nietzsche’s most challenging doctrines: in particular, with his project of a “revaluation of values” that, in the aftermath of the “death of God,” sets out to replace morality and religion with a new “tablet of values.” That can be achieved only by the “philosopher of the future,” a further development of the middle period’s “free spirit” (Nietzsche 1966, pp. 53–54).

The ultimate task of education, then, is just to make such a figure possible. What is needed to achieve that goal? Despite his praise of self-education and mutual education, Nietzsche recognizes a crucial role for teachers and schools in promoting the skills and dispositions without which independent learning is difficult or impossible. “Rigorous thinking, cautious judgment, and consistent reasoning” are not held up simply as

ends in themselves, as in a traditional education, but as strengths that will enable the philosopher “of tomorrow and the day after tomorrow” (Nietzsche 1966, p. 137) to create different ways of knowing and living.

Nietzsche and Self-Education

Paul Fairfield

Department of Philosophy, Queen’s University
Kingston, Kingston, ON, Canada

Friedrich Nietzsche held that education, or the kind of it that concerned him, is self-education in a particular sense of the phrase. As he succinctly put it, “there are no educators,” and it is a point that it would profit us to examine (Nietzsche 1996, p. 132). What, in the final analysis, can one mind teach another? Who, for instance, taught Nietzsche how to write books of philosophy? Not only

did Nietzsche write eloquently on the concept of self-education, but his own education as a philosopher exhibits rather well this very theme. Nietzsche was one of the greatest philosophical writers of his time and likely the greatest. His doctoral studies were in philology, not philosophy, and he did not complete them since, having gained a position at the University of Basel, this was not required. He was a professor there for a relatively short time until his medical leave allowed him to live the life of a wandering solitary, which is the period in which he wrote his greatest works. He did it without institutional support (aside from a modest pension), tenure, research grants, assistants, and the various academic “dignities and respectabilities” which he held in contempt (Nietzsche 2003, p. 147). It was by no miracle that he “became what he was,” as he liked to put it, and it was also not due to having had good teachers in the conventional sense.

What was Nietzsche’s own formal education like, and to what extent can it be credited with producing the thinker that he became? To the latter question, the answer is not zero, but it is not so far from this, at least if we trust Nietzsche’s own word on the matter (which we should not do uncritically). Some of Nietzsche’s fondest childhood memories were of his father’s and grandfather’s studies and the world of books which they opened up to him. As he wrote at the age of fourteen: “Our house was built in 1820 and so was in excellent condition. Several steps led up to the ground floor. I can still remember the study on the top floor. The rows of books, among them many picture-books and scrolls, made it my favorite place.” A biographer notes that “already in prepubescent days he liked nothing better than fossicking around in Grandfather Oehler’s library and visiting the Leipzig bookshops with him. As [his younger sister] Elizabeth reports, it was in fact Grandfather Oehler who first spotted Fritz’s unusual gifts, telling Franziska [Nietzsche’s mother] that he was the most talented boy he had ever seen, more talented than his own six sons put together” (Young 2010, pp. 8, 17). [I cite Young’s text somewhat reluctantly and am mindful of the controversy that surrounds it.] “I was never happier than when I was in grandpapa’s study,

browsing through the old books and magazines.’ Once again he was in a pastor’s study in a country parsonage, surrounded by books: this was as close as he could come to re-enacting the experience of being with his father at Röcken” (Hayman 1980, p. 26). Nietzsche’s father having died during the boy’s fifth year of life, the responsibility for his education fell to his mother and maternal grandparents who sent him at the age of five to a primary school for boys and the following year to a private school in preparation for entry 3 years later to a Cathedral Grammar School. This he attended between the ages of 10 and 14, following which he earned a scholarship to attend a small and prestigious boarding school named Pforta. By this time, he had acquired a strict work ethic in spite of ill health and was able to impress the teachers – most of them – of this self-contained institution which stood at some remove from town life and to which parents relinquished virtually all rights over their children for a period of 6 years.

According to Julian Young’s (highly controversial) biography, “Nietzsche never doubted that Pforta made him. And he was always loyal to the school and grateful, not only for the magnificent education in the humanities but also for the character ‘formation’ it had given him. Twenty-four years after leaving, he wrote, ‘The most desirable thing of all . . . is under all circumstances to have severe discipline *at the right time*, i.e., at the age when it makes us proud that people should expect great things from us. For this is what distinguishes hard schooling from every other schooling, namely that a good deal is demanded; that goodness, nay even excellent itself, is required as if it were normal; that praise is scanty; that leniency is non-existent; that blame is sharp, practical, and has no regard to talents or antecedents. We are all in every way in need of such a school; and this holds good of physical as well as spiritual things – it would be fatal to draw distinctions here! The same discipline makes the soldier and the scholar efficient; and, looked at more closely, there is no true scholar who has not the instincts of a true soldier in his veins.” At Pforta Nietzsche absorbed the ethos of the Prussian State and took to it like a duck to water. In later years even his physical bearing would give

many the impression that he was an army officer (he had served a short time in the military). The curriculum at the exclusive secondary school consisted in the main of Greek and Latin as well as the classics of German literature (plenty of Goethe and Schiller) while mathematics and the natural sciences were not emphasized and, for the most part, poorly taught. It was the world of Rome and especially Greece into which the students were initiated, renaissance humanism being as essential to the Pforta philosophy as Prussian militarism. Here Nietzsche would remain until his twentieth year when upon graduation he began his university studies first in Bonn and, the following year, Leipzig. To please his mother, he began his studies in theology – a discipline for which he had no passion but which held out the promise of a career. “As a scholarship boy from a poor background he had no option but to think seriously about bread-winning,” and the clerical profession had been his father’s career until his premature death (Young, 2010, pp. 25–26, 31). Unable to stomach this for long, he switched to classical philology, for which Pforta had well prepared him and again which led readily to a career.

At Leipzig Nietzsche found suitable teachers in the noted philologists Otto Jahn and (especially) Friedrich Ritschl, although his interests were turning increasingly in a most impractical direction. Philosophy was his new love, owing not to any formal studies in this discipline or the philosophy professors at Leipzig but to his own reading, in particular of Arthur Schopenhauer’s *The World as Will and Representation* which he discovered in 1865 at the age of 21. Significantly, while Nietzsche read widely in these and subsequent years, he was not formally trained as a philosopher and had no complimentary words for the professors in this field whom he encountered in his school years or later. In “Schopenhauer as Educator,” for instance, he would write in 1874: “One has only to recall one’s own student days; in my case, for example, academic philosophers were men towards whom I was perfectly indifferent: I counted them as people who raked together something for themselves out of the results of the other sciences and employed their leisure time in reading newspapers and going to concerts, and for the rest were treated

by their own academic comrades with a politely masked contempt. They were credited with knowing little and with never being at a loss for some obscure expression with which to conceal this lack of knowledge” (Nietzsche 1996, p. 188). In later years, his assessment would become harsher still. A typical example reads: “Like those who stand in the street and stare at the people passing by, so they [philosophical scholars] too wait and stare at thoughts that others have thought” (Nietzsche 2003, p. 146). When as a professor of philology at Basel, Nietzsche requested a transfer to philosophy; it was not without reason that he was denied.

While he continued to have high praise for Pforta, not only did Nietzsche discover his vocation independently but the whole story of how he became the thinker that he was must be told largely apart from his schooling. His studies at Pforta, Bonn, and Leipzig did not produce the philosopher he became. What did was a drive for knowledge that was nourished not by teachers but by an appetite for reading that was voracious in spite of the severe eye strain that it caused him. “Nietzsche’s headaches,” a biographer reports, “... were likely exacerbated by his extreme short-sightedness and by the strain imposed by prodigious amounts of reading. (Often he read through an entire night, his foot in a bucket of freezing water to prevent him falling asleep.)” (Young 2010, p. 32). No Prussian schoolmaster could have imposed the level of discipline that he imposed on himself or the passion for ideas that was awakened in him through his reading in various disciplines over a good many years. True education, he came to believe, far transcends any utilitarian end or vocational training but is a higher cultivation or formation (*Bildung*) that emerges from within. This does not entail that one pursues an education alone, and in the account Nietzsche would provide an important role is assigned to “teachers,” but in a sense of the word that is distinctive.

The vital matter in education, Nietzsche argued, is to find a vocation and, inseparable from this, a teacher. In his own case, the pursuit of truth constituted the former, while the latter was a less straightforward matter. Nietzsche’s doctoral supervisor, as noted, was a philologist who did

little to encourage his student's growing fascination for philosophy and in no way served as a model of the kind of thinker Nietzsche was aspiring to become. In these days, as he put it, "I believed that, when the time came, I would discover a philosopher to educate me, a true philosopher whom one could follow without any misgiving because one would have more faith in him than one had in oneself." This youthful idea he would abandon and replace with "the terrible effort and duty of educating myself," and it was an effort that included the difficult matter of finding himself not a master but an exemplar (Nietzsche 1996, p. 130). This is what a teacher in the highest sense of the word is, for Nietzsche: one who demonstrates in their own person and work that which the student aspires to learn and become. An educator in this sense is not assigned by an institution or by anyone but is chosen by the student. An essential part of self-education on his understanding of the term is the task of finding the teacher who can impart by example what the student needs to learn. "The education of youth by others," in his words, "is either an experiment carried on by an as yet unknown and unknowable subject, or a leveling on principle with the object of making the new being, whatever it may be, conform to the customs and habits then prevailing." If we would speak of education in a higher sense, and of the thinker in particular, then "one should speak only of self-education" (as cited in Babich 2010, p. 144).

In "Schopenhauer as Educator," Nietzsche recounted his failed attempts as a young man to find the teacher he was seeking in the universities of Germany. It was an apprenticeship that he sought, not (or no longer) a master at whose feet he could sit but a philosopher who could model what he wished to become. He found this in none of his teachers in the institutional sense, men whom he largely held in contempt for mediocrity and especially laziness: "When the great thinker despises mankind, he despises its laziness: for it is on account of their laziness that men seem like factory products, things of no consequence and unworthy to be associated with or instructed. The man who does not wish to belong to the mass

needs only to cease taking himself easily; let him follow his conscience, which calls to him: 'Be your self! All you are now doing, thinking, desiring, is not you yourself.'" The educator one seeks properly teaches one not to be them but to be oneself, and one becomes this through imitation. One is not oneself; one becomes it, or one might, and not by scrounging around in an interiority that may not even be, but by finding an exemplar (s) who is worthy of a kind of selective and critical imitation. The student imitates the teacher, but it is oneself that one becomes. For Nietzsche, "your true nature lies, not concealed deep within you, but immeasurably high above you, or at least above that which you usually take yourself to be. Your true educators and formative teachers reveal to you what the true basic material of your being is, something in itself ineducable and in any case difficult of access, bound and paralysed: your educators can be only your liberators" (Nietzsche 1996, pp. 127, 129). It is hardly without significance that the subtitle to *Ecce Homo*, Nietzsche's "autobiography" – although the scare quotes are an understatement – is *How One Becomes What One Is*.

There is no metaphysics of human nature at work here. Nietzsche was speaking of a process of formation in which one becomes what one is by aspiring to an ideal that is self-chosen and that is modeled by a teacher who is also self-chosen. This is a version of the "role model" argument, with the crucial difference that the teacher is not charged by an institution with exhibiting particular traits of mind or character but instead it is the student who must find the teacher who can impart less by instruction than example what it is that the student needs to learn. Becoming educated is a difficult task indeed, and not only for the usual reasons but because the student is not being acted upon but is driving a process that originates within their own being and that requires a kind of agency that far surpasses what is usual in our institutions of learning. The question for the student is: "what have you truly loved up to now, what has drawn your soul aloft, what has mastered it and at the same time blessed it? Set up these revered objects before you and perhaps their nature and their

sequence will give you a law, the fundamental law of your own true self. Compare these objects one with another, see how one completes, expands, surpasses, transfigures another, how they constitute a stepladder upon which you have clambered up to yourself as you are now.” (Ibid., p. 129) No academic counseling is possible here, no guidance from without, for what one is choosing is not only what one will know or do for a living but who one will become or perhaps fail to become. One becomes what one is in the company of like-minded souls, both peers of similar inclination and especially an exemplar who has succeeded in some measure in accomplishing what one aspires to accomplish for oneself.

For the young Nietzsche, it was Schopenhauer who served in this role – a man he never met but whose writings lit a veritable fire in the student or, more likely, fanned an existing flame. Schopenhauer was no Kant or Hegel but a thinker in an entirely different and, in the student’s eyes, more Greek mold. What did Nietzsche see in this writer? The answer appears to bear less upon Schopenhauer’s philosophical doctrines than upon stylistic and affective – one might say spiritual – matters. Schopenhauer was an accomplished stylist, to be sure, but it was his sense of life still more that spoke directly to Nietzsche and that inspired him to follow in kind. What the young philosopher was in search of was himself and, as Babette Babich states, “Schopenhauer is Nietzsche’s exemplar on the way to finding himself (and losing Schopenhauer in the process, as Zarathustra enjoins his followers to lose Zarathustra)” (Babich 2010, p. 139). A philosopher, Nietzsche came to believe, is not a disciple, nor does one become what one is in a vacuum. Even the solitary Zarathustra left his mountaintop from time to time for the town in the valley below. Here is how Nietzsche described the effect that reading Schopenhauer first had on him: “I am one of those readers of Schopenhauer who when they have read one page of him know for certain they will go on to read all the pages and will pay heed to every word he ever said. I trusted him at once and my trust is the same now as it was nine years ago. Though this is a foolish and

immodest way of putting it, I understand him as though it were for me he had written.” “As though” is a crucial phrase here; Schopenhauer never lived to hear the name Friedrich Nietzsche, but in the student’s mind, *The World as Will and Representation* spoke to him as the Bible speaks to a believer and as Nietzsche also wished to write, which is to say directly, personally, and honestly. One can read every page of Schopenhauer’s magnum opus looking for formal arguments and positions that Nietzsche would make his own and one will find little. It was not the arguments that mattered primarily but a quality of thought that is more resistant to analysis. There is an honesty in the great pessimist’s writings that spoke to Nietzsche directly, an intellectual candor and an inwardness that the young philosopher had never seen before (he never read Kierkegaard). “Schopenhauer never wants to cut a figure: for he writes for himself and no one wants to be deceived, least of all a philosopher who has made it a rule for himself: deceive no one, not even yourself!” (Nietzsche 1996, pp. 133–134). Honesty and writing for oneself, Nietzsche believed, are rare in a writer, and it was these qualities that he wanted to emulate in his own work. There was no learning this from the rank and file professors of his time who were more interested in striking a pose – including one of perfect objectivity – than thinking in a manner that is intellectually forthright, personal, and existentially urgent.

Schopenhauer, in Nietzsche’s youthful eyes, was an “untimely” figure: fearless, independent, forever swimming against the current of his times yet also cheerful in the way of one who is unconcerned with others’ estimations of his work. In an era of naive optimism Schopenhauer’s truthfulness was untimely, heroic, and isolating. Only one with an iron constitution could write in this way, and it was this rare combination of honesty and cheerfulness that the young philosopher was endeavoring to develop. “I know of only one writer,” Nietzsche stated, “whom I would compare with Schopenhauer, indeed set above him, in respect of honesty: Montaigne. That such a man wrote has truly augmented the joy of living on this

earth. Since getting to know this freest and mightiest of souls, I at least have come to feel what he felt about Plutarch: ‘as soon as I glance at him I grow a leg or a wing.’” He added: “Schopenhauer has a second quality in common with Montaigne, as well as honesty: a cheerfulness that really cheers” (Ibid., p. 135). Thinking at its highest reaches requires a free-spiritedness that was lacking in the nineteenth century, dominated as it was by ponderous notions of rationalism, empiricism, and positivistic science which constituted not only false conceptions of knowledge but a profoundly dishonest view of philosophy. Nietzsche always understood philosophy in a basically Greek way, as a relentless pursuit of truths that are forever elusive. In the end, wisdom is had by the gods (who, for Nietzsche, are dead), not human beings. The latter can at best love it in the sense of pursue it, but the thing itself eludes us. It is best sought, Nietzsche believed, with the right attitude of mind – one that is Apollonian and Dionysian at the same time and in equal measure. It is a joyful wisdom that philosophy properly seeks, not the formal certainty of modern epistemology but something roughly intermediate between science and poetry and that partakes of both. Philosophy should inspire as art does, seduce the senses at the same time that it persuades our reason, the gap between the two being more apparent than real.

This is what Schopenhauer achieved, for Nietzsche. Here was a writer who could teach the young thinker what he most needed to learn and what no school could impart, “that magical outpouring of the inner strength of one natural creature on to another.” The terms of Nietzsche’s praise reflect his own highest aspirations: Schopenhauer “is honest because he speaks and writes to himself and for himself, cheerful because he has conquered the hardest task of thinking, and steadfast because he has to be. His strength rises straight and calmly upwards like a flame when there is no wind, imperceptibly, without restless wavering” (Ibid., p. 136). When he encountered Schopenhauer’s work, Nietzsche reported that he had been existentially lost, “devoid of fundamental principles,” having rejected the religion of his youth and having found nothing with which to replace it. In November of 1865 “I

came across this book [*The World as Will and Representation*] in old Rohn’s second-hand bookshop, and taking it up very gingerly I turned over its pages. I know not what demon whispered to me: ‘Take this book home with you.’ At all events, contrary to my habit of not being hasty in the purchase of books, I took it home. Back in my room I threw myself into the corner of the sofa with my booty, and began to allow that energetic and gloomy genius to work upon my mind. In this book, in which every line cried out renunciation, denial and resignation, I saw a mirror in which I espied the whole world, life, and my own mind depicted in frightful grandeur” (as cited in Young 2010, pp. 81, 87). Here were large existential themes being spoken of in the boldest way possible and with an independence of mind seldom found in the philosophy of the day. Immediately the young philosopher became a “Schopenhauerian,” as would a famous composer with whom Nietzsche would form one of the most important friendships of his life.

Richard Wagner, a man 31 years Nietzsche’s senior, fit Schopenhauer’s definition of a genius – or so it seemed to Nietzsche at the time (and to Wagner for a while longer). The composer was a “brother in spirit” to Schopenhauer, as Nietzsche came to see himself, although his devotion to both figures was destined to be fleeting (as cited in Young 2010, p. 124). The philosopher Nietzsche was becoming far too original to be a “Schopenhauerian” or devotee of any kind, and in time both Wagner and Schopenhauer would become more like influences than the idols they had been in his younger days. As Young notes, “Nietzsche needed the ‘space’ to be his own man, to escape from the overpowering presence of ‘the Master’” whom Wagner had been to him and Schopenhauer had been on a more imaginary plane (Young 2010, p. 158). These two figures were not the philosopher’s only influences. That the young Nietzsche was a voracious reader has been noted, and among the writers he admired most were Goethe, Montaigne, Epicurus, Baruch Spinoza, Ralph Waldo Emerson, and Fyodor Dostoyevsky. Although he often accessed philosophers via secondary literature, Nietzsche’s admiration for each of these writers was bound

up with an affinity of spirit that he shared with them. All were exemplars or teachers in his sense, with whom he felt a personal connection and from whom he could appropriate less their philosophical positions than a sense of life or deep attitude of mind. What he saw in Dostoyevsky, for instance, was not the Christian moralist but the psychologist and proto-existentialist, a commonality of spirit that is more profound than any doctrine.

The self-education of this philosopher consisted in an independent reading of authors selected with the aim of finding models from whom he could learn not “what a professional philosopher must know” (whatever that is) but what he himself needed to know: what kind of writer was it possible for him to become and how could he become what he was in the world of thought. He needed, as anyone who is serious about creative work does, to learn from the masters, masters chosen in light of personal affinities and who had achieved something comparable to what he envisioned for himself. The highest aim of education, on his view, is the cultivation of genius and cultural leadership. This is what the thinker strives to become, and if no pedagogical method imparts it, then one must teach it to oneself by immersing oneself in the work of one’s exemplars. One educates and indeed becomes oneself by studying, imitating, and ultimately leaving behind one’s self-chosen teachers. One climbs the ladder that one must, then throws it away.

Nietzsche and Solitude

Thomas E. Hart

Philosophy, Ryerson University, Toronto, Canada

Introduction

Friedrich Nietzsche’s philosophy of education can best be understood as the backdrop or foundation of his larger philosophical project. That said, outlining the philosophy of education presents a fairly unique set of problems. First of all, he did not write a work devoted to that topic other than the romantic analysis of education which he gave in a series of public lectures called *On the Future of our Educational Institutions*, which played a significant role in his early departure from education, and second, two of the three concepts that make up his pedagogical philosophy are at best elusive and tend to defy a positive definition. The first problem means that a Nietzschean philosophy of education must be pieced together from many of his major works and combined with some of his earlier works. Part of his thought on the topic suggests that contradiction has a role to play, such that many attempts to put together his philosophy of education have often fallen prey to the allure of the “doctrines.” But by remaining open to the development of his thoughts, we can both avoid that allure and bring about a coherent picture of his philosophy of education.

Born on 14 October in 1844, Nietzsche lived in Röcken and Naumburg before attending Schulpforta. After completing his studies there, he matriculated at the University of Bonn in classical philology, but moved to Leipzig after his first year of study due to what he felt was the overly political atmosphere of the Bonn seminar. This point was confirmed later during his inaugural lecture to the chair of philology in Basel in 1869 when he declared that “the estimation of philology in public opinion depends upon the weight of the personalities of the [individual] philologist!” (Nietzsche 1909, p. 146). This problem was something that

he increasingly saw as an endemic not just in philology but in higher education in general.

Nietzsche saw this problem as manifesting itself in what he called the Philistine culture of the day. He had a great deal of concern for the stagnation of intellectual life in the form of overly specialized scholarship, in the fragmentation of society and culture through what he called “an inordinately stupid ease and comfort doctrine for the benefit of the ego” (Nietzsche 2007a, §6). His critique of contemporary culture based itself on what he saw as the denigration of education, the push toward greater professionalism and specialization and the rising State control over both education and culture. These conditions, largely the result of the Humboldtian reforms in education in the early part of the nineteenth century, led to what he felt was the most damaging result: the democratization of education. As such, Nietzsche’s so-called aristocratism and elitism are usually cited as reason enough to stop looking for a philosophy of education in his thought, since modern sensibilities take the latter to be anathema to the former. And in literal terms, this may be true, but that sentiment betrays a deeper issue first identified by Nietzsche which is the nihilism which results from the continued assertion of a set of values which we know to be baseless. Specialization speaks to exclusivity while democratization to its opposite. Nietzsche felt that this kind of contradictory yet universally accepted attitude was symptomatic of the age: *plus ça change, plus c’est la même chose*.

Underlying his philosophy of education is a conception of “higher” culture and “true” education. The dilettantism and commodified nature of the Philistine culture was something he sneered at on account of its incoherent desire “to create entire philosophies: the sole proviso was that everything must remain as it was before, that nothing should at any price undermine the ‘rational’ and the ‘real,’ that is to say, the philistine” (Nietzsche 2007a, §2). Given the choice between the nihilism and philistinism or the higher culture of true education, he can hardly be blamed for his choice. But we must be careful here because Nietzsche’s elitism has nothing to do with “the people” or “nation,” but with the nobility spirit required for true education and

culture. The ultimate objective of Nietzsche’s philosophy of education was the development of true culture through the nurturing of the sovereign individual who is characterized by the three concepts that make up Nietzsche’s pedagogical thought, namely, the pursuit of authenticity, inward directed competition and struggle, and finally sublimation.

Authenticity

The concept of authenticity is an understandably elusive subject. It is nonetheless useful to talk “about” authenticity in the face of the fact that we may not be able to talk about it. The distinction made by the addition of the quotation marks is that an irreducible definition of the word authenticity is impossible but what we can do is develop our understanding of the conditions that make authenticity possible. Nietzsche’s philosophy of education does precisely this. The concept of authenticity does not comprise an objective list of irreducible values or characteristics, but describes one’s comportment and attitude toward life. If the end of education is the nurturing and promotion of Nietzsche’s higher types and free spirits, then authenticity must be understood as the individual’s solicitude for himself or herself rather than the attainment of a set of external qualifications. Nietzsche’s free spirit is the person who understands their perspectival role in the creative production of the conditions for their life. Such an individual recognizes their view as a falsification of the Philistine’s “real” and “rational” world and that the illusions thus created are the necessary fictions fit only for their life. They are able, as he says, to exercise both their pro and con in the service of that creation rather than in the service of unthinking dogma and blind following a tradition for their own sake.

The pursuit of authenticity then means that the individual must question the traditional authority of concepts such as truth, logic and morality, and values such as honesty, sincerity, and humility. Its achievement requires acceptance of the world as the incessant movement of becoming, self-transcendence, and “self”-creation. This is ultimately a question of freedom end of rejecting the

current ethic in order to understand it as an external measure that force quantification of what is ultimately only to be defined or understood by its quality, which is to say, life. Authenticity must be descriptive of creating possibility rather than prescriptive of practice.

In *Authenticity And Learning*, David E Cooper points out that after this rejection Nietzsche wondered "... how the individual shall live in the era of history after the 'death of God?'" (Cooper 2011, p. 1). His answer, now that the shabby origins of our values have been uncovered, was to question the value of those values in order to understand the function they served in the development of the human type. Their function was to nurture the all too human capacity of solicitude and "self"-concern. This allows us to reflect upon our actions, beliefs, intentions, and values for the purpose of analyzing and, when deemed appropriate, annihilating them in an effort to improve the quality, but not necessarily the comfort, of our lives. Avoiding the responsibility of this capacity for solicitude can only result in nihilism and the leveling of meaning, which results from the loss of the ability to posit value. The incongruity of following policies or asserting values in which we no longer believe, Nietzsche might say, is what has created the modern crisis in education and culture. In order to avoid this, one must "live in the full awareness of the possibilities of action, belief, and purpose that are in fact open to him and which anyone concerned with his existence as an issue must consider" (Cooper 2011, p. 15). For an indication as to how one goes about achieving this, we must look at what Nietzsche offers as the model of a "true educator," the philosopher/artist and their embrace of agonism and inward directed competition as that applies to the individual.

Nietzsche says that what is truly important about the philosopher/artist is *how* they educate. In the series of public lectures that he gave at the University of Basel in 1872, Nietzsche created an archetype of the old philosophy professor, really just a thinly disguised portrait of Arthur Schopenhauer, to explain what he means. The philosopher/artist educates not through their philosophy, but through the lives they lead. Although Nietzsche ultimately rejected Schopenhauer's philosophy, in

the *Philosophy in the Tragic Age of the Greeks*, he had to admit that "the only thing of interest in a refuted system is the personal element. It alone is forever irrefutable" (Nietzsche 1998, p. 25). And it is this personal element that distinguishes a teacher from a true educator. In *Schopenhauer as Educator* he reminds us:

A scholar can never become a philosopher; for even Kant was unable to do so but, the inborn pressure of his genius notwithstanding, remained to the end as it were in a chrysalis stage. He who thinks that in saying this I am doing Kant an injustice does not know what a philosopher is, namely not merely a great thinker but so a real human being; and when did a scholar ever become a real human being? (Nietzsche 2007b, §7).

To educate means to create meaning, value, and culture, but as with authenticity, this cannot be done *for* the student. They must be shown how to do it for themselves. Kant, as far as Nietzsche was concerned, is the quintessential systematizer in that he, like many before and after him, attempts to leave no question unanswered or critique unaddressed. And while this may be noble as an objective, we are led to believe, through the quantity of effort, that we have achieved the quality of truth, though all the while the ground under that truth is shifting. Nietzsche sees this as a vice, not a virtue, that "the will to system is a lack of integrity" (Nietzsche 2006, §26). This is because this will to system seeks only to bring struggle to an end, and this, for Nietzsche, is the death of education, of philosophy, and of culture. "The philosopher as we understand him, we free spirits – as the man with the most comprehensive responsibility, whose conscience bears the weight of the overall development of humanity" (Nietzsche 2002, §61). This responsibility and conscience are born in agon or struggle which, for Nietzsche, must be directed toward one's "self" and is perhaps the most far reaching of the benefits of true education.

Contest

Nietzsche points to contest as the central activity in the process of life; all that lives does so because they struggled. The level of the struggle is determined by the degree of will to power possessed by

a given individual. The contest is with one's self and is directed at whatever we feel we "really" are. It is not directed outward, toward some external, alien, and ultimately arbitrary standard, but toward knowledge. In Nietzsche's pedagogical thought, there are two senses of the word "knowledge" operative which tie into the idea of struggle. The first exhausts itself in the content of knowledge and is subject to the externally directed form of agon. Modern education is essentially a process of indoctrination into particular bodies of facts and accepted ways of presenting such facts. The second sense of the word is knowledge as the process of knowing. In this sense of the word, knowledge is a process of directing the individual's attention inward at their unique development as a knower. It is integral to the pursuit of authenticity and that very Nietzschean notion of self-overcoming. To make oneself better today than yesterday and still better tomorrow again to borrow a sentiment from Protagoras may be a good way to put this since it is only the individual who can know if this has been achieved or not. Knowledge in the sense facilitates the creation of meaning and value. It creates the truths by which one's unique existence is possible. But such truths will not be of the objective, disinterested sort. Rather it creates truths that are felt in the blood and bone and are the necessary condition of life.

It follows then that if the internal contest is to be recognized as a fundamental to life, to the process of living, so too it will be a fundamental part of education, true education. This education must focus on method over content, but if the educator is to be an example, they must be actively engaged in their own pursuit of authenticity such that method in this context becomes the creation of "a unity of style" rather than a set of techniques adopted during teachers' college. Moreover, we can now see how Nietzsche's self-overcoming will involve not just the individual desire to become better and to reject the dangerously normative influence of the concept of a self-in-itself but also the overcoming of the guide, that is to say, the teacher. One's true educators can only be chosen from a specifically perspectival awareness of one's formation as an individual,

involving a critical awareness of the decisions one makes because for Nietzsche "the most desirable thing is still under all circumstances a hard discipline at the appropriate time" (Ferrer & Nietzsche 2012, 14 [161]). There is in all this a certain degree of subordination of the student to both educator and education, but this subordination remains under the control of the individual through the process and practice of sublimation.

Sublimation

In *Twilight of the Idols* in a section called "My Idea of Freedom," Nietzsche says that "[sometimes] the value of a thing is not what you get with it but what you pay for it – what it costs" (Nietzsche 2006, §38). A modern audience may be forgiven for wondering what novelty there is in this sentiment, but that is itself an indictment of modern education and culture. What one pays with is the effort one must put in, the blood, sweat, and tears. Indeed there is, where education is concerned, nothing that one can get with it since, contrary to the student handbook from just about every institution of higher learning today. The cant about the relationship between education and jobs, for example, is, well, cant. Education, if it is to be valued at all, must be seen as an end in itself. Nietzsche of course saw education as feeding into the higher culture, but in reality education and culture are hand in glove. This idea has all but been banished from the modern educational institution resulting in the reality that "the better the state is established, the fainter is humanity," as he says in a note from 1875. The remedy comes in the educational process itself through sublimation which is perhaps the most difficult task since in order to achieve it one must apply on "at least one of these instinct systems with iron pressure so that another could gain force, become strong, take control" (Nietzsche 2006, §41). Sublimation is directed at the instincts in the first instance in order to make room. In its common use, instinct is taken as the set of irreducible inclinations basic to the type, but we do well to remember that not such irreducibility is possible since we are wholly

nature and nature is dynamic. Rather, “[the] best we can do is to confront our inherited and hereditary nature with our knowledge, and through a new, stern discipline combat our inborn heritage and implant in ourselves a new habit, a new instinct, a second nature, so that our first nature withers away” (Nietzsche 2007b, §3). And they do this through sublimation.

As with authenticity and contest, sublimation is directly related to the creative capacity of the human type and the infinite possibilities that life represents for it. This involves the domination and redirection of the instincts in the service of creative potential, which will require a certain degree of “self”-destruction, which does not shy away from the many harsh truths and inherent tragedy of life. “To make the individual uncomfortable, that is my task” (Nietzsche as cited in Kaufmann 1988, p. 50).

If sublimation is to become an effective tool in the educational process, of becoming free and “who we are,” then it must include the highest degree of responsibility. For Nietzsche the normal practice of subordinating one’s will and strength to society or the State is apiece with the ease and comfort attitude of Philistine culture and philosophy. It is the highest degree of abrogation of responsibility, allowing everything, even their own thought to be judged by external metrics with the most damaging consequences. Without taking responsibility for how we create ourselves, we can lay no claim to our own development, expression, or creativity. On the other hand, should we embrace the responsibility brought on by this process of “self”-domination, we at least gain the potential to create the present and author the past and future from a position of life-affirming confidence, joy, and ebullience.

Conclusion

Nietzsche’s philosophy of education is about the creation of an environment wherein the free and sovereign individual is born out of their being guided through the flux of reality not to fit into a predetermined place, but rather to show them the

world of infinite perspective, authentic living, self-creation, and self-governance. This means obedience to one’s chosen path, the subordination of the instincts and drives that would draw one away from that path, a “hard discipline,” and a willingness to serve the higher goals of true education and culture. In other words, the individual must stand for something or they will fall for anything. And in this falling, there is a great deal at stake because the *laissez-aller* attitude to self and society precipitates mediocrity, blind conformity, and the leveling of meaning, with the result that “excellence and differentness become non-existent, and the capacity for reform within society disappears” (Sharp 1975, p. 102). In the final analysis education is about, well, education as is Nietzsche’s whole philosophical project.

Education as Liberation of the True Self

A key role for the Nietzschean educator is to reveal or liberate the true self. This is not a focus on the humanist subject but rather an exhortation to break free from conventionality, to be responsible for creating our own existence, and to overcome the inertia of tradition and custom:

...for your true nature lies, not concealed deep within you, but immeasurably high above you, or at least above that which you usually take yourself to be. Your true educators and formative teachers reveal to you what the true basic material of your being is, something in itself ineducable and in any case difficult of access, bound and paralysed: your educators can be only your liberators. (Nietzsche 1983, p. 129)

The true self could be revealed and one's acquired identity overcome, not by introspection but by examining our revered objects and educators of the past, as stepladders upon which we have climbed so far; in other words, how have we become who we are. Examining those held in high esteem was for Nietzsche the path to our true selves.

Nietzsche frequently refers to Schopenhauer as his "true educator," a topic explored fully in his essay "Schopenhauer as Educator," published in 1874 as one of the *Untimely Meditations*.

Although a reader can be forgiven for believing that it is the earlier philosopher in person that Nietzsche is referring to, the image is more a metaphor for Nietzsche's own self-educative process, and his description of Schopenhauer an attribution based on his perception of his own life. He was to write many years later, "...in Schopenhauer as Educator my innermost history, my becoming is inscribed. Above all, my promise! ..." At bottom it is admittedly not "Schopenhauer as Educator" that speaks here but his opposite, "Nietzsche as Educator" (Nietzsche 1967, "The Untimely Ones", p. 3).

In the light of Nietzsche's own admission, an analysis of his *Untimely Meditation* is more likely to reveal his own philosophy of education rather than that of his mentor. Nietzsche's depiction of himself as Schopenhauer's opposite is his retrospective attempt to reject Schopenhauer and the pessimistic response to life. However, at the time of writing, Nietzsche obviously saw himself in Schopenhauer (or Schopenhauer in himself), and Schopenhauer's ideas permeated much of Nietzsche's later writing as well.

Schopenhauer as Nietzsche's True Educator

Nietzsche identifies two maxims for the successful educator: on the one hand, to recognize and develop particular strengths in a pupil; on the other hand, to draw forth and nourish all the aspects in harmony. Schopenhauer was a philosopher who for Nietzsche was capable of achieving this balance. It is worth noting that Nietzsche does not ascribe to Schopenhauer any intentionality in his educative task. Rather he sees Schopenhauer setting a moral example to be emulated. The educative function seems to be one that is determined by the pupil, who adopts the challenge of achieving the standard set by his exemplar.

Three qualities of Schopenhauer stood out for Nietzsche: his originality and honesty in a period of German philosophy that he saw characterized by conformity; his cheerfulness emanating from courage and strength; and his uncompromising steadfastness. Nietzsche also followed

The original version of this entry was revised: An erratum can be found at https://doi.org/10.1007/978-981-287-588-4_900

Schopenhauer in his contempt for scholars in their limited search for "pure knowledge." He saw Schopenhauer as liberating philosophy from the control of State and society.

Nietzsche's early infatuation with Schopenhauer is evidenced in his psychological positioning of himself in relation to Schopenhauer as

...a son being instructed by his father. It is an honest, calm, good-natured discourse before an auditor who listens to it with love. (Nietzsche 1983, p. 134)

Janaway (1994) details the Schopenhauerean themes that impacted on subsequent musicians and philosophers, among them his aesthetic theory, his philosophy of music, his recognition of the unconscious, his treatment of the overpowering sexual drive, his pessimism, and his questioning of the value of human existence. Nietzsche believed life was more important than knowledge, and that art and music could provide the pathway to a joyful and creative existence. He followed Schopenhauer in his view that non-rational forces were at the heart of reality.

The period of German Nationalism in the mid nineteenth century was characterized by Bismarck's reliance on imagery of "iron and blood" and left little room for dissidence or free speech. Nietzsche distanced himself from German Nationalism and had a high regard for independent thinking and untimely men. What he found in Schopenhauer was this independence, a man not bound by conventional thinking nor by social etiquette.

Nietzsche, in line with Schopenhauer's contempt for Hegel, often denounced Hegel's idea of the State as the highest goal for mankind. He argued that under the power of the State the moneymakers and the military held power; that serving the State was a lapse into stupidity, counterproductive to culture; instead he saw it as the duty of philosophers to concern themselves with the world of culture, so that the spirit of humanity could be preserved. It was important therefore for Nietzsche to theorize the nature of this "spirit" and it was in Schopenhauer's image that he found his clues.

There were for Nietzsche three inspirational images of man in the modern era: the man of

Rousseau, full of fire and ready for revolution; the man of Goethe, committed not to action but to contemplation; and the man of Schopenhauer, who reconciles action and contemplation, voluntarily taking upon himself the suffering involved in being truthful, destroying his earthly happiness through his courage, and frequently remaining misunderstood. Nietzsche's image of Schopenhauerean man describes the self-overcoming inherent in his later formulation of the *Übermensch*.

Schopenhauer had interpreted Kant's ideas, to depict the world in terms of two aspects: that of representation, or the way we experience things, and that of will, an unconscious, irrational force, blind and constantly striving throughout all nature. The human condition was one of being constantly torn between the rational process of the conscious mind and the underlying all-pervasive will. Since the will had no element of space and time, it therefore lacked individuation. There being no plurality of individuals, all there was in itself was Will.

Nietzsche acknowledges that Kant's thought could easily lead to skepticism and relativism, resulting in an eventual nihilism, a destination that was anathema to Nietzsche's whole philosophical project. Schopenhauer's educative value seems to rest for Nietzsche in his ability to face the profound depression he feels at the valuelessness of his existence, and to transform it through contemplation. Aesthetic experience, Schopenhauer claimed, could provide a perception of the world uncluttered by subjective desires. What made Schopenhauer even greater for Nietzsche is that he grappled with the issues of life in an era that would limit his freedom to do so, and yet still emerged the genius.

Schacht (1995) argues that Schopenhauer's radical stance did not fit easily with Western religious and philosophical thought. He clashed with the Christian interpretation of divinity, with contemporary beliefs about rationality and historical progress, and with belief in the possibility of human happiness. The image of a solitary thinker issuing a challenge to accepted tradition is one easily associated with Nietzsche as well, so it could be argued that Nietzsche has assimilated not only Schopenhauer's ideas but also his style

of philosophy, and according to Janaway, "even his nuances of voice and terminology" (1994, p. 101). Other commentators go further:

His writings, all of them, are full not just of quotations and paraphrases from Schopenhauer, but of phrases allusions and rhythms both conscious and unconscious. Nietzsche breathed Schopenhauer and cannot be understood without him (Young 1992, p. 3)

Rather than an enlightenment quest for happiness and truth, life was a continuous struggle. This pessimistic description of life, however, was not an end point for Nietzsche but rather an ideal beginning for his counternihilistic philosophy.

Nietzsche challenges himself to derive a practical morality from his Schopenhauerian ideal – what he calls a "chain of fulfillable duties." In other words, he wants to demonstrate how the Schopenhauerian ideal educates. The practical duties deriving from this picture involved the advancement of culture through the production of Schopenhauerian man.

For we know what culture is. Applied to the Schopenhauerian man, it demands that we prepare and promote his repeated production by getting to know what is inimical to it and removing it – in short, that we unwearily combat that which would deprive us of the supreme fulfillment of our existence by preventing us from becoming such Schopenhauerian men ourselves (Nietzsche 1983, p. 161)

Culture and the Genius

Schacht (1995) argues that for Nietzsche, culture is the sphere in which human animality takes on a spiritual dimension. What is to be promoted is the introduction to, and participation in, cultural life; and Nietzsche's exhortation to become yourself is to be understood not as a call to return to nature or to intensify one's subjectivity but rather as an appeal to ascend to culture, and to contribute what one can to its enrichment.

What distinguishes man from animal for Nietzsche is our ability to catch a glimpse of ourselves on the path toward man as something high above us. Nietzsche sees nature as needing knowledge for its own redemption and self-

enlightenment – the intellect in the service of the will – and yet man spends most of his time trying to escape awareness of his wretched predicament, by focusing on the State, on science, on making money, or on being sociable.

It is only rare men who emerge from the dreamlike state and lift us up. These rare men are for Nietzsche no longer animal but true men – the philosophers, artists, and saints. It is they who create the new metaphors of life; it is through them that Nature is transformed, through the promotion of the culture:

It is the fundamental idea of culture, insofar as it sets for each one of us but one task: to promote the production of the philosopher the artist and the saint within us and without us and thereby to work at the perfecting of nature. For, as nature needs the philosopher, so does it need the artist, for the achievement of a metaphysical goal, that of its own self-enlightenment, so that it may at last behold as a clear and finished picture that which it could see only obscurely in the agitation of its evolution – for the end, that is to say, of self-knowledge. (Nietzsche 1983, p. 160)

While not denying that individuals must learn to take part in the struggle for existence, he argues that all the present institutions are engaged in producing currency rather than culture and that there is a need for a new type of institution, one that can focus on culture.

The role of the new educational institution would be to provide support and protection for those committed to his idea of culture. He talked of a new order of schools as the "consecrated home of all higher and nobler culture," where the dedicated few could prepare within themselves and around them for the birth of the genius and the ripening of his work. What this meant in practice was to assemble the free spirits of the age together and introduce them to Schopenhauer's (or Nietzsche's?) philosophy. That required withstanding social opinion and religious dogma, and becoming aware of the political distortions embedded in normalized concepts such as "progress," "universal education," "national," "cultural struggle," and the "modern state."

Again we find Nietzsche trying to liberate man from the strictures of fashion and convention, this time through his awareness of the defining power

of language as a cultural medium. He criticized the ornate style of literary men and the elegance of journalists as unsuitable for the cultural leadership role they were trying to play, as they were merely “servants of the moment.” There was no hope for a higher notion of education through State-funded efforts either. In his early lectures on education (Nietzsche 1909), Nietzsche saw the State as necessarily furthering its own interests in terms of maximizing the utility value of its citizens and promoting a culture that would enhance government.

Tanner (1994) observes that one of the characteristics of nineteenth-century German philosophy was the idea of adversarial opposition, in which the outcome is more fruitful than anything that could be produced by either of the opponents going it alone. Nietzsche was no exception, and for him life involved opposition between the instinctual, amoral energy of Dionysus and the ordered and beautiful form of Apollo, the non-rational versus the civilized, the wild versus the refined.

Of special importance to him was his notion of overcoming adversity. Commentators suggest that his philosophy may have been driven by a lifelong personal struggle against illness, against convention, and against his eventual insanity. It is this personal struggle and self-overcoming that typifies Nietzsche's later formulation of the *Übermensch* or “overman” concept. Kaufmann (1974) dispels the myth of Nietzsche's overman as any sort of outwardly focused bully, preferring instead the explanation of *Übermensch* as a repudiation of conformity to any single norm and the antithesis of mediocrity and stagnation, in other words an attempt to realize his own unique individuality. Man who has overcome himself and his adverse conditions is the overman.

Nietzsche describes among the adverse conditions of Schopenhauer's life his “culturally pretentious” mother, and notes among the positive qualities that allowed Schopenhauer to rigorously maintain his path: the rugged manly character of his father; his focus on men rather than books; reverence for truth and not government; his international experience; his dislike for a strong State; his refusal to be involved in politics; his ability to

recognize the genius in himself and others; his financial independence, and especially his freedom. His lack of training as a scholar was also celebrated by Nietzsche. These qualities not only allowed Nietzsche to celebrate Schopenhauer as *Übermensch* but also described much of the predicament Nietzsche himself had to overcome to find freedom in his own life.

Nietzsche's Spiritual Exercises

Babette Babich

Fordham University, New York, NY, USA

Spiritual Exercises

Nietzsche's third *Untimely Meditation*, composed in 1874, *Schopenhauer as Educator* (Nietzsche 1983a), reflects upon and describes a "spiritual exercise" not unlike the spiritual exercises of St. Ignatius of Loyola, detailing tactics and including practical advice. Thus Nietzsche's "spiritual exercises" correspond to the traditional practice of self-cultivation, self-education, characteristic of the Stoic philosophers but also influential for the Hellenistic neo-Platonic tradition, the church fathers, and St. Augustine, author of *De Magistro* and the *Confessions*. Beyond Antiquity, spiritual exercises refer to a theological practice of self-cultivation and self-discipline. As a classist by training, Nietzsche notably offered a series of reflections on self-cultivation usually associated with the phrase he adopted as his own from the 7th Century BCE lyric poet, Pindar: "Become the one you are!" emphasizing that one only assumes but does not know oneself and must undertake to seek to come to know and then and on this basis to perfect oneself. In this same spirit, Nietzsche's *Untimely Meditations* reflect on a project of self-discovery and discipline. In particular, *Schopenhauer as Educator*, illustrates the project of finding the ideal educator *for oneself*: inasmuch as and ultimately, so Nietzsche writes, education can only be "self-education" and for the sake of, like the Stoics, attaining liberation: "your true educators can only be your liberators." Here, it is well worth reviewing Ignatius of Loyola's (1986) own *Spiritual Exercises*. (For a philosophical discussion, in addition to Patrick Aidan Heelan, S. J. 1986, see Antonio de Nicolás's, articulation of spiritual technique (1986a). A former Jesuit, with all the training of the same, de Nicolás' highly programmatic rules for the direction of sainthood, as it were, are detailed in the second and third chapters of the first part of his book, *Powers of*

Imagining, entitled, respectively, *Imagining: Primary Text*, *Primary Technology* (1986b) and *A Text for Reading*, *A Text for Deciding* (1986c)).

Such spiritual exercises or practices as we may speak of these following Pierre Hadot or Michel Foucault, correspond to is "the secret" of education in Nietzsche's essay, *Schopenhauer as Educator*, the third of his *Untimely Meditations*, the first three of which were published, seriatim, from 1873 through 1874. (The fourth essay of the *Untimely Meditations*, *Richard Wagner in Bayreuth* would not appear until 1876.) If the second essay, *On the Uses and Disadvantages of History for Life*, has rightly commanded attention, the first essay is especially significant if only rarely discussed in its own right: a diatribe on the theologian and popularizer David Strauss, concerned with the same theme that occupies Nietzsche in his second essay, that is, concerning the use of historical philology (Strauss popularized the so-called 'historical' Jesus) along with the challenges of popular reception and not less with the question of an author's style.

Here in *David Strauss, the Confessor and the Writer* (Nietzsche 1983b), Nietzsche begins by examining the "appeal" of popular appeals as such, starting with Strauss's theological philological (or classical) scholarship, as Nietzsche criticizes this, along with his 'use' of history, for the sake of the convention of an historical Jesus, thus articulating a putatively 'scientific' but in fact conventionally rather than critically historical account, drawing on Darwin and Hegel in addition to Schleiermacher and the mechanics of cosmology, including a "philistine" relation to historical context as indeed to then-contemporary politics and war.

By contrast with such broadly philological concerns, *Schopenhauer as Educator*, offers an intimate address to the reader, beginning very nearly as Descartes begins his own *Meditations on First Philosophy*, including – recall Hadot's references to Pierre Courcelle on Augustine (Hadot 1995, pp. 50–52) – the trappings of the genre of "meditation," talking about travel and distant lands, as of different peoples, space, and time—all the ingredients of personal communication.

Thus, we begin with an overall impression confided by an experienced traveler who confesses to us that most people in most lands share the following common traits: they are lazy, fearful, and herdlike. The herd quality is already familiar to the reader of Nietzsche's *Untimely Meditations* not only after the first meditation's emphasis on popular edification and the second meditation's bucolic reference to the ahistoricity and forgetfulness of the herd animal at the start of *On the Uses and Disadvantages of History for Life*, contrasting the animal with the human condition to praise the human being's distinguishing excellence and capacity for memory, defining as "true men, those who are no longer animal, philosophers, artists and saints" (Nietzsche 1983a, p. 159).

From this perspective, at once conspiratorial and sympathetic, Nietzsche's first line epitomizes the famously misanthropic Schopenhauer:

When the great thinker despises mankind, he despises their laziness; for it is on account of their laziness that men seem like factory products, things of no consequence and unworthy to be associated with or instructed. (Nietzsche 1983a, p. 127)

Nietzsche's familiar tone invites the reader to suppose himself both like and unlike the "great thinker." Thus a more complicated reflection on this essay might highlight a certain contradiction, Nietzsche seems to take the reader's side, seeming to advocate on behalf of anyone who does not wish to be lumped in with "the herd" Schopenhauer seems to "despise." "Be yourself!" is the invitation, with the complicated explanation that "All you are now thinking, doing, desiring, is not you yourself" (Ibid).

In what follows Nietzsche invites the "youthful soul" (and almost every reader is able to respond to such an invitation, the young and the young at heart alike) to reflect along with him. The scope of the invitation to the soul is irresistible, promising "a happiness allotted it from all eternity," a "happiness," available to anyone who can break free of "the chains of fear and convention" (Ibid).

Of all of Nietzsche's writings, *Schopenhauer as Educator* exemplifies and justifies David B. Allison's striking and beautiful reflection in his preface to *Reading the New Nietzsche*:

Perhaps more than any other philosopher who readily comes to mind, Nietzsche writes exclusively for you. Not at you, but for you. For you, the reader, only you. (Allison 2000, p. vii)

Note that the titular reference to the 'New' echoes Allison's own earlier book collection (Allison, ed. 1985). Such a "New Nietzsche" is a properly "continental" Nietzsche, read together with, and through, Heidegger, Deleuze, Granier, Derrida, Birault but also Lingis and one can say, Allison as well (for a discussion, see: Babich (2005–2006)). As Allison's point here suggests, Nietzsche, as author, gives *everything* away, including the reader's convictions: telling the reader that everything he or she is or has done or had lived through, gone through, *is not* what he or she is, *not really*. Instead, the reader's real or true self corresponds to his or her "higher" self. Not only that but Nietzsche tells us that the experience of *true education* is and "can only be" *liberation*.

This is very exhilarating language.

And Nietzsche does more as he goes on to offer techniques, real ones, very accurate, very traditional techniques, for what he promises us here: in search of an educator. Instructively, to do this Nietzsche describes a memory palace: telling the reader of his day how to make one and explaining to the reader the purposes of such a palace, given the very contemporary, then and now, modern, all-too-modern project of "finding oneself." As always, if we mean to understand Nietzsche's meaning, we cannot dispense with Nietzsche's discipline of ancient philology (Classics) but we also need, more generally, a method of hermeneutic reading, including situating a text in its own and not less in our own historical context (cf. on Nietzsche and hermeneutics, Babich 2014).

Thus with explicit reference to the classical study of education, Nietzsche's description of the construction of a memory palace in his *Schopenhauer as Educator* should be taken together with Aristotle's practical philosophy of self-perfection. The method in each case involves self-examination, meditation, and reflection:

Let the youthful soul look back on life with the question: what have you truly loved up to now, what has elevated your soul, what has mastered it and at the same time delighted it? Place these

venerated objects before you in a row, and perhaps they will yield for you, through their nature and their sequence, a law, the fundamental law of your true self. Compare these objects, see how one complements, expands, surpasses, transfigures another, how they form a stepladder upon which you have climbed up to yourself as you are now; for your true nature lies, not hidden deep within you, but immeasurably high above you, or at least above that which you normally take to be yourself. (Nietzsche 1983a, p. 129)

As with any comparison of different aspects, bracketing prejudices and societal convictions, the point is to find a common aspect that does not change: this is what mathematicians, physicists, and phenomenologists call *the invariant*.

The project is classically archaic, the heart of philosophy, in utter accord with the wisdom of the Delphic oracle – *gnothi seauton* (know thyself). Nietzsche adds to this what he took from Pindar's poetic challenge to hold faith with and to be true to yourself, having learned, both as students *begin to learn* and as educators *have learned*, who you are, that is, to say *in potentia*: what you are capable of. (I discuss the complexities of Nietzsche's motto, as indeed of translating Pindar's phrase: Babich 2009.)

Nietzsche's Ladder

The project in Nietzsche's meditation is that of discovery. The treasure chest of the heart is less to be memorized than sounded out, discovered in its compass and depth, and a scaffolding to be constructed not for a descent into the depths of this treasure chest but for an ascent as we shall see. Nietzsche's project in *Schopenhauer as Educator* allows the reader to construct a *studiosum*, a study chamber of the heart. The result is a guide not to the arts as such but the self; again, we recall the method: "Place these venerated objects before you in a row, and perhaps they will yield for you, through their nature and their sequence, a law, the fundamental law of your true self" (Nietzsche 1983a, p. 129).

Using the things you love to descry yourself, you, the reader, are invited to study their relation to one another. Once again:

Compare these objects, see how one complements, expands, surpasses, transfigures another, how they form a stepladder upon which you have climbed up to yourself as you are now; for your true nature lies, not hidden deep within you, but immeasurably high above you, or at least above that which you normally take to be yourself. (Ibid)

Education is a triumph of emancipation or liberation. Thus Nietzsche's comparative phenomenology of the heart reveals not only an inner ideal but a progress, inasmuch as the self-searching "youthful soul" already stands and leans on them in order to have attained the vantage point already attained.

Here there is a turn around, a reversal. For what one discovers is just and only that one cannot be educated. This means that the point of seeking an educator brings one face-to-face with this same ineducability. In consequence, one does not need educators for the sake of education as much as one needs them to "free one" from education:

Your true educators and formative teachers reveal to you what the real raw material of your being is, something quite ineducable, yet in any case accessible only with difficulty, bound, paralyzed: your educators can be only your liberators. (Ibid)

This ideal echoes Nietzsche's great sympathy for both Baruch Spinoza and Blaise Pascal, and it hints at what he ultimately believes will be the grace or "light of art":

it is the perfecting of nature when it prevents her cruel and merciless attacks and turns them to good, when it draws a veil over the expressions of nature's stepmotherly disposition and her sad lack of understanding. (Ibid)

In this way Nietzsche discovers or "finds" himself as he reads, as he writes, *Schopenhauer as Educator*.

Telling his own story to himself in this way, Nietzsche suggests that before finding Schopenhauer, he engaged in a kind of educational "cruising," as Tracy B. Strong is calculatedly fond of this risqué and deliberately erotic language. (Tracy Strong varies Nietzsche's sampling selection of different philosophical offerings – "I tried this one and that one" (Nietzsche 1983a, p. 133) – in (Strong 2000, p. xxx).) By contrast, with this more modern invocation, Nietzsche's exemplar is deliberately antique: it is Pindar's

you are to, you ought to, you should become the one you are. (For a discussion, see Pindar (and Alexander Nehamas) in Babich 2009.)

In connection with Augustine's own *Confessions* and Pierre Courcelle's hermeneutic re-reading of those confessions as related in Pierre Hadot's *Philosophy as a Way of Life* which reflects on the same charms and the same dangers (see, again, the first chapter of Hadot 1995), the seductiveness of Nietzsche's confessional expression obscures the urgency of the task Nietzsche sets for himself at the start of his call to teach at the University of Basel in Switzerland. Owing to this urgency, Nietzsche titled his meditations *Untimely*. Thus Nietzsche challenged his own educational institutions much as Ivan Illich likewise challenged education in his book, *Deschooling Society*. Illich's parallel is a complex one, but his point (which Illich also argues to illustrate the role school plays as an instrument of globalization) is offered on the backdrop of cooption and cultural imperialism especially as this is evident in underdeveloped countries but which can also be seen at any level in society, especially in the contrast between high and low. As Illich notes in his own context which focuses on the former: "With very rare exceptions, the university graduate from a poor country feels more comfortable with his North American and European colleagues than with his non-schooled compatriots, and all students are academically processed to be happy only in the company of fellow consumers of the products of the educational machine" (Illich 2000, p. 34).

Nietzsche outlines the disparity of the scholar's vocation in pedagogic practice as opposed to the ideal which he takes to a reflection on the differences between one scholarly expert and another, not unlike the reflections Max Weber will later offer with respect to both science (*Wissenschaft*) and politics as vocation.

Nietzsche argued in his *Untimely Meditations* and overall that the great majority of scholars could be compared to machines churning automatically, eager to toe the latest trend and unwilling to question much less to offer a critique, anxious to avoid rocking the boat and so to risk being disturbed in their path to conventional

security. Thus Nietzsche reflected on the scholar in terms of the dryness of his element, the dust of books, the "grayness" of their thinking.

In his inaugural lecture, Nietzsche had argued that claims to expertise were founded on nothing other than scholarly taste, in other words, sheer personal judgment or mere convention. As Nietzsche went on to argue in a related passage in *Schopenhauer as Educator*, such conventions offer a hiding place for both the narrowly competent and the incompetent in addition to the malformed, adding that once decadence begins in our educational institutions, it can only grow.

The parallel instantiation Nietzsche draws upon varies Augustine's voice of the friend, angel, or messenger: *tolle lege*, take and read. To this extent the account that we have from Nietzsche of his discovery of Schopenhauer's books in a bookshop gives us a similarly parallel Augustinian atmosphere. No fig tree, to be sure (thus the relevance of Courcelle's challenge to the literality of Augustine's related facts of Augustine's life in his *Confessions*), no word from a nearby angel, Nietzsche was very literally surrounded by books, trying this one and that.

For Nietzsche, as for Allison who tells us how to read Nietzsche, what is telling is a spiritual, affective, and intimate connection with an author, Schopenhauer, who wrote as if what he wrote were directly addressed, in this case, to Nietzsche himself as reader. It was, Nietzsche tells us, seemingly embarrassed by the audacity of the claim, however "foolish and immodest a way of putting it, *as though* it were for me he had written" (1983a, p. 133).

The personal affinity worked only because by contrast with David Strauss, "confessor" and "writer," Schopenhauer's style was exactly not *popular*. Schopenhauer's style is not that of the Strunk and White variety or the sort of style US writing clinics might counsel for today's undergraduates, "writing across the curriculum," or the sort of journalistic inoffensiveness that might permit one to write a novel or a screenplay for the next television miniseries. In other words, Schopenhauer, who took extraordinary care with his writing, did not write in a way that would have guaranteed literary or scholarly fame, and

accordingly Schopenhauer never attained market success as a classic. Thus what Nietzsche found exemplary was less Schopenhauer's writerly success or fame, much less his timeliness, than that Schopenhauer wrote for himself. Nietzsche could thus characterize Schopenhauer's specifically non-stylized stylization or *artless artfulness*, saying that "Schopenhauer never wants to cut a [rhetorical] figure: for he writes for himself. . ." (Nietzsche 1983a). The intimate vocative address, as Nietzsche writes on the educator he found for himself, in his own encounter not with the man but with his writings, calls to the reader *as if, as though*, no one else were intended apart from the reader.

I mentioned the contrast with Strauss, but note again that the point can easily be overlooked if one has not first read Nietzsche's *David Strauss, the Confessor and the Writer*, the first of the *Untimely Meditations*. We recall that Nietzsche criticizes Strauss in terms of his philology and owing to his conspicuously writerly his style, that is, "as a *writer* recognized as a classic" (Nietzsche 1983b, p. 37). This assessment provokes Nietzsche's ire, but what is instructive is that Nietzsche makes the point with reference to German education and not less to the public confidence in its enduring value. This confidence:

seriously convinced of the superiority of all German educational institutions, especially the grammar schools and universities, never ceases to recommend them to foreigners as models, and does not doubt for a moment that they have made the German people into the most educated and judicious nation in the world. (Ibid)

The focus here is on what Nietzsche calls the philistine and the philistine's ideal, by contrast with Strauss' Schopenhauer. As Nietzsche writes in his essay on Schopenhauer, the difference between them is far from neutral: "Of all the offence Schopenhauer has given to numerous scholars, nothing has offended them more than the unfortunate fact that he does not resemble them" (Nietzsche 1983a, p. 182).

Here Nietzsche is quite conspicuously challenging extant university education, reflecting first on the oddity of paying people to practice an ancient tradition, philosophy, which was defined precisely in its opposition to payment. Historically,

Nietzsche recalls, "the sages of ancient Greece were not paid by the state but at most were, like Zeno, honored with a gold crown and a monument in the Ceramicus" (Ibid, p. 184). As Nietzsche argued in his reflections on the forces that drive what he called *misemployed and appropriated culture, the greed of the money-makers* (Ibid 164) inevitably leads to the institutionalization of education as a commercial industry:

as much knowledge and education as possible, therefore as much demand as possible, therefore as much production as possible – that is the seductive formula. (Ibid, p. 164)

Indeed nothing could be more timely in our own time's than Nietzsche's reflection, the growing acceleration of education:

A speedy education so that one may quickly money-earning being, yet at the same time an education sufficiently thorough to enable one to earn a very great deal of money. A man is allowed only as much as it is in the interest of general money-making and world commerce he should possess, but this amount is also demanded of him. (Ibid, p. 165)

Nietzsche adds a note on the implausibility of a professor as a civil servant, of in fact realizing "to the full the whole gamut of duties and limitations imposed upon him" (p. 185), but also the sheer improbability of making appointments of excellence to such salaried posts to begin with. Nietzsche argues that this presupposes the real competence or at least "the appearance of being able to distinguish between good philosophers and bad ones and, even worse, it presupposes that there must always be a sufficiency of good philosophers to fill all its academic chairs" (p. 185). Here the point is not only about assessing value, good and bad quality, but the role of any given authority, in this case the State, to make just distinctions. Nietzsche continues his reading of the role of university philosophy and concludes that it is as if the goal were to require instruction in philosophy, and Nietzsche uses language that echoes in Illich's *Deschooling Society* (2000), to the point that one might wonder about Nietzsche's likely influence on Illich, as Nietzsche observes that university schooling compels the educators as much as the educated:

to reside in a certain place, to live among certain people, to undertake a certain activity: they are

obliged to instruct every academic youth who desires instruction, and to do so daily at certain fixed hours. (1983a, p. 186)

For Nietzsche the project cannot succeed because it assigns the imparting of wisdom on demand, and supposes that one have, just at those hours, wisdom to impart, never mind that it also assumes interest on the part of the student just then, just when. For Nietzsche:

the only critique of a philosophy that is possible and that proves something, namely trying to see whether one can live in accordance with it, has never been taught at universities: all that has been taught is a critique of words by means of other words. (1983a, p. 187)

Nietzsche considered the effect of this, magnified in a curriculum, on “a youthful head, not very experienced in living” and concludes “what a desert, what a return to barbarism, what a mockery of an education in philosophy” (Ibid). Here Nietzsche cannot refrain from concluding that maybe this result is exactly desired: “education in philosophy only a means of deterring from philosophy” (Ibid). And so on.

Thus *written by* our own educator: this is Nietzsche as we encounter him not as a contemporary but, and just, through his writings. In this way, it can make all the difference that we tend to skip Nietzsche's original educators; thus we miss the second century AD Lucian who wrote the satirical dialogues *Philosophies for Sale* and *The Dead Come to Life or the Fisherman*. And we tend to forget Pindar and Archilochus in addition to, as both Thomas Brobjer and Jonathan Barnes have written on the relevance of the same like-wise second century, Diogenes Laertius in whose writings Nietzsche specialized, telling us that he prefers reading such ancient commentators to contemporary philosophical commentary, ergo choosing Diogenes Laertius above the Tübingen historian, Eduard Zeller, “because the former at least breathes the spirit of the philosophers of Antiquity, while the latter breathes neither than nor any other spirit” (1983a, p. 186).

We always also need to raise questions about Nietzsche's first book and his investigation of the presumptions and presuppositions of his own discipline of classics with respect to the “Homer

question” and even more with respect to his concern with ancient Greek music drama or tragedy and lyric poetry.

If we “knowers” do not know ourselves, as Nietzsche suggests, it is first of all because we do not seek ourselves. (The term in *On the Genealogy of Morality*, Nietzsche's polemical follow-up to *Beyond Good and Evil: Prelude to a Philosophy of the Future*, is *wir Erkennenden*. Cf. Nietzsche 1967, p. 15.) It is for this reason that we need genealogical, philological, historical hermeneutic thinking.

Reflecting on acquiring an educator, reflecting on the pursuit of education or what the French call formation (the German term is *Bildung*), Nietzsche details an array of difficulties involved in coming to know ourselves. Thus we began by emphasizing his mnemonic art as a practical hermeneutic phenomenology of the self; a spiritual exercise that must animate all learning and therewith any chance of finding ourselves. We turned to a reflection on our choice of exemplar in order to climb Nietzsche's “ladder” to ascend our “own true selves,” always highly personal, but always also in the context of a culture that has always already taken over education as an institution and a prescription, as Nietzsche invites us to recall at least a modicum of that condition of liberty in which Greek philosophy developed: “freedom: that wonderful and perilous element in which the Greek philosophers were able to grow up” (1983a, p. 182). At the end of his essay, Nietzsche invokes the signal characteristic of the philosopher in his capacity to “unhinge” us, to disturb us. This is, and can only be, liberation.

Unborn, but given the choice I would now pick some other culture. African, Chinese, European is exhausting, its people skilled in causing pain and ill-equipped to endure it. Last night we went to say goodbye to Gudrun, Thorsteinn, Vedhis, and the cat, and the Bishop dropped by and said: “The only solution to our problems would be for us all to change into cats.”

Philosophical Introduction

Friedrich Nietzsche was elevated to the status of one of the most important philosophers by Martin Heidegger. In his Nietzsche lectures, Heidegger (1977, p. 179) declares that philosophy has reached its end and that Nietzsche was the one who completed it. For Heidegger, traditional philosophy is synonymous to metaphysics. The philosophy does not simply end, stop, or vanish but attains its ultimate potential, which is the beginning of thinking. This possibility allows for the emergence of something new, which Heidegger refers to as *Ereignis*. This kind of new beginning is not based on the traditional understanding of the history of philosophy but thinking itself. According to Heidegger, the sciences have been separated from the ideas of philosophy. Philosophy comes to its end upon the completion of the separation between philosophy and science. Philosophy becomes transformed into a science and a technology. Heidegger describes this moment as *Gestell* (see Taminaux 1998, pp. 183–201). Also education becomes transformed into technology, and Nietzsche's statement of education of masses represents this idea.

Nietzsche, the philosopher of *The Will to Power*, is the last metaphysician of the West. The age whose consummation unfolds in his thought, the Modern Age, is a final age. The Modern Age is an age in which at some point and in some way the historical decision arises as to whether this final age is the conclusion of Western history or the counterpart of another beginning. According to Heidegger, Nietzsche's thinking and his five fundamental expressions belong to the end of philosophy. These expressions are nihilism, the revaluation of all values, the will to power, the eternal return of the same, and the overman (*Übermensch*). Heidegger argued that these five expressions are fundamental

for understanding our time as the end of philosophy, and they are the key to understanding science and technology. Heidegger claims that Nietzsche's philosophy represents the ultimate objectification of being as the end of philosophy. Heidegger refers to the opposing idea as meditative thinking and Gelassenheit (releasement, letting-be) (Heidegger 1991, p. 8, 2003, pp. 89–94).

Nietzsche and Education

What can Nietzsche contribute to the modern democratic concept of education? My answer is that nothing, unless we apply some philosophical counter-perspectives to his ideas. A number of truly embraced ideas, which allude to Nietzsche and his notion of self-realization, have been presented with regard to how to teach and educate (see, e.g., Lambert and Smeyers 2003). It is quite tempting to adopt those aspects of Nietzsche's philosophy that serve one's own purposes and to smooth over or ignore whichever aspects contradict them (see Rosenow 2004, p. 200; Cooper 1983, pp. viii–ix). However, there has never been a clear explanation of what the famous phrase “to be who one is” actually requires according to Nietzsche. My argument is that Nietzsche's demands are excessive. My perspective is Heideggerian, and from this perspective, the Nietzschean idea of education is really education with a hammer in the negative sense. We might even go so far as to argue that we do not even need the Heideggerian argument of the end of metaphysics in order to see it. It is education with a hammer if we view it through the traditional concept of education, the concept of philosophy, or just common sense. (Nietzsche's lectures *On the Future of Our Educational Institutions* can be said to have had at least one influence, namely, on Heidegger's program for university reform and the “leadership principle” he outlined in the Rectoral Address. Heidegger's later complaint that “Nietzsche ruined me!” takes on quite an interesting meaning in this context. I can see some contradictions between my Gelassenheit thesis and Heidegger's Rectoral Address, although identifying them also requires a close

reading of Heidegger's deposition to the Committee on De-Nazification. See Thomson 2005, pp. 43–44; Heidegger 2003, pp. 2–12; Peters 2002, pp. 27–43; Huttunen 2003.) My argument is that if we interpret Nietzsche in a Heideggerian way, we are able to reconstruct the notion of education that is referred to as Gelassenheit-education. This reconstruction follows Heidegger's own example of aesthetics. In his Nietzsche lectures, Heidegger presents a new understanding of the work of art and the end of aesthetics. He uses five of Nietzsche's arguments and presents counterarguments to them from the standpoint of his philosophy. I am presenting five counter-expressions to Nietzsche's five expressions concerning the end of philosophy (Heidegger 1979). These fundamental counter-expressions will provide the foundation for what we might refer to as *Gelassenheit*-education. This kind of education would also be the result of the thinking of education and not just the science of education. I will begin, however, by clarifying Nietzsche's teachings on education and educators.

Nietzsche as an Educator

There are three main literal sources concerning Nietzsche and education. The most well known is *Schopenhauer as Educator* (Nietzsche 1983). The second source is *The Will to Power*, which includes virtually any Nietzschean idea one could imagine. *The Will to Power* is comprised of a total of 1067 paragraphs (Nietzsche 1968) (on the editions of *The Will to Power*, see Kaufmann 1968, pp. xxvii–xxix). The third source is Nietzsche's five lectures entitled *On the Future of Our Educational Institutions*. It is a philosophical dialogue that is over 100 pages long. It consists of six public lectures held in the auditorium of the Museum at the University of Basel. Actually, only five lectures were delivered in the spring of 1872. The sixth lecture was never held and Nietzsche withdrew his offer to have the book published by writing:

I had to make a serious and important decision. This touches upon our business insofar as it in any case delays it. My lecture should still be completely

reworked and will be cast in another form; wherefore I require above all time. (Nietzsche 2004, p. 124, Appendix A: Letters)

Nietzsche's thinking on education is very anti-democratic and conservative, which is why it is education with a hammer. This becomes quite clear when we read the following quotation from his notebook:

General education is only a preliminary stage of communism: education will be so weakened down in this way that it can no longer bestow privilege at all. Least of all is it a means against communism. General education, i.e., barbarity, is just the presupposition of communism. Education "according to the times" degenerates here into the extreme of education "according to moment": i.e., the raw seeing of momentary utility. (Nietzsche 2004, p. 133) (The quotation is from Nietzsche's Notebook 8, not from the original lecture. Notebook 8 is thought to have been written from winter 1870–1871 to autumn 1872.)

I see very little possibility for Nietzsche to serve as a source of critical thinking in terms of education. Surely, his educational thought is not radical in the sense of critical pedagogy. From Heideggerian perspective, Nietzsche really is the last representative of the metaphysics, which should be overcome. For Nietzsche, culture and education are inseparable, and his primary concern is with the attainment of culture (Kaufmann 1974, p. 416). Nietzsche claims that culture distinguishes us from animals and makes us something more than mere things of nature. The purpose of education is to elevate us above nature (translation of the German words *Erziehung* and *Bildung*; see Cooper 1983, pp. 31–31; Grenke 2004, p. viii).

In the preface of *On the Future of our Educational Institutions*, Nietzsche demands three qualities from the reader. Firstly, he must be at rest and without haste and understand how to read the secret between the lines. "Such a human being has still not unlearned how to think while he reads" (Nietzsche 2004, p. 19). Secondly, he demands that the reader should not think his own education. Thirdly, the reader should not expect as conclusion "tables and new curricula for Gymnasium and Realschulen" (Nietzsche 2004, p. 18). These qualities required of the reader

are briefly condensed into the word "high-minded," and Nietzsche refers to Aristotle's *Megalopsychia*, the great-souled man (Aristotle 1989, pp. 1123a34–1125a35; Kakkori and Huttunen 2007). Therefore, worthy readers are extremely exceptional, but so are those who are worthy to educate or to be educated. I will return to this point later in more detail.

The Barbarism of Education

In the first lecture, Nietzsche recognizes two main drives that rule educational institutions:

1. The drive toward the highest possible *extension* and *broadening* of education
2. The drive toward the *decrease* and *weakening* of education itself (Nietzsche 2004, p. 36)

The second drive is the consequence of the first. The State lies behind these drives, because the State reserves education for itself. This is why education gives up its highest, noblest, and most elevating claims and resigns itself to the service of the State. It is for this reason that utility serves as the goal and purpose of education. In Nietzsche's view, the main goal of education thus becomes speed. In other words, students are encouraged to complete their education as quickly as possible in order to become money-earning beings. From Nietzsche's elitist point of view, the masses are almost like animals, who only seek immediate satisfaction and the release from senseless suffering. Nietzsche writes in *Untimely Meditations*: "And it is, truly, a harsh punishment thus to live as an animal, beset by hunger and desire yet incapable of any kind of reflection on the nature of this life" (Nietzsche 1983, p. 157). He claims that the most general education is barbarism. Is it barbarism because the education is a means to an end, utility? And we can read between the lines that Nietzsche (2004, pp. 36–38) considers it barbarism, as his view is that most people are not worthy of education.

These two drives also have fatal consequences for higher education and the study of science. The field of science has expanded to the extent that it is

possible to specialize exclusively in one particular narrow field. It is possible for a scientist to master one specific area of one specific discipline and become the most respected scientist in that field. Nietzsche (2004, p. 39) sees no difference between this kind of scientist and the factory worker, who makes nothing more than a specific screw or handle for a specific tool. Here, once again, Nietzsche's arrogance is visible. Not all humans are valued equally but only according to what they do and what position they hold.

One Proper Language for German Spirit

The main point of the second lecture is Nietzsche's concern with spoken and written language and the defense of classical education. He calls his age newspaper German, and only remedy to this is to put gifted youth with force under rigorous linguistic discipline. Moreover, if this does not help, there is always the possibility to return to Latin. "Take your language seriously!" (Nietzsche 2004, p. 44), demands Nietzsche. Nietzsche advocates *Hochdeutsch*, which is only spoken by the upper class, and rejects colloquial language, which he refers to journalism. He thinks that it is impossible for a student to have good taste if he does not speak the right language and if he does not speak correctly. The classical education begins with right language and with the correct manner of speaking, and it provides the possibility to become part of the German spirit. The exaltation of the German spirit begins at this point and persists throughout lecture series, remaining vague in terms of its meaning.

The Teachers and the Student

Nietzsche states that there is one major problem with classical education. There are so few adequate teachers and hardly any worthy students.

But we must be of one mind, that by nature itself only infinitely rare human beings are destined for a true course of education, and that even a far smaller number of higher educational institutions. . . . The same holds now with regard to the teachers. (Nietzsche 2004, p. 65)

The third lecture ponders the question of who and what a true teacher is and how to identify such a fabulous being. We learn from the text *Schopenhauer as Educator* that the true teacher is a philosopher (Nietzsche 1983). For Nietzsche, the ultimate true teacher was Schopenhauer, although there are interesting interpretations that he is actually not referring to the image of Schopenhauer himself but rather to his own process of self-education (Aristotle 1986). Being one's own philosopher teacher comes very close to the idea of a superman.

Nietzsche declares that the education of the masses cannot be the goal. Rather, it must be the education of individual, selected human beings, in other words geniuses. Moreover, we can conceive of the education of the genius through the metaphor of the mother. The genius must ripen and be nourished in the mother's lap of the culture of a people, from which he receives all the warmth and shelter he needs (Nietzsche 2004, pp. 71–72).

The bad philosopher is also a very bad teacher, and in the worst case scenario, he works for the State, because he teaches university philosophy. True teachers are great philosophers who teach the truth about things. These great philosophers do not give lectures every day, because they know that they cannot always speak about truth and true things. They also know that there are days when they cannot think of anything. A true teacher can also select his students, so he does not have to speak to the masses. According to this idea, lecturing on the history of philosophy is not speaking of truth. Nietzsche refers to those university philosophers who must teach every day and who cannot choose their students as learned as opposed to philosophers (Nietzsche 1983, p. 186).

The True Education

Nietzsche declares that there are no real educational institutions and no true education, although there is an urgent need for them. Either institutions have become nurseries of dubious culture or they produce sterile scholarship. In order for this to change, Nietzsche claims that our philosophy and education must begin not with wonder

(Erstaunen) but with horror (Schrecken). What he actually means by philosophical horror remains unclear to me, but the source of this horror is the opposite of the culture, namely, nature and natural needs. Nietzsche also referred to this horror earlier in the lecture series: “Whomever it is not able to bring horror is asked to leave his hands from pedagogical things” (Nietzsche 2004, p. 42). Nietzsche stresses that there are two sorts of things which should not be confused with one another. A human being must learn a great deal in order to be able to live his life. He is referring here to things that we usually teach children, namely, basic skills and basic knowledge. This vast work is not education for him, because he sees it as belonging to the world of necessity and utility. The true education begins in a stratum that hangs high above that world of necessity, of the struggle for existence, and of neediness. True education is aimed toward culture. We need instructions as to how to live our every-day lives, and Nietzsche admits that receiving these instructions is crucial. But those institutions which enable human beings to cope with the every-day struggle are not cultural institutions, but “institutions for the overcoming of the necessities of life, whether they promise now produce civil servants or merchants or officers or wholesalers or farmers or doctors or technicians” (Nietzsche 2004, p. 83). Here, culture is seen as something higher and something above the average person. Nietzsche goes so far as to claim that *Institutions of Culture* and *Institutions for the Necessities of life* are in direct opposition to one another, and he prefers to speak of the former (Nietzsche 2004, pp. 80–85).

Education has nothing to do with either children or the majority of adults. The goal is to educate those few decorous students who are not members of the vast group of students and who understand the importance of following and committing themselves to the power of the genius-teacher. Nietzsche describes this concept through the analogy of two kinds of travelers: mass travelers and the rarer lone travelers on the way to education. If you chose to follow the path of the smaller group, the road will be more difficult to follow, it will be steeper and more winding. Here, Nietzsche, our antichrist, speaks with biblical

tones, which he later repeats in *Schopenhauer as Educator*. The first path is quite easy to follow, which is perhaps why most of us chose it. And as you travel along this path, you are sure to encounter many likeminded souls travelling both in front of and behind you. The other path will offer less companionship, and, as I mentioned above, will be more difficult to follow, steeper, and often dangerous. Three types of people belong to this smaller group: first and foremost, the teacher-philosopher, i.e., the genius; secondly, the students, who are likely to become geniuses, the first-rate talents; and thirdly, the group of students who are needed in the process of the birth of genius, assistants, who are second- and third-rate talents. It is clear to me that Nietzsche himself considered himself to be a philosopher in this elitist group. Moreover, in the text *Schopenhauer as Educator*, it is Nietzsche who is the hero, not Schopenhauer, because he understands Schopenhauer’s brilliance and genius, which elevates him to Schopenhauer’s level and even beyond it. This is very human, but not humanistic (Nietzsche 2004, p. 96, 1983, pp. 175–176).

Academic Freedom

In the fifth lecture, Nietzsche describes his conceptualization of the university student and presents his views on academic freedom. He begins by criticizing the typical lecture hall scenario, in which the professor reads from notes and speaks to the students while they listen to and write what he is saying.

One speaking mouth and very many ears with half as many writings hands – that is the external academic apparatus, that is educational machine of the university in action. (Nietzsche 2004, p. 106)

It is in this academic apparatus that academic freedom lies. The professor says what he or she wants, and the students hear what they want. The State hovers somewhere in distance and reminds us that there is a purpose behind this action. Academic freedom implies the lack of a leader, the Führer, and poses the illusion of freedom, which actually makes the student powerless, lost, tired,

lazy, fearful of work, terrified in the face of everything great, self-contempt, and hateful.

Nietzsche does not reveal the potential consequences of this wrong kind of education and institution. The only thing that he does make clear is that in them the German spirit vanishes. So what happens to it then? What is this German spirit? Is it high culture, Wagner, Schiller, Goethe, and so on? From the postmodern point of view, this type of German spirit has died out, and it is not missed by many. Educational institutions must be rooted “in an inner renewal and excitation of the purest moral powers” (Nietzsche 2004, p. 117). These powers are geniuses, who are also leaders. These leaders must be obeyed, as all forms of education begin with obedience, as well as with subordination, discipline, and servitude. To put this another way, education begins with everything that we understand as being the opposite of academic freedom. The leader-philosopher-teacher must have certain abilities and freedoms in order to come into existence. He must possess manly characteristics and an early knowledge of mankind (whatever that may be), he must lack any kind of academic education, must not be narrowly patriotic, have no necessity for bread-winning, and no ties with State (Nietzsche 1983, p. 182). In other words, he needs to be Aristotle’s ideal of a virtuous man in the slave society of ancient Athens.

The Conclusion and Five Counterarguments

Nietzschean education is education with a hammer or, in Heideggerian terms, the education of enframing (Gestell) and calculative thinking. I have condensed Nietzsche’s idea of education based on his lectures into five arguments:

1. Culture is inseparable from education and is the highest goal of true education. Utility is not the goal of education. Nature is in absolute opposition to culture and is thus the source of our horror.
2. There is only one right and proper language for education – *Hochdeutsch* – the literary language.

3. Only a select group of people are worthy of being educated and even fewer are capable of educating.
4. Academic freedom as part of education means obedience, servitude, and submission to the educator-leader.
5. Educator has the truth in his power.

As the alternative to this idea of education in the time of the end of metaphysics, I summed up the Gelassenheit-education as five counterarguments. Gelassenheit-education or letting-be education must not be confused with O. Niell’s free education. Gelassenheit-education is based on the Heideggerian concept of human being. This concept is not Dasein, the famous slogan from *Sein und Zeit*, but is based instead on Heidegger’s *Zollikoner Seminare* (1987). (I disagree with Iain Thomson’s interpretation of *Sein und Zeit* and Heidegger’s philosophy of education. The basic problem is his interpretation of Dasein as human being. See Thomson 2004.) A human being is always already in the world, and the world opens up to her at a certain historical time and place. And one of the most important aspects of being-in-the-world is to be-with-others. The world opens up to us as something, because our basic mode of being is to understand the world. This understanding reveals the world as language and everything in the world is something either present-at-hand or ready-to-hand. There is nothing without language or names. For this reason, there is no distinction between the manmade higher culture and wild nature or the higher and lower needs of human beings. From this point of view, I have reconstructed five counterstatements as principle of the Gelassenheit-education:

1. Instead of pedagogical horror, there is a wondering, natural curiosity, and ability to ask questions. There is no dichotomy between nature and culture.
2. The language is the world. There is not one proper language that supersedes all others.
3. Education is itself the occurrence and it belongs to everyone. There is no distinction between the educator and the educated.

4. Freedom is those possibilities that we encounter in our own being in the world with others.
5. Truth is an occurrence and an historical event. No one can claim that she has exclusive access to the truth.

These five statements are just a brief outline of the principles of Gelassenheit-education. Heidegger speaks about learning and teaching in his lecture *Was Heisst Denken?* that supports these five statements (see Heidegger 1954, pp. 1, 48, 50). Learning and thinking are very important for Heidegger, and he sees them as belonging together. Learning and thinking form an hermeneutical circle; we know what thinking is once we are ready to learn how to do it and we learn it while we are thinking. Heidegger (1977, p. 346) poses the question of what learning is and answers: “Man learns when he disposes everything he does so that it answers to whatever addresses him as essential”. According to Heidegger, teaching is even more difficult than learning, and I generalize this idea by stating that to educate is also more difficult than to be educated. It is difficult because real teaching is *to let learn*, and the teacher must learn to let her students learn, *dasLernen-lassen* (Heidegger 1954, p. 50). We might go so far as to say that this means that the teacher is less sure of her materials than those who learn are of theirs. There is no room for the authority of the “know-it-all” in the genuine relationship between teacher and learners and educator and those who are educated. To become a good teacher is completely different than becoming a famous professor.

North American Critical Pedagogy

Introduction

Beginning in the late 1970s and early 1980s, a group of North American scholars (including Henry Giroux, Peter McLaren, Bell Hooks, Ira Shor, and Donaldo Macedo) began, in Paulo Freire’s words, “to reinvent my writings and research on literacy and pedagogy so that they may be applied to North American struggles for liberation in schools, the workplace, the home, and universities and colleges” (Freire 1993, p. ix). In a sense, then, Joe Kincheloe is right to demand that Freire “and his South/Latin American colleagues and progeny” be recognized as the originators of critical pedagogy (Kincheloe 2007, p. 11). In another sense, however, it is this “translation and reinvention” of Freire’s work into a North American context itself that has come to form the core of critical pedagogy – indeed, the very term “critical pedagogy” does not appear in Freire’s *Pedagogy of the Oppressed*, but was coined by Henry Giroux in 1983 (in an article appearing in *Harvard Educational Review* that August, which also formed the bulk of chapter 3 of a book, *Theory and Resistance in Education*, appearing a month later). Regardless of whether one considers North American critical pedagogy

to be the “core” of the discipline or merely an offshoot of Freire’s work, it is clear that Freire’s work could not simply be imported wholesale into the North American context; as Freire himself has said, “It is impossible to export pedagogical practices without reinventing them” (Macedo 2007, p. 394). This work of adaptation, translation, and reinvention thus marks out a North American “Freirean tradition” of critical pedagogy that is distinct from both its inspirations and its international cousins. This entry will identify the key themes and concepts of North American critical pedagogy and place them within the specific context of the political, institutional, and theoretical conjuncture of North America in the 1980s and 1990s, the key decades for critical pedagogy’s development.

The Theoretical Context

Seehwa Cho (2013, p. 20) suggests that North American critical pedagogy is best understood as a critical offshoot of earlier, mostly neo-Marxist, theories of education. Giroux’s *Theory and Resistance in Education* was presented nominally as a contribution to a preexisting field known as “radical pedagogy,” rather than as the inauguration of a new field. Giroux seems to have coined the term “critical pedagogy” for three major reasons. First, Giroux’s book is devoted to criticizing predominant trends within radical pedagogy, and his chief suggestion is that these theories need to be more *self-critical*; hence, a “critical pedagogy” would be a radical pedagogy that is more critical.

Second, Giroux’s main major source of inspiration – the theorists he turns to for resources to rebuild radical pedagogy – is the Frankfurt School; the term “critical pedagogy” seems to have been coined above all to draw the connection with critical theory and above all the work of two theorists, Herbert Marcuse and Jürgen Habermas, whose work Giroux cites most extensively. Like Freire before him, Giroux looks back to Marcuse for the latter’s blending of psychology and Marxism. In Habermas’s work, it is above all the analysis of the public sphere that interests Giroux, and *Theory and Resistance in Education* ends with a

suggestion that schools ought to function as a form of public sphere (allowing for open and critical discussion) as a way to revitalize democracy.

Finally, Giroux seems to have coined the term “critical pedagogy” because the major new task he outlines for radical pedagogy in his 1983 work is the incorporation of ideology critique into pedagogy. And so “critical pedagogy” is radical pedagogy that is not only self-critical and inspired by critical theory, but is also a pedagogy *of critique*. Following Frankfurt School theorists Adorno and Horkheimer’s theory of the “culture industry,” critical pedagogy develops an ideology critique through critical engagement with popular culture. By helping students to think critically about their own culture, critical pedagogy aims to develop critical consciousness, or “conscientization” – this is North American critical pedagogy’s translation or reinvention of Freire’s *conscientização* (itself a translation of Fanon’s concept of *conscienciser*).

In this early work, Giroux is also already drawing upon the other two major theoretical sources of North American critical pedagogy: British Cultural Studies and French Theory. While Giroux’s 1983 text engages mostly with Althusser and Bourdieu, the full range of French Theorists have been regular reference points for critical pedagogy over the last 30 years; Giroux’s introduction for the 2001 reprint of *Theory and Resistance in Education* begins with a quote from Bourdieu and ends with a quote from Derrida (Giroux 2001, pp. xix, xxxi). Of particular importance for critical pedagogy have been two major theoretical “imports” from the French: the notions of *power* and *reproduction*. Drawing mostly upon Foucault’s work, critical pedagogy has made use of a notion of power that is both restrictive *and* productive – not as two opposing possibilities of power, but as two sides of the same coin. Power in this sense is what subjects students *to* the status quo, but *also* makes them subjects empowered to meet, challenge, and even overthrow it. This dialectic is important for critical pedagogy’s engagement with the theory of reproduction – borrowed from both Foucault and Bourdieu. Schools have been presented by most radical theories of education as institutions engaged primarily in

reproducing the status quo and relations of domination. Critical pedagogy is animated by the attempt to find resources *within* the school and schooling for resisting, interrupting, and even undoing this process of reproduction. *Theory and Resistance in Education* devotes significant space to developing a theory of resistance – and this in turn has been followed up by the work of Giroux (e.g., 1997a), McLaren (e.g., 1997), Hooks (e.g., 1994), and others to develop a pedagogy of “hope,” “dissent,” and “transgression.”

The engagement with British Cultural Studies grew directly out of both the attempt to find resources for resistance within the theory of reproduction and the engagement with popular culture as a privileged site of ideology critique. The most significant influence of British Cultural Studies upon North American critical pedagogy has been the turn to Gramsci. Antonio Gramsci of course had some things to say directly about education, but it is the neo-Gramscian theory of *hegemony*, read through the lens of Cultural Studies, that has been most significant for critical pedagogy, as a way of analyzing the intertwined forces of culture, ideology, domination, and consent.

To flesh out Cho’s picture, then, we could say that North American critical pedagogy has emerged out of neo-Marxist education theory by way of these four major theoretical “supplements”: Freire’s Brazilian school (including Augusto Boal); first- and second-generation Frankfurt School critical theory; British (Birmingham-school) Cultural Studies; and French Theory. But theoretical development does not happen in a vacuum; it is driven by material conditions, and the specific ways in which these sources have been drawn upon and brought into dialogue cannot be fully understood without examining the political and institutional context of North American critical pedagogy’s development.

The Political Context

Freire’s inspirational works were written in the context of the radical uprisings of the late 1960s, and the Frankfurt School works that have proven most influential on critical pedagogy – Marcuse’s

late work and Habermas’s early work – both arose in dialogue with and even response to the student movement. By contrast, critical pedagogy emerged in North America during the ascendancy of the “Conservative Restoration” (Shor 1992). By the 1980s in North America, there was neither a revolutionary organization nor a radical counterculture left to carry the hope of a genuinely oppositional politics. The development of critical pedagogy – and especially of the “language of hope” – must be understood within this context. Critical pedagogy was from the beginning framed as a critical response to the “pessimism” of reproduction theories in sociology of education; the complaint was that such theories provided no resources for individual human agency – especially the agency of teachers – for radical social change. Critical pedagogy’s search for a “language of hope” is an attempt to find a theory that will empower teachers and students to overturn the status quo, an attempt to revitalize resistance and agency in the face of the retrenchment of radical politics during the 1970s. But the North American political context has not only shaped critical pedagogy’s demands for optimism, it has also had a substantial effect on the content of critical pedagogy.

A century and a half of red scares, violent repression, and covert manipulation has all but eradicated any organized tradition of communism, socialism, or anarchism in North America (and especially the USA); but – despite institutional resistance and even violent, organized suppression – the twentieth century saw the increasing strength and diversity of non-class-based oppositional politics in the USA, including political movements organized around feminism, racial equality, and LGBT issues. Within this context, it is perhaps natural that the theoretical-political basis for critical pedagogy has shifted from Marxism toward “post-Marxist” critical theory. But these movements are also testament to the realization that the struggle against economic exploitation is by no means incompatible with other forms of exploitation and discrimination – and, more generally, that struggling against one form of domination is no safeguard against the reproduction of other forms. For critical pedagogy, this political context has been reflected in theoretical debates; starting in the 1980s, critical pedagogy has been criticized by

feminists (e.g., Luke and Gore 1992), postcolonial and critical race theorists (e.g., Ladson-Billings 1997), and so on. While some of these criticisms have been presented as attacks on the tradition of critical pedagogy from the outside, most have situated themselves firmly *within* the tradition. The work of Bell Hooks (1994, 2003) is exemplary in this regard: unflinching in her criticisms of critical pedagogy with respect to both race and gender, Hooks nonetheless makes it clear that she sees her own work as falling within the Freirean tradition. In turn, other “canonical” figures within North American critical pedagogy – like Henry Giroux (1997b) and Peter McLaren (1997) – have taken the challenges of feminism, critical race theory, and other “marginalities” very seriously. This has meant above all reinventing Freire’s pedagogy, which (especially in his earliest work) framed oppression in the fairly orthodox Marxist terms of class and economic exploitation. The turn to postmodernism within critical pedagogy (including the neo-Gramscian theory of hegemony and the Foucauldian theory of discourses and regimes of truth) can be seen as a response to the need for post-Marxist critical tools.

The North American political context has also meant that critical pedagogy tends to frame its positive vision in terms of *democracy* rather than *socialism* or *revolution*. This democratic frame has in turn allowed critical pedagogy to reach back beyond Freire and the Frankfurt School to embrace the work of early American progressive education theorists like John Dewey. Dewey’s vision of education as the preparation for free, democratic life has become a founding tenet of critical pedagogy, and his conception of inquiry as communal problem-solving has been productively blended with Freire’s problem-posing method (if not without a certain creative violence to both theories). The embrace of Dewey’s democratic vision alongside the postmodern, diversified conception of domination has come to form the ethical “core” of critical pedagogy: its positive politics are best and most cohesively framed in terms of the aims of flourishing democracy and universal freedom.

At its best, critical pedagogy thus reframes the notion of revolution in terms of democracy and

equality and links the fomentation of student critical consciousness with the radical democratic reform of society. At its worst, however, critical pedagogy becomes a rehashing of identity politics, a reaffirmation of liberal-American individualism, and even a student-centered teaching method stripped of all political content. And so dissatisfaction with post-Marxist, postmodern politics has arisen among certain critical pedagogy theorists. Gregory Martin (2007, p. 339) charges that “critical pedagogy in its current manifestation has been scrubbed clean of its social consciousness and is no longer a material force for social change.” And no less central a figure in North American critical pedagogy than Peter McLaren (1998, p. 448) now claims that critical pedagogy is no longer a viable platform for social change. This group, following language proposed by Patricia Allman (2001), has started referring to itself as “revolutionary critical pedagogy” – or, more simply, “revolutionary pedagogy.” Will revolutionary pedagogy split off from critical pedagogy as a new discipline, the way critical pedagogy split away from radical pedagogy? Or will this be another internal(ized) critique, similar to the debates about feminism, race, and culture in the 1980s and 1990s? It may yet be too early to tell; but McLaren seems to suggest in his recent writings that he already considers revolutionary pedagogy to be a new discipline, distinct from critical pedagogy: “There is, for lack of better terms, left-liberal critical pedagogy, liberal critical pedagogy, conservative critical pedagogy, and variants of each of these. In opposition to these there is revolutionary critical pedagogy, which myself and others have been trying to develop” (McLaren 2010, p. 6).

The Institutional Context

While the political and theoretical context sets critical pedagogy radically apart from its inspirations, it is the difference of institutional context that has had the biggest influence on how Freire’s work has been “reinvented” or “translated” within the North American context and explains much of the way the theoretical context has unfolded:

While Freire and his colleagues went out to rural areas to work with adult, illiterate farmers, North American critical pedagogy has been predominantly taken up within secondary and post-secondary schools.

The most immediate consequence of this institutional setting is that critical pedagogy was immediately pulled into debates about curriculum and school reform. The Culture Wars that raged in academia in the 1980s coincided with the first growth and development of North American critical pedagogy within education and humanities departments in colleges; critical pedagogy was thus informed by, and in turn contributed to, debates over “the canon.” Michael W. Apple’s notion of a “hidden curriculum” (Apple 2004; Apple draws the term from Philip W. Jackson) has become critical pedagogy’s most significant novel contribution to this debate. The “hidden curriculum” refers not only to the values that are implicitly imparted through curriculum choices, but also to the lessons imparted by environment, forms of discipline, classroom structure, etc. Of course, Apple (2004, p. 46) is quick to add that “historically, the hidden curriculum was *not* hidden at all, but was instead the overt function of schools during much of their careers as institutions.” By expanding focus beyond the content of the *explicit* curriculum, critical pedagogy’s concept of “hidden curriculum” is a way of setting the Canon Wars into a larger context.

Finally, critical pedagogy’s development within the institutions of secondary and post-secondary education in North America means that it has had to grapple with issues of compulsory education in a way that Freire’s work never did. Children in the USA are required by law to attend school until the age of 16, and whereas Freire and his team taught farmers to read as a way of enfranchising them, North American critical pedagogy has been predominantly focused on educating students who are already nominally enfranchised and who have some baseline literacy. Thus, critical pedagogy’s focus has shifted toward questions of critical *cultural* literacy, the “hidden curriculum,” and the role of educational institutions in the reproduction of social relations. But this context has also had the important yet

ambiguous effect of pulling critical pedagogy into debates about school reform. The push in education over the last few decades toward standardized, high-stakes testing, the assault on teachers’ unions, and the deprofessionalization of teaching are all obviously antithetical to everything critical pedagogy stands for. But in this context, it has been easy to champion Paulo Freire’s work as a set of teaching *methods* and as an opposing proposal for school reforms. It remains highly questionable whether critical pedagogy could inform a national project of school reform without becoming domesticated as a set of student-centered teaching methods and dropping most of its political content. But nor does it seem that critical pedagogy can simply watch from the sidelines as neoliberals dismantle public education in the US-A. And so Henry Giroux, among others, has attempted to lay out critical pedagogy’s position within the contemporary educational context. His introduction to the 2007 collection, *Critical Pedagogy: Where Are We Now?* cites the danger of what Giroux calls the conservative “attack on higher education” and exhorts his peers to “mobilize to protect the institutionalized relationships between democracy and pedagogy” (Giroux 2007, p. 4) – a relationship which Giroux has of course been championing since his earliest work on universities as a form of the public sphere. While the terms of the debate remain problematic for critical pedagogy as a practice, Giroux’s work has been uncompromising in the demand that critical pedagogues act as public intellectuals, and not merely as teachers within their respective (institutionally recognized) classrooms.

Conclusion

Critical pedagogy today is an international and diverse movement. Though undeniably a part of this international movement, and in constant dialogue with its international peers, North American critical pedagogy can be seen to form a relatively coherent subset, staked out through its application of the general principles of critical pedagogy to the specific political and institutional conjuncture of the USA and Canada. For the reader who is

entirely unfamiliar with critical pedagogy, the goal of this entry has been to lay out the key concepts in a way that briefly indicates how they have been put to work. For the casual reader of critical pedagogy, the major goal has been to clear up the hasty assumption that authors like Giroux, McLaren, Hooks, Shor, etc. are simply “importing” and directly applying the work of Paulo Freire; rather, the Freirean tradition of North American critical pedagogy must be seen as an attempt to *reinvent* Freire’s work within the North American context. This context was dominated during the first two decades of North American critical pedagogy’s development by the Culture Wars and the Conservative Restoration. Today, in addition, the neoliberal war on education (including the school reform movement at the primary and secondary levels, and the corporate takeover of the university at the postsecondary level) has come to dominate the landscape. In response, critical pedagogy has followed the general trajectory of critical theory: from Western Marxism into post-Marxist multiculturalism, and now into schisms between left-liberal, radical, and even conservative factions. While the temptation is to follow one of these streams as the “genuine” expression of critical pedagogy, the split itself must be seen as expressing the truth of the movement; as an ongoing conversation between public intellectuals and committed educators, and as a movement devoted to overthrowing hierarchies (of oppressors and oppressed, but also of leaders and the led, teachers and students), the fragmentation of critical-pedagogical “schools” is a reflection of the various and conflicting demands of the social and political situation upon education and democracy today.

On “the Temptation to Attack Common Sense”

Renia Gasparatou

University of Patras, Department of Educational Sciences and Early Childhood Education, Patras, Greece

Synonyms

Common sense; Education; Rule following; Science; Verificationism; Wittgenstein

Introduction

Education happens all the time, in all places, and during all our lives. We all know that. However, the moment we hear the word “education,” our minds wander back to school. Schools and other educational institutions offer formal education and thus formalize the concept, turning it into a quasi-technical term that goes well with “policy,” “criteria,” “evaluation forms,” and all the rest of the modern educational vocabulary. The growing formalization of concepts is in line with a verificationist ideology that thrives in formal education: methods and outcomes need to be tested; we need a *scientific* language that measures what students learn in a scientific way; science is a priority anyway, for it informs us of what lies beyond our ordinary conception of the world.

Among the goals of education after all is to teach us a more accurate way to describe the world, leaving vulgar common sense behind.

Wittgenstein, however, argues against the temptation to attack common sense. In the following sections, the Wittgensteinian idea of common sense will be explored and then applied in education. Wittgenstein defends common sense as a guide for our thinking and as a relief from mental discomfort. It is the starting point and the final destination of our encounters; yet the process requires that people are able to walk their way through puzzlement. Such a defense of common sense might stand as a powerful educational ideal. Education should not teach us to hide confusion behind technicalities; it should rather enable us to embrace and dismantle it.

Wittgensteinian Common Sense

Philosophers often appeal to common sense as a criterion that can help address philosophical problems. It supposedly provides some kind of *consensus* about what it is sensible to say, ask, or mean (Gasparatou 2010). Thomas Reid is among the pioneers who use *common sense* to refer to sound judgment or to the views of plain men, for both can help undermine the absurd claims of the philosophers. In twentieth-century philosophy, Moore (1993) gives the most well-known “defense of common sense.” His appeal targets the skeptic; he argues that there is a large set of

propositions, such as "There exists at present a human body, which is my body" (p. 107), which, even though they are contingent, we all know with certainty; the skeptic also is certain of them. Common sense then refers to a list of truisms, to beliefs held by all.

When Wittgenstein talks about common sense, he has Moore in mind. Wittgenstein opposes the view that common sense can provide an answer to skepticism or any other philosophical problem (Gasparatou 2009a). And, yet, he agrees that common sense needs defending:

There is no common sense answer to a philosophical problem. One can defend common sense against the attacks of philosophers only by solving their puzzles, i.e., by curing them from the temptation to attack common sense; not by restating the views of common sense. (Wittgenstein 1958, pp. 58–59)

Wittgenstein's point of view in fact opposes most traditional appeals to common sense. Philosophy threatens common sense; but this is not reciprocal: common sense cannot threaten philosophy, for it cannot answer its questions. Just like it cannot answer scientific questions:

A philosopher is not a man out of his senses, a man who doesn't see what everybody sees; nor on the other hand is his disagreement with common sense that of the scientist disagreeing with the coarse views of the man in the street. That is, his disagreement is not founded on a more subtle knowledge of fact. We therefore have to look round for the source of his puzzlement. And we find that there is puzzlement and mental discomfort, not only when our curiosity about certain facts is not satisfied or when we can't find a law of nature fitting in with all our experience, but also when a notation dissatisfies us -perhaps because of various associations which it calls up. ... (Wittgenstein 1958, p. 59)

According to Wittgenstein then, stepping out of common sense amounts to mental discomfort. And one is forced outside its realm for two reasons. First, they may need to explain some fact that common sense does not explain. Subtler knowledge is called for. This is the realm of science. The second source of misunderstanding has to do with some conceptual knots that are created within ordinary language. Certain terms are used carelessly and lose their ordinary meaning; certain phrases are metaphorical and if taken out of

context, they project false images. If, for example, one says "I don't know what is going on in your head," this expression may be taken to imply that the mind is some sort of private room where things happen. But if we clarify this phrase, it will become evident that all one means is "I don't know what you are thinking." In such cases *grammatical investigation* clears misunderstandings away and brings clarity of meaning in context. This is the realm of philosophy. Now, one should not take Wittgenstein's distinction between science and philosophy or between factual and conceptual confusions as sharp. There can be conceptual confusion within science; furthermore, concepts may evolve as new scientific information is brought to light (Wittgenstein 1969, §94–99; Gasparatou 2009b). In any case, philosophy is a conceptual or grammatical investigation (Wittgenstein 1968, §89–133).

Wittgenstein's use of *philosophy* has both negative and positive connotations; none refers to just academic philosophy. In its negative use, it signifies our temptation to go *deeper* than ordinary language, with the result that we violate it somehow. In its positive use, philosophy is the activity of clarifying language, so that misunderstandings will be resolved. Each of us can be a philosopher in both senses; everybody can potentially give into the temptation to overstep ordinary language usage, in which case, they can potentially work to dismantle the misunderstanding. The only way to cure such mental discomfort is to pay close attention to ordinary language and uncover the rules of our language games.

The term *language game* has no clear definition. Wittgenstein resists definitions and all attempts to amend language or create an ideal metalanguage; these are attempts to arrive at some hidden essence. But there is no such essence; a term gains its meaning by its actual use in actual contexts, i.e., by the many language games people play with it. The game analogy opposes the view that language has a prioritized function: to *describe* the world (Wittgenstein 1968, §1–38). Description is only one language game among many. Each game involves rules. Rules are contingent: they could be otherwise. Yet they are also necessary: if they change, the

game changes. It would be plain nonsense, then, to believe that the many language games, like *promising*, *obeying*, *playacting*, etc., could be reduced to a single one, i.e., *describing*. You cannot reduce one game to another; if you change its rules, you alter the game. And indeed sometimes rules change: old language games die and new ones are born all the time.

Speaking of *language games* and *grammar*, Wittgenstein emphasizes the normativity of language. Language is a rule-governed activity; and grammatical investigation uncovers rules in order to clear misunderstandings away. At a minimum, rules are inner standards of correctness and meaningfulness. We grasp such rules by participating in the activities of our community. In fact, Wittgenstein expands the notion of language to cover all human practice; the totality of human practice is rule governed. *Rule following* then is a central theme (Wittgenstein 1968, §138–242). It presupposes some regularity in behavior, but it is not automatic; it is intentional. In fact, I follow a rule only if I intend to follow a rule, consciously or unconsciously. Intending does not require me to justify, explain, articulate, or even think about the rule as I follow it. But I need to have grasped the correct application of the rule by being brought up within a community of fellow rule followers. For example, people learn to shake hands in certain contexts. This is a human practice, involving language games and gestures, all of which are normative. The rules slightly change depending on the occasion. Grasping the normativity of this gesture within the context, we can apply it on different occasions without thought; we can also change the rules of this activity over the course of time. Yet it is always an intentional gesture that carries some normative habitual implications.

It is the task of philosophy to unravel rules *whenever confusion is created* (Wittgenstein 1968, §119, §125–133). The point is not to clarify all language or explain all rules. That would be impossible since rules change and new language games are created. Moreover, it would be a case of philosophical – i.e., conceptual – confusion: an overall all-purpose clarity does not make sense. To clarify is to dismantle some specific misunderstanding *to some specific end* in some specific

context. In cases of puzzlement then, we need to practice grammatical investigation and *return* to common sense:

... for as soon as we revert to the standpoint of common sense this general uncertainty disappears. (Wittgenstein 1958, p. 45)

Wittgenstein then invites common sense as an ideal. It is our ideal home: our starting point and our final destination. Starting from the language games we play, confusions arise, and we may need to clarify them so that we again revert to a common ground of contentment. This is the ground of sanity, the time when discomforts are put to rest. It is also a *common* home; it implies a worldview and a set of practices common to us all. After all, no language and no rules are private (Wittgenstein 1968, §243–275). Common sense is necessarily sharable too. And if Wittgenstein is right and philosophical problems arise from our everyday use of language, this is a nonstop guiding norm for philosophy, not for the academic philosopher but for the philosopher inside us all.

Educating for Common Sense

Wittgenstein's philosophy is full of insight about how we learn language and how important the social activity of sharing a language is for all other types of learning (Standish 1992; Smeyers and Marshall 1995; Peters and Marshall 1999; Smeyers et al. 2007). We share the grammar of our practices, and we *understand*, *mean*, *feel*, and *act* using a variety of language games. Growing up in a community, we learn to share rules or even come up with new ones (Burbules and Smith 2005; Smeyers and Burbules 2006). Wittgensteinian philosophy can explain how education, formal and informal, includes us in a *form of life* and even enables us to change it from the inside (Peters et al. 2008). The Wittgensteinian notion of *common sense* can add up to such discussions. In fact, it could serve as a game-changing educational ideal. Wittgenstein's plea for common sense demands that we learn to dismantle conceptual confusions. Since confusions arise in all human practices, education should teach us to deal with

them. Yet in order to do that, educators need to address their own discomforts.

Philosophers of education have pointed out instances of such discomforts in educational contexts (Winch 2006; Davis 2009; Standish 2012). Among the concepts in desperate need of clarification is the use of *criteria* in formal education today. Much of educational policy, research, and practice have blurred our discussions of *criteria* with a preoccupation with *data*. Here lies a Wittgensteinian-textbook conceptual confusion that relates to an ill-conceived verificationism. *Verificationism* is roughly the idea that to say something meaningful is to be able to back it up with verifiable data. This idea was once proposed by logical positivists. It somehow declined in philosophy of science decades ago. Yet it is still prevailing in education: whatever we do needs to be describable, documentable, measurable, and assessable by objective data (Standish 2004). For example, if we want to see if a teacher teaches well, we don't just go and watch them teach; we fill assessment forms, give them self-evaluation forms to fill, and since these practices are not considered objective enough, we also document how well their students perform in tests. So we no longer talk about the *qualities* of a good teacher, but rather about their *scores*. Any decision in education today about who to hire, which method is optimal, or which curriculum we should prioritize turns on data, measurements, and assessment forms. Instead of discussing the qualities we ought to embrace and promote, we are preoccupied with data.

Educators' obsession with data implies that some language games are given more priority than others. Within the verificationist ideology, *describing* is the prioritized language game; its superiority derives from science; science supposedly describes how the world operates on a deep level; hence, educational policies today prioritize science not only in curriculum design but also as a method for all disciplines, including educational practice itself. The implication is that any practice worth educating for would be reducible to the descriptive game. However, even if science *did*

objectively describe the world, this would not be a reason enough to stop all the other things we do with language. It makes no sense to eliminate *arguing*, *teaching*, *advising*, and all the other things we do with words in the fantasy that this would leave us free to *describe*. Wittgenstein's arguments against the idea that there is some linguistic function that stands above all the other functions of language are indeed relevant here.

Moreover, science does not merely or *objectively* describe the world. Scientific research is as much a social, cultural, normative, and imaginative practice as any. It is a mainstream concern in science education research today to attack naïve depictions of science as merely descriptive of nature. Effort is being made to inform teachers, students, and policy-makers of the true nature of science and to dismantle conceptual, factual, and historical confusion about the distinction between data and their interpretation, the role of the community, culture, creativity and imagination in the creation, and evolution of scientific theories (Lederman 2007). Then, it is not just that we cannot eliminate all other language games in order to describe scientifically; we actually *need* a vast variety of language games for science itself to evolve. Policy-makers struggle to ground their decisions on a misunderstanding of scientific method.

In education, science, and everyday life practices, to judge which methods are optimal is to exercise a normative power. This involves values, emotions, interpretations, and rules. And indeed we do exercise this normative power: we judge what kind of data is relevant or how to interpret it. Evaluation forms or metrics are blind unless we put them in the perspective of an overall discussion of the dispositions or the qualities we want to promote. For example, teachers' favorable evaluation is taken to suggest that their students understand them: *that is why* they do well in tests. Academics' high metrics scores are taken to imply that their work is influential. However, this is an interpretation of the data in the light of ideas and norms, which are debatable. Not everybody thinks that good teaching means "teaching

to the test" (Standish 2016) nor does everybody think that *influential* research necessarily means *highly cited* research or *good* research. The idea that there might be some objective database that could spare us the process of judging is thus incoherent. Databases depict underlying norms and values. However, in education today instead of doing the hard work of clarifying and refining such norms, we undermine them by fixating on technicalities. Educators misidentify the normative for the descriptive, diminish rules into formulas, portray rule following as blindly complying with procedures, and reduce inner-yet-social standards of excellence to external metrics.

Contrariwise, we should be more confident of our natural rule-following practices. Wittgensteinian philosophy can remind us that, as natural rule followers, we comply with criteria for every single practice or habit of ours from handshaking to scientific research; we explore new ones, we initiate others into our normative practices, etc. Within this flux, it is hard to formalize criteria. We employ more that we realize, we create new ones every day, and we impose them differently depending on the context. We judge by using our criteria while debating over such criteria at the same time. Thus, our criteria are never *subjective*: they are sharable. Neither are they *objective*, not if by "objective" we mean automatic or causal. Imposing criteria is an intentional and intersubjective practice that is open to revision, just like all human practices. There is nothing mysterious about it.

The current use of *criteria* in educational settings today shows that the use of a concept may hide a series of implications that need to be explicitly addressed through Wittgensteinian investigation. Furthermore, it is a key example of how the formalization of a concept makes a whole practice seem more obscure than it really is. Formal education claims its authority by working against common sense. The aim is to present educational research and practices as *scientific*, when in fact scientific practice is misrepresented too. For even science has its home in common sense.

The Wittgensteinian notion of *common sense* should be an educational ideal altogether. Wittgenstein would not suggest we rest content with our common beliefs or silence the philosopher – or the scientist – within us. It is part of our human nature to try alternative viewpoints or wish to go deeper into a better understanding of our worldview, to live better and to create new language games for all to play, and to have a more accurate knowledge of the facts and incorporate it into our practices. All the more reason why we should embrace philosophical discomfort, practice grammatical investigation, and learn to make our way through confusion, puzzlement, and distortion, back to an enlightened clarity of mind. Education should enable us to move this circle from common-sense-point one through grammatical investigation and back to common-sense-point two and then all over again when another discomfort arises. This temporal equilibrium he would call *common sense*.

Educators can start incorporating this ideal by solving their own conceptual perplexities. This would require policy-makers, administrators, and teachers who *engage* with confusions rather than succumbing to them or obscuring them. The catch is that only such educators can truly promote this ideal. Grammatical investigation is – or should be – one more practice among the many normative human practices we grasp while growing up. Yet one can only learn to play the game while actually playing it with others in formal and informal educational settings.

Wittgensteinian *common sense* has one more advantage: it is a vague and elusive ideal. There can be no formula and no clear-cut prescription; it is partly a matter of social initiation and negotiation and partly an individual endeavor; it includes a lot of disappointment (Standish 2004; Smeyers et al. 2007); and in the end, just like any other practice, one can only learn how to do it while doing it. We do not need formulas from education; we need to learn to notice *differences*, to uncover *pieces of nonsense* (Wittgenstein 1968, §119), and to assemble *reminders for particular purposes* (Wittgenstein 1968, §127).

On Heidegger on Education and Questioning

Babette Babich

Fordham University, New York, NY, USA

Introduction

Discussions of Heidegger and education take a number of perspectives as thematic foci. Questioning is key to Heidegger's thinking from the start of *Being and Time*, calling into question the foundations of what we suppose ourselves to know. Thus questioning involves a reflection on education, that is: both teaching and learning. Heidegger himself thematizes education, significantly so in the light of the political circumstances of his 1933 “Rectoral Discourse” as well as, in an inventive mode which would, as we shall see have been better had it been identified as such, as a reconstruction of his postwar reflections on the “Art of Teaching” and, most importantly, *What is Called Thinking?* Heidegger's reflections on questioning also include a meditation on both phenomenology and hermeneutics in “The Question Concerning Technology” in which he famously describes “questioning as the piety of thought.”

On Heidegger and Education

A number of contributions to Heidegger and education may be found throughout discussions of Heidegger, not only on education and pedagogy but also in terms of Heidegger's specifically didactic style. [Consider, quite conspicuously, Peters (2009) as well as the contributions to Peters and Allen (2002), Ehrmantraut (2010) as well as Mayer (1960) as well as Meyer-Drawe (1988) and Nießeler (1995). On Eugen Fink's social-hermeneutic theory of education in particular, see Meyer-Wolters (1992)]. There are approaches to Heidegger and education that look specifically at Heidegger's reflections on technology drawing implications for newer forms of education, be it

distance learning via and including computer-mediated/digital education, or else for today's interactive museum and science "learning centers" (Standish 1997; Waddington 2005). Still other considerations of Heidegger and education are concerned, some positively, some not so positively, with "authenticity." [See Nießeler (1995), once again, as well as Brook (2009)].

Many reflections on Heidegger and education begin with a reading of Heidegger's "Rectoral Address" [Heidegger (1985); the initial lecture was originally published as *Die Selbstbehauptung der deutschen Universität Rede, gehalten bei der feierlichen Übernahme des Rektorats der Universität Freiburg i Br. am 27. 5, 1933* (1933)], just where Heidegger specifically highlights the role of the university (à la John Henry Cardinal Newman or, indeed, à la Wittgenstein who also thematizes the university), and some go on to consider Heidegger's postwar reflections on the same National Socialist context, while other approaches review Heidegger's reflections after his return to university teaching in his 1951–1952 lecture course, *What Is Called Thinking?* inasmuch as Heidegger there too explicitly raises questions of education, specifically adverting to both teaching and to learning.

But Heidegger's concern with education is a broader one than may be indicated by word-search-specific remarks on education alone. Hence the attention Heidegger pays to learning as to learning to think and to questioning runs throughout his work, characterizing his style of philosophizing. Indeed, Heidegger's reflections on questioning in *Being and Time* mark a hermeneutically styled, phenomenological philosophy in general: hence its value for a specifically Heideggerian philosophy of education. [See Peters (2009), Gordon (1998), and Fink (1979) as well as his (1970) and overall Gallagher (1992)].

Heidegger's point of departure in *Being and Time* is classically instructive, highlighting the opposition between what we take ourselves to know, on the one hand, and what knowing ultimately is on the other. In this way, Heidegger's introductory quote from Plato's *Sophist* meditates on knowing unknowing: supposing oneself to know – "For manifestly you have long been

aware of what you mean when you use the expression 'being'" – which Heidegger conjoins with the unsettling disquiet of the recognition that one does not know, "We, however, who used to think we understood it, have now become perplexed" (Plato, *Sophist* (244a)).

This Platonic or Socratic reticence contra the presumed knowing that is characteristic of the sophist (by contrast with the philosopher in Plato in general) already offers an illustration of the revelation not of facts confidently assumed but attests to reflective breakdown. By contrast with presumed and long-standing knowledge ("you have long been aware of what you mean when you use the expression 'being'"), and precisely where one, that is singularized in the second person, plural in this case, *anyone* who, had not thought to question, questioning is prescribed as needful remedy for us, in the first person plural: "We, however, who used to think we understood it, have now become perplexed."

Heidegger's illustration of the breakdown of the ready to hand in the case of a tool like a hammer, defective or broken, or even simply missing, works as a halt, be it brief or longer lasting, in a given undertaking with which one has to do with the (now) problematic hammer. If we articulate an unspoken algorithm of problematization, the deficit calls the overall project as such into question. One can ask, must it be done? Now? What else might serve in place of a hammer? Where can a hammer be found? Such an array of reflections can in turn remand the project into an ad hoc stage, using work-arounds and substitutes – not only a hammer can be a hammer – or may initiate a stage of still further "preparation": anything worth hammering is best secured with the appropriate hammer for the job.

Philosophy itself is inherently of such a "work-around" character in some cases or else it is more classically of the preparatory and reflective variety. Undertaking to reflect on a given theme, we may ask ourselves what we know, and if we remember our Plato (as Whitehead once celebrated, we are all so many footnotes to Plato and as Ricoeur further emphasized, the goal of scholarship is ultimately to be a footnote), it often transpires not only that we do not know but

much rather, as in the famous case of the son, Euthyphro, who, supposing himself to know what piety is, undertakes to bring his own father to court on the grounds of impiety, or else of Thrasymachus, who tells Socrates that he, Thrasymachus, knows justice to be no more than the interest of the commanding powers that be, and so on.

The Socratic (Nietzsche would correct us here and say the Platonic) lesson of knowing our own unknowing calls on us to reflect upon our long-standing and recalcitrant habit of presuming to know what we do not know.

Thus, again, we recall that Heidegger begins his *Being and Time* with the above-quoted citation from Plato's *Sophist* reflecting not on piety (like the *Euthyphro*) or justice (like the *Republic*) but precisely to raise the question of what we mean by being. By asking a classically Platonic question, Heidegger makes a phenomenological move, simultaneously hermeneutic, reflecting on the reflection and so bracketing the assumption with which he begins. We are to question whether we know what being is, but to this end, prior reflection is required.

Do we know what we are doing when we put something into question? What is questioning? What are we doing when we question?

This style of questioning is familiar to us as characteristic of Heideggerian philosophy. And just this questioning makes Heidegger essential reading for anyone reflecting on education, that is: on the nature of teaching and the nature of learning.

Heidegger routinely recalls us to such a starting point: as if philosophy were the proper project of the perpetual beginner. What, he asks us to ask, is the origin of the work of art? What is metaphysics? What is the relation of being and thinking, that is, the relation between what is and what is thought? What is the essence of, that is to say, what is the nature of, technology? How can we come to a free relation to it? What is the uncanniest of the uncanny? What is the danger? What is a thing? What is called thinking? Do we think? More subversively still, presuming the height of what we suppose human thinking to be to be science, does science itself think?

Here it must be noted that not all readings of Heidegger attend to the hermeneutic dimension proper to his phenomenology. Indeed a standing problem with traditional Anglophone readings of Heidegger and education, especially given the above-noted attentions to the *Rektoratsrede*, etc., corresponds to the analytic character of these readings (importantly, Thomson 2004, but see also Tubbs 2004 as well as many of the contributions to Peters and Allen (2002), a character compounded by the fact, shades of the above-noted Euthyphro parallel (and we will return to this below), that such analytic approaches not only take themselves to be superior to other readings but also insist on describing themselves as "continental" and not, heaven forbid, as "analytic." The analytic tactic of refusing to be described as analytic works (not at all coincidentally) to resolve the analytic-continental divide on the side (as it were) of the angels: the Anglo-Saxon, the analytic, today the "dominant" side, proving its dominance by excluding other approaches altogether by denouncing them as "bad" or even mocking them. The institutional insularity of such a tactic (this is already a done deal) is less significant than the political dimensions of many readings today. For in reading Heidegger on education, it is traditional (and reasonable enough) to begin as already noted at the outset where Heidegger himself thematizes education, just as Michael Peters, likewise, has very insightfully shown [See Peters introduction to his co-edited collection 2002]. Yet to begin with Heidegger's address as a university administrator under the Nazi regime and to continue with Heidegger's postwar appeal to be permitted to continue to teach [Heidegger 2000; Hodge 2015 might have profitably drawn on some of the essays in Peters and Allen 2002] and to go on to reflect on his attention to teaching as such in the context of his return to the university in 1951–1952 [this is the point of departure for and organizing principle of Peters and Allen (2002), but for an insightful situating of this approach and including a useful bibliography including Michael Bonnet's contribution, see Peters' own chapter, "Introduction: Heidegger, Education, and Modernity," pp. 1–25] is to read Heidegger under the

sign of Nazism and in the wake of the publication of the *Black Notebooks* that is also consequently under the sign of at least a certain anti-Semitism. [See not only my essay (Babich 2015a) which looks at education and the all-too-ontic instaurations of formation, inclusion and exclusion, but also the several contributions in English, including my own, to Malpas and Farin (2015)]. There are quite a few problems with this, none of which are served by a lack of hermeneutics or indeed a lack of an as yet unattempted Heidegger-specific philology.

When the *Trivium* Is No Longer Trivial: On Things that No Longer Go Without Saying

From the outset, even with his earliest works, were this a discussion of history (rather than questioning), Heidegger reflects that what has transpired in the university is the displacement of pedagogy. This shift does not merely affect scholars and teachers – and this has been true for some time and is becoming ever more serious in a digital age but also in an age that focuses on the student as opposed to the teacher [consider Rancière’s wonderful return to Jacobin who taught that one need not be learned at all to teach at all (Rancière 1991)], given current culture where the student but so too the ever and ever younger scholar, is valued with more grants, more initiatives, more support, more discussions/thematizations by contrast with the increasingly devalued professor [including breaking professorial appointments into several junior positions, at other times more egregiously so as in the replacement of tenured appointments with adjunct or time-limited appointments, inevitably reducing qualification]. At the same time, Rancière’s celebratedly ignorant schoolmaster is increasingly more descriptive than prescriptive: newer “profs” routinely have never (quite) learned what it is they are supposedly engaged to teach. Some might argue that today’s enthusiasm for digital humanities as for the flipped classroom or what we may call the wiki-teaching model betrays a confidence that sets adjuncts equal to tenured professors, only

given that they might be, as they now are not, simply better paid: money makes the teacher and competence correlates to remuneration. Education works if and only if the result of education is employment.

These are contemporary concerns, as relevant for Ivan Illich as they were for Michael Oakeshott. For Heidegger, already and nearly a century ago, what is lost is the prerequisite “art” of teaching, that is: *formation*, or *Bildung* as such. Thus, Heidegger’s concern is not the eons-old plaint of the older scholar vis-à-vis the young (as if this complaint were baseless, as it is not [Oakeshott is useful on reminding of this as is Illich and indeed Nietzsche and many others all in addition to Heidegger. I highlight a discussion of Oakeshott in a discussion of the Harry Potter films, specifically Professor Severus Snape, Babich (2016)]). Ignoring both practical pressures, and without appealing to popular culture, as I have just done by referring to Alan Rickman’s Snape, Heidegger refers to the supposedly classical components of the *trivium*, in his application to the rehabilitation committee that would have permitted him, as it ultimately did not permit him, to continue teaching after the war, i.e., grammar, dialectic, and rhetoric, are ordered, each of them, one to the other.

To quote Valerie Allen’s and Ares D. Axiotis’ reconstruction (less than clearly identified as a reconstruction, this essay is presented by the editor of the collection, *Heidegger, Education, and Modernity*, and on the publisher’s website as a ‘translation’ of Heidegger’s de-Nazification “deposition,” here cited from Allen and Peters 2002 in the context of education, and by way of what I take to be an analogy to Plato’s reconstruction of Socrates’ ‘defense’): Heidegger is here supposed to employ the conventionalities of traditional rhetoric. Thus we learn and are to learn:

first from grammar which teaches us to speak aright, then to dialectic, which teaches us to reason aright, and finally to rhetoric, which teaches us to speak and reason well. *Trivium*, although a singular word, already points to the multiplicity within — *tri-via-um*, three roads made into one (Allen/Axiotis 2002, p. 32)

It is worth noting the ordinarily unadverted to classical dissonance: in a classical modality, one

departs from convention by conventionally, formulaically, calling attention to this departure – *the Jury may ignore the remarks of the witness* – as Socrates famously does in his own *Apology*. In the face of a judicial hearing on Nazi guilt as a university professor, a hearing deciding whether Heidegger would or would not have the right to continue to teach, that is to say, to be “rehabilitated” after the war (the German text would highlight the play on *Habilitation* that is entailed), again, facing a committee empowered to decide whether to suspend his *venia legendi* or else to grant him the right to rejoin the members of the university teaching corps, Heidegger in just this circumstance is presented as spending his time talking about teaching.

That this would have been a dissonant thing to do is important to note. For, like Heidegger, every other professor subjected to this process [including, with the sole exception of Heidegger, every other Nazi rector in Freiburg (Babich 2015a)] *had* supported the Nazi regime and *had* taught under its auspices during the war. Almost all of the other affected rectors, administrators, and other academics comported themselves in their own denazification hearings by doing all the conventional things academics do: the very things Heidegger begins by listing as recommended to him (he was coached, as his colleagues were coached: all with good advice). [Again, I list those academics who succeeded Heidegger at Freiburg, all of whom were, successively, inevitably yet more involved with the Nazi regime than was he, and I note their fates after the war, fates which in most cases led to a straightforward continuation either in university governance or in research (Babich 2015a). Unlike his fellow Nazi academics, his co-professors, Heidegger conspicuously opted not to follow but to depart from protocol (the authors speaking in Heidegger’s place use the word *Scheideweg*, a term used in 1955 by Dietrich von Hildebrand, to make Heidegger’s choice plain). As Heidegger is here imagined as saying and this too follows the rhetorical tactic of the *Apology*: “I am admonished by earnest supporters to seize this occasion publicly to recant any offending words and deeds and to promise to do the same in future lectures and

publications” toward the end of a patent rehabilitation (Allen/Axiotis 2002, p. 29). This odd circumstance, and it has been noted that Plato’s Socrates offers a parallel instantiation of this sort of fatally “rhetorical” display, has been detailed by my own teacher Hans-Georg Gadamer, not with too much sympathy in his: “Back from Syracuse” (Gadamer 1989).

Where Socrates undertook to “teach” the jury who would decide his life (and his death), so too Heidegger here is supposed as being minded to instruct his committee (a tone consistent with that adopted in the 1966 interview with *Der Spiegel*). And like Socrates, that means expectedly (of course the results of the trial are known in each case), Heidegger was not successful. As Plato wrote the *Apology* (on Socrates’ behalf and it is owing to this writerly reason that Nietzsche will speak of the pre-Platonic as opposed to the pre-Socratic philosophers), the description was largely ideal. Heidegger’s enactment of a similar didacticism, written as if on his own account, is no exemplar for the aspiring academic.

Instructing his questioners on the “art of teaching,” Heidegger is represented as detailing grammar and dialectic, using, that is to say, taking up the role of logic and of subjection (as he discussed this in two senses), including the risqué language that Allen and Axiotis opted to set into Heidegger’s mouth (as if we might ever be allowed to forget that he was a farmer woman’s son) belongs to the conception of the *logos spermatikos* [Heidegger is here depicted as speaking of “putting the mare beneath the stallion” (Allen/Axiotis 2002, p. 29) and so on) (Ibid., p. 35; for useful if approximately analytic and non-Heideggerian discussion of the *logos spermatikos* (a term that is not here employed although what Allen and Ariotis do insert into their essay surely glosses it), see Nye (1990)], and goes on to characterize rhetoric, the third in the series of the *trivium*, as “the bastard son of academe” (Allen/Axiotis 2002, p. 35).

The current Black Notebooks scandal brings this very “bastard son” into the light, not that we are all that happy to consider it, and a number of readers have urged that we banish it or at least bracket it (see for a discussion of these rhetorical recommendations: Babich 2015b). Still others,

habitually antagonistic to Heidegger, like Emmanuel Faye and Richard Wolin, and to a lesser degree, those concerned to reduce the question of the meaning of Being to meaning as such, like Tom Sheehan, argue that it is less rhetoric as such than it is Heidegger who must be regarded as metaphorical bastard: Heidegger is to be jettisoned, stripped of any rightful claim to teach philosophy in the academy, let alone instruct us on education, much less philosophy of education.

Questioning

Being and Time begins as a book in the way all monographs begin: we read a cover or title page and then a table of contents with a structural outline of themes. Detailed in the table of contents is a breakdown of the lineaments of the investigation, both promising and didactically useful to the reader.

An epigraph in Greek is featured on a single page, affixed as prefatory to the text, complete with an explanatory gloss. This is further augmented, if we are reading the English translation, with footnotes adverting to the translators' troubles with Heidegger's terminology:

For manifestly you have long been aware of what you mean when you use the expression 'being'. We, however, who used to think we understood it, have now become perplexed.

Heidegger glosses this in what is already his characteristic style as we know from the early writings: he updates the point in its current relevance and he intensifies it: "Do we in our time have an answer to the question of what we really mean by the word 'being'?" Elsewhere I describe this rhetorical style as *cadence*, letting fall; *intensification*, heightening or worsening a certain readerly anticipation; and *retrieve*, recovering or reprising an unadverted to meaning or philosophical advance (Babich 1993). Heidegger immediately answers his own cadence by intensifying its immediate purchase and persistence, do we have an answer? "Not at all." Heidegger thus goes on to vary and thus intensify Plato's own remark, "it is fitting that we should raise anew the question of

the meaning of Being. But," Heidegger asks again, "are we nowadays even perplexed at our inability to understand the expression 'Being'? Not at all" (BT, [19/1]).

Heidegger thus begins *Being and Time* with a question posed to those of us, that would be philosophy in general, then and still today, who are persuaded that no question need be raised with regard to being. So regarded, *Being and Time* is nothing less than a questioning of a series of heretofore non-question-worthy questions regarding being. Instructive is Heidegger's way of approaching and hence of getting to articulate and thus to frame this kind of questioning.

We then read *introduction* 1 followed on the next line by *exposition of the question of the meaning of being* and we move to the first section of the first part – I: *the necessity, structure, and priority of the question of being* – all in majuscule in the English edition, where the first paragraph section is plain enough. The project to begin with declares "¶ 1. The Necessity of Explicitly Restating the Question of Being" necessary above all because "*This* question has today been forgotten" (BT I:1). Indeed, Heidegger goes on, the question is forgotten with a perfect good conscience. What is more, note the intensification, its oblivion is justified: there is no question; there is no need to question; there is, in fact, no kind of obscurity at all:

On the basis of the Greeks' initial contributions towards an Interpretation of Being, a dogma has been developed which not only declares the question about the meaning of Being to be superfluous, but sanctions its complete neglect (BT I:1 [21/2])

Here, not unlike the accounts given by Glenn Most and John Hamilton detailing the ancient lyric poet, Pindar as not at all (not really) obscure (and so too or ditto Heraclitus), in today's very current university trend in a German context that is also to be named a "scientific" trend, "that which all ancient philosophers found continually disturbing as something obscure and hidden has taken on a clarity and self-evidence such that if anyone continues to ask about it he is charged with an error of method" (ibid.).

We hide the obscure in plain sight as obvious and ordinary, that is, as not worth asking about.

But exactly this spells out what will be the project of Heidegger's undertaking:

By considering these prejudices, however, we have made plain not only that the question of Being lacks an answer, but that the question itself is obscure and without direction. So if it is to be revived, this means that we must first work out an adequate way of formulating it (BT 1:1 [24/4])

In this way, Heidegger proceeds in the next section to reflect on the need to illuminate and to clarify the "formal structure of the question of Being" (Cf. BT I:2).

There is a good deal to say about the prelude to this clarification just because, as it turns out, the prelude itself concerns our presuppositions or presumptions. This focus, of course, is the key to phenomenology. Contra these prior assumptions, contra the everyday knowledge one supposes oneself to have to begin with, just as Descartes begins his own *Meditations* by reflecting on things one takes oneself to know, we find our assumptions hinder the acquisition of founded knowledge. Husserl likewise deploys the same method: conscientiously setting aside, or bracketing, "prejudices" (as Heidegger and, later, as Gadamer will speak of them) for the sake of knowledge but also for the sake of any possible epistemology.

It is not ignorance, non-knowing, nescience that stands in the way of knowledge for philosophy. Thus Nietzsche ironically, provocatively emphasizes the origin of logic in illogic, that is, as he argues (the point is a critical one for Nietzsche) (Babich 2014), philosophers and educators alike assume the development of knowledge, or the constructive creation of knowledge, on the ground of learned ignorance.

We need to acknowledge our non-knowing, our ignorance. Where one already has knowledge, one does not undertake, just because one need not undertake, to seek knowledge. What one takes oneself to know stands in the way of learning as it also stands in the way of questioning as such. When we "already" know, when the answer is given, questioning can only be supererogatory: unneeded, or pointless.

Contra presumptive knowledge, convinced as we are by our "convictions," to use Nietzsche's term, Heidegger "formulates" nothing less

obvious than the question of his project as a question. Thus Heidegger offers a preliminary hermeneutic phenomenology of what "belongs to any question whatsoever" (BT I:2), in order to make "the question of Being" manifest in "its own distinctive character" (ibid.).

Heidegger continues in this second section to articulate a phenomenology of questioning and because this phenomenology details a reflection on questioning, the phenomenological method is essentially hermeneutic:

Every inquiry is a seeking [*Suchen*]. Every seeking gets guided beforehand by what is sought. Inquiry is a cognizant seeking for an entity both with regard to the fact *that* it is and with regard to its Being as it is (BT I:2)

Questioning is fundamentally intentional, most evidently when one reflects on questioning. For Heidegger, a "cognizant seeking" may be framed as an investigation: questioning "can take the form of 'investigating' [*Untersuchen*], in which one lays bare that which the question is about and ascertains its character" (BT I:2). In this sense, every questioning is also always (and already) a phenomenological reflection, directed to itself and raising a specifically hermeneutic question. This is what Heidegger calls, *qua* "inquiry about something," that express directedness to "that which is asked about [*sein Gefragtes*]" (BT I:2). And even here further reflection is significant because "all inquiry about something is somehow a questioning of something [*Anfragen bei. . .*]" (BT I:2).

In other words, one does not question in an arbitrary fashion but with intentional specificity concerning what is asked about, even when, especially when, the question is empty or *pro forma*. In addition to what is thus thereby queried, an inquiry has that to which the questioning is directed: "that which is interrogated [*ein Befragtes*]" (BT I:2). Already "formal indication" is at work and Heidegger explains "specifically theoretical" questions of investigation, be they specifically philosophical or scientific, or, just for the instructive sake of an example, in terms of police work, as represented in popular crime fiction as "detective work". Here the example of the detective can be useful for understanding

Heidegger's questioning in a way that lays bare both its pedagogic value in practice and its theoretical contribution to the philosophy of education.

It is already the specificity of questioning that "determines" and conceptualizes what is asked about. "Furthermore," Heidegger goes on to say, "in what is asked about there lies also that which is to be found out by the asking [*das Erfragte*]" (BT I:2). The question articulated already delimits as such or outlines the answer sought. Hans-Georg Gadamer will emphasize this as the dialectical, dialogical character of hermeneutics. Here the example of the detective is appropriate as an investigation seeking "what is really intended" (ibid.). Once one finds this that is "really intended" in the case of a murder mystery, one has uncovered the intended "goal." One knows, in questioning suspects and eliminating possible alternatives, the answer to the mystery of the question of the "who" (who committed the murder?), and therewith, also, one knows, and this in advance, some part of the why question and some part of the how of it.

A hermeneutic phenomenology of questioning is useful in a further, more properly reflexive fashion. As Heidegger underlines, the investigator is not a neutrally objective subject or "immaculate perceiver" to use Nietzsche's language. Much rather: "Inquiry itself is the behaviour of a questioner, and therefore of an entity, and as such has its own character of Being" (BT I:2 [24/5]). Hence, if we keep to the murder mystery or detective instantiation of questioning, the literary (and in the interim also filmic and television) personage of Hercule Poirot goes about his inquiry differently than does (the variety of actorly types exemplifying) Sherlock Holmes or else Agatha Christie's heroines, be it on the page or on the screen, and so too television's Peter Falk with his Socrates-like Detective Columbo by contrast, say, with Basil Rathbone's or Benedict Cumberbatch's Sherlock Holmes. Thus Heidegger, himself almost anticipating Falk's Columbo, easy given philosophy's paradigm investigator in the person of Socrates and his style of questioning, as we may recall this style in either the *Euthyphro* or the more educationally reflective *Meno*, reflects

thematically that "When one makes an inquiry one may do so 'just casually' or one may formulate the question explicitly" (Ibid.). In either case, the fashion in which one frames the question as a particular questioner will make a difference.

What matters is both the logical framing that is the question and the very pre-given orientation toward what is sought that is also entailed in and by and through the question. This means that the question is indispensable in every way, and reflection on the question as such is not a merely formal reflection but exactly hermeneutico-phenomenologically *essential*: Here we pay attention in the following quote to the exigent character attributed to what *must* be:

Inquiry, as a kind of seeking, must be guided beforehand by what is sought. So the meaning of Being must already be available to us in some way (BT I:2 [25/5])

Heidegger, we recall, began by framing this point as not specific to the Being question as such but as holding generically for all questions, formally: "Every seeking gets guided beforehand by what is sought" (BT I:2 [24/5]).

Ask and It Shall be Given, Seek and Ye Shall Find

It is the 'Being question' which permits us to unpack the character of questioning:

We do not know what 'Being' means. But even if we ask, "What is 'Being'?", we keep within an understanding of the 'is', though we are unable to fix conceptionally what that 'is' signifies. We do not even know the horizon in terms of which that meaning is to be grasped and fixed. But this vague average understanding of Being is still a Fact (BT I:2 [25/6])

In other words, the Being question, what is is, *presupposes* an understanding of what is is. That is, and this is also the logical question of reference, as of indication, as of signification, we need to know in some way (even prethetically as Heidegger will say) what we are talking about just in order to pose a question about it. And this is most particularly so in the case of the supposedly vague and general and for these reasons typically taken

to be needless or pointless question of Being, just because the theme itself is being, i.e., is isness, what it is for something to be, that is, for it to be said of anything that it is. "What we seek when we inquire into Being is not something entirely unfamiliar, even if proximally, we cannot grasp it at all" (Ibid.).

The difference here with respect to Being is that we are not reflecting on the "origin" of a thing, whether in particular or in general. At issue then is not a question of genesis or genealogy, birth or mythology, i.e., "telling a story" to use Heidegger's language as he puts it, just to the extent that Being, of which we speak, Heidegger's *Sein*, and about which we seek to inquire, is not an entity or particular being and hence cannot be explicated as entities can be, that is, "by tracing them back in their origin to some other entities" (Ibid.). Rather as Heidegger explains:

Since Being is asked about, and since beings are constituted in their Being, all the conditions of questioning as articulated in this section turn out to be available. In so far as Being constitutes what is asked about, and "Being" means the Being of entities, then entities themselves turn out to be what is interrogated. These are, so to speak, questioned as regards their Being (BT 1:2 [26/6])

Paraphrasing Brentano on Aristotle, Heidegger reflects that "there are many things which we designate as 'being' [*seiend*], and we do so in various senses" (BT 1:2 [26/7]). Key to this overall involvement and to this very multiplicity, the questioning itself is also included as a reflection on Being, still more critically, as a reflection on the inquirer as well: we, ourselves, are as questioners to be implicated. Thus we are also to be put in question. This last point is decisive as the questioner turns out in this case to be quite singular, just given the inquirer's preoccupation both with him- or herself, reflexively and existentially, *concerned*, as Heidegger will explore this concern, with the very real and immediate question of its own being as such. Thus Heidegger logically locates Dasein in terms of questioning and with respect to the Being question as such:

to work out the question of Being adequately, we must make an entity — the inquirer — transparent in his own Being. The very asking of this question is

an entity's mode of Being; and as such it gets its essential character from what is inquired about — namely, Being. This entity which each of us is himself and which includes inquiring as one of the possibilities of its Being, we shall denote by the term "Dasein" (BT 1:2 [26/6])

If it is clear that this is as such specific to the kind of question that constitutes the so-called Being question, it ameliorates what can appear to be a kind of circularity. Heidegger thus pays attention to what he calls the "clue" of "the formal structure of the question as such," noting that "we made it clear that this question is a peculiar one, in that a series of fundamental considerations is required for working it out, not to mention for solving it" (BT 1:3 [28/8]).

Heidegger does not raise the question of questioning in order merely to frame the thematic of Being as such or even Dasein. Rather he is and remains concerned with exploring the notion of the question as such, as a question: noting that the "distinctive features" of the Being question as a question can only be illuminated fully once we "we have delimited it adequately with regard to its function, its aim, and its motives" (Ibid.).

Perhaps the most significant point then in Heidegger's sustained reflections in *Being and Time* and elsewhere is the difficulty of setting oneself on the path of actual inquiry. In other words, questioning as such, really questioning, turns out to be elusive. The problem, as Heidegger also writes in his *What is Metaphysics?*, coincides with authenticity, *owning* the question as one's own question and as such. That is the challenge of actually posing, framing, engaging, and putting the question as such, in other words: really questioning.

After reflecting on this challenge as his point of departure in *What is Called Thinking?*, Heidegger emphasizes that what is most thought-provoking of all is that we continue to fail to think: we are (still) not thinking. The point bears on the project of education. One can imagine Heidegger meant this statement to be heard in context, in this particular lecture course, as a vindication of his return to the university and in the wake of his failed efforts to impress the denazification committee that had instead withdrawn his *venia legendi*.

For Heidegger, once restored to his university post, speaking to his students as they set out on what he tells them will be required of them in order to follow the path of those who mean to “learn to think” (Heidegger 1976), what must for Heidegger be underscored contrasts bridges, specifically, what must be presupposed to build and to use bridges, with what must similarly be presupposed for the sake of the leap. The metaphor is replete with references to the (very parodic) challenges of Nietzsche’s *Thus Spoke Zarathustra* and Nietzsche’s *Übermensch* (or overhuman). [I discuss this in a number of places; see most recently Babich (2013)]. For Heidegger, there can be no bridge and thus he underscores the necessity of the leap, to be distinguished from the “make-shift ties and asses’ bridges by which humanity today would set up a comfortable commerce between thinking and the sciences” [Heidegger, *What is Called Thinking?*, p. 8].

With the example of the leap, Heidegger emphasizes that we can learn “only if we always unlearn at the same time” (Heidegger, *What is Called Thinking?*, p. 8). That same unlearning entails the need to let go. This is a kind of *Gelassenheit* – letting be or releasing what we think we know. [I explore some of the complexities of this notion using an aesthetic metaphoricity in Babich (2015c)]. The enemy of thinking, the enemy of learning, is nothing other than our original formation: what we have learned. Heidegger thus invites his listeners in his first lecture course given upon his return to teaching at the university to “radically unlearn what thinking has been traditionally” [Heidegger, *What is Called Thinking?*, p. 8]. And to that end, there is nothing but that same releasement that would “allow ourselves to become involved in questions that seek what no inventiveness can find” [Heidegger, *What is Called Thinking?*, p. 8].

Here Heidegger reflects – and just this is often quoted in essays on Heidegger and education – that “Teaching is even more difficult than learning” (Heidegger 1976, p. 15). The “even” in this articulation is to be foregrounded inasmuch as what is at issue in teaching is above all a letting learn. Just such a “solicitude” (as we remember the elusive because very compact

discussion of solicitude [*Fürsorge*] in *Being and Time*) (Babich 2015d) is “difficult” precisely because “the real teacher lets nothing else be learned than – learning” (Heidegger 1976, p. 15). The teacher has to be more teachable than the one who learns, and at the same time, the teacher has to be able to allow the student to learn, whereby Heidegger offers his own version of Nietzsche’s Zarathustran remonstrance: one repays a teacher badly if one remains a student or a follower much less an acolyte, reflecting that the teacher has, just in order to be a teacher, to withdraw as such: like the pointer that Heidegger had already noted as part of the human condition of adverting to what is revealed as it obscures itself, as it withdraws. So too the teacher’s comportment “often produces the impression that we properly learn nothing from him” (Heidegger 1976, p. 15). Said otherwise: a teacher to be a teacher must get out of the way. But what this means is *not* that the teacher is not important but that we do not know our teachers. As Nietzsche would say, we do not recognize them. This is ineluctable and it means that our true teachers, “true” as Nietzsche would say, are not honored with teaching awards: like Schopenhauer, as compared with Hegel or Wilhelm von Humboldt, they are not singled out as the great men and women of our educational institutions. Indeed, they are not likely to be known as such. The withdrawal in question for Heidegger, who prefers to speak of reticence, is not a matter of the initially noted focus on the student (as opposed to the professor), on the young (as opposed to the old). The teacher’s withdrawal is not for the sake of support, that would be a kind of unsettling *Fürsorge*, that is a disrupting leaping-in for or on behalf of the other, no matter how well-intended the mentorship or how positive the encouragement (although this is certainly how many teachers institute their own successors). Much rather and by contrast, for Heidegger, what is incumbent on the teacher as teacher is letting learn. That means the teacher has to free the learner for his or her ownmost possibilities of and in being, including one’s ownmost projects, concerns, challenges, and limitations. What is here at stake is Being as such.

Just as “the sign stays without interpretation,” as Heidegger writes just before he turns to reflect on Hölderlin’s *Mnemosyne*, the human being himself (or herself and this should always be said when we are speaking of Heidegger’s or of Hölderlin’s *human being*) is a sign, an indication pointing toward what is already withdrawn, revealed, and obscured, in eclipse. “We,” he repeats this, “are a sign that is not read” (Heidegger 1976, p. 18).

“We are trying to learn thinking” (Heidegger 1976, p. 16), so Heidegger teaches. *What is Called Thinking?* is a class, specifically: a written set of lectures for a class, and, exactly par for the course, he begins Lecture I of Part Two by reprising his reflection on the question: “What is it to which we give the name thinking?” (Heidegger 1976, p. 113). In the case of science, the investigation seeks to frame the query in a characteristic way, specific to the regional specificity of the science in question, and Heidegger also speaks of this more generally in terms of the age of “world picture.” [I am of course referring to Heidegger’s essay of the same name, but it is also part of his reflections in *Being and Time*: “Scientific research accomplishes, roughly and naively, the demarcation and initial fixing of the areas of subject-matter. The basic structures of any such area have already been worked out after a fashion in our pre-scientific ways of experiencing and interpreting that domain of Being in which the area of subject-matter is itself confined” [BT 1:3, 29/9)]. The scientist is interested in a certain representation of the world, and, as Heidegger also points out, the modern, technologically advanced scientist is interested rather less in attaining a theoretical understanding of a specific subject field than in being able to challenge forth nature productively in a specific, experimental, instrumentally calculable way. In part, this is all about the kind of query specific to science which, as Immanuel Kant had already pointed out in his own phenomenological reflection on the method of scientific understanding, follows a very specific questioning tack: by setting specific questions that nature is compelled to answer, instrumentally articulated. This is the experimental project of science, not an objective or neutral undertaking and often quite violent, sometimes, in the case of

animal research, a very bloody, fatal matter of interrogative compulsion and torture. But by this kind of questioning, one finds, this is the specialized nature of modern science, just and only the answers one wishes.

Here, a phenomenological hermeneutics is invaluable as one can recognize that the kind of inquiry thereby scientifically deployed is exactly non-neutral, utterly subjective: one challenges forth toward quite specific ends not only of explanation but for the sake of technologizable prediction and, ultimately, for the sake of calculatively specific and indeed manufacturable control. What one has thereby is a techno-scientific picture of the world just to the extent that the means, the how, and the whereby and the ways of this interrogation will always be part of the scientific image presented. This eliminates the innocent idea of simply going up to nature, as it were, and figuratively, in the case of science, asking neutral or objective questions. For Heidegger by contrast, to return to the question of questioning, we note the relevance of what he calls, at the conclusion of his *Question Concerning Technology*, “the piety of thought” (Heidegger 1977, p. 35).

We only can ask after the means of our interrogation in the case of science (and in the case of the technology that we use to advance science), if we mean to question in such a way that we call our own presuppositions into question. In other words, we take ourselves to know in the case of modern, i.e., scientific, technology that we *know* what technology is (an instrument or a tool, a human undertaking or preoccupation); our presumption is that technology in its essence is already available to us in advance of any questioning after it. Here, we may now recall, this conviction stymies inquiry, getting in the way of any kind of questioning, superficial or genuine/authentic: why ask where we already know? In the case of technology, the problem is and remains that we seek to control technology. But where we do not see the problem, where we already know what technology is (it’s a tool, it’s a means: it’s neutral, it’s fundamentally human), control remains elusive. Heidegger later suggests in his lecture celebrating the local Messkirch composer, Conradin Kreutzer and published as *Gelassenheit*, what he had already

pointed out in the *Question Concerning Technology*, namely, it is enough, if it is also hard enough, to reflect on what is needed to gain a “free relation” to technology as part of any philosophical inquiry that would ask after the nature of the essence of technology as of anything in particular.

A determination is already at work when we put the object of inquiry into question in a specific way, for a specific purpose, and in terms of a given disciplinary project or undertaking. We ask philosophical questions as we ask scientific questions, economic questions, political questions, religious questions, and spiritual questions, and we also ask idle questions and in no case are these questions themselves unspecified even in their non-specificity but require further reflection or thinking. As Heidegger says in *The Question Concerning Technology*, questioning is anything but nondirective: questioning is utterly intentional. Questioning is the phenomenological *epoché* articulated in a sentence: “questioning builds a way” (Heidegger 1977, p. 3).

Acknowledgments The author is grateful to Miles Groth for his valuable questions and for sharing his own email correspondence with me. The author also wishes to call attention to Valerie Allen and Aris Axiotis for their creative and (in the words of one commentator who supposes the text to have been Heidegger’s own) “unusually accessible” vision of what Allen/Axiotis speculate that Heidegger would have said, had he said it, on the theme of what they (rather than Heidegger which may account for its accessibility) name the “Art of Teaching.” Allen/Axiotis 2002. Cf., by contrast, Heidegger 2000, 376 and perhaps also 1998.

On Marxist Critical Ethnography

Dennis Beach

University of Gothenburg, Gothenburg, Sweden

Introduction

First of all, my sincere thanks to the editorial team for inviting me to submit this chapter for publication in the present volume. In this entry, I will try to explore the connections between research and practice from a critical pedagogical perspective. Such connections are less frequently commented on than they should be, and this entry aims to make a contribution. It concerns policies regarding education research and its drivers, and pertains

specifically to one mode of inquiry, that of educational ethnography, and its potential to provide a powerful critique of the operation of power and intentions to control societal and cognitive rhythms through dominant (i.e., white supremacist, hegemonic) ideologies emanating from the standardized knowledge industry and values of Anglo-centric capitalism (Malott 2010). The argument of this entry is that it is this kind of critique of how power is infused into education that should be the main democratic driving force of educational research, including educational ethnography. This entry considers some criteria for this kind of research in the interests of Malott (2010) names as a possibility of empowerment for all (also McLaren 2000).

From Ethnography to Marxist Critical Ethnography

As Hammersley wrote in 2006, educational ethnography has many driving forces, interests, and advantages and as a practice has been influenced by a diverse range of theories and methodologies ranging from phenomenology and existentialism to symbolic interactionism, ethnomethodology, Marxism, feminism, and semiology. Moreover, it has also developed within different disciplines and fields, such as anthropology, sociology, and cultural studies influenced by both modernist and postmodernist epistemologies (also Jordan and Yeoman's 1995). Young's (1971) "new sociology of education" has played a very important role in developments in the past 40 years however, particularly in the UK where ethnography of education has been particularly developed (Troman 2006). This tradition foregrounded both neo-Marxist and interactionist perspectives in the analysis of education and schooling and presented in this way different possibilities and reasons for opening up the "black box," misrepresentations, and symbolic violence of schooling processes (Bourdieu and Passeron 1970). In the Marxist tradition, the intention was toward a critical examination of education processes without abandoning the political core of class analysis in social and civic institutions that reproduce civil

society through the workings of asymmetric power relations (Malott 2010; McLaren 2000). A key point here though is that society and social reproduction in school is filled with both acquiescence and cultural struggle at one and the same time (Malott 2010; Foley 2002; Willis 1977).

The Marxist tradition of critical ethnography offers a particularly interesting means to explore the social relations and practices of contemporary capitalism in terms of these coincidences, as they materialize within the everyday world. It is particularly valuable in critical analysis due the unique capacity ethnography offers for getting up close to sites of exploitation and oppression through participant observation and learning about how they are lived and experienced by subjects themselves. It does this by endowing the researcher with first-hand experience of what forms acquiescence, exploitation, and symbolic violence take in the world and how they are organized on a daily basis in face-to-face interaction (Jordan and Yeoman's 1995). The study of classes as the social relations of production is transformed in this way into the study of class cultures with unique, self-valorizing, and expressive (symbolic) cultural practices with material consequences (Foley 2002; Willis 2000). In the formulation of these new interests, various sites of cultural contestation and everyday cultural practice are interrogated to enable a more complete and micro-contextually sensitive understanding of societal forces of power in terms of how dominance and change are both mutually possible within any given moment of struggle.

The concepts of social class and social class relations are still however a central watermark in this research, which involves the development of detailed textured investigations of the complexity of everyday life and an attempt to establish a clear theoretical understanding of the political economy of capitalism as the methodological framework within which to construct a critical ethnography (Beach 2014). This involves a shift from ethnography, as a systematic study of people and cultures designed to explore cultural phenomena by observing and partaking in social practices from the point of view of the subject of the study herself, to Marxist critical ethnography, as

ethnography with a political purpose to change things in the interests of the presently exploited classes, groups and individuals in society. It is done by re-inscribing critique in ethnographic analyses informed by Marxist theory to address processes of unfairness or injustice within particular lived domains, to paraphrase Madison (2012).

By its connections to Marxism, there are certain specific understandings of social class embedded in and essential to this critical ethnography. In Marxism and Marxist ethnography, social class is much more than a socially constructed category (Beach 2010b). It refers to materially real-class positions in the hierarchical relations of material production in capitalist society. This makes the concept ontological with some epistemological injunctions and a cultural, historical, and material category, not an imaginary social relation. This forms a main difference between Marxist theories of class and other theories (Foley 2002; Malott 2010; McLaren 2000; Postone 2003). Marx put the issue similarly in chapter 5 of *Capital* in his writing about wage labor.

Understanding class as a deep and ontologically real feature of capitalist social formations is a key aspect of Marxist critical ethnography (Jordan and Yeomans 1995) that derives directly from the Marxist historical materialist conception of the organization of society that operates in respect of productive relations when people secure the material means for their survival. The concept of the economic base is central here, as is the idea of State administrative surveillance systems (Althusser referred to the ideological and repressive State institutions) and the hegemonic discourses that expand and conceal formations of social control based on economic advantage and interests (Malott 2010). Classic Marxian notions of class struggle and cultural critique become standard key research organizers on the basis of the importance of the above concepts even in ethnography (Banfield 2004; Foley 2002). This applies as class refers to an ontological relation and an aspect of structured reality in the production of material life itself not despite this.

Class is still a socially ontological category from the perspective of a Marxist view of history

in this respect even in ethnography, but it is still also always a relative concept as well, as classes exist in relation to each other and/as an aspect of the development of capitalism and capitalist (Bourdieu and Eagleton 1992). It is also studied in this way too. It does not become a freely floating concept that exists outside of the conditions of production; there is always a dialectic relationship between the mode of production and class formation (Postone 2003) and this is also a subject of investigation in Marxist critical ethnography, which will also include in its comprehension of things an affirmative recognition both of existing states of things and of their negation (Beach 2010b).

The position of Marxist critical ethnography in relation to class and history thus takes into account and will analyze the transient nature of history, the formational characteristics of which were initially described by Marx, in chapter two of the *German Ideology*. What this means is that the ethnographies will look for the causes of developments and changes in human society in relation to the means by which humans collectively produce the necessities of life. Social classes and the relationship between them, along with the political structures and ways of thinking in society, are founded on and reflect this contemporary economic activity. These form the relations that determine society's other relationships and ideas, which are described as its superstructure. What individuals become and may become coincides with production in terms of both how and what is produced, wherewithal the nature of individuals depends on the material conditions determining their production.

The critics of Marxism often forget these basic premises: or perhaps they are not aware of them (Bourdieu and Eagleton 1992) or deliberately misrecognize and misrepresent them (Beach 2010b). What the premises mean of course are, as succinctly put by Marx, that although people are the makers of their own history, they do not make this history under conditions they have made for themselves or which they may have freely chosen. They make their histories collectively under circumstances and conditions that have been inherited from the past and that may

weigh like a nightmare on their intentions and interactions.

This position is fundamentally important to critical ethnography and its concepts of structure and agency (Beach 2010b, 2011, 2014), and without them it would be grossly unclear what power relations are constituted by and in terms of as well as what role various socioeconomic factors can play in the configuration of these relations (Wolfrey 2000), as the emphasis on symbolic aspects of relations of production alone prevents the economy from being grasped as a system governed by the laws of interested calculation, competition or exploitation separate to other systems, and without this it becomes very hard to see either what gives rise to domination or how forms of domination may change in different societies. Commodities have an intrinsic value which is expressed in exchange value, and disclosing how this operates in concrete circumstances and on the basis of what forms of power and microcognition is, as stated earlier, a main aim of critical ethnography and indeed critical pedagogical research more broadly as well (also Malott 2010; McLaren 2000). In Marxist analyses, capital is not just a resource to be acquired; it is intrinsic to a system of relations based on the exploitation of labor (Beach 2010b). In other words, it is not the exchange of commodities that regulates the magnitude of their value but rather the magnitude of their value which controls their exchange proportions, whom or what controls the magnitude of this value and by what means becomes the key analytical questions here in Marxist critical ethnography (Beach 2010b).

These latter points are not merely academic ones. They have significant implications for an understanding of causality, and they concern ways of grasping and changing the world that elude bourgeois thinking. Marx' materialist view of history posits causality as consisting in *vertical and determining* and, simultaneously, horizontal and codetermining relations (Banfield 2010). Social formations that are dominated (determined) by the capitalist mode of production are codetermining features (horizontal relations) within the limits of a historically material and specific (i.e., capitalist and vertical) class relationship where all other social relations are rooted.

In other words, class cannot be evaded or talked or written out of fashion (Foley 2002), at least not from a Marxist perspective and not without the loss of grasp on the social totality as suggested above (*ibid*). This is an important point in relation to the ethnography of education as it tells you what to look for in complex social interactions as well as what the status of what you are registering as data or findings actually is (Jordan and Yeomans 1995). In other traditions, such concerns with class ontology such as this tend to be dismissed and everything tends to become epistemologically relative (always), subjective (always), symbolic (only), and reducible to discourse, which is a delusion that is often held and voiced with strong conviction by postmodern relativists, despite superior evidence to the contrary (Beach 2010b, 2014).

Important Points in Marxist Critical Ethnography

One element of critique of ethnography generally that is commonly expressed, and that has been voiced extremely well by among others Martin Hammersley in an article in the *Journal of Ethnography and Education* in 2006, is that ethnography is often weak in terms of using and contributing to the development of theory. However, what we can hopefully see above is that this critique cannot and does not apply to Marxist critical ethnography, where theory is central. Marx was after all a philosopher, theorist, and historian whose main intention was to analyze and critique social organization in a scientific way by creating a methodology for social science. This theory and method perceives human history to consist of a series of struggles between oppressors and oppressed as the ultimate driving force of cultural development, which is also empirically and scientifically investigated. There is thus therefore always of necessity a clearly articulated and distinctly dialectical relationship between data production and theory.

In Marxist critical educational ethnography, the value of theory is often described and written about in at least two different ways. These were described

in Beach (2010b). They are on the one hand, and as suggested already, a tool for teasing out the patterns of exploitation in a given setting from the general texture of everyday life, and, on the other, compositions of a semiotic system that can signify the main organizing features, principles, or outcomes of education, within contemporary society and in relation to the vertical dimensions of the relations of production. They do this with the help of empirical data that has been produced through a planned and conscious theoretically informed engagement with the researched setting. As also Beach (2010b) has pointed out, these ideas have a stabilizing effect on research and counteract under-theorized understandings of key aspects of the kind that can lead to normalized assumptions.

In making this statement, and specifically in relation to critical ethnography, I agree with Banfield (2004, p. 53) in his recognition of the primary importance of the economic field and the need to attend to it to avoid the risk of falling into an empiricist fallacy of thinking that data can speak for itself, or an assumption that that field-work always lacks the foundations for generalization, whatever you do (Foley 2002). In Marxist critical ethnography, none of these circumstances apply. Data is not assumed to speak for itself and generalizations are possible. They are made from data from long-term participant observation from participating in historically real material, economically productive conditions with other people. We analyze and generalize from these analyses on the role class plays in terms of how social conflicts materialize and how social characters experience and overcome oppression. The intention is to contribute to the development of concrete and abstract practical and theoretically based solutions to the problems encountered by exploited groups of people.

This is thus not about only focusing on actor perspectives and meanings. The world of action is more than a universe of interchangeable possibilities and totally devoid of objectivity, but this is not to say that subjectivism has no place in critical ethnography at all, for as Bourdieu's work makes clear it certainly does. What is said instead is that the aim should not only be to show acts as understood, interpreted, and articulated from the actor's

perspective but also to suggest something of how these acts are culturally produced under specific historically given material conditions of production of late capitalism, with a view to also changing these very relations (Beach 2010b).

There is a parallel again here to Banfield (2004). It is about taking a point of departure in actual behavior to show regularities between individual (psychological) conditions and external (social-material) circumstances (Malott 2010), and then establishing dialogue with people in an attempt to penetrate behind surface conditions to grasp and reveal hidden motives and causes to create new forms of understanding from experience and to help to change hegemonic blind commitment into more rational forms of action (Beach 2010a). This aim is similar to Freire's (1970) notion of conscientization. It treats practical common sense knowledge as a subject of critical reappraisal in terms of its relationships to the world of production and as the starting point of a social transformation or revolution (Allman 1999; McLaren 2000).

Conscientization is an important concept in Marxist critical ethnography (Beach 2010b; Soyini Madison 2012), where it is seen as a counter hegemonic strategy that uses Marxism and other critical theories, not in order to assert a set of partisan practices and ideologies (Hammersley 2006), but rather in order to open up the analysis toward the processes through which actors carve out and stabilize spheres of rationality, and the processes through which such rationalized spheres can be recognized and challenged so they may ultimately be actively changed (Carr 1995). This form of ethnography thus seeks to establish critical communities who will engage in processes of discussion, argument, action, and debate toward the rational development of practices that can contribute to social transformation (Postone 2003).

This is a statement that is among other things again about the relations of base and superstructure in terms of the primacy of vertical aspects of determination acting prior to and "above" horizontal ones of codetermination (Beach 2011). But it is at the same time a statement about the need to

study and theorize in terms of both (Foley 2002). There is an emancipatory intent and an aim for establishing a kind of catalytic validity (Lather 1991) that challenges the status quo. There are distinct validity forms for this kind of research (Beach 2010b). These are located in forms of pragmatic (Kvale 1995) and as stated above catalytic validity (Lather 1986), where knowledge is valid if it is integrated with and or instigates change that is sustainable and beneficial to ideologically disadvantaged and materially exploited groups. Banfield (2004) drew out implications for methodological practice of a critical ethnography of this kind. This ethnography must:

- Hold to a stratified emergent ontology with a materialist view of history
- Take structures and generative mechanisms as its object of inquiry
- Advocate a standpoint epistemology
- Acknowledge the fallibility of knowledge
- Accept the openness of the social world
- Understand events as the outcome of multiple causal processes

Banfield used Bhaskar's (1991) identification of the common failure of social analysis to maintain the distinction between ontology and epistemology as his starting point (Beach 2010b). However, as I try to do, he then pointed out that this results in two fundamental errors: the ontic fallacy where what is known is reduced to what is, and the epistemic fallacy, where what is collapses into what is known and reality collapses into text where all claims to truth are equally valid, and the only way to settle disputes is through the "practical exercise of power" in the form of symbolic (or even worse) forms of violence (Foley 2002).

Adopting a Marxist theory in ethnography does not make it impossible to fall into these traps, but it does make it difficult to, and it can help one to find a way out (Beach 2010b). This involves providing a challenge to the foundations of conventional modernist science as a critical tool for change, by developing a commitment to make science and reflection as available to everyone as possible within a globalization of thinking and of

affirmative action toward maximizing social and educational equality (McLaren 2000). It is interested in understanding how the ruling bloc builds civic consent through the State and its cultural/educative institutions and what the ability to control these institutions rests upon beyond legal and moral force (Foley 2002; Willis 2000).

Civic consent is never secure and there is always the possibility that the working class may create a progressive, counterhegemonic culture, through collective cultural identities that are produced in(side) various cultural struggles (McLaren 2000). Marx's notion of alienation is broadened here to include objectifying, alienating, everyday cultural practices through communicative or expressive cultural practices in various cultural sites in much the same way that laboring in commodity-producing factories does (Foley 2002). Marxist critical ethnography is a means to uncover intimate knowledge about what makes these social processes and how they can be undone (Beach 2010b).

On Some of Nietzsche's Ideas That Inspired Postmodernist Educational Thinking

Paul Smeyers

Ghent University, Ghent, Belgium

KU Leuven, Leuven, Belgium

Stellenbosch University, Stellenbosch, South Africa

Synonyms

Nietzschean education; Nietzschean nihilism; Nietzschean perspectivism; Nietzschean responsibility

Introduction

It is fashionable these days in the wave of the criticism of poststructuralism and postmodernism to blame Nietzsche for nihilistic tendencies in educational theory and to reproach his nihilism for being subjectivistic and relativistic (see, e.g., Arcilla 1995, p. 45). Thus, Johnston (1998) too argues that a total break from education as it is currently practiced is what would be needed if one were to adopt a thoroughly Nietzschean stand on education. And he further holds that Nietzsche castigates the interpersonal values that education promotes in favor of an intrapersonal, intrasubjective, and individual emphasis: "For Nietzsche, though, there is no question of a reconciliation between the realms of the individual and social. One simply has to overcome the social if one desires in turn to self-overcome" (Johnston 1998, p. 81). Clearly, it is easy to show that Nietzsche has been misinterpreted in ways both sinister and potentially dangerous, for instance, where he was posthumously adopted as the approved philosopher of the Nazi Party, but the fashionable criticism concerning his subjectivism and relativism is another and equally important matter. In this chapter I will first deal with nihilism (and perspectivism) in general and the particular position Nietzsche holds concerning this. Then I will

sketch some of the ways Nietzschean insights have found their ways in the context of educational theory. His thoughts have inspired many so-called postmodern philosophers and philosophers of education (for a further development of these ideas, see, e.g., Blake et al. 2000).

Nihilism and Perspectivism

According to Nietzsche, the nihilist despairs because he longs to value something but in good faith cannot, for he believes that only values believed to be objective can in good faith be professed (and he no longer believes in objective values). The particular form of nihilism in which Nietzsche is interested should however be understood as the state one may be in when nothing truly matters to one. Overcoming this nihilism is not so much a matter of replacing old values with new ones, as it is of coming to value something where previously one valued nothing. Roughly what he means is that we must take a certain sort of responsibility for what we say about the world and accept that we cannot lean on something else when values are concerned. Sense can no longer be made of the idea that the ways in which we view the world are justified by something standing above, beyond or behind the world itself. Neither nature, nor reason, nor revelation can provide the moral standards for the governance of life. He holds that as there are no objective values, as all values are the creation of human beings, they typically serve the needs of their creators – understanding why they were created requires therefore investigating the (historically and psychologically conditioned) needs of their creators.

Nietzsche teaches that we are free to adopt the perspective that proclaims the value of creating subjective value. This creation should not be understood as a kind of subjectivism, as if the subject could create values *ex nihilo* or could impose or project values into the world. What Nietzsche means is that we have to take responsibility for having to take responsibility, rather than trying to deny the fact of such responsibility by means of a fantasy of access to the world's nature that would be wholly independent of our "human,

all too human" interests and aims. His interest lies in the loss of the world: more specifically how humans create and do not *find* a world. He wants to transcend the reaction of those who seek compensation in imaginary revenge (instead of a real reaction, i.e., a deed) or those who nostalgically restate values; for him Christian moral values are not objective. Failing to take responsibility characterizes what he calls "the herd" and threatens the very possibility of individuality in the present age.

The error that Nietzsche thus diagnoses at the root of Socratism is a matter of treating obedience as interpretation, as accepting one's culture's interpretation of itself, of its members, its world, as something that presents itself as a candidate for philosophical justification. Unless we have good reasons to rule out alternative interpretations, we cannot be said truly to mean anything at all by our moral judgments, since judgments guided only by instinct are blind. Though he is not trying to rule out the possibility of all rational inquiry whatsoever, he is concerned to understand the nature of what he thinks of as specifically *philosophical* resistance to the ordinary conditions that govern the employment of any concepts at all. His claim is not that we must learn to live without reasons but rather that we must come to see where it no longer makes sense to ask for reasons, because a search for reasons ends in discovery of the conditions for whatever we want to explain.

From this it follows that "perspectivism" cannot be a *view* with which Nietzsche intended to replace the traditional epistemology he rejected. In the same vein, there is his denial of the thing in itself: this presupposes a particular essence, a metaphysical system or ontology that gives once and for all the *eidos*, the nature of something and associated normative implications. One should be careful here: we do not impose interpretations on the world so that we are responsible for the sense we make of the world in this sense; rather what is at stake is a fundamentally *practical* matter. As he denies that we can make good sense of the idea of the *object* of such an imposition, the concept of imposition itself makes no sense. Two different senses of "responsibility" are at work here. On the one hand, responsibility is a matter of articulating one's (Socratic) standards of judgment, standards

which must be sufficiently independent of one's actual practices of judgment to have the required kind of objectivity and justificatory status. On the other hand, there is responsibility in an existentialist vein, where one either accepts or disowns responsibility for what one says and does and is, just because there is no one and nothing else to bear that responsibility (this would constitute an absence of standards). But as for Nietzsche, the conception of standards being appealed to here is incoherent, and he therefore finds the notion of responsibility incoherent. Rather than claiming that we should take responsibility for the meaning we *impose* on the world, Nietzsche seems to show us how we resist the meaning we find in the world and how we are inclined to hide in the herd. Thus he seeks to replace the Socratic notion of *responsibility*, which in his view expresses philosophical dissatisfaction with life, with a notion of *responsiveness* understood in terms of the notion of commitment, a form of passivity, an openness to what matters to us.

Nietzsche intimates the possibility of a new relation to things, a relation in which we have learned to leave them be. On the one hand, we accept them in their pristine and unsayable integrity; on the other we transform them through continually renewed mythic and artistic renderings. The tragic form of art is for Nietzsche a way to overthrow nihilism by the discovery of the special value of what is near to us, the value of what seemed to be unimportant:

My formula for greatness in a human being is *amor fati*: that one wants nothing to be other than it is, not in the future, not in the past, not in all eternity. Not merely bear what is to endure that which happens of necessity, still less necessary, still less to dissemble it—all idealism is untruthfulness in the face of necessity—but *love* it. (Nietzsche 1979, *Why I Am so Clever*, § 10)

The things around us are wonderful because they are fragile. One can love them; they can become precious and things we care for, because they are not immune from the uncertainties of life. When we realize this, the little things of life acquire a new significance for us, and this may lead to a better attunement to the world. The latter is however not to be taken as equivalent to "resting in

peace”: this cannot be reconciled with his idea concerning self-realization and the emancipation of the creative will. It is however meant to temper the ambitions of reason itself by focusing on its limitations and its presuppositions. Obviously, the Enlightenment and all that goes with it were for Nietzsche neither a necessary nor a sufficient condition for the justification of a particular individual stance. Like its metaphysical predecessors, it had lost its credibility and could no longer convince.

At a deeper level living in accordance with nature prescribes an ideal of human perfectibility. Schatzki (1994) characterizes the *Übermensch*, being the fullest expression of the will to power, by the pursuit of a single goal, freedom (the ability to harmonize the divergent inclinations and instincts within one into a coherent force directed toward one's ruling goal), discipline (the struggle required in order to attain freedom), the creation of values, and the affirmation of all elements of reality. The return to nature is thus not a return to an unbridled, instinctual beast of prey, rather “. . . it is a rising up to a harmonized existence that focuses on an achievement, affirms what is, and creates the values according to which it operates” (Schatzki 1994, p. 158). Evidently this creation of values and ends is not a free arbitrary willing, it is not a matter of whim; rather it involves the unrepressed flowering-forth of the necessity that is a person's own nature, one of the products of the overflow of which are the values and goals that govern his life. In the same vein, creativity is neither the apotheosis of the modern idea of individual self-assertion nor an imitation of nature; rather it is the focused expression of the nature in us, which at least partly varies from person to person. It is art alone that would seem to have the power to do this. Art does not harden and solidify phenomena into new metaphysical determinations. Images, symbols, and metaphors can affirm and enhance the presencing of the phenomena in ever new and renewed configurations.

Education and the Nietzschean Legacy

One of the themes that attract attention is the matter of the real essence of man, not to be

found deep inside himself but rather far above himself and able to be revealed to man by his true educators. The search for freedom is thus a search for man's authentic being resulting from a deep feeling of responsibility on man's part. This is a freedom man can achieve only by himself, only by struggling with himself. It is not to be equated with lawlessness but rather a “freedom for.” This involves for man a mastery over himself and a full responsibility for his own good and bad actions. The heavy price to be paid for this is his loneliness and isolation from society. A person must be willing to burden himself with his personal destiny, a willingness that can be developed by learning to live in solitude and by finding friends who will confront him with difficult truths. It is important to understand this correctly: the idea of “being” and “becoming” is not about finding a personal essence or destiny but about becoming a free, authentic creator of values (understood in other than in subjectivistic terms), purposes, and perspectives for oneself (a version of child-centered pedagogy does not fit with Nietzsche). It is thus about *being* a destiny rather than having one. Thus Rosenow (1989) argues that Nietzsche's concept of “self-overcoming” is a revision and revaluation of the traditional concept of self-mastery or self-control. Here the focus is on the social and cultural mechanisms, including education, that adapt man to human society, repress his nature, and deny his freedom. It explains Nietzsche's rebellion against established norms and values, the overcoming of his socially defined personality, and his lack of reverence for scholars and philosophers who advocate the supremacy of reason.

It will be clear from the above that Nietzsche's position is different from the extreme relativism and skepticism that claims that because all the traditional groundings for value and knowledge were an illusion, we are now faced with the “nothingness” of these values, a position he refers to as “nihilism” and which in his opinion is the fundamental character of our age. Both modern nihilism and traditional western values have the same logical relation to the world: they judge it negatively and hence devalue it. He wants to reinstate the value of phenomena such as birth, death, human

illness, and suffering, the sensory, i.e., the human body. By offering a psychological account of notions such as guilt, sin, and redemption, he tries to undermine the traditionally sharp distinction between human beings and other animals. He argues that the fact that we feel both responsible for what we do and yet ultimately powerless to do other than we do, that we feel, as it were, victims of ourselves, is a feature of our lives that has a complicated psychological and sociological history. Here, speaking is seen as a form of promising, i.e., a social activity. In obeying the laws of the community, the individual member is keeping what Nietzsche considers to be a promise, a "pledge," in order to enjoy the advantages of society. To say of someone that she has the right to make promises then means that she speaks intelligibly, that she takes responsibility for what she says. This is different from a community that fails to make sense (the herd). To give one's word (as the sovereign individual has the right to do) is to incur an obligation to let oneself be understood, an obligation to overcome one's unwillingness to do so, to renounce one's desire to remain opaque.

What the teacher has to teach simply is not transmissible to a crowd; and education is not the determination of who the student should be but of how she might become who she and only she is. It is not about liberating the potential but instead about confronting her with various demands that enable her to give shape to her life herself. The educator serves as a living exemplar of what this can mean, as a beacon for her student of what it is to be enthralled by a subject. The authority and discipline the subject commands are indeed indispensable. The true educator celebrates success when her students become worthy of demanding their independence. The disciplined training that allows the student to end her servitude to custom (including morality) ultimately results in the achievement of maturity and individuality and thus in the end of her servitude to higher persons. The true educator is she who successfully demonstrates a solitude to her students. She serves as the model of how one may escape herd life and bear one's individuality heroically. Only she who has attained her solitude is worthy of being an educator, a catalyst in the formation of other solitaires,

prompting the sort of response that may foster the enhancement of our life. Throughout she is alone; even the relations she has with others are further affirmations of this and of her independence. But this kind of solitude is not that of the hermit: what has significance in her life, what gives her life meaning, necessarily refers to others. Her relations toward others are therefore not conceived in terms of what is useful (for her); instead they form the necessary background for her own self-overcoming, for her finding for herself an answer to the question of the meaning of life.

Education as a *process*, for Nietzsche, ultimately does not assist a self-overcoming individual to overcome hitherto accepted valuations. It can quite evidently not supply the task of overturning valuations that education itself comprises; it necessitates a movement away from the social ideal to an individual one, in favor of intrapersonal, intrasubjective, and individual values. Such a self-overcoming requires something that education as normally understood ultimately cannot provide "a moment-to-moment, hour-to-hour, day-to-day self-realization of one's strengths and weaknesses, together with a profound ability to suffer well" (Johnston 1998, p. 77). This kind of individual cannot be disseminated but rather must be self-taught. This is the reason why it is not correct to attribute to Nietzsche the ideal of an aristocratic education for a few rare individuals. The mission of all education in the end is that it should pass into (what is perhaps not best expressed by the concept of) "self-education." Though education holds an important function for the masses (passing on acceptable values from one generation to the next), for the self-overcoming individual this kind of education too has to be overcome. In the end one must be able to distance oneself from the means of one's education, even, as Schacht argues "... if we must initially be seduced and induced to engage with it and take it seriously enough to be affected by it" (1998, p. 330). As one finds in the connotation of the German word *Erziehung*, the object of this education is to "draw us out" and up toward becoming what we are, thus providing us with a way of facing and coming to terms with the terror and horror of existence.

Logic of normative theory; Normative philosophy of education; Philosophy of social science; Practical reasoning

Introduction

The investigation into logical form and structure of natural sciences and mathematics covers a significant part of contemporary philosophy. In contrast to this, the metatheory of normative theories is a slowly developing research area in spite of its great predecessors, such as Aristotle, who discovered the sui generis character of practical logic, or Hume, who posed the “is-ought” problem. The intrinsic reason for this situation lies in the complex nature of practical logic. The metatheory of normative educational philosophy and theory inherits all the difficulties inherent in the general

metatheory but has also significantly contributed to its advancement. In particular, the discussion on its mixed normative-descriptive character and complex composition has remained an important part of research in educational philosophy and theory. The two points seem to be indisputable. First, the content of educational philosophy and theory is a complex one, connecting different disciplines. Second, these disciplines are integrated within the logical form of practical inference or means-end reasoning. On the other hand, the character of consequence relation in this field, although generally recognized as specific, represents an unresolved problem, a solution of which requires a sophisticated logical theory and promises to influence the self-understanding of educational philosophy and theory.

Kant, Herbart, and Mill: From a Noble Ideal to an Art

Immanuel Kant (1724–1804), who occasionally taught the course on pedagogy at the University of Königsberg, in total four times after receiving his professorship, envisaged the theory of education as a most desirable but difficult aim.

An outline of a theory of education is a noble ideal, and it does no harm if we are not immediately in a position to realize it. One must be careful not to consider the idea to be chimerical and disparage it as a beautiful dream, simply because in its execution hindrances occur. (Kant 2007, p. 440)

In 1809, Johan Friedrich Herbart (1776–1841) was elected to the chair of logic and metaphysics, formerly held by Kant. Herbart outlined the form and content for the “noble ideal” of educational science:

Pedagogics as a science is based on ethics and psychology. The former points out the goal of education; the latter the way, the means, and the obstacles. (Herbart 1901, p. 2)

The quotation shows that educational theory is formed by the disciplinary integration, not disciplinary differentiation. Although in Herbart's works no explicit analysis of the logical form of the science of education had been given, several important aspects of it became clearly visible.

Firstly, the science of education (SE) is a logical consequence of ethics (E) and psychology (P). Secondly, the consequence relation connects normative or “ought to-be/ought to-do” statements (goals) and factual or “is” statements (ways, means, obstacles), as premises, with a normative statement in the role of conclusion. Thirdly, this connection is instrumental.

The exact content of the Herbartian science of education remains underdetermined since it can be conceived in different ways. If taken in the wide sense, the science of education (SE_W) encompasses both ethics and psychology, together with their logical consequences: $SE_W = Cn(EUP)$ where $Cn(X)$ is the set of all and only those sentences that are logically implied by the set X . The set $X \cup Y$ is composed of all and only those sentences that belong to the set X or the set Y ; the set $X - Y$ has all and only those sentences that belong to the set X but not to the set Y . If understood in the narrow sense, the science of education (SE_N) includes only the proper educational content: $SE_N = SE_W - (Cn(E) \cup Cn(P))$. If conceived in the intermediate sense, the science of education (SE_M) comprises, in addition to proper educational content, only those parts of ethics and psychology that are logically relevant, i.e., required for obtaining an educational conclusion: $SE_M = SE_N \cup \{p: p \in (EUP) \text{ and there is a } q \text{ such that } q \in SE_N \text{ and } q \notin Cn((EUP) - \{p\})\}$.

John Stuart Mill (1806–1873) differentiates science from art: the former consists of assertions on matters of fact, while the latter gives precept and is thus characterized by the prevalence of imperative mood (J. S. Mill 1858, p. 588). Education is an art and, as such, inherits its logical form.

The art proposes to itself an end to be attained, defines the end, and hands it over to the science. The science receives it, considers it as a phenomenon or effect to be studied, and having investigated its causes and conditions, sends it back to art with a theorem of the combination of circumstances by which it could be produced. Art then examines these combinations of circumstances, and according as any of them are or are not in human power, pronounces the end attainable or not. The only one of the premises, therefore, which Art supplies, is the original major premise, which asserts that the attainment of the given end is desirable. Science then lends to Art the proposition (obtained

by a series of inductions or of deductions) that the performance of certain actions will attain the end. From these premises Art concludes that the performance of these actions is desirable, and finding it also practicable, converts the theorem into a rule or precept. (J. S. Mill 1858: Book VI, Ch. XI, p. 589)

In Mill's account, art is identified with means-end reasoning, in a way which closely resembles Aristotle's description of deliberation (*bouleusis*) in *Nicomachean Ethics*, 1112b. Mill's concept of art and Hebart's concept of the science of education agree in view of instrumental connection between the conclusion and the “major premise” but diverge in regard to the source of normative force. According to Mill, any art, including education, supplies the goal by itself, while, according to Herbart, the goal of education is borrowed from ethics. The science of education in Mill's sense is a normative theory or art (SE_A) which has two distinguishable parts: educational goal(s) (G) and logical consequences following from educational goal(s) conjoined with a relevant descriptive science (S). The problem of exact determination of theoretical content is left unresolved, like in Herbart; a plausible interpretation may be that Mill conceives education in a narrow sense, i.e., excluding the descriptive science: $SE_A = Cn(GUS) - Cn(S)$.

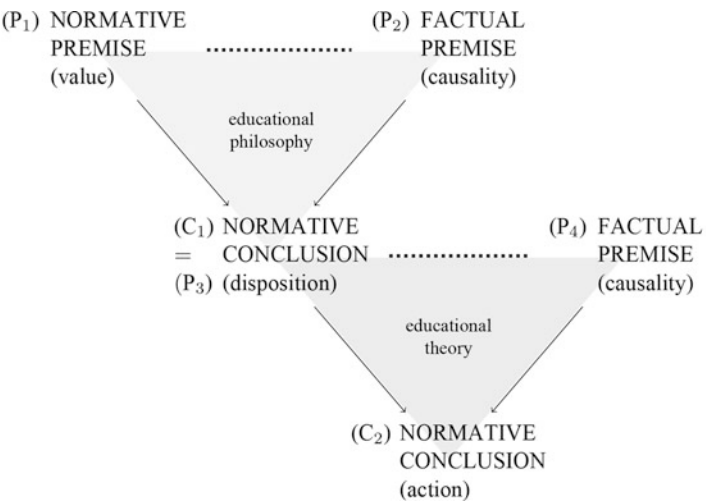

Frankena, Brezinka, and Suppes: Philosophical and Practical Unity Versus Openness

Aristotle's distinction between theoretical and practical reasoning (the first one leading to the formation of a new belief and the second to a new desire or intention) was reactualized in the twentieth century, and the research into practical syllogism (more accurately, practical inference for it need not have exactly two premises) has been under way since 1950s. Elizabeth Anscombe (1919–2001) deemed it as one of Aristotle's best discoveries, but the one whose true character has been obscured. Georg Henrik von Wright (1916–2003) went even further in recognition of its theoretical value and assigned to practical inference a dominant position in the methodology

On the Logical Form of Educational Philosophy and Theory: Herbart, Mill, Frankena, and Beyond,
Table 1 A semiformal example of practical polysyllogism

(P1) Value V ought to be the case.	(P2) Disposition D is a necessary condition for value V.
(C1)=(P3) Therefore, disposition D ought to be the case.	(P4) Action A is a sufficient condition for D.
(C2) Therefore, action A ought to be done.	

On the Logical Form of Educational Philosophy and Theory: Herbart, Mill, Frankena, and Beyond, Fig. 1 A modified depiction of the Frankena’s model. A node lying immediately below heads of arrows is a joint consequence of nodes above tails of arrows. The dotted line connects premises. The two parts in the minimal structure have been termed here as “educational philosophy” and “educational theory”

of social sciences and humanities as the source of their methodological autonomy.

Practical reasoning is of great importance to the explanation and understanding of action. (...) the practical syllogism provides the sciences of man with something long missing from their methodology: an explanation model in its own right which is a definite alternative to the subsumption-theoretic covering law model. Broadly speaking, what the subsumption-theoretic model is to causal explanation and explanation in the natural sciences, the practical syllogism is to teleological explanation and explanation in history and the social sciences (von Wright 1971, p. 27).

Practical inference plays a pivotal role both in normative theories and in descriptive sciences of man. It was in the context of revived interest in practical inference that William (Wiebe Klaas) Frankena (1908–1994) reopened the discussion on the logical form of normative philosophy of

education. According to Frankena (1965), its minimal logical structure is given by a chain of two practical syllogisms, i.e., by a practical polysyllogism; an example is given in Table 1. Although Frankena (1965), p. 9 refers to Mill as the source of his inspiration, his “two-tier model” presents a reconciliatory synthesis of Herbart’s and Mill’s account. Frankena, unlike Mill, does not take the goal as self-imposed by the art of education but, like Herbart, as derived from wider theoretical context in which ethical considerations provide the normative source. A diagrammatic representation of the Frankena model is given in Fig. 1.

The “complete normative philosophy of education” (PE), as Frankena called it, covers normative educational philosophy (EP) and educational theory (ET). Its logical form is given by the formula $PE = EP \cup ET$, which can be further analyzed.

Educational philosophy is the consequence of basic value statements or goals (V) and scientific nomological statements (S): $EP = Cn(V \cup S)$. The reduction of educational philosophy to only those consequences that do not belong to initial sets gives the set $(EP|D)$ of normative statements on valuable dispositions, $EP|D = Cn(V \cup S) - (Cn(V) \cup Cn(S))$. Educational theory uses the reduced educational philosophy $(EP|D)$ and couples it with relevant scientific nomological statements (S^*) in order to deduce statements about valuable instrumental actions (precepts, in Mill's terminology), $ET = Cn(EP|D \cup S^*)$. It is an interesting fact that Frankena takes educational theory to be determined not by three but by four sets: the set of basic value statements, the set corresponding to the reduced educational philosophy, and the two sets of relevant scientific statements. Therefore, he does not presuppose that the practical consequence (Cn) is a strongly transitive relation allowing for the removal of intermediate conclusions, i.e., the relation where $Cn(Cn(X) \cup Y) = Cn(X \cup Y)$ holds. If the consequence relation were transitive, then a complete philosophy of education would be determined by the set of value statements and the two sets of nomological statements, i.e., then $PE = Cn(Cn(V \cup S) \cup S^*) = Cn(V \cup S \cup S^*)$ would hold.

The science of education takes different forms depending on their presupposed philosophical background. There have been, inter alia, hermeneutical, critical, and empirical theoretical orientations. According to Habermas (1972), p. 308, this is not a pluralism of competing theories but of knowledge types, exemplified by empirical-analytic, historical-hermeneutic, and critically oriented sciences, constituted by the three types of cognitive interests: technical, practical, and emancipatory.

For Wolfgang Brezinka (born 1928), a representative of the empirical orientation, it is only descriptive use of language that is permitted in the science of education. The prescriptive use of language characterizes normative philosophy of education and practical pedagogics, both of which consist of "mixed normative-descriptive" statements. Frankena's concept of a "complete normative philosophy of education" results in a huge theory, the one reminiscent of Dewey's

On the Logical Form of Educational Philosophy and Theory: Herbart, Mill, Frankena, and Beyond, Fig. 2 In Brezinka's view, a practical pedagogics (PP) is a consequence of a normative philosophy of education (NP) and science of education (SE), but without a complete theoretical unification; (PP) is a proper subset of $Cn(NP \cup SE)$ but not identical to it: $PP \subset Cn(NP \cup SE)$

identification of philosophy with general theory of education.

If we are willing to conceive education as the process of forming fundamental dispositions, intellectual and emotional, toward nature and fellow men, philosophy may even be defined as *the general theory of education*. (Dewey 2001, p. 316).

In contrast to Frankena's all-encompassing view on the philosophy of education, in Brezinka's fragmented, three-partite composition of educational knowledge, it is neither philosophy nor science but only educational practice that can act as an integrative force (cf. Fig. 2).

To the extent that an epistemologically justified synthesis of actual knowledge and normative demands is sought, this can only be achieved in practical pedagogics. Practical pedagogics, however, cannot be said to be a unified theoretical system of pedagogical knowledge, but can rather be viewed as a praxis-oriented selection of existing theoretical knowledge on the one hand and possible valuations and norms on the other. (Brezinka 1992, pp. 243–244)

Patrick Suppes (1922–2014) points out the existence of conflicting normative principles. For example, the "antinomy of method" (Suppes 1971, p. 286) is an inconsistency of principles, one of which requires the maximization of learning and problem-solving techniques, while the other demands the maximization of content. The discovery of jointly unsatisfiable normative

principles is the major task of analytical philosophy of education.

An examination of inconsistencies [in implicit principles] can be, I believe, one of the more fruitful avenues of progress in the philosophy of education. Consistency of principles is a necessary condition that almost all men accept. It can be imposed and exploited without further analysis of the epistemological status of the principles. The close articulation of principles in the philosophy of education can have the kind of beneficial effects found in other philosophical endeavors, ranging from the foundations of mathematics to contemporary formulations of decision theory and normative economies. (Suppes 1971, p. 285.)

Suppes's discussion of antinomies reveals that a conclusion arrived at by a piece of practical reasoning can be defeated by adding a normative premise. This fact sheds doubt on the claim that the conclusion corresponds to a stronger type of normative judgment like a directive, precept, recommendation, instruction, advice, etc. Typically, the conclusion of a practical inference is a weak suggestion (Žarnić 1999).

Practical Consequence Relation: An Open Question

The content of action-oriented educational philosophy and theory is of "mixed normative-descriptive" type. This is not the only difference that divides them from empirical sciences. Another, equally prominent difference lies in the nature of consequence relation.

The properties of consequence relation were for the first time explicitly defined in 1930s by Alfred Tarski (1901–1983). The Tarskian consequence relation fits the language used in empirical sciences and mathematics. It is a relation between sets of sentences of a denumerable language and its "structural properties" are reflexivity, weak transitivity, monotony, compactness, and "explosiveness." It has been argued by a number of researchers that the consequence relation underlying the practical inference is not a Tarskian one. In particular, the non-monotonic character of practical consequence relation (the defeasibility of conclusion by premise addition) has been widely

acknowledged and discussed in philosophical logic.

Instead of reporting on results achieved, let us turn toward an open question of the non-transitivity. Consider Frankena's "two-tier model"! If the consequence relation is strongly transitive, then the complete normative philosophy of education is determined by the three sets: the set of basic values (V) and the two sets of scientific statements (S and S^*); the set of intermediate conclusions on valuable dispositions (cf. C_1 in Fig. 1) is superfluous and can be left out. Weak transitivity, $Cn(Cn(X)) = Cn(X)$, together with monotonicity, $Cn(X) \subseteq Cn(X \cup Y)$, implies strong transitivity, $Cn(Cn(X) \cup Y) = Cn(X \cup Y)$. In the shorthand notation, if the practical consequence (Cn) is not strongly transitive, then it is possible that $Cn(Cn(V \cup S) \cup S^*) \neq Cn(V \cup S \cup S^*)$. This possibility shows that different normative philosophies of education can be built upon the same basis; it also demonstrates, assuming that normative value is inherited from basic values, that the practical conclusion must be weaker in its normative force than the basic normative premise.

There are at least two reasons for claiming non-transitivity of the consequence relation in the normative context. Texts from the normative philosophy of education usually display enthymematic arguments, and enthymematic consequence is not transitive. Nevertheless, enthymematic arguments can be expanded to their complete form where omitted premises are explicitly stated. Therefore, we must turn to another, irremediable property to account for non-transitivity.

In its typical form, action-oriented practical inference consists of three sentences: the "major premise" stating which disposition ought to be cultivated, the "minor premise" about a kind of causal relation between a type of action and the disposition, and the conclusion stating which token of an action type ought to be performed or omitted. Causal relation is usually conceptualized in terms of sufficient and necessary conditions. Consider the minimal structure of a chained instrumental reasoning (such as the one in Table 1)! Firstly, a basic value is connected to a

valuable disposition via an assertion that the disposition is a precondition for the value realization. Secondly, the valuable disposition is connected to an action that ought to be done via an assertion that performance of the action is a precondition of attainment of the disposition. The transitivity of consequence relation will hold only if the two causal preconditions create a chain, but this need not be the case. For example, concatenation of a necessary condition for a value with a sufficient condition for a disposition does not yield a sufficient or a necessary condition for the value, and, so, the direct transmission of normative force from the value to an action will fail. Further research should reveal whether transitivity can be preserved against the background of a theory of causality that takes into account the nexus of the more fine-grained relations such as the relation of INUS condition (the concept has been introduced by John Leslie Mackie), which is an insufficient but necessary part of a condition which is itself unnecessary but sufficient for the result, or the relation of SUIN condition (introduced by James Mahoney et al.), which is a sufficient but unnecessary part of a factor that is insufficient but necessary for an outcome. For example, suppose the following hold: the communicative rationality is valuable; the self-reflection is a necessary but not a sufficient condition for the flourishing of communicative rationality; the use of Socratic method is a sufficient but not a necessary condition for the development of self-reflection. The Socratic method would then stand in a weak condition relation to the communicative rationality, and this relation, resembling but not identical to the SUIN condition, might provide a channel of value inheritance from the communicative rationality to the Socratic method.

On the Paradoxes of Nietzsche and Education: Perspectives

Gary Lemco

East Side Union High School District, San Jose, CA, USA

As an aesthetic phenomenon existence is still *bearable* for us. . . art furnishes us with eyes and hands and above all the good conscience to be *able* to turn ourselves into such a phenomenon. (GS §107)

To speak of “Nietzsche and education” invokes an irreconcilable paradox: do we refer to what Friedrich Nietzsche “intended” to teach or “to

mean” or do we assess his pedagogical value on the basis of his “interpreters?” Nietzsche courts *contradiction* as an inescapable component of human nature, which attests both to his capacity for cosmic self-criticism and to his philosophical humility in the face of human finitude. In those moments when Nietzsche contemplates the world as an artwork – to be sure, an “all-embracing artwork” – he sees the universe and philosophy as an engagement, a collaboration that addresses – Ave Wagner! Ave Mozart! Ave Dante! – a *dramma giocoso*, a “Divine Comedy” (Hales and Welshon 2000, 10). The *literary-musical* analogy should be noted as particularly pertinent: if Nietzsche’s apperception of the universe remains predominantly *aesthetic*, in the manner of a conductor’s reading of a symphonic poem, will any particular realization prove “definitive?” Could any one “truth” emerge from the plethora of possible interpretations of a score, which proves an elusive “fable,” construction, or “architecture” of the human imagination as it encounters a world in perpetual, affective flux? One ought not ignore Nietzsche’s repeated self-assessment as an *ironist*, a philosopher whose capacity to exact at once the sublime seriousness and irrational absurdity of existence, so that a “final” accountability of his thought – and any interpreter’s having imbued that thought accurately – eludes “finality” by nature.

It might be argued that Nietzsche’s cosmology derives from an ontological, power-based perspective, particularly if we concentrate on the writings of his third or “synthetic” period. But such a claim does not belie Nietzsche’s consistent declaration, which we find in *Ecce Homo*, that his valuations derive from an *aesthetic* viewpoint, which, as pianist Edwin Fischer testifies, evolves from *great models*. For Nietzsche, the power of “models” beckons to a “nexus of influence” that embraces every aspect of the Romantic Era, an enormous fund of Imaginative fertility which systematically addresses – and attacks – the usual distinctions of “opposites.” Nietzsche “teaches” us, as had his intellectual and imaginative kindred – Schopenhauer, Goethe, Beethoven, Schumann, and Wagner – to embrace that Manichean sense of eternal dualism, between darkness

and light, matter and spirit, fact and fiction, and destruction and creation. Even “theory” and “practice” might serve this duality, for “in the beginning was the deed,” as Goethe tells us. Or as Wagner told Liszt in his letter of 20 July 1850, the “true artist is the performer. Whatever we may create as poets and composers, it expresses nothing more than a wish, not an ability; only the performance . . . reveals that *ability* – that art.” Nietzsche, in his persistent pursuit of mental “experimentation,” approaches the rationalist impulse with the same vigor that he had devoted to myth and humanism. But he retains his keen sense that while a scientist discovers a world, a poet creates one. World building, meaning building, and metaphysics once more regain their status as essential forms of recreation. Nietzsche never forgets the power of imagination, its capacity to reify being and to *transcend* it, at once, to “become what it is.”

Nietzsche may be said to attempt “a mythico-transcendental reflection perhaps unique to the history of philosophy” (Kofman 1993), which entails a sustained attack on traditional notions of ontology, epistemology, logic, causality, consciousness, science, knowledge, and truth. If ever a philosopher synthesizes virtually every rationalist and imaginative impulse in Western – and occasionally Eastern – thought, Nietzsche does. Never has Pontius Pilate’s eternal query from *John* 18:38 “What is Truth?” received such a bold, radical extension into man’s thinking world, his very attempt to fulfill the Delphic injunction: “know thyself.” While difficult to “reduce” Nietzsche’s philosophical energies to one mode or perspective, we might posit him as compelled by *axiology*. A persistent inquirer into value – and “the value of values” – concomitant with his exploration of the relation of man’s aesthetic-moral evolution to a higher pitch of knowledge and self-fulfillment, we then may claim that Nietzsche proposes to educate “the overhuman.” That the world and the value of the world remain a necessity, Nietzsche does not doubt, but who has *earned the right* to stipulate that value he questions most severely and rigorously, and the resultant expression of that value must, for Nietzsche, entail a proposition – an

interpretation – that asserts the bond or relation between aesthetic judgment and moral obligation.

What then, does Nietzsche purport to teach: what constitutes his “educational” curriculum? Nietzsche gathers from his reading of the pre-Socratic Heraclitus that reality remains protean, an ambiguous flux comprehensible only as an indeterminate world of ever-shifting, *agonistic* relationships between dynamic, often competitive, forces: “Thus the dark Heraclitus compares the world-building force to a playing child that places stones here and there and builds sand hills only to overthrow them again” (Nietzsche 1962, p. 142).

When men demand that reason alone can make reality intelligible, they encounter an impasse: the change, becoming, and mutation of the empirical world – and thus, the basis of science – fail to conform to the ontological demands or dictates of systematic thought, a desire for an orderly and *fixed* world of being. The urge or impulse to “system” and orderliness, as required by reason, Nietzsche avers, evolves merely as a *utilitarian* value, its efficacy in aiding in the accomplishment of desired goals, a “will” to an exertion of power:

A morality, a mode of living, tried and *proved* by long experience and testing, at length enters consciousness as a law, as *dominating* — And therewith the entire group of related values and states enters into it: it becomes venerable, unassailable, holy, true; it is part of its development that its origin should be forgotten — That is a sign [that] it has become master — Exactly the same thing could have happened with the categories of reason: they could have prevailed after much grouping and fumbling through their relative utility — There came a point when one collected them together, raised them to consciousness as a whole — and when one commanded them, i.e., when they had the effect of a command — From then on, they counted as *a priori*, as beyond experience, as irrefutable. (Nietzsche 1968a, WP §514)

The analogy to and from Heraclitus transfers the *ontological* conflict of value – between impermanent reality and a need for reliable, certain fixity – to a *psychological* reaction: man must *anthropomorphize* or reify being so as to predict, codify, and control it. The world of metaphor thus suits man’s “interpretative” purposes. Once more, we intuit Nietzsche’s veneration of Goethe, whose

own biography declared an indivisible bond of *Dichtung und Wahrheit*, Truth and Poetry. Nietzsche would appear to have taken as his “textual” reading of experience the grandiose claim of Goethe at the conclusion of Part Two of *Faust*: “*Alles Vergängliche ist nur ein Gleichnis.*” All that passes away is only a symbol, a *simile*. Few entities could be more ephemeral, more transitory than a “drive,” an “impulse;” and for Nietzsche “thinking itself is merely a relation of [such] drives to each other” (Nietzsche 1989, §36). Nietzsche must assess the *value of thought*, terribly, even tragically, aware that his perspective, too, must pass away.

Since the world in and of itself does not require *justification*: its “truth,” if any, lies in its immanence, its infinite, ongoing possibility. To attempt to make statements about the world, to posit “interpretations” of the world’s *facticity*, would demand the role assigned to the philosopher – or Nietzsche’s philologist – to explore the genealogy of the declaration, or proposition, of any hypothesis on the nature of being and its claim to “truth.” Nietzsche will declare those who do demand existence *justify* itself to be decadent, ascetics who fear the ascendancy of becoming and wish to establish a fixed reality on a par with Plato’s *Forms* or Kant’s *noumenon*. Life remains infinite and open to an infinite number of hypotheses or “experiments” in character. The hard truth, the “ugly” truth – in defiance of the John Keats equation that “Beauty is truth, truth beauty” – remains the absence of truth, a living, enduring *uncertainty* that itself demands a “tragic courage” of the seeker of truth, a strength of will and personality that Nietzsche calls *Redlichkeit*, integrity. Armed with the moral courage to face an ambiguous reality, the superman may declare *Amor fati!* to life, a *positive evaluation* that affirms and beautifies the necessity of existence in all of its apparent contradictions:

In so far as the word “knowledge” has any meaning, the world is knowable, but it is *interpretable*; otherwise, it has no meaning behind it, but countless meanings. (Nietzsche 1968a, WP §481)

Science itself, contends Nietzsche, harbors a desire to transcend the secular limits of empirical

observation. By asserting the primacy and definitive character of *truth*, science betrays its moral failings, its essentially *ascetic* priority, impoverished by its reliance on a mechanistic view of the world:

Do we really want to permit existence to be degraded for us like this — reduced to a mere exercise for a calculator and an indoor diversion for mathematicians? Above all, one should not wish to divest existence of its rich *ambiguity*: that is a dictate of good taste, gentlemen, the taste of reverence of everything that lies beyond your horizon . . . an interpretation that permits counting, calculating, weighing, seeing, and touching, and nothing more — that is a crudity and naivete, assuming that it is not a mental illness, an idiocy. (Nietzsche 1974, GS §373)

Ever skeptical of ossified, complacent ideas, Nietzsche investigates the bases of what has passed for knowledge, the various philosophical canons of rationality, logic, and truth. “Logic,” asserts (1968a, p. 512), “does not spring from a will to truth”. In his attack on “rational thought,” Nietzsche categorizes the impulse to reason as “an interpretation of a scheme that we cannot throw off” (1968a, p. 522). Reason expresses “the will to be master over the multiplicity of sensations” (1968a, p. 317) that invest our lives. Nietzsche, following David Hume, questions our notions of causality as the basis for “legitimate” experience. Causation, for Nietzsche, will “reduce” to a species of psychological habit:

The question “why” is always a question after the *causis finalis*, after the “what for?” We no “sense for the *causa efficiens*.” here Hume was right; habit (but not only that of the individual!) makes us expect that a certain often-observed occurrence will follow another: nothing more! (Nietzsche 1968a, WP §550)

But Nietzsche goes further than Hume, exploding the very notions of “deeds” and “objects” conditioned by “will” and “intention.” In *Twilight of the Idols*, Nietzsche identifies as one of the “four great errors” our tendency to connect an event, a deed with a doer.

We had made a nice misuse of that ‘empiricism;’ we had created the world on the basis of it as a world of causes, as a world of will, as a world of spirit. The oldest and longest-lived psychology was at work here — indeed it has done nothing else: every

event was to it an action, every action the effect of a will, the world became for it a multiplicity of agents, an agent (‘subject’) foisted upon itself upon every event. (Nietzsche 1968b).

Objects, for Nietzsche, become constitutionally perspectival, according to their functional utility. “Knowers” have a vested *interest* in what they perceive: they build up and organize the objects of their knowledge. Debunking Kant’s notion that objects are transcendently conditioned, Nietzsche posits that knowledge must be regarded only in an “anthropocentric and biological sense” (1968a, p. 480). Given the nature and limits of human finitude, with its lack of omniscience and of Kantian things in themselves, man remains compelled to reify the nature of those objects required by a human perspective, for human needs and aspirations. That empirical objects assume a “fictional,” subjective – even “mythical” – identity becomes inevitable. Human knowledge, predicated on our ability to express it – that is, reliant on the conventions of language – results from a successful imposition of concepts and utilitarian conventions upon segments of reality (Hales and Welshon 2000, 76). Ergo, a logical perspective, need not capture an alethic perspective. With his patented cynical aplomb, Nietzsche suggests in *Twilight of the Idols* that “logic and rationality are merely necessary for thinking, and that life might be possible without them” (Nietzsche 1968b).

So far as logic, rationality, and science depend upon and are constituted by the syntax and semantics of formal language and its relationship to ontological verification, Nietzsche remains a radical skeptic. “One and the same text permits innumerable interpretations – there is no ‘correct’ interpretation” (Nietzsche in Bertram 2009, p. 98). Even more, Nietzsche postulates that *error* remains an inevitable component of truth, a necessary constituent for life itself, so that the active species might endure, thrive, and master its environment:

“Truth:” this according to my way of thinking, does not necessarily denote the antithesis of error, but in the most fundamental cases only the posture of various errors in relation to one another. (Nietzsche 1968a, p. 535)

Increasingly, as Nietzsche explores his radical, ontological perspective, he casts away “appearances” [*Erscheinungen*] and stipulates “appearance” [*Schein*] as a first precept of his epistemic, perspectival framework. If “fact” no longer satisfies the quester after knowledge, then illusion, “lies,” and *metaphor* – Goethe’s *simile*, which the great poet himself claimed as “unapproachable” and “irreducible” in the next few lines of his *Faust* – must serve as the basis of experience.

With this word [appearance] ...nothing is expressed other than the *inaccessibility* [of reality] to logical procedures and distinctions. . . I do not set appearance in opposition to reality, but on the contrary I take appearance as reality which resists conversion into an imaginative ‘World of Truth.’ (GOA XIII 1896, 121)

Much in the tradition of Leibniz, Nietzsche must postulate new *monads*, or quanta of force, that resist further genealogical causation. The prime mover in Nietzsche’s new ontological perspective shall be *will to power*, which becomes a veritable Proteus for Nietzsche, both a normative and descriptive valuation, providing the basis of action, especially of *meaningful* action – Hamlet’s very dilemma, as posited in *The Birth of Tragedy*, §7 – following Goethe’s “In the beginning was the Deed.” Dawn announces the burgeoning of a new intellectual conscience – a new integrity [*Redlichkeit*] – whose spiritual disposition demands a *passion* for knowledge. The new knowledge rejects the traditional distinctions, such as subject and object, declaring “there is no causality, no correctness, and no expression; there is, at most, an *aesthetic* relation: I mean a suggestive transference into a completely foreign tongue” (Nietzsche 1979a, p. 86). This “foreign tongue” of reified being will, perforce, assume an *aesthetic* character, analogous to a conductor’s *knowledge* of a musical composition that embraces a synoptic – what musician’s would call “agogic” – apperception of the myriad forces that constitutes the music at hand, to be “realized” as palpable, empirical sound from a written “text,” the printed score. The music “appears” before the musicians but only as a potential entity that must be “willed” into experience *for that moment*, i.e., its interpretation:

[*Schein*] itself belongs to reality: it is a form of its being; i.e., in a world where there is no being, a certain calculable world of identical cases must first be created through appearance: a *tempo* [*italics mine*] at which observation and comparison are possible, etc. Appearance is an arranged and simplified world, at which our practical instincts have been at work; it is perfectly true for us; that is to say, we live, we are able to live in it: proof of its truth for us — (Nietzsche 1968a, §568)

Consonant with an aesthetic, musical will to power, the test of knowledge, the “litmus” of comprehension lies in one’s *tempo of knowledge* and the *tempo of one’s style* in communicating that “joyful wisdom” (Lemco 1992, pp. 91–103). Bruno Walter (1886–1962), a conductor and Wagner acolyte himself, provides us Wagner’s *own definition* of the relation between tempo and musical knowledge, which Nietzsche assumes as a matter of course:

...the question of a tone-work’s right performance in a word...is this: Has [the conductor] given throughout the proper *tempo*? For his choice and dictation of that tells us at once whether he has understood the piece or not...only through a knowledge of the correct rendering, in every respect, can that proper tempo itself be found. Seeing, however, that in the course of a piece of music its content, mood, and technical requirements change incessantly, the tempo has to be adapted to remain always *right*... The right delivery, which is to be made feasible by the choice of the right tempo, demands a feasible continuity of tempo — let us call it ‘apparent continuity.’ (Walter 1961, pp. 29–31)

So, music captures the Heraclitean essence of ontological, *reified flux*: a powerful musician, by nature, has assimilated and absorbed the mechanics, the syntax, and means of his craft; his response has become “automatic,” or *pre-conscious*, according a phenomenological perspective on his art. His knowledge, as such, has become a *bodily* phenomenon, especially as Nietzsche tends to denigrate “consciousness” as an *epiphenomenon* (Hales and Welshon 2000, pp. 130–156). At times, Nietzsche indicates a kind of “somatic” will to power at work, working in tandem with a musician’s “ideas” of a piece of music – so that “freedom” and “necessity” merge indistinguishably – which literally *dictate* the nature of art, music, and dance. But we must recall

that each performance, each interpretation, and each “experimental realization” remain entirely *provisional* and perspectival in nature, existing in and for the moment and passing away, aware that any number of variations and options remained and remain possible.

When we finally consider Nietzsche’s attempt to impose a *hierarchy* of values – given that “man is the creature that measures values. . .the ‘valuating animal as such’ (1968c, II, p. 8) – we may wonder if Nietzsche has not had recourse to an *objective criterion* of truth, in violation of his own perspective, when he posits the *higher man* as the *telos* of humanity’s development, an extension of the “artist, philosopher, and saint” whom he lauds in his *Untimely Meditation on The Use and Abuse of History*. As Zarathustra proclaims, “Man is something that shall be overcome.” Even in *The Dawn*, there appear those remarks suggesting that “the venerable art of philology . . . that achieves a *lento*. . . teaches us to read *well* . . . slowly, deeply, cautiously” (Nietzsche 1982, §v) in its quest for a rigorous, unbiased interpretation. In spite of his skepticism of academic pedagogy, Nietzsche asserts that “schooling has no more important role than to teach rigorous thinking, careful judgment, logical conclusions” (Nietzsche 1986, §265). But if the teacher, philologist, and the philosopher themselves remain prone to error and exist merely as the sum of their perspectives, who then may assert “truths,” if all claim to absolute value, including God and doctrines, merely exhibits mendacity in their assertion of a “final” or “definitive” meaning? Nietzsche’s answer lies in a series of *ad hominem* arguments: those individuals who affirm life, who enhance and organize experience in the service of life’s *totality* and so retain their intellectual moral conscience, have gained the right to will according to their subjective lights. The “worthiness” of such an individual derives from “the strength of a spirit [measured by] how much of the truth one could . . . endure” (1968d, p. 39). Nietzsche bestows the title *Dionysos* on such a spirit, he who “fixes” man and creation within an orbit of *artistic* meaning, however ephemeral, for which he takes, as certified by Nikos Kazantzakis – full *moral* responsibility.

What had this prophet (Nietzsche) done? What did he tell us, above all, to do? He told us to deny all consolations – gods, fatherlands, moralities, and truths – and, remaining apart and companionless, using nothing but our own strength, to begin to fashion a world that would not shame our hearts. Which is the most dangerous way? That is the one I want! Where is the abyss? That is where I am headed. What is the most valiant joy? To assume complete responsibility (Kazantzakis 1966, p. 329)!

Ontological Issues in Educational Administration: The Ontological Status of Educational Organizations

Augusto Riveros¹ and Paul Newton²

¹Faculty of Education, Western University,
London, ON, Canada

²Faculty of Education, University of
Saskatchewan, Saskatoon, SK, Canada

Introduction

This entry aims to elucidate some of the ontological assumptions, questions, and debates that have emerged in the field of education and, more

specifically, educational administration. Ontology, in its most basic formulation, has been defined as the study of “being,” namely, the nature, constitution, and manifestation of reality. This entry examines one salient example of this type of inquiry in the field of educational administration: the question about the ontological status of educational organizations.

From its very beginnings, educational administration, as a field of study, has been concerned with questions about “being,” particularly regarding the nature and constitution of “reality” in educational organizations. Oplatka (2009) indicated that while theoretical tensions, conversations, and debates in the literature are diverse, they are necessary in order to critically interrogate the questions, problems, areas, and objects of study of researchers and practitioners alike. “Theories offered tentative explanations of reality that helped administrators grasp the order and regularities of social behavior in organizations, gaining insights informed by theoretical knowledge, and changing the reality adequately” (Oplatka 2009, p. 21).

One reason to theorize about the nature of the social world relates to the explanatory capacity of the theoretical constructs used by researchers and practitioners alike. When we talk about influences, causes, effects, and other relations between phenomena in the world, we are making assertions about how things come to exist, the nature of their properties, and how they relate to each other. While philosophers generally see the notion of “existence” as primitive, that is, as a precondition to ascribe properties, there is much disagreement about what actually “exists.” Most philosophers would agree that the proposition “something exists” is true. Where they would disagree is on what “something” refers to.

Explaining, describing, and including entities in a theory about the world requires some form of “ontological commitment,” which is the adoption of a discourse or conceptualization about the type of entities that exist in the world. An ontological commitment is fundamental for theorists in the natural and social sciences, that is, a theory must be committed to the entities that would be required for its affirmations to be true. An

examination of the theory's assumptions about reality would offer key insights about the theory's capacity to explain and describe phenomena in a given disciplinary field. Ontological commitments vary across theoretical perspectives in the natural and social sciences, and in particular, they differ across theoretical approaches to educational administration. In this entry, we will not attempt a thorough description or inventory of these approaches. Instead, we make use of a commonly accepted taxonomy of ontological perspectives to exemplify how theorists in educational administration have considered the question about reality.

Traditional accounts of the ontological debate established a distinction between nominalism and realism. The doctrine according to which abstract objects exist independent of human meaning, action, and intention is known as "realism." Plato is perhaps the most notable historical example. In his theory of forms, Plato argued that the particulars we enter in contact with through experience are nothing but imperfect exemplars of ideal types that must be real in order to guarantee the continuity and permanence of our experience.

Nominalism is the doctrine according to which abstract concepts or terms do not refer to real entities or, in other words, abstract entities do not exist, only particulars. For instance, while nominalists believe that persons are real, they would deny that there is such a thing as "social class." For nominalism, abstract nouns are only names that refer to characteristics attributed to individuals; they do not denote existing entities. Weber argued that functional and organismic notions used to describe organizations were just metaphors or idealizations used to make sense of the individuals' institutional behavior.

An influential contemporary approach to the constitution of social reality is known as "constructionism." In this view, both our scientific and everyday understandings of reality are produced and maintained through symbolic interactions between social actors. In their view, different categories of meaning related to the nature and constitution of the "real" have been developed historically through processes of meaning negotiation. The constructed significations about the world are "institutional" in the sense that they are

considered "givens" about the world. In their view, the notion of "objective reality" is a convention that provides the background for social practices. This conventionalist account of social reality relies on the notion of "institutional facts," that is, socially structured practices and objects that contribute to the enactment of social life. For conventionalism, reality is created through intersubjective interactions between social actors.

More recently, the term "anti-realism" has been adopted by philosophers to indicate a position according to which there is no "fact of the matter" that would allow us to decide between competing ontological frameworks. This perspective may lead to varieties of ontological relativism that contend that ontological commitments depend on the context created by discourses and social relations. While ontological constructionism has gained widespread acceptance among academic communities in the social sciences and, as we will see, in the study of educational administration, some criticisms that have been presented in recent times by realists propose a nonrelativistic account of reality that would serve as the foundation of scientific explanation and truth.

Constructionist perspectives about the social world could include "realist" elements. In their view, while the concepts of "race" or "gender" are constructed through historical processes of meaning negotiation, their effects on social actors are "real" in the sense that they create identities, affect social relations and structures, and inform social action. In the following section, we discuss and situate these ideas in the context of the question about the ontological status of educational organizations.

The Ontological Status of Educational Organizations

The distinction among realist, nominalist, and constructivist ontological commitments would provide the backstage to discuss different understandings of organizations in the literature. Realist models situate organizational transformation within the structure; thus, roles, hierarchies, and processes become the focus of the analysis. In contrast, nominalist approaches situate

organizational change in the actors, their beliefs, or the discourses they use to describe the organization. Research in this area tends to emphasize the role of sense making, cognition, and/or subjectivity in the construction of organizational reality. Constructivist approaches tend to present organizational reality as a symbolic product of intersubjective interactions.

Realist Approaches to Educational Organizations

Early realist approaches to the study of educational organizations were interested in establishing a clear separation between actors and structures. By focusing on the structure of the system, these embryonic realist ontologies aimed to analyze the system's functioning and assign causal efficacy to its components. Gunter (2005) noted that these "instrumentalist" approaches to educational organizations tended to portray schools and other institutions as real mechanisms that have causal effects and power. In realist-instrumentalist models, educational organizations exist independently of the actions and practices of school actors. One example of this realist perspective could be seen in the "theory movement" in educational administration. The theory movement adopted the ideas of positivism and applied them to the study of educational organizations; it portrayed organizations as systems that process information, respond, and adapt to their environments. Research from this perspective aims to understand the flow of information, the preservation and change of the organizational structure, and the study of the adaptation of people to the organizational goals.

Recently, Blackmore (2013) has noted that concurrent with the rise of the School Effectiveness and Improvement (SEI) movement, schools have become subject to intense accountability regimes that aim to measure and predict educational outcomes. In order to accomplish this goal, schools have been reified in the policy and academic discourses, where they are portrayed as "learning organizations," that could be measured, controlled, and transformed, to become more efficient and effective. In this model, schools are

thinking adaptive systems that learn and, as such, could be treated as entities on their own.

Hartley (2010) argued that these forms of organizational realism correspond to the functionalist paradigm in the social sciences, that is, an approach that assumes general stability and objectivity of the social world, as well as the foundational role of the natural sciences in the measurement and prediction of social action. The outcomes of organizational realism have been manifested in several forms in the literature on educational administration, from the early studies by the theory movement to more contemporary approaches to school effectiveness and improvement.

An alternative to the conventional instrumentalist and functionalist approaches to realism could be seen in critical realism. Mueller (2015) argued that critical realism offers an alternative to the dichotomies of realism/nominalism. In her view, there are three principles that distinguish this approach from traditional realist accounts: first, its ontological account of objectivity as an *a priori* existence, a logical and material precondition to social phenomena; second, the acceptance of the idea that social reality (e.g., educational organizations) is socially constructed along with the idea that social reality precedes, in an objective sense, human action and experience (this could be evidenced when social actors are introduced to organizations and social institutions that historically precede them, such as schools); third, the belief in the existence of unobservable causal mechanisms that account, in a logical and material sense, for the regularities observed in the social world.

Nominalist Approaches to Educational Organizations

Nominalist approaches would emphasize the discursive or subjective character of educational organizations. As noted above, notable scholarship in the field of educational administration has given primacy to the study of meaning, action, and intention in the constitution of organizational realities. From these perspectives, human intention and action are essential constituents of organizational goals. This means that the interweaving

of meanings generate organizational realities, not as independent entities but as abstractions that nonetheless guide and frame the actions of individuals. Gunter (2005) characterized approaches centered on the study of subjective experiences and narratives as “humanistic,” where “the perceived realities of doing the job, combined with how the tensions and dilemmas that are encountered and worked through in real time, can be revealed” (p. 96). Hartley (2010) argued that in these approaches, organizational action “is a construction, contingent upon time and place. It is negotiated, and therefore is open to asymmetries of power in its definition and in its expression” (p. 278). From this perspective, organizational realities are produced in action and cannot be understood in isolation from the lives and experiences of social actors. Authors in this area see action and intention as the unit of analysis, avoiding the reification of organizations as entities on their own. Nominalist views defend that the only way we can access organizational realities is through the actions, perceptions, meanings, and intentions of social actors.

Constructivist Approaches to Educational Organizations

In the process of investigating the connections between meaning and social action in the context of educational institutions, researchers have turned to discourse-oriented approaches as ways to capture the fluidity and complexity of organizational realities in education. In these approaches, reality is seen as text and discourse; the real is constructed in as an effect of power, ideology, and/or hegemony. Blackmore (2013) describes this positioning from a feminist perspective:

Feminist theorists see difference as socially constituted through organizational structures, processes and cultures and not just something individuals bring with them into organizations such as schools and universities. Feminists thus identify the historical processes and practices of the racialization and gendering of leadership. (p. 149)

In Blackmore’s view, organizational identities emerge in the intersection of hegemonic

discourses. Gender, race, ability, social class, and sexual identity are examples of these intersections. This suggests a view of organizations as dynamic and discursively constructed, not as static and permanent entities that exist with independence from human action, intention, and desire. Hartley (2010) noted that perspectives that consider emancipation and radical change, such as the one presented by Blackmore (2013), aim to reveal the oppressive character of power structures, emphasizing the relational character of practices and identities in education. By “relational,” these approaches mean that entities (identities, practices, objects, etc.) appear or emerge as a product of the interactions between discourses, structures, and actors. In the following passage, Blackmore (2013) highlights the way contemporary feminisms frame issues of ontology:

Feminist post-colonial perspectives of leadership argue that leadership is not only situated, but that the nature of knowledge and the ontological position of white-Western leadership are also contested [...]. Post-colonial research on leadership contextualizes leadership within wider relationships between education, economies and societies around issues of globalization, educational inequality, poverty and cross-cultural relations. (Blackmore 2013, p. 150)

Realism in Educational Administration Reboot

In recent educational scholarship, realist approaches to the study of educational institutions have emerged in two primary forms: (1) a large body of research and scholarship fueled by the evidence-based education movement or data-based decision-making approaches and (2) emerging theoretical works responding to a preponderance of nominalist approaches in educational research. Research of the first form tends to large-scale quantitative studies, effect size research, and systems for the establishing of quality criteria for educational research (e.g., the What Works Clearinghouse <http://ies.ed.gov/ncee/wwc/>). This type of work has been termed “naïve realism” or “instrumental realism” by critics (Eacott 2015). Scholarship of the other form is diverse;

however, it might be characterized as a variety of responses to the dominance of nominalism and constructivism in academic educational research and the dominance of instrumental realist research in the policy maker and practitioner communities. Some theorists have reasserted ontology as a central concern in the study of educational organizations. A variety of forms of realism and ontological examination are grounded in sociological analysis (Eacott 2015), cognitive science (Evers and Lakomski 2000; Riveros et al. 2012), and the philosophy of science (Evers and Lakomski 2012).

Returning to a central concern of ontology in education, some scholars have renewed interrogation into the ontological status of educational organizations. For example, in Colin Evers and Gabriele Lakomski's influential work, the ontological status of organizations receives attention through the lens of contemporary cognitive science and is argued to be ontologically real as a cognitive system – in the same way that an individual's cognitive system is ontologically real. Similarly, other scholars, in interrogating the growing popularity of leadership as a phenomenon, have argued for an ontological reorienting toward organizational analysis and situated practices (Newton and Riveros 2015). This work and the work of other scholars similarly engaged in a critique of leadership discourses in education promises to bring renewed emphasis on the ontological features of educational institutions and research in educational administration.

Introduction

This entry brings together the philosophies of Charles S. Peirce, John Dewey, and Gilles Deleuze, crossing over the continental and pragmatic divide to demonstrate their analogous approach to the action of signs in the world. They conceived of philosophy as proto-science, *natural* philosophy; yet embedded in cultural life and human experiences. This relation between nature and culture, traversing the Cartesian schism, is a province of semiotics, the study of signs. Genuine signs have a triadic structure and conform to the a-signifying logic of included middle. Further, the article discusses reality according to Sir Roger Penrose (who is Professor Emeritus of Mathematics at the University of Oxford) positing it as having a semiotic structure where matter and spirit, body and mind are not dualistic categories but form one organic whole. Values which are traditionally inculcated in schools as abstract concepts acquire semiotic reality: Values are signs situated in life; as such they can be interpreted and created anew in the process of experiential learning. These signs partake of universal Platonic ideas at the level of the unconscious and virtual, rather than conscious, particular, and actual. The task of bringing them to consciousness, to construct a semiotic bridge between actual and virtual, is challenging, yet it is achieved by edusemiotics and elicits some important implications for moral education.

Peirce and Dewey as Precursors to Edusemiotics

Dewey's logic as a theory of pragmatic inquiry posits learning as a progressive capacity for intelligent revaluation of lived experience. Experience is rendered meaningful by means of multiple transactions between the knower and the known (or, rather, knowable). Knowledge is not reduced to fixed facts but is a dynamic process of constructing meanings embedded in life. Contrary to the spectator theory of knowledge grounded in Cartesian dualism, it is active participation encompassing the triad of the observer, the

Ontology and Semiotics: Educating in Values, Fig. 1 A genuine sign

observing, and the observed that ensures continuity traversing the presupposed binary opposites. In Dewey's educational philosophy, values are not indubitable and set in stone judgments but represent experiential and experimental outcomes of revaluation or reorganization of experience leading to "widening and deepening of conscious life – a more intense, disciplined, and expanding realization of meanings" (Dewey 1916/1924, p. 417).

The world of values, from the perspective of edusemiotics, is complementary to both subjective and objective worlds: They form the third world embedded in the ternary process~structure of semiosis. According to Peirce, semiosis is a relational process of the action and transformation of signs perfusing the universe as a whole. Values reside in the world outside of the individual consciousness of the Cartesian subject; they represent multiple potentialities that become actualities when we realize them in ethical action at the physical, material level. Genuine signs are triads (Fig. 1) by way of relation between a sign and its referent via an interpretant (Peirce's term); it is the chain of semiotic interpretants, in thought and action alike, that enables signs to become other signs in an evolutionary process that is irreducible to the biological evolution grounded in Darwinian natural selection.

Signs are patterns of coordinated relations, and interpretive activity necessarily leads to embodied knowledge. It is by means of interpretants as the included thirds between the otherwise opposite terms in a dyad that signs acquire their meanings and enrich human experience with value in

addition to conceptual understanding; this process affecting our habits of thinking and acting in the world. Peirce's triadic semiotics posits matter as effete mind, and mind has to be entrenched in habits so as to eventually congeal into matter with "inveterate habits becoming physical laws" (Peirce, CP 6.25). It is mind hidebound with incorrigible habits that may be called physical matter. As related to human experience, habits represent our unconscious dispositions to act in a certain manner under specific circumstances. The transformation of habits – both intellectual and moral, at the levels of intelligent thought and ethical action – is the aim of edusemiotics. By interpreting and thus reorganizing experience, human subjects acquire the opportunity to learn, develop, and grow in the manner of genuine signs.

As embedded in semiosis, logic can be conceived of in terms of an ethics of thinking which is inseparable from human action or ethics as the logic of doing (Deely 2001). Logic as semiotics is not a prerogative of human consciousness but represents *ratio* in praxis and in nature. A purely cognitive (conscious) process is enriched with an affective, bodily (unconscious) dimension and makes learning from experience a function of a coordinated relation between the unconscious and consciousness (cf. Dewey 1991). The libidinal economy of the unconscious represents a significant factor that influences human development. Edusemiotics posits holistic education and affirms the relational dynamics between all dualisms: nature and culture, body and mind, consciousness and the unconscious, public and private, cognition and affect, etc.

The edusemiotic approach to moral reasoning, an embodied reason capable of entering the background of implicit meanings and values "hiding" in the unconscious, leads to a model grounded in Peirce's logical category of abduction that borders on an uneducated – read: as yet unconscious of itself – guess. Psychologically, abductive inference functions as insight, intuition, or imagination; yet it exceeds *direct* Cartesian intuition and represents a paradoxical mediated immediacy as all cognition is mediated by signs. Abduction is colored by feelings and emotions. It expresses multiple ontological possibilities that Peirce,

borrowing from Shakespeare, called *airy nothings*, surpassing empirical sense data. Abduction belongs to "more unconscious and tentative methods" (Dewey 1991, p. 113): It jump-starts cognition while staying out of conscious awareness. At this level there are physically efficient ontological *generals* as a set of possibilities or hypothetical ideas which are "already determinative of acts in the future to an extent to which [we are] not now conscious" (Peirce, CP 6.156). These unconscious ideas affect our moral judgments amid what Dewey called problematic and obscure situations that call for the revaluation of values and the creation of new values in novel experiential contexts. Edusemiotics fully supports the pragmatic thesis that our best teacher is lived experience, not formal instruction.

Deleuze's A-signifying Semiotics

Deleuze's semiotics is a-signifying, that is, defying a simple dyadic relation between signifier and signified, between content and expression. Opposite terms are connected by a third element forming a conjunction in a manner analogous to Peirce's and Dewey's logic. Philosophers, as well as creative artists, are semioticians and symptomatologists or *apprentices* who read, interpret, and create signs as symptoms of life. In accord with a-signifying, triadic, semiotics, signs enter into self-referential relations (dubbed circular, hence begging the question, in analytic philosophy). This geography of relations transcends the dualistic split of nature and mind by establishing a bond between them. The conjunction "and" is a feature of the logic of signs (multiplicities), the defining characteristic of which is the relational dynamics of becoming in contrast to static being.

The included middle puts to flight the direct representations of analytic philosophy of language. The representational system presupposes a class of things as represented but not themselves being representations; they are posited outside language and outside thought. But from the perspective of semiotics, language and the world form a single extralinguistic fabric. Signs indeed perfuse the world, and meanings are conferred by

virtue of mediation in the relational network constituting a sign process, resembling the growth of a rhizome as Deleuze's new image of thought, in contrast to the dogmatic Cartesian image. Rhizome is a metaphor for an acentric network of signs that are "regulated" not by mechanical laws but by organic growth. Rhizome as a biological notion defies the primacy of classical physics as a scientific model for all other discourses, including education that tends to be "located" in social sciences where the research methods are often borrowed from the outdated paradigm of classical (Newtonian) mechanics with its direct linear causality.

New concepts, meanings, and values are created experimentally as "interpretants" expressing multiple contingencies and contexts embodied in actual events. The interpretive process includes involuntary, virtual or unconscious, memories, similar to those of which Proust's protagonist in his novel became aware when he actually experienced the taste of madeleine. Such is the process of experiential learning and becoming conscious of the unconscious. The creative aspect pertains equally to concepts and values because the focus is on practical evaluations from which the very "value of values" arises. The virtual field of unconscious disembodied ideas produces effects embodied in actual experiences due to the process of learning as interpretation, revaluation, and becoming aware of the unconscious. The conjunction of the unconscious and consciousness – of the world of ideas and the mental world – takes place in the material, sensible, world at the level of empirical reality. Deleuze's empiricism is transcendental, bringing together different series of signs. Such a conjunctive, apparently mystical, event constituting a participative encounter, in contrast to detached observation, is exemplary of edusemiotics. At the ontological level, such an event is akin to the actualization of the virtual: "from virtuals we descend to actual states of affairs, and from states of affairs we ascend to virtuals, without being able to isolate one from the other" (Deleuze and Guattari 1994, p. 160). Both levels are metaphysically real, and the difference between them is bridged by a transversal, semiotic, connection.

The Triadic Nature of Reality

The process of semiosis and the absence of mind-body dualism at the ontological level presuppose what contemporary physicist and mathematician Sir Roger Penrose defined in terms of some contact with the Platonic world of ideas (Penrose 2004). The relation between the three worlds (Fig. 2) – the physical world, the Platonic world of abstract ideas, and the mental world – is usually considered a mystery.

From the perspective of semiotics, however, such a relation is not mysterious but is isomorphic to the dynamic structure of signs (Fig. 1) that perfuse the universe as a whole. Analogously, Peirce's category of abduction sheds its share of mystery. Abduction functions as some sort of Geiger counter, equated by Penrose with a bridge connecting the "small" and "large" worlds even if, according to Penrose, we do not understand the nature of such an included, mediating, element in the framework of currently available scientific theories. But semiotics as the *science of signs* leads us to understand such an unorthodox expanded reality: Signs are intrinsically such bridges and interconnections comprising the tri-relative, nonlinear, and self-referential process of semiosis. It is the ontological primacy of relations that ensures the correspondence or coordination between empirical facts and (supposedly) transcendental values.

Importantly, what "inhabits" the Platonic world is not only the True but also the Good and the Beautiful as "non-computable elements – ... judgement, common sense, insight, aesthetic sensibility, compassion, morality" (Penrose et.al. 1997, p. 125). These elements populate the virtual plane, and the Platonic world mediates between

Ontology and Semiotics: Educating in Values, Fig. 2 Three worlds

the conscious mind and the actual, physical world. Unconscious ideas express themselves nonverbally, at the level of feelings, emotions, and instinctive actions bypassing representation in consciousness, hence cannot be articulated or deliberated upon in propositional language. Still, abduction is a mode of inference. Proceeding below awareness, it enables an intuitive grasp of moral meanings. Naturalistic ethics recapitulates ontology, but the natural world exceeds its reductive description by the laws of Newtonian mechanics. Nature includes a semiotic, or value, dimension related to the human experiences from which we learn. The abstract *universals* of the Platonic world always already exist in a semiotic relation to the *particulars* of our actual existence: They are not strictly universal but reflect the particularities of events that, upon interpretation, acquire new meanings and values. The “contours” of the presupposed universals are therefore dynamic and fuzzy: New meanings and newly created values are the outcomes of learning inscribed in the unlimited process of semiosis.

Conclusion

Human development as the semiotic process of becoming is thus theoretically unlimited, and moral education as experiential learning continues throughout a lifespan. It is by means of semiotic interpretation as practical learning that the “man-sign,” as Peirce said, can acquire information and come to mean more than it did before. The information “written” in signs exceeds sense data and must come to us in a fully Platonic manner, both as the intelligible and the sensible. Structured by sign relations, human experience is an expression of a deeper semiotic process. Any object of experience contains potentialities as virtual or implicit meanings, even if they are not yet actualized or made explicit. Edusemiotics as a novel conceptual framework affects the widespread top-down model of formal moral education reduced to teachers directly inculcating values to students. At the informal, cultural, level such inculcation may easily turn into ideological indoctrination. Still, considering that many of our moral judgments are abductive and

subconscious, it is not enough to consciously deliberate on moral dilemmas or make a decision of right versus wrong even when applying our best critical skills to such reasoning. Critical reason and verbal deliberation are complemented by clinical and creative aspects that cannot be “computed” or analytically deduced but are intrinsic to the value dimension of edusemiotics. By discarding the presupposed centrality of an independent self-centered Cartesian *Cogito* versatile in analytic reason, we are stepping into the semiotic process of learning and evolution. Being non-computable (at the level of conscious mind), our moral judgments strongly depend on insight, intuition, and imagination, which are the psychological counterparts of abductive inference peculiar to logic as semiotics and which enable some contact (as Penrose would say) with the third, quasi-Platonic, world. In the framework of edusemiotics, learning is irreducible to the accumulation of facts but encompasses education in values as the creation of meanings in lived experience. The triadic, self-referential, structure of signs leads us to understand that the level of moral ideas as potential meanings and values must exceed the steady references already present in the conscious mind because true intelligence encompasses our thinking (mental world) as coupled or integrated with our doing (physical world, the world of action).

Not all signs are symbols, such as in verbal language that directly represents reality (read: objective reality, excluding its semiotic dimension); signs include “pictures or diagrams or other images (. . . Icons) [and those] more or less analogous to symptoms (. . . Indices)” (Peirce, CP 6.338) that need to be read and interpreted in practice just like physicians who read current symptoms and provide diagnosis and prognosis in each clinical situation. The edusemiotic task of educating in values poses a challenge of learning languages other than verbal. It is the language of images (Semetsky 2011, 2013) that expresses unconscious ideas and values implicated in human experiences. In contrast to the conscious propositions of an individual mind, the language of images belongs to what Carl Jung called the collective unconscious. An expanded consciousness, in which the unconscious has been *integrated*, can transcend the limitations of the present and let in various

opportunities afforded by an open future. An apparent closure of a semiotic triangle each and every time opens new possibilities (the process symbolized by the dotted line in Fig. 1). When complemented by the language of images in addition to linguistic signs, edusemiotics – by realizing virtual meanings in practice – can compute the essentially noncomputable. Such paradoxical computation is not, however, a rule-based algorithm. It amounts to the revaluation of experience mediated by signs and includes Peircean abduction as a hypothetical conjecture enabled by insight into the Platonic realm of ideas.

The ontology of three worlds grounded in recursive interconnections has serious implications for education. A relation that is ontologically basic decries the notion of an autonomous agent. “Self” and “other,” teachers and students, form a single unit, a sign; individual character building is not all there is to moral education. Edusemiotics posits the ethics of integration as a follow-up to the feminine ethics of care in terms of harmonious relations between all binary opposites, thus also promoting the value of intercultural dialogue (cf. Besley and Peters 2012). To maintain balance and ensure communication between different semiospheres (a term belonging to the famous semiotician of the Moscow-Tartu school, Yuri Lotman) at both individual and social levels is a challenge. Ultimately, moral education demands creating a field of shared meanings and values of which both sides in a relation partake. Meanings, as the outcomes of the learning process, lurk in the future, and edusemiotics represents a future-oriented philosophy of education. It teaches us how to evaluate options in the future evolution of signs and subsequently choose a course of action among many possibilities. Human decision-making is informed by signs: Our actions in the world are also semiotic interpretants that punctuate the nonlinear process of semiosis. Life goes on, and there is always room for more experience. Learning never ends.

Introduction: Open Digital Practices Defined

Open digital practices are developed, enacted, and iterated on by individuals to support engagement or their learning activity through digital technologies, defined as being devices, software, platforms, and other digital resources capable of producing and conveying digital material. Digital space is the space generated as a result of these digital technologies and material in which open digital practices are enacted. Digital spaces can be closed or open in a variety of ways (access, code, language, community practices), but it is important to note at the onset that open digital practices can move between, often problematically, open and closed spaces. Digital material refers to the generative or referenced work of the open digital practices; digital material ranges considerably text, images, audio recordings, video, and the attendant compositions that may emerge as a result of the open digital practices.

Open digital practices are largely an artificial categorization, one designed to encompass the larger space of digitally enhanced methods and activities across a range of categories; it does pose questions about the nature of digital engagement as being reproductive or responsive of the digital space itself, of the practices themselves as being adaptations or appropriations, and of the nature of open overall. These questions become increasingly important as the digital influence over the academy, and society more generally, continues to grow. Open digital practices sit within, are responding to, and are shaped by the context of an increasingly digital society. Each of these questions and points will be addressed in this entry.

Open digital practices involve the use of open or freely available online tools (e.g., search engines) and resources (e.g., Wikipedia) for learning across a range of communities, fields, and learning activities. Open digital practices are designed to enact an open inquiry about the lived world of the individual using any number of digital tools, materials, and digital spaces available to them. They are digital manifestations of practices as defined by Bourdieu and Nice (1977) in that they “tend to reproduce the regularities

immanent in the objective conditions of the production of their generative principle, while adjusting to the demands inscribed as objective potentialities in the situation.”

Open digital practices, as such, are *re-producing* the digital space in which they are being enacted and *responding* to the opportunity provided by the digital space itself. This is important to note as it suggests that it is problematic to see these open digital practices as inherently stable or replicable. While they are in some way reproducing the digital space in which they are being employed, they are also iterating on that digital space in search for opportunity. With each application both the digital space and the opportunity presented therein shift, requiring a constant iteration on the open digital practices themselves. For example, the non-fixed structure and visual form of microblogging platforms, for instance, surrounding the character limit and opportunity to include emoticons, images, links, and GIF embeds, mean in turn that opportunities for constructing and communicating knowledge also evolve. Microblogging evolves to meet the changing patterns of individuals, while in turn bringing about further changes. A further aspect requiring constant iteration is chronology. For example, a tweet in 2008 and one in 2016 will potentially be rendered and received differently, and the digital space, in this case the Twitter interface, in which it is rendered will vary dramatically. A further example might relate to how the nature of information sharing itself among academics or in particular communities evolves over time and influences the reception of the work under observation.

For the purpose of illustration, let us use the example of how open digital practices enable us to share details of some recently published work or a piece of ongoing research being undertaken alongside colleagues. Assuming we are able to articulate what it is that makes our work distinctive and interesting, it is with considerable ease that we can enter words into a publishing platform or online web. The preprogrammed templates and functionality of these online platforms present our work that it is polished and professional as the research whose merits are being conveyed. A few

clicks and a small number of characters later, the website has been shared through a microblogging platform to an expectant audience. However, we do need to stretch the memory too far to recall a time when the responsibility of “getting the work out there” fell to the member of the team who had shown an interest in HTML, a talent that was often being nurtured through his or her own personal website. Most of us will be familiar of occasionally encountering these sites and, after reducing the brightness of our screen, noting how starkly they contrast with the clear sophistication and built-in eye-for-design of contemporary web spaces. On these occasions, we have to work hard to avoid concluding that the research described in a wall of bold Times New Roman on a yellow background is not similarly outdated. The point here is not to diminish the efforts of some of the earlier pioneers of open digital practices, but simply to say that as we draw on emergent digital spaces to convey knowledge, the way our content is received will be influenced by the rapidly changing representation environment in which it is encountered.

These open digital practices are methods for enacting learning across fields of digital activity. Yet, open digital practices extend beyond socialized digital learning theories (discussed in Jonassen and Land 2012) to account for solitary practices of meaning-making: the selfie, the informal path of leisurely discovery through hyperlinks, the curation of digital content, and the methods employed in generating multimedia remixes all involve open digital practices in varying degrees of sophistication. Some of these solitary practices lead to socialized interaction and the myriad practices involved in managing digital social engagement: the understanding and proper use of the digital community vernacular, constructing and iterating on one’s avatar, and collaborative online research and composition are all socialized open digital practices again in varying degrees of sophistication. Yet, it is important to note that open digital practices are methods for digital engagement across the spectrum of socialized and solitary activity.

Open digital practices involve both digital engagement and the development of digital

literacy, positioned here as the ability to locate, evaluate, employ, iterate, and reflect on digital tools and materials and their impact on understanding. Open digital practices are cyclically linked to digital literacy and digital engagement; they require digital engagement to be enacted, and feedback received from this engagement in turn feeds into the learner’s digital literacy. As such, open digital practices should be viewed in concert with digital literacy and digital engagement. As open digital practices are iterative – they are both **reactive** in terms of feedback received from digital engagement and **proactive** in terms of developing practices to engage the space – they involve some degree of reflective practice.

Open Digital Practices: Context, Education, and Material

The concept of open digital practices emerges from, is influenced by, and subsumes several parallel concepts. It is through these parallel concepts that we see open digital practices visibly on display. Concepts such as open education and open learning, which both assume broad opportunities for learning and access to material, are engaged through open digital practices. Open learning is defined here more broadly than open education as a learner-centered activity where relative, but not unproblematic, autonomy exists to pursue learning through closed or open, formal or informal, digital activities. Open learning does not assume an instructional agent in the learning process. Open education is defined through the role of the instructor in the learning process, assuming that instructors guide or model learning through adherence to a structured or formal curriculum. Open digital practices are used to engage both open learning, emphasizing student autonomy, and open education, emphasizing the role of the teacher. Both provide opportunities for identifying and iterating on open digital practices.

Open education and open learning, in particular, have evolved from their initial conflation with distance learning (Rumble 1989) and, more recently, with a complex, conflated association with massive online open courses – MOOCs

(Yuan and Powell 2013). MOOCs are generally defined by their large number of participants, often in the thousands, that require students to develop or iterate on their open digital practices to navigate and interact within the digital course space.

Open education and open learning account for informal and formal digital learning practices, for networked learning, for the open learning spaces in which this open learning takes place (Land and Oliver 2012), and for open practices for assessment and reflective practice (Camilleri and Tannhäuser 2013). As such, open digital practices, as positioned here, are partly the methods for enacting digital engagements in open education and open learning. Yet, open digital practices can exist outside formal educational structures like courses, curriculum, and instruction; they are not exclusive to education or learning. Rather, they are methods for the individual to engage digital space across the formal and informal and across the socialized and solitary spaces. Some of these engagements can and often does occur within educational or learning structure: with open education, open courses, and open learning being the most visible.

Open digital practices are presented here more broadly than many of its parallel concepts. For example, open digital practices share many structural elements of open educational practices, which involve the production, use, and reuse of open educational resources (OER) to stimulate open education and lifelong learning. Open educational practices suggest “the combination of open resources use and open learning architectures” (Ehlers 2011); open digital practices, when positioned in this way, become methods for engaging those open resources and open learning architectures. Tangential concepts that support this position include open courseware (OCW), open textbooks, digitized public domain material (made available through national libraries, museums, or cultural institutions, for example) with open access, and the aforementioned OER.

Open digital practices nominally diverge from open educational practices insofar as they assume neither an instructional agent in this process nor unfettered access to open educational resources.

This is an important distinction. As stated before, open digital practices can be adaptations applied in closed spaces, often with closed material. They can be enacted as solitary digital engagements. As such, open digital practices span the informal and formal fields of activity, the solitary and socialized fields of activity, and movements between these. They can be enacted within an educational context or outside it.

Open Digital Practices: Constraints

This definition of open digital practice places the emphasis of open on the digital practice rather than the digital space or digital material being used in their enactment, a deliberate attempt to avoid spatial or material determinism. By doing so, open digital practices become rhizomatic methods for engaging digital space. They avoid or ignore, insofar as is possible, the structural, legal, or educational constraints of the attendant space and material. Structural constraints include the limits of the code presented in the digital space itself or the functionality around or access to the material in the digital space. Legal constraints exist primarily at the material level but extend to open digital practices: copyrighted works, orphan works, and public domain content being governed by fair use or fair dealings legislation. Educational constraints include inquiry related to the subject under investigation or the adherence of these inquiries to the curricular or disciplinary content. Many open digital practices lead to digital engagements that fall outside the boundaries of disciplinary practice, for example.

Yet, open digital practices can pass through these constraints, often problematically, toward digital engagements. For example, a digital engagement might involve using copyrighted material with a series of open digital practices: downloading the copyright material, editing the material, remixing, and disseminating the new representation via blogs or social media. Depending on the context in which it is enacted, such use of open digital practices and copyrighted material can be illegal, as copyright is balanced by fair use or fair dealing; structurally impermissible

in that the downloading of the original copyrighted content is blocked; or both, as removing the software that prevents the copying of copyrighted material – DRM – or “jailbreaking” a mobile device to remove the software that restricts activity. These activities are all manifestations of open digital practices themselves. They allow the individual to make an open inquiry or seize an opportunity presented by their digital engagement. Looking beyond issues of copyright, the practice of harvesting and then hybridizing content from the open web challenges conventional notions of authorship. As Kathleen Fitzpatrick argues in her 2011 discussion of the digital future of authorship, the remix culture that we propose is a feature of open digital practices and challenges us to revisit some of the established ideas we hold around originality and plagiarism within scholarly practice. Without proposing that the ability to draw a range of content into a single text is confined to texts created within digital environments, it is the ease with which this can be achieved, alongside the vast world of resources on which we can draw, that call for us to reflect on what we mean when we talk about authorship and originality within educational settings.

While not advocating illegal activity, it is important to note that attendant practices, digital spaces, and even communities have emerged from these legal and structural constraints. For example, returning to Bourdieu and Nice (1977), hacker communities employ open digital practices to both recreate the digital space and seize opportunity within closed digital spaces. These hacking practices inevitably change as digital spaces shift in response to their hacking and opportunities evolve as a result. The open digital practices involved in those wishing to mitigate or pass through legal or structural constraints further include those privacy or anonymity practices (such as Tor) or those wishing to access material that is not actively being “crawled” by search engines (such as that found on the dark web). These examples serve to illustrate that open digital practices are often responses to the structure of the digital space itself, whether open or closed; they are open inquiries structured at least partly by

openness and closure. Yet, openness itself is problematic as the next section identifies.

Open Is Problematic: Openness and Closure

While open digital practices can be positioned with relative clarity as digital methods for enacting open inquiry, the term open itself is challenging in that it suggests unrestricted space, mobility through that open space, as well as “unproblematic self-direction and autonomy” (Knox 2013). The position of open digital practices advanced here contests that suggestion. “Openness is neither neutral nor natural: it creates and depends on closures” (Bayne et al. 2016). Open digital practices allow the learner to create closures to engage open digital space: a copy and paste from Wikipedia, a remix of digital content posted to social media, a curated image board, a blog post, and the selection criteria for an audio playlist are all ultimately closures structured by open digital practices. Open digital practices challenge the pervading binaries of open learning insofar as many of these digital practices are enacted in what might be perceived as closed spaces. Closed digital spaces are positioned here as being either proprietary or spaces where the individual has little or no control over the structure of the space and the data they have generated as a result of their digital practices. For example, an open digital practice for participating in a discussion board in a gated, closed learning management system (LMS) is open practice in a closed space. The practice itself, composed of the methods for engaging in discussion online, is ported from, or influenced by, the open digital practices of the learner emerging from the more open, or less explicitly closed, spaces of digital activity.

However, open and closed exist in tandem; they are not binaries in the sense that the existence of one does not exclude the existence of the other. As mentioned, open digital practices can exist within closed digital spaces, just as closed spaces can exist within, or are indeed structured by, larger open spaces.

Open Digital Practices: Adaptation and Appropriation

The definition positioned here, that of digital methods for enacting inquiry across informal, formal, solitary, and socialized fields of activity, suggests that open equates to fluid. Open digital practices are fluid, iterative responses to and engagements with the lived world of digitally enhanced space. They evolve, not unproblematically, through iterative and reflective practice. This definition does not presuppose that all open digital practices are inherently fluid in their structuring; some are indeed sedentary insofar as they move unaltered from one digital space to another. For example, the use of less formalized vernacular from an informal affinity group (a Facebook page dedicated to amateur history and genealogy, for example) ported to a more formal digital space (an online and assessed course in history from an accredited university) will likely produce less than favorable results. Yet, the feedback received from their application in this new digital space triggers their iteration and, as such, their openness.

As such, a further distinction to be made is that open digital practices are often structurally fluid (an *adaptation*) or spatially fluid as in the use of an open digital practice from one community in another (an *appropriation*). Their openness depends on their movement and iteration across digital engagements. Building on the example described in the previous paragraph, an adaptation of an open digital practice might involve the adjustment of vernacular language used in one digital community to the context of another: the removal of emoticons and the use of (or nonuse) of abbreviations, for example. It suggests a familiarity with the digital space itself, a familiarity with the practices employed by its members, and a familiarity with the constraints provided by its structure. An appropriation might involve the porting of a vernacular language employed by one digital community in another without adjustment. For example, using emoticons in a formal disciplinary digital engagement suggests familiarity with aspects of digital practices without a fully realized digital literacy in respect to their digital

space. While likely producing less than favorable results, it will generate feedback that may in turn stimulate iteration on these open digital practices. This feedback might involve criticism from members within the digital space or merely be ignored by the larger community, but both provide some measure of feedback that can be used to stimulate further iteration.

This distinction between adaptation and appropriation is important as it demonstrates the openness in open digital practices itself. Adaptations are attempts to both recreate the digital space in which the engagement is taking place while maximizing opportunity presented by their use. As such, they are sophisticated and iterative manifestations of digital literacy, an understanding of how digital engagements are to be constructed and what will be produced as a result of those digital engagements. Appropriations are less sophisticated in how they align with the recreation of digital spaces and their accompanying opportunity. Yet, both are open, insofar as the open digital practices are employed at will and with agency by the individual.

Open Digital Practices: Technology and Attendant Practices

Further, open digital practices do not restrict activity to a particular digital technology. While the digital engagements generated by mobile phones, laptops, and other digital technologies vary considerably in terms of the open digital practices used therein, the practices themselves remain open and digital. This immersiveness contributes to the interactional context that structures the digital engagement.

For example, an open digital practice used to navigate an urban space through an application on a mobile device will not ascribe to the same level of digital immersiveness as that of an open digital practice used to engage in a discussion forum from a desktop computer, yet both are fluid, iterative responses to digital engagement. Recording audio comments to a collaborative document via a mobile application is an open digital practice, yet one with a different contextual structure than

providing feedback to that same document via a desktop computer with text. However, they bear the same characteristics of open inquiry of the lived world presented above. As such, they are incorporated into the definition of open digital practices presented here.

In summation, open digital practices are digital methods for enacting open inquiries in and about digital spaces through the use of digital technologies. While largely an artificial categorization, one designed to encompass the larger space of digitally enhanced methods and activities across a range of categories, open digital practices problematize the nature of digital engagement as being reproductive or responsive of the digital space itself, of the practices themselves as being adaptations or appropriations, of the digital material generated as a result as being plagiarized or authored, and of the nature of what open means in the digital overall. Open digital practices sit within, are responding to, and are shaped by the context of an increasingly digital society yet remain idiosyncratic as they are responses to the lived worlds of the individuals employing them.

Introduction

The term open distance learning, or open and distance learning (ODL), is contested and combines two different concepts which are often related both in theory and in practice. This entry will review the potential differences between “open” and “distance” learning and how the terms have been used. It will then examine the

changing applications of ODL, the ways in which it is intended to increase inclusion and social justice, and the issues relating to its application. The advent of e-learning and its incorporation within the term “open, distance, and e-learning” (ODEL) in the twenty-first century leads to a brief review of ODL in relation to the most recent developments in open educational resources (OER) and massive open online courses (MOOCs).

Definitions

Open distance learning (ODL) combines aspects of two separate concepts, “open learning” and “distance learning,” and these are also sometimes conflated with “distance education.” While these are often connected in theory and in practice, they are essentially different concepts. “Open learning” is an educational philosophy that emphasizes openness in terms of learner’s choices, most frequently in relation to access, flexibility, and time and place of study. In its fullest sense, it can include choice of curriculum and assessment method, though these have not so far been implemented in practice very frequently or successfully.

The term “open learning” originated in the 1950s and 1960s and gained impetus from the foundation of the Open University, UK, in 1969. It occasioned much debate in the 1980s and 1990s as a slogan applied to a variety of different educational and training initiatives, many of which were not “open” by most of the criteria listed above, for example, in the UK, to in-house training initiatives that were restricted to employees (Gaskell 2007).

Openness is thus a value-laden concept with a social justice agenda. But it is rarely found in a “pure” form, and most educational programs fall within a continuum between “open” and “closed.” “Open universities,” for example, take many different forms, most of which do not fulfill all the conditions for “openness”; The Open University, UK, is relatively unusual in its lack of entry requirements for undergraduate programs but has a structured curriculum and fixed assessment and

exam timetables, whereas the Indira Gandhi National Open University (IGNOU) requires some entry qualifications although these are not as high as in conventional universities in India.

“Distance learning” relates more directly to the modes and media through which students and teachers interact, while “distance education” emphasizes the methods and processes of the delivery of learning and teaching to students. “Distance learning” may also include some face-to-face provision, such as in the University of South Africa (Unisa).

UNESCO (2015) summarizes the differences as:

Open learning is a philosophy founded on the principle of flexibility concerning when, where and how the learner studies. This approach is especially relevant for learners who are physically and/or geographically challenged.

Distance education is the use of specific instructional techniques, resources and media to facilitate learning and teaching between learners and teachers who are separated by time or place.

However, the two terms are not directly opposed and are usually interrelated: open learning is particularly suited to delivery at a distance, and distance learning and education very frequently reduce some of the barriers to openness that are faced in conventional campus-based contexts. For these reasons, the combined term “open and distance learning” became particularly popular from the late 1980s to the early 2000s with reference to a philosophy of openness within a system that used multiple media for delivery. In 2002, for example, UNESCO combined the terms:

The terms open learning and distance education represent approaches that focus on opening access to education and training provision, freeing learners from the constraints of time and place, and offering flexible learning opportunities to individuals and groups of learners. Open and Distance Learning is one of the most rapidly growing fields of education, and its potential impact on all education delivery systems has been greatly accentuated through the development of Internet-based information technologies, and in particular the World Wide Web.” (UNESCO 2002a, p. 7)

The reason for the combination of terms was that “The use of the term *open* is intended to highlight this key feature of the theory and practice of distance education.” (UNESCO 2002a, p. 22)

The growth of the World Wide Web encouraged an explosion in the number of terms used to describe open, distance, flexible, blended, online, and other structures and media for learning, and ODL is sometimes used as an umbrella term to describe a range of approaches. For example, in 2015 the Commonwealth of Learning (COL) issued a summary of “Open and Distance Learning: Key Terms and Definitions” which includes 21 different entries – those above and others such as “flipped classroom,” “learning technologies,” “open schooling,” and “virtual education” (COL 2015).

The inclusion of “open schooling” is a reminder that ODL is not restricted to higher education, although it is used extensively in this context. It can be used to support school-age children, for example, by the National Institute of Open Schooling in India (NIOS), which uses ODL methods to provide education to remote areas for secondary and senior secondary exams and enrolls about 35,000 students annually. ODL has also been very important in training and supporting teachers in developing countries, for example, through the OU UK’s Teacher Education in Sub-Saharan Africa programs.

Characteristics of ODL

ODL is generally characterized by the separation of teacher and learner for most, if not all, of the teaching and learning process. This distance is mediated by the use of various technologies and pedagogies. Some of the earliest examples of ODL, such as the University of London’s external system, originally developed in 1858 (now the International Programmes), initially involved sending packages of printed material to distant students. They studied the materials, often in isolation, for as long as they wanted and then registered to take the University of London’s exam when they felt prepared to do so. However, not all students were confident distant learners, so during the twentieth century, particularly with the development of the Open University, UK, from 1969, great emphasis was placed on the provision of learner support to enable students to

succeed. Learner support has been characterized by Tait (2000) as comprising three main elements: cognitive, the design and mediation of high-quality printed materials by academics and learning technologists to provide the core teaching materials of a particular course or affective, a supporting and interactive environment; and systemic, an efficient infrastructure. All these elements are core to student support in ODL (Tait 2000).

The affective element of learner support has often been developed by the growth of student services departments which provide a range of support services, including telephone and now online response to queries, and also by the employment of part-time staff (or adjunct faculty). These staff are often allocated a group of students, mark their assignments, and respond to student queries, but are not otherwise expected to undertake the usual faculty occupations of original research, scholarship, and publication. They are often on short-term contracts and are paid considerably less than tenured faculty.

The systemic infrastructure of ODL was seen as one of its great strengths in the twentieth century because of its cost efficiency. Peters, originally in 1967, compared distance education to an industrialized form of teaching and learning in which there is a division of labor, for example: “planning, developing and presenting the subject matter and correcting assignments was now done by different persons, at different times and at different locations. ... Where teaching [previously] had been individualized to a great extent by the personality of the teacher, it was now *standardized, normalized* and *formalized*” [sic] (Peters 1998, p. 110). This has implications for ODL pedagogy but also for ODL costings. ODL generally has high fixed costs, in relation to the creation of materials, usually by course teams, but low variable costs per student as they all receive the same material, and there is the potential for huge economies of scale through the numbers of student enrollments. This can be compared with the conventional costing structures of face-to-face teaching which involve low fixed costs, high variable costs (dependent on student numbers), and not much scope for economies of scale (Rumble 2014).

The Application of ODL

ODL has been welcomed by many countries and individuals for its potential to reduce costs and for its provision of educational opportunities. It can provide high-quality, flexible education to those who are unable to attend conventional educational establishments, for example, people in full-time employment, carers, women (in some cultures), remotely located students, and students with some disabilities. In this way, ODL can enhance an individual's prospects of employability and contribute to a country's human resource capital, capacity building, and sustainable economic development. In many countries, for example, Nigeria and India, there is no possibility for many to attend campus-based universities because there are too many people competing for limited places. In these cases, ODL can be an answer.

ODL's popularity and success in some contexts is well documented. In terms of inputs, US enrollment statistics in 2012 indicate that over 2,500,000 students were studying solely distance education courses – 12.5% of the total enrollment that year – and a further 2,810,000 students (13.3%) were studying some, but not all, of the courses in their programs online (NCES 2015). In terms of outputs, the University of South Africa (Unisa), a single-mode distance teaching institution, claims that about 35,000 students annually obtain degrees and diplomas from their programs.

However, there have been concerns that the levels of “dropout” from ODL programs are too high and that more should be done to support students to successful outcomes. Generally, retention rates on distance learning programs are lower than in campus-based universities, but this can be relative. In the UK in 2011–2012, for example, 43.6% of the OU UK's part-time students were not continuing 2 years after entry, compared with 2.3% of part-time students at Durham University. However, the OU's dropout rates here compare not unfavorably with the same data for part-time students at Plymouth University (42.9%) and the University of Dundee (48.1%) (HESA 2011–2012 Table T3e). Complex interrelated factors influence the level of dropout from any

program, particularly for those studying part time with other commitments, and the media and processes of ODL are not the sole factor in the equation. Other concerns about ODL include the view in some countries that the quality of distance learning and the outcomes from study are not comparable with conventional university standards, and so ODL qualifications are regarded as of limited value.

The Introduction of Online and E-Learning

The development of information and communication technologies (ICTs) during the 1990s and twenty-first century, and their application in online and e-learning, has expanded the reach and impact of ODL and had a profound impact on many of the original concepts, processes, and costings, such that a new acronym emerged: open, distance, and e-learning (or ODeL). Indeed, the term “ODL” is increasingly subsumed within terms relating to online learning or education. While UNESCO's Paris Message on June 2015 combines the terms “Online, Open and Flexible Higher Education for the Future We Want” and covers both online and open learning, in other contexts the term “open” is omitted. This is potentially of some concern, because it emphasizes the method of delivery, whether distance or online, rather than the open access and social justice principles originally embodied in the term “open learning.” It may also have contributed to a lack of awareness of, or attention to, the long traditions of research into ODL among some new e-learning enthusiasts.

The affordances provided by ICTs have the potential to break down the original divisions of labor within ODL and encourage much more communication and interaction between all the participants in the teaching and learning process, through, for example, online forums, email, and social media. Wider pedagogical implications include the increase in learner-managed learning and, more recently, learner-created content. Campus-based universities are also increasingly offering distance and online learning programs,

and this has caused a rethink of higher education pedagogies and structures generally. Among concerns raised by faculty are that they are overloaded by student email and forum queries and are also obliged to update their own technological expertise in the attempt to match that of their students. Professional and technical development of teaching staff has never been more essential. From an institutional perspective, online learning was initially welcomed by many who thought it would provide as a cheap solution to all education, but in fact the cost structures of online learning can be far closer to face-to-face education than to traditional models of distance education media delivery (Rumble 2014, p. 207). For students, the impact of ICTs has varied, depending on their access to the internet and ability to use any resources available.

The Impact of ODeL

The increasing use of e-learning has had two major and different impacts on the provision of ODL. In the first place it has opened up access to millions of learners through the development of online resources that are made freely available to anyone who has internet access and is interested in learning something new. This has encouraged a move from formal education to more informal learning. The earliest example of this kind is the OpenCourseWare initiative of the Massachusetts Institute of Technology (MIT) which in 2002 made all the material from 50 courses freely available online. UNESCO then coined the term “Open Educational Resources” (OER) to refer to: “the open provision of educational resources, enabled by information and communications technologies, for consultation, use and adaptation by a community of users for non-commercial practices” (UNESCO 2002b, p. 1). Many OER were intended to be adapted or included within wider programs, but they have not been used as widely as hoped and are often largely stand-alone “bites” of information. To meet some of these gaps, massive open online courses (MOOCs) were developed from 2011. These “massive” open online courses enable anyone to study a particular

subject without any cost and so are extremely valuable and popular for personal information or informal updating; however, they do not as yet provide much formal accreditation, and their business model could be difficult to sustain.

The second major impact of online aspects of ODeL is that, while aiming to increase access, it has in fact reinforced some of the barriers to open and distance learning, particularly in developing countries. What was intended to open up access to all has the potential to reduce participation for many. Some of the main issues are the lack of infrastructure, such as a reliable electricity supply, and the professional expertise and experience of those trying to teach in an unfamiliar context. Provision of large quantities of additional computers to developing countries is not the answer; many will lie unused because of a lack of an appropriate infrastructure. Online learning has also emphasized the concept of the “digital divide,” that is, the gap between those who have access to computers and the Internet and those who do not. This is very clear from the World Bank data about Internet users 2015: whereas 78% of the European Union population are internet users, only 19% in sub-Saharan Africa and only 8.6% in the least developed countries use the internet. Without the ability to access online learning materials, potential students are excluded from many of the new ODeL developments.

Additional barriers to open access and ODL are the cultural, linguistic, and pedagogical paradigms inherent in many ODeL resources. The resources have so far mainly been created by developed nations in the northwestern hemisphere, and their usage in other contexts is contested. The majority of OER, MOOCs, and even Wikipedia entries are written in English, so that those who have English as a second, third, or fourth language may well find difficulties in learning from their content. Pedagogical expectations of teachers and learners, which tend to be transmissive in many Eastern cultures, are very different from those in many Western cultures, which encourage interaction. The dominance online of the Western view of ODL has thus created tensions and even accusations of “neocolonialism.”

Conclusion and Future

Open distance learning is a fluid term, combining two different concepts, and so has been used in different ways. It has been and continues to be used in contexts that aim to emphasize a social justice agenda in education and open access to the provision of learning opportunities. The term has developed alongside that of “distance education” although their emphases are different. Both terms are increasingly subsumed within “online learning” or “e-learning,” but these emphasize the media used rather than the underlying principles of openness.

ODL has supported millions of students, who would not otherwise be able to attend conventional educational institutions, to gain their educational ambitions. There are legitimate concerns about, for example, students’ access to ICTs, cultural agenda, the quality of some ODL programs, and student “dropout” rates. Nevertheless, ODL has a major place in international development agenda in the future, as UNESCO indicates:

Lack of infrastructure and professional competence in open and distance learning remain important barriers. Nevertheless, these forms of educational delivery have come to stay, and many countries are looking at open and distance learning as a major strategy for expanding access, raising quality and ensuring cost-effectiveness. (UNESCO 2002a, p. 10)

Open Education

- Open Educational Resources

Open Education (OE)

- Defining Openness in Education

Open Education and Education for Openness

Michael A. Peters
University of Waikato, Hamilton, New Zealand

Introduction

Open education involves a commitment to openness and is therefore inevitably a political and social project. The concept of openness in regard

to education predates the openness movement that begins with free software and open source in the mid 1980s with roots going back to the Enlightenment that are bound up with the philosophical foundations of modern education with its commitments to freedom, citizenship, knowledge for all, social progress, and individual transformation. Yet in another way political, social, and technological developments have taken place in parallel alongside the history of the movement of open education that have heightened certain political and epistemological features and technologically enabled others that emphasize questions of access to knowledge, the coproduction and codesign of educational programs and of knowledge, the sharing, use, reuse, and modification of resources while enhancing the ethics of participation and collaboration.

Open education as a movement sits within the broader framework of the history of openness that brings together a number of disciplines and fields to impact directly upon the value of knowledge and learning, their geographic distribution and ownership, and their organization (Peters and Britez 2008; Peters and Roberts 2012; Deimann and Peters 2015).

Openness is a concept that has come to characterize knowledge and communication systems, epistemologies, society and politics, institutions or organizations, and individual personalities. In essence, openness in all these dimensions refers to a kind of transparency which is the opposite of secrecy and most often this transparency is seen in terms of access to information especially within organization, institutions, or societies. Certainly, this is part of the meaning of openness in relation to politics and societies – openness implies a form of open government which demands that citizens have access to official information and that reasonable grounds are advanced for withholding information from the public domain. This is the basis for the movement of freedom of information that led to the passage of legislation concerned with rights to information beginning with the Freedom of Information Act passed in the USA in 1966 and then by 70 countries around the world since then. Freedom of information means that the public has enforceable rights to access records and

information held by government or public bodies. Such freedom of information is seen to be integral to democracy considered as a form of open government where government decision-making at all levels is transparent, public records are open to public scrutiny, and individuals have rights of access to such information. The doctrine of open government is related to the theory of free inquiry and the free expression of opinion based on traditional freedoms such as freedom of speech, freedom to publish, and freedom of the press. It originates in Enlightenment philosophies that are the basis for modern theories of rights and stands against State secrecy and the use of State secrecy against its citizens.

In organization and institutions openness has come to mean a certain mode of operation characterized by cooperative or collaborative management motivated by the belief that democracy provides a set of principles not only for civil society but also for public and private organizations. Often this mode of organizational openness is associated with features of democratic procedure including open meetings, free debate, elected positions, and voting as a means of decision-making. Most often open meeting procedure is followed. Such organizations and institutions make use of flat hierarchies and consensus decision-making.

The political and organizational levels are given direct application, philosophically speaking, in the concept of the “open society” which the French philosopher Henri Bergson (1956) first used to identify those dynamic societies no longer tied to a static kind of tribalism and the Viennese philosopher Karl Popper developed in the Cold War context as a concept for defending liberal politics against communism and State totalitarianism (closed societies). Karl Popper’s (1947) notion of the open society also, at least implicitly, is associated with his epistemological doctrine of critical rationalism or “falsificationism” that holds that science progresses through criticism and that claims to knowledge should be open to empirical testing and falsification. In a clear sense then, openness can also be construed as an epistemological doctrine that also implies a central role for science and philosophy as one of the central

means for achieving a rational society based on its openness to criticism. Stated in this general way Popper's doctrine is consonant with principles of criticism that begin the modern project dating from Kant's (1998) *Critique of Pure Reason* or Descartes' (2005) *Discourse on Method* insofar as criticism is the source of rationality and modernity both in its literary-historical as well as its scientific-technological senses.

This sort of account in its general form also allows for counter-Enlightenment strands of thinking such as Romanticism that wants to criticize and question the very commitments of modernity by pointing to the pitfalls of rationalism and forms of rationalization in modern society that have compromised freedom and led to excessive regimentation and bureaucratization of society. The ecological critique of industrialism might also be seen to belong to this counter-Enlightenment form of criticism as might some forms of postmodernism.

Open education in terms of its most recent developments cannot be separated from the development of open systems and the history of open source, open access, open archiving, and open publishing. Education has always been dependent to some degree on changing information and communication technologies from the abacus and stone tablet to the blackboard and computer. The more critical question is to understand how these new technologies, and especially Web 2.0 platforms and protocols, promote a ubiquitous learning that collapses spaces between school and home, work and school, work and personal interest, teacher and student, and so on, transforming formal education and the market and creating new forms of social production that are essential to the knowledge economy.

Openness also has a line of thinking that directly ties it to individuals and their psychological make-up. Openness is one of the five personality traits empirically established in research dating from the 1930s that has come to serve as a model of personality (along with conscientiousness, extraversion, agreeableness, and neuroticism). Openness is sometimes interpreted as "intellect," seen as "openness to experience" and associated with appreciation of art, curiosity, adventure, and the imagination. Open people who are regarded as experimental, creative, curious, less thrown by

complexity and subtlety, are contrasted with closed people who may be more conservative, less flexible, more bound by habit, resistant to change, and tied to the security of a familiar environment. We might even talk loosely here of open personalities as "global" personalities. Openness in this context has a great deal to do with education for it has been argued since days of Rousseau and "philosophers of free play" for children (Pestalozzi, Froebel, Montessori, and even Dewey) that openness to experience is an educationally important value and that unstructured play (freedom) is one of the best ways of encouraging curiosity and experiment.

It is clear that there is a vital historical and political framework that embraces a variety of perspectives of freedom and openness that are part of the commitments of open education – commitments that lie deeply woven into the fabric of modern education as it developed during the Enlightenment and thereafter. Part of the project of education for openness is to identify and to recognize these deep commitments and to provide a theoretical context for viewing and understanding claims to openness and freedom in education within this context. Education for openness is about a meta-awareness of the political, social, economic, and technological frameworks that enable and permit greater world democratic use and reuse of educational resources and programs through new technologies enhancing the virtues of openness such as the ethics of participation, collaboration and coproduction, codesign, and coevaluation of all aspects of education. In this way education for openness is also about exploring the possibilities of open education in both its historical and future perspectives, and the encouragement of greater dialogue across all boundaries. In this sense the project has a world-historical component that is visionary in its commitment to principles of open inquiry, open access, open collaboration and leadership, and to education's role in promoting open democracy at a grassroots level, that is, through the everyday actions of students and teachers who communicate and exchange ideas and resources across time and space.

Open education and education for openness are related projects and perhaps one of the most significant educational movements to surface in the twenty-first century.

Introduction

Open Education: The Very Basic Idea

Openness and education represent a perfect couple or “kindred spirits” (Deimann 2013) because they are inherently linked to each other. As for

openness, an open mind-set is a necessary prerequisite to discover the world in its fullest degree which is a process of enculturation or education or – to put it more philosophically – *Bildung*. This special conception has risen to prominence with the work of German philosopher and diplomat Wilhelm von Humboldt who described it as a free, dialogical, and dialectical interplay between the person and the world in such a way that all the individual’s potentials are unfolded (self-realization). In this regard, the child is made acquainted to the world in schools by means of a standardized curriculum to ensure that all relevant fields are covered. Moreover, in educational psychology, curiosity is understood as one of the major determinants for learning which reflects again an open mind-set as expressed, for example, by the child’s desire to approach foreign objects and person as soon they are within the field of view. In later years, as adults continue their engagement with other, openness becomes of the Big Five personality traits (among conscientiousness, extraversion, agreeableness, and neuroticism) and is described more precisely as open to experience which is then expressed, for instance, in a general interest in learning.

In order to help children and adults strive for interacting with the world, teachers are also required to manifest a certain understanding of openness and to approach students not as a piggy bank that need to be filled with predefined and validated content but as individuals with an innate desire to explore the world. In this regard, open education can be depicted as the idea of providing an alternative mode of delivery which is based on an enlightened understanding of teachers and learners (i.e., both are autonomous and yet involved in an interdependent relationship). In contrast to standardized concepts of education which follow a predetermined curriculum with predefined lessons and assignments, open formats seek to leverage a higher degree of freedom in terms of access to educational content, resources, and programs. There is also more choice available such as what to learn or how to study a certain subject (“self-regulated learning”) and is aimed at the principle of personalization (student-centered

learning in contrast to teacher-led education). Yet, for a very long time, alternative modes of delivery in schools and universities have been limited to the engagement of single teachers who deliberately opposed the standard curriculum or who – as Robert Owen (1771– 1858) – provided special educational treatments such as infant schools for the children of the workers in his New Lanark Mill. Most of these efforts failed because of the continued struggle between progressive movements most often triggered by technological innovations and the power of established clerical providers (Peter and Deimann 2013).

This situation has changed tremendously during the last decades because of improved conditions to disseminate materials and to reach out for potential learners. It seems that the promise of the Internet – connecting people and resources worldwide – has finally become a reality. The educational utilization has started with the open educational resources (OER) movement in 2001 when the Massachusetts Institute of Technology (MIT) decided to publish a large portion of its content under a free license. Some years later, the first massive open online course (MOOC) took place in Canada as another significant open education format which in 2012 bifurcated into a conservative xMOOC version and a progressive connectivistic (cMOOC) style. Although there is a quantitative increase in terms of open courses and OER, there is also a heated debate regarding the quality of openness in education as the title of Martin Weller’s (2014) book “The Battle for Open: How openness won and why it doesn’t feel like victory” suggests. The military language is used on purpose because open education has gained significant influence in the discourse on educational policy, and several actors now propose their open education initiatives as nothing less than a revolution of education. Yet, there is no common agreement on the underlying understanding of openness because of conflicting interests (economic vs. educational). Thus, the degree of openness can vary considerably as the kind of liberty that is attached to it. Many commercial MOOC providers market the free and open access as an attempt to democratize education and dissimulate that the resources are restricted by

copyright law. In contrast to that are open educational practices that capitalize on the power of the Internet (global interaction among peers) and the opportunities of OER, i.e., the rights to reuse, revise, remix, and repurpose material within a legal framework. Therefore, it is important to stress that it is the open licensing of resources that constitute the decisive factor for true open education, i.e., the version that comes closest to the philosophical tradition of *Bildung*.

These and other indicators make it safe to assume that open education will continue to play an important role as a “simple idea,” a philosophy, and a practical concept. The next sections will review significant developments and discuss several points of friction that have become apparent in recent discourses.

Institutionalized Forms of Open Education

While the basic idea of open education is relatively plausible – education is fundamentally dependent on an open approach of teaching and learning – the realization is quite a challenging endeavor. An explanatory account of the troublesome issues that can occur in the process of implementing ideas from a philosophical perspective is provided within the context of secondary schools during the 1960s and 1970s which represents a major proponent of the open educational movement. Open schooling, open learning, or open curriculum are just three of a multitude of terms that tried to convey a certain feeling or spirit of openness in education but failed to substantiate them on a microlevel. All these approaches can be subordinated under a certain zeitgeist that shaped the perception of the role of education for children. More specifically, as the Plowden Report laid out, education was conceived as a major force “(…) in determining the individual’s ultimate position in the occupational hierarchy of industrial societies” (Blackstone 1967, p. 291).

It therefore was about time to rethink the role of schools as they seemed no longer able to provide opportunities for children to develop their potentials. Ivan Illich (1971) was one of the most

provocative voices when he claimed that we should deschool the society as there was a bulk of literature with similar attempts. Yet, it was the Plowden Report which acted as a catalyst for reforms with its detailed review of best practices. One of the major goals of open education during this period was the shift from predefined content and rigid curriculum to practices that seemed to be conducive of bringing out the best of children. Therefore, content, methods, and social interactions could greatly vary between open schools, but the ultimate purpose was always the same. It was about the aforementioned concept of *Bildung*, i.e., an abstract idea of connecting the person and the world in a way that all his/her innate talents can unfold. The process of *Bildung* never ends and cannot be measured with formal degrees but only in philosophical terms such as autonomy. Sure enough, the implementation of abstract norms is on a different layer than the social reality around and within the institution. That is a lesson which Wilhelm von Humboldt painfully had to learn during his days as a policy maker trying to realize the “theory of *Bildung*” in formal schooling.

By the same token, open schooling was informed by theory, more specifically psychological theories that describe how children learn (and it was on a similar level of abstraction as the theory of *Bildung*). Many learning theories that have been adopted by advocates of open education portray the individual as an active agent and a self-motivated maker of meaning. The child is thus not a passive vessel or an empty piggy bag waiting to be filled with content. But how can a child be educated to become an active agent and how can an educational institution ensure that each child is treated in a responsible manner?

It was not only open schools that attempted to fulfill the promises of open education. In the area of higher education, the foundation of the Open University, UK, in 1969 has been another milestone as it functioned as a role model for many other institutions around the globe. Open education became an institutionalized stand offered as an alternative to conventional higher education provisions. While open schools fell victim to a

changed zeitgeist in the 1980s as a conservative turn took over in politics, open universities evolved and kept on playing an important role in the distance education movement. However, as has become apparent during the MOOC hype, there were not many connections between distance and traditional education providers, and therefore commentators from outside distance education glorified the projects of people like Sebastian Thrun or Daphne Koller as tremendous achievements of teaching learners worldwide not knowing that there were many initiatives in open and distance education that have paved the way for MOOCs.

With the rise of ICT, another important driver became more and more apparent which was linked to the natural promise of the Internet: the free and unrestricted flow of information across an ever-expanding network. The Internet made possible what thereto was the privilege of professional distance education providers which is to scale up education using a decentral network and advanced technologies.

Grassroots Developments: OER and Early MOOCs

Started as an initiative within a well-known institution, open educational resources have then ushered into a grassroots development that invites everybody who wants to be part of a global movement. The least common denominator of OER is to commit oneself to apply open licenses such as Creative Commons but without a strict give and take principle (“I can use an OER only then if I provide another OER produced by me”). Instead many practitioners argue for the “sharing is caring” principle which is a bold hope because it avoids formal regulation and relies on the belief of common goods. OER is thus built on a social motivation which ideally works perfectly, and the pool of open educational resources continuously evolves and is refined by an engaged community. On the contrary, only a small amount of producers are feeding a large crowd that does not care about

the deeper meaning of OER. This has happened in a somewhat related way when commercial social media services market their products with the sharing attribute to convince their users to upload as much content (videos, text messages, pictures, etc.) as possible on the platform. This is not to say that social media has little value for human interaction and communication but to stress the imbalanced relationship between producers and platforms in terms of the right to utilize the content. To produce such a vast amount of digital media and giving it for free to YouTube, Facebook, and Twitter is not the most troublesome problem but the fact that the material once it is uploaded falls under copyright regulations.

There have been major OER sponsors like the Hewlett or Gates foundation that helped to establish a remarkable pool of resources by funding a lot of projects. With this support, OER could gain more and more influence in educational practice and policy making. As it relates to working with OER, there is evidence that having a closed community with a descent level of trust is a big advantage.

As more and more OER were produced and spread all over the world, it became clear that this does not automatically usher in open educational practices – a term that is deliberately used to convey the need for a change in teaching practices from teacher led to student centered. In fact, it is a rather naive assumption to believe in the “transformative power” of OER as it neglects the inner power relations in educational contexts such as the “hidden curriculum.” A move toward transforming traditional practices which is also akin to the idea of OER has been undertaken in 2008 with a massive open online course (MOOC), called Connectivism and Connective Knowledge (CCK08). The concept was aimed at overcoming the centralized structures of learning management systems (LMS) and virtual learning environments (VLE) that were perceived as closed and isolated silos in a walled garden. A central issue in the new approach is its emphasis on ownership of content, i.e., learners who are using their own blog or a wiki are regarded as vital parts in the teaching

process as they provide open and free access. In addition to that, the course CCK08 proposed a broad range of open-source software tools (some of them were suggestions by users). Both the open access to the course and the open technologies are critically for the third open component which is open knowledge, i.e., a transparent process of gaining and sharing knowledge throughout the course.

The idea underlying the MOOC was thus to connect learners with all kinds of digital tools and services and to create an open learning space that is closely related to the benefits of the Internet. Interaction and collaboration among participants in highly different relationships are thus the new default in contrast to the traditional one-to-many model with a predominant “sage on the stage.” As the MOOC is framed as an open online space in which knowledge is collaboratively produced, shared, and disseminated, utilizing digital tools can be seen as an informal learning activity that contributes to the development of digital literacy.

There have been several MOOCs following the blueprint of the CCK08, but they were all received and discussed inside the small ed-tech community. This has altered dramatically when two Stanford scholars in 2011 decided to open their course “Introduction to Artificial Intelligence” to the general public because what follows was according to the media nothing less than a tsunami with 160,000 participants from 190 countries.

The xMOOC: Replacing, Reproducing, and Augmenting Higher Education

With the hype around MOOCs from Harvard and Stanford, a new institutionalized form of open education emerged: commercial platforms providing free access to high-quality lectures from US or European universities. Learners can log into these 6–8-week long courses and apply for a certificate which is not free of charge and one of the only stable revenue streams. The rapid increase of courses on MOOC platforms attracted hundreds of thousands of learners and inevitably raised the

question whether there is still a need for brick-and-mortar colleges, and there were bold claims of “the end of the university as we know it.” Consequently, attempts of replacing traditional (offline) courses by online offerings soon started to spread. In this regard, the Senate Bill 520 which was intended to require 145 public colleges and universities in the State of California to grant credit for MOOCs from third-party providers represented a landmark case. The automatic transfer of credit acquired in MOOCs was a simple strategy to bypass the problem of over-enrolled lower level classes and to help students move forward in a faster pace. It would also save State resources, and for the providers it would allow for production-scale effects as one MOOC could be broadcasted on multiple campuses.

With the focus on technological aspects, pedagogy was less important and regarded as a sure-fire success but would backfire after evaluations revealed inferior learning results. MOOC participants performed worse than students in regular classes which is an indicator of the special affordances of learning in online courses. Described as the Matthew effect, MOOCs systematically advantage those learners who already have a high level of competence. Ironically, those learners who were portrayed as the target groups (e.g., socially underprivileged) would be disadvantaged by the mode of operating in a xMOOC, i.e., being exposed to video-based instruction without a proper support taking care of the special needs.

What then happened was that xMOOCs more or less reproduced the existing structures of higher education and fell short of being a transformative power. Many of the xMOOCs have also become valuable source for prospective students who get a chance to see how professors typically teach a class and for current or lifelong learners who are given the opportunity to refresh their knowledge.

Conclusion

Open education has been introduced as a simple but powerful idea which is about helping the

human to become an educated, self-reflected, and autonomous person by providing access and opportunities to resources and peers. Whereas on this philosophical level there is quite an agreement, the implementation of open education in educational settings has proven to be a rather challenging task. In the earlier movement, the lack of a common definition and a set of guiding principles was the main reason that open schooling vanished into thin air in the 1980s. A changed zeitgeist could thus relatively easily ban open practices and favor traditional instruction. With the emergence of OER, a clear definition was given to the movement which is based on licensing. Only those materials that follow an open license are eligible as OER and allow for open educational practices such as the early MOOCs.

Interestingly, the later MOOCs deliberately altered the criteria for openness insofar as it was now only open (i.e., cost-free) access instead of open licenses. This is a different move compared to what happened in the open schooling phase. Here there was an implicit agreement and commitment to openness that would not need to be transformed into a formal definition. The xMOOC advocates are aware of the formal criteria as outlined in the OER projects but for economic reasons refuse to apply them in their courses.

Surely, there will be other lines of conflict in the future as open education keeps on playing a significant role in educational policy.

Introduction: Privacy, Security, and Safety in Open Education?

In online education and especially in open online education and connected learning scenarios, learners and teachers are vulnerable. Their thoughts, their questions, and their learning progress are exposed to the public. Their statements might be archived and indexed by search engines and preserved over years and decades. They produce data points and they interact not only with a small group of peers but with a greater public. Often, learners and teachers in open education have to rely on proprietary software that they pay for either with licensing fees or with their personal data. To date, privacy, security, and safety are not a priority of policy makers, institutions, or single educators in the realm of Open Education. This needs to change.

In his 2016 article, Cory Doctorow states that societies around the world have reached “Peak Indifference (Doctorow 2016).” Doctorow argues that, from the date of publication in the summer of 2016 onwards, the group of people on our planet who are indifferent to systemic data collection, its (mis-)use, and the potential consequences for individuals and society as a whole will not become larger but smaller. Doctorow also draws upon a comparison to the perceived risk of smoking and its effect on people’s behavior: as with smoking,

consequences of infringed privacy and security are often not perceived immediately. Therefore, both smokers and users are not inclined to change their behaviors as these changes are rarely rewarded instantly. This line of argument can easily be transferred to the behavior of online educators, their learners, institutions, and policy makers.

National governments address issues around privacy, security, and safety differently. While Germany and its federal States follow a more strict policy regarding storage and analysis of learners’ and educators’ data, other educational institutions experience more freedom with regards to public-private partnerships for the purpose of data analysis and data sharing. Different standards and their application to different (open) educational formats sometimes call for a distinction between “users” and “students” and most laws were not written with digital or online education in mind (Hutchens et al. 2016). As with all other questions of online governance, the impact of a single nation or even a supra-national union is limited due to the interconnectedness of the web. Supra-national policies like the European plea for Open Access and Open Science (European Commission Research and Innovation 2016), national initiatives like the German call for use of Open Educational Resources (OER) (European Commission EPALE 2016) and the US policy forming around #GoOpen (Office of Educational Technology 2016) should be saluted and simultaneously critically examined for potential societal benefits, possible negative impacts on educational systems’ stakeholders. Lock-in effects might loom ahead – the recently announced cooperation between the US Department of Education and Amazon is an example – and they should be proactively examined as well as threats regarding the privacy, safety, and security of both educators and learners.

Open learning formats like [ds106 Site](#), [Phonar Site](#), and [Phonarnation Site](#) are breaking ground for new ideas around Open Education. They form around the idea of an open web and they use tools and software that are available, both proprietary and Open Source. Among others, formats like these clearly address the need for privacy, security, and safety in open education. Initiatives form [University of Mary Washington](#) around concepts

like the “Domain of One’s Own” and they make strong claims regarding the ownership of a personal space on the web, of control over one’s digital identity. However, the number of educational institutions invested in these initiatives and the number of learners represent only a small percentile of the overall online education “market.”

Simultaneously, end-to-end encryption technologies in messaging apps like WhatsApp or iMessage are on the rise. These developments are rooted in the increasing adoption of alternative messaging systems like Signal, Telegram, Wickr, or Threema by users, and they reflect a slight consumer trend towards privacy. Again, this serves as a supporting argument for Doctorow’s thoughts on “Peak Indifference” from 2016.

It is startling that neither technologies nor larger issues like privacy, security, safety, and surveillance are on top of the agendas of policy makers, educational institutions, educators, and suppliers of educational technology. This has several reasons: a lack of expertise among policy makers, a lack of lobbying for privacy and security with regards to online education, a lack of interest from suppliers of technology due to the supposed lack of a business model, but also a reluctance to question and change practices as well as user behavior at large (Gibbs 2016).

On the contrary: educational institutions and policy makers see digital and online education as a chance to implement Learning Analytics software that enables them to personalize learning (or better: personalize teaching) in order to address a learner’s weak spots. Learning Analytics is supported by various trends, of which a few shall be named here: a Big Data hype, a growing concern of rising costs, an increasing number of learners, and the idea of predicting a learner’s success before he or she has even started his or her studies (The New Media Consortium 2016). Learning Analytics can serve as a canvas for more encompassing questions with regards to the interdependency of Open Education, surveillance, privacy, and security: Are educators, learners, and society willing to give up personal information and data on sensitive issues like their learning processes and intellectual progress? For what

purposes and under which regulations? Who do they trust with handling and securing their data against possible infringements? For how long should this data be stored and by whom? Which security measures need to be applied and who is data being exchanged and shared with? Which business models are deemed acceptable? How can educators provide private, safe, and secure spaces for discourse, for open questioning and learning in an increasingly privacy-infringing learning environment? How can one teach and learn openly while maintaining safety and security? How are spaces for “stupid questions” provided, and how is the “right to be forgotten” maintained in a world where every data point, every interaction, and every wrong answer can be indexed, archived, linked, tracked, and potentially associated with a learner’s digital footprint? Following up on these questions is complex and messy and there seems to be an endless pool of perspectives, opinions, and scientific disciplines that can contribute meaningful insights and findings. To bundle and cluster these findings alongside Open Education and safety, it is proposed to follow three strands of inquiry and questioning:

1. Privacy, Security, and Safety: Content and Resources
2. Privacy, Security, and Safety: Infrastructure and Technology
3. Privacy, Security, and Safety: Governance and Strategy

These proposed strands of inquiry draw upon a workshop the author co-facilitated at the Open Educational Resources conference #OER16 Conference Site in April 2016 in Edinburgh, Scotland. They reflect conversations and findings from the conference as well as comments and results of a follow-up workshop at the Disruptive Media Learning Lab at the University of Coventry.

Privacy, Security, and Safety: Content and Resources

Questions around openness, privacy, safety, security, and surveillance can be posed from various

perspectives and angles. Many of the discourses in the realm of openness revolve around content and courseware – the emphasis of Open Educational Resources is exemplary. The availability of well-edited, factual content seems to be less and less an issue. The community dedicated to the ideals of an open web works relentlessly on making content and resources available online. Wikipedia, with all its questions around governance, community, equality, and equity, is among the most-cited examples for this trend, but there are countless initiatives in the realm of Open Data, Open Science, and Open Access that work on making content and resources accessible to Open Education and society as a whole, both regarding their content and their technical forklability.

However, questions remain regarding content, resources, and safety: What has a content-driven approach to safety in Open Education to offer? How can content be used as a lever to promote safety, security, and privacy in Open Education? What endangers Open Education and safety from this perspective? The most prominent answer might be that content and topics of education should never ignore issues of privacy, safety, and security. Any educator and her institution should address questions on safety and raise learners' awareness of them. In every Massive Open Online Course on computer science or coding, there should be a module on ethics, surveillance, privacy, and security. In every open class that is held online, there should be remarks regarding exposure, hints at both the risks and the threats of working collaboratively online, but also of the potentials and gains that this practice can entail. Privacy, security, safety, and surveillance need to be embedded in every online offering just as there is a fire escape plan with clear signage and instructions in every classroom. This cannot exclude content.

Educators around the world need to share and research good practices of how content-driven initiatives for safety, privacy, and security affect their learners' percipience and behavior with even more rigor and intensity. Which content and which resources were proven to affect behavior? Which resources had a counter-effect and why?

Any open educator should feel and respond to an obligation of pointing their learners to these issues, of course not only via content and resources but also in everyday behavior. Anyone funding research in the realm of educational technology and resources needs to include aspects like privacy, security, and safety in their calls.

Also, following Doctorow's concept of "Peak Indifference," the Open Education community should not stop its efforts to educate stakeholders and policy makers on these issues on the one hand but to also act on their emphasis of learners' safety. Surveillance, safety, privacy, and security cannot be separated from any other topic in the realm of the "digital,"- so why should they be separated from content and resources in education?

A reduction of openness and safety on content alone is neither sufficient nor practical, but content and resources can be leveraged especially when dealing with issues like privacy, safety, security, and surveillance. As with many other ideas of openness, content and resources can serve as Trojan Horses to foster dialogue and critique in the realm of Open Education and safety.

Privacy, Security, and Safety: Infrastructure and Technology

Questions on Open Education, privacy, safety, and security cannot be separated from issues around infrastructure and technology in teaching and learning, both regarding software and hardware. Learners and educators produce and provide sensitive data, they expose themselves to educators and institutions, they trust their learning communities and, in open formats, they are exposed to the public. Especially in open online education, learners often lose the right to be forgotten, the right to be wrong, and the right to a learning curve even though all of these are essential elements of learning themselves. Technology and infrastructure must be designed in a way that provides an appropriate amount of safety, security, and privacy (as a counterpart to surveillance). Still, there is a large potential in learning and teaching

openly, in networks and rhizomes, and in exchange and negotiation, which can only be tapped if learners interact with and expose themselves to their learning community. Related questions then are: How can educators and learners interact and co-create using online infrastructure but still retain the right to safety, security, and privacy? What are good practices in using software and hardware for purposes of teaching and learning openly without giving up control over safety, security, and privacy? What can software, hardware, and infrastructure provide to ensure and foster both learning in open communities and safety of individuals? How can an open and safe online learning environment be shaped?

Educators and educational institutions need to have the right and the ability to fork and adjust learning environments as their role in Open Education entails responsibility for the learning community and their learners' safety. Educators and their institutions need the capacity and agency to decide on issues related to infrastructure, learning environments, and safety. They need trusted independent bodies to advise and guide them in this process, in which there so often is no clear right or wrong answer but rather shades and nuances.

Learning and teaching software infrastructure needs to be thoroughly documented and transparent so that both educators, their institutions, and learners are put in a position from which they can consciously decide on risks, potentials, and possible outcomes. Educators have the agency to answer questions on ownership of content (both provided by the educator and the learner) and on ownership and processing of learners' data and without being at the mercy of the software industry and software providers' inconsistent business models. How can educators be provided and supported with expertise, agency, and time to consciously position themselves in this context?

Ignoring questions around infrastructure and technology leads to learning environments that facilitate discrimination and judging, that put learners in a position that they regret later on. Certainly, these issues can be resolved and handled responsibly and in a way that enables all educators to learn from one another. It is the

responsibility of all open educators and their institutions to bring these solutions forward, to foster dialogue around them, and to jointly collaborate in order to offer safe, secure, and private infrastructure which enables open teaching practices. The education community should not seek refuge under the umbrella of education technology corporations whose main responsibility is seen in the quest for a business model. Rather, the Open Education community needs to exchange concepts, ideas, and research as well as software that enables educators to teach and facilitate in open educational settings without putting their learners and themselves in the risk of exposure, discrimination, and setbacks by a choice of software and technology. How can we use software and information technology to teach and learn openly and still be safe from discrimination, exposure, and indexing?

Privacy, Security, and Safety: Governance and Strategy

Governance and strategy, legal frameworks, and ethical guidelines play major roles in the context of Open Education, privacy, security, and safety. Neither issues around Open Education, content, and resources nor issues around Open Education, infrastructure, and technology can be resolved without elaborate and well-reasoned governance structures and strategies on supra-national, national, federal, local, and institutional levels. Openness, security, safety, and privacy are not binary – one can only reason, judge, and work towards states of openness and safety. It therefore becomes clear that there is a dire need for fair and responsible governance and strategy making in the realm of Open Education. While governance and strategy can describe and advise on procedural levels there are also moral and ethical arguments and principles to be considered in the realm of Open Education and privacy.

Ethical and moral arguments are reasoned for with a specific set of cultural values and norms as starting points while governance is often understood as a standardization of norms, processes, and desired outputs and outcomes. However,

both areas, governance and ethics, can and should be analyzed for potentially transferable key findings. If generalizations of good practices are detectable, these might then be transferred to other areas and implemented in different contexts. In Open Education, there might be much to be learned with regards to safety from developments in the realm of open source software, from community management in large social networks, from the collection of personal biometric information in countries all over the world, from different models of democratic governance, or from ideas and concepts related to open governance. Especially from a safety- and security-perspective, governance models around the world might provide valuable insights; they might trigger new approaches to governance and strategy making on all levels related to (open) education.

Especially on an institutional level, governance and strategy for Open Education potentially serve as protection of educators who teach openly. One should not expect open educators to understand every detail of infrastructure and software, of data security, or of potential discrimination as they remain experts in their field and will most likely not convert to become IT security specialists. Governance, institutional strategy, laws, regulations, and ethical guidelines can provide a reasonably safe and secure scenario for educators in their efforts to offer an open infrastructure.

When Open Education, safety, security, and privacy are not explicitly mentioned in governance guidelines, strategy papers, and funding criteria, this ignorance exposes educators, their institutions, and consequently their learners to a position of uncertainty and risk. Researchers and educators as well as policy makers on all levels have a mandate and an obligation to collaborate and collect practices and findings around governance and strategy in order to assist future efforts in this realm. How can governance and strategy support Open Education and safety? How do we govern and still create open spaces for learning and teaching? How much governance is needed in order to provide safe, secure, and private Open Education scenarios and protect those participating in them?

Call to Action

In 2013, a “Bill of Rights and Principles for Learning in the Digital Age” was introduced by online educators (Corcoran 2013). Three years later, it is up to educators and researchers to foster and facilitate a debate around Open Education, safety, security, and privacy and to exchange practices, research, and ideas that work towards goals in Open Education. Especially with a narrative of privatization and commercialization in mind that presents many formats and courses masked as Open Education, it becomes clear that a community of open educators should keep on trying to balance the scale at least. By failing to address issues around safety, security, and privacy in the realm of Open Education, educators will exclude those who desperately seek exactly that and any failure to address these issues is in conflict with the principles of Open Education. Open Education has the potential to enable, empower, and connect educators and learners to exchange and debate openly, to collaborate and to co-create, and to transfer learnings to new subject areas and problems. In failing to address safety, security, and privacy, educators will fail Open Education.

[Creative commons licensing](#); [Educational technology](#); [Open access](#); [Open education](#); [Open educational practices](#); [Pedagogy](#)

Introduction

For many in education, the term Open Educational Resources or OER probably translates functionally as “free resources on the Internet.” But this shorthand provides only a partial definition which obscures some of the key features and questions of interest that drive the “OER movement,” as the community of practitioners and

scholars who are engaged with OER are often described. For example, how can educational resources be “free”? What is the significance of their “openness”? How do they get on the Internet? Also, what should we make of the fact that there is a “prehistory” of openness in education which predates current digital versions?

Along with their parent category, Open Education, OER belong to a pantheon of technology-enabled “opening” movements, including Open Source Software and Open Access that act as drivers for openness, collaboration, and transparency, yet tend to operate as “silos”, with each aiming to act upon a specific domain of knowledge and practice. Adoption of open approaches can make an enormous contribution in education but challenges, barriers, and threats abound. While the sharing and reuse of open resources is widely accepted as a “good idea” (and promoted by prominent international organizations such as UNESCO and the OECD), this has not yet led to widespread adoption. Education rests upon the communication, exchange, and critique of ideas, so to advocate for “openness” in this space is, in a sense, rather uncontroversial. Yet, although few would say they are against openness in principle, specific forms of openness can struggle to gain traction, and OER has arguably been one of these.

Research into the use of OER by educators and their students also suggests engagement can be hampered in various ways, for instance by inequitable access to connectivity and bandwidth; technical and skills barriers; restrictive or unclear institutional policies; and lack of time or reward (Windle et al. 2010; Browne et al. 2010; Rolfe 2012; Atenas et al. 2014; Schuwer et al. 2014; Havemann et al. 2014). While awareness of these issues and concerns is important, they are not the focus of this entry. Instead my aim is to contextualize and then closely examine OER, so as to provide an overview both of what they are and why educators should take an interest in them.

Educational Openness

Openness in education is not fundamentally digital, although increasingly in the current era,

educational practices labeled as *open* are technology enabled. Yet it is worth noting that discussions of “open learning” and initiatives to make education more accessible did not originate with the OER movement. As Peter and Deimann (2013) indicate, popular movements to democratize access to knowledge have taken historically specific shapes. They trace the roots of what we might today refer to as “open education” back to the late Middle Ages, when the rise of literacy kindled a public desire for access to knowledge and discuss a series of historical phenomena, including the development of correspondence schools, which can be understood as precursors to today’s digitized forms of open education.

Educational adoption of the term *open* came into common use in the second half of the twentieth century, when institutions such as the UK’s Open University were created specifically with a mission to open up access to formal higher-education qualifications. Such institutions have tended to waive or relax the usual prerequisite entry requirements and typically offer programs through distance and part-time modes, making study accessible to groups such as working adults, stay-at-home parents and caregivers, and those who live far from campuses. By offering the option to attain a traditional qualification via non-traditional routes, these institutions have played a key role in widening access and participation, thereby fostering the intellectual development and economic opportunity of their students (Peters et al. 2012).

Following the development of the World Wide Web, the idea of being *open* (in education and elsewhere) has increasingly become associated with digital content and practices. Through the 1990s, Open Source Software (which the web itself had been built upon) began to challenge the preeminence of the business model of the corporate software vendor. In academia, an emergent Open Access movement was beginning to question why research outputs, particularly those from publicly funded institutions, should be locked away behind publisher paywalls. The Budapest Open Access Initiative (2002) summed up their position as follows:

An old tradition and a new technology have converged to make possible an unprecedented public good. The old tradition is the willingness of scientists and scholars to publish the fruits of their research in scholarly journals without payment, for the sake of inquiry and knowledge. The new technology is the internet. The public good they make possible is the world-wide electronic distribution of the peer-reviewed journal literature and completely free and unrestricted access to it by all scientists, scholars, teachers, students, and other curious minds.

Meanwhile, the idea that educational content could be digital and freely available had been trialed in the form of Reusable Learning Objects (McGreal 2004). At the same time, the new ubiquity of desktop computing (at least, in First World academic institutions) enabled rapid expansion in the production of digital content by individual educators, as well as institutional initiatives, which potentially might be easily shared online.

In 2001, one such institution, the Massachusetts Institute of Technology (MIT), took the bold step of announcing it would be releasing much of its digital learning content, packaged up as self-study “courseware,” under the auspices of the MIT OpenCourseWare (OCW) initiative. While OCW was widely characterized as “putting courses online,” MIT made it clear that OCW is content only and does not include “teaching” (communication with, or assessment by, MIT staff). This content was simply being made freely available for noncommercial use by students, teachers, and anyone else with an interest, anywhere. This, more than any other single phenomenon, provided a template for OER.

OER Definitions and Debates

In 2002, UNESCO convened a “Forum on the Impact of Open Courseware for Higher Education in Developing Countries” to discuss how MIT’s approach could be scaled up into an international network of open content redistribution that would be inspired by, but not restricted to, OCW. The delegates at this event coined the phrase “Open Educational Resources” and stated this term should be understood to mean:

The open provision of educational resources, enabled by information and communication technologies, for consultation, use and adaptation by a community of users for non-commercial purposes (UNESCO 2002, p. 24).

The OER movement was thus officially born and has since been making the case for educational materials to be available “to all” and assisting educators to locate content which they can freely adapt without “reinventing the wheel” (Smith and Casserly 2006; OECD 2007; Caswell et al. 2008).

Significantly, the concept of OER that the UNESCO forum participants defined encompasses much smaller-scale forms of content, as well as the OCW model of whole courses’ worth. Weller (2010) has usefully characterized and contrasted these subsets as “*Big and Little OER*.” This expanded scope is significant. Larger-scale projects such as OCW and, more recently, Massive Open Online Courses (MOOCs) and Open Textbooks typically are made possible through provision of dedicated institutional resourcing and expertise. Conversely, individual educators, often lacking both the significant time and technical skills necessary to develop larger-scale resources, nonetheless produce a wide array of learning resources. The decision to include such small-scale resources therefore reflected a large-scale ambition: the OER movement would seek to engage individual educators (as well as institutions) in sharing their own resources and reusing and repurposing those of others. This set the stage for definitions and discussions of the nature and purpose of OER to proliferate.

Each element of the phrase *Open Educational Resources* contains potential for differences in interpretation and emphasis. Working back from the noun *resources*, one can note that OER definitions frequently include lists of examples of the types of things that are considered a resource. Here the main differences hinge upon the question of how inclusive the definition wishes to be; so educator-produced learning materials, such as slidesets, videos, or documents, are always “in” but granular-level units of content, such as photographs, may not be. Resources that are primarily

provided for the use of other educators such as syllabi and lesson plans are only sometimes mentioned but probably uncontroversial inclusions. Datasets are rarely listed in definitions but can certainly be viewed as a type of educational resource, while software and systems, which might reasonably be understood as things of a different kind from *resources*, are also sometimes present. The meaning of *resource* is furthermore contingent on the way the qualifying term *educational* has been interpreted. Although *educational* can suggest something produced specifically for the purpose of education, in the context of OER it is perhaps more usual, and useful, to include any resource that is put to educational use: therefore, any list of examples can never be exhaustive.

Notwithstanding OER scholars’ propensity for generating new definitions, there is widespread agreement with the key points of the original UNESCO definition. That is, it is generally understood that the term OER should refer to *freely available digital resources*, which have been released under some form of *open license* (in practice, almost always one of the Creative Commons licenses) that explicitly grants permission for both *use and adaptation*.

Assuming then that OER is best understood as a diverse category, we could say its contents are united by both educational use and *openness*. But openness itself is not an entirely obvious attribute. As Pomerantz and Peek (2016) note, the polyvalence of the term *open* has experienced rapid expansion in the late twentieth and early twenty-first centuries. Consequently, the meaning of *open* in any given usage tends to be both contextual and contested. The particular use of *open* in OER reflects deep concern with good practice in intellectual property and authorship, and therefore in licensing resources and granting of nonrestrictive permissions. The use of such licenses removes the ambiguity of permission that occurs when resources are simply made available without explicit licensing – which may or may not confer tacit permission to link to, or re-upload elsewhere, but cannot be assumed to imply any permission to adapt, translate, or mash up.

Open therefore, crucially, does not equate to completely unrestricted, and what it means in the

context of a given resource will depend on exactly which open license is in effect. Wiley's (n.d.) Open Content Definition has been highly influential in this regard. Wiley proposed that open content such as OER should permit the "5 Rs":

1. *Retain – the right to make, own, and control copies of the content (e.g., download, duplicate, store, and manage)*
2. *Reuse – the right to use the content in a wide range of ways (e.g., in a class, in a study group, on a website, in a video)*
3. *Revise – the right to adapt, adjust, modify, or alter the content itself (e.g., translate the content into another language)*
4. *Remix – the right to combine the original or revised content with other material to create something new (e.g., incorporate the content into a mashup)*
5. *Redistribute – the right to share copies of the original content, your revisions, or your remixes with others (e.g., give a copy of the content to a friend)*

From this perspective, *open/closed* is best understood as a continuum rather than a simple binary; the greater the restrictiveness of the license used, the fewer permissions are granted, and therefore the less open a resource becomes (Wiley 2009).

The Creative Commons (2016) licensing framework has become the gold standard for the OER community as it provides a comprehensive range of options, from completely open (public domain) through open but *requiring attribution* and various combinations of attribution with the addition of one or more of the further restrictions: *non-commercial*, *no derivatives*, and *share-alike*. In accordance with Wiley's principles, content released under licenses which include the *no derivatives* restriction are not seen as truly open, as this restriction prohibits revising and remixing. The widespread acceptance of Wiley's 5 Rs and adoption of Creative Commons licensing together provide a "fleshed out" sense of exactly how openness should operate across the OER lifecycle.

Although broad agreement has therefore been reached in the OER community on how openness

applies in the context of OER, this has not, as yet, effected truly widespread transformation of educators' practices. This is not to deny that educators frequently do share resources online, but this is often done without explicitly licensing, or else applying the default license (typically, "all rights reserved") when using social sharing platforms. Assuming their intention is for these resources to be reused or adapted by others, this perhaps reflects a need for greater awareness of copyright and licensing practices. But this also may reflect a tension around the nature of openness that the OER movement has found difficult to resolve.

Educators who share or reuse "without a license" are, arguably, already aligned with the wider purpose of the OER movement and yet are seen as operating outside of it. For Amiel and Soares (2016), there are two notions of "the commons" in play here: the legal and the social. While it is true that open licenses provide a robust solution for contributing works to a legal commons, this is not the primary motivation for sharing. Perhaps (in addition to the challenges associated with selecting licenses and platforms that sometimes make licensing complex or unclear) sharing is more likely driven by a commitment to the social commons. This issue, amongst others, points to the need for a greater understanding of educational practices in relation to OER and, potentially, for more fluidity in the way we understand and discuss openness.

The Turn to "Open Educational Practices"

Much of the discussion about OER in its initial decade has tended to be "resource focused." Perhaps inevitably, as a movement for opening content, OER has tended to put content at the centre of the discussion. Thus, much attention has been paid to practical questions regarding the wider resource lifecycle: sharing, storing, discovery, enabling use and reuse, leading on to subsequent sharing of the repurposed version, and so on. Another significant strand of research has considered the quality and sustainability of open resources and how these might be ensured.

While these are important topics and pose questions that are by no means resolved, this resource focus has, at times, tended to obscure the complexity of human endeavor involved in resource creation, discovery, modification, and consumption – and indeed, in the process of education generally, which after all, consists of much more than resources. While enrolled students undeniably benefit from access to a variety of copyright and open resources via their library (and indeed, Google), curriculum, context, assessment, and credentials also matter, as do conversation, collaboration, and the forging of relationships with intellectual peers and mentors. In response to these concerns, OER scholars have argued for adoption of the term “Open Educational Practices” (OEP), in order to place the focus on the open educational activities of individuals and communities (Andrade et al. 2011; Cronin 2016; Ehlers 2011). However, this new concept is perhaps even more slippery than OER to define, as OEP gives rise to the same issues with the polyvalence of the term *open*, only more so.

The turn from OER to OEP is less of a question of licensing and more one of ethos. This does not represent a radical break with the OER movement; indeed, OEP is often discussed in close relation to OER. However, the value of OEP as a concept is in its more wide-ranging remit. An influential definition has been given by Andrade et al. (Andrade et al. 2011) who state:

OEP are defined as practices which support the (re) use and production of OER through institutional policies, promote innovative pedagogical models, and respect and empower learners as co-producers on their lifelong learning path (p.12).

This suggests OEP is most usefully understood as a lens for looking at practice rather than an itemized list of relevant activities.

OEP consist not only of creating and reusing OER but also of other forms of transparency around academic practice, such as blogging, tweeting, presenting, and debating scholarly and pedagogic activities, in ways that promote reflection, reusability, revision, and collaboration. OEP can be tactics for developing and strengthening communities of practice and disseminating positive ways of working, as well as leveraging open

resources and innovative pedagogies. The initial wave of MOOCs provide an illustrative example, as they were driven by a connectivist pedagogy, which assumes that learning should be driven by interaction, debate, and reflection amongst participants (McAuley et al. 2010). Assessment practices can also be opened, for example, by asking students to create work to be shared beyond the usual audience of the assessor(s), and sometimes classmates, and thereby “adding value” to the wider world (Wiley 2013; DeRosa 2016; Hendricks 2015). In inviting us to revisit educational openness in all its forms, OEP helps us to understand and leverage the benefits specific forms of openness confer, to seek synergies between them, and to ask “why not open this?”

The concept of OEP therefore constitutes more than a fresh take on working with OER. It seeks to frame considerations of how and why people choose to author and learn with open resources, and the practices involved in their selection and modification, but also, importantly, to direct attention to practices that are less about resources; that instead act to open educational spaces or open other spaces *for* education.

Conclusion

In attempting to build a bridge into a future where educational resources are freely and openly available to all who seek knowledge, whether this might be for the purpose of self study, for learning collaboratively with others, or for teaching, the OER movement has presented us with an important vision. But a resource-focused vision of education can only see pieces of a larger puzzle. Without integrating a sense of the complexity of practice, and of the history and commitments underpinning forms of educational openness, there is a risk that advocating for resources to be open is seen as an end in itself. That said, articulating the overarching goal of the OER movement is not straightforward.

Certainly, the argument has been made that educational resources in digital form can and should be made openly and freely available and that this contributes towards a wider project of

opening access to education. But it is important to recognize that providing access to OER, in itself, increases access to educational material, rather than “education.” The recent shift of focus to consider *practices* is recognition that it is not only resources that can and should be opened. Licensing and resource lifecycle management concerns must not overshadow the more fundamental discussion about why resources should be open in the first place. Returning to Weller’s distinction between big and little OER, big OER continues to thrive, even if OCW has ceded its place in the spotlight to MOOCs and Open Textbooks. But mainstream adoption of sharing and reuse of little OER has proven a tougher nut to crack. To achieve its desired ends, there needs to be wider recognition that openness in education is not a movement for the emancipation of resources but of people and practice. Through this improved understanding, it is hoped that the cause of open education – to disseminate knowledge, strengthen communities of practice, and promote innovative pedagogies – can be further advanced.

Introduction

The educational dimensions of Openness elicit very strong and impassioned responses. On the one hand are Open activists and advocates, who see the promises of open, especially those arising with digital and distributed networked technologies, as the panacea to a lot of contemporary challenges at building just, fair, and safe educational platforms. Openness, for them, encompasses a wide spectrum of processes, values, and ideologies, ranging from calls for dismantling the classroom to the augmentation of existing pedagogic practices that would change the inequalities of power and inequities of ownership that are identified as key critiques of the modernist-capitalist university framework. On the other hand are the Open skeptics, who point out that the unbridled celebration of openness is both utopian and unsustainable. Eschewing the idea of the Open as an alternative, they are quick to point out that open is equally constructed by positions of power and can often be exclusionary and discriminatory, toward those who do not offer themselves to be opened up. Openness, in these discourses, emerges as a powerful force but not innocent of the erosion of agency and engagement that it seeks out to correct. The conversation between these two factions is often heated and confrontational. However, taking sides necessitates the production of Openness as a black box, where instead of being a method and an instrument to achieve larger principles and ideals, Openness becomes the very object of inquiry and the lens through which it is studied. We need to rescue Openness from this mystical status and map it at various levels of lived and embodied reality to produce it as an intersectional standpoint that addresses the promises and perils of Openness in education.

Main Text

Openness has been one of the most ubiquitous characteristics, attributes, and promises of the emerging digital technologies. The “Open Everything” movements that have come to symbolize the alternative possibilities and the democratic potentials of the Internet and digital computation have heralded Openness as a prerequisite for building fair, just, equal, and safe societies. Especially as we move toward networked realities that are governed by the invisible presence of algorithmic governance and big data descriptors, there is a clear idea that the only sustainable future of our digital ecosystems and the contingent orders of social, political, and economic structuring is in building open systems. Open Data, Open Hardware, Open Software, Open Societies, Open Governance, Open Access, Open Education, Open Governance, Open Content, and Open Science – the list is almost endless, and there seems to be an easy and reasonable presumption that sufficing almost any process of knowledge production, information governance, informatics processing, and meaning making by “Open” would result into a more egalitarian system that is inclusive, affordable, and nondiscriminatory. So strong is this rhetoric of the Open as Good, that Openness easily gets conflated with other desirable ideologies of free, simple, moral, accountable, transparent, responsible, responsive, equal, equitable lives. Almost militantly, Openness has emerged as a space for resistance, as a strategy for appropriation, as a moment of experimentation and innovation, as a process of construction, and a metaphor for participative, democratic, and inclusive practices of living.

The educational potentials of building open systems are often presented as commonsense to those who believe that information is a public resource and should not be commodified for private profits by informatics corporations. The social promise of Openness in education allows activists to conjure utopias where existing problems of discrimination and exclusion could be reconfigured to create equal and tolerant learning spaces for the future. The economic entrepreneurs have persistently argued that open systems offer

new spaces for social, political, and personal interaction and action, allowing alternative currencies, markets, values, worth, and commodities which can be created for the betterment of educational structures. Across a variety of disciplines ranging from law and medicine to humanities and arts, it has been found that open as a methodological process of reaching decisions is more robust and less prone to error than specialized knowledge created by the institutionally appointed fountainheads, thus destabilizing the very core of “expert-driven knowledge” that our current educational models are premised upon.

The landmark experiment conducted by *Nature* magazine in 2005 that showed how, in a random sample of entries selected from Wikipedia and the *Encyclopaedia Britannica*, the rate of error was so comparable that the difference was negligible has most significantly shown the power of collaborative knowledge production (Giles 2005). Experiments with crisis and disaster mapping across the world, where communities have been able to report news that is otherwise censored or made invisible, have shown that when it comes to new curricula building, user-generated content through social media can offer a scope and scale that is unprecedented in hidebound academia. The emergence of open-source movements has shown that the “wisdom of crowds” is more reliable when it comes to forming complex, iterative, recursive, and self-learning systems of computation and networking. Sociologists point out that the emergence of social media networks and sharing economies has changed the ways in which people think of themselves, but also, most tellingly, how they think about the worlds that they occupy – be they the virtual connections with strangers on Facebook, or the chance encounters in the augmented reality of Pokémon Go, where they intersect with others wandering in search of mythical monsters on the streets. In arts and culture productions, open movements have now created YouTube celebrities who garner more influence and power than certain academic canons. The rise of file-sharing networks driven by peer-to-peer technologies has destabilized the primary capitalist models of knowledge economies and is forcing for an ever-increasing demand for

open repositories of knowledge to be built and be made available for free like other natural and fundamental resources. The rights to universal access and ironically the right to be forgotten are both being championed as a part of the third generation of human rights, dramatically impacting the geopolitics of knowledge consumption, production, and interaction (Davidson and Goldberg 2010).

Even as it is easy to empathize with the Openness advocates who promise that opening up data and information, processes and practices, structures, and systems of life and living will create the worlds that we want to stand for, there are also strong voices that exercise caution when it comes to this unbridled celebration of Openness. The obvious detractors of universal openness and open education have been the older social, political, and economic centers who have been trying to adapt to these rapidly changing landscapes by evolving as well as putting limits on the scope and scale of Openness. Thus, while governments across the world are signatories to various treaties that promote openness, they put a very clear statute of limitations on information that needs to be protected and policed, giving us the exemplary stories of the persecution of Edward Snowden and the continued suspicion of spaces like Wikileaks. Social media have faced a severe backlash from the traditional structures of fundamental beliefs, where the emergence of new bodies with new voices, sprouting hashtags ranging from #BlackLivesMatter to #EverydaySexism, has led to extreme bullying, intimidation, and violence which has now been embodied in predatory practices of slut shaming and the systemic intolerance that was exhibited in #GamerGate. The emergence of alternative currencies and peer-to-peer connectivity has had the older forms of knowledge capital and social worth challenged so that learning is more amorphous and eccentric. Opening up individual data can be exploited by private companies like Google and Amazon that are able to build predictive futures based on minute and often invisible information that is harvested from an individual without their consent. The neoliberal university often finds itself in cohorts with these companies, thus

exposing their students to data capture without consent. Learning spaces where this data is available for public consumption without any restrictions can also lead to the rise of social vigilantes as we have seen in the case of public mobbing in human flesh search engines in Northeast Asia and in bullying and doxing on queer teenagers on physical and virtual campuses.

However, even outside of these obvious resistances, there is another set of voices that warns us that Openness is a privilege rather than a natural state of data reality – Open activists who work with heavily underserved social and political groups have told us stories of people being persecuted, threatened, and identified through open geo-location data that puts the vulnerable populations in conditions of immediate extinction. The recent dismissal of academics in Turkey, following their alleged involvement with the coup against a dictatorial government, or the suspension of students who participated in Occupy Movements from New York to Hong Kong, reminds us that the walled gardens of learning are fiercely being protected by punishing the people who seek to transgress the boundaries. Openness critiques have also pointed out that openness is an affordance that can only be granted to individuals who can be sure that opening their lives through data and information is not going to put them into conditions of danger or threat – a massive infrastructure of law, legislation, intermediary responsibilities, and checks and balances to curb totalitarian takeover of data and information needs to be put into place before we can bask in the glory of open systems and structures (Rajadhyaksha 2011). Unfortunately, more often than not, open data makes unsuspecting learners, with minimum or reduced digital literacy, to be at the mercy of those who can abuse their open data in the absence of clearly spelled protections for the individuals and the communities. Openness, as has been pointed out in the examination of State-sponsored mandatory biometric database citizen systems, or in the instance of private companies exploiting user data through ICT4D initiatives like Internet.org that harvests the next generation of global south users under the guise of providing them with free but limited access to

data connectivity, often forces people into being opened, without agency or consent, often leading to monopolizing the conditions of access and quality of education for those who do not understand what it means to be dwelling in the open (Luchs 2016).

On both the sides of the debates, there are disagreements and obviously different imaginations of the forms, formats, and functions of openness in education. It is fruitful to be not partisanly in these discussions and recognize that while openness is a principle that needs to be promoted, it is also a value that needs to be accompanied by protections for those who are made open. It is necessary to realize that at the heart of these debates is the unquestioned truth that Open is political. In many descriptions and deployment of open education movements, the idea of open is often reduced to mechanics, aesthetics, design, and development of open systems, pretending that Openness is a benign, neutral, or a technological principle. In these cases, the call for Openness is decoupled from the ambitions, intentions, and uses that are mounted on the opening of things and thus might often be counterintuitive to the basic impulse of Openness which is a manifesto – a call for actions oriented toward particular ideologies of better human life and governance. Openness is reduced to a process, an interface, a design principle, a tweak, and a blueprint of prescriptive tokenism that works through the rhetoric of access, presence, and interaction without actually enabling engagement and equity for the end users. The depoliticization of openness, in fact, works as an “Opaque Metaphor” (Chun 2008) where it pretends to have a descriptive relationship with the new futures that it is imagining, while it is a prescriptive process that seeks to stabilize and strengthen the invisible power structures that inform and shape it. It replaces politics with presence, accountability with transparency, action with access, rights with terms of services, and interaction with interface, thus producing a seeming agency of choice at the cost of freedom.

This ironical openness, which performs exactly appositionally to what it purports, is often facilitated by making Openness into a panacea black

box, where Openness appears as a mystical value that hides the actual actors, networks, and affects that operationalize it. This is when Openness, instead of becoming a means toward a particular aim, often becomes a goal unto itself. In many of the technocentric discussions of Open Education, there is a clear focus that the reward of building an open system is to have an open system. Little attention is paid to the potential abuses, pitfalls, dangers, and precariousness that these systems produce for all the stakeholders of learning. When critical questions are asked of these openness calls, the concerns are deflected by changing the site and location of openness.

Thus, a question about open processes in education – referring to exclusion, limited access, conditions of censorship, and unequal geopolitical safety – is addressed by talking about open principles, giving abstract buzzwords like participation, collaboration, engagement, and transformation.

A critique of open principles – drawing from material reality and the flawed operation of these principles that serve to strengthen the privileges of those who are marked by the affordances of digitality – is countered by evidence from material practices and lived realities, offering anecdotal responses to a structural critique.

Investigations on consequences of data on embodied lives – the infinite memory of the web, the additional responsibility of rhetorical debate, and exposing of one’s ideas beyond the scope of the immediate peer group – get transported to thinking about data objects as self-contained and simulation rather than representation, thus making openness a lab space rather than a lived system.

Openness, then, for both sides of the spectrum, remains a wicked problem where the nature, location, and intention of openness in education cannot be pinned down because it has condensed so many different modes and modalities into an inscrutable all-encompassing ethos. Openness, as is discussed in these instances, is the object of inquiry, the site of investigation, the lens of meaning making, and the location from which the question is asked.

One of the ways in which Openness can be examined against the political touchstones that

necessitated these Open Education movements is to triangulate it through three distinct standpoints that reify Openness. This capacity of Openness to be this moving target that changes its form and meaning in the very act of understanding it and engaging with it can be broken by thinking of Openness not as an abstract principle, but as residing in and bearing material and physical consequences on **objects, processes, and people**.

Thus, when faced with the question of Openness, it is important to realize the objects that would demonstrate openness. In the case of universities advocating for OpenCourseWare, for instance, the presence of closed hardware or proprietary software that ties the educational public resources to non-scaling and static infrastructure as we repeatedly see in the “Googlization of the world” (Vaidyanathan 2011), is counterintuitive to the principles of Openness. The objects that would be required to facilitate Open Education – code, protocols, platforms, and software – would have to subscribe to the ethical and technological standards of Openness, thus increasing the scope of OpenCourseWare beyond course content.

Similarly, when thinking of open processes, we could take the case of open access discussions. It is crucial to realize that open processes cannot merely be about end-user engagement with a finished result. The principles of openness would advocate that the openness has to be at the level where the communities that are being served by these processes, be involved at the very conception and inception of these open promises rather than as beta testers for the models that already foreclose the possibilities that might be the needs of the community. An open access process that builds a repository of privileged access for a selected public while promoting intellectual property rights regimes that penalize and punish unauthorized entries – like in the case of Aaron Swartz in his struggles with MIT, JStor, and the US Federal Government – cannot be deemed acceptable (Swartz et al. 2015).

On the third standpoint, it becomes important to realize that Openness is not just about information but about lived reality. Thus, in the case of open data, those who do not have the agency,

capacity, or the discretion to control and monitor how data about them is being used need to be protected. Students from contested geographies, when forced to enrol in the never-forgetting archives of the social web, can be put into condition precariousness and abuse, as gendered, racial, and sexual identification might subject them to regulation and stigma (Worth et al. 2015). Opening up people against their will and without their consent can damage our fundamental faith in the human rights to life and dignity. As we have seen repeatedly in cases of online surveillance, those who question the status quo and dare to resist the forces of neoliberal governments and universities are often identified and punished through massive surveillance systems that build continued profiles of these activists and protestors.

In the construction of these standpoints, what remains crucial for us is to understand that Openness is a powerful force that helps reconfigure several educational movements of life, labor, and language. However, the formulation of “Openness and Education” often leads to a skewed attention on the conditions of being open rather than the implications of Openness on education. Thus, Openness becomes an object of study rather than a toolkit of change making. It posits Openness as separated and discrete from the realm of educational impulses that transcend classrooms and shape our material and lived reality. Open Education, in this framework, becomes the object of technocentric solutionism that seeks to construct conditions of Openness in innovation and experimentation labs and sandboxes, excluding the politics and poetics of learning and reducing the Open in “Open Education” to merely a question of infrastructure and design (Irani et al. 2010). It is an imperative to think about Openness and its materiality to see how it can operationalize the critique and configuration of contemporary education – Openness as a standpoint where the ideas, ideals, and ideologies of the Open are in close syncopation with the logics, logistics, and logos of the educational structures that we occupy. Openness thus becomes intersectional, interdisciplinary, and reconciling the contradictions and the multiplicity of Open movements without

resolving them. Open Education becomes a space where we start to conceptualize Openness on a spectrum, mapping it on to the objects, processes, and people and transforming it into a material reality of learning rather than an administrative strategy of resource management.

Open Universities

Andy Lane
Open University, Milton Keynes, UK

Synonyms

Distance education; Distance teaching universities; E-learning; Online learning; Online universities; Open and distance learning

Introduction

Open universities is a collective term that encompasses higher education institutions that only operate a distance education model (referred to as using a single mode) rather than only, or also using, a traditional campus-based education model (institutions that use both are known as dual mode rather than single mode). They use communication technologies and large-scale operations and aim to offer greater flexibility and/or openness to studying at tertiary level to largely mature adults. Not all open universities carry open in their title and many universities offer distance teaching alongside campus-based teaching. Most students of open universities study part time compared to most campus-based students studying full time. Open universities are also driven by social idealism, economic pragmatism, and technological innovation and have been seen by some as disruptive innovations and necessary for the future of higher education. This is reflected in the fact that the majority are the product of national or regional government policy and planning in the last 50 years as part of the broader drive to widen participation in higher education and doing so by providing an alternative to the existing higher education institutions and their practices.

Origins

Distance education has a long and varied history. It was originally conceived and operated as correspondence teaching using the postal system to deliver teaching materials and convey assignments between students and tutors from the mid-nineteenth century onward. There was then some experimentation in the use of radio and television broadcasts for educational purposes in the early to mid-twentieth century (Peters 2008).

The concept of an “open university” as the second generation of distance education was developed through the establishment of the first university to use open in its title, The Open University (although first conceived of as a University

of the Air – Weinbren 2014). Also known as the British Open University or the United Kingdom Open University (UKOU), it was granted its Royal Charter by the UK Government in 1969 and admitted its first students in 1971. The initiative of a Labor Prime Minister, it arose out of three main, often long-standing, influences and philosophies, many of which have also been central to the establishment of subsequent open universities by regional or national governments.

The first, socioeconomic influence was the expansion of the higher education sector in the UK following the Robbins Report in the early 1960s, which coincided with worldwide moves to firstly widen access to, and secondly widen participation in, higher education as a means of social and economic advancement in a technological age, a trend which continues to this day. This desire to widen access was aimed not only at those already deemed qualified to enter higher education direct from secondary education but also to provide educational opportunities for those who did not have traditional secondary-level qualifications necessary to enter most universities and wanted to study later in life (which can be broadly framed as *lifelong learning*). In this respect the Labor movement was probably influenced by the setting up of Ruskin College Oxford in 1899 which has ever since aimed to provide campus-based university-standard education for working class people to empower them to act more effectively on behalf of working class communities and organizations.

A second influence was the prevailing debates throughout the twentieth century about the nature of (higher) education. This included reflections on previous models of distance education, which included correspondence courses, the establishment of the University of London External program in 1851, and the success of distance education initiatives in Russia in the 1920s and 1930s and UNISA in South Africa in the 1940s. It also included the debates that largely began in the 1960s about open education, open learning, and open schooling (an influence shaped by several different discourses around *open and distance education* over the following decades, much of which has taken place within a growing number of

books and journals devoted to open and distance education).

A final influence was the advent and widespread adoption of new communication technologies throughout the twentieth century, initially broadcast radio and television and latterly personal computing, mobile telephony, and the Internet, which led people to experiment and innovate around pedagogies based on many types of technology. While these technological developments were available to all universities, it has often been open universities that have been at the forefront of their use in higher education because they supported their large-scale industrial teaching model (e.g., the UKOU began using computer-mediated communication in some modules from 1988 and presented its first large-scale online module in 1999 – Weinbren 2014), although that is now changing as all higher education institutions use such technologies in one way or another (this is often described as *technology-enhanced learning*).

Next Steps

Since the establishment of the UKOU, around 70 single mode “open universities,” 55 with open in their title (e.g., Open University of Sudan, Madhya Pradesh Bhoj (Open) University in India) but some without (e.g., Athabasca University in Canada and Anadolu University in Turkey), have been set up in over 50 countries. Most are publicly funded and the product of governmental planning, but a few are private enterprises (e.g., Wawasan Open University in Indonesia). In some countries open universities have been set up as an umbrella organization that works with a number of dual mode universities (e.g., Open Universities in Australia); in one case an open university has been designed to serve the population of several countries (the Arab Open University), while a few universities are dual mode but with distance education being a significant part of their activity (e.g., Thompson Rivers University in Canada and Deakin University in Australia).

Most countries have a single open university (e.g., the UKOU is one of about 130 higher

education institutions in the UK); some large population countries have more than one (e.g., India has a single national open university and also 15 state-based open universities). Lastly, there is one global association (International Council for Open and Distance Education) and several regional associations (e.g., European Association of Distance Teaching Universities, Asian Association of Open Universities, etc.) to which the various open universities or distance teaching universities belong. Thus the organizational form of open universities varies (see Shale 1987, for an early typology) and continues to vary as higher education itself adapts to changes in economies and societies. However all have been hugely influenced by the evolving policies and practices of the UK Open University which set an ideological rationale, a pedagogical template, and an organizational model for the modern single mode distance teaching university.

The ideological rationale was encompassed by the UKOU's first Chancellor, Lord Crowther, who first gave meaning to what openness might mean for the UKOU (and possibly other open universities) when he said it would be "open as to people, places, methods and ideas" in his inaugural speech. This is still reflected in its mission, although how these four "opens" and openness in general are interpreted in practice by the UKOU (and other institutions) has changed and is changing further with the advent and discourse around open educational resources, open educational practices, and massive open online courses (McAndrew et al. 2010).

The pedagogical template was one of course teams of academics and media staff creating multiple media teaching materials (although print materials dominated) that addressed specified learning objectives, with groups of 15–25 students on a course allocated to a local tutor who provided some face-to-face tutorials supplemented by telephone tutorials, regular tutor-marked assignments with extensive feedback on them, and some courses having embedded 1-week residential schools (Peters 2008). The balance of media and modes of communication have since changed as technologies have evolved.

The organizational model was an "industrialized" one shaped by, and helping to shape, the pedagogical template. It aimed to produce teaching materials for courses through teams, use the existing communication infrastructure (postal service and telephony service), and employ tutors to teach groups of students so that in principle any number of students could study the same course presentation (Shale 1987). It also relied on "the organisation of the operating technological system: course creation, production and distribution, student services, management of tutors and counsellors, and quality control" alongside the more traditional university function of organizing research and teaching (Peters 2008).

Lifelong Learning

The overriding purpose of most open universities, often expressed in their aims or missions, is about providing greater educational opportunity for all in the name of personal and national development (Tait 2008). As noted earlier, the vast majority of them have been established by national or regional governments to provide an alternative route into tertiary education to the more numerous public and private campus-based universities. This has meant that they have contributed to the global desire to increase the participation rates in higher education as higher levels of national gross domestic product are correlated with higher levels of participation in higher education. At the same time this demand for wider participation in higher education globally is deemed to be unachievable through the expansion of traditional universities and that open universities should be part of the solution to meet that demand (Daniel et al. 2010).

Open universities have also been seen as principally serving mature students more than secondary school leavers, serving groups in society that have not traditionally attended campus-based universities, and enabling students with tertiary-level qualifications to take another such qualification to change career. Through all this time, open universities have been seen as important players in the policy and practice around the concepts of open learning, lifelong learning, flexible learning,

credit transfer, and the recognition of prior learning. They have also been central to defining openness in higher education as open entry, with just over half of open universities operating no entry requirements to (some of) their courses.

Open and Distance Education

While open universities might see open entry as a key feature of open education, what is meant when people talk about open education and distance education in the scientific and popular literature has varied over the past 50 years. Most recently these debates have been influenced by the emergence of open licensing (e.g., Creative Commons) kick-starting the open educational resources and practices movements and the advent of digital technologies promoting online or e-learning which has achieved global recognition through massive open online courses (MOOCs). In both cases open universities have not necessarily been the first movers in these innovations but have played a significant part as some of the distinctions between traditional universities and open universities have become more blurred, as noted by the many authors in Illyoshi and Kumar (2008). Two developments illustrate how issues of openness and education for all are bringing open universities and traditional universities closer together. The first was the establishment of the Open CourseWare consortium, latterly the Open Education Consortium, as a global body bringing a diverse set of higher education institutions, including some open universities, together and also involving bodies such as UNESCO and thus acting as a counterpoint to the specialist International Council for Open and Distance Education, which has consultative partner status with UNESCO. The second has been the genesis of MOOC platforms (e.g., Coursera, EdX) through which different universities, some dual mode, can run these “distance education” courses (many early MOOCs were designed with little reference to, or acknowledgment of, the long-standing research and experience in distance education and were often based on video lectures). While platforms based in the USA (where open

universities have not particularly taken root) were the front-runners in establishing MOOCs in the public eye, in Europe it has been FutureLearn (wholly owned by the UKOU) that has partnered with a significant number of traditional universities and is gaining more attention, while equally research into and experiences with MOOCs around the world are rediscovering the lessons learned by distance teaching institutions. Interestingly, the current “education for all” impact of extra mural or outreach activities, such as open education resources and MOOCs with their millions of subscribers, is an echo of the ongoing massive public reach of some open universities that (partly or almost wholly) teach through radio and television broadcasts.

Technology-Enhanced Learning

Open universities are reliant on technical media and communication technologies to operate their industrial teaching models. The most common media used for teaching purposes over the years are print, radio, television, audio and video cassettes, computers, correspondence, email, telephone, and fax. These equally rely upon a technological infrastructure provided by postal systems, telecommunication systems, and the Internet, all means by which teaching materials can be delivered or accessed remotely and by which there can be mediated communication (one-way, two-way, multi-way) between faculty and students. The balance and acceptability of these media and technologies have meant that the pedagogical approaches of open universities have changed and continue to change. It has also led to some open universities being named differently to reflect the prevailing technology (e.g., Egyptian E-Learning University), but equally some have gone the other way with the University of the Air Japan becoming the Open University of Japan. The greater accessibility, availability, acceptability, and affordability of technical media and communication technologies are making an ever greater impact on all higher education institutions, not just open universities or dual mode universities. Technology is clearly seen as

having a big role in the future of higher education; it is yet to be seen whether that is as an enhancement to the traditional campus-based model or through more universities becoming de facto, open universities.

Impacts

It is fair to say that open universities have received a disproportionate amount of attention compared to dual mode universities (Kaye and Rumble 1991), but it is equally fair to say that despite the constant and continued increase in their numbers, open universities have received significantly less attention than traditional universities from policy makers, the news media, and the public. Partly it is because they are very new institutions. Partly it is because there are far more campus-based higher education institutions and some countries still do not have an open university as such. Partly it is because much higher education policy focuses primarily on school leavers rather than mature adults and even where open universities are established to offer such opportunities to mature adults, retention and completion rates can be much lower than for campus-based institutions even though enrolment levels can be very much higher (Daniel (1999) coined the term Mega Universities for those with student populations greater than 100,000; most in this category are open universities). And, partly it is because cultural acceptance of distance education varies significantly around the world, both in terms of comparisons with traditional universities and in terms of how teaching and learning are viewed; and throughout there is questioning of the quality of distance education over campus-based education.

The different mode of operation of open universities and a stronger focus on their teaching rather than research missions means that they are not often included in national or international “league tables” or labeled as being different. Comparisons do happen sometimes and in some countries. The UKOU did feature in the 401-500 band in the Times Higher Education 2015-16 ranking of the top 800 universities globally, was generally placed in the top 50 UK universities for

the quality of its research under the Research Excellence Framework in 2014, and has also achieved a rating of 90% or higher every year in the UK-wide Student Satisfaction Survey and is one of only three higher education institutions to have achieved this consistently since it started in 2007. However this has been achieved after 45 years of operation and most open universities have much shorter track records. Although notably the Open Universiteit Nederland was proclaimed as “best university 2015” in the Netherlands, in the Dutch university guide, “Keuzegids Universiteiten” 30 years after it started teaching students. In some cases new open universities have built upon the UKOU’s global reputation to help build their own locally. For example, the Arab Open University has a number of degrees that both heavily draw upon UKOU modules and teaching materials but also has those degrees validated by the UKOU.

Teaching and learning cultures around the world are often dominated by the perception that face-to-face, classroom-based, and teacher-led lessons are better than reading teaching materials. This is often because some cultures venerate their professors and students would never dare to question them and their academic authority and may be wary of materials written by someone else whose academic authority is less well known. This is coupled with a strong behaviorist approach to teaching and learning in universities in many parts of the world, focusing on knowledge and understanding, rather than the constructivist approach to teaching and learning more prevalent in other cultures whereby students are expected to develop critical skills and questioning attitudes toward their subject. Because of these cultural views, some countries have statutory requirements for significant minimum classroom-based teaching times for courses that open universities must also abide by; and even in countries where distance education operates, the students prefer broadcast lectures over text-based teaching materials. However there can also be good reasons to use broadcast media in some countries due to the differences between the spoken and written language, where, for example, the pronunciation of words in Chinese or Japanese cannot easily be

presented in print because of the ideographic characters of their scripts.

Open universities are part of the higher education landscape and are likely to remain so given their origins in governmental policy. They have not displaced traditional campus-based universities but added an alternative model. It remains to be seen if open universities will play a greater role than they currently do, either nationally or internationally, as governments grapple with the growing costs of higher education and the changing expectations of their citizens in general and students in particular. While more and more higher education institutions do run distance education programs, mostly this is at postgraduate level, where there is less need to invest in the mechanisms to scale up these programs to large numbers of students. As well as avoiding the challenge of widening participation at scale, few dual mode institutions also operate open entry to their undergraduate courses as the most prominent open universities do. It is this philosophy of providing educational opportunity for all adults who can afford to register that is likely to remain the defining feature of open universities throughout the twenty-first century.

Open Works, Open Cultures, and Open Learning Systems

Michael A. Peters

University of Waikato, Hamilton, New Zealand

Open Works

The idea of openness as a political, social, and psychological metaphor has been part of a set of enduring narratives in the West since the time before the flourishing of modern democracy, scientific communication, and the rise of the knowledge economy. Principally these narratives have been about the nature of freedom, the primacy of rights to self-expression, the constitution of the public sphere or the commons, and the intimate link between openness and creativity. The core philosophical idea concerns *openness* to experience and interpretation such that a work, language, and system permit multiple meanings and interpretations with an accent on the response, imagination, and activity of the reader, learner, or user. The classic work that philosophically develops this central idea is the *Philosophical Investigations* by Ludwig Wittgenstein (1953) who draws a close relationship between language as a set of open overlapping speech activities or

discourses he calls “language games” and a “form of life” (or culture). Wittgenstein of the *Investigations* demonstrated that there was no such thing as a logical syntax or metalogical language considered as a closed system of rules that acts as a hard and fast grammar for any natural language. The “language games” conception seems to deny the very possibility of a logical calculus for language such that there are no necessary and sufficient conditions (or logical rules) for use of a word. In Wittgenstein’s account of rule-following, we see a view of openness to language and to the text that permits multiple interpretations and the active construction of meanings. This emphasis on the openness of language, of the text, and, indeed, of “openness to the other” as aspect of subjectivity, which rests on the values of multiplicity and pluralism, is in part a reaction by Wittgenstein against the logical empiricist understandings of logico-linguistic rules that allegedly allow for only pure and single meanings unambiguously correlated with words that depict the world.

Wittgenstein’s *Tractatus* addressed the central problems of philosophy concerning the relations between the world, thought, and language. He presents a solution that is grounded in logic and in the nature of representation such that thought or proposition picture or represent the world by virtue of shared logical form. In the *Investigations* Wittgenstein shifts his emphasis from logic to ordinary language which works to appreciate the openness of language and the language-user while disabusing us of the fallaciousness of traditional approaches to the question of language, truth, and meaning. He begins this new philosophy by asserting that the meaning of a word is its *use* in the language, and he demonstrates that there are multiple uses that are part of the activity of language games that comprise a culture or “form of life.” In a famous passage in the *Investigations* (paragraphs 65–69), Wittgenstein argues there is no feature common to all games that constitute the basis for calling them “games”: they are tied together through a set of *family resemblances* that unite them. In philosophical terms this constitutes at one and the same time the openness of both language and culture. Others following him have appealed to Wittgenstein’s concept of

openness to protect the nature of language, thought, and art.

Morris Weitz (1956) in his famous essay “The role of theory in aesthetics,” for instance, appeals to Wittgenstein to claim that art is an *open* concept in that it is possible to extend its meaning in unpredictable and completely novel ways in order to apply the concept to new entities or activities that were not included in the original concept – thus, no necessary and sufficient conditions for something to count as art can be provided. (A closed system in this instance is one for which both necessary and sufficient conditions can be stated.) Following Wittgenstein, he says we should ask not “what is art?” but “how is the concept of ‘art’ used?” Weitz (1956, p. 31) notes also that sub-concepts of art like “novel,” “painting,” “tragedy,” “comedy,” and “opera” are likewise open, suggesting that “A concept is open is its conditions of application are amenable or corrigible, i.e., if a situation or case can be imagined or secured which would call for some sort of decision on our part to cover this, or to close the concept or invent a new one to deal with the new case and its property.” He asks, is Dos Passos’ *U.S.A.*, V. Woolf’s *To the Lighthouse*, or Joyce’s *Finnegans Wake* a novel? These works require an extension of the concept to cover the new case, and thus, the decision turns on our decision to enlarge the conditions for applying the concept. As he puts it:

“Art,” itself, is an open concept. New conditions (cases) have constantly arisen and will undoubtedly constantly arise; new art forms, new movements will emerge, which will demand decisions on the part of those interested, usually professional critics, as to whether the concept will be extended or not. . . the very expansive, adventurous character of art, its ever-changing changes and novel creations, makes it logically impossible to ensure any defining properties. (p. 32)

The multiplicity and radical openness that Wittgenstein finds in language and thought, then, seems to intimate a pluralistic world. This openness seems to apply also to other forms of expression such as music as well as to culture and human nature. The emphasis on radical openness distinguishes the late Wittgenstein as someone who overcomes the postmodern condition and

provides a constructive and positive response to disintegration of culture, language, and the self (see Peters and Marshall 1999). He is also a philosopher who understands the emerging nature of information systems and networks (Blair 2006) and anticipates the Internet as a system platform for language, communication, art, and self-expression (Hrachovec and Pichler 2007). (see in particular the work of Kristof Nyiri who in a variety of papers including “Wittgenstein as a Philosopher of Secondary Orality” (1996), “The Humanities in the Age of Post-Literacy” (1996), and “The Picture Theory of Reason” (2000) examined the problem of machine consciousness, post-literacy, and the new unity of science. See his website with full text papers at <http://www.hunfi.hu/nyiri/>.) Even Wittgenstein’s own compositions were radically open to interpretation encouraged by the “hypertext” nature of his writings (Picher 2002). Others have followed in his footsteps or arrived at the value of multiplicity of meanings and the plurality of interpretation somewhat differently but drawing on similar source and motivations.

Three Forms of Openness

In 1962 Umberto Eco, the Italian novelist and semiotician, published his *Opera aperta* (*The Open Work*). (the book has been googled with Introduction and parts of the first chapter available here: http://books.google.com/books?id=7jroM0M8TuwC&dq=the+open+work&printsec=frontcover&source=bl&ots=s-XHUVdCck&sig=YZjd9kj2R58K_Gbo0HoWsqkW-vcw&hl=en&ei=a_VGSvD4DpGsNuTHgJcB&sa=X&oi=book_result&ct=result&resnum=8.) which while belonging to his pre-semiotic writings nevertheless utilizes the underlying notion of a linguistic system to discuss the development and values of open works where openness stands for multiplicity of meaning, freedom of reader, and the plurality of interpretation. As David Robey makes clear in his Introduction to the Harvard release of the modern classic:

Opera aperta in particular is still a significant work, both on account of its enduring historical usefulness of its concept of “openness”, and because of the

striking way in which it anticipates two of the major themes of contemporary literary theory from the mid-sixties onwards: the insistence on the element of multiplicity, plurality, polysemy in art, and the emphasis on the role of the reader, on literary interpretation and response as an interactive process between reader and text. (p. viii)

In “The Poetics of the Open Work,” Eco begins by noting that a number of contemporary avant-garde pieces of music – Karlheinz Stockhausen’s *Klavierstück XI*, Berio’s *Sequenza I* for solo flute, Henri Pousseur’s *Scambi*, and Pierre Boulez’s third *Piano Sonata* – differ from classical works by leaving considerable autonomy to the performer in the way he or she chooses to play the work. He traces the idea of “openness” in the work of art from its beginnings in Symbolist poetry focused on Mallarmé and the Modernist literature of the early part of the twentieth century exemplified by James Joyce. Citing Henri Pousseur, he defines the “open” work as one that “produces in the interpreter acts of conscious freedom, putting him at the centre of a net of inexhaustible relations among which he inserts his own form” (p. 4). Eco’s openness is a response to the aesthetics of Benedetto Croce who was a product of Italian fascism and strongly emphasized the idea of pure meaning and authorial intent.

Eco distinguishes between three forms of openness in the work of art in terms of interpretation, semantic content, and the “works in movement.” While all works of art are capable of bearing a number of interpretations, the open work is one in which there are no established codes for their interpretation.

For Eco, the openness of Modernist literature (such as Symbolist poetry) is distinguished from medieval openness by the absence of fixed interpretative registers, which he gives, quoting Dante, as the literal, the allegorical, the moral, and the anagogical. In medieval literature, no interpretations may exist beyond these four registers – that is the code by which writings were interpreted. Modernist literature has no such preestablished codes by which it is to be interpreted, and indeed, what marks the Modernist artist out from the pre-Modernist artist is the artist’s awareness of the artwork as inevitably giving a “field of

possibilities” of interpretation. Rather than seeking to limit those possibilities (through an established code of interpretation and so on), the artist actively seeks the openness that is implicit in all artworks. Eco gives as an example of this active seeking of openness of interpretation in the absence of preestablished codes the poetry of Verlaine and Mallarmé and the novels of Kafka, which have been described (especially by Lukács) as “allegorical,” but which yield, says Eco:

no confirmation in an encyclopedia, no matching paradigm in the cosmos, to provide a key to the symbolism. The various existentialist, theological, clinical and psychoanalytical interpretations of Kafka’s cannot exhaust all the possibilities of his works.

The second form of openness Eco describes is on the level of the semantic content. This is a somewhat problematic idea as applied to music, since it is proverbially uncertain what the semantic content – what the “real-world meaning” – of music may be. Nevertheless, Eco uses serial music as an example of this semantic openness, comparing it to the verbal puns of Joyce’s *Finnegans Wake*, by which two, three, or even ten different etymological roots are combined in such a way that a single word can set up a knot of different submeanings, each of which in turn coincides and interrelates with other local allusions, which are themselves “open” to new configurations and probabilities of interpretation.

Serial music is composed using a particular arrangement usually of the 12 possible semitones as the organizing principle and hence often implies several continuations or contexts at once. Henri Pousseur describes the listener to contemporary music (i.e., contemporary with the late 1950s and early 1960s), which disrupts the usual “term-to-term determination” of music, placing himself “in the midst of an inexhaustible network of relationships” and choosing for himself his own “modes of approach, his reference points and his scale.” Leaving aside the difficult problem of whether “logical-sounding continuation” of musical material can be compared with the semantic content of language – in other words, whether music’s meaning lies in the apparent logic of its continuation – we should also recognize that the

difference between the first two forms of openness in the work is one of degree: Kafka and the Symbolists may disrupt our normal sense of narrative form, or of logical continuation, through the use of unorthodox symbolism, or ambiguity, but this is not a difference in kind from the kind of disruption which occurs in Joyce’s use of pun. This recognition will help us to develop a theory of the open work applied to Kurtág’s own musical symbolism.

The third kind of openness Eco perceives is that of the “work in movement” [*opere in movimento*], which he identifies at the start of his book. This is exemplified by Mallarmé’s *Livres*, in which the order of the poems in this unfinished – both serendipitously and intentionally “unfinished” – work is left undetermined, and also by two of the pieces of music he referred to at the start of *The Open Work*. Stockhausen’s *Klavierstück XI* requires the pianist to choose between a number of groupings of notes, to create a sequence of his own devising from among these notes. And in Boulez’s third *Piano Sonata*, the first section of which is made up of ten different passages on unordered sheets of paper, which may be freely reordered, although not all permutations are permitted.

Open Cultures

As many scholars and commentators have suggested since the “change merchants” of the 1970s – Marshall McLuhan, Drucker, and Alvin Toffler – first raised the issue, we are in the middle of a long-term cultural evolutionary shift based on the digitization and the logic of open systems that have the capacity to profoundly change all aspects of our daily lives (work, home, school) and existing systems of culture and economy. A wide range of scholars from different disciplines and new media organizations have speculated on the nature of the shift: Richard Stallman established the free software movement and the GNU project (see the GNU site <http://www.gnu.org/gnu/initial-announcement.html>, a 2006 lecture by Stallman entitled “The Free Software Movement and the Future of Freedom” and Aaron Renn’s

(1998) “Free,” “Open Source,” and Philosophies of Software Ownership (<http://www.urbanophile.com/arenn/hacking/fsvos.html>); Yochai Benkler (2006), a Yale law professor, has commented on the wealth of networks and the way that social production transforms freedom and markets; his colleague, Larry Lessig (2004, 2007), also a law professor, has written convincingly on code, copyright, and the creative commons and launched the free culture movement designed to promote the freedom to distribute and modify creative works through the new social media (see his best-seller *Free Culture* <http://www.free-culture.cc/freeculture.pdf>); Students for Free Culture (see the website here <http://freeculture.org/>), launched in 2004, “is a diverse, non-partisan group of students and young people who are working to get their peers involved in the free culture movement”; Michel Bauwens (2005) has written about the political economy of peer production and established the P-2-P Foundation (see the foundation http://p2pfoundation.net/The_Foundation_for_P2P_Alternatives and the associated blog: <http://blog.p2pfoundation.net/>); Creative Commons (see <http://creativecommons.org/> | Creative Commons) was founded in 2001 by experts in cyberlaw and intellectual property (see Wikipedia: <http://blog.jimmywales.com/>); the world’s largest and open-content encyclopedia was established in 2001 by Jimmy Wales, an American Internet entrepreneur, whose blog is subtitled *Free Knowledge for Free Minds* (see *Free Knowledge for Free Minds*: <http://blog.jimmywales.com/>).

One influential definition suggests:

Social and technological advances make it possible for a growing part of humanity to access, create, modify, publish and distribute various kinds of works - artworks, scientific and educational materials, software, articles - in short: anything that can be represented in digital form. Many communities have formed to exercise those new possibilities and create a wealth of collectively re-usable works.

By *freedom* they mean:

...

- the *freedom to use* the work and enjoy the benefits of using it,
- the *freedom to study* the work and to apply knowledge acquired from it,

- the *freedom to make and redistribute copies*, in whole or in part, of the information or expression,

the *freedom to make changes and improvements*, and to distribute derivative works. (See Definition: <http://freedomdefined.org/Definition>)

This is how the Open Cultures Working Group – an open group of artists, researchers, and cultural activists – describe the situation in their Vienna Document subtitled *Xnational Net Culture and “The Need to Know” of Information Societies*:

Information technologies are setting the global stage for economic and cultural change. More than ever, involvement in shaping the future calls for a wide understanding and reflection on the ecology and politics of information cultures. So called globalization not only signifies a worldwide network of exchange but new forms of hierarchies and fragmentation, producing deep transformations in both physical spaces and immaterial information domains... global communication technologies still hold a significant potential for empowerment, cultural expression and transnational collaboration. To fully realize the potential of life in global information societies we need to acknowledge the plurality of agents in the information landscape and the heterogeneity of collaborative cultural practice. The exploration of alternative futures is linked to a living cultural commons and social practice based on networks of open exchange and communication. (See Vienna Document: <http://world-information.org/wio/readme/992003309/1134396702>)

Every aspect of culture and economy is becoming transformed through the process of digitization that creates new systems of archives, representation, and reproduction technologies that portend Web 3.0 and Web 4.0 where all production, material and immaterial, is digitally designed and coordinated through distributed information systems. As Felix Staler (2004) remarks:

information can be infinitely copied, easily distributed, and endlessly transformed. Contrary to analog culture, other people’s work is not just referenced, but directly incorporated through copying and pasting, remixing, and other standard digital procedures.

Digitization transforms all aspects of cultural production and consumption favoring the networked peer community over the individual

author and blurring the distinction between artists and their audiences. These new digital logics alter the logic of the organization of knowledge, education, and culture spawning new technologies as a condition of the openness of the system. Now the production of texts, sounds, and images is open to new rounds of experimentation and development providing what Staler calls “a new grammar of digital culture” and transforming the processes of creativity which are no longer controlled by traditional knowledge institutions and organizations but rather permitted by enabling platforms and infrastructures that encourage large-scale participation and challenge old hierarchies.

The shift to networked media cultures based on the ethics of participation, sharing, and collaboration, involving a volunteer, peer-to-peer gift economy, has its early beginnings in the right to freedom of speech that depended upon the flow and exchange of ideas essential to political democracy, including the notion of a “free press,” the market, and the academy. Perhaps, even more fundamentally free speech is a significant personal, psychological, and educational good that promotes self-expression and creativity and also the autonomy and development of the self necessary for representation in a linguistic and political sense and the formation of identity. Each of these traditional justifications of free speech and their public communication firmly relate questions of self-governance to questions of democratic government, the search of truth, and personal autonomy. Yet the modern discussion of free speech from Milton’s *Areopagitica* and John Stuart Mill’s *On Liberty* has also drawn attention to *limiting* conditions to emphasize that freedom is not an independent value but in liberal society exists in a tight network of rights and constraints that limit it in various ways (Mill and Van 2002). As Momigliano (2003) comments:

The modern notion of freedom of speech is assumed to include the right of speech in the governing bodies and the right to petition them, the right to relate and publish debates of these bodies, freedom of public meeting, freedom of correspondence, of teaching, of worship, of publishing newspapers and books. Correspondingly, abuse of freedom of

speech includes libel, slander, obscenity, blasphemy, sedition.

Openness has emerged as a global logic based on free and open-source software constituting a generalized response to knowledge capitalism and the attempt of the new mega-information utilities such as Google, Microsoft, and Amazon.com to control knowledge assets through the process of large-scale digitization of information often in the public domain, the deployment of digital rights management regimes (May 2008), and strong government lobbying to enforce intellectual property law in the international context.

Two long-term trends are worth mentioning in this context. First, the Internet and open technologies, defined as open source, open APIs, and open data formats, are in the process of formation developing from the Web as linked computers to the Web as linked pages and linked *things* (the so-called semantic Web) (see Kevin Kelly’s presentation on TED on the Internet on the next 5000 days: http://www.ted.com/talks/kevin_kelly_on_the_next_5_000_days_of_the_web.html). In this respect “open cloud computing” is a recent development that signals the next stage of the Internet.

The key characteristics of the cloud are the ability to scale and provision computing power dynamically in a cost-efficient way and the ability of the consumer (end user, organization, or IT staff) to make the most of that power without having to manage the underlying complexity of the technology. The cloud architecture itself can be private (hosted within an organization’s firewall) or public (hosted on the Internet). These characteristics lead to a set of core value propositions (including scalability on demand, streamlining the data center, improving business processes, and minimizing startup costs) (see The Open Cloud Manifesto, <http://gevaperry.typepad.com/Open%20Cloud%20Manifesto%20v1.0.9.pdf>, and open cloud computing, <http://gevaperry.typepad.com/>).

Second, the Internet is a dynamic changing open ecosystem that progressively changes its nature toward greater computing power, interactivity, inclusiveness, mobility, scale, and peer governance. In this regard and as the overall system develops, it begins to approximate the complexity of the architectures of natural ecosystems. The

more it develops, one might be led to hypothesize, the greater the likelihood of not merely emulating Earth as a global ecosystem but becoming an integrated organic whole. Open cultures become the necessary condition for the systems as a whole, for the design of open progressive technological improvements and their political, epistemic, and ontological foundations.

Intellectual Property and the Global Logic of Openness

The rediscovery of openness in the information society, as Chris May (2006) notes, is the end of a period when intellectual property seemed to be the dominant paradigm for understanding how knowledge and information might fit into the contemporary information society. He usefully charts the ways in which the emerging realm of openness is challenging the global regime of intellectual property and the extension of intellectual property into areas previously unavailable for commodification, including claims over aspects of the “public domain” and “knowledge commons.” The State as the guarantor of intellectual property finds itself writing, articulating, and enforcing intellectual property laws that attempt to mediate interests of capital and different publics that structure the new media ecologies. In this context openness increasingly stands against forms of individualized knowledge property in the global digital economy (May 2008). Indeed, the strong argument is that openness challenges the traditional notion of property and its application to the world of ideas. May suggests that openness can act as a countervailing force to balance the expansion of property rights under informational capitalism in an ongoing dialectical relationship. He writes:

Openness is the contemporary manifestation of an historical tendency within the political economy of intellectual property for resistance to emerge when the privileges and rights claimed by owners inflict onerous and unacceptable costs (and duties) on non-owners.

The shape of culture as a digital artifact, the formation of a deep ecology of human communication, and the emergence of a new social mode of (peer-to-peer) production depend on the outcome

of this ongoing struggle for openness and the assertion of its logics of global dispersal, distribution, and decentralization. This struggle is many-sided and not only takes many different forms against multinational knowledge capitalism and its expansion of claims to intellectual property into new public and cultural domains but also involves struggles against the surveillance panoptical power of the State and the corporation that threatens to create all-encompassing citizen and customer databases that rest on information-sharing, search algorithms, and the compilation of consumer characteristics and behaviors.

Viral Modernity?

A viral modernity challenges and disrupts the openness of a free distribution model as well as distributed knowledge, media, and learning systems. The celebration of hacker culture of the 1980s was based on the heroization of the disruption of computer security and the main activists and enthusiasts such as Steve Jobs, Steve Wozniak, and Richard Stallman focused on cracking software leading to the development of the free software movement. As Tony Sampson (2004) indicates the virus flourishes because of the computer’s capacity for information sharing and the computer is unable to distinguish between a virus and a program. The alterability of information allows the virus to modify and change information, providing conditions for self-replicability. In these circumstances

viral technologies can hold info-space hostage to the uncertain undercurrents of information itself. As such, despite mercantile efforts to capture the spirit of *openness*, the info-space finds itself frequently in a state far-from-equilibrium. It is open to often-unmanageable viral fluctuations, which produce levels of spontaneity, uncertainty and emergent order. So while corporations look to capture the perpetual, flexible and friction-free income streams from centralised information flows, viral code acts as an anarchic, acentred Deleuzian rhizome. It thrives on the openness of info-space, producing a paradoxical counterpoint to a corporatised information society and its attempt to steer the info-machine.

This situation leads Fred Cohen to advocate the benevolent virus and friendly contagion as a foundation of the viral ecosystem instead of the

corporate response to securitize and privatize all open systems through sophisticated encryption.

Digital Selves, Open Selves

The numerical representation of identity that is involved as an aspect of new digital media in forms of reading and writing the self through these media has a sinister downside through the application of new information technologies to security and identity issues with the linking of government and corporate databases. Biometrics is responsible for the shift from identity politics to I.D. policies considered in relation to the question of security, verification, and authentication. The Identity Cards Bill introduced in the British Parliament in the 2004–2005 session provided for the Secretary of State to establish and maintain a national register to record “registrable facts” about individuals (over 16 years) in the UK in the *public interest*, which is defined in terms of national security, prevention or detection of crime, enforcement of immigration controls, prevention of unauthorized employment, and for securing the efficient and effective provision of public services. “Registrable facts” pertain to “identity” (name, previous names, date of birth – and death, gender, physical identifying characteristics but *not* ethnicity), residence and history of residence, “numbers allocated to him for identification purposes and about the documents to which they relate” (passports, driver’s license, work permits, etc.), information from the register provided to any persons, and information recorded by individual request. I.D. cards will store 49 different types of information (for the full list, see the BBC website: http://news.bbc.co.uk/1/hi/uk_politics/4630045.stm). In terms of the Bill, each individual is required to allow fingerprints other than biometric information, signature, and photograph, to be taken with penalties for not complying. This information is recorded on a renewable I.D. card for which the individual is responsible. Information on individuals may be provided for purposes of verification on consent. Public services may be conditional on identity checks, although it will be unlawful to require an individual to produce an I.D. card except for specified purposes, e.g., of public authorities and uses connected to crime

prevention and detection, including antiterrorism. In certain cases information may be used without the individual’s consent. National Identity Scheme Commissioner will be responsible for ruining the scheme and making annual reports. Various offenses are stated in relation to giving false information, unauthorized disclosure of information, tampering with the register, false use, etc.

The House of Lords Select Committee Report (see Report: <http://www.publications.parliament.uk/pa/ld200405/ldselect/ldconst/82/82.pdf>) published on 17 March 2005 had a brief to consider the constitutional implications of the Identity Cards Bill and concluded that “it adjusts the fundamental relationship between the individual and the State.” It is worth quoting the report on the significance of what the Bill proposes:

Our own concerns are not founded on the [EU] Convention [of Human Rights], but rather on the fact that the Bill seeks to create an extensive scheme for enabling more information about the lives and characteristics of the entire adult population to be recorded in a single database than has ever been considered necessary or attempted previously in the United Kingdom, or indeed in other western countries. Such a scheme may have the benefits that are claimed for it, but the existence of this extensive new database in the hands of the State makes abuse of privacy possible.

The Report expressed the primary concern to ensure an adequate legal and constitutional infrastructure for the maintenance of a National Identity Register, with appropriate separation and limitation of powers. In particular, while recognizing the Bill as enabling legislation, the report expressed concern about the concentration of power and responsibility for the national register in the hands of the Secretary of State, calling for an independent registrar with a duty to report directly to Parliament.

The Identity Cards Bill was passed by MPs by a small majority in late June 2005, after the failure of the first bill which is known as the Identity Cards Act 2006. While it is aimed at preventing illegal immigration and working, as part of anti-terrorist measures and to prevent identity and benefit fraud, there are critical issues around altering the relationship between the individual and the

State including the loss of privacy, the potential for harassment of ethnic minorities, and its “function creep,” not to mention fears of the surveillance society. In the United States, the Defense, Homeland Security, Interior, and Veterans Affairs departments and NASA have implemented smart-card programs that includes setting up identity proofing, registration, and issuance processes. The Real I.D. Act was introduced in 2005 to protect against terrorist entry and improve security for drivers’ licenses and personal identification cards. (see http://www.epic.org/privacy/id_cards/real_id_act.pdf.)

These concerns are not at all removed from the politics of space and new science of networks or, indeed, from education as I.D. cards are now mandatory in many US schools that have set up their own security systems. Pitted against the postmodern view that considers identity to be both dynamic and multiple, a discursive construction reflecting an ongoing and open-ended process of forming multiple identifications in the face of globalization and media cultures is the *mathematization of identity* for State, educational, and business purposes – the nexus where biometrics meets smart-card technology and the ultimate basis for applications in telecommunications (GSM mobile phones, DirecTV), financial services (electronic purses, bank cards, online payment systems), transportation, travel and healthcare (insurance cards) industries, computer/Internet user authentication and non-repudiation, retailer loyalty programs, physical access, resort cards, mass transit, electronic toll, product tracking, and also national ID, drivers license, and passports.

The other side of the State and corporate digital reproduction of identity is a tendency that emphasizes the relation between openness and creativity as part of a networked group. The “open self” is self-organizing and is formed at the interstices of a series of membership of online communities that shaped spontaneous self-concept and self-image. Openness to experience is one of the five major traits that has shaped personality theory since its early development by L.L. Thurstone in the 1930s and is strongly correlated with both creativity and

divergent thinking (McCrae 1987). Sometimes referred to as the “big five” personality traits, “the five-factor model” trait theory emerged as a descriptive, data-driven model of personality based on openness, conscientiousness, extraversion, agreeableness, and neuroticism. Openness is associated with creativity and the appreciation of art, emotionality, curiosity, self-expression, and originality. Meta-analysis reviewing research that examines the relationships between each of the five-factor model personality dimensions and each of the 10 personality disorder diagnostic categories of the Diagnostic and Statistical Manual of Mental Disorders 4th edn (DSM-IV) reveals strongly positive (with neuroticism) and negative associations (with the other factors) (Saulsman and Page 2004). One of the limitations of personality theory is its focus on the individual and in the age of networks this centeredness might seem somewhat misplaced. There are close links between open content, open science, and open collaboration that make collaborative creativity sustainable. Openness to experience is probably the single most significant variable in explaining creativity, and there is some evidence for the relationship between brain chemistry and creative cognition as measured with divergent thinking (Jung et al 2009). Openness also can be defined in terms of the number, frequency, and quality of links within a network. Indeed, the mutual reinforcement of openness and creativity gels with Daniel Pink’s (2005) contention that right-brainers will rule the future. According to Pink, we are in the transition from an “Information Age” that valued knowledge workers to a “Conceptual Age” that values creativity and right-brain-directed aptitudes such as design, story, symphony, empathy, play, and meaning.

Open Learning Systems

If the e-book has failed at least up until the introduction of the new e-book readers such as Amazon’s Kindle DX (2009) and Sony’s Reader, then it was because e-books in the main became simple

digitized versions of books. The new generation of e-book readers sought to overcome these problems and to focus on advantages of hypertext, mobility and mobile data connection, adjustable font size, highlighting and annotation, text-to-speech facility, and readability based on electronic ink. Amazon's Kindle DX released June 10 features a 9.7 in. display, improved pixel resolution, built-in stereo speakers, 4 GB storage capacity, holding approximately 3500 non-illustrated e-books, extended battery, and support for PDF files (see here: <http://www.amazon.com/gp/product/B0015TCML0>). Amazon announced partnerships with three major textbook publishers representing 60% of the market, and Amazon will test the Kindle DX with five universities this year. Kindle titles now represent 35% of books' sales within Amazon. The company now offers 275,000 books in Kindle format and received a huge sales demand when it launched Kindle 2 earlier this year (see the live launch). Amazon's Kindle DX is one of a range of e-readers available including i-Rex's iLiad, Sony's Librie and Song Reader, mobile java devices such as Wattpad, Bookeen's Cybook Gen3, Polymer Vision's Radius foldable eBook, COOL-ER by Coolreader, eSlick by Foxit Software, Ganaxa GeR2, and Jinke's Hanlin V3 eReader (see the full list: http://en.wikipedia.org/wiki/List_of_e-book_readers). Plastic Logic, a spin-off company from Cambridge University's Cavendish Laboratory, is a flexible A-4-size and robust plastic electronic display with a thickness of a credit card that is the core element of a soon to be released eBook reader.

The e-book reader has come a long way since Michael Hart launched Gutenberg Project in 1971 and the first digital books were offered in 1993. The e-book has arrived, yet it still suffers disadvantages: the e-book still requires an electronic device and electric power; it is more fragile than the paperback and more prone to damage, loss, and theft; there is arguably a loss of book aesthetics; the full range of printable material is not available; and due to digital rights management and protection, e-readers are not easily shared.

One of the fundamental issues concerns digital rights and various technical attempts to prevent users from sharing or transferring ownership. Often e-book purchase agreements prevent copying, restrict usage and printing, and limit the right to distribution, thus privatizing information or knowledge.

The first expanded books began with The Voyager Company in 1991. Founded in 1985 Voyager developed interactive laserdiscs pioneering home video collections of classic films. In the early 1990s Voyager sponsored a conference on digital books that attracted multimedia and hypertext experts who helped to shape the first expanded books adding a search method and the capacity to change font size as well as other navigation features (drop-down menus) and margins for annotations and marginalia. The first three expanded books were released in 1992: *The Hitchhiker's Guide to the Galaxy*, *The Complete Annotated Alice*, and *Jurassic Park*. In 1992 Voyager came out with the The Expanded Books Toolkit, which allowed authors to create their own Expanded Books. (see the entry on expanded books in Wikipedia: http://en.wikipedia.org/wiki/Expanded_Books.)

Other experiments have taken place after Voyager was sold. Perhaps the most long lived is Sophie, a project of the Institute for the Future of the Book.

In 1996 a group of Voyager employees formed Night Kitchen with the intent of creating an authoring/reading environment that would extend the Expanded Books Toolkit concept to include rich media. The result TK3 never officially came to market, but teachers in high schools and colleges used it in their classrooms and with their students created some remarkable projects. The Mellon Foundation approached some of the TK3 team and asked them to build a new multimedia authoring program which would be open source and would extend TK3 by enabling time-based events (e.g., a timed, narrated slide show or embedding links at specific points in video clips). That became Sophie (for demonstrations of Sophie, see here and for a useful history of multimedia, see "When Multimedia was Black and White").

Bob Stein, the cofounder of Voyager, is the founder and a director of The Institute for the Future of the Book which has carried through the experiment of the expanded book with Sophie. The Institute's mission is stated as: "The printed page is giving way to the networked screen. The Institute for the Future of the Book seeks to chronicle this shift, and impact its development in a positive direction." It goes on to make the following claims:

The Book

For the past five hundred years, humans have used print – the book and its various page-based cousins – to move ideas across time and space. Radio, cinema and television emerged in the last century and now, with the advent of computers, we are combining media to forge new forms of expression. For now, we use the word "book" broadly, even metaphorically, to talk about what has come before – and what might come next.

The Work and the Network

One major consequence of the shift to digital is the addition of graphical, audio, and video elements to the written word. More profound, however, is the book's reinvention in a networked environment. Unlike the printed book, the networked book is not bound by time or space. It is an evolving entity within an ecology of readers, authors and texts. Unlike the printed book, the networked book is never finished: it is always a work in progress.

As such, the Institute is deeply concerned with the surrounding forces that will shape the network environment and the conditions of culture: network neutrality, copyright and privacy. We believe that a free, neutral network, a progressive intellectual property system, and robust safeguards for privacy are essential conditions for an enlightened digital age.

Tools

For discourse to thrive in the digital age, tools are needed that allow ordinary, non-technical people to assemble complex, elegant and durable electronic documents without having to master overly complicated applications or seek the help of programmers. The Institute is dedicated to building such tools. We also conduct experiments with existing tools and technologies, exploring their potential and testing their limits.

Humanism & Technology

Although we are excited about the potential of digital technologies and the internet to amplify human potential, we believe it is crucial to consider their social and political consequences, both today and in the long term.

New Practices

Academic institutes arose in the age of print, which informed the structure and rhythm of their work. The Institute for the Future of the Book was born in the digital era, and so we seek to conduct our work in ways appropriate to the emerging modes of communication and rhythms of the networked world. Freed from the traditional print publishing cycles and hierarchies of authority, the Institute values theory and practice equally, conducting its activities as much as possible in the open and in real time.

"Openness" and "Open Education" in the Global Digital Economy: An Emerging Paradigm of Social Production

Michael A. Peters

University of Waikato, Hamilton, New Zealand

Introduction

On February 14, 2008, Harvard University's Faculty of Arts and Sciences adopted a policy that requires faculty members to allow the university to make their scholarly articles available free online. The new policy makes Harvard the first university in the USA to mandate open access to its faculty members' research publications (see Peter Suber's blog) and marks the beginning of a new era that will encourage other US universities to do the same. Open access, to use Suber's definition, means "putting peer-reviewed scientific and scholarly literature on the internet, making it available free of charge and free of most copyright and licensing restrictions, and removing the barriers to serious research." As Lila Guterman reports in *The Chronicle of Higher Education News Blog* "Stuart M. Shieber, a professor of computer science at Harvard who proposed the new policy, said after the vote in a news release that the decision 'should be a very powerful message to the academic community that we want and should have more control over how our work is used and disseminated (see <http://chronicle.com/news/article/3943/harvard-faculty-adopts-open-access-requirement>).'" Open access has transformed the world of scholarship, and since the early 2000s with major OA statements starting with Budapest in 2002, movement has picked up momentum and developed a clear political ethos. Harvard's adoption of the new policy follows hard on the heels of open access mandates passed within months of each

Openness

► Open Education, An Overview of

Paper presented at Economic and Social Research Council (ERSC, UK) Seminar Series on "Education and the Knowledge Economy," University of Bath, March 6–7th, 2008.

other – the National Institutes of Health (NIH) and the European Research Council (ERC). As one blogger remarked: “open archiving of peer-reviewed journal literature [is] now on an irreversible course of expansion” (see the comment by Ray English on the same site) not only as US universities follow Harvard’s lead but also as open archiving makes available learning material to anyone including students and faculty from developing and transition countries. Harvard’s adoption of the open archiving mandate is similar in scope to the step taken by MIT to adopt OpenCourseWare (OCW) in 2001. These initiatives are part of *emerging knowledge ecologies* that will determine the future of scholarly publishing challenging commercial publishing business models and raising broader and deeper questions about content development processes as well as questions of resourcing and sustainability.

The Ithaka Report, *University Publishing in a Digital Age* (2007), indicates that there have been huge changes in creation, production, and consumption of scholarly resources with the “creation of new formats made possible by digital technologies, ultimately allowing scholars to work in deeply integrated electronic research and publishing environments that will enable real-time dissemination, collaboration, dynamically-updated content, and usage of new media” (p. 4). As the report goes on to mention alongside these changes in content creation and publication, “alternative distribution models (institutional repositories, pre-print servers, open access journals) have also arisen with the aim to broaden access, reduce costs, and enable open sharing of content” (p. 4). (The Association of College and Research Libraries (ACRL) recently released their research agenda for scholarly publishing around eight themes: the impact and implications of cyberinfrastructure, changing organizational models, how scholars work, authorship and scholarly publishing, value and value metrics of scholarly communications, adoptions of successful innovations, preservation of critical material, and public policy and legal matters. See here.)

We can consider open publishing, open access, and archiving as parts of the wider movement

called *open education* that builds on the nested and evolving convergences of open source, open access, and open science and also emblematic of a set of still wider political and economic changes that ushers in “social production” as an aspect of the global digital economy, an economy that is both fragile and volatile as the current world credit and banking crisis demonstrates so well.

Consider the recent writer’s strike in Hollywood held by the Writers Guild of America (WGA) which voted to settle its 100-day strike against the Alliance of Motion Picture and Television Producers (AMPTP) on the basis of a 3-year contract that gives the WGA jurisdiction over projects created specifically for the Web, provides payment for “ad-supported streaming” over the Internet, increases payment for residuals on downloaded movies and television shows, and includes a two percentage of the distributor’s Web stream revenue. As Michael Wolff, media commentator and contributing editor for *Vanity Fair*, puts it:

The epochal point is that Hollywood, which has been the center of the culture, the coolest place, the ruler of the Zeitgeist, is out of it. It’s on the industrial sidelines. It’s just a bunch of crabby managers and a sullen workforce in a dysfunctional relationship in a declining industry, quarreling over an ever smaller piece of the pie.

Why? Because the value of the story keeps going down and the era and cult of the Hollywood writer is over.

Cheap production technology, no-barrier-to-entry distribution, and a Niagara of “product” (65,000 new videos are uploaded on YouTube daily) mean the entire Hollywood story-development complex is now in a daily competition with do-it-yourself writers. Hollywood product itself is remade, reduced to clips, bites, fractals, and mixes. Sitting through an entire feature film more and more feels like an unreasonable commitment. (We use DVRs to fast-forward, to pause, to hold for some other time-anything not to have to watch something from beginning to end.) The narrative is disposable. Video games, whose 2007 receipts of \$8.7 billion rival Hollywood’s \$9.7 billion box-office take, are anarchically unplotted. And while Hollywood is getting larger and larger fees from licensing its characters (born of those tortured three acts) for video games, the more video games become the

entertainment model, the less patience my son and his friends will invariably have for conventional story lines. Not only is reality TV a network solution for lowering costs, but it works too because it busts scripted, plotted formulas. Movies as displays of visual virtuosity more and more become pure technology plays. The *Zeitgeist* is expressed through engineering (most of which is not created in Hollywood), not through the story. If you don't have story, that great collaboration of writers, re-writers, directors, producers, agents, executives, publicists, managers, stars, and the retinues-however painful and abusive and exploitive that process might be-do you have Hollywood?

The present decade can be called the "open" decade (open source, open systems, open standards, open archives, open everything) just as the 1990s were called the "electronic" decade (e-text, e-learning, e-commerce, e-governance) (Materu 2004). And yet it is more than just a "decade" that follows the electronic innovations of the 1990s; it is a change of philosophy and ethos, a set of interrelated and complex changes that transforms markets and the mode of production, ushering in a new collection of values based on openness, the ethic of participation, and peer-to-peer collaboration. In a fundamental sense it also represents the continuation of a meta-story, albeit in a new register, of freedom. In the postscript to *Building Knowledge Cultures: Education and Development in the Age of Knowledge Capitalism* (Peters and Besley 2006), we made the argument that

there has been a shift from an underlying metaphysics of production—a "productionist" metaphysics—to a metaphysics of consumption and we must now come to understand the new logics and different patterns of cultural consumption in the areas of new media where symbolic analysis becomes a habitual and daily activity. Here the interlocking sets of enhanced mobility of capital, services, and ideas, and the new logics of consumption become all important. These new communicational practices and cross-border flows cannot be effectively policed. More provocatively we might argue, the global informational commons is an emerging infrastructure for the emergence of a civil society still yet unborn.

We also emphasized the link of this new logic of consumption to a classical concept of freedom:

Information is the vital element in a "new" politics and economy that links space, knowledge and

capital in networked practices. Freedom is an essential ingredient in this equation if these network practices develop or transform themselves into knowledge cultures. The specific politics and eco-cybernetic rationalities that accompany an informational global capitalism comprised of new multinational edutainment agglomerations are clearly capable of colonizing the emergent ecology of info-social networks and preventing the development of knowledge cultures based on non-proprietary modes of knowledge production and exchange.

Since publishing that book I have been involved in a number of courses, journal issues, and publications that explore the dimensions of "open knowledge production systems," a term I first used in 2007 in an introduction to a symposium in *Policy Futures in Education* to discuss John Willinsky's (2006) excellent book *The Access Principle: The Case for Open Access to Research and Scholarship* (see (2007) Review symposium. *Policy Futures in Education*, 5(3), 401–423. <http://dx.doi.org/10.2304/pfie.2007.5.3.401>). As editor of *Policy Futures*, I have also published Cushla Kapitzke's special issue on the ethics of copyright and patents with Willinsky and Richard Stallman, director of the Free Software Foundation, as contributors among others. This issue was later published in revised form as *Global Knowledge Cultures* (Kapitzke and Peters 2007) together with an essay I wrote. This year the journal has published a special issue on "Digital Libraries" with Ruth Rikowski and Isaac Hunter Dunlap as guest editors (Vol. 6 No. 1); a symposium on Yochai Benkler's (2006) *The Wealth of Nations: How Social Production Transforms Markets and Freedom* with contributions from Philippe Aigrain, Leslie Chan, Jean-Claude Guédon, and John Willinsky and with a response by Yochai Benkler (Vol. 6, No. 2); and, forthcoming, an issue called "Commercialisation, Internationalisation and the Internet" by Chris Armbruster (Vol. 6, No. 4). I followed up *Building Knowledge Cultures* with a book entitled *Knowledge Economy, Development and the Future of the University* (Peters 2007a) that reflects on the role of the modern university in a global networked economy and a variety of published papers including "Opening the Book" (Peters 2007b), a keynote address at the Spanish Research Council's

sponsored Conference on the Book held in Madrid in late 2007 where I discuss one aspect of messianic line of thinking about e-texts that I have called simply "openness" going back to Walter Benjamin and entertain the concept of "open knowledge production systems" that in my view will not mean the "end of the book" but its radical subsumption in a new electronic textual system involving a set of changes in all aspects of the "culture of the book" including all phases of its creation, production, and consumption as well as its practices and institutions of reading and writing. (*Ubiquity* magazine has received permission to publish an excerpt (Introduction and Chapter 11). The excerpt is available at http://www.acm.org/ubiquity/views/v8i18_peter.html. *Ubiquity* associate editor A. Triptahi writes of it:

Prophetically, almost 30 years ago Jean-François Lyotard forecast the end of the modern research university based on Enlightenment principles. He envisaged the emergence of technical institutes in the service of the information-rich global multinationals. This book reflects on the post-war Western university and its discourses charting the crisis of the concept of the modern university. First, it examines the university within a global networked economy; second, it adopts poststructuralist perspectives in epistemology, politics and ethics to appraise the role of the contemporary university; third, it introduces the notion of 'development' in a critical fashion as a way of explaining its potentially new regional and international learning roles; fourth, it analyzes the rise of global science and the disciplines in the context of the global economy; and, finally, it raises Lyotard's "logic of performativity" and the assessment of research quality within a neoliberal economy, linking it firmly to the question of freedom and the republic of science.

In terms of courses and teaching, I have held a number of Advanced Seminars, as they call them, since starting at the University of Illinois at Urbana-Champaign, including: "Knowledge Futures in Higher Education: Knowledge, Freedom and Development" which included a linkup to World Universities Network's (WUN) *Horizons Virtual Seminar Series: Global Knowledge Futures* (2005) (see <http://www.wun.ac.uk/cks/teaching/horizons/horizons.html> for the six presentations in the series); "Education and Development in Higher Education" (with Fazal Rizvi) (2006); "Knowledge Systems, Scientific

Communication, and Academic Publishing in Higher Education" (with Bill Cope) (2007); as well as a number of online-only classes at the masters level using Moodle and Elluminate, including "School-based project in Internationalization" (2007), "Open Source, Open Access, Open Education" (2008), and "Global Citizenship Education" (2009). I mention these classes because for me as for most academic there is a very strong link between teaching and research and working with graduate students, I use these class sessions to theorize much of the work that later appeared in published work. The experience and practice of e-learning, online teaching, and e-publishing work is a necessary part of the ability to theorize. (This course, perhaps closest to the concerns of this paper, theorizes the emergent paradigm of open education (OE):

first, by setting the scene briefly outlining the challenges of higher education represented by globalization, the knowledge economy and the development of e-learning; second, by reviewing and concept and contemporary forms of 'openness', including open source, open access and the 'open society'; third, by providing a grounding in the state of the field of open education, including related topics like copyright, licensing and sustainability; and, fourth, by encouraging innovation concerning current practices and possible alternative practices in open education. (Course description).

This paper builds on those experiences, embodies a variant of the same story, and continues the same line of argument by theorizing the emergent paradigm of open education (OE). A term that was used in the phrase "open educational resources" first came into use at a conference hosted by UNESCO in 2002, defined as "the open provision of educational resources, enabled by information and communication technologies, for consultation, use and adaptation by a community of users for noncommercial purposes." As the OECD report (2007, pp. 30–31) comments:

The definition of OER now most often used is: "open educational resources are digitised materials offered freely and openly for educators, students and self-learners to use and reuse for teaching, learning and research." To clarify further, OER is said to include:

- Learning content: Full courses, courseware, content modules, learning objects, collections and journals.

- Tools: Software to support the development, use, reuse and delivery of learning content, including searching and organisation of content, content and learning management systems, content development tools, and online learning communities.
- Implementation resources: Intellectual property licences to promote open publishing of materials, design principles of best practice and localise content.

(OECD 2007, pp 30–31).

This paper first plots the dimensions of the emerging paradigm of open education by reviewing four major reports that have been released during the last year or two; second, it provides a very brief history of "openness" in education linking it to a successive series of utopian historical moments based on a set of similar ideas stemming from core enlightenment concepts of freedom, equality, democracy, and creativity; third, it relates the concept of "openness" to a set of three political theorists – Bergson, Popper, and Soros – who have theorized the "open society" as a defense and celebration of liberal democratic societies; fourth, and in related fashion, the paper backgrounds and develops the notion of "social production" as developed by the Harvard law professor and liberal theorist Yochai Benkler; and finally, I make some glancing observation and conclusions.

The Emerging Open Education Paradigm

What is now called simply "open education" has emerged strongly as a new paradigm of social production in the global knowledge economy. In the last year or so, four major reports have documented existing developments and new tools and technologies, heralded the utopian promise of "openness" in global education extolling its virtues of shared commons-based peer production, and analyzed the ways in which it contributes to skill formation, innovation, and economic development.

The powerful Washington-based Committee for Economic Development (see the website <http://www.ced.org>) released its report *Open Standards, Open Source, and Open Innovation:*

Harnessing the Benefits of Openness (see http://www.ced.org/docs/report/report_econ_openstandards.pdf) in April 2006 examining the phenomenon of "openness" in the context of today's digital economy highlighting the key attributes of accessibility, responsiveness, and creativity and commenting on the relevance of three areas of open standards, open-source software, and open innovation. The report by The Digital Connections Council of the Committee for Economic Development built on three earlier reports dating from 2001: *The Digital Economy and Economic Growth* (2001), *Digital Economy: Promoting Competition, Innovation, and Opportunity* (2001), and *Promoting Innovation and Economic Growth: The Special Problem of Digital Intellectual Property* (2004). (Digital versions are available on their website at <http://www.ced.org/projects/ecom.shtml>.) These reports emphasized intellectual property issues involved with file-sharing and peer-to-peer networks and the way that "heavy-handed enforcement of intellectual property rules and reliance on business practices designed for the trade of physical goods can stifle the collaboration and innovation that is vital to the growth of the digital economy." What is perhaps of greatest interest in the present context is the emphasis in the new report on what they call "open innovation" – new collaborative models of open innovation, originating outside the firm, that results in an "architecture of participation" (Tim O'Reilly) – and to a lesser extent their definition of "openness." This is what the report says about "open innovation":

Open innovation can be seen in the growing use of digital software tools tied to computer-controlled fabrication devices that allow users to design an object and then produce it physically. As the costs of these digital design tools decrease, users are able to innovate, breaking the model of manufacturers being the source of innovation and customers simply consuming them. The openness model, the antithesis of a "not invented here" attitude, encompasses not only manufacturers and users, but suppliers whose innovations should be welcomed by the companies they supply (Executive Summary).

The report goes on to mention "the extraordinary increase in 'peer production' of digital information products" which are produced by

individuals without any expectation of monetary gain and commenting that "sophisticated commercial firms are harvesting the benefits of openness." In this same context they mention the movement of "open science" promoted by the National Institutes of Health (NIH) and the model of OpenCourseWare on which they comment:

Advocates for more openness contend that openness will result in greater innovation than would be achieved by restricting access to information or allowing first creators to exert greater control over it. Such a belief in the value of tapping the collective wisdom is profoundly democratic.

What is remarkable about this set of statements is the link between firm innovation, what we might call open education, and the emergence of the paradigm of social production (more about this concept later).

In 2007 three substantial reports were released that reviewed open education as a movement and assessed its benefits: The OECD's (2007) *Giving Knowledge for Free: The Emergence Of Open Educational Resources* (available electronically at http://www.oecd.org/document/41/0,3343,en_2649_201185_38659497_1_1_1_1,00.html); Open eLearning Content Observatory Services (OLCOS) project and report entitled *Open Educational Practices and Resources* (available at http://www.olcos.org/cms/upload/docs/olcos_road_map.pdf); and *A Review of the Open Educational Resources (OER) Movement: Achievements, Challenges, and New Opportunities* (Eds. Atkins et al. 2007), a report to The William and Flora Hewlett Foundation (available at http://www.oerders.org/wp-content/uploads/2007/03/a-review-of-the-open-educational-resources-oer-movement_final.pdf). These three reports share similar emphases each focusing on "openness" and the promise of the new technologies and their educational benefits. The OECD report focuses on four questions:

- How can sustainable cost/benefit models for OER initiatives be developed?
- What are the intellectual property rights issues linked to OER initiatives?

- What are the incentives and barriers for universities and faculty staff to deliver their materials to OER initiatives?
- How can access and usefulness for the users of OER initiatives be improved? (pp. 3–4, Foreword)

The Executive Summary gives us a flavor of the potential of OE (I prefer the term OE to OER because it embraces the notion of practices as well as the notion of sharing educational resources and also because it gels with open source, open access, and open science (as well as open innovation)) and the utopian educational promise that graces these three reports:

An apparently extraordinary trend is emerging. Although learning resources are often considered as key intellectual property in a competitive higher education world, more and more institutions and individuals are sharing digital learning resources over the Internet openly and without cost, as open educational resources (OER) (p. 9).

The report then concerns itself with the following questions: What are open educational resources? Who is using and producing OER and how much? Why are people sharing for free? What are the provisions for copyright and open licenses? How can OER projects be sustained in the long run alongside a set of policy implications and recommendations?

The OLCOS report, by comparison, focuses on: policies, institutional frameworks, and business models; open access and open content repositories; and laboratories of open educational practices and resources, warning against instituting open education within the dominant model:

OER are understood to be an important element of policies that want to leverage education and lifelong learning for the knowledge economy and society. However, OLCOS emphasizes that it is crucial to also promote innovation and change in educational practices. In particular, OLCOS warns that delivering OER to the still dominant model of teacher centred knowledge transfer will have little effect on equipping teachers, students and workers with the competences, knowledge and skills to participate successfully in the knowledge economy and society. This report emphasises the need to foster open practices of teaching and learning that are

informed by a competency-based educational framework. However, it is understood that a shift towards such practices will only happen in the longer term in a step-by-step process. Bringing about this shift will require targeted and sustained efforts by educational leaders at all levels (p. 12).

In chapter "Competences for the Knowledge Society," the report opines "priority must be given to open educational practices that involve students in active, constructive engagement with content, tools and services in the learning process, and promote learners' self-management, creativity and working in teams" (p. 37) and "introduces the idea of value chains of open educational content which emerge when teachers and students re-use available content and make enriched and/or additional material (e.g., use cases, experiences, lessons learned, etc.) available again to a larger community of practice" (p. 37). The report defines a competency-focused, collaborative paradigm of learning and knowledge acquisition where "priority is given to learning communities and development of knowledge and skills required for tackling and solving problems instead of subject-centred knowledge transfer." For the purposes of this paper and the audience, I quote further from the report:

We believe that, to acquire the competences and skills for personal and professional achievement in the knowledge-based society, the learner's autonomy, personal mastery and self-direction must be acknowledged and innovative approaches implemented that foster self management, communication and team skills, and analytical, conceptual, creative and problem solving skills. However, there is of course a huge difference between identifying required competences and operationalising them for inclusion in the concrete practices of teaching and learning at different educational levels (p. 39).

The report then lists the following skills of "digital competence":

- Ability to search, collect, and process (create, organize, distinguish relevant from irrelevant, subjective from objective, real from virtual) electronic information, data, and concepts and to use them in a systematic way.
- Ability to use appropriate aids (presentations, graphs, charts, maps) to produce, present, or understand complex information.

- Ability to access and search a website and to use Internet-based services such as discussion fora and e-mail.
- Ability to use ICT to support critical thinking, creativity, and innovation in different contexts at home, leisure, and work (p. 39).

The report to The William and Flora Hewlett Foundation is perhaps the most comprehensive even although it follows similar lines of investigation to the others but frames the report in terms of Amartya Sen's work with the plan to develop "a strategic international development initiative to expand people's substantive freedoms through the removal of 'unfreedoms.'" What is impressive about this report is not only the inventory of open education projects (the incubation of high-quality specialized open resources) but also its attempt to conceptualize the issues and to move to a new understanding of openness in terms of an ethic of participation (and the design of "open participatory learning infrastructure") that supports the role of technology in emphasizing the social nature of learning and its potential to address questions of the digital divide in developing countries.

There is much else that deserves attention in these reports. While they touch on conceptual issues to do with openness, they do not make the necessary theoretical links to the wider literature.

The History of "Openness" in Education: From the Open Classroom to OCW

We can group "openness in education" around a successive series of utopian historical moments based on a set of similar ideas stemming from core enlightenment concepts of freedom, equality, democracy, and creativity. The early history of open education consists of political and psychological experiments conducted in special schools established in the early twentieth century. The movement from the very beginning thus was shaped by contemporary political and psychological theory that attempted to provide alternatives to the mainstream that was connected to and

exemplified a form of society and set of institutions that was seen as politically desirable. These early ideas that also significantly involved an analysis of the space and architecture of schools and the associated idea of freedom of movement underwent considerable refinement and development over the course of the twentieth century. An important aspect concerned not only the analysis of architecture but the overcoming of distance in a form of distance education that began in the late nineteenth century through correspondence and progressed through various media eras including that of radio and television. Open education consisted of several strands and movements that often coalesced and overlapped to create a complex skein that despite the complexity was able to rapidly avail itself of new communication and information technologies in the last decade of the twentieth century and to identify itself more broadly with the new convergences among open source, open access, and OpenCourseWare movements. It was as though the open education movement in its infancy required the technological infrastructure to emerge as a major new paradigm rather than a set of small-scale and experimental alternatives or a form of distance education. We can chart these utopian moments in terms of five historical moments:

- The Open Classroom
- Open Schooling
- The Open University
- OpenCourseWare
- Open Education

The movement for openness in education was anticipated by a range of models after those of Homer Lane and A. S. Neill and, to a lesser degree, Bertrand Russell's libertarian school, all established in the early twentieth century. All three thinkers were wedded to the classical enlightenment doctrine of freedom and autonomy in education even though they tended to give its expression through then contemporary psychological theory influenced by Freud concerning child rearing. Lane established Little Commonwealth at Evershot, Dorset, in 1913. Influenced by the group therapy movement, he emphasized "shared responsibility" and freedom of "self-

expression." A. S. Neill, a follower of both Lane and Wilhelm Reich, the controversial psychoanalyst, established Summerhill in 1921 on the basis of a concept of personal freedom and equality that he held were important for learning and the development of self. Ideas of freedom and democracy also figured in Carl Rogers' (1969) *Freedom to Learn* written under the influence of the therapeutic movement including Otto Rank and existentialist philosophers like Martin Buber and Søren Kierkegaard. Rogers emphasized "self-directed learning" and facilitation rather than teaching as he entertained strong doubts about the necessary connection between teaching and learning. In the same environment Everett Reimer's and Ivan Illich's influential works during the 1970s, most famously in *Deschooling Society* (Illich 1972), argued formal education had confused schooling and education and created a kind of psychological impotency that delivered a stultified and non-creative uniformity.

In a broad sense these ideas were also given a concrete expression in the "open classroom" movement which originated in Leicestershire and was based on freedom of movement, the importance of "play," and a novel analysis of the space and architecture of schools. In Britain the movement became known as "informal education" based on "learning by doing" in home-like settings or "learning centers" where pupils were encouraged to be self-directed and creative in "schools without walls." The Plowden Report (1967) in the UK outlined a philosophy of primary schooling based firmly on Piagetian stage theory that emphasized children as individuals and supported a move to child-centered methods and curricula suited to the "needs of the child." Open schooling as "informal education" – informed by both Romantic thinkers like Rousseau, Pestalozzi, Froebel, and later, of course, Dewey – emphasized process over structure, dialogue rather than formal instruction, democracy rather than control, and freedom and self-expression over teacher-directedness and authority. A number of texts of the time explored the relation between open education, freedom, and knowledge (Nyberg 1975) and the relation between the open school and the open society

(Puckrose 1975) or emphasized the link with "community" and the move away from hierarchy (Easthope 1975).

Informal education tended to emphasize alternatives based on opening up traditional processes and structures of the school and decoupling the school from specific location or internal architecture, an age cohort, or depending upon a single source of authority. The unschooling, homeschooling, and community-schooling movements, for instance, focused on self-direction (autodidacticism) and harnessed community institutions and resources found in museums, local libraries, and even mass media. The informal education movement also had strong links with "'adult education' and, later, the concept of life-long learning."

Distance education began in the late nineteenth century and was initially based on correspondence, a tradition based on early international science that survived in "correspondence schools" where children were isolated in rural areas and separated from local schools by great distances. Instructional radio was introduced much later though its utopian promise was never fulfilled, similar to when instructional television began transmitting courses in the early 1930s. The model of technology-based distance education really received its impetus in the 1960s when the Open University in the UK was established founded on the idea that communications technology could extend advanced degree learning to those people who for a variety of reasons could not easily attend campus universities. It is interesting that the Open University really began with the BBC and ideas for a "wireless university" or "teleuniversity" that could combine broadcast lectures with correspondence texts and visits to local universities. From the start the idea of the "Open University" was conceived as a response to the problem of exclusion. The Open University advertises itself as based on "open learning" which is explained in terms of "learning in your own time by reading course material, working on course activities, writing assignments and perhaps working with other students." The Open University has around 150,000 undergraduate and more than 30,000 postgraduate students. 10,000 of our

students have disabilities. It has been immensely influential as a model for other countries, and distance education flourished in the 1970s and picked up new open education dimensions with the introduction of local area network environments (see, e.g., the Indian Open Schooling Network (IOSN) at <http://www.nos.org/iosn.htm>, the National Institute of Open Schooling at <http://www.nos.org/>, and Open School BC (British Columbia) at <http://www.pss.gov.bc.ca/osbc/>).

OpenCourseWare (OCW) is very much a feature of the twenty-first century. MIT, one of the first universities to introduce OCW, announced its intention in the *New York Times* in 2001, formed the OpenCourseWare Consortium in 2005, and by 2007 published virtually all its courses online. This is how the MIT website expresses the history of OCW:

MIT OpenCourseWare is an idea - and an ideal - developed by the MIT faculty who share the Institute's mission to advance knowledge and educate students in science, technology, and other areas of scholarship to best serve the world. In 1999, the Faculty considered how to use the Internet in pursuit of this goal, and in 2000 proposed OCW. MIT published the first proof-of-concept site in 2002, containing 50 courses. By November 2007, MIT completed the initial publication of virtually the entire curriculum, over 1,800 courses in 33 academic disciplines. Going forward, the OCW team is updating existing courses and adding new content and services to the site (<http://ocw.mit.edu/OcwWeb/web/about/history/index.htm>).

OCW does not grant degrees nor provide access to faculty. Site statistics show that 49% of users are by self-learners, 32% by students, and 16% by teachers. The OpenCourseWare Consortium (at http://www.ocwconsortium.org/index.php?option=com_content&task=view&id=15&Itemid=29)

is a collaboration of more than 100 higher education institutions and associated organizations from around the world creating a broad and deep body of open educational content using a shared model. The mission of the OpenCourseWare Consortium is to advance education and empower people worldwide through *opencourseware*.

On November 28, 2007, MIT celebrated the initial publication of the entire MIT curriculum on OpenCourseWare with a conference called

Unlocking Knowledge, Empowering Minds with a keynote by Thomas Friedman and a symposium panel on the future of OCW and education with Harold Abelson, (moderator) professor, Electrical Engineering and Computer Science, MIT; Charles Vest, president, National Academy of Engineering, president emeritus, MIT; John Seely Brown, former chief scientist, Xerox Corporation; and Sam Pitroda, chairman, National Knowledge Commission, Government of India. (The videos are available for viewing at <http://ocw.mit.edu/OcwWeb/web/about/milestone/index.htm>.) Steven Lerman, dean for Graduate Students, MIT, in his presentation mentioned that MIT OpenCourseWare has reached 35 million people and another 14 million in translation. MIT is of course only one example of the OpenCourseWare movement, an important player, but nevertheless, only one institution among many (see the OpenCourseWare Consortium for the full list of participating countries and list of courses at <http://www.ocwconsortium.org/>). Most recently The Cape Town Open Education Declaration subtitled "Unlocking the promise of open educational resources" arose from a meeting convened in September 2007. The Declaration begins:

We are on the cusp of a global revolution in teaching and learning. Educators worldwide are developing a vast pool of educational resources on the Internet, open and free for all to use. These educators are creating a world where each and every person on earth can access and contribute to the sum of all human knowledge. They are also planting the seeds of a new pedagogy where educators and learners create, shape and evolve knowledge together, deepening their skills and understanding as they go.

This emerging open education movement combines the established tradition of sharing good ideas with fellow educators and the collaborative, interactive culture of the Internet. It is built on the belief that everyone should have the freedom to use, customize, improve and redistribute educational resources without constraint. Educators, learners and others who share this belief are gathering together as part of a worldwide effort to make education both more accessible and more effective.

The Declaration mentions the expanding global collection of OCW as the basis for this development, although in terms of its history, it is clear that origins and strands of the movement go back much further. The document also

mentions the variety of openly licensed course materials, including lessons, games, software, and other teaching and learning materials that contribute to making education more accessible and help shape and give effect to a "participatory culture of learning, creating, sharing and cooperation" necessary for knowledge societies. Perhaps, most importantly, the Declaration indicates that open education

is not limited to just open educational resources ...[but] also draws upon open technologies that facilitate collaborative, flexible learning and the open sharing of teaching practices that empower educators to benefit from the best ideas of their colleagues. It goes on to provide a statement based on a three-pronged strategy designed to support open educational technology, open sharing of teaching practices and other approaches that promote the broader cause of open education.

(The full declaration can be found at <http://www.capetowndeclaration.org/read-the-declaration>.) The open education movement and paradigm has arrived. It emerges from a complex historical background, and its futures are intimately tied not only to open source, open access, and open publishing movements but also to the concept of the open society itself and its meanings.

Bergson, Popper, Soros, and the Open Society

To exist is to change, to change is to mature, to mature is to go on creating oneself endlessly – Bergson.

Henri Bergson's (1859–1941) philosophy of time and concepts of multiplicity and creative evolution, was among the first to theorize the origins of the open society. He contrasted it with the closed society in the book *The Two Sources of Morality and Religion* (Bergson 1977 [1935]). With closed morality, religion is static and concerned primarily with social cohesion and social order, whereas with open morality, religion is dynamic and concerned with progress and creativity. The source of the latter is what Bergson calls "creative emotions" which are intuitions that overturn accepted ideas and practices and the source of *elan vital*, one of the two competing life forces.

George Soros (2006) who wrote "*Europe as a Prototype for a Global Open Society*" said:

The concept of open society was first used by the French philosopher Henri Bergson in his book *The Two Sources of Morality and Religion* published in 1932. One source is tribal and that leads to a closed society whose members feel an affinity for each other and fear or hostility toward the other tribes. By contrast, the other source is universal and leads to an open society which is guided by universal human rights and seeks to protect and promote the freedom of the individual (see http://www.soros.org/resources/articles_publications/articles/europe_20061120).

Bergson's work has been revitalized at the hands of Gilles Deleuze (1991) who has used his concepts of multiplicity and creative evolution as the source of his "becomings" and ultimately for being itself.

Karl Popper, a German-Jew escapee, wrote *The Open Society and Its Enemies* (Popper 1945) in two volumes *The Spell of Plato* and *The High Tide of Prophecy: Hegel, Marx and the Aftermath* while in political exile at the University of Canterbury in New Zealand from 1937 to 1943. While Popper's concept of the open society is *epistemological* rather than political, in essence the work is a critique of historicism and an attack on the origins of totalitarian societies and a defense of liberal democracy as the open society. In the Preface to the second edition, Popper (1966, p. xi) writes:

I see now more clearly than ever before that even our greatest troubles spring from something that is as admirable and sound as it is dangerous – from our impatience to better the lot of our fellows. For these troubles are the by-products of what is perhaps the greatest of all moral and spiritual revolutions of history, a movement which began three centuries ago. It is the longing of uncounted unknown men to free themselves and their minds from the tutelage of authority and prejudice. It is their attempt to build up an open society which rejects the absolute authority to preserve, to develop, and to establish traditions, old or new, that measure up to their standards of freedom, of humaneness, and of rational criticism. It is their unwillingness to sit back and leave the entire responsibility for ruling the world to human or superhuman authority, and their readiness to share the burden of responsibility for avoidable suffering, and to work for its avoidance. This revolution has created powers of appalling destructiveness; but they may yet be conquered.

Popper's work was written during the war years largely as an attack on Marxism, totalitarianism, and fascism, the predominant forms that he saw as threatening the so-called free world. He argues that Hegel's and Marx's historicist philosophies are characteristic products of their time, philosophies in response to tumultuous social change, and he goes on to argue:

there can be no history of "the past as it actually did happen"; there can only be historical interpretations, and none of them final; and every generation has the right to frame its own. But not only has it a right to frame its own interpretations, it also has a kind of obligation to do so; for there is indeed a pressing need to be answered. We want to know how our troubles are related to the past, and we want to see the line along which we may progress towards the solution of what we feel, and what we choose, to be our main tasks. It is this need which, if not answered by rational and fair means, produces historicist interpretations. Under its pressure the historicist substitutes for a rational question: "What are we to choose as our most urgent problems, how did they arise, and along what roads may we proceed to solve them?" the irrational and apparently factual question: "Which way are we going? What, in essence, is the part that history has destined us to play?" (p. 268).

For Popper history has no inherent meaning that can be read. His philosophy of science, laid out much more fully in a range of works dating from *The Logic of Scientific Discovery* (Popper 1959 [1934]) and including *Conjectures and Refutations: The Growth of Scientific Knowledge* (1963), *Objective Knowledge: An Evolutionary Approach* (1972), and *The Open Universe: An Argument for Indeterminism* (1982), spelled out a doctrine of critical rationalism (critical "open-mindedness") with falsifiability (as opposed to verification) as the hallmark, demarcation, and criterion of science. (It is not the place here to enter into the complex history of postwar philosophy of science although it is important to recognize that Popper's ideas were contested both internally by his students like Imre Lakatos and externally by Thomas Kuhn and Paul Feyerabend, among others.)

Popper was a "Cold Warrior" like Friedrich von Hayek, his countryman, who wrote the fiercely anti-socialist tract *The Road to Serfdom* (1949) and was responsible for inviting and

securing a place for Popper at the London School of Economics (LSE). Hayek and Popper together formed a formidable twin opponent to socialism and strong defense of the principles of liberal democracy and the "free market" in the postwar period. (Popper's and Hayek's combined influence as defenders of the Austrian school of liberalism was exerted not only through their interlocking ideas – Hayek referenced Popper's critical rationalism and Popper accepted Hayek's evolutionary epistemology as a basis for his own thinking – but also through the Mont Pelerin Society that Hayek set up after WWII as a basis for the "open society." Popper was present at the inaugural meeting in 1947. For a statement of aims, see <http://www.montpelerin.org/home.cfm>.)

George Soros, born in Budapest, Hungary, in 1930, emigrated to the UK in 1947 to study at the LSE where he became first acquainted with Popper's thought and then a devotee, strongly influenced by Popper's critique of totalitarianism and the concept of the open society. As a philanthropist who made his fortune as a trader in the USA during the 1960s and 1970s, he established the Open Society Institute in 1993 to help develop democratic institutions throughout Central and Eastern Europe. A strong critic of neo-conservatism and especially the presidency of George W. Bush and the inherent instability of unregulated global finance capitalism, Soros wrote a series of books on these and related topics such as *The Bubble of American Supremacy* (2005), *Open Society: Reforming Global Capitalism* (2000), *The Crisis of Global Capitalism: Open Society Endangered* (1998), *Underwriting Democracy* (1991), and *Opening the Soviet System* (1990).

The New Paradigm of Social Production

Benkler's (2006) recent book *The Wealth of Networks* develops a vision of the good society based on access and distribution of information goods in a global networked information economy that places a high value on individual autonomy where within the public information space of the Internet and the information commons people

have the individual means to pursue their own interests. Benkler (2006, p. 1) begins:

Information, knowledge, and culture are central to human freedom and human development. How they are produced and exchanged in our society critically affects the way we see the state of the world as it is and might be; who decides these questions; and how we, as societies and polities, come to understand what can and ought to be done. For more than 150 years, modern complex democracies have depended in large measure on an industrial information economy for these basic functions. In the past decade and a half, we have begun to see a radical change in the organization of information production. Enabled by technological change, we are beginning to see a series of economic, social, and cultural adaptations that make possible a radical transformation of how we make the information environment we occupy as autonomous individuals, citizens, and members of cultural and social groups.

He indicates that a set of related changes in the information technologies entailing new social practices of production has fundamentally changed how we make and exchange information, knowledge, and culture, and he envisages these newly emerging social practices as constituting a new information environment that gives individuals the freedom to take a more active role in the construction of public information and culture. As he writes:

This new freedom holds great practical promise: as a dimension of individual freedom; as a platform for better democratic participation; as a medium to foster a more critical and self-reflective culture; and, in an increasingly information dependent global economy, as a mechanism to achieve improvements in human development everywhere (Benkler 2006, p. 2).

The emergence of the global networked information economy made possible by increasingly cheaper processors linked as a pervasive network has created an information economy based on the production of information and culture that enables social and nonmarket or peer-to-peer production and exchange to play a, perhaps even the, central role.

Benkler's arguments chime with a number of others who have been working in the same area of the intellectual commons as a newly defined public space or laid the groundwork for doing so:

Richard Stallman, John Perry Barlow, Larry Lessig, James Doyle, and Pamela Stephenson. Stallman's (2002) collected essays in *Free Software, Free Society* originally written a couple of decades ago provide a discussion of the philosophy underlying the free software movement, including the GNU project and manifesto, the difference between "free" and "open" software, the concept of copyleft, and the GNU General Public License. As Larry Lessig (2002, p. 10) writes: "Every generation has its philosopher . . . who captures the imagination of a time." The philosopher who best captures our time, Lessig asserts, is Richard Stallman, who began as a computer programmer designing operating systems and came to define the freedom of code as the central pressing issue confronting a computer society. Free software is Stallman's answer to the question of control—"free" as in "free speech," that is, free from control, transparent, and open to further development, change, and innovation. Such freedom, then, is the basis of "free laws," an economy of free code and the "free society." The principles demand openness and transparency that form the basis for control of code, for laws that guarantee this freedom, and for government itself. Stallman argues that copyright is not defined as a natural right in the US Constitution, and he seeks to reduce it, arguing also for the distribution of scientific publishing in non-proprietary formats.

John Perry Barlow (1994) raises perhaps the central enigma in an article called "The Economy of Ideas":

If our property can be infinitely reproduced and instantaneously distributed all over the planet without cost, without our knowledge, without its even leaving our possession, how can we protect it? How are we going to get paid for the work we do with our minds? And, if we can't get paid, what will assure the continued creation and distribution of such work?

The fact is, as Barlow points out so well, the accumulated canon of patent and copyright law applies well to things but faces insuperable difficulties when applied to nonmaterial goods. Information increasingly separates itself from the material plane to exist merely in the ideational

form as pure ideas. Digital technologies tend to eliminate the distinction between the idea and its expression in some physical form also "erasing the legal jurisdictions of the physical world." Barlow (1994) argues:

Notions of property, value, ownership, and the nature of wealth itself are changing more fundamentally than at any time since the Sumerians first poked cuneiform into wet clay and called it stored grain.

This led Barlow to examine the nature of information and to investigate a number of underlying "hypotheses":

- Information is an activity.
- "Information is a verb, not a noun; it is experienced not possessed; it has to move; it is conveyed but propagation, not distribution."
- Information is a life form.
- "Information wants to be free; it replicates into the cracks of possibility; it wants to change; it is perishable."
- Information is a relationship.

Barlow ends his meditation on information by suggesting that everything we know about information as intellectual property is wrong and we are going to have to rethink it. He suggests "The protections that we will develop will rely far more on ethics and technology than on law," and "Encryption will be the technical basis for most intellectual property protection." He goes on famously to maintain:

The economy of the future will be based on relationship rather than possession. It will be continuous rather than sequential. And finally, in the years to come, most human exchange will be virtual rather than physical, consisting not of stuff but the stuff of which dreams are made. Our future business will be conducted in a world made more of verbs than nouns.

Barlow's prophetic work on the nature of information predates much of the attention it received later from scholars in law such as Lessig, Benkler, and Boyle. Lessig (2004), building on earlier work (e.g., Lessig 2001), argues that for an underlying conception of freedom and its protection as the basis for "free culture," at the same time

warning of the dangers of "big media" in colonizing public media space. He emphasizes the way the Internet makes possible the efficient spread of content through peer-to-peer (p2p) file-sharing in a way that does not respect traditional copyright, and he warns us of the dangers to the kind of creativity that is the basis of cultural innovation. In *The Future of Ideas*, Lessig (2002) describes how the Internet counterculture has encouraged an explosion of innovation and creativity and the legal architecture protecting it as a public space is now under threat.

In the same context we can also talk of James Boyle and Pamela Stephenson. Boyle is a law professor at Duke University and the cofounder of the Center for the Study of the Public Domain established in 2002 with the mission:

to promote research and scholarship on the contributions of the public domain to speech, culture, science and innovation, to promote debate about the balance needed in our intellectual property system and to translate academic research into public policy solutions.

Boyle (1997) argues that that we need a political economy of "intellectual property." Likening the Net to an environment and drawing on the politics of environmentalism, he suggests "our intellectual property discourse has structural tendencies towards over-protection, rather than under protection." He claims that the "public domain" is disappearing:

in an IP system built around the interests of the current stakeholders and the notion of the original author, around an over-deterministic practice of economic analysis and around a "free speech" community that is under-sensitized to the dangers of private censorship.

He argues that a pay-as-you-read architecture will be inefficient and that such a system will "Lead to extraordinary monopoly and concentration in the software industry, as copyright and patent trump antitrust policy" and possibly legitimize the extension of "intellectual property rights even further over living organisms, including the human genome, transgenic species and the like" as well as privatizing "words, or aspects of images or texts that are currently in the public domain, to the detriment of public debate, education, equal access to information. . ." (Boyle 1997, n.p.).

Boyle is one of a number of scholars working in this area including Michael Carroll, Molly Shaffer Van Houweling, and Larry Lessig, along with the filmmakers, Eric Saltzman and Davis Guggenheim, the computer science expert Hal Abelson, and CEOs like Jimmy Wales (founder of Wikipedia), Laurie Racine (founder of DotSUB), Joi Ito (founder of Neoteny), and John Buckman (founder of Magnatune) and all members of Creative Commons. Pamela Samuelson has also completed work on intellectual property and the public space. Stephenson (1996) in Wired's "The Copyright Grab" warned that President Clinton's white paper on intellectual property was a sellout of the public and a reward of supporters in the copyright industry.

"Henry" in the Crooked Timber seminar on Benkler's *The Wealth of Networks* indicates how this recent literature maps onto "to a broader tradition of thought; that of people like Jane Jacobs, James Scott, Richard Sennett and Iris Marion Young." He acknowledges that the Internet enables us to engage with each other in new creative ways and "to form networks of collaboration and of conversation, creating possibility conditions for the kinds of diversity and critical thinking that democratic theorists prize." The essential point emphasized here, especially for the Left, is that these newly enabled forms of "community" or "conversation" are non-constraining and occur without central planning or the heavy-handed agency of the State. Henry suggests that three key norms – linking, attribution, and authenticity – structure the blogosphere creating an economy built on "gift exchange." He contemplates how self-regulatory solutions tend to rigidify over time to reduce spontaneity and tend to introduce more formal rules and hierarchies.

Introduction

Openness as a set of practices has received less attention from practitioners and researchers than the specifics of producing and distributing open

educational resources (OERs) or engaging in open education through innovations like massive online open courses (MOOCs). As a result, openness as a philosophical position and its relationships to power inside and outside formal educational contexts has also remained relatively undeveloped to date. However, it is possible to identify key arguments that enable the relationship between openness and power to be framed.

1. Who defines openness, and what remains open or closed, inside and outside formal educational contexts? This includes the relations of power between transnational bodies, State agencies, education providers, corporations, and individuals.
2. How does the political economics of openness reveal relations of production that are themselves rooted in power? This includes work on ideas like the commons, the public university, MOOCs, open data, information justice, and free culture.
3. These associations also map onto discussions of openness, in terms of scholarship, authentication, publishing and access, data, and so on. How do these commodities of openness relate to social relations of power?
4. The associations between openness and power map onto a number of terrains grounded in the self, including: the rich history of open education in community, cooperative, adult, and workers' education; pedagogic research focused upon personalization, collaboration, and networks; critical or radical pedagogy around emancipation and self-actualization; Marxist critiques of education as it is restructured through processes of commodification and valorization. Can these terrains be brought into relation?
5. Is it possible to scope a future for openness as it relates to power? In particular, how does current research and practice enable thinking about openness in terms of utopias or dystopias?

This entry will pick up on each of these areas in turn, in order to frame the social nature of openness in educational contexts. As a result, its

relationship to concerns of democracy, social justice, and freedom, through processes for knowledge consumption, production, and distribution, will be developed.

Openness and Power

A starting point for understanding openness and power is the question of "who decides?" in terms of what is made open and who has the power to open up a specific context. In the process of opening up a particular context, a connected issue is what is then closed or closed off as a result? These questions bring a range of actors, with a range of different forms of agency into relation, including: transnational bodies like UNESCO and the World Bank that set global agendas for open access as a means of encouraging economic growth and social justice; State and governmental agencies that scope national policy for open data and quality assurance; education providers that wish to widen access to their knowledge, skills, and practices; corporate bodies partnering with education providers to deliver educational services; and individuals who are producing, distributing, and consuming open educational artifacts.

Both transnational and State agencies support open approaches to education through policymaking related to open data, open licensing frameworks, and open standards. A key strand has been to move beyond raising awareness of key open education issues, in order to focus upon sustainable, social, and economic development. This has then tended to open up debates about licensing, copyright, and intellectual property law, with alternate positions being developed around copyleft and copyleft, which are themselves rooted in libertarian politics. This adds to the complexity of the analysis of openness and power, which at times sees left and right-wing politics converging on specific issues concerning the relationship of the State to the individual and the community, while doing so from both free market and democratic perspectives.

One further criticism of transnational agendas for open practices has emerged from the global South and from marginalized voices in the global

North, who have viewed the promotion of strategies for open educational resources as a form of commodity dumping. Moreover, the argument has been that openness often legitimates established anglophile, colonial logics embedded within education systems and sees them transposed across the globe. This then questions the relationship between open educational processes and indigenous approaches to learning. A further critical question is whether openness enables the reproduction of historical power rooted in policies and practices of assimilation, surveillance, and regulation? (Weems 2013).

Inside the State, educational institutions, including private providers, have been encouraged to develop institutional strategies and policies for openness, through work on open licensing, open data frameworks, OERs and open repositories, open scholarship and research, and MOOCs. Strategies that focus on incentivizing the development of open educational products and services have been rooted in building *both* internal capability *and* capacity to reach new markets. Beyond the issues of transnational power noted above, the emergence of openness as a potential growth area has affected higher education providers, which are forced to compete on a national and global terrain for student numbers. Here, national and corporate demands for flexible labor markets have challenged the design and delivery of educational contexts, in order to generate on-going employment and economic growth. This has led to fundamental questions about the role of universities as gatekeeper institutions for society's knowledge and the relationship of the educator/researcher to her public, her institution, and her discipline area. These questions demonstrate that openness has disrupted boundaries between the contexts in which educators/researchers operate. Moreover, it questions the identities of the institution and its educators/researchers in the face of the power of the market.

There is an increasing focus on how such boundaries are clarified through policy and strategy, which themselves reinforce the social relations of power between institutions and individual educators or students. Here policies for the development of OERs, open licensing, and social and

public media are critical in either enabling or removing agency for educators/researchers and students (Hall et al. 2014). Research has then attempted to address the ways in which the boundaries of structure and agency, governed through institutional policy, has underscored cooperative learning agendas or radical collegiality between educators/researchers. A first counterpoint is the institutional need to develop the digital capabilities of its workforce, in order to compete, so that issues of coercion and performance management shape the relations of production of MOOCs, OERs, open data and scholarship, and so on. A second is the power relations that exist inside the classroom, in particular where students and citizens are encouraged to engage in the production and distribution of open educational artifacts, for instance through citizen science or documentary media projects. At issue here is the democratic relationship between educator and student in the governance, design, delivery, and assessment of any curriculum that is becoming open.

One emergent area of research has been the extent to which the opening or closing of contexts, including data, teaching content, research, and scholarship, can function as a tool of disciplinary power (Johnson 2013). Understanding the power that exists to open up a context or set of contexts raises three questions. First, is governance defined deliberatively or is it imposed? Second is openness used to reproduce or challenge a specific set of societal norms? Third, in the process of opening up, which contexts or possibilities are closed off? For researchers, educational openness needs to consider issues of social and educational justice, as specific pedagogic practices and policies are validated and legitimated, and reproduce or challenge power.

While openness as a philosophical position is related to the structural forms through which agency and power flow, the flows between ideas of "open" and "closed" continue to shape any analysis of power. Where openness is not seen be the opposite binary to closedness, theoretical and methodological positions emerge that describe openness as emerging from certain closings, and vice versa (Edwards 2015). This underpins discussions of the governance of the

educational commons, as it emerges through: institutional academic commons; spaces like Wikipedia or Wikileaks; and in national projects like the Free Libre Open Knowledge (FLOK) Society's attempt to create an open infrastructure for Ecuador's National Plan for Good Living (FLOK Society 2014). In thinking about how opening up/closing down in one context materially affects another, questions emerge of what forms of openness are worthwhile and who has power to decide? What specific pedagogic approaches, forms of assessment, or types of educational resources are opened up, and as a result, which are closed off or delegitimized?

The legitimization of openness ties into broader analyses of the political economics of education, which are themselves rooted in social relations of production and power. For instance, some researchers have described open education as a liberal project that focuses upon the freedom of things rather than the freedom of people (Winn 2012). This discourse amplifies critiques of the relationship between educational labor and intellectual property and therefore of the power relations that openness or closedness reproduce. This includes a critique of the labor of educators/researchers and of students in open environments, where data, content, curricula, assessments, scholarship, and so on are being openly produced, distributed, and consumed. However, such open production and circulation does not necessarily reveal the social relations of production and power. These relations of power question the nature of the material wealth that is created: is this a social use-value or should it be made available for exchange and trade? Here the boundaries between openness as a public or communal good are ruptured by the commodification of open data and knowledge for exchange value, which reinforce specific forms of agency. One outcome is that enforced openness, designed for the production of educational value, may reinforce relations and regimes of power that are shaped technologically, financially, and intellectually.

One domain in which agendas that promote openness run up against established power structures is in free culture movements. This highlights where freedom of action is potentially enabled/

disabled by opening or closing *either* access to educational material *or* the ability to reuse or remix such material. Here the power of educational publishers and the operation of transnational legal terrains militate against the immediate opening up of access to content, for making modifications in the face of copyright law, or for invoking copyleft or copyfarleft as an educational practice. However, free culture as a function of openness is also opposed by some educators who fear that open licensing may underscore intellectual and reputational damage through the erosion of academic norms. This leads to critical questions related to the power of academics to leverage their intellectual capital. First, if educators who receive a salary are not required to sell their work, why can they not give that research or teaching material away? Second, if academics are not required to sell their work, why do they require all of the protections of copyright and specifically those protections that exist for financial benefit? The idea of openness in publishing is therefore uncovers a complex and contentious set of relations (Eve 2014).

Throughout these questions of political economy in both open and closed educational contexts, relations of power are defined by the interrelationships that emerge between, established networks of publishers, policymakers, technology firms, and so on and educators, educational institutions, and citizens. Issues of legitimization or empowerment are amplified by the relationship between open data and education. This is an area of economic growth that affects national industrial strategies for the development of new markets and which enables private providers to design and sell new educational services as commodities in established markets. Openness is framed by the power of corporations to use transnational policy, in order to leverage institutional and personal data as business intelligence and new services, rooted in learning analytics. Potentially, the governance of open approaches then empowers those who are already empowered, because they have better technological access, data management infrastructures, and analysis skills. At the boundary of corporate enterprise, educational provision and individual learning, different levels of social

and political power and intellectual capital affect the interpretation and legitimation of what is opened up or closed down. As a result, researchers question the application and value of openness under conditions of unequal capabilities.

A resultant issue is whether a standardized view of openness is then developed and imposed, and which normalizes judgements about the educational performance of individuals, including in contexts that were previously closed. While digital technologies have generated energy around the possibilities of openness in education, they risk reinforcing pedagogic selections and exclusions because they are built upon and reproduce certain normative, ontological architectures. This raises important questions about the politics of knowledge and links back to issues of social and educational justice in the design of open education or in framing education through enforced openness. In this case, there is the risk that observable behaviors become a form of dressage or conformity, irrespective of the circumstances of that behavior. As a result, the impact of policies for openness may materially affect marginalized groups or those who do not adhere to institutional norms. Such norms reflect historical and material relations of power, which themselves have an effect on social justice. This might be explored in light of the experience of groups who demand safe, autonomous spaces for working, for instance some feminist and activist groups, through participative methodologies.

Such explorations develop the Self as a critical domain for discussing legitimized open practices. Relevant research maps onto a number of terrains, including: the rich history of open education in community, cooperative, adult, and workers' education; pedagogic research around personalization, collaboration, and networks; critical or radical pedagogy focused upon emancipation and self-actualization; and Marxist educational analyses of the structuring reality of value inside the social factory. Open education projects can be analyzed in terms of how the Self is represented or reproduced, from each of these theoretical positions. Such projects include those which focus upon: lifelong, community-based learning; peer-to-peer learning; open educational cooperatives;

federated MOOCs like FutureLearn in the UK; or connectivist approaches to pedagogic development (van Mourik Broekman et al. 2014).

One practical issue that arises is the extent to which these theoretical positions overstate the democratic potential of openness and whether the conceptions of learning and self-organization that are developed are determinist. The politics of the wider educational ecosystems with which any open education system interacts is crucial. Here the realities of open/closed systems and their interrelationships, alongside the variable human and corporate capital of the actors in those systems, need to be addressed. Methodologically, this work has been undertaken through community-oriented approaches that enable grounded analyses of the impacts of open/closed educational structures on agency, through participative action research, grounded theory and constructivist grounded theory (Anderson et al. 2015). There has also been an engagement with actor network theory and network analysis in uncovering relations of power in specific ecosystems. In part, these approaches have been important because open education practices and philosophies support wide-ranging agendas: first, progressive and liberal agendas for democratic inclusion; second, radical and critical engagement with emancipatory, communal self-actualization; and third, free market and economically liberal tendencies.

A final area that enables openness and power to be scoped is open educational futures, in particular as they relate to social justice, democratic engagement, and self-actualization. Extant research into governing networks that maintain hegemonic power in the domain of public policy, alongside the role of network governance models for policy implementation, offer one potential mirror for critiquing open educational contexts. For some researchers, the apparent democratic possibilities of openness are subsumed under forms of *openwashing*, which give the appearance of openness, while sustaining proprietary practices and established norms (Watters 2014). In this context hegemony becomes central, and impacts the role of actors like the educator/researcher, quality assurance agencies, and

corporate educational publishers, in reinforcing or challenging forms of power. These emerge through sociocultural codes, educational policies and strategies, open data architectures, innovations like MOOCs, and so on. A central question for researchers and educators is what might openness look like in practice? Any response might reflect issues of freedom of educational action, related to: public, communal or private value; openness defined for use or for exchange; equality or equality of opportunity; and democracy and social justice.

These points are rooted in freedom of educational action, though which claims made for openness might be grounded through a discussion of the sociopolitical binary of utopia/dystopia. Here technological and sociocultural forms of determinism that are rooted in the potentially revolutionary nature of openness can be challenged. The relationship between hegemonic and *both* counter-hegemonic *and* delegitimized positions reveals how openness relates to socioeconomic privilege. A second issue surrounds what is normalized through openness in specific educational contexts, and whether it is possible to enable deliberative responses to the governance and implementation of open educational projects and practices. Such responses address the material and historical effects of open practices and how they impact specific individuals or groups. This highlights the complex power relations that emerge from an analysis of openness and how the theoretical frameworks used to develop understanding are immanent to the practical, political, and educational forms that openness takes.

Ortega y Gasset, José (1883–1955)

Fernando Bárcena

Theory and History of Education, Faculty of Education, Universidad Complutense de Madrid, Madrid, Spain

Introduction: Thinking the Present

Strictly speaking, José Ortega y Gasset (Madrid 1882–Madrid 1955) is not a “theorist of education” in the modern and specialized sense of the concept. He is, however, a “thinker of education,” a “philosopher of education,” and in his own way an “educator.” Careful reading of his pedagogical writings reveals a line of thinking that continually problematizes the idea of education, thereby generating new concepts and enlightening metaphors. Ortega’s pedagogical vocation is geared mainly to the cultural regeneration of the Spain of his lifetime. Although he once said he dared not harbor any particular pedagogical ideas himself, he was concerned with how the younger generations were being educated. For instance, in *Biología y Pedagogía* (1920), he wrote “elementary teaching should ensure and foster a primary, spontaneous life of the spirit, which is exactly the same today as 10,000 years ago, and which must be defended from the ineluctable mechanization of life itself by its creating specific organs and functions” (Ortega y Gasset 2007, 105). The point is to teach not for a ready-made life but for the *creative life*: first to strengthen living life – *natura naturans* – and only afterward civilization and culture, *natura naturata*. These ideas are encouraged by the “vitalist philosophy” that characterizes Ortega. Having taken shape in the neo-Kantian philosophy during his stay in Marburg (1906–1908),

Ortega's pedagogy belies a philosophy that places life as "radical reality."

Taken all together, Ortega's written output may lack a systematic structure, but it is highly suggestive nonetheless. He makes frequent use of "thought exercises" or *meditations*; "Meditation is at the same time both walking and forging one's way," he states in *¿Qué es La Vida?* (1930–1931); "it is coping with each thing as it comes upon us" (J. Ortega y Gasset, VIII, 413), i.e., thus making thought become present in the act of thinking. His written work is an open-ended program, an example of which is the eight-volume set of *El Espectador* (1916–1934) (J. Ortega y Gasset, II), in which he makes insightful comments on a wide range of topics.

At first, the neo-Kantian philosophy he picked up during his stay in Marburg showed him the possibility of *Europizing* Spain. As he stated in *La Pedagogía Social como Programa Político* (1910), "Spain's current reality is becoming a problem, [...] so Spain is a problem" (J. Ortega y Gasset, II, 88). A particularly decisive year was 1914, which he perceived as a radical breakdown of enlightened ideals. It was the year his *Meditaciones del Quijote* (1914) was published, a youthful but important work featuring his well-known phrase: "I am myself plus my circumstance, and if I do not save it, I cannot save myself [...]: 'keeping up appearances', the phenomena" (J. Ortega y Gasset, I, 757).

That same interest in thinking in the present and its contradictions led him to give a number of conferences in Buenos Aires under the title of *Meditación de Nuestro Tiempo*. In *Introducción al Presente*, he states: "The discovery that we are fatally assigned to a certain age group and lifestyle is one of the melancholic experiences that every sensitive man sooner or later feels. A generation is an integral way of existence indelibly fixed on the individual" (J. Ortega y Gasset, VIII, 58 and VI, 385–397). By bringing his audience into the present, Ortega highlights its constituent dramatics, since it is cohabited by three "presences in the present": three vital dimensions together in each present, in unavoidable conflict and hostility. This means different things to a youth of 20, a man of 40, and an old man of 80. Consequently, each of

us makes ourselves felt in the present depending on which generation we each belong to. In pedagogical terms, for Ortega, education is always the result of different generations meeting in the common affiliation of time. Every generation settles in and "sees" the present in its own way, i.e., from its particular point of view.

Spectator Pedagogy

Two of the common denominators we find in Ortega's work are *perspectivism*, a philosophical current in which the different conceptions of the world depend on the individual's point of view and circumstances, and *vital reason* ("razón vital"), which is an attempt at moving beyond the pure reason and practical reason of idealists and rationalists. Truth can be found by juxtaposing partial views, fundamental to which is the ongoing dialog between man and life. Reality "is offered in individual perspectives [...]. The visual perspective and the intellectual perspective are further complicated by the perspective of evaluation. Instead of disputing them, we integrate our visions in generous spiritual collaboration, and much as the two independent banks of a river merge into one broad river bed, so we compose the stream of what is real" (J. Ortega y Gasset, II, 163). Or as he says in *El Tema De Nuestro Tiempo* (1923): "Each individual is a point of view on the universe" (J. Ortega y Gasset, III, 614).

In sharp contrast to most of the philosophical tradition prevailing in the West, which soon gave up on analyzing the sphere of human affairs, what mattered most to Ortega y Gasset is life, not theory: "The only thing I am stating is that, from time to time, spontaneous life should give rise to theory, its obvious pupil, and then, theories should be made in utmost purity, with utmost tragedy" (J. Ortega y Gasset, II, 163). As he said in *Principios de Metafísica Según la Razón Vital* (1932–1933), life is *radical reality*, the root from which all human realities spring and the project each person must undeniably "carry forward": "Life is what we do and what happens to us" (J. Ortega y Gasset, VIII, 570). The life each of us is given is, however, not given *ready-made*: it

must be *decided*. Life is always what we are doing, which is why it is so important to analyze *why* we are doing one thing and not another. Thus, the importance of philosophy is that it helps orient us. In *Los que estudian filosofía como profesión y los que buscan una claridad sobre la vida* (1934), he makes his case clear: “To start with, philosophy is but the sensation that life is invisible unless it has a certain something that it lacks on its own but must instead be sought out. This certain something is insight into itself” (J. Ortega y Gasset, V, 314).

On this backdrop, Ortega’s *El Espectador* project leans toward the theoretical and vital as well as a certain kind of pedagogy or what amounts to the same thing, a *problematization* of the specifically human endeavor we call “education.” The spectator, as Ortega notes, “speculates, looks, but what he wishes to see is the life flowing within him” (Ortega y Gasset 2004, II, 162). This “spectator pedagogy” is a pedagogy of seeing. If “looking” is “seeking” among everything that matches up with our utilitarian concerns, then “seeing” is letting our mind fill with the landscape and all its nuances, objects, and elements. In *Pedagogía del Paisaje* (1906), he then said that *the landscape teaches better than the most skillful pedagogue*. Ortega, who had studied with Paul Natorp, would say that his admirable “social pedagogy” would have to be complemented by a “pedagogy of the landscape.” Seeing is having to learn to get around in the landscape, to travel: “it is having to integrate each and every possible vision” (García Morente 1975, 76).

On educational matters, Ortega always takes a new point of view, critical with the often mechanized pedagogy of his time. And when he negates or rejects something, he does not do so lightly. Rather, it is more a matter of focusing his vision. Thus, the spectator aims in one direction: for instance, he proposes a new educational ideal whose solution does not rely on pedagogy, since neither pedagogy nor its skills are what determines the ideals of education; in every time period, the ideals of education are determined by civilization and culture, by individual and social aspirations, and by man’s general preferences. The meaning of education is therefore not the

domain of pedagogy or its discourses. And, therefore, pedagogy would do well to engage in fruitful dialog with other disciplines (especially philosophy).

To speak of pedagogy and education necessarily requires having to speak of childhood, and Ortega makes a number of different considerations about childhood. For example, in *Biología y Pedagogía* (1920), he suggests that “the problem of education is always a problem of elimination, and the problem of elementary education is the problem of essential education” (Ortega y Gasset 1985, 426). The essential, he says, is “to foster the spontaneous, primitive life of the spirit, precisely so as to ensure and enrich culture and civilization” (Ibid., 438). In that vein, Ortega fervently advocates the need to respect a child’s childhood: “Pedagogy always tends to act against the child’s childhood, striving to cut back on its childishness by inserting as much adulthood into it as possible” (Ibid., 467). He adds: “maturity and culture are creations not of the adult and the wise man, but rather, were born of the child and the savage. Let us make perfect children, imagining in our mind’s eye as much as possible that they will become adults; let us teach children as such, guided not by an ideal of exemplary man but by a standard of childishness. The better man is never the one who was less a child, but the other way around: the one who, by the age of thirty, finds in his heart the splendid treasure of his childhood” (Ibid., 467). For Ortega, therefore, “a great deal of pedagogy today, the undeniable processes starting with Rousseau and Pestalozzi notwithstanding, is more like hunting a child, a cruel method to infringe upon childhood and produce adults who harbor a gangrene childhood inside.” For Ortega, the essential point is therefore to attend to the child’s present as far as being a child, i.e., a pedagogy that does not force out of him what is already in his own (present) time of childhood.

Pedagogy of Contamination

Ortega is well aware that many of the problems concerning the lack of clarity in pedagogy stem from the lack of a philosophy of education. In

Pedagogy and Anachronism (1923), for example, in which he remarks on some of Kerschensteiner's pedagogical ideas, he states that "pedagogy is merely taking a way of thinking and feeling about the world, i.e., a philosophy, and applying it to educational problems. [...] The important point is that the pedagogue has almost never been the philosopher of his pedagogy" (J. Ortega y Gasset, III, 515). In a late piece of writing, *Apuntes Sobre una Educación para el Futuro* (1953), Ortega says "the idea of education inevitably leads to the idea of a theory of education, which in turn logically and inescapably necessitates a general theory of human things" (Ortega y Gasset 2007, 225), in other words, a general philosophical clarification in which the theory of education may find its firm underpinnings.

The main problem in the progress of education, he notes, is that of making a "general philosophical clarification", but, at the same time, this requires a deal of clarity on the "philosophical diversity" of our time" (Ibid., 226). Ortega seems to agree with this statement, but he is also clear about his priorities: "The practical method of achieving a philosophy of education is not to start by working out a 'philosophical clarification' based on set of questions that are difficult to specify beforehand. In my opinion, what is needed first and foremost is to achieve a clear view of what makes Western man today" (Ibid., 237). Indeed, one of the original aims of education is above all to constitute a system for teaching future generations: "Is it not inescapable to feel in possession of a clear idea regarding what will be, along general lines, the structure of the life those future generations will find themselves in?" (Ibid., 237).

It is important to have clear ideas on this matter, since, as he points out in *Misión de la Universidad* (1930), "we are our ideas" (Ortega y Gasset 2007, 36): "It is compulsory to live up to the times, and especially, up to the ideas of time" (Ibid., 36). Rather than a kind of "idealistic sanctimoniousness," he says, we have to reassess the relationship between contemplation and action and between theory and practice, which means fostering culture over specialism: the contemporary professional is a "new barbarian" (Ibid., 36).

Ortega postulates the need to give young people a "specifically synthesizing" talent (Ibid., 69), so "in the organization of higher education, in building the University, it must start with the student, and not with knowledge or with the teacher. The university must be the institutional projection of the student, the two essential dimensions of which are: one, what he is: scarcity of his acquisitive faculty of knowing; and the other: what he needs to know to live" (Ibid., 49). Indeed, because the knowing that must be acquired contrasts with the limitation in the faculty for learning, it is vital to split up the science of teaching based on what Ortega called the "principle of the economy of teaching": "the child or teen is a disciple, an apprentice, and this means that he cannot learn everything he should be taught" (Ibid., 49). We should only teach what can in fact be learned.

In his conference *Pedagogía de la Contaminación* (1917), a text reflecting ideas akin to those of the Institución Libre de Enseñanza, Ortega said that "nothing truly worth learning can in fact be taught" (Ortega y Gasset 2007, 87). What our schools call "teaching science" is in fact nothing more than a mere "release on the soul of the disciples of a burden of pre-made scientific doctrines or a ready-made doctrinal of research methods" (Ibid., 88). As a result, what gets taught in modern schools is "frozen science, immobilized, supplanted, dogmatized" (Ibid., 88). Moreover, commonly used pedagogy is missing the essential element of science, "the movement of thought floating in an atmosphere of problems [...] People do not want wisdom, but recipes: recipes for manufacturing locomotion devices and alkaloids and serums" (Ibid., 89). The current relevance of Ortega's musings is astonishing. Where in contemporary pedagogy is there room for teaching what cannot be mechanically taught? Where is the space for "that unique reality of science that is the tragic behavior of thought raising itself" (Ibid., 90) in endeavor, while refusing to receive anything rote, whether by inheritance, tradition, or authority? Pedagogy lacks something. And that "something" is the "conscience of culture [...], none other than philosophy" (Ibid., 94), which is precisely what cannot be taught: philosophy is not taught; "at most, it

is contaminated” (Ibid., 94). “In opposition to mechanized pedagogy I say that the only true and un-hypocritical pedagogy is the pedagogy of contamination” (Ibid., 94).

The Falsehood of Study

As a whole, Ortega’s ideas on education revolve around an essential question: what does it mean to “study” and “to be a student”? He brings up this question in the first lecture in the course “Principios de Metafísica Según la Razón Vital” (1932–1933), in which he points out the *constitutive tragedy of pedagogy*: “By putting man in the position of being a student, it forces him to do something false, to pretend the student feels a need he does not feel” (J. Ortega y Gasset, VIII, 559). This first lesson is very important because it constitutes a real exercise in philosophy of education that problematizes some consolidated ideas of pedagogy on study and being a student.

Ortega begins thusly: “We are going to study Metaphysics, and therefore, what we are going to do is a falsehood” (Ibid., 555). The falsehood does not refer to the discipline but to the *studying*. What is false is *having to* study something without feeling any *intimate need* to study it. Ortega insists on an idea: “A truth does not exist on its own, but for the one who has need of it” (Ibid., 556). Unless we are in a particular state of need – which surely implies disorientation and puzzlement – we seek out nothing. It is not the object of study that comes first and then curiosity afterward; rather, it is quite the opposite: because we have an intimate need (and thus concern and care) for something, we feel curiosity and we seek. We do not need anyone to “motive” us. The only thing required to study and therefore to learn what we call philosophy is not an outstanding talent but a *real need* for it. It is not necessary to have special talents but to pay attention. The need Ortega writes of is an intimate, inner need. Thus he states: “The student is a falsification of man. Because man himself is only what he genuinely is, by intimate and inexorable need. Being a man is not being, or doing

(which amounts to the same thing) just anything, but being what one cannot help but be” (Ibid., 561).

That is where the “constitutive tragedy of pedagogy” comes into the picture: in the fact of not acknowledging the falseness of the “doing” that pedagogical knowledge attempts to analyze (i.e., study), something that is in and of itself artificial and therefore false with respect to what man is essentially. Ortega is not claiming that no one should study; rather, he suggests radically reforming the way of doing: “Teaching needs to be turned the other way around, saying: teaching is primarily and fundamentally nothing but showing the need of a science and *not teaching* the science whose need is impossible for the student to feel” (Ibid., 693).

At the bottom of this intimate need is the *radical disorientation* of man. Man needs *orientation*, since living is having to wonder *what to do* next at every step of the way. Life is a project one does by going forward. Ortega goes on to tell us that as an activity, studying is rather artificial, because the human condition cannot be reduced to the condition of man as a being who studies. In other words, the life of human beings is not limited to any of its uses, because there are myriad uses to be made of life. All in all, it hints at something important: since human life is disorientation, man looks to philosophy for a bit of what he lacks, and in doing so, he can only *stop* to think. He has the need to think and he has the need to *learn how to think*; he slows down his pace: he stops, pays attention, and learns to see.

These ideas are of interest because in his discourse, Ortega highlights the extent to which *curiosity*, which always issues forth from a state of need, of necessity, and of radical disorientation – and therefore cannot be presupposed beforehand in the student – is associated with the *amateur* who dedicates himself to something he truly loves (*amat* in Latin). Thus he states: “A curious man is a careful man, i.e., a man who does what he has to do attentively, extremely rigorously and exactly. He is not unconcerned with what concerns him; quite the contrary, he is concerned about his own concerns” (Ibid., 560).

Conclusion

What interest today can there be in the educational ideas from a philosopher the likes of Ortega y Gasset? One way to approach this question is to emphasize the fact that Ortega y Gasset's writings constitute the kind of tentative, essay-like *exercise of thought* needed for theorizing on the human affairs of education that – while taking nothing for granted – help us situate our activity as thinkers, with utmost *attention* to present-day events.

As the lines above have tried to make clear, Ortega y Gasset saw human life as an ongoing *project* carried out in a specific time and place, i.e., in a given set of circumstances, leaving us no choice but to *decide* at each moment on *what to do*. Therefore, thinking is something that we human beings must always do, at all times, to decide on our life, especially when, as Ortega y Gasset insists, the human condition itself involves a radical *disorientation*.

This, then, is where we justify the need for pondering what philosophy actually consists of and philosophy understood not as a professional, academic, or more or less specialized undertaking but as a way of life, as a vital, existential choice. It is a way of life that commands our gaze and our attention to the present and a way of life that catches and piques our curiosity and puts us in relation to ourselves as beings that form part of a world of relations: we are beings in the world we live in, in relation to things and other human beings. In that sense, education is concerned with the art of learning how to be in the world, how to invent and create new ways of being in it, and how to contaminate each other in contact with culture – culture being cultivation and care – because nothing truly worthwhile in preparing for human life can in fact be taught so directly or mechanically.

Overview of Metatheory of Educational Knowledge

Introduction

Metatheoretical study is a second-order study that deals with the nature and characteristics of theory. Metatheory of educational knowledge, thus, takes educational knowledge and theory as its object of study. The questions this study involves are: What is the nature of educational knowledge? What is the relation of educational knowledge to other kinds of knowledge? Is there a unified or different kinds of educational knowledge? How is an educational theory verified? Naturally, there are different answers to these questions given by different metatheoretical accounts. In what follows, these metatheories are reviewed briefly.

Metatheories of Educational Knowledge

As far as philosophy of education is concerned, in an earlier attempt, Hary Broudy (1969) put forward a conception of metatheory of educational knowledge in terms of philosophical inquiry. According to Broudy, since philosophical inquiry deals mainly with speculation and theory critique, these two sorts of inquiry are essential in philosophy of education. He holds that speculation itself might be advanced in two ways. The first is a problem-centered endeavor as Dewey and pragmatists in general do. In the eyes of pragmatists and neopragmatists, educational theory, like any other theory, does not deal with uncovering some laws and realities but is a plan of action for removing and solving the problems of human life. Thus, the validity of educational knowledge can be achieved mainly by its workability. The second way, according to Broudy, for speculation is applying a philosophical view in relation to educational problems deductively. On the other hand, theory critique is also conducted in two ways: either in terms of the logical form of a theory or in terms of its content appraised by means of philosophical and scientific knowledge.

In a more elaborated way, William Frankena (1969) divides philosophical inquiry into three types: speculative, normative, and analytic. In the speculative inquiry, a combination of scientific, moral, aesthetic, and religious experience is

put forward in order to provide people with meaning. In the normative inquiry, the aim is to suggest some standards for human actions. Finally, the analytic inquiry concerns with examining the assumptions of concepts and statements.

Equating knowledge with true statements, Wolfgang Brezinka (1994) has put forward his view on the metatheory of educational knowledge in terms of the kinds of true statements. Somehow similar to Frankena's suggestion, he distinguishes three kinds of knowledge: analytic, normative, and scientific. Thus, there would be three types of knowledge in education. Analytic knowledge give people true analytic statements. While these statements do not give people informative knowledge, they provide them with elaborated awareness of the concepts and statements that might be unnoticed in the first confrontation with them. In the case of the normative knowledge, Brezinka parts with positivists who put a sharp contrast between normative and informative statements. Even though Brezinka accepts the differences between these two statements, he nevertheless takes a moderate position with regard to the normative statements according to which some normative statements are more convincing than others because they provide people with more satisfactory consequences in solving their problems. Still, by talking about scientific educational knowledge beside the normative knowledge, one might think that Brezinka embraces the sharp contrast that he rejected. The question is: Is it possible to have a pure scientific educational knowledge in which statements are void of any normative components? In other words, is it possible to reduce human "actions" in educational circles to mere mechanical behaviors as behaviorists held? Brezinka holds that in scientific knowledge of education, one does not deal with merely facts; rather, a framework of end-means is presupposed because people have an aim and look for proper means to achieve the aim. Thus, he takes educational science as a teleological-causal-analytic science. However, the compatibility of teleological and causal-analytic aspects remains controversial.

An important step in metatheoretical endeavors is no doubt taken by critical views. In

this respect, the most significant role of an educational theory is to critique what is going on in educational centers in the name of knowledge and truth whereas, in the real fact, they have a hegemonic function. Critique being concerned with human finitude goes back at least to Kant. However, there are different accounts of the human finitude than what Kant held. Two important contemporary accounts of critique can be found in the Frankfurt School and post-structuralism. The former has mainly suggested the ideology-critique conception and the latter the problematization (to mention just Foucault) conception of critique. In what follows, a brief exploration is given of them respectively.

In the Frankfurt School there are two conceptions of critique: immanent and transcendental. The former is supported by Max Horkheimer and Theodor Adorno and the latter by Karl-Otto Apel and Jurgen Habermas among others. In the immanent or negative critique, one attempts to find out the limits and contradictions of the existing condition of the society and avoids the imagination of a desired or positive order which is taken essential in the transcendental view. The proponents of negative critique deal solely with particular things and conditions of the society because they hold that the positive view appeals to abstract and absolute categories which make it difficult to evaluate and this can pave the ground for despotism. The negative dialectic deals mainly with ideology critique. In this kind of critique, one attempts to discover different hidden features of false consciousness that is used to justify the constraints of the existing condition of society. Criticizing the hidden curriculum has been one of the famous features of ideology critique in the educational circles.

On the other hand, in the transcendental or positive critique, it is held that negative dialectic is not enough and a positive aspect is also needed. In dealing with the Kantian transcendental question of the conditions of the possibility of human knowledge, Apel goes beyond the Kantian individualistic account and introduces "the community of communication" as the condition of the possibility of knowledge. This is an a priori condition as any meaningful claim presupposes this

transcendental language game (Apel 1987, p. 281). This view paves the ground for Habermas to talk about communicative action and the "ideal speech situation." By appealing to the ideal speech situation, as Habermas holds, it would be possible to reach a logical and rational consensus. The concept of ideal speech situation has led to talk about an "emancipatory" education. Klaus Mollenhauer uses this phrase under the influence of the positive aspect of Habermas's view. An emancipatory education provides people with overcoming the constraints of rationality in the society (Young 1989, pp. 58–59).

In poststructuralism, language has come to the fore in delineating the nature of inquiry. Michel Foucault, for instance, gives the central position to language. Language is not, however, taken here in terms of subjectivity, as was the case in phenomenology, nor in terms of "profound" meanings as it is understood in hermeneutics or in terms of the signifiers used to be the touchstone in structuralism.

In dealing with language, Foucault starts with statements but goes beyond them by looking for the presuppositions of statements, or the positivity of the discourse, and then to the archive. In discursive analysis, what is at stake for Foucault is the social reality of discourse which is taken to bridge the gap between thought and things. By introducing the emergence of discourse as the problematic, Foucault takes a critical view on any conception of theory and knowledge which takes the consciousness and thought as the pivotal point as well as any representational conception that concentrates on things. Foucault's problematization conception of critique undermines consciousness-centered accounts, on the one hand, and attempts to show the impact of unconscious elements in the social reality of discourse. Discursive formation, then, cannot be achieved by anthropologized accounts. Instead, Foucault appeals to events, discontinuities, chance, and, in a word, the relations among the forces. On the other hand, Foucault critiques representational accounts by showing how discourse interposes itself between people and things. According to him, "man and life and nature, are none of them domains that present themselves to the curiosity

of knowledge spontaneously and passively.” (Foucault 1973, p. 72).

The critical core of Foucauldian inquiry appears at two levels. At the first one, by appealing to discursive analysis, Foucault problematizes a state of affair by introducing the hidden discourse that nourishes it or makes it possible. At another level, Foucault deals with the negative aspect of discourses, namely, with what a discourse makes impossible. Here, he introduces his Nietzschean concept of self-creation to show how people might override the requirements of a discourse and think about their self-creation.

This notion brings one to a controversial dimension of Foucault’s thought. While some hold that Foucault rejects truth in inquiries altogether, others believe that he not only deals with immanent truths with regard to different discursive formations but also that in his later works he alludes to a context-transcendent conception of truth (Healy 2005, p. 79). The latter view attempts to show how Foucault’s overemphasis on the “subjugated knowledge” in different discourses has made his interest in a context-transcendent truth invisible.

The hermeneutic approach to inquiry, in its turn, brings to the fore the human understanding. Even though the distinction between “explanation” and “understanding” was once conceived as a crucial matter, after Heidegger and Gadamer this obsession with “method” has been undermined as a sign of the dominance of empirical inquiry. Instead, by putting understanding at the top, empirical inquiry is taken to be as a certain form of human understanding of things.

To limit this introductory note to Gadamer as a towering figure in hermeneutics, the following points can be made about the nature of inquiry, in general, and educational inquiry in particular. First of all, in his attempt to delineate human inquiry, Gadamer takes a postfoundationalist position in the absence of incontrovertible foundations.

Secondly, Gadamer holds that human inquiry has an essential dialogical character. Thus, inquiry begins with a question rather than a claim and continues, instead of counterclaims by others, with taking the question as an open question that

itself needs to be understood and decided upon by means of examining tentative answers of interlocutors. Argumentation in hermeneutics is essentially jurisprudential as it involves weighing the grounds given by the both sides of the argumentation. Being constrained within a horizon, any person has particular prejudices that need to be loosened toward a mutual understanding with others and reaching “fusion of horizons.”

Thirdly, even though agreement with others and consensus is important for Gadamer, understanding the subject-matter concerned has a much more vital position. Thus, consensus is necessary but not sufficient for conducting an inquiry. That is why some (e.g., Christopher 1995) has talked about “Gadamer’s Realism.” That is to say, the thing in itself is important as the aim of inquiry even though it is surrounded by thick layers of prejudices that need to be overcome.

Fourthly, achieving truth in an inquiry is not merely a matter of Logos, namely, dialectic, nor merely a matter of Nous or intuition. Gadamer’s position, instead, is somewhere between the two sharing both of them (Healy 2005, p. 42).

Vandenberg (1974), among others, has brought this “in-between” conception to educational inquiry. According to him, people first understand a phenomenon within their lived experience intuitively. Then, they use certain philosophical descriptions to elaborate that experience. Finally, the theoretical framework itself should encounter with people’s lived experience again.

Conclusion

In the first glance, it seems that different meta-theoretical accounts are hard-line rivals whose rivalry can only be finalized in terms of an either-or logic. In one sense, this intuition is true but is surely wrong in another sense. As far as every metatheory holds an exclusive claim for the validity of its own account, an either-or logic is inevitable. However, if exclusivism is abandoned, then holding a compatibilistic perspectivism would be more convincing. By the compatibilistic perspectivism, I mean that every metatheory has a glance to educational knowledge from a certain

perspective so that these perspectives can have a complementary relation to each other and altogether they provide a comprehensive portrait. Take, for instance, pragmatist's insistence on workability of educational theories in relation to Brezinka's or Gadamer's mild realisms. The workability is, no doubt, a very important criterion for evaluating theories but by no means the sole criterion so that it cannot be compatible with Brezinka's or Gadamer's concerns.

Papatuanuku in a Maori Philosophy of Education

Carl Mika

University of Waikato, Hamilton, New Zealand

Introduction

Maori abstract thought must grapple with the everyday, concrete realities of life (Marsden 1985), and this dual work is initiated and continued by the grounded yet mysterious nature of a primordial entity, Papatuanuku (Earth Mother). Papatuanuku has been attributed with a number of sublime characteristics; one of these is its basis for philosophy itself (Mika 2016). This entry analyses that concept and applies it to a specific, Maori notion of education that turns on the wellbeing of the self. Of particular relevance here is Thrupp and Mika's (2012) interpretation of the verb "ako" (teach/learn), which corresponds with the foundational wellbeing that is provided by things in the world; moreover, "ako" is critical in its stance, because as Thrupp and Mika argue, it resists foreclosing against the full possibility of things in the world – a full potential that has already been offered by Papatuanuku. Maori philosophical thinking hence involves a strong *metaphilosophy* as it seeks to reflect on the speculative exercise

that engages with that thinking, including on those limitations that are scribed by Papatuanuku.

The Influence of Papatuanuku on Maori Philosophical Thought and Education

A Point of Reference: The School of Athens

Maori philosophy retains its own distinctive flavor, but it may also make contact with Western thought. Occasionally, key individuals from the latter are represented in art, and what is suggested in that genre and its subsequent interpretation can be equally as fascinating for a Maori discussion as the alleged congruence of the illustration with the individual's theories. We can refer briefly here to two key philosophers – Plato and Aristotle – and their depiction in the well-known fresco *The School of Athens*. What might be most striking to the Maori onlooker is that Plato is pointing at the heavens; Aristotle, in what is generally taken to be a stark contrast, gestures at the earth. A common interpretation of the fresco is that it signifies the essential difference in their philosophies. Aristotle, who played no minor part in the current focus on taxonomies and essences, deals with the realm of the present. Plato, on the other hand, apparently wants an escape from the realm of appearances and urges thinking in terms of abstract ideas. The division between the two – which, it must be noted, may be exaggerated – has set the path for dominant Western propositions about knowledge itself.

Whether the fresco properly aligns with the full extent of Plato's and Aristotle's philosophies is an intriguing subject, but it is the "either/or" binary in the interpretation that could be particularly revealing for the Maori philosopher and may signal something prominent for him or her. Importantly, Maori philosophy would not necessarily take the dualistic representation at face value, due to its own suspicion that binaries are not reflected so simplistically in the natural face of the world. A Maori worldview would note with interest, though, the possibility that there are vastly different ways of interacting with things in the world, and the Maori philosopher may wish to engage

with that sort of depiction, in the form of a dialogue with the representation. Thus, a Maori reaction to Plato and Aristotle, along with their respective philosophies, is not an incidental one, because it is the *fact* of a dichotomous representation that is especially appealing, not so much a debate on whether Plato and Aristotle deserve to be represented in such a way or not. What may be most significant for the Maori thinker in this instance is, again, the *fact* that a less-than-subtle delineation between sky and earth has been made.

The Importance of Papatuanuku in Maori Philosophical Self-Development

Vital to a Maori incursion into thinking here is the manifestation of a problem: in the present case of the fresco, an illustration potentially jars with a Maori metaphysics that would normally prefer to assign objects to an interrelationship rather than a distinction. The speculation that proceeds from that point is consistently influenced by that initial and delicate "shock," because Maori thought attempts to reintegrate feeling with rational thought (Smith 2000). Feeling, somewhat unusually for any worldview that prefers rationalism, must be acknowledged as equally important in Maori philosophy because it has a stated genealogy with apparently rarefied thought, along with other states of being. The upshot for Maori philosophy is that thought and feeling are inextricable; moreover, the thinker must reflect on that interconnection as much as the topic at hand. Its emotional impetus means that the philosopher is likely to continue to acknowledge that instinctive reaction throughout the work. At the very least, the philosopher may theorize to themselves that they were brought to their work by a feeling or an exasperation. This initial prompt is not forgotten in subsequent arguments, with the Maori philosopher often fluctuating between considering an issue on its own rational terms and suddenly referring to that very first, sometimes irrational, impetus.

The expectation that Maori learning in its broadest sense is most fundamentally linked to a vulnerable relationship with emotion is

highlighted by Thrupp and Mika (2012). Through that emotional response, the self learns. Thrupp and Mika note that the current discourse around the term “ako” reduces the term to its more visible facets of “teaching and learning.” In fact, the term carries with it a sense that far exceeds that didactic approach. Alongside its classroom fit, it also dictates that one is susceptible to what an object withholds from view and that one’s role is to speculate on the interconnection between things, rather than to simply provide a self-originating definition for them. The self is encouraged to explore creative approaches to a thing; in general, teaching and learning with “ako” recognizes the highly active links between the speculative self and what appears to be the object of thought.

This responsive mode of thinking illustrates that there is something involved that transcends pure, rational thought. Let us turn here to the fresco’s more substantive suggestion that thinking either takes place by ignoring or embracing the world of appearances in some measure. Maori constantly reference two central metaphysically vital phenomena in their oratory – Papatuanuku (Earth Mother) and Ranginui (Sky Father). Their English glosses, it should be noted, suffice for concise translation but do not do justice to the depth of their sense. Both phenomena were originally joined but were thrust apart, and thus they appear to be separate. However, both are still joined in some ways even if not physically, with their initial symbiosis persisting in each other in much the same way as an original, emotional impetus for thought does for the Maori philosopher. Papatuanuku in particular has received a great deal of coverage in Maori literature, perhaps because her equivalence with “earth” renders her more tangible. She has also been equated with “the infinite” (Marsden 2003, p. 22) and is the mysterious backdrop or nurturing force for land (“whenua,” which simultaneously means “after-birth”). All human activity takes place within the horizon of Ranginui and Papatuanuku, which are responsible for the manifestation of all things. The self is one element among many that are initiated and sustained by Ranginui and Papatuanuku.

Papatuanuku may also be conceived of as “world” in an active sense, and the relationship of objects with the perceiving self and Papatuanuku is highlighted in the following summation by Raerino (2000):

Kai roto i ngā kupu me ngā momo kōrero, waiata, haka me ngā karakia a te Māori ngā oro o te taiao. Ko ngā oro nei hai tūhono i te ao tangata, ki te ao o te wao. Ko ngā momo oro hai tūhono i te ao kikokiko ki te ao wairua, te ira tangata ki te ira atua. (p. 1)

Within words and the diversity of talk, songs, performance and prayers of the Māori, resides the sounds of the world around us. These sounds link man to the world of the environment. These sorts of sounds connect the bodily realm to the spiritual realm, the intrinsic humanness to the intrinsic godliness. (*author’s translation*)

Sounds here are not just audible waves, but in a Maori sense can be thought of as requests or intimations made between the seemingly external world and the self (and vice versa). With this consistent metaphysical relationship, thought is more complex than the fresco would suggest. Philosophical thought lends itself traditionally to grasping the Platonic forms, to a glance upwards. Most tellingly, it is sometimes termed “blue sky thinking.” It is hence a kind of inquiry that feels inherently different to its other, more empirical, approach. But instead of looking up into the heavens, as if the earth is to be avoided, the Maori philosopher’s gaze is more multifaceted and thought is directed and continued by both Ranginui and Papatuanuku. It is at once both concrete and obscure. Thinking is not as rarefied as Plato would have it, nor should it be as utterly “in the visible world” as Aristotle wants it. From a Maori perspective, the pointing upwards that is meant to signify an escape from what could fool the self is only permissible because of the fact of those entities to begin with. The knowing subject that is “above” entities is never fully free of the world, even though he or she appears to be; instead, those entities continue to reside with the Maori philosopher as he or she moves to where Plato dictates in order to philosophize. The Maori philosopher stays firmly within the earth while ascending elsewhere.

Conceptual Notions of “Earth” Within Education

This position makes perfect sense when we do consider that Papatuanuku’s conceptual impetus is locatable in its notion as “ground.” One distinctive discipline of thought that has emerged since the early 1990s, in written form at least, is kaupapa Maori. The term “kaupapa” contains to it an abbreviation of “Papatuanuku” – “papa” – and is hence constituted by Papatuanuku, with Charles Royal (2008) stating that:

Nā, mō te kupu ‘papa’, he kupu nui tēnei i te reo Māori He tikanga nui hoki i roto, ā, e takea katoatia ana i a Papatuanuku. Arā, ahakoa puta ai tēnei kupu ki whea, kei te takea mai i a Papatuanuku, ka tū rānei a Papatuanuku hei taurira mō te whakaputanga o te kupu ‘papa’ nei. (p. 68)

And so, the word ‘papa’ is an important one in the Maori language. It contains to it some vital philosophical aspects; these are fully undergirded with Papatuanuku. That is, regardless of where this word emerges, it has its basis in Papatuanuku, or Papatuanuku stands within the sign of ‘papa’. (*author’s translation*)

Kaupapa Maori is a theoretical body of work, or a research method, that seeks to address colonization and reclaim Maori autonomy. In the vast majority of cases, it is positioned as a Maori ground for social, human-centered activity, but its metaphysical congruence with a ground beyond the human self deserves to be reiterated here. “Papa” may be thought of here as the conceptual soil for a relationship with an idea. The “papa” element of that practice is responsible for thinking, because it is the ground that endures in all cases. It shows itself in Thrupp and Mika’s “ako” to the extent that it draws the Maori learner on to question, inquire, represent, and articulate but never fully leaves the thinking process although thought seems to have soared away from it. This ground also encourages continual thought on the nature of colonization – itself an educational exercise. It highlights the need to reflect on a potentially unpleasant aspect of existence so that the self is formed by a critique: “ako” in its focus on vulnerability is thus congruent with a speculative glance towards what is antithetic as much as pleasant (Thrupp and Mika 2012).

“Ako” proposes that the environment “moves towards us” (Thrupp and Mika, p. 210), with the self responding. Thought, when assessed against the active process that “ako” dictates, is not outside of the influence of those more earthbound things, as they have been initiated by the ongoing and active influence of Papatuanuku. The inescapability of the earth for the Maori thinker is also reflected in yet another term that has certainly suffered in translation. The sort of “groundedness” that is suggested in the term “whakapapa” and its association with “papa” is not commensurate with its English linguistic and conceptual equivalent, “genealogy.” “Genealogy” as a translation is perhaps more reminiscent of a sequential display of different “grounds” rather than an active and persistent “grounding” that “papa” depicts. It is true that whakapapa does denote a relationship between all things in the world, but what is more intriguing about the term is the role of the earth as a conceptual ground in thought. “Whakapapa,” read as an active concept, depicts the “becoming” (“whaka”) of a ground (“papa”) throughout all things in the world (Mika 2011). This ground for a Maori philosopher may be one that involves a given capacity to reflect on other things in the world: it “becomes” in the sense that it provides a fluidly speculative approach to the nature of all things. “Ako” in this case, as a possibility for a learning process, is associated with this ground to the extent that this ground draws one’s attention to one thing *as* it relates to all other things. The self then reflects on both the thing in itself and that relationship. The “becoming” that is alluded to here is a subtle irruption into the self’s perception, such that thinking takes place. Again, we can detect that one is exposed, in the susceptibility inherent to ako, to the outer world, and that thinking is dependent on the lure of Papatuanuku and her originary relationship with all things that exist.

Maori access to thinking in the learning process is therefore incredibly important, because it needs to take place on its own terms and within the influence of that intangible interplay between the earth, the earth’s continuous becoming (“whakapapa”), and its intellectual manifestation through a critique of the base of colonization

(“kaupapa”). Maori are not able to freely reflect on (and within) that primordial ground described above, partly because philosophical research in general appears to be marginalized and also due to the nature of philosophy in schools and universities. It is only marginally visible in schools and, although it occupies a privileged position as a discernor of first assumptions in university study, it does not often attract funding to the extent that its empirical counterpart can. It is also characterized by speculation rather than certain knowledge and is therefore associated with the continual process of inquiry rather than a neatly packaged “outcome.” For Maori, the withdrawal of philosophical thought in the academy and in schools represents the recession of Papatuanuku in the active nature of thought and poses some serious repercussions for one’s self-formation, which can be equated with “ako” and its emotional and spiritual relationship with things in the world. Philosophy in a Maori setting is intimately related to the balance of the self with the external world, and indeed that world is not so external as it constitutes all its individual elements. Maori philosophy therefore acknowledges that speculation about that external world is simultaneously to inquire into its proper representation and, crucially, the connection of that process of theorizing with the community’s health. To that extent, a Maori *papa* of thought is consonant with the balance of the self and the world.

Summary

Maori oratory recognizes and acknowledges the role of the earth in thought and existence generally. Learning is not exempt from its influence, because one is immediately underscored by the earth even as one is moved to represent aspects that originate from it. The term Papatuanuku, as we have seen, shares ontologically in the learning that is proposed through ako. Both indicate that the thinking and learning self is at the mercy of a vast constellation of elements that, in turn, ask that speculative self to represent the world with that complexity in mind.

Introduction

This section covers a description of the term “Pasifika” people in New Zealand. Furthermore, an explanation of the use of the term Pasifika is covered, as it pertains to people’s identities through the evolving nature of diasporic movements. Examples of diaspora include youth and education are also explored. Finally, the section ends with coverage on the Rethinking Pacific Education Initiative.

Who Are Pasifika People?

This entry is focused on Aotearoa/New Zealand’s perspective of the term “Pasifika.” The umbrella term “Pasifika” has been used by the New Zealand government to describe the ethnic makeup of people migrating from the Pacific Islands to Aotearoa/New Zealand. The origination of the word Pasifika is from the Niue language. In this entry, the term “Pasifika” is used interchangeably with “Pacific,” and Bedford and Didham (2001) state that the term “Pacific” has been commonly and widely utilized at all levels of society including educators, policy makers, community workers, the media, and institutions. In fact, the use of the term has often led to broad generalizations about a group of people who in fact are extremely diverse. Many Pasifika people do not solely identify as saying they are “Pasifika.” Rather, people self-identify with their specific Pasifika ethnic group (e.g., Niuean or Tongan or Tuvaluan). With the different terminologies of Pasifika, (Pacific, Pasefika, Pasifiki, pan-Pacific, to name but a few), there has not been one term that has been consistently used in New Zealand. Pasifika and non-Pasifika people select the term they find most appropriate and relevant to them to use.

Aotearoa/New Zealand is a country that has attracted people from the Pacific Islands over a long period of time. Macpherson et al. (2001) identified that at the end of World War II, there were 2,200 Pasifika people based in Aotearoa/New Zealand. With the subsequent flow of migration, Pasifika people were coming to Aotearoa/New Zealand for various reasons, such as employment and education. In the 1950s, the New Zealand government encouraged a more diverse population to become involved in the workforce. In particular the labor market attracted the flow of Pasifika people, and it was at this point in time that the Pasifika population began to change in size and sociodemographic character (Macpherson et al. 2001).

Similarly, the New Zealand government used the term “Pacific Islanders” in the early 1980s to group and to classify New Zealand migrants belonging to various Pasifika ethnic groups under one name. In the early 1990s up to the present, this

term has evolved into various names such as “Pacific Islands,” “Pacific nations,” “Pacific peoples,” and “Pasifika” or “Pasefika.” The term “Pacific” has been commonly and widely utilized at all levels of society including educators, policy makers, community workers, the media, and institutions (Bedford and Didham 2001).

The “Pasifika Education Research Guidelines” (Anae et al. 2002), developed for the Ministry of Education in Aotearoa/New Zealand, provides one definition of Pasifika peoples. At the time of development, it made reference to the six Pacific nations, namely, Samoa, Tonga, Niue, Cook Islands, Tokelau, and Fiji. In this context, “Pacific people” is exclusive of Māori and in the broadest sense covers peoples from the island nations in the South Pacific and, in its narrowest sense, Pasifika peoples in Aotearoa/New Zealand. The research guidelines go on to clarify the issue of Pasifika people as being a heterogeneous group with different inter and intra-ethnic variations in the cultures. Variations include New Zealand-born/New Zealand-raised, island-born/island-raised Pasifika people being recognized as diverse groups.

At the time of writing, Pasifika peoples are defined as New Zealand residents belonging to the seven Pacific nations, namely, Samoa, Cook Islands, Tonga, Niue, Fiji, Tokelau, and Tuvalu. There are 265,974 people identified in this ethnic grouping, which represents 6.9% of the country’s total population. As a significant population in New Zealand, Pasifika people are a multiethnic group. Diversities exist at specific levels. One of these levels is called cultural diversities which refer to differences in language and culture between all of the Pasifika ethnic groups. Another level is the intra-cultural diversities where differences are associated with youthful groupings. Some groups include diversities that are traditional in nature and differences between village or island heritages. As an example, priority is placed on a particular island (e.g., Pukapuka) over the affiliation to a national birth place (e.g., Cook Islands).

In a geographical definition, Pasifika people are commonly defined by Westerners as people living in Oceania particularly in the sub-regions of Polynesia, Melanesia, and Micronesia. These

island nations in the South Pacific have diverse cultures, different languages, and various ethnicities, which constitute the three most salient features of its people. In 1820, French explorer Dumont d’Urville coined the terms “Polynesian,” “Melanesian,” and “Micronesian” to describe and to distinguish the Pacific and its inhabitants from the rest of the world. Each “nesian” grouping has distinct characteristics. In breaking down the word Melanesian, “Melas” refers to black and “nesos” refers to island, encompassing New Guinea, Bismarck Archipelago, Solomon Islands, Vanuatu, New Caledonia, and Fiji. Melanesians make up more than three-fourths of the indigenous Pasifika population. Micronesia consists of Palau, Guam, Northern Mariana Islands, Federated States of Micronesia, Marshall Islands, Nauru, and Kiribati. Micronesia is one-twentieth of the Pasifika region population and to the East of Polynesia is French Polynesia (Tahiti Islands) and Rapanui or known in the English name of Easter Island.

Often the question is raised, so who is a Pacific Islander? Hau’ofa (1994) believed that the question does not need to be asked if Oceania is used. This was a term coined by the late Professor Epeli Hau’ofa (1994) who pointed to the sea of islands, being Oceania. The expanded Oceania is extensive across the world from Australia and New Zealand through to the north to the USA and Canada. Oceania is about a world of people connected to one another by the sea.

Pasifika languages are diverse, with several hundred spoken lingua franca across the Pacific. There is some familiarity with either English or French as one or other languages have been used in virtually all the Pacific Islands. In Vanuatu, as well as the lingua franca of Bislama, English and French languages are both used due to British and French colonization.

The people of the Cook Islands, Niue, and Tokelau have a free association relationship with New Zealand which permits the people of these islands to have New Zealand citizenship, while their own country makes their own laws and conducts its own affairs. This is one reason why there are more Cook Island Maoris, Niueans, and Tokelauans living in New Zealand, than in their home island nations.

Pasifika Diaspora

Since the 1950s, Pasifika people have migrated from the Pacific to countries such as New Zealand, Australia, and the USA. Pasifika people live all over the world and are known to be a flowing diasporic population. Generations of Pasifika people are born outside of their Pacific nations, and as a result, many Pasifika youth do not know what it is like to grow up on an island. The onset of diaspora presents certain challenges such as language maintenance. Pasifika youth are more likely than their grandparents to grow up speaking a language that is not their mother tongue. There are many reasons for Pasifika diaspora. It is known through Pasifika communities that the journey of migrations for Pasifika people in New Zealand was about obtaining opportunity in a land of “milk and honey.” This meant that a vision of a better lifestyle and employment for their children was highly important. Many Pasifika parents and families place a high emphasis on education as a way to obtain qualifications and then go onto well-paid careers. There are other motivational factors for Pasifika migration. Remittances are one of the biggest forms of economy in the Pacific region with families and individuals living away from their islands and working in countries as a means to send money back to their families. Educational opportunity abroad increases the likelihood of earning wages or salary that is higher than what can be earned in the Pacific.

Pasifika Youth

Generations of youth who have Pasifika heritage are being born in countries that are not their original ancestral home country. Pasifika youth make up over 50% of the Pasifika population which makes them predominately New Zealand-born Pasifika or Pacific. Because of this reason, it is often described by commentators in education that Pasifika youth are struggling with identity formation and conceptualization. Their worldviews and lifestyles reflect an individualist

approach which is more and more different from their elders. New ethnic identities are being formed especially with the influence of Western cultures and the high use of the English language.

Issues have been associated in describing Pasifika youth identities. There is complexity in positioning the Pacific Samoan self in ethnicity (Rimoni 2012). The experiences of growing up in a country that does not reinforce the value systems of Pasifika cultures pose challenges for cultural identity and what it means to be Pasifika. The notion of “Pasifika edgewalking” has been used by Tupuola (2004) to explain how Pasifika youth “edgewalk” between identities and roles that are Pasifika and Western because they are influenced by both cultures. Local and global cultures influence generations of Pasifika youth which allow them to move between cultures or live between two (or more) worlds. In this notion, Pasifika identities are fluid and constantly changing. Music, fashion, and media come together to influence the way Pasifika youth represent their identities which are somewhat different from their elders. The ASB Polyfest, the largest Secondary School Performing Arts Festival which is run in Auckland, New Zealand each year since 1976, provides an avenue for Pasifika youth to compete as Samoan, Tongan, Niuean, Fijian, Cook Island Maori, Tuvaluan, and Tokelauan performers for their schools. The festival is seen as a competitive but culture-embracing event that allows for Pasifika youth to learn the cultural practices of their Pasifika ethnic groups. The 2-day event is judged by Pasifika elders who are experienced in the culture and language. The schools and youth spend countless hours preparing and practicing for the major competition. Pasifika secondary school performances extend beyond the city of Auckland, which has the highest population of Pasifika youth in New Zealand. Smaller cities in New Zealand are also taking up the Pasifika youth performances as an approach to motivating and affirming identities of Pasifika. “Malaga” (or journey) was the name given to a group of Pasifika students’ cultural show based in Porirua, Wellington (Mackley-Crump 2011). Over 900 students were involved in the show.

Education and Pasifika People

For Pasifika people, education is located in formal (early childhood education, schools, and tertiary institutions), as well as informal contexts such as the family. Informal learning and education has occurred in Pasifika homes and communities for many generations and has been perceived as part of lifelong learning. Lifelong learning has its roots in traditional education with Pasifika elders which enable opportunities for young people and adults to learn specific cultural skills and knowledge. Telling stories is integral to the practices in the Pacific Islands. This is how Pasifika people have taught one another. This is how specific learning takes place, on certain principles and values. Another institution of learning has been the church. The church has provided a place for the mother tongue language with services being spoken in Tongan, Samoan, Cook Island Maori, Tuvaluan, Tokelauan, or Fijian, as examples. In New Zealand, early childhood language centers or nests have been traditionally founded by some of the churches and have been designed to support Pasifika language maintenance and growth. Typically, the mothers of the communities have been the pioneers of such centers and the educators of the young children.

The situation of New Zealand Pasifika education has been evident in the inadequate academic achievement rates. The issues are long standing. For example, 28% of Pacific students left compulsory education with no formal qualifications in 1999. As a result of educational challenges, the New Zealand government developed the Pasifika Education Plan (PEP) in 2001. The plan was developed to provide strategic direction for educators and communities to improve the outcomes for Pacific students in early childhood education, the compulsory (primary and secondary) sector, and tertiary education. Since 2001, the PEP has been revised and relaunched by the Ministry of Education. It was a document reflecting the changing priorities of Pasifika students and families. Further, it was a plan to integrate community input and consultation, by recognizing the roles of the family and community. The plan was about

Pasifika people, educational services, and the government working together.

New Zealand tertiary education includes all involvement in post-school formal education. This encompasses foundational education (such as adult literacy), certificates and diplomas, bachelor degrees, industry training, adult and community education, and postgraduate qualifications. Tertiary education institutes (TEIs) include universities, polytechnics, colleges of education, Wananga (Maori higher education institution), and specialist colleges. In terms of educational performance in higher education, 30.4% represents Pasifika school leavers with a university entrance standard and 25.6% corresponds to the tertiary participation rate of Pasifika students aged 18–24 years old. Of the Pasifika students enrolled in tertiary education, 75.6% enrolled in their second year, but only 39.9% of Pasifika students were able to complete their qualification within 5 years. Of 213,120 Pasifika students, 1500 (0.7%) enrolled in postgraduate-level study. These figures show that the educational progress and academic achievement of Pasifika students has slightly and steadily improved compared to previous years.

The Birth of Rethinking Pacific Education Initiative (RPEI)

The discourse of educational challenges for Pasifika people does not only exist in Aotearoa/ New Zealand but also out to the Pacific region. But the year 2000 marked a significant change in education for the Pacific region. Three key leaders in the Pacific came together literally under an umbrella in the pouring rain. Associate Professor Kabini Sanga, Professor Konai Helu Thaman, and Dr. 'Ana Taufe'ulungaki were waiting for the rain to stop, and, as they huddled under the shelter of the umbrella, they came to a point where they decided that it was time for some dynamic changes in Pasifika education. As a result of the umbrella of discussion, the three leaders brought together other key leaders and educators, Pasifika and Maori, in a colloquium to begin the rethinking

of Pasifika education. From the colloquium, participants began to identify the issues, challenges, needs, and areas of attention for their Pacific countries. Papers were produced and edited into a book, the “Tree of Opportunity” (Pene et al. 2002). The rethinking Pacific education initiative (RPEI) was a significant and positive turning point for Pasifika education in the Pacific region. The word “Pacific” was used as an embracing descriptor of Polynesia, Melanesia, and Micronesia. The official government aid development agency of New Zealand (NZ Aid) became the principal funding organization for the initiative. RPEI initially began mobilizing and engaging with an initiative in Vanuatu. However while RPEI started within a collaborative initiative, it became a philosophy and a movement. The rethinking Pacific education initiative snowballed and outlasted the funding. Leadership development and mentoring is a constant strategy in building up island countries’ educational development. Pasifika people are assuming responsibility for their own communities by focusing on what skills and knowledge they have, rather than focusing on what is not available.

Introduction: Philosophy and the Philosophers on Stage

Philosophy and education have since their beginnings, in the context of Western traditions rooted in European, Ancient Greek, and Roman culture, showed strong affiliation toward each other. Although philosophy has traditionally been regarded as a fundamentally lonely activity, it is yet only one side of a complex and indeed dynamic picture. The philosopher depicted as the lonely thinker is appropriate in one sense, since thinking — as any cognitive processes in general — always takes place as a critical process

(*intra muros*), i.e., inside the mind. Philosophical thinking has a critical character, in the sense that its main purpose is seeking answers, or as first, seeking appropriate forms of questioning, often fuelled by a deep crisis of various possible sources and features.

The processes in the cognitive sphere coined as philosophy are yet not as individual as it is generally viewed. Not because the processes within the mind would lose their individual character, but – unless they are not confined in a solipsistic world – they must be acknowledged as such in a public discourse. This external characteristic as a condition of philosophy, i.e., the need of philosophical thinking to be identified as philosophy, indicates the other side of the philosopher. Thus we may remember the philosopher as depicted in various social environments, e.g., in the circle of his disciples or being engaged in discussion with peers, etc. The philosopher must be ready to share his ideas, with different possible goals: seeking confirmation, provoking the public, or teaching the young (Arendt 1978). Whatever ambitions he may have, overt or covert motifs behind his public activities in the field of philosophy, these activities are not external to his existence as a philosopher. The Master of philosophy is not simply a wise person bringing forward original thoughts on universally relevant issues, but he must be acknowledged as such by his fellow philosophers and as a rule, by the following generations of his peers – regardless, in historical perspective, of his public reputation.

Apart from its public reputation, philosophy seems to have always been in the need of legitimizing source, i.e., the sphere of philosophers, characterized as a dynamic discursive process which provides the models, strategies, and policies of teaching philosophy with general frameworks at any time. Philosophy, though sometimes regarded as a holy entity, has always been defined by philosophers, who in their due turn would deliver the legitimizing label to their peers according to specific rules, either written or not. Raphael's well-known fresco, *The School of Athens* (*Stanza della Segnatura*, Vatican), could be telling in our perspective, in a twofold sense: first, as grasping the complexity of a symbolical though

virtual gathering of the greatest philosophers and scientists in the Antiquity, in the very center of picture with the two greatest philosophers, being regarded as such by their contemporaries. By this moment, their symbolic presence and mutual acknowledgment provide legitimacy to each other, thus having rendered to be respected as such by later generations. The moment grasped by Rafael is by no means ephemeral to the time of its creation, the first decade of the 1500s. This is not only the representation of gathering of ancient philosophers but the moment of the glorious victory of philosophical reason and rationality against the exclusivist omnipotence of Christian theology and the scholastic education of philosophy of the time. The free spirits of the ancients have been liberated from the tutelage of doctrines embedded in another important tradition, fiercely defended by the authority of the *Mother Ecclesiae*, commonly known as the *Roman Catholic Church*. At the same moment, all the various spirits of modernity, as regards philosophy and the sphere of sciences, were set free to develop into innumerable varieties – to fight against and by rewriting, preserving most of the traditions of the main historical paradigms.

As mentioned above, we may discern the philosopher engaged in his utmost individual activity, mentally active in various fields of the cognitive sphere, on the other hand pursuing philosophical discourse in the context of a specific public sphere – specific in the sense that it would provide him with the legitimate label, acknowledging him as a philosopher. Needless to say, philosophy and philosophers have a unique position, so much differentiating him from the men of any other science: findings of philosophical inquiries are not only questionable, or defiable, but, much worse, often found hardly verifiable. In fact, again unique to philosophers, their findings are often refuted by their own disciples (if not, their disciples are probably not philosophers themselves). It still does not necessarily mean that they are not philosophers. But in more serious cases, it may also happen that philosophers are denounced, which is possible on the same grounds – as so often seen in abusive forms of show trials.

At this moment, we ought to remember the unique character of the relation between the philosopher and his relation to the public, in general. The philosopher's reputation tends to be curiously contrastive, especially in critical periods, when philosophers are put on stage, to the extremes: either highly prestigious or deeply suspicious (Aristophanes 2003). The archetypical conflict refers to a most critical period in the history of Athens, highlighted by the trial of Socrates. Among the major affects it is well-known Plato's decision to leave the public sphere, with all its consequences to the crisis between the political and philosophical spheres – as regards to the interpretation of the public sphere in Plato's philosophy (Arendt 1978).

Three Perspectives

Thus, philosophy in the context of education may perhaps be characterized in three essentially different perspectives to describe the most characteristic paradigms in the context of education, or in a strict sense, teaching philosophy. Far from any intention toward an essentialist typology, these three types are as it follows: (1) the Socratic tradition, (2) the Academic paradigm, and (3) the modern paradigm, with its abundant variety of models, yet usually with more or less overt ideological motivations. The first two great paradigms – resisting to be confined in periods of times – provide models developed under the influence of the Socratic and Platonic ways of interpreting the role of the philosopher in close relation to the meaning of philosophy. In any case, Socrates and Plato provided two sides of the same line of a philosophical school, probably the most influential one of the Greek classics. In Athens, the political, cultural, and economic center of the Mediterranean in the fifth century, Socrates and his disciples paved the ground for a strand of pursuing philosophy on very similar grounds – with two entirely different outcomes. These models made possible the development of two great models in dealing with philosophy. The common ground may perhaps be best grasped by the concept of *paideia* worked out by Werner

Jaeger in his interpretation of Plato's philosophy in the frame of the fundamental concept of educational activity (Jaeger 1963). Here we may recall some key points from the development of the Greek philosophy (Heidegger 1959). Humans, as strange beings as they are in Nature, and against any other naturally occurring existent, are aware of their own mortality. However, they have some other special faculties that are not clearly conceptualized but help them to find themselves closer to the so-called divine sphere. In a long and complex process of evolution, Heraclitus, Pythagoras, Parmenides, just to mention only a few names, had proceeded in developing a conceptual framework that would allow a movement in the cognitive sphere to understand the world of invisibles, i.e., *ideas*, otherwise not revealed to human perception. Cognitive skills in the field of mental faculties enable a strange mobility – that is moving “upwards” – toward a monolithic center of truth that reveals itself to a *divine* capacity, i.e., thinking. This is the point when we first encounter the term philosopher, characteristic to Heraclitus, who had decided to leave the annoying world of the political sphere. As it is known, immortality was accessible to the Greeks by an extraordinary action that is visible to all and worth of memory of all (Kirk, Raven Schofield 1983). It was revolutionary – and very antipolitical – that inside the cognitive sphere, by ascending to the sphere of logos, men may leave the world of mortals and join the world of immortals (the interpretation of “soul” is not a matter of interpretation in here).

The Socratic Pattern

It was the work of the Sophists and Socrates which made possible that philosophical inquiry took the form of critically engaged discourse and as such introduced into the *polis*, metaphorically speaking, to public spaces of the *agora*. However, in contrast to the Sophists' pragmatism, Socrates relied on the pursuit of *paideia* not for any educative purpose, such as adopting certain techniques to outsmart any given counterpart, nor in order to conveying a set of knowledge, eventually practicing the acquired skills. The Socratic model of

paideia (as far as its interpretations are based on an authentic interpretation of solely indirect sources) implies that we are responsible for the world of mortals, i.e., we ought to encourage all our fellow humans, especially our fellow citizens to critically revise the concepts they rely on during their everyday pursuits. Humans share certain commonness in their faculties, e.g., *sensus communis* that would allow everyone to make distinctions and draw conclusions by using commonly accepted rules of logic (Arendt 1982). In this way, teaching does *not directly* enriches the person with the idea of good – as a set of knowledge that must be learnt so as to gain better life and attain a good community, described as just and fair – therefore content in itself. Thus, Socrates was engaged in the everyday life of the polis, and was interested in everyone's lives (he participated in battles fought by the city but also enjoying rather frivolous *symposia*), assuming a universal responsibility in a community that was given to him by birth.

Among later forms of the Socratic tradition, the concept of *cultura animi* can be mentioned (Arendt 1982), although it meant, in the Roman period of time, a combination with various forms of Academism. Similarly, *skepticism* might also be reckoned as heir of the Socratic tradition. In the past century both early phenomenology and Wittgenstein – with the first attempts of the first Vienna Circle (*Wiener Kreis*) – found interest in the critical understanding of the language of philosophy or even the everydayness. Together with their successors, such as pragmatism and critical thinking they are sometimes regarded as being influenced by the Socratic tradition. However, most of these intentions have hardly gained any impact on the *patterns of education* – except their immense popularity as topics of teaching and studying philosophy (Pfister 2010; Liessman & Zenaty 2004).

The Platonic Pattern: Academism

The second model of teaching philosophy, probably the most influential paradigm of education in general, is embedded in the tradition of academic

philosophy. Thus, as mentioned above, the Platonic model of *paideia* bears the hallmarks of the consequences of Plato's experiencing his Master's trial, as Socrates' most famous disciple decided to withdraw from the public sphere and turn his (mental) eyes toward the real objects – far from perishing in the sphere of opinions. This is the moment when the philosopher will take the role of a leader of the young soul – hence the term pedagogy as compounding *paidea* + *gogos* – leading him out of a sphere of shadows and uncertainties. Against the Socratic practice of *paideia*, Plato had introduced two remarkable changes, apparently both having technical character, yet profoundly influencing the understanding the role of philosophy and that of the philosopher (Jaeger 1963).

1. The activities of philosophizing and teaching will be drawn into the safe and *autonomous sphere of Academy* – literally isolating it from the unsafe world of politics. Thus Academy was conceived of as analogous to the model of the cognitive sphere – as the justly leading part of the soul – against the inferior parts of the soul, closer to its eternal counterpart, the body. Further, Academy had been isolated from the body's equally perishable worldly formulation, i.e., the polis.
2. The *specialization of the fields of universal knowledge*, for the time being resulting only in methodologically separated disciplines, to be further divided by the Aristotelian model of philosophy and its particular forms of education. Thus, the once universally present logos will be transformed into techniques of *logics*, also as means to be applied in different forms of *-logies*, to be sure, always having the ambition to provide universal coverage to all known physical, political, or spiritual existents.

The Modern Pattern(s)

Although modern forms of theories and philosophies of education, comprising the role of philosophy in education, here labeled as a third paradigm, have been interested in pedagogy, they are approaching the “original” understanding

of *paideia* in departing from or showing contradictory ways to it. As they are regarded here as ideologically motivated paradigms, teaching philosophy may be seen as modern development, with their roots in a *revolt against scholastic education*. So much different in their characteristics that indeed impossible to coin all of them under one term, the loose term still refers to various models whereby ideology plays – either overt or covert – yet decisive role. Generally speaking, and in an allegedly oversimplifying way, educational models, explicitly in teaching philosophy, have evolved under the tutelage of political ideologies, especially that of liberalism, nationalism, and socialism, or as usually, a specific combination of these dominant ideologies. It is also relevant that ideologies, in the context of understanding the *legitimate role of philosophy and the philosopher*, are closely related to the ways ideologies define some of the basic values of the human existence. To be sure, ideology is not meant that they are learnt, say indoctrinated as ideologies, but certain values are not only treated as topics of discursive (critical) learning, but they provide a *normative framework of education*. The principles upon which different models of teaching philosophy are being built have acquired ideological characteristics all over modernity. In the context of modernity, we may mention *some* of the cardinal values: *human dignity, freedom, justice, individuality, and the stability of the State* (Hobbes 2011; Locke 2001; Rousseau 1979). Although they are manifold in character, they are primarily associated with ideas that are *defining humans* as such, without relying on *any transcendent foundation* and serve as an overall ground for the *stability of a political community*.

Totalitarian regimes, as extreme cases, may represent specific forms in ideological formulations – however, in general outlines, often imitating some of the Western formulae (social justice in appropriate political order, the concept of “end of history,” social Darwinism, etc.). In its extreme forms ideological education is ready to penetrate the autonomy of the sphere Academy, severely corrupting the autonomy of philosophy and that of the education, in general. The other moment in totalitarian forms of

ideological education, paradoxically though, draws closer to the Socratic tradition by its *holistic approach*, bearing a specific political intention: each human being is *responsible for the world*. That is why, surely not in ironical sense, philosophy was also coined as *the worldview* in the educational programs of Communist countries.

Toward *Paideia* in Teaching Philosophy

The Socratic-Platonic tradition still today lurks over the Western tradition in contemporary education, in both forms of the classical paradigms. Platonic Academism is present in the sense of systematic, specialized yet reflective ways of teaching philosophy – present in either basic forms of teaching philosophy: be it *history of philosophy* or *problem-based teaching*. However, providing universal forms of didactics in philosophy, the efficiency depends on a thoroughly processed syllabus and detailed scheme of each lesson. These techniques are often associated with a certain *authoritative* teacher’s attitude; personally varying communicative skills may prove very efficient if selection of texts and topics are appropriate to the target group’s cognitive skills.

The Socratic tradition, in the strict sense, is also present although more often through the teacher’s personal – often *charismatic* – attitudes, with all its advantages and hazards: students motivated in autonomous thinking may feel engaged in further reading, thus resulting excellent results, with potentially long-lasting interest in philosophy. On the other hand, the hazards are also well-known: many students may feel neglected, or disinterested if the teacher is focusing his efforts to a relatively close group of students. These methods are preferably applicable, more efficiently practiced in groups where the course was the students’ own choice, such as in optional seminars, classes, reading clubs, etc.

As a summary, the Socratic model of critical discourse has often been noticed as a most influential form of motivating students to engage themselves in further philosophical readings. However, as a model of teaching philosophy, the Socratic model is acknowledged in a very restricted sense – usually without its basic pursuit of *paideia*, since it is not regarded as compatible

with the fundamental aims of the schooling system. By definition and following the very original experience of Socrates, it is regarded as a way of philosophy that means too high risk to the stability of the social and political order. Still, in critical thinking, for example, certain techniques are adopted, yet hardly assuming the universal responsibility and existential risk, so much characteristic to the philosopher who had never written down a word in his life.

Another, relatively new development seems to apply a certain Socratic way of philosophy, yet questioned by many professionals. The worldwide movement known as *Philosophy with children* has often been regarded as philosophically not legitimate, it still seems to have been spreading and preparing pupils to be open for philosophical thinking: reflecting on the everyday life phenomena, finding conceptual tools and logical forms to a critical understanding of their world. Whatever means applied, philosophy with children may also prove to be a path toward the old tradition of *paideia*.

Peirce and Embedded Philosophy of Education

Phyllis Chiasson
Davis-Nelson Company, Port Townsend,
WA, USA

Introduction

Peirce's contribution to educational philosophy is embedded within his phenomenological construct. This educational philosophy is general enough to provide for nearly all learning needs and interests, yet specific enough to provide for widespread testing and verification (Hechinger 1960). Peirce's phenomenology provides a sturdy foundation for the development of educational practices that can elicit essential and overarching learning capabilities in young children through adults (Chiasson 2008a, b).

Discussion

Phenomenology is descriptive; it is the study of appearances, which requires facility with proto-reasoning skills, the skills of a good phenomenologist (Peirce 1935, Vol. 5, para. 41). These are skills required for eventual facility with critical thought.

Thus, a good critical thinker in a Peircean sense is first of all a good phenomenologist; that is, someone who can observe without judging, relate in multiple ways, and interpret without deciding.

Facility with these pre- (or proto-) reasoning capabilities can then lead into insightful but untested hypotheses. Hypothesis construction (by means of retroduction) is the very essence of critical thinking, requiring an interplay of Peirce's three sorts of inference types: abduction, deduction, and induction.

Peirce's unique phenomenological construct suggests these proto-reasoning capabilities, which he identifies as necessary for achieving the insights necessary for proto-abductive inferences, must also be necessary for the eventual development of effective critical thinking skills. In Peirce's sense then, a good phenomenologist is someone who possesses the pre-/proto-reasoning skills necessary for engaging thoughtfully and deliberately with not only plans and processes but with possibilities as well.

Phenomena are comprised of things and their qualities. Qualities are the properties of things (including ideas and events), which describe them and/or distinguish one thing from another. Peirce contends that a phenomenologist becomes expert by learning to observe carefully among the qualitative similarities and differences of things without placing judgment upon them (Peirce 1935, Vol. 5, para. 43).

Mastery of critical thinking skills, the psychological equivalent of Peirce's normative sciences, requires that one first master the proto-reasoning skills of a competent phenomenologist. Proto-reasoning skills include the ability to notice, analyze, and then interpret/reinterpret phenomena. From a Peircean point of view, mastery of these phenomenological skills is essential prior to even attempting to develop the semiotic skills of logic and reasoning (Peirce 1932, Vol.1, para. 186). By mastering proto-reasoning skills, even very young children learn to become observers and chroniclers of phenomena, preparing them for the eventual mastery of critical thinking skills.

As with all learning, proto-reasoning skills can only be mastered experientially. For, as Peirce writes "[We] can know nothing except what we directly experience. . . . All the creations of our mind are but patchworks from experience" (Peirce 1935, Vol. 6, para. 492). While the acquisition of facts and examples are a sort of

experience, they cannot substitute for direct and deliberate experience with phenomena.

Proto-reasoning skills enhance direct and deliberate experiences because they enable the suspension of judgment while deliberately engaging with phenomena by:

- 1. Qualifying (noticing/identifying the qualities of things)
- 2. Relating (comparing and contrasting qualities of things)
- 3. Representing (expressing/interpreting things) (Peirce 1935, Vol. 5, para. 436)

Thus, the basis for Peirce’s embedded philosophy of education (which is a sort of *design for thinking*) is the same basis as for his philosophy overall: that is, his particular version of phenomenology, which he also termed the *Doctrine of Categories*. By developing verbal and nonverbal facility with these overarching *Categories*, individuals can gain the ability to engage more effectively with specific learning requirements in both the cognitive and practical worlds.

Qualifying

Qualification is the first platform of Peirce’s embedded philosophy of education. Quality, the category that Peirce named “Firstness,” provides the basis for the development of proto-reasoning skills. Qualities fall into three broad types, which Peirce called “modes of being” (Peirce 1932, Vol. 1, para. 23). Those types are (1) affective (feeling based); (2) sensory (sense-based perceptions); and (3) rational (reason based). Learning the language of qualities is essential for learning the language of relationships (or signs), which in turn are necessary for learning to think critically.

Qualities are the properties, or characteristics, of things. There can be *no thing* (nothing) without qualities to define it. Thus, qualities are whatever a thing has that enables an observer to identify it in some way. If someone says that

Seattle is a large city, then that person is using the rational quality of *size* to sort it into the category of large cities as opposed to medium-sized or small cities.

Qualities allow people to identify a thing as a kind of (or sort of) something. Peirce maintained that properties are true of every real thing, whether anyone ever comes to know that something is real. In this sense, the property (or quality) of motion having to do with the earth orbiting the sun – instead of the other way around as people used to believe – would still be real (or true) had no one ever determined this to be true.

Types of Qualities

Affective Qualities

When children learn to express feelings, they are learning to express qualities of affect. However, qualities of affect are much more than just learning to express play yard feelings such as anger or joy.

Peirce contended that all of scientific discovery depends upon the ability to sense a kind of feeling – a “hunch” and that beliefs arise from a sense of “satisfaction” with whatever truths a person feels he or she has found (Poggiani 2014, pp. 538–39). (Both hunches and satisfactions are affective states.) Peirce also held that motives for doing things fall into higher or lower ethical classes (Peirce 1935, Vol. 5, para. 585) depending upon one’s ability to shape the qualities of the affective mode of being. Below are just a few examples of affective states and a few words that describe them:

Joy	Happy Pleasant Glad	Gratified Delighted Thankful	Anger	Angry Mad Furious	Indignant Wrathful Revengeful
-----	---------------------------	------------------------------------	-------	-------------------------	-------------------------------------

Education in the qualities and language of affect is a necessary first step in bringing learners into the world of aesthetic and ethical inquiry that proceeds learning to think “rightly” (critically) in a Peircean sense. Perhaps, “first step” is not the right term to use here, since affective education is a long-term process and does not end, even as

introduction into the other sorts of qualities begins.

Affective education involves understanding and experiencing the range between good and bad feelings; between beautiful and ugly surroundings; between good and evil; between boredom and intense focus. This is the foundation of Peirce’s optimistic philosophy. “Love,” he wrote, “recognizing germs of loveliness in the hateful, gradually warms it into life and makes it lovely” (Peirce 1935, Vol. 6. para 289).

Every point along the continuum of each of these states is part of the affective state of the human condition and must reside at the foundation of learning in a Peircean-based educational program.

Sensory Qualities

Peirce contended that aesthetics must inform ethics and ethics must inform reason for right reasoning to occur. The qualities of sensation provide the empirical qualities necessary for informing aesthetic sensibilities. In turn, these are mediated by sentiment (affect) for determining personal value. Qualities of sense may be much easier to for learners to absorb than qualities of affect. For example, red – a quality of vision – is indisputable (to anyone who is not colorblind), while compassion takes a lifetime of experience to experience and understand. Qualities of sense fall into the categories of the normal five senses, plus two others relating to skin sense (or touch) – balance and muscle sense. Below are a few examples of qualities that fall within some of these categories:

Vision	<i>Color</i>	<i>Brightness</i>	Skin sense	<i>Touch</i>	<i>Temperature</i>
	Red	Light		Tickle	Hot
	Blue	Dim		Itch	Cold
	etc.	Dull		Tingle	Cozy

Rational Qualities

Rational qualities have to do with making objective, measurable observations. Something is *larger* than another is. One event occurs *before*

another. Size, time, space (or location), matter and energy, shape, quantity, and change are just some of the rational qualities. Others include generality, opposition, elasticity, complexity, simplicity, etc. The table below lists a few examples.

Size	Little, tiny, miniature, big, large, huge, mammoth,	Long, short, high, tall, slim, wide, narrow	Time	Duration, moment, interval, instant, second, minute,	Hour, day, year, now, past, present, future, then,
------	---	---	------	--	--

Thinking in terms of qualities provides a valuable philosophical perspective for everyone. Instead of asking: “What is this?” or “What is this for?” learners can begin to wonder, “What does this smell like?” or “Look like” or “How does this make me feel?” “How might it seem to someone (or something) else?”

Relating

The second platform of a Peircean-based philosophy of education is relating things based upon qualities (Peirce 1932, Vol. 1, para. 575). Deliberately relating phenomena based upon their qualities can be done by diagrammatic (or relational) thinking. The tools of diagrammatic thinking require facility with qualification skills, since sorting factors are the qualities, or properties of things. The tools of diagrammatic thinking range from simple sorting practices to much more complex analysis forms. Peirce put great stock into what is now termed “diagrammatic thinking.” Today, many careers require diagrammatic thinking. For example, all computer programmers have mastered diagrammatic thinking, as have engineers, architects, many writers, and individuals in myriad other careers. Engaging young learners in these relational tools provides them with a way to respond deliberately in situations that most adults may incorrectly think are well beyond the scope of young people.

Types of Diagrammatic Thinking

Classification Analysis

A Venn diagram is one form for classification analysis. It is a more complex form of classification than a “simple sort” or a “matching sort” that would ordinarily be used with preschool and early elementary children or a “tree diagram,” which is another ordinary tool of simple classification.

Which of these things is like the others? Which is not? Those questions are verbal forms of classification. However, the nonverbal forms are just as vital to learning. Learners sort a variety of physical things into two or more groups and on down, and then identify their reasons for sorting – such as “Things that I like versus things I don’t like.” “Things that are soft and things that are not soft.” “Things that are familiar; things that are unfamiliar,” etc.

The more familiar learners are with qualitative terms, the more thorough and creative their classification sorts can be, as qualities are the sorting factors for analytic thinking. Preschool children can learn how to make simple sorts by putting away toys, or the silverware, or helping to organize a toolbox. Naturally, not all children will participate willingly or spontaneously in sorting activities, but that does not mean that sorting and classifying skills should be ignored.

Structure Analysis

The second type of diagrammatic thinking involves part/whole thinking. Some people are naturally adept at this kind of analysis and can easily imagine what something will look like when assembled. Others have a deficit in this area. However, everyone can learn how to do structure analysis.

A whole is a structure; a part is a unit of a structure. A person is a whole made up of parts such as arms and legs. The earth is a whole made up of parts such as sea, atmosphere, crust, and core. Everything that exists can be thought of as a part of the whole that we call the universe.

In the case of classification analysis, the relationships are “types of” or “sorts of” something. In structure analysis the relations are spatial.

Things normally considered parts may be thought of in other situations as wholes. A hand, for example, may be called a whole instead of a part if one is concerned with its parts. In structure analysis, the largest including thing with which one is concerned is called a whole. Its included units are called parts. Just as for classification analysis, structure analysis is best introduced to learners as physical experiences: following directions to put a toy together; figuring out how to build a birdhouse; making potholders; learning to sew; making a fort or a go-cart. The more experiences that learners have figuring out how to do things in the physical world, the better their chances at developing skills with structure analysis.

Systems Analysis

The operation of a system reflects a structure moving and/or changing in time and space. Just as structures are wholes that have parts as parts, operations are wholes that have stages and phases as parts. When someone performs a systems analysis, she has a purpose in mind that guides her selection of what she is going to identify as stages of that operation.

The words “stage,” “phase,” and “operation” indicate time-based relationships. Thus, learning to deal with systems is a vital aspect of learning to deal with time – and time is not just a matter of consequence in its ordinary sense of learning to “tell time.” Time, in a philosophical sense, is the arena in which everything occurs. Peirce even used time as a metaphor for his multidimensional doctrine of continuity. Without continuity, there can be no thought, no reality, no relationships, and no thingness of any sort. Additionally, understanding systems and systems-within-systems provides good preparation understanding the consequential thinking of pragmatism and for later introduction into vital world problems in such systems sciences as ecology, economics, political science, sociology, famine-and war prevention, world population studies – and even the personal skill of time management.

The stages and phases chosen when analyzing an operation should be those most appropriate to the purpose. Thus, when they are old enough,

learners should be helped to name ordering factors for stages and phases – just as they choose sorting factors for classifications and identify factors for structure analyses – with direct reference to their purposes.

Interpreting Signs

The purpose of having a basic understanding of different kinds of qualities and different forms of analysis is to arrive at a point where learners can begin to think matters out for themselves in productive ways. By the word “relationships” Peirce meant *signs*, something that represents, points to, or stands in place of something else. In general, this is what Peirce means when he says, “all thought whatsoever is a sign and is mostly of the nature of language.”

Peirce does not mean the term “sign” in just the ordinary sense of that word – as say, a billboard or a stop sign. Also, notice that he says that “thought is *mostly* of the nature of language.” He did not say that *all* thought is language based. Peirce included mathematical thinking as thought – and mathematics as language. In the same sense, he would have included music as a language, as well as any other system or pattern of thought for which there is form and syntax. The particular expression (words, images, diagrams, movement, touch, etc.) by which thinking occurs depends upon the predisposition of the individual doing the thinking. Thus, a pattern of thought is a language, which occurs as signs in any affective, sensory, or rational modality – whether verbal or not.

Peirce identifies three types of signs: representations (icons), indications (indices), and symbols.

Icons (Direct Representations)

Icons are the least ambiguous of signs. They can be either replicas or likenesses. A replica looks like, sounds like, smells like, tastes like, and/or feels like what it is. For example, a video or DVD is a replica of the performance that made the movie, so is a CD a replica of the session that produced the music. A photograph is a replica of the person whose picture was taken, so is a realistic oil portrait of that person. A “scratch and

sniff” sample in a magazine is a replica of the scent of the perfume. A likeness, on the other hand, is a nonliteral representation of something; say a caricature of someone or a cartoon drawing of a mouse.

Indices (Indications)

Indications (which Peirce called “indices” in the plural and “index” in the singular) point to something that is elsewhere in time and/or space. Symptoms, such as rashes, fevers, etc., that physicians observe to diagnose illness are indices, so is a toothpick inserted into the center of a cake that comes out dry indicating that the cake is done (or if coated, not done). Clouds are an indication of rain. A frown on someone’s face is an indication she is upset or angry, or perhaps has a headache, etc. Indices often provide the empirical basis for making inferences that lead to scientific discoveries, medical diagnoses, automobile repairs, search and rescue efforts, and countless other vital and practical activities.

Symbols

Symbols stand in place of the thing or concept that they represent. Moreover, unlike representations (which look like what they are), symbols require agreement among minds for people to know what they mean. Religious forms, such as crosses, six-pointed stars, and crescents are symbolic. Perhaps most significantly, words and numbers are symbols. Words are the most ambiguous of all signs, meaning that they are the most easily misinterpreted and misunderstood. Peirce developed his sign theory to reduce the inherent ambiguity of language – to make language a tool for clear thinking and for effective reasoning.

Once learners master the language of qualities, the tools of analysis, and how to use signs effectively, they will be ready for developing skills for exploring the invisible realms of content, context, and meta-context (including value and purpose) for deciphering meaning.

Conclusion

That Charles Sanders Peirce was a polymath is not open to question. That his semiotic will continue

to influence researchers and developers in many fields (including computer science, linguistics, mathematics, and philosophy) well into the twenty-first century and perhaps beyond is generally accepted.

However, few have yet recognized the value of extracting from Peirce's philosophical construct (in particular from his phenomenology) this viable system for improving learning capabilities in learners of all ages (including those with many sorts of cognitive disabilities) (Hechinger 1960; Upton 1973; Davis and Chiasson 1981; Chiasson and Tristan 2012). This is understandable, for Peirce's writings are difficult to read and understand. However, a Peircean-based learning model is overarching – that is, its roots are preaesthetic, prevalue, and prereason. Its applications are universal.

Fortunately, throughout the twentieth and into this twenty-first century much has already been done to express other applications of Peirce's philosophical construct. Perhaps, his concepts can now be articulated well enough to bring them into the field of educational philosophy and from there into direct classroom practice.

Where Peirce's philosophy was once impenetrable, it is now simple and practical enough for use even at the prereading level (Chiasson 2008a, b). Now, even young children can master age-appropriate expressions of these proto-reasoning skills. These Peircean-based proto-reasoning skills embedded within his phenomenological construct are the true *basic skills*, for they are the skills underlying all meaningful learning.

Introduction

This article provides a historical overview of the most important approaches in German phenomenological pedagogy to the present. Phenomenological pedagogy both as a theory and empirical research aims at redefining traditional theories of *Bildung* and education in empirical and systematic ways. Within this process of re-definition, the phenomenological methods of description,

reduction, and variation have been adopted critically and developed further. Phenomenological pedagogy thus can present an epistemological and methodological program of its own, one which differs from other approaches within the field of the human sciences, including hermeneutics.

Phenomenological pedagogy has a tradition reaching back more than hundred years. From its very beginnings, it has developed its own approaches to a theory of *Bildung* and education *as experiences*. Traditional theories of *Bildung* (or formation: how we form ourselves and are formed by others) and education, as they have been formulated by Humboldt, Schleiermacher, Herbart, Hegel, and Nietzsche, are redefined by a phenomenological approach in ways that are both empirical and systematic.

Phenomenological Description (Fischer)

In his paper *Deskriptive Pädagogik*, Aloys Fischer (1880–1937) formulates programmatic thoughts on the relation between pedagogy and phenomenology as early as 1914. Fischer is a representative of the *Münchener Schule* (Munich School) surrounding Theodor Lipps. The Munich School critically rejects the egological conception of consciousness proposed by Husserl by claiming a primordial experience of what they referred to as “reality.” Through this assumption, the Munich phenomenologists break away from Husserl’s subject-centered perspective and anticipate thoughts which are later introduced by Merleau-Ponty under the rubric of “world” or “lifeworld.” This is what is meant by “reality” or Real-Ontologie. The methodic tool to capture the experience of reality is the description. Fischer states:

The basic question of all description is what the *Given* in the experience is. Every pedagogy and every theoretical school in pedagogy talks about education . . . every school believes it knows about the matter which is signified as ‘education’ in every detail and is quick to state what and how education *should be*. [. . .] It seems to me that everyone forgets the description of the matter while they try to define and label it. [. . .] Not the meaning of the words, which is the linguistic clarification of the meaning, but the description of matter either: “in question” or

“at hand” is the task which is the foundation of all scientific research; it is the task that makes research possible. (Fischer 1914/1961, p. 144)

Fischer combines the question of methodology with the question of the subject matter of pedagogy as a science, in this case a human science (or *Geisteswissenschaft*). Pedagogy is not a normative science of practice. It is a descriptive science which tries to grasp the subject matter at hand, before it is defined theoretically. Fischer locates the epistemological problem in the fact that educational science, in contrast to sciences with clearly defined objects of research (e.g., Geology), is notoriously insecure about its own subject matter. This is an insight which many pedagogues have expressed, from Herbart to the present. This could be accomplished by employing phenomenological description. Fischer points out that describing a student’s practice in school needs a highly developed psychological and pedagogical awareness: “(It) comes very seldom as a natural gift and can only be attained as the result of sound practicing” (ibid., p. 140).

The method of description is used as a way to reach intersubjective validation of experiences. Fischer goes on to prove the fruitfulness of this method in his works on psychology and school pedagogy. Fischer supposes that description can be “theory-free” (Ibid., p. 142). He maintains that description can lead to pure facts (*Tatsachen*) which are free from presuppositions and prejudices, an argument which seems hardly convincing today. Fischer’s approach has a strong tendency to the moral and the normative, without being able to clarify the conditions of this morality and normativity. Fischer thus affirms a model of traditional, normative pedagogy of role models and culture within the relation of the generations. Still Fischer’s thoughts and research became key issues in phenomenological-pedagogical thinking and reflection.

Anthropological Turn (Bollnow)

After the Second World War and the years of Nazi terror, the phenomenological movement was weakened, and a shift from phenomenological to anthropological concepts occurred. Anthropology in this context means the science (*logos*) of

concepts and notions of mankind (*Anthropos*) and operates in a historical, philosophical, and linguistic perspective. These reflections became important for pedagogy, and pedagogical anthropology was widely spread, even in phenomenology. One of the main representatives is Otto F. Bollnow (1903–1991) who combines Heidegger’s phenomenology with linguistic-philosophical, anthropological, and existential questions (Dilthey and Jaspers) along with a critical reception of existential philosophy and philosophy of life (*Lebensphilosophie*). Bollnow highlights phenomena that are part of what he calls an “education of discontinuity” (Bollnow 1959), for example, crisis, awakening, admonition, guidance, venture, failure, and encounter. He carries out only a few studies which can rightly be called phenomenological–descriptive. They explore the phenomena of practicing (*Übung*), human space, and atmosphere in pedagogy. In contrast to Fischer, the ontological dimension is not considered by Bollnow as a fact of education to be described empirically but as an expression of life itself in the sense of *Lebensphilosophie*. This expression becomes manifest in cultural objectifications (Dilthey) and can be interpreted hermeneutically as a text. Following Bollnow, the understanding of cultural objectifications is reduced to a singular sense. The multiplicity and ambiguity of sense is thus equalized and foreignness is excluded. Looking at Bollnow, we can see how “the pedagogical” is reduced to the pedagogical relation as it was articulated in *Geisteswissenschaftliche Pädagogik*.

In the 1960s and 1970s, German scholars suggested concepts which develop the phenomenological approach further and stand in critical differentiation from Bollnow’s anthropological and hermeneutical pedagogy. Günther Buck, Heinrich Rombach, Werner Loch, Eugen Fink, and Egon Schütz refer to Husserl, Heidegger, and Gadamer and are able to develop genuinely phenomenological approaches for a theory of learning, *Bildung*, and education.

Learning as an Experience (Buck)

Günther Buck’s (1925–1983) study *Learning and experience*, first published in 1967, has become a

classic in German pedagogy (Buck 1989). Buck examines the experience of the process of learning from a historical perspective (Aristoteles, Bacon, Hegel, and Husserl) as well as developing his own theory. It is framed by a hermeneutic of practice (*Handlungshermeneutik*). Buck's theory of understanding and learning as well as his theory of experience in *Bildung* is strongly influenced by Gadamer. From a hermeneutic perspective, understanding and learning are situated within a temporal horizon. Referring to Husserl, Buck integrates the notion of intentionality into his theory. Husserl's analysis of intentionality shows that the structure of experience as a horizon is connected to the circle of anticipation and fulfillment (or disappointment; *Enttäuschung*) of anticipations. On the one hand, the structure of experience as bound by a horizon is based on previous experience (*Wirkungsgeschichte*). On the other hand, this "horizon structure" enables change and the openness to that which is new. The horizon can change. In interpersonal understanding, two horizons come together, and they melt or merge together (*Horizontverschmelzung*) and consequently can change (*Horizontwandel*).

Following Gadamer and Hegel, Buck defines the concept of negation as the "determinate negation" of a specific anticipation in the sense of Hegel – as a dialectical negation that produces something positive. The negation crosses out an intention and brings a moment of discontinuity into the continuity of experience. By going through a "negative" experience – that is, a disappointment of anticipations in a certain situation – we not only experience something, but we also experience ourselves. As one's own horizon is changed in an experience, future anticipations change, as well as past experiences.

Learning from experience can then be seen as learning *as* experience. "Negative" experiences enable us to change previous knowledge and experience, at the same time they open us to new experiences. Given this fact, learning is related to the past as well as to the future. By undergoing "negative" experiences, we are able to become aware of latent attitudes and habits. Learning itself is a reflective moment within the process of experience. By using hermeneutic methods of

understanding, we can explicate the latent structures of the sense of experience in learning.

Buck presents a hermeneutic-phenomenological notion of learning and thus contributes significantly to an understanding of learning as a pedagogical concept. His theory of learning has become an important reference point for contemporary German qualitative research and theories of *Bildung*.

Learning and the Course of Life (Lebenslauf) (Loch)

Werner Loch (1928–2010) developed a biographically based theory of education. Following the ideas of Helmuth Plessner, it is grounded in a non-essentialist anthropology and sees the human being as an open question. Proceeding from this assumption, the phenomenon of education is defined in its structures – both biographically and intergenerationally. It is conceptualized as related to the concept of learning (Loch 2001). In his biographical research, Loch points out various stages of the "curriculum vitae" and differentiates them in relation to learning and educating. Similar to Buck, Loch succeeds in establishing an original, pedagogically significant conception of learning which goes beyond Bollnow's theory. Learning is related to knowing how and competence and is thus determinable in a way that is both nonempirical and noncognitivist. The lived body then becomes important both as a category of reflection and as a phenomenon. Learning is connected to sedimented habits and the habitus in general. Activity and practice function in the "mode of knowing how" rather than of "knowing that." To obtain knowing how, supportive and helping educational practices are important, as well as inhibiting and limiting educational practices. Loch differentiates negative from positive inhibitions in learning. While negative inhibitions in learning work against what is to be learned and can be pedagogically suspended, positive inhibitions are to be supported. Loch does not work out this difference systematically, but he works toward a determination of the negative aspects within educational processes, which Buck calls "negativity" and which have attracted attention in current approaches (see below).

In terms of methodology, Loch can point out important differences between diverse approaches in the human sciences. He succeeds in fleshing out the “poetic” and “creative” function of the phenomenological method and contrasts it to methods of hermeneutics and psychoanalysis.

Structures, Operative Concepts, and Co-existential and Existential Elemental Phenomena (Rombach, Fink, Schütz)

By the end of the 1960s, Heinrich Rombach (1923–2004) and Eugen Fink (1905–1975) provided new phenomenological perspectives on *Bildung* and education as experiences by focusing on structures and elemental phenomena (*Grundphänomene*) and by using a type of reflection they christened “categorical.”

Heinrich Rombach developed a structural phenomenology (Strukturphänomenologie). He advocated a shift from anthropology to structural anthropology and from phenomenological pedagogy to structural pedagogy. According to Rombach, describing mankind as (a) structure and existing within structures means that one must give up the subject-centered and *geisteswissenschaftliche* perspective as well as the sociological one (Rombach 1979). Rombach combines the reflection on elemental phenomena with a reflection on experience as pedagogical experience. This enables him to distinguish between various kinds of experience (as opposed to political, economic, aesthetic, or other experience) and to contrast them with the specific dimension of pedagogical experience.

This differentiation, which is important for educational reflection, was introduced earlier by Rombach’s mentor in Freiburg, Eugen Fink. Fink earned his doctorate under Husserl and Heidegger and remained Husserl’s loyal assistant, even when Husserl was persecuted by the Nazis. Fink sees educational science as a cultural practice to be sustained after the collapse of general guiding principles and narratives in the modern and late modern era and the emergence of nihilism (Nietzsche). Education is both: science and practical life lessons (*Lebenslehre*). Fink poses the question whether educational science could be brought back to lifeworld experience as a lesson

or precept for life and whether it is capable of producing guiding principles and ideas. As we do not have an authoritative, final, and universal interpretation of the meaning of the world and society at our disposal, it is the task of pedagogy in particular to produce these interpretations collectively, but only in a provisional way. In his social phenomenology, Fink differentiates in six fundamental co-existential elemental phenomena: play, power, work, love, death, and education. They are connected to social, co-existential, and embodied practices in the time and space of society and as an expression of care about *Dasein* after the “end of the grand narratives” (Lyotard).

Within education, concern and care, learning, wonder and astonishment, questioning, and counseling become basic practices. Fink’s fundamental thesis sees “man as a fragment,” as someone who does not exist as a complete being or as an object. He can only experience himself in relation to self and world in a fragmentary way. The totality of man and world, or of man and nature as suggested by the *Geisteswissenschaften* as well as the continuity in the generational succession derived from it, have broken apart.

Fink develops a theory of *Bildung* on the basis of this social-anthropological description. *Bildung* can no longer be *Allgemeinbildung* or general *Bildung* in a holistic sense anymore; it has become fragmentary *Bildung*. In this conception of *Bildung*, negativity is not an operation of consciousness but an existential trait of experience. *Bildung* can then be described as coping with this existential plight. In this definition, *Bildung* becomes a practical-existential experiment of sense under preconditions of a provisional, insecure nature, or, in other words, an existential and co-existential practice as production and provisional creation of meaning. It is also a reflective practice, as the operation of phenomenological variation can mark different modes of experiencing in politics, arts, love, time, and labor as differences, and compare these modes. At the same time, the phenomenological reduction enables us to free ourselves from what is taken as facts and opens a perspective on what is possible.

The concept of education is similarly redefined: Fink calls the educational practice

“community of questioning.” This community is determined by power, by society, and by culture and has its reference point in the collective plight of not knowing and not knowing how (Fink 1970). According to Fink, the relation between the generations is marked by foreignness. Under preconditions of foreignness and insecurity, the community of questioning aims at future situations and considers options or possibilities to overcome particular difficulties in their own situation. Education is thus characterized by difference and controversy concerning different interpretations of particular situations. These controversies are those of subjects situated in a sociopolitical space, which means that education becomes a democratic process. Education also becomes a question of productivity, of generating provisional ideas. Fink’s theory of *Bildung* and education differs from his contemporaries who were oriented toward hermeneutics or *Geisteswissenschaften*. The differences can be seen in his considerations of the fragmentary nature of the self. Dealing with and relating to these differences are described as practices of *Bildung*. Apart from the differences in the relation to the self, Fink also considers differences as foreignness between the generations and differences of sociality, democracy, and power. His theory of *Bildung* and education offers connections to Foucault or Derrida and other poststructuralists who were influenced by phenomenology.

Fink’s student Egon Schütz (1932–2015) has developed this approach into an “existential-critical pedagogy” and deepened it in the context of many studies on anthropology, ethics, and aesthetics (for the following see Eugen-Schütz-Archiv).

Schütz adds five existentials as modes of the human “relationship to being” (*Seinsverhältnisse*) to the six co-existentials suggested by Fink: freedom, reason, historicity, language, and the lived body. Schütz radicalizes Fink’s thesis of fragmentarity by referring to Heidegger’s criticism of humanism and subjectivity. The “anthropological circle” as fundamental mode of human self-understanding constitutes the center of Schütz’ theory. Theoretical, practical, scientific, and everyday definitions and conceptions (*Vorstellungen*) of mankind can never lead to complete

self-transparency. Man remains subject to his finiteness and corporality even within the processes of self-formation (*Sich-Bilden*) and self-imagination (*Einbilden*). Taking the anthropological circle into account, Schütz describes *Bildung* as an existentially risky act of limited freedom which takes place under the conditions of finiteness, corporality, and co-existentiality. Schütz sees education as a co-existential experiment, in which man engages in practices of dealing with himself and with the other as incomplete or imperfect beings. He applies the phenomenological methods of reduction and variation: One’s own view as well as different scientific theories and models are critically evaluated in terms of their anthropological presuppositions. These pre-meanings and prejudices are then bracketed in a phenomenological epoché. Following this step, perspectives can be varied, and, stepping back from one’s own approach and others’ theoretical conceptions, enables a variation of different views on the thing itself (*Sache selbst*).

Seen from the perspective of methodology, we can state that Rombach, Fink, Schütz, and Loch make the phenomenological method of reduction and variation fruitful for a theory and practice of *Bildung* and education. They succeed in differentiating phenomenological research in education from pedagogical hermeneutics (*hermeneutische Pädagogik*). Sense, understanding, and interpreting are terms both of hermeneutics and of phenomenology. However, phenomenological description refers to intentional acts, an important way in which it differs from empirical observation and hermeneutic interpretation. Phenomenological description aims at “working out, how a creature like man, who is equipped with a lived body, soul, consciousness and conception of self and thus becomes a self, can express sense-giving intentions at all” (Loch 2001, p. 1198).

Hermeneutics, on the other hand, practices a reconstructive interpretation (*Auslegung*) of something that is given as a text. Phenomenology strives to put sense into what is perceived, thus performing a productive and prospective task:

Putting sense into the human expressions [...] thus becomes the constitutive task of phenomenological

description, which consequently obtains the character of an attribution (*Zuschreibung*). (Ibid.)

According to Fink, this productive and creative dimension is guaranteed by reflectively employing the “operative concepts” of phenomenology (description, reduction, variation).

Thus, phenomenological description not only refers to a description of what is present, visible, and noticeable but also to an analysis of “operative concepts”. Intention and attribution, reduction, and variation are central operative concepts within phenomenology. Only by employing these concepts, one can move from a reconstruction of what is given to a constitution of sense, in the field of education as in any other.

Contemporary Approaches

During the 1980s and 1990s, new and genuinely phenomenological approaches were developed in German educational discourse. Besides Husserl and Heidegger, the new reference points become Merleau-Ponty, Waldenfels, Levinas, Derrida, and Foucault. Phenomena of sociality, corporality, responsivity, alterity, genealogy, and power have been made fruitful for phenomenological reflection on processes of *Bildung* and education. Within this discourse, special attention has been paid to Waldenfels’ philosophy of responsivity. In reference to Merleau-Ponty and to French post-structuralism, Waldenfels widens Husserl’s concept of intentionality through a phenomenology of corporality, foreignness, and “attentionality” (Waldenfels 2007).

By referring to Husserl’s concept of *Lebenswelt*, Wilfried Lippitz follows *geisteswissenschaftliche*, hermeneutic, phenomenological, and socio-theoretical perspectives and critically evaluates them. Following Merleau-Ponty, this endeavor brings Lippitz to a phenomenological definition of learning. To carry out his research, Lippitz redefines the method of description in a hermeneutic-phenomenological perspective under the term of “exemplary description” and, in doing so, refers to Fischer, Langeveld, and Buck. In later works, Lippitz focuses on questions of pedagogical ethics, which he connects to topics of foreignness and alterity. By referring critically

to Levinas, he sketches out a relation to self and to the child and the intergenerational relation (which all carry opportunities for processes of *Bildung*) as ethical relation set in a horizon of alterity and foreignness (Lippitz 2003). Käte Meyer-Drawe also refers to Merleau-Ponty and his phenomenology of intercorporeality, in order to think intersubjectivity within re-learning or learning anew. Besides adapting Merleau-Ponty, she employs theories of Husserl, Buck, and Waldenfels, but also those of Plato and Aristotle and develops an influential theory of learning as experience and learning as a process of re-learning or learning anew. Meyer-Drawe critically examines psychological and neuroscientific concepts in a genealogical analysis. Thus, she is able to describe these approaches in their claims for omnipotence, their reductionism, their discursive power, and their definitional authority. She also succeeds in differentiating them from a pedagogical-phenomenological theory of learning (Meyer-Drawe 2001/1984). Malte Brinkmann makes the phenomenological orientation fruitful for a theory and research of pedagogical experience, by considering epistemological and methodological questions. Based on a phenomenological theory of practicing (*Übung*), he examines temporal and corporal experiences of power within learning and education by using video research (Brinkmann 2012).

Conclusion

The epistemological question of the subject matter and the core of pedagogy as a discipline and profession on the one hand and the methodological question of an adequate research method in connection with the operative terms of phenomenology on the other can already be found in Aloys Fischer’s *Descriptive Pedagogy* (1914). Both questions, the substantive and methodological, have become central to phenomenological educational science. Bollnow answers them in a way that is strongly anthropological and ontological in nature. The conservatism and traditionalism of *Geisteswissenschaftliche Pädagogik* that Bollnow generally affirmed was subsequently overcome by

Buck's theory of learning as experience, Loch's curricular theory of education, and Schütz' existential-critical approach. All three redefine learning, education, and existence differently. At the same time, the methodological difference separating the phenomenological approach from hermeneutic and social-theoretical methods becomes evident. The work of Lippitz, Meyer-Drawe, and Brinkmann define the pedagogical relation, educating, learning, and practicing (*Übung*) as experiences that are defined within the horizons of corporality, responsivity, foreignness, and power and thus differentiated from other approaches within the human sciences and in qualitative research more broadly.

Introduction

In Scandinavia and Europe, educational institutions are being transformed due to particular political, economical, and educational agreements such as The Bologna Process, to the policies of The Organization for European Economic Co-operation (OECD), and to changes in availability of global knowledge and information mobility through internet and social media. Moreover, families, kindergartens, schools, universities, social welfare programs, and cultures in general are affected deeply by increasing political migration, economic centralization, unemployment, and profound organizational changes in society and work. The structural changes of human and cultural life in Europe contest the common meaning of humanity and democracy and revive critical questions of how to possibly judge and incite alternative thinking and acting in the present situation in education. However, due to the influence of the Bologna Process and the

OECD, education is increasingly a means for political and economic interests. The sole focus on knowledge and (lifelong) learning is making education the strategic center of rotation of society with issues of humanity in the purpose and aims of education coming under severe pressure. This critical situation calls for a radical rethinking of educational means and aims, and actualizes a renewed interest in how to encounter the young generation in the complexity of their lived present, rather than in their potential to increase the outcomes of education. The state of affairs has stirred up major contrasting educational views represented in the Western traditions of education. The cultural history of education in respectively Anglo-American (the English-speaking world) and Continental traditions (Europe and Scandinavia) is key here (Biesta 2011). Although the basis of the present problem is neither of the two systems per se, the very idea that more knowledge represents the main answer to educational questions and prospects has its source in the Anglo-American ideal of capitalism, competition, and the belief in an always more profitable future. While in the English-speaking world education is an object of study dependent of interdisciplinary views and conceptions from “real” disciplines like psychology, sociology, history, economy, and philosophy, the historical European understanding of education as “*pädagogik*,” indicates an independent discipline in its own right with its own conceptions, characteristics, and historical justification (Langeveld 1969; Oelkers 2001; Biesta 2011). Education as an interdisciplinary objective study – the study of the object of knowledge – and education as “*pädagogik*” – a discipline of its own oriented toward the moral relation between the new and the older generation – deploys a distinct difference of how educationalists understand their relation to education and how education relates to other disciplines like philosophy and phenomenology.

Dependent of whether we consider phenomenology to be a philosophy or a methodology, its relation to other disciplines is impacted. Phenomenology as a philosophy in its own right with its own conceptions, definitions, and disciplinary regulations encounters the sphere of other

disciplines based on philosophy’s own language and meanings. Philosophy of education might be an example of how philosophy as a discipline lends its bearing to the object of education by subjugating education to philosophy in a hegemonic relationship. An encounter between phenomenology as a philosophy and education in this context would mean that education accepts the philosophical (phenomenological) characteristics to take control over educational intentions, purposes, and vocabulary. Education would become “phenomenologicalized” and lose its own disciplinary qualities. While phenomenology as a philosophy claims its own independence from other disciplines, phenomenology as a methodology lets itself be applied to other disciplines, allowing the disciplines to be in their own right and asking their own professional questions. Phenomenology as a methodology is not merely a method to be applied, it is implicitly also a way of seeing and living life, or as Mollenhauer (2014, p. 20) indicates “a way of life,” but it positions itself according to the disciplinary character of the other discipline. Phenomenology as a methodology is a kind of human science theory that explores the discipline and questions its foundations, not in order to subjugate it, but in order to sustain its legitimation. Hence, phenomenology as a methodology supports the discipline’s own questions and intentions without taking over its vocabulary and disciplinary characteristics. Phenomenology as methodological approach (and way of life) and education as “*pädagogik*” have coexisted in Europe over decades as a method of existential inquiry into professional practices of children and young peoples’ lifeworlds (for more details see van Manen 2014), reinforced by a range of philosophers like Merleau-Ponty, Heidegger, Levinas, Løgstrup, and Gadamer. Phenomenology as methodology (or human science theory) and a particular way of life focuses on the individual’s lived experience of existential phenomena “the reality slowed down”, as Mollenhauer puts it (2014, p. 19). In this way phenomenology offers “*pädagogik*” ethical resistance by asking questions of reason, basis, and alternatives. By constantly reflecting and transforming “*pädagogik*’s” own questions, paradoxes,

and complexities while sustaining education as “pädagogik” phenomenology puts education as well as itself to the test of revealing the experiential reality of the young to reflection in research and practice.

Phenomenology as Methodology in Education

Nonphilosophers commonly carry out a methodological phenomenology and the professional practice of research indicates that phenomenology is seen from the perspective of the actual professional practice rather than from the perspective of philosophy. This means that phenomenology in this context is not a philosophy of education, but a way of doing educational (pedagogical) research and practice. Phenomenology is a way of contemplating educational questions within the context of educational theory and practice. We might call this “practice” a “phenomenology of practice” which according to van Manen (2014) is a methodological approach relevant to any professional practice. Phenomenology in education is a “phenomenological ‘pedagogic’”. The term ‘pedagogic’ was first used in *Phenomenology & Practice* 2/2014 as the common basic anglicized term indicating the fact that there is no Anglo-American pedagogical tradition, and therefore no word for the practice of this tradition. It is therefore not easy for the Continental pedagogue to tell the English reader what pedagogic is. Theoretical pedagogic, in German “Allgemeine Pädagogik,” cannot be equated to philosophy of education for reasons explicated in the introduction to this article. One main distinction is that education refers to what is happening in schools and educational institutions, while pedagogic refers to everything that is happening to the child from early childhood to adulthood; the broader upbringing and educating the young generation. The special issue of P&P was a tribute to the translation into English of Klaus Mollenhauer’s classic book *Vergessene Zusammenhänge. Über Kultur und Erziehung* (Mollenhauer 1983), 30 years after its publication. It is a virtually giving or giving back “the

phenomenon of pedagogic itself [...] without recourse to pat definitions and easy theoretical conceptualizations” (Levering and Saevi 2014, pp. 5–6), as the word “pedagogic” is the anglicized form of the German term “pädagogik,” the adults’ formal, nonformal, and informal being and acting in relation to the younger generation. The term “pedagogic” indicates a differentiation to the English term “pedagogy” that according to Wivestad (2014, p. 7), “lacks the ‘ic’ and hence the ‘techne’; it lacks the signals of an academic discipline. Wivestad (2014, p. 8) refers to Hügli (1989, p. 4), who claims that pädagogik “is and continues to be... a collective singular [noun] encompassing the whole spectrum of practice and theoretical concerns with upbringing [Erziehung].” Pädagogik as a discipline of its own is here pointed out in English by the term “pedagogic.” There is a range of European countries that share the German educational tradition and thus the term “pädagogik” in singular, indicating the unity and autonomy of the discipline (e.g., Norway – pedagogikk, Sweden – pädagogik, Denmark – pedagogik, The Netherlands – pedagogiek, Spain, Portugal, Italy, Poland – pedagogia, Latvia- pedagogija, Lithuania – pedagogika, Estonia – pedagoogika, France –pédagogie). Within the European and Scandinavian cultures, pedagogic is understood as the educational practice of helping the young generation to grow up in a culture, as well as the theoretical and conceptual reflective and reflexive responsibility for questioning and reformulating this particular culture’s insights, traditions, and habituations. While we might think of education as a formal preparation or qualification to jobs in society, and as children’s socialization to same age mates and to the cultural norms and standards of the status quo, pedagogic also presupposes an element of subjectification *of* and *by* the child or young person (as well as of the adult or teacher). This quality of subjectification, which in German is called “*Bildung*,” indicates a subjective independent counter voice or self-action (Mollenhauer 2014) sometimes from the utterly other; a resistance to the actual, which according to this tradition is the crucial identifier of pedagogic.

Explore Education Anew

Jan Masschelein (2011) in his paper entitled “Experimentum scholae,” provides an interesting exploration of education via the related word “school.” He alludes an allegory to Hannah Arendt’s introduction to her book *Between Past and Future*, where she claims that educational terms like authority, freedom, culture, and the word “education” itself are being emptied of content; the meaning of these words has “evaporated,” leaving behind “empty shells.” The challenge they present to education is “to distil from them [the empty shells] anew their original spirit” (Arendt 1968b, p. 15 in Masschelein 2011, p. 530). Masschelein continues:

Distilling the original spirit is neither to perform a historical reconstruction or genealogy, nor to engage in essentialist analysis in order to define a (suprahistorical) essence. It rather consists of attempts to relate these words to the experiences and materialities connected to the inventions or events that they name and to our actual experiences.

The term “distill” etymologically stems from Latin “distillare” “trickle down in minute drops,” from dis- “apart” + stillare “to drip, drop” (www.etymonline.com), and in chemistry is used to purify and identify a compound. To distil anew the original educational experience then could be to filter out replicas and counterfeits and to admit that experiential insights of education cannot simply be approved by tradition and institutional customs. On the contrary, what is called education has to be explored as fresh and uncontaminated as possible. This is Masschelein’s point of departure in his exploration of education. Also phenomenological method has to be invented anew every time an original research project is initiated (van Manen 2014), and no method (or any style or attitude) can be freed from prejudice and assumptions. Phenomenology in education or a phenomenological pedagogic is concerned with actual experiences of everyday life as they are experientially lived, sensed, and acted (rather than as they should have been or ought to be according to norms and traditions), and in particular the existential experience of situations as experienced by the singular child or young person.

Phenomenological pedagogic resists preset aims and the adult’s psychological effort and ability to define the inner landscape of the child in order to make the correct preplanned learning incitement, as is commonly a teacher’s task today. Rather, the existential orientation of a phenomenological pedagogic evokes a concern for the child’s life as experienced by the child, and in his or her attention to issues of the world. The attentiveness to what is experienced – to what shows itself in the presence of present – demands that the adult or teacher inserts him or herself in time, space, and relationship with the experience and is exposed to what actually happens (rather than to what should have happened according to plans, norms, and assumptions). The adult is concerned with the present – he or she is “present in the present” (Masschelein 2012, p. 356), caring for the present, and in touch *with* and touched *by* what is actually happening.

Let Existence Address

Mollenhauer (2014, p. 26) asserts that at the heart of Continental pedagogic lingers the quest of a moral responsibility for my own being and acting and thus for how I encounter the other as an-other. A moral responsibility for how I am and act (rather than a professional accountability for *who* I am, e.g., teacher, social worker, psychologist) comes from the existential basis of phenomenological pedagogic, indicating that my being and acting has other ways of being and acting as its alternative. What would it mean to education if educational practice spoke to the existence of children and young people, and put reality to the test of human responsibility? What if the adult or teacher realized that all life situations (including the life with young persons) were an exposure to existential choices? The relation between the adult and the child – if it is a pedagogical relation – must be a relation of potentiality, openness, emptiness – a relation that is not preplanned to the extent that it is in the full power of the adult. On the contrary, the responsible relation hesitates in the presence of the other and requestions its purpose and aim. Here, intention and aim are not

theoretical concepts helping the adult or teacher to master educational practice, so to speak, from the outside by applying general rules and regulations to present situations in order to pursue objectives and fixed processes and results. Rather, the concern of the pedagogue is to be present in the present along with the young and being attentive to the existing pedagogical and ethical bases. The moral and pedagogical concern for the child and young person's experience *in* and *of* concrete educational relations and situations is a risky project that might lead to educational failure and defeat. One aspect of risk is the fact that the authority of the adult is different from the authority of the child or young person – although neither of them is unaffected by the power and powerlessness of the other. Authority unlike authoritarianism is a gift from the other and it is relational. Authority like morality, however, is never preset, but could always have been given to me differently or not given to me. The willingness of a phenomenological pedagogic to be addressed by the complexity of existence and care for the other is an ethos that cannot be utilized for a purpose outside the situation (even though the purpose might have good intentions), but has to be put “to the test of its own thinking” (Masschelein 2012, p. 355). To put education to the test of its own thinking might mean to explore its validity for children's lives and for the critical questions of present time, which more often are complex existential dilemmas (e.g., fleeing from war, terror and poverty, young peoples' experience of dismissal, discrimination, devaluation, unemployment, marginalization) than controllable issues of knowledge or learning. Existential educational traditions in Europe put the person (as first person) to the test of ethical existence and coexistence (Masschelein 2012; Mollenhauer 2014; van Manen 2014). They test out a kind of truth telling that concretely and riskily demonstrates (often through cultural works of art like fiction, paintings, and film) what being a teacher or young person might be and, implicit in the demonstration, offers a judgment or ethos of what is good and right. Moral questions are always *questions* that unlike statements or rules are constantly put to the test of

relational coexistence and the complexity of human and existential life.

Why Phenomenology Matters to Education

What does phenomenology mean to education, or said in another way, can phenomenology address questions or incite understandings to education that would not be possible without phenomenology? Education as pedagogic and phenomenology coincide in their shared focus on the concrete, situated, singular, and irreplaceable human experience taking place in the complexity and paradoxes of the moral-relational lifeworld (Sævi 2015, p. 344). Nevertheless, while pedagogic tends to recollect concrete episodes in a more formal scholarly way, like useful didactic material for a particular educational purpose (Mollenhauer 2014, p. 74), phenomenological pedagogic puts lived experience concretely forth as existential examples, depicting present moments in the (em)pathically and bodily sensed experience. Examples of concrete presence in existence can be seen in the films made by the Belgian directors Jean-Pierre and Luc Dardenne, where young people and adults in open, exposed life situations put questions of pedagogic and existence to test (Mai 2010; Masschelein 2012). The films explore existential educational questions where responsible actions take place (or the lack thereof) to let pedagogic happen, or as one of the directors say, to allow the “future [to] take place” (L. Dardenne 2008 in Mai 2010, p. 84). The Dardennes ask once again the old questions of what a teacher, a father, a mother, a child, or the other as other actually is, when existence has little or no support in traditional norms and regulations. They show how humanity and relationality in contemporary life conditions are exposed and vulnerable to human responsibility. They put education to the test of its own thinking and acting and the risk of losing is real. The films help us see that the experience of what *is* in pedagogical situations is different from what ought to be or should have been. The attention to what is experienced implies

nearness and attentiveness to the moral and pedagogical potential of the situation and indicates a basic difference between existential phenomenological pedagogic and a psychological prescriptive foundation of education (Saevi 2014, p. 43). Being experientially present, relating the meaning of the episode to my own experience, my own practice or what might have been my own practice, allows the experience to address me as a pedagogical possibility. The responsibility for that which *is* urges us as adults and teachers to keep educational situations open to experiential understanding – rather than to point to a problem or suggest a solution. If the future should have a chance to take place in present education as Luc Dardenne says (2008), being with children must carry existential human and moral weight as experiential moments for the adult and teacher.

Phenomenology of Digital Media

Joris Vlieghe

Liverpool Hope University, Liverpool, UK

Synonyms

Digital media; Heidegger; Human embodiment; Learning and teaching practices; Phenomenology; Technology

Introduction

Although digital media are fairly recent phenomena, it could be said that the phenomenological movement, from its earliest stages on, has offered a most fruitful starting point for understanding the meaning and the impact of these media for our lives, in general, and for education, in particular. Central to the work of both Husserl and Heidegger is a concern with the growing presence, if not the ubiquity and inevitability, of technology in our daily lives. Their reflections sometimes have a prophetic quality. It is no coincidence that their ideas inform many contemporary thinkers who aim at coming to terms with our present world, which is increasingly a digitized one. The sphere of education is no exception to that: even more educators and children/students relate to one another through screens, instead of meeting one another in real-life presence. And, whereas the initiation into the world used to be one predominantly based on reading and studying (school) books, it is imaginable that digital and social media will become the dominant technologies

which structure the way in which the new generation encounters the world.

First, a particular, “traditional” phenomenological understanding of technology, as present in the work of Heidegger, is discussed, as well as how this view informs contemporary debates on the growing impact of digital technologies on education. As often as not, this impact is deemed unfavorable. Subsequently, this chapter also zooms in on recent work on education and digitization which criticizes this traditional perspective and which tries and comes to an experiential account which is more open to the possibilities that go together with the use of digital media – an account that also gives due to the complex history of technology and stresses bodily dimensions. In view of the format of this text, only a limited number of authors and a limited scope of issues can be discussed. However the authors and examples presented are representative for the way in which phenomenology can contribute to a better understanding of how digital media affect the world of education.

Digital Technologies and the Framing of the World

A basic insight to be drawn from Heidegger’s seminal text *The Question Concerning Technology* (1978) is that we completely misunderstand technology if we only regard it as a set of tools at our disposal. Instead, technology pertains to a way of understanding itself. The world appears to us “enframed” in a way never encountered before we started to rely on technology when leading our lives. More precisely, Heidegger claims that under the conditions of a technological worldview, literally everything is seen as a resource, i.e., something which is out there only to be used and optimized. This analysis stills holds true today (if not with greater urgency than in Heidegger’s own time), as Iain Thomson has shown in an important study on Heidegger and higher education (Thomson 2005). Thomson argues that Heidegger’s analysis, although written long before the introduction of computer technology in our daily lives, actually gives a most accurate description of how digital media operate: the things which appear on our

computer screens are marked out as mere information that can circulate – things that can be quantified and exchanged. And, this applies to almost literally everything: the texts we read and write; the people we encounter and befriend; the world we live in, explore, and enjoy; etc.

As such, we no longer appreciate things for their intrinsic qualities. Rather, we have come to take mere quantity as a sign of quality. This might well explain a rise in instrumental thinking, which has intensely affected the sphere of (higher) education. For instance, subject matters are no longer seen as worthwhile to explore in and out of themselves, but as a potential source of economic benefit, and students solely appear as a possible source of investment (Ibid.). It is important to note that this way of looking isn’t a harmless and easily rectifiable distortion of sight but that it reflects what subject matters, students, and universities *are*: a technological worldview goes together with an *ontological* reduction. As Heidegger claims in regard with the contemporary world: “Only what is calculable in advance counts as being” (quoted in Ibid., p. 149). In that sense, the use of technologies, and particularly of digital technologies, defines what we are, and they delineate the ways in which we relate to reality as such.

On a more *ontic* (i.e., concrete) level, similar analyses have been made in relation to the introduction of digital technologies in the classroom. For instance, Richard Dreyfus (2001) argues that the physical copresence of students, teachers, and the things we study is a necessary condition for education to take place and therefore that the *telepresence* we increasingly encounter on-screen and online is a dangerous evolution. Drawing from Merleau-Ponty, he claims that we can only learn to master a subject *matter* when it is *sensed* as having a reality of its own, i.e., when we (as bodies) are confronted with something external that poses a challenge to us and that doesn’t automatically yield to our will and intention. Therefore, Dreyfus argues, computer and Internet learning is most problematic: the hyper-mediated relation to reality within virtual spaces, as well as the ready-made and algorithmic character of e-learning-programs, prevents this confrontation with a recalcitrant reality. These programs seem to be

developed to immunize pupils/students against this kind of unsettling experience.

To give another illustration, it could be argued that the use of ready-made (PowerPoint) presentations prevents students from experiencing the way in which a teacher actually composes (letter for letter) the words she draws attention to: they just appear with a click of the mouse. This precludes a most valuable educational experience students might have in the traditional classroom context. As Cathy Adams (2016) shows, the use of blackboard and chalk grants students the possibility of witnessing how words come into being. Chalkboarding thus provokes a different and more caring sort of attention when compared to the consumerist-style attention that goes together with seeing appearing slide after slide. Under traditional conditions, it is as if students have a more direct feel of why the words which are produced are important and of how much the teacher cares about these words. This unique way of disclosing the world has up till now no equivalent in the digitally supported classroom (Ibid.).

Beyond a Normative Approach

These analyses underline that technologies, and especially digital ones, are never just means at our disposal, i.e., instruments which we might choose to use (or not) and which are easily interchangeable for other instruments without this having much consequences. They show, on the contrary, that (digital) technologies define to a rather large extent how we experience ourselves, others, and the world. More importantly, they actively give shape to the realm of education – in a more harmful than a fruitful way, so it may seem. As such, phenomenology appears to be a good ally for those who believe that with the advent and proliferation of new technologies, we are destroying something of great value and that the use of digital media obstructs the path of true education. Such a view is not only normative, but also technological determinist, as the consequences which are laid out appear to be unavoidable.

Nonetheless, it is also possible to take a more neutral and productive approach, open to the possibilities which come with digitization. This is evidenced by recent work on digitization and education that starts from a (post)phenomenological perspective. This other approach is closer to the principal aim of phenomenology, viz., try and give a precise, rich, and detailed but also maximally unprejudiced and unbiased account of the way in which reality appears to us. Not unsurprisingly, phenomenology has also been effectively applied in order to come to detailed descriptions of what it means to relate to others and the world under pre-digital and digital conditions. Rather than seeking for a justification against (or for that matter in favor of) new technologies, the first and most important task of such a purely descriptive approach is to draw out what it means to educate and to educate digitally, which (new) possibilities come with (new) technologies, and to draw out differences with what education looks like in more traditional (i.e., classroom) settings.

A substantial effort to give such a descriptive rather than a judgmental account can be found in the work of Gloria Dall’Alba and Robyn Barnacle (2005), Max van Manen and Cathy Adams (2009), and Norm Friesen (2011). Rather than playing out traditional media against digital ones, van Manen and Adams argue that “online computer technologies intensify the phenomenology of writing” (van Manen and Adams 2009, pp. 20–21). Digital, and especially online, technologies open up writing to an unprecedented experience of what it means to be a writer. Drawing from Blanchot, they show that writing online and offline is about entering a not easily graspable space (and as such writing offline and online are markedly different from oral discourse which is always a matter of direct expression and which therefore never implies this kind of journey into the unknown). In order to come to terms with the differences between online and offline text production, van Manen and Adams carefully craft an experiential account of the different ways in which writing comes into being under these two conditions. And so, they convincingly show that in

“cyberwriting” there is a different sense of what it means to make one’s ideas and feelings public, another contact to the insight and truth one seeks through writing, a different feel of one’s own and one’s readers presence, proximity/distance and corporeality, etc.

Likewise, in his study *The Place of the Classroom and the Space of the Screen* (2011), Friesen gives a detailed and rich analysis of “the differences separating screen and classroom as spaces for pedagogy” (p. 15). At stake here is not a plea against or for online learning but the development of “an experientially attuned vocabulary,” in order to offer an accurate picture of the lived experiences of teaching and learning online and offline. Defying much of the mainstream research regarding digitization, which is almost exclusively concerned with how the use of traditional and digital media affects study performance and learning outcomes, Friesen’s goal is to flesh out what it means to be a student, to be a teacher, and to be together (to share experiences and meanings) in both conditions. As such he is describing things which we can all recognize ourselves, but in a more structured way than we usually do. More exactly he analyzes teaching and learning according to the four basic dimensions (or existentials) that structure lived reality: “lived time, lived space, lived body, lived relation[ality]” (p. 25).

The Constitutive Role of Digital Technologies for Humanity

Next to challenging a normative take on the digital in education, recent (post)phenomenological work has also addressed other assumptions which are implicit to the account sketched in the first section, viz., that technology is only a phenomenon of a recent date and that digitization is the paramount exemplification of the recent tendency of relying too much on technology. Over and against this, it could be argued, from a (post)phenomenological point of view, that technology has a much longer history and that our very humanity has actually always been dependent upon the uses of technologies. This follows from

Bernard Stiegler’s (1998) reinterpretation of Husserl’s analysis of the constitution of time consciousness and the role of memory. Whereas Husserl only discriminates between primary retention (actually sensed experience) and secondary retention (past experiences that are not directly accessible, but which co-constitute the meaning of our actual experiences), Stiegler shows that Husserl omits to take into account the most important constitutive dimension of memory: the technological tools we rely on – which he calls tertiary retentions (e.g., carving a date on the wall of a monument or writing a diary entry). The idea here is that it is only thanks to the existence of external memories that human beings have something they can properly call memory in the first place. Technological memory is not an exteriorization of the conscious faculty of memory; it is exactly the other way around.

Therefore, our reliance on digital technologies is not a recent or exceptional phenomenon. Rather, our very constitution as human beings (and the very possibility of conscious phenomena) is dependent upon the use technological prostheses. In that sense digital media are less a “new” phenomenon than often taken for granted. They are merely the latest version of the technologies without which a human life is inconceivable. Moreover, this view entails that the word technology refers to much more than to mechanic, electronic, or digital devices alone. Instead, it concerns *all* tools and supports we rely on to lead a human life. An electric drill is as much a technology as a prehistoric stone axe is, and the same goes for chalkboarding *and* PowerPoint. Also, technology has not merely to do with the *instruments* we use but also with the *use itself* in a practical, material, and bodily sense, i.e., with the gestures and disciplines required to work with particular technologies (Stiegler 1998). It is here that education plays a crucial role, as it is the place where we get acquainted with the basic grammar of the operations necessary to master the culturally dominant technology – be it reading and writing in a traditional or in a digital way (cf. Vlieghe 2015). As Norm Friesen (2011) has argued, even though there exist marked differences (e.g., the inevitability of the play of

concealing and disclosing that goes together with the body that *cannot not* talk in the classroom), there are also important similarities between classroom and educational on-screen activities. Both demand the development of habits, an inflexible bodily discipline, and a “regimentation of time, space and the body” (p. 81). Over and against the prejudice that we leave our bodies behind when sitting in front of a screen, engaging with digital media should be considered as being as much a physical engagement as using traditional media is. And so, in order to understand what it means to teach and learn off- and online, we first and foremost need to concentrate on how we come to embody particular technologies (cf. Dall’Alba and Barnacle 2005).

On this point a fruitful dialogue has been opened between (post)phenomenologists and media theoretical approaches. According to these last approaches (developed in the wake of McLuhan and the Toronto School of Communication and more recently in Germany as media ecology), communicating our feelings and ideas is not only dependent upon technological infrastructure but profoundly influenced by it (i.e., the medium is the message). Media theorists have been especially interested in differences between pre-digital and digital writing and reading technologies. In this regard the recently translated work of Vilem Flusser deserves to be mentioned (e.g., Flusser 2011). Drawing from both phenomenological description of experience and the analysis of features of the material infrastructure we rely on, Flusser argues that there are marked differences between alphabetic and nonalphabetic writing systems, as well as between picture-based, text-based, and computer-based forms of communication: each media technology goes together with a substantially different experiential realm. Flusser goes so far as to claim that our capacity for logical thought and our sense of historical progress are predicated upon the characteristics of (alphabetic) writing. This particular form of writing presupposes a particular repertoire of bodily gestures which support a one-dimensional, *linear* form of thought (alphabetic writing goes in one predefined direction without any possibility of returning), which is opposed to the

two-dimensional form and much less inflexible form of thought which is related to image-based scripts such as ideographic writing systems. Most prophetically, but without making normative commitments *à la* Heidegger, he argues that we are gradually shifting toward a new era, in which our experience of the world is mediated by computer images rather than alphabet-based texts. This will introduce a new, zero-dimensional style of thought (a form of thought which is akin to the computational force of computers) (Ibid.).

The Digital and the Human Body

As noted, a major consequence of the work discussed above is that the often heard claim that digitization implies disembodiment is misguided. A full phenomenological account of digital education requires attention for the body, even if the body is engaged in different ways in digital teaching and learning than it is in the classroom. Taking the human subject as external to the technologies she counts on is not an accurate starting point for understanding the digital (or for that matter for coming to grips with the role of any educational technology, as the example of the gesture of writing illustrates). Rather, as Don Ihde (2002) – one of today’s most renowned phenomenologists of technology, proposes, we should ground phenomenological analysis on human-technology relations (meaning that this relation is as important as the intentional subject-world relation in Husserlian phenomenology). Over and against the technological determinist reading of Heidegger sketched above, Ihde (Ibid.) claims that this positive reading of what (digital) technologies allow for is already (implicitly) present in Heidegger’s prioritizing the practical relation which we entertain with our world when analyzing the proper characteristics of human existence.

Drawing from Ihde and Levinas, Gallit Wellner (2014) argues that we should understand the human-digital technology relationship in terms of the *screen*. Digital media don’t accidentally have screens. Rather, they are defined by having a screen. Moreover, digital media appear as

closely intertwined with our own bodies, in the sense that they address us as a face (or, more exactly, as a quasi-face as Wellner wants it). For instance, “[t]he screen of the cell phone, like a facade of a home, represents an exteriority which hides an interiority. The screen acts like a face that requires a response . . .” (Ibid., p. 311). Therefore, in order to understand our rapports to the digital, we need to take into consideration bodily and emotional qualities that relate to the screen which always appears as something other (alterity) in the strong meaning of that word.

This sense of alterity inherent to screens might be disputed by turning once more to Friesen’s (2011) analysis of experiential differences between classroom and online education. To give only one example, Friesen draws attention to how the experience of silence (e.g., occurring between two students collaborating on a project) is totally opposed on- and offline. Whereas the meaning of silence in the classroom is always constituted by the bodily presence of others and the surroundings one happens to find oneself in, silence experienced online is always linked to the physical distance between those who fall silent. In the first case, the meaning of this silence might be drawn from the other’s body language or her gazing at a salient thing in the surrounding (which might be expressive of heightened attention or boredom). In the second case, however, the other’s silence might mean that the other is no longer communicating (as she is presumably checking up her Facebook account).

This last example illustrates how difficult it is to get away from the normative and technological determinist assumptions discussed above. Although the last analysis gives a rich and detailed account of the phenomenon of silence under both conditions, and although it takes into account the embodiment of both online and offline learners, it also tends to reinforce the idea that the technology in question fully settles what is and what is not possible under digital conditions (techno-determinism), and it tends to frame the digital in a judgmental way, opposing the flat space of the screen to the living place of the classroom – which seems by and large preferable (normative stance). This will probably remain a pitfall and an ever

present challenge to any future phenomenological investigation into the meaning of digital media for education.

Introduction

In education, ethics and aesthetics are more commonly regarded as subject matter to be taught than as essential features of the field. Ethics in education may be conceived as students' moral education, whether defined secularly or religiously, values to be taught to students and embodied by educators. Aesthetics, in turn, is largely understood as part of the arts' curriculum; although, in rarer cases, it may be associated with the pleasing (or perhaps not-so-pleasing) physical building in which teaching takes place.

When we consider how education is experienced, however – the curriculum *as lived*, as opposed to the curriculum *as plan* (Aoki 2005) – we discover that education itself has important ethical and aesthetic dimensions. Whether one is an educator or a student, one's everyday experience of education contains fundamental ethical and aesthetic components that are often overlooked, unseen, or taken for granted in our classrooms and our everyday educator–student interactions. These integral dimensions, however, can be revealed when education is considered from a phenomenological perspective.

This entry begins by reviewing the major phenomenological understandings of ethics and aesthetics. We see how, despite common understandings, neither are principles or ideals we employ. Rather, both ethics and aesthetics are relational experiences, arising through simple yet deeply meaningful encounters we have with our world. This entry then considers how the phenomenology of ethics and aesthetics manifests uniquely within the educational sphere, providing shape and depth of meaning to our encounters.

The Phenomenology of Ethics

Ethics is the study of how one should live: what makes life worth living, what principles or beliefs should guide one's life, how these ideas are established and enacted, and upon what basis they are developed. For phenomenological philosophers, however, to understand ethics is not to examine it as a set of abstract principles or

rules that we follow, but rather as something that arises within and becomes manifest through everyday human life. The phenomenology of ethics, then, is a close study of how we live well with others in our world. Specifically, phenomenologists seek to identify those experiences and their meaning that underpin *eudaimonia* or *the good life*.

From a phenomenological perspective, ethics is understood as being rooted in our interpersonal relations and intersubjectivity. The most basic relation that we enter into is with another person. This original ethical experience – encountering another – serves as the foundation for all other dimensions of ethics, including the development of ethical principles and systems. The first phenomenological philosopher to articulate this position was Emmanuel Levinas. Indeed, one might say that the phenomenology of ethics is first and foremost a Levinasian phenomenology. This is not to claim that other phenomenologists have not offered other phenomenologies of ethics, only that the majority of subsequent ethical investigations are deeply indebted to Levinas' ideas.

Responding to and seeking an alternative to Heidegger's ontology, Levinas demonstrates that there is a profoundly ethical basis to human existence that arises from our first and most simple encounter with another human being: the instant of seeing the other's face. For Levinas, this moment is our most fundamental ethical experience. It is ethics, as well as the origin of subjectivity and intersubjectivity. It is also where all philosophy must begin.

According to Levinas (1968, 1985), when we see the face of the other, we respond to it immediately because it demands and commands us to. We respond to it – and its injunction not to harm the other, but to defend and protect him or her – before we can think or stop ourselves. And in this immediate, spontaneous response, we experience responsibility for the other. It is a response driven by the naked vulnerability of the other's face and the power it holds over us. In looking upon the other's visage, we do not see the face's physical features but the being embodied there. And in that face, we do not see another like ourselves, but an other, someone who is

wholly different to us. The other's face challenges us because of its difference, and, in that difference, it signifies, it "speaks." This signification is, for Levinas, the origin of discourse, communication, and community. Moreover, in placing us in relation to and responsibility for the other, it also calls forth an awareness of ourselves, our subjectivity, our humanity, and our being in relation to others in the world. Importantly, however, our response to and the responsibility we experience for the other are unidirectional. Our response and responsibility are not dependent on a similar response and responsibility being returned to us. Although directly emergent from our experience of interrelation, our response – and by extension, our experience of ethics – is initially singularly ours.

Many phenomenologists have expanded upon Levinas' phenomenology of the face, including Edward Casey, Alphonso Lingis, Ian Thomson, and Max van Manen. From Levinas' ethics, it can be established how certain actions – such as glances, touches, or inaction – have an ethical character. We can also articulate how what we see when we look upon another – the original ethical act – draws forth an awareness of ourselves as ethical beings and of our world as having ethical (or unethical) features. It further opens up an understanding of how our initial perception and what we perceive has the capacity to change who and how we are in the world. Quite simply, Levinas' phenomenology of the face allows for the articulation of the ethics of looking, seeing, being seen, being unseen, and responsibility. It also makes possible explorations of the complexity of ethics within particular environments, such as education or health care. Ethics, Levinas shows us, is intimately intertwined with human relationality. It emerges in our relations with other people, with others in a community, with those like us and those unlike us, and even with animals, things, the natural environment, and our world as a whole.

The Phenomenology of Aesthetics

Like the phenomenology of ethics, the phenomenology of aesthetics has a relatively clear and

specific foundation. Although phenomenological philosophers since Husserl have used art to gain insight into phenomena – such as Merleau-Ponty's study of Cezanne's paintings or Heidegger's exploration of van Gogh's painting of shoes – few have undertaken a rigorous and systematic phenomenology of aesthetics. It seems that the experience that historically was associated with the arts and, in particular, with the beautiful proves a challenge to the phenomenological project. And yet, when attempted, such a phenomenology provides unique insights into the affective domain of life.

To fully understand the phenomenology of aesthetics, we must understand how the term has changed over time. Traditionally, aesthetics was conceived as the experience of the beautiful in the arts. In the modern period, however, the concept expanded to include the experience of anything beautiful (such as people, places, or things). In recent years, aesthetics has undergone yet another, more radical transformation to include negative affective dimensions of existence, coming to reflect more accurately the term's etymological root as being "sense perception."

Early phenomenologies of aesthetics, not unexpectedly, approached it solely as arising through beautiful artworks. These studies initially struggled with the challenge of understanding the experience of art as being more than mere representation. The first to do so was Roman Ingarden (1961, 1973a, b), who posited that the artwork (for him, the literary work) is a being in itself, which is composed of strata that are experienced by its audience. Combined, the strata create the entity of the work, but each layer carries its own value and unique aesthetic qualities. Meaning arises in the encounter between the audience and the strata within the art object. While human consciousness is required for the experience of the strata, Ingarden insists that consciousness itself is not the creative force in the encounter; such force resides in the object. What is "cocreated," however, is the object as a work of art; that is, as an aesthetic object.

Building upon Ingarden's understanding, Mikel Dufrennes (1973) provides the first comprehensive phenomenological analysis of the arts.

According to Dufrennes, to understand the art object, one needs to account for it within a lived world. Like his predecessor, Dufrennes differentiates between the art object, which may be encountered in various ways, and the aesthetic object, which is “the work of art perceived for its own sake” (1973, p. 16). Unlike Ingarden, however, Dufrennes’ phenomenology is not limited to viewer and viewed, reader and text. It also recognizes the history and location of the work, as well as the influence of the artist. Indeed, Dufrennes claims that, in our experience of an aesthetic object, the creator becomes manifest in the work as a “quasi-subject.” At play in any encounter, then, is the creator, the created object, and the audience member or viewer within the lived world.

According to Dufrennes, in the relation between the audience and the art object, the aesthetic object emerges. The viewer/audience “responds to the subjectivity of the work through his own subjectivity” (1973, p. 198). In much the same way that ethics arises in the relation between beings, aesthetics emerges in the deep and sensuous bond that forms between the audience and the artwork (specifically the artwork that contains both its object-specific qualities and that manifests its creator). However, where the ethical relation is understood as fully manifesting instantaneously before we can stop it, the aesthetic relation begins from the first encounter but may build and continue to expand over time. For Dufrennes, aesthetic experience fully manifests as *expression*: affective qualities that form the identity of the aesthetic object over time and that increase and grow with extended reflection. It is expression that gives the object subjecthood as an aesthetic object revealing a fundamental truth.

Although having limited their analysis to art, Dufrenne’s and Ingarden’s phenomenologies form the foundation necessary for conceiving of aesthetics more broadly as the affective, sensuous qualities of phenomena. Indeed, many phenomenological philosophers, both past and present, have demonstrated how the aesthetic dimension of phenomena can reveal truths of our world and serve to supplement more traditional phenomenologies. For instance, Gaston Bachelard’s

various considerations of things like nests, drawers, burning candles, embers, and childhood dreams – studies undertaken using the terms “poetics” and reveries – demonstrate how the aesthetic dimension of these small, simple experiences are deeply bound to the larger meaning of human life. Likewise, Roland Barthes’ phenomenology of photography (1981) shows how the meaning of photography is not found in its objective, identifiable qualities – whether the common *studium* or the more rare *punctum* – but in what truth of its subject a particular image reveals aesthetically to the viewer.

In recent years, phenomenologists have grappled to articulate a new language to account for this expanded understanding of aesthetics. Michel Henry (2008) posits the affectivity of life (i.e., the feeling of being alive, every instant of every day) to be the proper ground of all experience and any philosophical study. He calls this affectivity *pathos*. Adopting a more limited scope, Arnold Berleant (2010) introduces the notion of *negative aesthetics* to complement the traditional positive aesthetics. Like Henry, however, Berleant argues there is an aesthetic dimension to more than just artworks and landscape. It is found in much of life, including urban spaces, social and political action, and even terrorism. In our experiences of various nontraditional aesthetics, Berleant argues there is evidence of a direct connection between aesthetics and ethics: the former often immediately and bodily identifies the latter.

The Phenomenology of Ethics and Aesthetics in Education

Although highly abstract when considered philosophically, the phenomenologies of aesthetics and ethics in education are poignantly revealed in simple, everyday interactions between teachers and students: in the glances and nods, the small words of praise or censure, or things like notes written on assignments. In fact, we can find the richest demonstrations of the ethical and aesthetic components of education in those moments that often go unrecognized by one or both parties or are immediately forgotten.

In education, we generally accept that *how* a teacher does something is as important as what they do; the *how* of education can have profound impact. A single glance can recognize someone in his or her singularity or leave the student feeling overlooked and alone. As Max van Manen's ongoing phenomenological studies of education reveal, small things like the teacher's tone, tact, or even the ability to remember a student's name carry great meaning. Speaking kindly when a student needs it, not calling upon a student at a particular moment, or correctly pronouncing a student's name are all ethical acts. Ethics arises in those momentary interactions; it emerges within the pedagogical relation. The actions may be immediately recognized as ethical or, more likely, go unnoticed, but they each originate from an authentic encounter with the other, the Levinasian response to the face. In encountering his or her student, the teacher has already responded and taken responsibility for that student, even before the teacher chooses to act in a particular way.

Van Manen draws upon the tradition of the Utrecht school and continental pedagogical philosophy, which have long recognized pedagogy as being inherently ethical. These pedagogical moments, however, contain equally important, but less acknowledged, aesthetic components. Students bodily and sensuously experience a teacher's tact or tone or thoughtlessness. These therefore have innate aesthetic components. The aesthetics of the act give shape, form, and feeling to the encounter. We need only think of those moments where someone apparently says a kind word, but it is insincere. We do not believe them for what we feel belies their words. And yet, we only know the insincerity through what is felt. Similarly, a well-placed nod from an adult can carry volumes of meaning to a youth, much more than could be said or explained, and such an act may be remembered by the individual years later. As Berleant and others note, we often immediately identify that which is ethical or unethical in our world by how it makes us feel.

The aesthetic dimension of education can be found in the affective qualities of these single

pedagogical moments, but it is also evident in the larger project, as is ethics. The German pedagogue Klaus Mollenhauer (2014) describes how *presentation*, what "ways of life" adults present to children (i.e., what we portray to children as we live with them), and *representation*, what cultural materials are given to a child (i.e., the formal visual and textual educational materials), are equally important in modern pedagogy. The worlds to which children and youth are exposed help shape them and will have both immediate and latent effects. That which appeals and inheres in children, the "pedagogical call," is likewise both ethical and aesthetic. Manifestations of pedagogical relationality, ethics, and aesthetics are intimately intertwined.

Conclusion

Phenomenology provides us with an opportunity to understand that ethics and aesthetics are not abstract values from a bygone era that have resulted in arbitrary social rules we follow but fundamental components of being human and being human in a world with others. As relational phenomena, they both manifest in the encounter *between* one being and another. The phenomenologies of ethics and aesthetics show us that, in addition to being relational beings, humans are intertwined with our world and one another. Moreover, we see upon close inspection how the two – lived ethics and lived aesthetics – are intimately connected. They shape and inform one another. When considered in the context of education, the phenomenologies of ethics and aesthetics play important roles in revealing the depth of meaning found in everyday educational encounters. Through their light, we may begin to perceive the rich nature of contemporary pedagogy.

Introduction

In the field of higher education, until quite recently, there has been relatively little explicit attention to insights that can be gained through phenomenology. Even the recent interest can be seen as modest, when compared with the potential for phenomenological perspectives on higher education to inform practice, policy, and research. An increasing interest suggests phenomenology may resonate at a time when higher education is increasingly falling under the influence of a pervasive neoliberal agenda, with its emphasis on accountability and performativity. This instrumental agenda is evident in an overemphasis on reducing complex phenomena related to teaching and learning to readily measureable quantities, as well as in widespread, empty rhetoric about “excellence,” and “world class standards.” An agenda such as this risks promoting superficial compliance – or falling in – with how one is expected to “play the game,” whether as teacher or learner. It creates a distance from who is learning, what is actually being learned, and the mutual responsibilities of students and higher education institutions for enhancing this learning.

Such an agenda contrasts starkly with insights from phenomenology into educating students in higher education, which point to alternative ways forward. In recent years, significant insights have

been gained through phenomenology for educating students during undergraduate and (post)graduate programs offered by higher education institutions, such as universities, colleges, and institutes of technology, or equivalent. In particular, the work of existential phenomenologists – especially Martin Heidegger, but also Maurice Merleau-Ponty and Emmanuel Levinas – has contributed to re-thinking common conceptualizations of what it means to educate in higher education. In so doing, they provide inspiration for addressing challenges facing contemporary higher education, while reminding us that the current reality is not the only one possible.

The focus in what follows is a sketch of some of the insights and influences from phenomenology that are informing current issues related to educating students in higher education. Issues in educating students have featured prominently among those explored with inspiration from phenomenology. Following a brief introduction to some key ideas from Heidegger's work on higher education, several ways in which phenomenology challenges us to re-think higher education and its common practices are outlined below.

Re-thinking Higher Education on Ontological Grounds

Arguably, to date, the potential for insights through phenomenology to inform higher education has been made most apparent by Martin Heidegger, with several others taking inspiration from his work. Among the broad range of topics he tackled, Heidegger lectured and wrote about teaching and learning in higher education, as well as about the role higher education can play in society. An account of phenomenological perspectives on higher education would be incomplete without acknowledging his substantial contributions and continuing influence. Regarding himself primarily as a teacher, Heidegger considered he had devoted his life to higher education. It is perhaps through his idealized vision of reforming the university as a means of nation building that Heidegger fell prey to Germany's National Socialism. Like much of the

German populace, Heidegger later attempted to downplay his links to Nazi ideology and failure to speak out against the Holocaust, although this did not avert a ban that prevented him from teaching in Germany between 1945 and 1949.

In line with Heidegger's broader interest in inquiring into the meaning of being, he sought to re-think education on ontological grounds. In other words, he gave careful thought to what education would entail if it were to enhance our capacity to become and to be more fully human. Indeed, this is a recurring theme in several of his works. More particularly, many of Heidegger's lectures and other texts are pedagogical in both approach and intent. Through his way of inquiring, Heidegger sought to redirect attention to what addresses or concerns us in our living among others and things. He saw potential in education for recovering attentiveness to what matters for us, as human beings in our becoming.

Heidegger's ontological interest places him at odds with much of the extant higher education literature, with its concern with structures in the "mind" that are to correctly represent a world "outside." He considered that truth was not to be found in such representationalism, so this was not a fitting goal for higher education. Instead, he described truth as *aletheia* or phenomenological unhiddenness. Differently expressed, he saw truth as world disclosure, with education offering a means to this form of truth. Truth as world disclosure is conditional upon continual striving for attentiveness and responsiveness to others and things in our dynamic and changing world. This means efforts toward achieving truth would inevitably always be incomplete.

The way in which Heidegger conceptualized learning is itself imbued with this attentiveness and responsiveness. For Heidegger, "to learn means to make everything we do answer to whatever essentials address themselves to us at a given time" (1968, p. 14). This notion of learning cannot be reduced to receiving or acquiring correct knowledge or to engaging in activity with an expectation of procuring something. Instead, it includes both attuning and responding to what is central in what addresses us. If learning is to attune and enable us to respond to what matters

to us in our living, then education has a key part to play in transforming our ways of being in a manner that is directed to others and things in our world. Iain Thomson argues that the transformation or “turning around” advocated by Heidegger occurs “by turning us away from the world in which we are most immediately immersed, then by turning us back to this world in a more reflexive way” (2001, p. 254).

Consistent with this notion of learning that transforms, Heidegger regarded teaching neither as filling students with knowledge as though they were empty vessels nor demonstrating how to uncritically become (like) their teacher. On the contrary, while he considered teaching to be exalted and highly worthy, he emphasized that it was not the teacher or course content that should be in focus, in themselves, but creating space and opportunities that enable students to learn: “Teaching is more difficult than learning because what teaching calls for is this: to let learn” (Heidegger 1968, p. 15).

Heidegger’s conceptualizations of learning and teaching have provoked re-thinking of a prevalent preoccupation in higher education with knowledge acquisition and its application, as well as an associated privileging of the intellect. His conceptualizations prompt us to place emphasis, rather, on integrating knowing, acting, and being through higher education programs (Dall’Alba and Barnacle 2007). These programs have a crucial contribution to make toward enabling students to integrate what they know and can do with how they are learning to be. Redirecting attention from knowledge as an end in itself highlights the potential of higher education to open possibilities for being and becoming how one strives to be among others and things.

Technologizing Higher Education

One of the developments that Heidegger regarded as posing serious questions for our being was the rapid uptake of newer technologies. Similar to other spheres of life, newer digital technologies for communicating and accessing information have become ubiquitous in higher education,

especially in wealthy countries. Educational offerings in online environments involving these technologies are a trend likely to continue. These newer digital technologies – regularly superseded by more novel newcomers – have become a persistent presence in many higher education institutions. These technologies can offer benefits that include increased flexibility in accessing course and support materials, allowing communication among people who are geographically dispersed and improved access to higher education for those with some disabilities. At the same time, the frequent development of newer digital technologies and the presumption they are indicative of innovative, cutting edge programs carries a risk of compulsion to use them in courses. This compulsion is evident, including at institution level, often with limited thought about whether or how these technologies contribute pedagogically to student learning. At times, there is a view that technologies can replace teachers to improve the budget bottom line, typically with little account of the actual costs, either financial or to the persons involved.

This approach to the use of technologies exemplifies a broader concern expressed by Heidegger, which is not limited to employing particular technologies. He argued that technology is not merely a neutral means to an end; not simply a tool we employ for specific purposes. In higher education settings, this can mean we do not simply make use of technologies, but we can be set upon in our use of them. Similarly, but more paradoxically, Heidegger claimed the essence of technology is not anything technological. Instead, he saw technology as a “way of revealing.” In our highly technologized world, the particular way of revealing he identified frames human beings and nature as resources, ready and waiting to be exploited, what he referred to as “standing reserve” (1993/1954, p. 322). He named this calculative, technological rationality *Ge-stell* or enframing (p. 324). When teachers and students are ordered as standing reserve for the purposes of attaining targets on courses employing newer technologies, monitoring throughput in course completions, or ranking institutions across diverse settings, enframing is apparent.

Heidegger's notion of technological framing opens a range of avenues for re-thinking higher education in our technologized world. As Paul Gibbs (2010) points out, the extensive massification of higher education we have witnessed in recent decades in many countries carries with it a risk of embracing and encouraging a technological, calculative way of being toward others and the natural world. This is because a focus on mass education can distract us from education that directs attention to responding to the uniqueness of particular situations. This, in turn, risks promoting an inauthentic, dispersed self who lacks commitment to being and becoming among others. Gibbs argues, like Thomson (2001), that higher education has a key part to play in fostering critical awareness of a technological way of being. This awareness is necessary for taking a resolute stance on our becoming, in a world among others.

The notion of technological framing also provides a starting point as Kevin Flint and Adam Barnard (2010) explore the shaping of the self that occurs in a professional doctorate program. They inquire into ways in which discursive technologies operating within an academic institution can limit opportunities for personal development within the doctorate. They use this inquiry to explore spaces for personal development through research in shaping multiple selves among doctoral researchers.

Re-thinking Teaching and Learning Practices in Higher Education

Phenomenology also provides inspiration and insights for exploring common teaching and learning practices in higher education settings. In the higher education literature, the part that assessment plays in directing student learning has been highlighted. Arguments have been made in favor of assessment of student learning that links to the world beyond educational institutions, as well as incorporating online forms of assessment to improve their contemporary relevance. While these arguments can be seen to have some merit, they typically feature the attributes

and design of assessment tasks. In so doing, they downplay the learning or, more specifically, the transformation in ways of being in the world, which assessment has the potential to encourage (Vu and Dall'Alba 2014). Beyond assessing student achievement, assessment tasks can direct students' efforts in integrating what they know and how they act into forming who they are becoming.

Another common practice in higher education settings is discussions between teachers and students for pedagogical purposes. Teachers can approach these interactions as a means of meeting obligations to students or, in other words, fulfilling contractual requirements. Amanda Fulford (*in press*) points out that this approach reduces teaching to a closed exchange between teachers and students, such as providing and receiving course content. She demonstrates this is an impoverished conceptualization of teaching that does not have student learning as its focus. It also fails to take account of the centrality of relationships among teachers and students to the pedagogical encounter and the learning that can be promoted (Giles et al. 2012).

In a manner reminiscent of Heidegger's critique of commodity exchange in educational settings, Fulford (*in press*) argues that limited exchange of this kind lacks spontaneity and openness to the unexpected, which enable learning. This requires a way of being with students and developing sensibilities that are attuned to reading the relationship and acting in the moment, in ways that encourage learning (Giles et al. 2012). Drawing on Levinas' notion of encountering the Other, such as through another person or ideas, Fulford points to ways in which teaching can open spaces and possibilities for enabling such encounters, in ways that take seriously responsibility for the Other in higher education settings.

Embodying Learning

A further way in which phenomenology informs efforts to re-think teaching and learning practices in higher education is by challenging a preoccupation with developing the intellect, through

highlighting the inescapably embodied way in which we live and make our way in the world. Although not specifically directed to educational settings, Maurice Merleau-Ponty's concept of the "lived body" serves as a source of ideas for exploring alternatives to an emphasis on reason and the intellect. In higher education, where intellectual development often reigns supreme and online environments tend to be associated with innovation, critical analyses of the ways in which our learning and being-in-the-world are necessarily embodied are timely.

Given a preoccupation with the intellect in higher education, the broad array of varied bodies who study and move about in these settings can go largely unnoticed in the research literature. In a study exploring the experiences of mature age students from working class backgrounds in a number of British universities, Serena Bufton (2003) describes how their embodiment intrudes into their efforts to learn and belong in this unfamiliar environment. She points to ways in which nature and culture intersect in the body, as Merleau-Ponty noted and Pierre Bourdieu subsequently elaborated in his notion of "habitus." Bufton outlines how these students experienced a lack of "fit" between the institutional habitus and their own local accents, cultural values, life experiences, and way of speaking and seeing the world. Her study draws attention to a potential blind spot in higher education institutions, where knowledge can be attributed an illusory neutral status.

An additional phenomenological exploration of embodiment builds on Merleau-Ponty's argument that embodied being in the world is a precondition for conceptual understanding. Robyn Barnacle (2009) draws on several phenomenological and feminist scholars in re-thinking mind-body relations in higher education. Taking the example of the role of the gut in emotional responses and mood – recognized in expressions such as gut reaction and gut instinct – she points to inadequacies of the intellect alone for learning. Against the background of her analyses and those of others, Barnacle explores the potential of harnessing sensibility in conjunction with intellect for learning in higher education. She argues

that a key purpose of curricula is to promote a sensibility among students for the way in which particular fields or disciplines engage with the world. This is inevitably an embodied understanding.

Conclusion

This outline has sketched some of the rich and varied ways in which phenomenology is serving to inform questions related to educating students in higher education. As noted in the introduction, interest in phenomenology in the field of higher education, although modest to date, shows signs of expanding. The outline above indicates there is considerable scope for interrogating current issues in higher education through a phenomenological way of inquiring that endeavors to return anew "to the things themselves." This scope extends, of course, well beyond the sketch given here. Phenomenological inquiry allows us to turn back to the world of higher education, with its challenges, possibilities and contradictions, in a more reflexive way. Sharpening such attunement to the lifeworld – our inevitable entwinement with others and things in our living – carries a promise of enabling us to become more fully human. Higher education has a key part to play in directing efforts towards achieving this aspiration.

Phenomenology of Inclusion, Belonging, and Language

Anna Kirova

University of Alberta, Edmonton, AB, Canada

Synonyms

Language as “house of Being”; Phenomenology; Phenomenology of language; Phenomenon of childhood migration; Play and belonging; Play and language; School and inclusion

Introduction

More than 230 million people, 20% of them young children, live in countries in which they were not born. When children migrate, a sudden change occurs in their lifeworlds that is not of their making; instead, the experience “befalls [them], strikes [them], comes over [them], overwhelms and transforms [them]” (Heidegger 1982, p. 57). This essay explores the phenomena of belonging, language, and inclusion in the lived experiences of young children whose childhood has been interrupted by migration. The

phenomenological inquiry is based on Heidegger’s (1982) notion of language as the “house of Being.” It is guided by the following questions: What is the lived experience of a child whose life is interrupted by migration and whose home is replaced by a space in which to live, where a new language is spoken that does not serve as a guide to the world? What is it like to live in-between languages and cultures? How does a child experience school as a stranger in a world of others? Can the experience of loss of words serve as a means to attain new understandings?

The essay begins by considering the possibilities opened by the phenomenological method – and, in particular, van Manen’s (1994) “fundamental existentials” – to understand children’s lived experiences. It explores how immigrant children experience these existentials in relation to the objects and people at home, to their unfolding sense of self and the meaning of belonging to a place, and to the changes in their lived space brought about by the process of migration. Following Heidegger’s (1982) notion of language as the “house of Being,” it then reflects on the meaning of “being in the Other’s house” as explored through immigrant children’s experiences of school, their loneliness and isolation from their peers, and their inability to make themselves understood through language. Play as a shared experience in childhood is investigated in relation to young children’s ability to engage with the world and others linguistically and non-linguistically. Play as an experience of being with others allows young immigrant children to live between languages as well as to develop their relation to the language of home and the home of language.

The Structure of Human Experiences

Phenomenological research of children’s experiences aims to clarify, describe, and interpret children’s unique ways of attending to the world. As a human science research methodology, phenomenology provides a particularly suitable paradigm for studying the phenomena of belonging,

language, and inclusion in immigrant children's lives because it is concerned with questions of meaning with the goal of understanding the significance of a given human experience.

According to van Manen (1994), the structure of any human experience can be revealed by reflecting on that experience while guided by four existentials by which human beings experience the world: lived space, lived body, lived time, and lived other. In a general sense, *lived space* refers to the physical environment or landscape in which we find ourselves. *Lived body* acknowledges that we are always physically in the world, and our bodies reveal some aspects of ourselves in a particular situation. *Lived time* is subjective time as opposed to objective or clock time. Time is experienced differently depending on the context in which we experience it. The *lived other* is the relationship we have with others in the interpersonal space we share with them.

The exploration of the ways in which these existentials are experienced by immigrant children allows for an understanding of the phenomena of belonging, language, inclusion, and the pedagogical possibilities such an understanding offers (Kirova 2007).

Home, Self, and the House of Being

Home is intimately tied with one's sense of self; it is where our own being finds its genesis and belonging. As Steinbock (1995) asserts, "the homeworld is not just any world, but selectively appropriated with the density of a tradition. It is not the world we experience, but the world *from which* we experience" (Steinbock 1995, p. 222, original emphasis). The walls of the home form a boundary between inner and outer, private and public, space. One rarely thinks of a home in terms of its walls, however. Rather, the objects inside the house create a feeling of at-homeness because the use of the everyday objects in the home is habitual. Children do not question the presence of these objects: they are taken for granted.

The first and most noticeable change in an immigrant child's lifeworld is the change in their

physical surroundings brought by the loss of the familiar world of home (Kirova 2007). For many children, migration means losing the familiar objects inside their home. Yet familiar objects alone do not create a sense of at-homeness; the same objects may be experienced differently in a new space. In order for an object to become part of our home, our bodies need to "know" it in relation to other objects as we inhabit the space at home. Only then does home become a place where our own being finds its genesis and belonging.

A child's sense of at-homeness is also connected to the people who share the space at home. These people, usually the child's parents, siblings, and other members of the family, are those who have shown the child what the objects in the home are and how they are used and cared for. Thus one's identity is shaped at home by the way in which the objects in the home are presented and understood. A child understands that "something *is* only where the appropriate and therefore competent word names a thing as being, and so establishes the given being as a being" (Heidegger 1982, p. 63). Home, then, is where language gives being to the things in the world.

For an immigrant child, everything inside the new home *is* because it has been appropriately and competently named in the child's mother tongue. However, in the world outside the new home, things remain nameless because other people's words are not understood. What is the child's experience of a world where language no longer shows the essential being of things? How is reality conceived in a new language?

Being at School Is Being in the Other's "House"

Immigrant children no longer belong to the world they left behind, nor do they yet belong to the new world. School is where children encounter the world outside of home. And, while going to school is only a fraction of immigrant children's new existence, it plays a central role in their understanding of the world. At school, children are asked to relate to each other and the adults in a

particular rule-governed manner that is fundamentally different from their experiences at home. In contrast to the home, in school a child is asked to become one of a type: a student who is expected to have the same kind of relationship with each teacher based on designated school rules. These rules are abstractions sustained by the school/classroom community and the requirement that students relate to the world in another way, that is, by mastering symbolic forms (e.g., the alphabet, numbers, musical notes) that represent their knowledge and relationship to the self, others, and the world around them. Thus school not only necessitates an ontological change in children, it also imposes a particular (scientific) epistemological construction of their knowledge of and about the world understood through symbols, among which language plays a prominent role.

If the being of anything that exists resides in the word that names it and if language, as a result, is the house of Being, as Heidegger (1982) suggests, then immigrant children's inability to name things in the new world of school is more than an inconvenience. Words achieve their meaning not just from the things they refer to but from associations created in the mind. The lack of these associations and of a common language creates a real barrier between immigrant children and the rest of the people in the school. With no friends and no way of making themselves understood through language, a child feels lonely (Kirova-Petrova 2000). The feelings of loneliness and isolation that immigrant children experience also affect how they experience time while they are at school. Time is experienced as being stretched out (Kirova 2001). As an observer rather than a participant in the life of school, an immigrant child finds school days long and boring. Not being at ease in the new language means, for immigrant children, among many other things, being unable to share humor with their peers. Sharing humor creates a sense of *we-ness* only if a joke is understood. A meeting ground for *we-ness* to happen is rooted in both experience and language and thus is inaccessible to an immigrant child. Laughter becomes a performance for

immigrant children, a way to show others that they too are part of the group. However, this brings little satisfaction. For many children, gaining a feeling of belonging to a peer group is a long and sometimes painful process during which they may become victims of stigmatization and public humiliation that leave them "empty of happiness" (Kirova-Petrova 2000, p. 108).

However, immigrant children's struggles with the new language also open up possibilities to experience the rare occasions when language speaks itself as language. "But when does language speak itself as language?" Heidegger (1982) asks and then answers:

Curiously enough, when we cannot find the right word for something that concerns us, carries us away, oppresses or encourages us. Then we leave unspoken what we have in mind and, without rightly giving it a thought, undergo moments in which language itself has distantly and fleetingly touched us with its essential being. (p. 59)

Heidegger suggests that an experience we have with language draws our attention to our relation to language so that we may then remember this relation. Thus immigrant children can ask, "In what relation do I live to the language I speak?" In speaking their mother tongue, children, like adults, talk about many topics, facts, occurrences, questions, and matters of concern. There is an "essential self-forgetfulness" (Gadamer 1976, p. 64) to language. However, this self-forgetfulness does not apply to those who are learning to speak another language. In trying to choose the right word and to think how to say it, immigrant children only occasionally feel successful. To think in one language and have to translate this thought into another language in speech means that a different mode of thinking is activated. In one's own language, thought is accompanied by the unfolding of speech. The way of thinking is different when that thought is not accompanied by an unfolding of speech. This disconnect can change some new language learners' mode of thinking, with results that may be interpreted by others, and by the immigrant children themselves, as indications that they are stupid (Kirova 2007).

In contrast, native speakers rarely have to concentrate much on what to say. When we are at home in a language, the words seem to choose us. In a self-forgetful mode of thinking and speaking, the interaction is truly conversational or dialogic. In contrast, the mode for using a new language requires reflective thinking rather than a prereflective living with language (Kirova 2007). This way of speaking, of choosing the right words, implies a reflective approach to language: an approach that involves suspension from an immediate stance and results in greater self-consciousness.

As in the experience of turning a house into a home, the experience of learning to use another language brings feelings of not belonging. Unlike learning one's native language, learning a new language is a conscious, purposeful activity. Language becomes homework; it is hard work to learn a new vocabulary. Language is something "out there" that immigrant children need to grasp, a skill yet to be acquired. To come to dwell in the language is to come to a different level of experience. Like dwelling in a new space, dwelling in a new language requires more than memorizing the meaning or the position of the words in a sentence to know how to use them. Learning a new language does not mean learning a corresponding system of signs for what one already knows. This aspect is only part of the story. Rather, language comes into being as language through dialogue and therefore comes to be understood through "a life process in which a community of life is lived out" (Gadamer 1989, p. 446).

How does this life process look to an immigrant child? What "community of life" must children live out in the new world for the new language to come to being through genuine dialogue?

Play Is Being with "Others"

For young immigrant children, it is play that allows them to engage in dialogue with other members of the community in the world around them. The world of children's play is shared (Kirova 2007). It requires and creates a sense of

togetherness, which does not mean only doing things together or behaving playfully. Rather, the true meaning of play comes to life only if the players intentionally let themselves be absorbed into the spirit of play. In the world of play, the sense of togetherness represents itself, not only through the boundaries of shared space but through the boundaries of shared meanings of objects used in play that are created and communicated through language and gesture. Thus possibilities open for genuine dialogue between native and nonnative speakers.

Although play experience is here and now, the players are not limited to the immediate setting: play creates openness where things can be anything. Unlike the adults' world of fixed meanings, for children, things are not yet clearly defined and structured, particularly in the world of play. In the open sense making of play, a pencil suddenly becomes a spoon, a horse, or a soldier. The complete openness of possibilities in play allows changes and newness to emerge in the play world. The power of openness extends an invitation to children to enter life, which allows them in turn to experience the endlessly evolving ways of seeing and feeling the world around them.

Yet even in play, language limits one's opportunity to create meaning in new ways: the openness of play is closed off by naming. In play, often a child is looking for something in particular, and when this something is found, a word calls it into being. To name is to bring forth an object into the context of the mind. Thus to name it is to bring it into being. Naming gives rise to an image, creating concreteness in children's landscapes of images, and giving enormous creative possibilities. Yet once something is named, it *is*, and it *is* the same for everyone involved in the naming. Thus a shared meaning is created. As Heidegger (1982) explains, "the word itself is the relation, by holding everything forth into being, and there upholding it. If the word did not have this bearing, the whole of things, the 'world,' would sink into obscurity" (p. 73).

What play allows is acquisition of the new language to be experienced as dialogic, as a process that is on the border between the self and the

other. Holland et al. (1998) explain that “the self is a position from which meaning is made, a position that is ‘addressed’ by and ‘answers’ others and the world” (p. 173). Thus it is possible in play to reauthor the self in a dialogue, and doing so closes the distance one feels when using the new language. Children’s unique ability to engage in activities in which, as in play, meaning is created rather than imposed shows our human capacity to construct new relatedness to the world and to others.

Conclusion

The investigation of the phenomena of belonging, language, and inclusion in the lived experiences of young immigrant children based on Heidegger’s notion of language as the house of Being allows uncovering the creative and active relation-making processes that immigrant children engage in as they perceive and create new childhoods among scattered and conflicting events and experiences. This investigation shows that for young children these processes are not limited to language. Rather, young children’s ability to engage with the world linguistically and nonlinguistically, as in play, allows them not only to live between languages but also to develop their relation to the language of home and the home of language.

Furthermore, Heidegger’s notion that breaking up what is taken for granted is “the true step back on the way of thinking” (1982, p. 108) allows us to explore how language helps immigrant children experience themselves in the two worlds they live in – home and school – as well as in-between these worlds. Whether the new way of understanding the world is adopted or rejected, there is a chance to reflect on one’s basic way of living. Through encounters where one breaks out of unquestioned frameworks and meets the other in face-to-face situations, there is an opportunity to understand the other better. Such encounters help immigrant children to understand themselves better in terms of where and how they come to be as they are, and what and how they will be when they are at home in the new world.

Phenomenology of Language

► Phenomenology of Inclusion, Belonging, and Language

Phenomenology of Movement and Place

Stephen J. Smith
Faculty of Health Sciences and Faculty of Education, Simon Fraser University, Burnaby, BC, Canada

Introduction

Movement essentially has its place, its material supports and environmental affordances, and its fit with locales, habitats, and regions. This is

clearly the case in hydrological terms with precipitation patterns, runoffs, and confluences of flows, currents, waves, and tides defining navigable waterways and in geological terms with distinctive landscapes affecting climatic conditions and animal habitations and migrations. Such large-scale correspondences between movement geometries and place typologies are reflected in incremental scales of biological, social, cultural, and historical life. Yet human movement seems curiously and anomalously abstracted from these scales of life by the natural sciences in terms of the putative functioning of a physiological, anatomical, and biomechanical entity. The social sciences may bring to mind the spaces and places that contextualize human movement, giving its functionality many varied forms. But something about the essential life value of movement remains obscured when motility, reduced to bodily functionality, is correlated with sociocultural, historico-political forms of life. The vitality of movement and the liveliness of places no longer seem integrally connected.

Phenomenology provides a reminder that, in the apodictic certainty of lived, living, and to-be-lived experiences, movement and place are co-constitutive, mutually and reciprocally connected, and actively experienced aspects of unitary life phenomena. Intentionality, as the fundamental precept of phenomenological theorizing, is an interaction effect of place-based movements. It is the effective, affective register of being-in-the-world, being flesh of the world, and experiencing simultaneously the immanent and ecstatic moments of moving within, and seemingly at times without, the world. If movements have their places then so, too, can places be recognized as more than sets of activity affordances, more even than networks and meshworks of interactivity. Movement capacity is the kinetic, kinesthetic, aesthetic, and energetic resonance with landscapes, waterscapes, aircapes, and firescapes along with all manner of built and constructed environments. Motility and mobility are, in phenomenological parlance, the noetic (experiencing) and noematic (experienced) correlates of an inherently animated, participatory consciousness.

As least three registers of movement and place appear in the phenomenological tradition. Each of these registers, of *corporeality*, *humanity*, and *virtuality*, provides topical vantage points from which to think through the particular relations of movement and place. Each of these registers also has educational importance for how we might understand curricular constructions, pedagogical relations, and instructional practices in schools. *Corporeality*, contrary to its connotations of corporal punishment, is indicative of a post-Cartesian movement education and, in fact, suggestive of somatic practices and processes of educating physically. *Humanity* is a concentrated focal point for ecological education and a corrective to school curricula and pedagogies of anthropocentric humanism and anthropomorphic speciesism. *Virtuality* indicates an educational response to the challenges of living in an “interactive age” in which life has been taken up in technologically mediated facsimiles and where what is called for may not necessarily be more of the same technological mediations of life. These three ways of casting the phenomenological intentionality of movement and place thus suggest educational applications and inventions of learning to live well and with others in diverse realms and regions of the world.

Corporeality

The place correlates of human agency inform an “I can” that far exceeds the cognitive grasp of movement activation, execution, and termination. The “body-as-lived” is the trope generally invoked in the phenomenological tradition to anchor this expanded sense of agency. Yet focusing on the body, albeit as sensing, feeling, intuiting “flesh,” inevitably localizes movement within self-containment. Maurice Merleau-Ponty’s (1968) best efforts to define this primary intentionality may well fall short of the mobilization of the places that a fully operative intentionality would reveal.

The body as pre-thetic, preconscious motility as advanced by Maurice Merleau-Ponty, and cast by neo-Husserlians in keeping with

lifeworld interests, provides the core phenomenological rendition. Yet movement is associated unproblematically, for the most part, with bodily capacities that are exercised in places that are, to some appreciable extent, interchangeable. Critical and feminist philosophers such as Luce Irigaray, Hélène Cixous, Julia Kristeva, Elizabeth Grosz, and Iris Marion-Young rightly point out the perspectival limitations of these studies of corporeality and the privileging of particular motile bodies. They indicate a more fluid, permeable corporeality that acknowledges the sociopolitical spatializings of otherwise marginalized bodies. In this regard, they extend a line of critique prompted by Marcel Mauss' study of culturally determined comportments, Alfred Schutz's sociological proposal of multiple lifeworlds, Pierre Bourdieu's culturally enframing habitus, and Michel Foucault's genealogies of subject positioning.

The corporeal turn, which is to say, the turn to more variegated modes of embodiment, still with an emphasis on the "primacy of movement," has been pursued vigorously by Maxine Sheets-Johnstone (2011). She draws extensively upon the work of psychoanalyst Daniel Stern in describing the vitality affects and kinetic-kinesthetic-affective dynamics of movement. Yet motility as corporeality, if no longer tied to particular bodies, still seems cast against spatial backgrounds, or else inserted into them, rather than being formative of place awareness if not the very sense of place itself.

Movement has its place, but in being corporealized and somewhat psychologically cast, it is ultimately placeless. By the same token, a troubling humanism remains in phenomenological scholarship that treats place, whether as habitat, environment, or lifeworld, still as the backdrop to movement. Place remains spatial, coordinated topographically with predominantly human interests.

This topology of thought is reflected in educational questions about what is worth knowing about the world and how that knowledge is best taught. Bodies of knowledge are defined in relative movement abstraction to become passed on through judicious placement in school curricula. The arts, crafts, trades, and sports are cast

accordingly as the practical subjects of an otherwise cognitively oriented, liberal curriculum. Yet corporeality serves as a reminder that bodies of knowledge are also moving bodies and that "lived curricula" are the enactments of knowledge-in-action, interaction, and in responsiveness to the changing circumstances of life. Physical education provides a case in point of a school subject based in the latter twentieth century on Cartesian precepts of extended matter molded through bodily exercises and technical skill development and guided by what Gilbert Ryle called "the ghost in the machine." This curriculum superseded movement education as a more expansive and space-attuned sense of bodily capabilities that now, in the twenty-first century, reappears somewhat under the guise of "physical literacy." Somatic education with its sources in the nineteenth century provides inspiration for extending even farther the curricular incorporation of kinetic, kinesthetic, and affective sensibilities. A "somaesthetic" agenda, as Richard Shusterman (2008) defined it, provides a broad curricular framework for connecting the corporeal register of movement and place with the ways of means of educating children and youth physically right across the school curriculum.

But what of the places not represented in the curriculum and inaccessible within its movement strictures? Environmental studies and ecological education afford movement beyond classroom walls; however, the fuller educational significance of these curricular shapes may yet be discerned in the scholarship of eco-phenomenology beyond themes of place-based pedagogy.

Humanimality

The animal body is characterized by its distinctive motility; however, it is the conjunction of movement and place that characterizes the evolution of such variety of animal life forms. Increasing complexity and what we human animals put on ascending scales of intelligent capacity are functions of self-movement within a range of geographical and cultural spaces. Whereas crustaceans have their environmental niches, cetaceans roam the oceans. Whereas marsupials move

distinctively in burrows, trees, grasslands, and bush, human mammals move freely on most landforms and, with technological support, through waterscapes, aircscapes, and even firescapes.

An evolutionary line of movement analysis is thereby opened up in considering increasing biological and morphological complexities as a result of place adaptability. Yet so, too, is a phenomenological direction of inquiry indicated in taking into fuller consideration the animate consciousness of moving in, through, around, on, over, under, between, away from, and toward places of daily immersion in the world.

The revival of nature studies and onto-ethological scholarship from Jacob von Uexküll's (2010) "a foray into the worlds of animals and humans" (Von Uexküll 2010) to the subsequent phenomenological treatments of animality by Martin Heidegger, Maurice Merleau-Ponty, and, more recently, Jacques Derrida and Giorgio Agamben bring animate consciousness to considerations of the "intertwining" of humananimality in "the flesh of the world" wherein "the relation of the human and animal is not a hierarchical relation, but lateral, an overcoming that does not abolish kinship" (Merleau-Ponty 2003, p. 268). Our common animality sets movement in place and within networks and webworks, and as coterminous with landscapes, seascapes, firescapes, and aircscapes of ambulation and flight. "Becoming animal" is a trope in the scholarship of Giles Deleuze and Felix Guattari and a practice of the self with others in David Abram's eco-phenomenological writings (Abram 2010).

The educational significance of this "animal turn" is not simply its expansive ecological sensibility. The long-standing human science interest in matters of pedagogical relationality can now register with matters of "vital contact" (Smith 2014) and "transpecific conviviality" (Acampora 2006). What was seen as being out there, whether expansively environmental or narrowly humanimal, can be recognized, heard, and felt as interactional effects and desired, intuited, and divined as connective affects and vitalities of kinship. The nominal reference of pedagogical relationality, namely, the child, allows transposition to many kindred others. Ecological and environmental programs in schools will

continue to be the places where humananimality is explored; however, it remains to be seen how the mainstream school curriculum can incorporate this deepened relational register of movement and place.

Virtuality

All of which can still be tethered readily to considerations of environments and habitats, and various disciplinary renderings of places and their animations. But that tethering puts emphasis on environment, world, space and place as affordances, networks and webworks of motility more so than on motions, emotions, and the generation of the diverse forms and multiple structures of animate existence, which is to say, on the constitutive features of life and of the auto-affectivity to which "life phenomenology" from Martin Heidegger to Michel Henry draws attention.

What might be discerned phenomenologically that is not so wedded to the coupling of anthropocentric functionality and spatially constrained forms? What might be described (even designed, managed, and developed) from the affectivities of dwelling in different locales with various other kinds of animate beings?

Michel Henry's postulate of the "auto-affectivity" of life as the generative force of feelings, forms, and functions and as the essence of life's manifestations is the consistent thread to his writings. While animality and animal life do not figure in Henry's accounts of immanent auto-affectation, there remains a strong sense that such themes cannot be too far removed from a radical phenomenology of transcendence within immanence, without necessarily falling into the difficulties of addressing animality via the "ek-stases" of biological, ethological, and related logics of lifeworld appearances. Indeed, with the "animal turn" in philosophy after Heidegger's "world poor" rendition, and following the inspiration of Uexküllian-inspired onto-ethology, Henry's oeuvre suggests that intentionality is inherently affective. Our relations with one another and with those of a different kind are premised on kinetic-kinesthetic-affective attunements and immersion in a common unfolding of life.

A life ethic, which is to say an ethic of interanimality, may well be best realized in the translation of auto-affectivity to the dynamics of sensing, responding to, and corresponding with other-than-human animals. This translation (along with transposition, mimetic resonances, and even Deleuzian notions of becoming-animal) is, from a Henryian assertion of affectivity over effectivity, a move to a register of virtuality that does not abstract from life, but actually reveals its full force. “Seeing the invisible” is how Michel Henry described it (Henry 2009). Life phenomenology aims surely at an immateriality (in contrast to the current crass materialisms) to which our everyday senses can vaguely correlate. We can bracket out the identity assertions of Husserlian phenomenology (i.e., that which pursues noetic-noematic intentionality), the nostalgia of lifeworld phenomenology (i.e., past tense, “lived” experience), the worldliness of existential phenomenology (i.e., Heideggerian being-in-the-world and Merleau-Pontyan flesh of the world), and even the hyletic materiality of radical phenomenology and still feel life as an auto-affectivity and animating force. Movement and place can thus become the expressive terms of a turn toward life as that which moves deeply, affects profoundly, and carries the words we say to invoke it.

The movement of life philosophy shifts human consciousness to corporeality, the imperatives of human responsivity to humananimality, and grounds humane interactional qualities of sympathy, empathy, compassion, and care in the virtual kinetic-kinesthetic-aesthetic dynamics of life-wide attunement. More practically speaking, there emerges a praxis which contests the “barbarisms” (Henry 2012) of life-denying representations and the contrived relations by which we distinguish ourselves from other-than-human animals as well as those of our own kind. The school curriculum can be reanimated, repopulated, decolonized, and revitalized to become a deeply lived space.

Michel Henry’s corpus of writings provides telling phenomenological account of what is essentially at stake in practices that, on the ek-static surface, appear to be quite removed from the interrogation of the auto-affectivity of life. The gradients between suffering and joy may

well be more representationally known to human beings; however, for neither human beings nor for other-than-human beings can there really be any escape from the pathos of life. We can only act in and through affectivity and, through a series of becomings, realize a pathic, motile connectedness to humans and other animal beings in all kinds of places.

This affective turn, following the corporeal and animal turns, provides insight into optimal learning environments. Such optimization is not necessarily reflected in current enthusiasms for flipped classrooms, twenty-first century communication and social media, and online learning. While face-to-face exchanges seem indicated by the corporeal turn, and body-to-body interactions by the animal turn, virtuality as auto-affectivity remains a learning design challenge to connect the fullest possibilities of life expression with the places we know as schools and which may increasingly be places where “experiential learning” can best flourish.

Yet still the places of engaging meaningfully with others for the sake of vital, life-giving, life-showing, life-affirming interactions may seem like externalized forms that inform movement potentiality rather than as Deleuzian flows, vectors, and valencies of animated, humanimal life. Virtual movements, unlike the representational forms digitized for virtual worlds, should be regarded as the auto-affective, auto-impressive, and self-moving expressions of life that Michel Henry claims for the inner landscape revealed by “material phenomenology.” Such movements are of a pedagogical affectivity yet to be realized more fully but never totally within the shifting configurations of “optimal” learning spaces.

Future Registers

The phenomenological tradition from Edmund Husserl to Michel Henry shows the shifting renditions of movement and place to reveal the expressive and worldly potentialities of life’s immanent auto-affectivity. Corporeality, animality, and virtuality are phenomenological markers of the realization of what Henry referred to as “the inner necessity” or what Henri Bergson called

the *élan vital*, which is to say the inherent forces and efforts of movement that are most palpably discernible in places of creative life expression.

The three motile, phenomenological registers of corporeality, humanimality, and virtuality can be regarded as terms of a dialectic in which attention turns initially and literally to human corporeality. But the human saturation of the phenomena of the world inevitably occasions thinking about an animal nature. The ecological turn to the wider movements of eco-philosophy in turn gains strength in critical relation to technologically virtualized places. Yet renewed questions of virtuality, developed through a radical, material phenomenology, draw attention back to human movement but now with consideration of the profound kinetic, kinaesthetic, somaesthetic dynamics of life affirmation. What continuation of this dialectic might we now discern on the phenomenological horizon?

Phenomenology challenges us with the pressing questions of life, of living with others of a human and other-than-human kind, of the quality of our relations with others, and of speaking, writing, acting, and teaching in authentic, life-affirming ways. Across the academic disciplines and fields of study where the human sciences have taken root, a most pressing task is to reawaken a phenomenological attitude and mobilize the methodological resources of the human sciences in service of the movements, affects, and languages of life. How might phenomenology continue to have us recognize a primacy to movement and bring us in touch with the motions and gestures of the multiple lifeworlds of daily living? Alternatively, what are the appearances of nature, environment, ecology, technology, and virtual worlds that privilege certain animations? What are the affects and effects of an enhanced phenomenological sensitivity? What senses, feelings, emotions, and moods of self-affirmation and responsiveness to others sustain us in our daily lives? To what extent might the descriptive, invocative, provocative language of phenomenology infuse the human sciences and engender a language for speaking directly and movingly of life?

Educational theorizing from matters of teachable content to those of teaching relationships to those of learning environments provide instances

of how the phenomenological dialectic of movement and place has been applied to considerations of curriculum, pedagogy, and instruction. Yet a thorough phenomenology of education goes beyond instances of application and, in turn, may well provide the very material conditions for addressing questions such as those posed above and thus for contributing substantially to the ongoing phenomenological movement.

Phenomenology of the Adult-Child Relation

Michael A. van Manen and Max van Manen
University of Alberta, Edmonton, AB, Canada

Introduction

A phenomenological focus on the meaning and significance of the adult-child relation starts from the question of how the child experiences the

relation with the adult and how the adult experiences the relation with the child. Phenomenology explores the immediately lived or pre-reflective dimensions of the relational experience rather than the ways we may already conceptualize, theorize, or interpret adult-child relations. It is a form of inquiry that is rooted in continental philosophy. It aims to grasp the meaning structures of human experiences as lived through in everyday situations, relations, and actions. It is methodologically challenging to determine how young children experience the relations they maintain with adults, especially in infants and young children. The descriptions have to be interpretive and intuitive yet also tentative and informed by psychological and philosophical understandings of the intersubjectivities and intentionalities of the child's relations with others.

Historically, the phenomenological perspective was adopted to free itself from earlier denominational interpretations of the adult-child relation. The term "relation" in the phrase adult-child relation encompasses all those affective and emotional states and the sentient and existential human qualities that exist between an adult and a child. Commonly, the meaning of the term "relation" or "relationship" tends to be taken for granted. According to the OED, the terms "relate" and "relation" derive etymologically from *relatus*, meaning to bring back, return, and report, and from *ferre*, meaning to bear and carry. The contemporary dictionary meanings of relation(ship) refer to the connections formed between two or more people or groups based on social interactions and mutual goals, interests, or feelings. Thus, the adult-child relation can be seen as a connection that emerges between parents and children that they continually return to.

Culturally and historically adult-child relations differ empirically and qualitatively in terms of authority, affectivity, closeness, sense of genealogy, and felt responsibility. These relational factors are continually undergoing changes. But the focus here is primarily on the phenomenology of the existentiality of these relations.

The Emergence of the Adult-Child Relation Thematized as Childhood

The emergence of childhood as the development of relational distance between the old and the young arises already in the early work of Johan van den Berg (1956) and in Philip Ariès (1962). Van den Berg documents how by the eighteenth century, the child had become increasingly vulnerable with respect to themes that have to do with adulthood such as sexuality, birth, death, and faith. These "secrets" of adulthood were kept from young people for a gradually expanding period of time, leading to a prolonged childhood and a deferred adulthood. According to van den Berg, the distance between children and adults was created as a result of the increasing complexity of the social order.

In other and less complex times and places, children were perceived simply as miniature adults. They were not yet seen as uniquely and urgently vulnerable due to their young age, innocence, immaturity, or lack of experience. As society and familial relations grew more complex, the young person was infantilized to a state of dependency, and thus a relational distance was created that was named "childhood." To belong to childhood is to belong "not yet" to adulthood.

Some suggest that adults may no longer know (or wish to know) what it means to stand and act in a mature adult relation with children. Consequently, young people exist in a state of abandonment, a relational and moral vacuum that is neither childhood nor adulthood. The childhood of the theorized child seems to be disappearing, but others have pointed at early texts and art, such as the Grandfather and Grandchild portrait by Ghirlandaio (1490), that show that the adult-child relation does indeed possess historical significance that recognizes the way of being of a child. In the painting the (grand)child clearly seems to experience the relational quality of childhood.

Here follow some selected modalities of thematized adult-child relations.

A Relation of Nearness and Distance

The phenomenology of childhood is in part described by the experience of relational distance between children and adults. The sense of distance can already be observed at the moment of the birth of a child and in the reference to the newborn child as newcomer and as stranger. When a “child” is born, he or she still very much enters our life as a stranger. We do not choose a child as we choose a friend for the qualities that he or she already possesses. And even if such choice would become technologically available to some degree, then the newcomer is still someone who is different, relatively unformed, and a carrier of potential. The adult names this difference. To name a child is the adult’s act of dealing with the distance that this difference creates. In the act of naming, the child is recognized and adopted into the family and community. And in the act of naming, the newcomer and childhood itself is named. But the notion of childhood can only exist in the recognition of the connectedness and duality of the adult-child relation. Childhood and adulthood always implicate each other; they are joined terms of a relational discourse.

There is a socially constructed distance between childhood and adulthood that inevitably brings about misunderstandings, alienation, conflict, and rebellion between the generations. Entire industries, disciplines, and educational institutions have been established with the purpose of dealing with the child’s process of *adultus*, literally “growing up.” Some may see this as a phenomenon of questionable value to the child, when adults begin to show special interest in childhood that spells trouble for the child – but it also means that there is trouble with adulthood. It means that adulthood has become so complicated and so full of dangers and contradictions that young people can no longer simply grow up in a natural apprentice relation beside older people as was supposedly possible in earlier ages. As the phenomenon of childhood is historically and culturally relativized, the question arises whether and on what basis children still deserve special rights as children.

A Relation of Prematurity

For developmental psychology, the child is someone who “cannot yet do” certain things, not now but later. Classic developmental child study in the tradition of Rousseau-Piaget tends to perceive the child from the perspective of the end phase of adulthood. But from a phenomenological point of view, the scientific empirical data of developmental psychology are not given by nature; there are no natural facts that developmental psychology can offer to educators as guides for educational or child-rearing practice. The adult must orient to where a particular child is now. From the child’s present world, educator or parent must be prepared to assist and help the child in his or her becoming.

The converse terms childhood and adulthood are relational antonyms. In the experience of the child, the adult experiences his or her adulthood. The adult-child relation trades on the tensions between maturity and immaturity, sophistication, and innocence. It is a relation of growing up for the child when the relation gradually dissolves as the child gains in cognitive, affective, and moral maturity.

The original and most personal relationship between adult and child is the mother-child and parenting relationship. In his classic text, *The Child’s Relations with Others*, Merleau-Ponty (1964) describes how initially the child’s relation with others is still undifferentiated as the child is unaware of itself as a separate being. In other words the genesis of the adult-child relation is for the child initially a non-relation. It is not as if at birth there are two separate entities that establish a relation. Rather there exists for the child immediately an undifferentiated prenatal oneness with the maternal body. There is not yet a communicative relation as long as the child remains unaware of itself in its absolute difference. The first child me is still latent and entirely unaware of itself, while the adult me is a me that knows its own limits.

Around 6 months of age, the child, in exploring things with the hand, will touch the other hand.

And thus, suddenly, the child learns to distinguish between the body (the touching hand) as immediately felt introceptively and the body (the touched hand) as discovered and observed extroceptively.

A Relation of Separateness and Inwardness

The child discovers its separateness when, for example, smiling at the mother or father in the mirror and then being startled when hearing the voice of the mother or father issued not from the specular image but from the physical body of the parent. A little later, the child becomes aware of his or her own observable body, when seeing the specular appearance of its own image in the mirror. Through the specular image, the child notices that he or she is visible for himself and herself as well as for others. By the second and the third year of age, the child becomes more sensitive to the look of the adult with whom the child experiences a certain self-conscious relation. This is also the time that the child senses his or her own independence and the capacity to say “no.”

One can infer two phenomenologies of separateness between childhood and adulthood through the civilizing process of morals and manners. First, children are separated from adults since they lack the consciousness of an economy of inwardness (e.g., the young child is still allowed to show his or her emotions openly). Second, children are kept separate from adults when childlike feelings have to go into hiding or “underground” (e.g., the child may learn to feel shameful about sexual discoveries). Children are “taught” that certain behaviors and feelings are distasteful, shameful, repulsive, and disapproved. All kinds of commands and prohibitions, do’s and don’ts, are more likely to arouse in children certain anxieties and therefore the inclination to render these acts private.

Thus, children learn when and how to feel shame and embarrassment about things that they are to keep suppressed. And this has an important consequence for their relations with others,

especially for their close relations of intimacy. Elias points out how this increased social prescription of many impulses necessarily increases the distance between the personality structure and the behavior of adults and children. What we see is the effect of the function of manners and customs which separates the young person (childhood) from father and mother (adulthood) through the invisible wall created by hidden feelings, driven to an experience of psychological, social, and generational distance through such processes as social rules, praise, and punishment (Elias 1978).

A Relation of Pedagogy: Child-Rearing and Education

Within the educational and child-rearing context, the adult-child relation is the parent-child, teacher-student, or pedagogical relation. The concept of the pedagogical relation was meant to arbitrate over the question whether the experience of pedagogy – parenting, teaching, childcare – is a primordial human experience, thus requiring an independent discipline for study, or whether it is merely an aspect of general processes of socialization whereby young people are initiated into the social order that surrounds them. Wilhelm Dilthey (1833–1911) was the first to propose that a science of education or pedagogy can only find its real starting point by studying the relation between the adult and the child.

Herman Nohl (1967), a student of Dilthey, described the pedagogical relation as an intensely experienced relation, characterized by three aspects: First, the pedagogical relation is a very personal relation animated by a special quality that spontaneously emerges between adult and child and that can be neither managed nor trained nor reduced to any other human interaction. Second, the pedagogical relation is an intentional relation wherein the intent of the adult is always determined in a double direction: by caring for a child as he or she is and by caring for a child for what he or she may become. Third, the

pedagogical relation is an oriented relation; this means that the adult must constantly be able to interpret and understand the present situation and experiences of the child and anticipate the moments when the child in fuller self-responsibility can increasingly participate in the culture.

For the student, the pedagogical relation with the educator is more than a means to an end (to become educated or grown-up); the relation is an event that has significance in and of itself. The relation to a real teacher, someone in whose presence the child or young person experiences his or her evolving identity, is possibly more profound and more consequential than the experience of relations of friendship, love, and so forth. Students may always feel indebted for the rest of their lives to a real and admired teacher, even though the stuff that they learned from this person may have lost its relevance. In part, this may be due to the fact that what is “received” from a great teacher is less a particular body of knowledge or set of skills than the way in which this subject matter was represented or embodied in the person of this teacher, his or her enthusiasm, self-discipline, dedication, commitment, and so forth.

Pedagogy can be generally described as distinguishing what is good or right from what is bad or wrong in our ways of acting and interacting with children. Of course, in our everyday living with children, we do not always know how to distinguish actively and reflectively what is good from what is not good (or less good) for children. In certain situations and predicaments, we may question and doubt ourselves or admit that we may not know what is best for this child or these children. The point is that this doubt and uncertainty belongs to pedagogy and shows us the profoundly ethical nature of pedagogical thinking and acting (van Manen 2015). Without this ethical uncertainty, pedagogy would be reduced to a set of techniques, recipes, or rules. Teaching, parenting, and caring for children are never simple affairs that can be handled by means of rules and recipes. Situational predicaments that can be “solved” by techniques and procedures are not

ethical predicaments. And so, pedagogy is both the tactful ethical practice of our actions and the doubting, questioning, and reflecting on our actions and practices in living with children.

A Relation of Possibility

Children come to us bearing a gift: the gift of experiencing *the possible*. Children are children because they are in the midst of the primal process of becoming. Children, who are not already resigned to the fate of being born into a world of powerlessness and misery that leaves no hope for them, experience life as possibility: anything can happen.

In sharing his or her life with this child, the adult cannot avoid but become an example. This imitational process (*mimesis*) is the meaning of learning. In early English to “learn” meant to teach as well as to learn. A teacher could learn (teach) a child to learn something. As an adult, one embodies possible ways of being for the child. Merleau-Ponty describes how “*mimesis* is the ensnaring of me by the other, the invasion of me by the other; it is that attitude whereby I assume the gestures, the conducts, the favorite words, the ways of doing things of those whom I confront . . . It is a manifestation of a unique system, which unites my body, the other’s body, and the other himself” (1964, p. 145). Conversely, I see the child trying on my gestures, my ways of seeing and doing things, my ways of reacting, and my ways of spending time. And as I see that happening, I am confronted with my own doubts. Is this the way I want my child to act and be? And if not, is it the way I want myself to act and be?

Historically and culturally, the world contains many possibilities of living and being. Children encounter the world through friends, schools, media, neighbors, and digital technologies and through our mediation. But children find their own uniqueness and identity through personal exploration, choice, and commitment. This is what Hannah Arendt (1958) described as the

fact of “natality” that children are constantly born into the world and must be allowed to renew the world. How can the adult safeguard this newness for the growing child? Children cannot just be expected to discover a life. They must also be allowed to act, experiment, and create themselves. Adults have lost this neotenic openness, but in this too, they can learn from the child. Neoteny is the retention by adults of child-like qualities: to remain open to the new and human potentialities. Agamben points out that, in evolutionary terms, adults inherited the physiology of infancy: the hairless skin and fetal features of the eternal child. But because of this neoteny, the adult is granted the possibility of openness and potentiality: to make the impossible possible (1995, pp. 95–98).

A Relation of Violence and Abandonment

A critically significant relation between adults and children is probably most pointedly named a relation of violence and abandonment (Giroux 2003). This is a highly complex and extremely problematic dimension of the experience of childhood of young people who, because of their young age, belong to the biology of childhood but whose social and political circumstances actually rob them of the social, cultural, and pedagogical benefits of a sheltered childhood.

From a critical perspective, childhood can be regarded as an oppressive socially constructed category aimed to regulate and commercially exploit the educational and social lives of children. Keeping children stuck in theories and constraining categories of “childhood” may make it difficult to treat their expressed views and lived experiences with respect and dialogic openness and integrity. The terrible truth is that, globally, every day thousands of children are losing their parents and experience being exploited by adults and abandoned by the societal institutions that ought to protect them.

There exists a relation of violence for millions of children who are orphaned by wars, suffering

from abuse, disease, or starvation, or recruited as child soldiers in distant lands. We know that there are street children of 5 and 6 years of age who are learning to survive in metropolitan areas without any medical care, illiterate, physically and sexually exploited, and exposed to the excesses of violent drug culture. For them, the adult-child relation is an empty existential category without promise or pedagogical significance.

Phenomenology, Education, and the More-Than-Human World

Patrick Howard
Cape Breton University, Sydney, Nova Scotia,
Canada

Synonyms

Bioregionalism; Curriculum theory; Eco-phenomenology; Place-based pedagogy; Relational pedagogy

Introduction

Education has always been interested in the larger living landscape – the biotic, more-than-human natural community. Schools, museums, parks, zoos, camps, youth organizations, and natural history groups facilitate and mediate relationship with place, both natural and built. In formal schooling, nature study, conservation education, outdoor and adventure education, environmental, global, place-based, and education for sustainability are fields across which lines are blurred in their shared goal to more deeply understand the relationship between humans and the environment on which people depend. At this point in human history, there are strident calls for education to be central to efforts to transform the human relationship with the natural world and in so doing mitigate and reverse dire projections of catastrophic climate change and subsequent mass extinction.

Phenomenology is emerging as an important approach to more deeply understand human relationship, the lived experience of being-in-the-world. The experiential focus of phenomenology and its demand for awareness requires close attention to the felt meaning and embodied nature of our experiencing. This to experience takes place within a network of relations with which people have contact. Understanding the pre-reflective experience of place and environment through careful description provides a language by which assumptions, unexamined values, and taken-for-granted horizons of understanding are made comprehensible. Language born of culture and history frames and structures the world. Language is not often critically reflected upon but provides the ever-present background for meaningful contact with the world. Phenomenology can potentially disrupt that language, providing new light and new language by which to understand human relationship with the larger living landscape.

The Challenge for Phenomenology

The destruction of the Earth and the tearing of the very fabric of life in the name of hyper-

consumption and the global market economy are not susceptible to easy fixes and solutions. Consumerism fueled by pervasive and sophisticated media manipulation pressures parents to work more, longer and farther afield, depriving children of a stable home and relegating them to the care of strangers in often crowded day care. In developed nations, there is a marked rise in eating disorders and obesity as children spend hours inside in the company of television, video, and computer. A lack of connection to people, community, and place is having a profound effect on children. Research has drawn a link between children diagnosed with ADHD and the lack of opportunities of these children to actively engage in outdoor activities in more natural settings and green landscapes. The phrase “nature deficit disorder” was coined to describe the disturbing trend (Louv 2005, p. 70). Large-scale international education efforts have been organized over the past three decades. The documents lay out detailed global plans to make these issues the central concern of education in the future. However, it is arguable education rooted in Judeo-Christian and eighteenth-century Enlightenment constructs of the self-maximizing individual and an infallible free market is an obstacle to a transformative vision that includes an understanding of human ecology and the development of a planetary consciousness.

The international efforts to transform education unabashedly call for the teaching of values. Education has always been a normative undertaking, and values are implicit in every aspect of the pedagogical relationship. Educational theorists are ever mindful of the postmodern critique and the demise of the master narrative and are uncomfortable with reorienting education to any named purpose. Recently proposed transformative visions of education anticipate the deconstructionist critique and present not a master narrative of any one culture but a story of the ultimate “ground” in any theory – the planetary ecosphere – and develop a powerful visionary context for education, embedding the human community within the Earth community.

The growing initiatives to make sustainability, or environmental education, or whatever name is

locally given to an ecocentric reorienting of education lead to the question of *how* to educate for the values of embeddedness, interconnection, participation, relationality, holism, attunement, awareness, and ecology. In many schools, children learn about the world, their immediate environment, and the landscape outside their windows in the science classroom. Science is a cultural pursuit firmly entrenched in the language of objectivism, reductionism, and rationality. It is rooted in the western philosophical tradition and reflects and reinforces society's dominant values. Science has provided and continues to provide through the same abstract and reductionistic methodology the conveniences of technology and the advances in medicine that are to be celebrated as great human achievements adding immeasurably to quality of life. Science allows people to understand conceptually the diversity of life and the importance and complexity of life systems. It has educated the world about the dangers of continuing into a future dependent on carbon. Science is powerful; the culture and profession has legitimacy and the confidence of society. Societies have knowledge, data, and facts, but these do not counter growing global crises emerging on many fronts.

Schools may emphasize energy audits, conservation of resources, using efficient lights, turning off computers, and recycling waste. Because of powerful, pervasive cultural beliefs, these learning activities can further reinforce a resourceist position, one predicated on wise use, efficiency, and the value of the natural world to humans, in other words, ever strengthening an anthropocentric orientation. Schoolyard gardens and green space restoration may be understood as making places more pleasant for human use, consumption, and entertainment. Children learn about the natural world by dissecting owl pellets and diagramming the water cycle. The knowledge gained from these learning activities begs the questions, "In what way do our children *know* the living Earth and what *value* do they give it?" Wendell Berry (2000) says, "We know enough of our history by now to be aware that people *exploit* what they have merely concluded to be of value, but they *defend* what they love" (p. 39). Educators

are asking, "Can the technical, resourceist bias of the sciences with its dispassionate, objectifying language make it incapable of bearing the burden that we place upon it?"

Restoring the Relational

Educators are challenged to find means to go beyond the knowledge of science while at the same time being inclusive of it. This *life* is a particularity, a relationality of embeddedness in place that is unavailable to empiricism and objectivism. There is life, a sentience that engenders care and affection. It calls for a kind of sensitivity, the pathic, the felt, a "living way of knowing" (Jardine 1998, p. 95) that is perhaps not a "knowing" at all. At least not in the sense of *knowing* as we usually consider it. Things cannot survive as abstractions, as categories on chart paper and poster board, but only as unique, individual creatures, entities living in place. Most often what happens in dissecting the owl pellet is that the owl disappears, the mouse that was her meal disappears. In the quest for empirical certainty, in reducing an entity, a species to its constituent parts, it disappears in abstraction. The creature is lost – the individual and the unique are lost. In the coldly determined intelligence of the categories, the trees are lost to "forestry," the skeins of fog, and misty droplets to the "water cycle." In a sense, life is lost. Science cannot show the *life* in the life cycle of the owl. Its life is a wholeness, part of the totality of experience in a place. It is embodied, experiential, and connected to the life process. Some education researchers interested in uncovering a language to describe the primacy of experience as it is related to growing *ecological* awareness and a renewed sense of responsibility to the biotic community look to hermeneutic phenomenology to disclose human existence as a network of relations.

But in what sense do educators use the word "ecological"? In paying close attention to the meaning of the word is to address its significance. "Ecology" can be defined firstly as the science of relationships between organisms and their environments and secondly as the relationships

between organisms and their environments. The definition itself tends toward objective abstraction by placing *the science* as a common term with *the relationships*. When the life of the English word ecology is traced to its roots, it is understood the word is derived from the German *Ökologie* from the Greek *oikos*, house and dwelling. The original life of the word is tied to relationship, clan, and family. The term *dwelling* suggests a noun and synonym for *house*; yet it retains the sense of its verb form, *to dwell*: ecology as dwelling, as what it means to dwell in place. Heidegger describes the troublesome separation in the West between becoming and being as the artificial separation between what it is “to build” and “to dwell.” It has been argued that society is preoccupied with building at the expense of dwelling. Education curriculum privileges the knowledge of building at the expense of the knowledge of dwelling. In his book *Transformative Learning: Educational Vision for the 21st Century* (1999), Canadian scholar Edmund O’Sullivan posits that modernity, with all its wonders and advances, has reached the full fruition of its limitations. O’Sullivan believes a new consciousness is called for – “a planetary consciousness” resulting from an educational framework that must be “visionary and transformative and must clearly go beyond the conventional educational outlooks that we have cultivated for the past several centuries” (1999, p. 3). He argues for what he calls a comprehensive and integrated perspective or what was previously known as a cosmology, one that would engender “an ecologically sustainable vision in the broadest terms; what can be termed a planetary vision” (1999, p. 4). This requires reclaiming the word ecology for education to understand that as we build, we must dwell, and the two cohere.

Language and the Dialogical Nature of Reality

Phenomenology begins with particularity, with phenomena, the reality given in lived experience before reflection. Bypassing theory, concepts, presuppositions, and cultural beliefs, phenomenology brackets these and adopts as a method the

description of the world as it is lived. Phenomenologists describe the pre-reflective; its focus is experiential and outward into the world; as the great French phenomenologist Maurice Merleau-Ponty put it, the world is the “natural setting of, and field for, all my thoughts and all my explicit perceptions” (2002, p. 406). David Abram, the American phenomenologist, finds in Merleau-Ponty ecological implications centered on the inextricable relationality of human perception mediated through the body with the larger living world. Abram says the entire phenomenological endeavor has taken place within a region of inquiry circumscribed by a tacit awareness of the Earth as the ground and the horizon of all of our reflections, and the hidden thrust of the phenomenological movement is the reflective rediscovery of our inherence in the Earth. Abram’s work is seminal, and its importance cannot be understated. He provides a language whereby the biosphere as it is experienced and lived from within by an intelligent body becomes accessible and his work allows for an articulation of the interactive and dialogical nature of reality. It is of value to turn to Abram’s words here,

To touch the coarse skin of a tree is thus, at the same time, to experience one’s own tactility, to feel oneself touched *by* the tree. And to see the world is also, at the same time, to experience oneself as visible, to feel oneself *seen*... We can experience things – can touch, hear and taste things – only because, as bodies, we ourselves are entirely a part of the sensible field, and have our own textures, sounds and tastes. We can perceive things only because we ourselves are entirely a part of the sensible world that we perceive! We might as well say that we are organs of this world, flesh of its flesh, and that the world is perceiving itself *through* us. (Abrams 1996, p. 68)

Educators who turn to phenomenology as a philosophical orientation and a research method are in essence seeking to understand and rethink human relations with the larger living field through an experiential approach. Abram is not only paying attention to the experience of nature but to the nature in human experience. Phenomenology opens a space for a deeper understanding of the interactive and dialogical nature of reality and allows for an experiential approach to give

voice to new meanings and possibilities. However, this is often a difficult and challenging task. Curriculum theorist David Jardine writes,

Phenomenology raises the possibility of real hope, i.e. the hope that life as it is actually lived can be faced. It maintains that we as educational ‘theorists’ have living connectedness with the ‘subjects’ of our inquiry. These children in this classroom, this teacher, are not distant objects . . . they are us, our kind, our kin, and understanding them is understanding our kinship with them, understanding, not severing, the ties that bind us to the Earth, to our lives, to the lives of our children. (1998, p. 24)

David Orr’s (1994) bold statement, “all education is environmental education” (p. 12) is provocative and points to the inherent divide between humans and the natural world that is at the heart of the educational enterprise. Students are taught facts devoid of their larger purposes in transmissive, largely passive classrooms that reinforce the divide between the dominant inside space, the human-built world, to the detriment of the larger, living world outside the walls of the school. Andy Fisher (2002) in his important book *Radical Eco-psychology: Psychology in the Service of Life* explores the shifts in patterns of identity and relationships that occur when connections to the web of life essential to human well-being are included. Fisher believes phenomenology offers a bridge to span the distance, the alienation, and estrangements and cultivates a deeper understanding of humans as human *beings*. Inquiring into the strange and unfamiliar is a hermeneutic endeavor. Fisher demonstrates how Gadamerian hermeneutics, particularly, through its central tenet of a “fusion of horizons,” allows for a gaining of self-understanding through an interaction with something other, novel or alien. A person’s horizons are enriched and expanded when prejudices are risked, and assumptions and pre-understandings are examined. Fisher’s work is important as it picks up the work of philosophers like Merleau-Ponty, Eugene Gendlin, and David Michael Levin whose focus on the nature of human nature explicated an embodied intelligence uniquely designed and attuned for relationship with the world. Like Abram, Fisher is a hermeneutic phenomenologist able to demonstrate how nature enters into human experience

influencing the body and mind, as we are wholly dependent, deeply embedded in the web of life.

Deepening a Sense of Place in the Biotic Community

Phenomenology and hermeneutics have been used to inform environmental education that is place-based or bioregional and more recently to investigate sustainability education and the perceptions of children of their experiences in both built and natural environments. Heidegger’s work firmly positioned place at the center of the investigation of the meaning of being. Dasein is firmly rooted and is always in the *world*. Heidegger (1971) writes, “the way in which you are and I am, the manner in which humans *are* on the earth, is . . . dwelling. To be a human being means to be on the earth as a mortal. It means to dwell” (p. 147). Place-based or bioregional education is phenomenological in its central premise to learn to “reinhabit” local places, by becoming aware of the particular ecological relationships that operate within and around the place. The very idea of a *region* in which we “live-in-place” is an elusive concept. The specification of place or bioregion contests a purely topographical definition of place as objective geographic location in a map. A phenomenological approach to learning about place introduces a new geography as experiential, subjective, and storied. It is just this phenomenal, experiential, and lived dimension of the bioregion that offers an opportunity to develop a more complex, subtle picture of the interrelationship between humans and the places they inhabit.

The challenge is to activate and reactivate an attunement and awareness for the bioregions in which people dwell. Phenomenologists Ingrid Stefanovic and Louise Chawla are among those few researchers who inquire into the environmental, place-based experiences of children. Typically undervalued for their naiveté or innocence, the words and experiences of children have been largely overlooked. However, phenomenological research that opens up such lines of inquiry is of particular significance. The hermeneutic phenomenological task of laying bare origins coupled

with the often unstructured, unaffected visions of the child suggested profoundly interesting possibilities to understand more fully what it means to live, to dwell in place. A phenomenological lens means deepening a relationship with the biotic community. For urban children, who often live in homogenized and utilitarian landscapes that are ecologically and aesthetically impoverished, exploring a deeper sense of their connection to the life of the bioregion through phenomenology is a research area in need of further inquiry.

At this point in the human story, the relationship between human beings and the earth, the built environments, urban spaces we design to reflect our embodied embeddedness in place, and the education of the young to live in ways that honor both human nature and the larger living biotic communities on which they depend are areas that phenomenology can meaningfully inform and provide direction.

William Pinar (2004) says curriculum theory is “about discovering and articulating, for oneself and with others, the educational significance of the school subjects for self and society in the ever-changing historical moment” (p. 16). More researchers and curriculum theorists are amending Pinar’s “for self and society” by adding “the Earth.” Societies are beginning to seek a vision for the school subjects that includes consciousness of our Earth-centeredness. Phenomenology can be important in more deeply understanding how profoundly informed is human experience by the cycles and rhythms of the larger living landscape. Phenomenology helps describe human dependence on the more-than-human natural world in new ways and provides a deeper sense of educator David Orr’s words, “All education is environmental education.”

Phenomenology, Language, and the Unspoken: The Preverbal Dimension of Children's Experience

Eva-Maria Simms

Duquesne University, Pittsburgh, USA

Synonyms

Implicit; Lived; Pre-verbal; Unarticulated; Unspoken: latent

Introduction

The world of experience, which is the arena of phenomenological research and theory, is not the epistemological, clear world of rational thinking but the messy, entangled, and qualitative world of significations that are complex and hidden and have a pre-personal, latent, general structure. A -non-epistemological undercurrent runs through human experience, which is difficult to unearth and raise to reflection. The unspoken in phenomenology does not mean that something cannot be said but that it escapes ordinary attention. In the following, we will explore some of the basic phenomenological insights about the implicit

dimensions of perception and meaning and show how in children the unspoken plays out through the body, social life, space, and things and lived time.

Edmund Husserl (1859–1938), the founder of the phenomenological movement, used the example of a cube to illustrate the complexity of a perceptual act: even though we ever see only one side of an object, in our experience, the hidden, concealed sides or *profiles* are present as constituting absences as well. Without them the cube would not be a cube. Even the ground upon which the cube sits is an essential element of its structure. Situated in space, the cube exists in a web of relationships with other things that are close or distant. Things have dimensions or *profiles* that we do not perceive directly but that come into play in establishing their reality or being. Husserl spoke of the “fullness,” or the *plenum* of things, which upon close observation of the perceived world reveals itself. As soon as a thing appears as a figure before the larger background of other related things, places, and events – its *horizon* – we can no longer think of it as a discrete, closed-off entity. Since even its physical outlines are never completely present, a thing is always more than what meets the eye. It reveals some of its aspects and conceals others, and its existence as a physical object is tied into a larger, more or less perceptually present, web of *meaning*. Phenomenologists call this web of relationships that constitute the being of things *the world* and a thing within its worldly horizon a *phenomenon* (Husserl 1952, 1964, 1969).

If a brief phenomenological analysis of something so simple as a cube results in its appearance as a set of complex and infinite relationships, objects can no longer be defined as simple Cartesian *res extensa*, materialistic entities, or even Kantian concepts that can be circumscribed and known. Phenomenology begins with an “idealist” understanding of the world, i.e., a world that is as much idea as it is matter. Husserl’s great contribution was to place this idealism back into *existence*. His rallying call, “to the things themselves,” gave the phenomenological movement the task to investigate not merely the concepts of things, the Cartesian *res cogitans*, but

how objects actually appear to human experience in their situated, spatial, temporal, and relational fullness.

In our ordinary, everyday experience of the world, we encounter our cube, for example, as the library building in our neighborhood. One person says “there is the library,” and the other replies “let’s go and check out a book,” and both assume that they refer to the same building in their shared landscape. Phenomenologists call this *the natural attitude*, which comprises a set of assumptions and habits, which let us function in the world. We take the world for granted as a world of discrete entities, which we can name and manipulate, and even other people and our own bodies are counted among them. The *phenomenological attitude*, on the other hand, attempts to go beyond the natural attitude through careful description and analysis of the way things, like the cube of the library building, appear to our experience. The goal is to reclaim more and more of the fullness of a thing’s being and to understand more of what it *essentially* is: hidden inside the cube is a collection of books on shelves, the repository of past human experience, coded in alphabetic notation, which needs to be disseminated into the minds of the next human generation in order to continue the cultural project which evolved in this location. The task of phenomenology as a research method is to systematically explore the fullness of things that is hidden behind our habitual knowing and understanding. Some of the concealed profiles belong to the perceptual world and others to history and culture. A thing is not a discrete and self-enclosed object but a complex and multi-related *phenomenon*. The unknown, the mysterious, the transcendent, and the unspoken is not somewhere else: it conceals itself in ordinary, everyday life. It is present as the halo of meaning around things. Some of it can come into awareness and language, but much of it remains concealed and unspoken. This play of presence and absence is at the heart of the phenomenological project, and it reveals itself in every simple act of perception.

The work of the French phenomenologist Maurice Merleau-Ponty (1908–1961) showed that perception and the body’s engagement with

its environment are more primary than cognition, and epistemological capacities rest on the foundation of perceptual structures. Prior to concepts and language, human beings are embodied, perceptual beings (Merleau-Ponty 2012). A phenomenological analysis of embodiment shows that the perceiving body has its own *nascent intelligence*: we do not have to think how to conform our hand to pick up the smooth round of an apple or how to adjust our gait when walking downhill. The body has a precognitive knowledge and implicit rationality, and *meaningful* interactions with the perceived world can be found already in animal life. Perception – animal or human – has to be thought as a radically non-dualistic continuum between the body and its particular environment: the structures of perception and the structures of the perceived world belong together and form a whole. In his later work, Merleau-Ponty would call this intertwining of body and world *the chiasm*. The challenge, according to Merleau-Ponty, is to show how cognition and language arise out of the perceptual substructure of human existence and how thinking and speaking are shaped by and indebted to it.

Merleau-Ponty's philosophy of perception has been very productive for researchers in cognitive neuroscience, child psychology, and education. His question, "how do cognition and language come about?" led him to an intense interdisciplinary study of animal behavior and child psychology in order to understand the relationship between perception and thinking (Merleau-Ponty 2010). Child development offers a special lens through which to see the relationship between perception and the acquisition of symbolism and abstract cognition. Like animal consciousness, infant consciousness begins as perceptual consciousness, and child consciousness in general is closer to the perceived world than the adult mind. Merleau-Ponty provides us with an epistemological framework for understanding that human consciousness – in early human development and across cultures – can be structured differently than Western adult consciousness, which has been the unquestioned model of what it means to be human in Western philosophy. His challenge to cognitivism and Piagetian epistemology is to look

at the child (and the adult) not only as an *epistemological* being that develops its thinking but as an *ontological* being that has a profound experiential relationship to others, places, things, and time. One way of summarizing this attitude is to say that *ontology precedes epistemology*: we are perceptual, meaning-seeking beings before we have logic and symbolism. Another way of capturing the primacy of perception is to widen our understanding of thinking toward a "wild thinking" or "nascent cognition," where meaning and understanding, though differently structured, are already present in pre-symbolic animal behavior.

If we bring together the phenomenological insight into the fullness and concealedness of things and the search for pre-symbolic, perceptual, situated consciousness, a specific task arises for phenomenological psychology and pedagogy (Simms 2008). If the young child is primarily an experiencing being, what are the structures of child perception and cognition? How do developing human beings act within the horizon of the world that is meaningful to them? Merleau-Ponty and other phenomenologists have developed a hermeneutic strategy for exploring the complex field of human experience by focusing on some of its fundamental and irreducible structures: *embodiment, social relationships, spatial situatedness, things, and temporality*. Phenomenology, and particularly the phenomenology of childhood, explores the world as it is experienced, the *life world*: the *lived* body, the *lived* relationship with the other, the *lived* space and things, and the *lived* time. With respect to children:

- The focus on the experience of the developing *lived body* reveals children's perceptual, motor, and semiotic capacities (semiotic, meaning making).
- The focus on the experience of *lived social relationships* reveals the entanglement of self and other within the growing circle of human relationships and the introduction of culture and language.
- The focus on the experience of *lived space* and *things* reveals the physical environment as it intersects and structures perception, emotion, and cognition.

- The focus on the experience of *lived time* reveals the rhythms of nature, relationships, and culture, which provide the larger framework for human development and history.

Body, others, space, and time are existential *a priori* or *factivities* because their structure is foundational to all human experience. All human beings are embodied, social, temporal, and live in places, even though there is a wide variety in how these essential structures are taken up by individuals or by cultures. The experience of the body cannot be separated from the experiences of others, space, and time because they always appear together, but for the sake of understanding, we can train our lens on one or the other aspect.

The Body: The Preverbal Foundation

The body as lived and experienced is not the anatomical body, which is an abstraction and conceptualization that reflects the perspective of the body as seen from the outside by the other. The anatomical body is a scientific construct that homogenizes and standardizes the body. As a *lived* body, on the other hand, we can experience ourselves as “all ears” or “all thumbs,” or a toothache can concentrate bodily reality in one cheek and make it proportionally large. This principle of differential bodily signification becomes especially apparent in children's drawings: if you tell young children to draw a soccer game, there is a good chance that the players in the drawings will have large feet and no or very undifferentiated hands; if you instruct them to draw children playing catch, the reverse is true, and hands will be large and fingers visible. Children's drawings reveal that in the *experienced* body, size is not a matter of mathematical extensiveness but of signification: big people or body parts are more important than others in the experienced situation.

The lived body finds itself engaged with people places, and things and lives itself as an unreflected presence with them – unless its smooth transcendence and projection into the world as its *action space* is interrupted. A child follows the trajectory of a ball thrown to her, and her hands configure

themselves to catch it. Her repeated practice in catching is not a cognitive, reflective act but the gradual adaptation of bodily structures to environmental events through repetition. Adults shape and define the meanings of children's body parts and body actions intentionally: the girl might be forbidden to practice with the ball at all, or to run, or to venture outdoors because of her parent's personal fears or cultural restrictions. Psychologically, the human body can have a more expansive or more limited perception of what it is able to do, and what kind of world it is competent in. Simone de Beauvoir (2011) saw the social training of girls into a limited body action space and the following loss of the sense of “can do” openness and transcendence as the key issue for women's liberation. Bodies are disciplined and/or rewarded through situated, often subtle cultural practices within family, neighborhood, school, and peer group. But bodies can also be liberated through subtle reclaiming of gestures and action spaces. Merleau-Ponty thought that much of our bodily life is latent and hard to access consciously, but that the body is also the pivot where nature and consciousness meet.

Social Life: The Mystery of Self and Others

The latent dimensions of social life exert a powerful influence on human development from the very beginning. Prior to being independent individuals, human beings are born into social relationships. Infants come from a womb, and without the care of others, they do not flourish. Attachment, love, and desire form the trajectory that pulls the human infant toward the other. The earliest relationship with the other has a personal and a cultural dimension because it sets the patterns for how a particular child relates to the physical and social world, as we saw above.

A phenomenological analysis of the relationship of self and others reveals that the clear boundaries between them, which habitual consciousness presupposes, are not so clear after all. Merleau-Ponty (1948/2004) thought of self and others not as interior, self-enclosed entities but as unique

styles of *conduct* in the world. Most of the time, the self is submerged in its activities and not aware of itself, and the other appears as a co-actor inserted into the fabric of a child's world. But in early childhood, the self acquires the ability to sometimes look at itself *as if through the eyes of the other* and become self-reflexive and aware of its own unique being. Only if the self can look at itself from the perspective of the other can human beings acquire distance from the magical flow of the perceptual world and reflect and think about the world – and themselves. The self is indebted to the other because it receives its first nourishment, its name, its validation as a person, its ability to see possibilities and think, and its language through others. But it also receives the demands and injunctions of others and the distortions and injuries that socialization brings along the path of love. The other has a core that remains impenetrable, but even the self – because of its formation through the other and because it lives through a body – can never be completely self-transparent. Human beings will always have an irreducible gap or lacuna in them that is impenetrable to reflection and knowledge.

Space and Things: Moods, Play, and the Disciplining Power of Spatial Forms

Things, as we saw in our example of the cube, are not mere objects, but to experiencing consciousness, they are *phenomena*, i.e., focal entities within a horizon of meaningful relationships. This is particularly the case for children: early childhood transitional objects, like blankies or teddy bears, are experienced as animated and intentional and have a deep emotional presence. Things have a physiognomy, i.e., their perceivable and imaginary structure invites a child to respond and act. The bouncing ball calls the body to stretch out its arms and run forward, the small space under a drooping bush is irresistible and invites sitting quietly, the drawer wants to be opened and closed, the box needs something in it, and the long, smooth hallway beckons running and sliding. Things are evocative and they inspire

different moods: comfort, excitement, uncanniness, and fear.

As a child, the writer Annie Dillard found an old dime in the alley behind her house, and she spent the next weeks digging up the alley in order to find more hidden treasure. She felt like an adventurer or treasure hunter on a quest. Her father had told her that old cities like Rome, where old coins can be found, were half buried under ground, and she kept digging deeper in order to find more of the treasures hidden in the earth. Children are often intensely sensitive to the hidden, secretive profiles of things, and their imaginative play responds to, brings out, and reveals possibilities that belong to the concealed dimensions of the fullness of the world (Van Manen and Levering 1996).

Things are the markers of place in the expansion of space, and they are related to other things through spatial nearness and distance. The phenomenology of lived space shows that space is structured as a horizon around the body. The body inhabits a particular place, the “here,” which through habitual daily engagement, becomes the center around which the nearness and distance of places is structured. The “here” is familiar, and the “there” is arranged in growing circles of distance and unfamiliarity around it. Lived space, however, is not homogenous in its extensiveness but consists of islands of familiarity that are independent of measured distance. The alley behind a person's house can be the most distant and unfamiliar place because it does not exist on his or her experiential map, while a hotel room in a distant rainy city can quickly become too near and familiar.

Spatial forms, as we saw above, interact with the body and are the other side of bodily gestures: without the ground, there would be no upright gait; without things to reach for, there would be no hands; without the illumination of things through light, there would be no eyes. This intertwining of body and space implies that bodily consciousness can be shaped and manipulated through spatial arrangements. The arrangement of school furniture, for example, disciplines children's bodies into gestures of solitary calmness, containment, and focused attention. Educational

spaces are predetermined by adults and support the socialization of children into the knowledge and values of their culture (Langeveld 1983a,b). They are a good example of the preverbal communication between body and spatial affordances, and teachers and children usually participate in a habitual way without registering the coercive power of space.

The preverbal, spatial field provides the subtle but tangible encounter with a particular culture and its history: places and their things precede our individual lives and carry the material record of a culture's past products, intentions, and values inscribed into their structures.

Lived Time Versus Clock Time

Lived, experienced time has a different flow than clock time. While the clock gives the illusion of time as a homogenous, forward moving stream from past to present to future, the phenomenology of lived time shows time to be experienced as nonlinear, fragmented, and tied to movement in space. Piaget's observations and research showed that time for young children is tied to the sequence of events: his daughter complained that it could not be afternoon since she did not yet take her nap! Past, present, and future do not line up in a neat sequence but are entangled: the past can loom ahead and a future that was imagined can fall behind. The duration of time is not a matter of measure, but of the fullness of events.

The present. Young children assume that the *present* time is not homogenous for all beings but that each lives in its own time, which can shrink or expand depending on particular activities. Children – unreflective about themselves and turned toward the world – strongly sense the flow of ambient becoming, where things move through time alongside the child's own being. To be in the present means to be co-temporal *now* and *with* others in action space. Children easily let go and forget what is no longer part of their direct experience of ambient becoming. In the world of the young, there is no central time master who assures that all are governed by the same abstract time frame.

The future. Children assume that *the future* does not continue infinitely: when a person has reached the fullness of her or his being, time seems to stop. Parents are just old and do not get older for a long time, and if I eat more, I will be older than my older brother. In children's conception of time, growth is not homogenous and time not continuous. On a more visceral level, the young are directed toward the *future* in their desire for coming things. The range of the future, the width of its horizon, and the openness it provides to the child's initiative are strongly determined by parental presence. The strength of the child's reach toward what is coming has its foundation in the trust and hope a healthy adult environment inspires. Freedom for the child means to be granted the opportunity of meeting oneself in a future that is created, in safety, through one's own initiative and imagination. The future is the realm of the possible, and it exists for human beings always as a purely imaginary dimension.

The past. Children participate in their culture's *past* through family narrative and the education process. Family narratives shape children's early memories of their own lives, and it becomes impossible to separate what a person remembers first hand from memories generated by intense, imaginative participation in other people's narratives. Even the untold or repressed family stories are part of the total fabric of a person's history. Narrative participation creates a sense of cultural belonging and allows the child's life to transcend its own generation. In the education process, the child is inserted into the officially sanctioned narrative of a culture's past. Education is the transmission of cultural memory accumulated by past generations.

Conclusion

The preverbal, unspoken dimension of human experience can be accessed through the rigorous process of the phenomenological method, which penetrates the veil of habitual, everyday, unreflected experiences and reveals the power of the interwoven structures of embodiment, social relationships, space, and time.

Introduction

Education has always been closely related to philosophy. The first serious observation about the purpose and means of education was undertaken by the Pre-Socratic thinkers. Pedagogy, didactics, and other educational disciplines originated from philosophical thinking. In fact, it is impossible to have a serious discussion about education without venturing into the philosophy of education. As Max Black put it nicely, “All serious discussion of educational problems, no matter how specific, soon leads to a consideration of educational *aims*, and becomes a conversation about the good life, the nature of man, the varieties of experience” (Black 1969). It is precisely from this quote that we can interpret philosophy of education as a modern philosophical discipline which aims to determine the purpose and means of education, as well as its influence on life and society. It can range from research of educational theories to the history of philosophy from the beginnings of philosophical thinking to present day. Nowadays, we can discuss Aristotle’s philosophy of education knowing that, formally speaking, the philosophical discipline did not exist in his time. Perhaps we can find the simplest and clearest definition of

philosophy of education in *Encyclopædia Britannica*: “Philosophy of education, philosophical reflection on the nature, aims, and problems of education. The philosophy of education is Janus-faced, looking both inward to the parent discipline of philosophy and outward to educational practice” (Siegel).

Philosophy of education primarily researches and deals with philosophical education, but is not limited to that. Philosophical education is a comprehensive philosophical education which aims to raise a person as a philosophical being. Although it may sound strange, this is necessary. A philosophical human being would be a person who reflects about things and events happening around them. Primarily, a person should be able to think critically about themselves and the world around them. After that, the second level of such an education assumes a higher degree of critical thinking about common philosophical issues. Ideally speaking, this level of philosophical education should be present at philosophy departments at university level (and higher). Today, first-level philosophical education is teaching and learning critical thinking.

Education without philosophical education most often leads to two things – short-term memory and practicing certain skills to cope through life. Such education is one-dimensional and defeats the purpose. If we consider critical thinking at early educational stages, ideally speaking, it would consist of content (knowledge) and reflection on that content. Therefore, there should be content and a method for processing that content. In that way, we ensure that the content is understood, information processed, but also encourage taking a personal critical stand.

Philosophy in education is the existence of philosophy in education either as a separate teaching subject or a group of subjects. A person can acquire certain philosophical notions or methods. Philosophy in education can also be considered in terms of particular theories which exist around a specific type of education.

Philosophy of education as a philosophical discipline is comprehensive and contains, among other things, philosophical education.

Philosophical education also incorporates what is called “philosophy in education.” As a Venn diagram, it looks like this:

As part of philosophical education, learning critical thinking is a philosophical study. One of the specific aims of philosophical education at present is to find ways and methods of teaching critical thinking. In addition, one of the aims of philosophy of education is to reflect about the nature, aims, problems, and usefulness of teaching for critical thinking. This is important in today’s world when people (and children) are bombarded with thousands of relevant and irrelevant pieces of information which expose them to different types of manipulation: political, media, economic, etc. It is precisely critical thinking that can provide the individual with the proper tools to resist this manipulation and choose only relevant information while also developing their own critical thinking.

Critical thinking started in philosophy and that is why critical thinking has to be regarded as philosophy in education and must be strongly connected with philosophical knowledge. Critical thinking in formal and informal education nowadays is rather popular and in demand. There are many different programs for learning critical thinking. Unfortunately, there are programs which neglect their philosophical origin, only

claiming that they teach critical thinking, when, in fact, they do not. Learning for critical of thinking cannot be learning critical thinking if it is not based on philosophy. Among many definitions of critical thinking, the one that really points out the essence of the relation between critical thinking and philosophy is in Lipman's most famous work *Thinking in Education*. While listing the definitions of critical thinking, he states that critical thinking is "a light version of philosophy" (Lipman 2003).

Critical Thinking as a Light Version of Philosophy

There are well-known and well-researched studies and theories on education by eminent philosophers. Now that learning critical thinking has reappeared as an important issue as the purpose of education, we have to think back on what critical thinking is and look for the origins of critical thinking among a variety of thinkers. Recent literature offers many definitions of critical thinking. Some of the crucial aspects of critical thinking are present in Richard Paul and Linda Elder's definition: "Critical thinking is that mode of thinking – about any subject, content, or problem – in which the thinker improves the quality of his or her thinking by skillfully taking charge of the structures inherent in thinking and imposing intellectual standards upon them" (Paul and Elder 2002).

With critical thinking, that is, a light version of philosophy, we improve the quality of our thinking and thought processes. Critical thinking allows us to view things and events in and around our lives from all sides and find solutions to our problems more easily. The only rules that can be true for critical thinking are the rules of formal and informal logic. In all periods of human history, critical thinking was a desirable human trait. Naturally, thinking critically can be dangerous sometimes, if we remember Socrates and how he had to drink poison to carry out his own death sentence.

Critical thinking does not hold any concrete values or principles that could be imposed by

teaching critical thinking. It is a way of thinking that avoids emotional content and arbitrary principles. Critical thinking needs to be impartial and has to rely on common sense and consistent argumentation, according the rules of formal and informal logic, as mentioned before. The need to practice critical thinking in modern-day society has become stronger due to the fact that we are permanently exposed to different means of manipulation. Along with standard manipulation, such as, political and economic, there is media manipulation that has reached every segment of our lives. In part, media manipulation is so obvious that it does not even call for critical thinking. However, critical thinking is an exceptionally adequate tool for uncovering media manipulation on a larger scale. It encourages people to think about the messages received on a daily basis from the media and, by doing so, notices how people are being manipulated by the media.

Even the very use of the term "critical thinking" is sometimes subject to manipulation. The term is sometimes used to attract target audience and justify unfounded criticism that only serves its own purpose. Obviously, that is not critical thinking nor should it be. Critical thinking is not, even though it is sometimes perceived that way, negative thinking only for the purpose of criticizing. That is not critical thinking that is the opposite of it.

Critical Thinking Through the History of Philosophy

Critical thinking is the light version of philosophy, that is why we need to take a look back and see who among the eminent philosophers promoted what we may nowadays refer to as critical thinking. Teaching for critical thinking was developing alongside philosophical thought. Here is a brief overview.

There are traces of critical thinking even among the Pre-Socratic thinkers. The first teachers of critical thinking that we know of were the sophists. As it is often claimed, they taught reasoning skills, that is, oratory. Known

as the masters of persuasion, they often prepared their students to discuss in court and at political gatherings. This becomes more understandable if we consider the fact that the sophists rejected any kind of objective norms, including the truth. Nevertheless, we must not equate sophism with sophistry and its distortions, also known as eristic, as the use of fallacious arguments for the sole purpose of outsmarting someone. Further, there is a famous quote by Protagoras: “DIOG. IX 51 It was he who first said [Protagoras] that there are two opposed arguments on any matter” (Diels 1983). Therefore, a thing or event can be viewed from different angles; if we think critically about an event, then we are looking at it from all possible angles, forming at least two opposing views. Critical thinking should encourage us to question all possible pros and cons of a premise and lead us to a valid conclusion. Perhaps certain sophists pursued the wrong goal, but they were among the first to encourage critical thinking.

Socrates is an essential figure for critical thinking. With a carefully constructed line of questioning, he pointed his interlocutors toward the “truth,” and that truth was something they were not aware of before the conversation with Socrates. In modern terms, we could say that Socrates did not teach his interlocutors what to think but how to think. Socrates’ ways of “extracting” the opinion out of the interlocutor, the way he “made” them think about their own views and judgment, is known as the Socratic method. This is the first known method for learning critical thinking. The goal of the Socratic method was to define the notions under discussion. “He wanted to give birth to true ideas in the clear form of definition, not for a speculative but for a practical end” (Copleston 1993). Although it is not always possible to agree on a definition, the process can guide us toward a clearer, more understandable, and concrete definition. The process itself has actually resulted in fundamental rules of definition. Even Matthew Lipman points out Socrates and the sophists as the philosophers who started to develop critical thinking.

Another important figure for critical thinking in Antiquity is Aristotle. He is considered to be the founder of formal logic, which later developed

and also shaped informal logic. Critical thinking without the rules of formal and informal logic is not possible.

The doubt advocated by ancient skeptics is related to the development of critical thinking theories. The name itself comes from the Greek word σκέψις, which means searching, but also skepsis. If we take the etymological meaning, critical thinking is closely related to skepticism because it requires doubt to look for the truth. Of course, there is a big difference, because sometimes we can arrive at verifiable truths.

In the Middle Ages, Thomas Aquinas developed a system for thoroughly questioning views and beliefs. For each idea under his study, he would demonstrate all the views; he would argue those points of view, either to dispute or support them; and in the end he would express his own sound views on the matter. He executed this so precisely that it is safe to say that every idea in his system was the subject of critical thinking. However, Thomas Aquinas did not question religious dogmas. In spite of that, the systematic approach to certain theories and facts suggests a methodology which is more than acceptable as part of the written methodology of critical thinking.

During the Renaissance, the most interesting author is Erasmus. He pinpointed fables as a great source of practical thinking simply because fables carry a strong message for practicalities of life. Erasmus encourages people to read and think about fables as a good exercise for developing critical thinking. Whether Erasmus used the term critical thinking the same way as we do today, that is difficult to say. More importantly, he claimed that fables were a “guide to practical thinking” and added that they were appropriate for practicing “good vocabulary.” These two things (practice thinking and vocabulary development) are the goals of modern-day critical thinking workshops.

In any case, even though elements of contemporary critical thinking theories can be found among Renaissance thinkers, the actual call for the practice of critical thinking in the modern sense of the term only happened with Francis Bacon.

In 1605, the English philosopher Francis Bacon published *Of the Proficiency and*

Advancement of Learning, Divine and Human. This is the first work that is considered to tackle critical thinking (and not only what we call critical thinking). Bacon states that the mind cannot follow the “right path” if left only to its natural tendencies. He points out that the world has to be observed empirically. Bacon outlines the main topics and ideas which he developed and perfected in his later works. He also suggests clear obstacles or disorders in learning which have to be avoided or addressed to ensure progress. He diagnosed three distempers of learning: “So that in reason as well as in experience there fall out to be these three distempers (as I may term them) of learning: the first, fantastical learning; the second, contentious learning; and the last, delicate learning; vain imaginations, vain altercations, and vain affectations” (Bacon 1906). Here, it is clear that Bacon is discussing erroneous learning/thinking, which he explores further in *Novum Organum Scientiarum* (1620), where he describes four types of idols for four kinds of natural human tendencies that lead to misconception and prejudice. We can get rid of misconception and prejudice with reason. With his three distempers of learning (fantastical, contentious, delicate) and four types of idols (tribe, cave, marketplace, theater), Francis Bacon offered a wide range of misconceptions and prejudice. By discovering the errors in our thinking and becoming aware of the misguided beliefs and views, we have made the first step toward eliminating them.

The goal of developing critical thinking is nothing more than learning how to think correctly. Therefore, Bacon’s observations on “distempers of learning” and “idols” could be labeled as a catalogue of incorrect thinking or typical mistakes in thinking. Other notable works crucial to the theoretical development of critical thinking are *Rules for the Direction of the Mind* (*Regulae ad directionem ingenii*, 1684) by René Descartes, a French philosopher, physicist, and mathematician. Even though he planned to write 36 rules, Descartes only managed 21 rules for direction of the mind. From the point of view of critical thinking theory, some of these rules can be applied to shaping the rules of not only scientific, mathematical, and philosophical research but also critical

thinking. The first 12 rules relate directly to the rules of the scientific method. However, critical thinking cannot be excluded from that. One of the aims of critical thinking is reaching valid conclusions, which can be related to the truth. Some 10 years after *Rules for the Direction of the Mind*, Descartes wrote *Discourse on the Method* (*Discours de la méthode*, 1637). Here again, Descartes explains the four rules of the scientific method, but the rules can also be applied to the “rules” of critical thinking.

Bacon and Descartes were the first ones to grapple with the issues crucial to the theory of critical thinking today. Descartes points out that there has to be a special mental discipline to guide the mind while thinking. Descartes calls for precision and clarity. He also advocates *skepsis* as an important component of thinking. We could say that he follows Socrates’ line of thinking, who would successfully confuse the interlocutor and make them doubt their own views or way of thinking. That is when we start to think more deeply – when there is confusion and doubt. Descartes demands systematic doubt, which becomes integral to critical thinking. Furthermore, he insists that each argument has to be subject to doubt, to be questioned, and to be tested. Bacon and his catalogue of human misconceptions and typical errors in judgment and Descartes with systematic “*skepsis*” and demand for questioning are the modern pioneers of critical thinking.

Immanuel Kant pointed philosophy toward the knowing of the mind in his three critiques and the power of the mind to think systematically and reasonably. In *What Is Enlightenment?*, Kant urges using our own mind: “Enlightenment is man’s emergence from his self-imposed nonage. Nonage is the inability to use one’s own understanding without another’s guidance. This nonage is self-imposed if its cause lies not in lack of understanding but in indecision and lack of courage to use one’s own mind without another’s guidance. Dare to know! (*Sapere aude!*) Have the courage to use your own understanding, is therefore the motto of the enlightenment” (Kant 1970).

In *The idea of a University* from 1852, John Henry Newman indirectly suggests the

advantages of critical thinking. Newman lists all the advantages we can attribute to someone who thinks critically. W. Graham Sumner, an American philosopher, published *Folkways: A Study of Mores, Manners, Customs and Morals* in 1906 with useful contributions to the discussion of critical thinking. He sees critical thinking as a way of raising good citizens. Newman, W.G. Sumner, and several other authors prove that in the mid-nineteenth century there was a need for theoretical research of the study of thinking, that is, for critical thinking in educational systems. Consequently, that was the time when social progress led to discussing “the learning of thinking” within the system of education. Living without thinking about what surrounds us, life without critical thinking, may be simpler, but most aforementioned authors, as well as Bertrand Russell, would agree that thinking philosophically is difficult but also that it is extremely useful for individual progress, to navigate life and find happiness.

John Dewey, the Founder of Modern Critical Thinking Theory

The importance of John Dewey in the modern development of critical thinking is probably best illustrated by the following quote: “In fact, people have been thinking about ‘critical thinking’ and have been researching how to teach it for about a hundred years. In a way, Socrates began this approach to learning over 2,000 years ago, but John Dewey, the American philosopher, psychologist and educator, is widely regarded as the ‘father’ of the modern critical thinking tradition” (Fisher 2001). Therefore, modern-day theory of critical thinking was founded by the American philosopher, pedagogue, and psychologist John Dewey, primarily in *How We Think* (1997). Dewey does not use the term “critical thinking,” he says “reflective thinking.” The idea is the same. Critical thinking is the reflection of our mind about events and things around us. Dewey’s successors gradually neglected the expression “reflective thinking,” and critical thinking became more common. According to Dewey’s definition of reflective thinking, we can gather that it is the

same as critical thinking in the modern sense of the word: “Active, persistent and careful consideration of any belief or supposed form of knowledge in the light of the grounds that support it, and the further conclusions to which it tends, constitutes reflective thought” (Dewey 1997). For most authors, this is evidence that Dewey was actually referring to critical thinking, being the “father,” originator, or founder of contemporary critical thinking theories. The slogan “learning to think” is also closely related to critical thinking in Dewey’s philosophy, where he demands learning, more specifically, practicing critical thinking. It was Dewey who was among the first thinkers to state that learning to think is fundamental to education.

Conclusion

After Dewey, a series of authors continued to develop his reflective thinking system, most famously, Matthew Lipman who elaborated on Dewey’s theory. With the aid of other theories, he developed the theoretical and practical framework of Philosophy for Children. The following articles deal with issues important to the current state of philosophical education. They bring a cross section of elaborate methods and approaches in Philosophy for Children, but also discuss the transition between the first and second step in philosophical education when students go from learning critical thinking to philosophical thinking at high school philosophy classes and thinking about philosophical issues at the International Philosophy Olympiad.

The only way to properly develop critical thinking is to start practicing it and developing thinking skills from early age with philosophical methodology. After that, it can be expanded across philosophic and academic areas. Therefore, think critically!

Philosophical Idealism and Educational Theory

Mark Joyal
University of Manitoba, Winnipeg, MB, Canada

Introduction

Among ancient discussions of Greek education, philosophical idealism makes its first appearance in Plato's *Republic*, within his formulation of an ideal state. Here the mathematical sciences and dialectic are presented as affording the student a path to the apprehension of unmediated reality, which, in Platonic theory, is education's supreme goal. Most subsequent discussion or activity among Greeks and Romans which attempts to integrate philosophical idealism either develops or responds to Plato's thinking on this subject. Plato's speculation also succeeded in finding accommodation in more widespread views about ancient educational curricula and in the thinking of some modern educationists.

Plato

An ancient tradition records that above the entrance to Plato's Academy was displayed the inscription, "Let no one enter who does not know geometry." The earliest surviving evidence for this inscription is in a work by the Emperor Julian (*Against Heraclius the Cynic* 237d), written some 750 years after Plato established his school, and there is good cause to believe that the story is apocryphal. Nevertheless, the tradition reflects important realities about Plato, his philosophical priorities, and his educational goals both in theory (in his writings) and in practice (in the Academy itself). Drawing philosophical inspiration especially from his Pythagorean predecessors, Plato looked to mathematical sciences (arithmetic, plane and solid geometry, astronomy, harmonics) as providing the most compelling evidence for intelligible, immaterial, unchanging reality – the transcendent "Forms," which he considered to be the student's highest object of study.

Plato describes and discusses his theory of Forms in numerous dialogues, but it is in his most famous work, the *Republic*, that he applies their contemplation to the system of education which he formulates for his Utopian society. Here, in Book 7, Socrates explains at length the shape which education takes for the "Guardians" of this ideal society and the purpose of this education (Annas 1981, pp. 272–293). The Guardians have already completed their cultural and physical training when they come to the study of numbers, which they will pursue to the age of 30. This study serves the general purpose of developing the intellect and training people how to think, but much more importantly (in Plato's view) it turns the mind away from our world, the world of becoming (*genesis*), towards truth and reality (*ousia*), the world of Forms (525a–c). Numbers are not Forms, of course, but in our world of becoming their

study is the closest that we can come to Forms themselves (Cornford 1932, pp. 38–39). The order in which the mathematical subjects are studied is important too. Arithmetic prepares the way for geometry, which requires us to think in two and three dimensions. Astronomy comes after geometry; now the student's eyes are raised up from the earth towards the heavens. The celestial bodies, nevertheless, are material and of this world. The heavenly music which they create (originally a Pythagorean belief), however, brings us closer to immaterial reality, and it is direct, unmediated apprehension of reality that should be the goal of education.

Just how can the student achieve this direct contemplation of real, unchanging goodness, justice, courage, and so on? To answer this question Plato invoked his doctrine of *anamnesis*, “recollection,” which presupposes that the soul, in discarnate state, has had direct apprehension and knowledge of the Forms before a person's birth. Its subsequent incarnation and contact with the body cause the person in whom the soul has been embodied to forget this knowledge, but it can be “recollected” when this person is given the right promptings, especially through skilful questioning. A problem with the doctrine of *anamnesis*, however, is that it explains why, not how, people are able to gain access to the Forms. More problematic still is that the doctrine requires proof of the soul's immortality. Plato therefore saw greater potential for explaining how the study of numbers could lead to apprehension of reality in the application of dialectic (*Republic* 532a–535a), which Socrates calls “the capstone of the curriculum” (534e) (Annas 1981, pp. 276–293).

The use of dialectic to accomplish this goal (and its concomitant potential to exemplify recollection) is demonstrated most vividly in Plato's dialogue *Meno* (81e–85d). Here Socrates interrogates a young, unschooled household slave who has no previous knowledge of mathematics. Through a long series of carefully framed questions he leads the slave to the correct solution to the problem of doubling the area of a square. Socrates conducts the interrogation as one who (like the slave) does not know the answer to the

problem he has set, in other words, as an “intellectual midwife” who possesses no body of knowledge himself but is expert in bringing to birth the intellectual offspring conceived by others (cf. *Theaetetus* 150b–151c). The inquiry is therefore viewed as a nonempirical “common search.” Its success is achieved through a solution that is based not on variable opinion (*doxa*), about which people may well disagree, but on secure knowledge (*epistēmē*), which is derived from immutable numerical truths. Dialectic, moreover, elevates the particular geometrical solution which Socrates coaxes from the slave to a general truth whose existence does not rely on the senses.

There are, then, two stages in the process by which, to Plato's thinking, the student may apprehend pure reality: first, the study of the mathematical sciences, and then, the learning and application of dialectic (Cornford 1932, pp. 173–190). We know from surviving evidence that the practice of dialectic – the processes of collection, division, and classification – was an activity central to Plato's Academy.

Aristotle

In his research and teaching, Aristotle pursued the dialectical activity of classification with great energy. As is well known, however, he broke decisively from his teacher Plato by rejecting the theory of Forms. Unlike Plato, he was an empiricist, unwilling to exclude the role of perception and the senses from the acquisition of knowledge. Aristotle observed that experience and memory enable us to collect related instances of things and events, and “from many notions that come from experience, one universal supposition about similar things is produced” (*Metaphysics* 981a5–7). The procedure which leads to this result is called induction; through its application people are able to apprehend universals which, when analyzed, yield first principles. But our discovery of first principles depends on sense perception, so disputes may be expected to arise over the authenticity of a first principle. In these cases, it is the task of dialectic to defend (or disprove) its

authenticity (*Topics* 101a25–b4). According to Aristotle, the knowledge of first principles and first causes is “clearly” *sophia*, i.e., “wisdom” (*Metaphysics* 981b25–982a3).

The fact that Aristotle refused to endow these first principles with their own separate existence is of fundamental importance for understanding his break from Plato and their disagreement over the goal of education. For Plato, apprehension of first principles – of his Forms, in other words – is impossible when the soul is incarnate, since it is then in contact with the body, which is implicated in fallible sense perceptions. For Aristotle, it is only through the sense organs that first principles can be apprehended.

Precisely where Aristotle’s thinking on ideals belongs in his educational activity is far from clear, but the evidence of ancient commentators on his works (writing mainly between the second and the sixth centuries A.D.) may provide some help. Some of these commentators distinguished two kinds of Aristotelian writings, the *exoterikoi* and the *enkyklioi* “discussions” or “arguments” (*logoi*). Just what the adjectives *exoterikoi* and *enkyklioi* refer to in these phrases is open to some basic disagreement. Many have believed that *exoterikoi logoi* are popular works which Aristotle intended for wider consumption, especially philosophical dialogues not unlike Plato’s, whereas *enkyklioi logoi* are works which were not meant for publication but, being of a more technical nature, reflect the teaching which took place in his school. But there are flaws in this argument, and an alternative proposal has been put forward (Bos 1989, pp. 111–152): *exoterikoi logoi* are discussions which deal with the things outside (*ta exo*) the physical realm, while *enkyklioi logoi* deal with physical reality, the things within (*en*) the circle (*kyklos*) of the universe. These latter *logoi*, being nearer to the experience to which people can easily relate, are the subject matter for the preliminary stage of education, which would later acquire the name *enkyklios paideia*, an important designation often translated as “standard education.” The former *logoi* are the concern of advanced students, whose object of

investigation would be *philosophia*, which is concerned with transcendent, theological principles.

Later Platonists and Early Christians

It remains difficult to determine how far Aristotle may have been dependent upon Plato – even if only by reaction against him – in formulating an educational curriculum which was designed to bring the student to the contemplation of immaterial existence. About numerous other ancient thinkers, however, we need not be in any doubt (Hadot 2005, pp. 263–293). For instance, the Alexandrian (Jewish) Platonist Philo (ca. 25 B.C.–ca. A.D. 40), best known for his commentaries on the Pentateuch, often referred to *enkyklios paideia*, especially the mathematical sciences, as an important but preliminary stage in the curriculum, subordinate to the pursuit of *philosophia*; hence his characterization of this early stage as the “handmaid of wisdom” (*Intercourse with the Preliminary Subjects* 73–76). Yet just as *enkyklios paideia* contributes to the pursuit of philosophy, so philosophy then contributes to the possession of wisdom (*sophia*), which is the knowledge of divine and human matters and their causes (79). Clement of Alexandria (ca. 150–ca. 215) adopted Philo’s evaluation of the relative places of *enkyklios paideia*, *philosophia*, and *sophia* (even quoting Philo), but Clement went further by defining wisdom as “knowing God” (*Miscellanies* 1.5.30.1–2). Lactantius (ca. 240–320) characterized wisdom in a similar way but denied that the path to *sophia* ran through *philosophia*, since “knowing God” is something that all people – not only philosophers but “workmen, peasants, women, and all who have human form” – are capable of by nature, and these people should therefore receive instruction (*The Divine Instructions* 3.25–26).

The opinions on education of St. Basil of Caesarea (329/330–379) demonstrate a profound Christian engagement with Plato’s writing on the subject and deserve special attention. Early in his essay *To the young, on how they may benefit from*

pagan literature (2), delivered ostensibly before an audience of youths, Basil makes a basic point emphatically: Christians consider this life and its goods to be nothing, and believe the soul to be infinitely more valuable than the body.

So long as you are unable, because of your age, to understand the depth of the Holy Scriptures' meaning, in the meantime . . . we give a preliminary training to the eye of the soul We must recognize that a contest is set before us, the greatest of all contests, to prepare for which we must do everything and perform every task, as far as we can, and we must associate with [the writings of] poets, prose-writers, orators, and all men from whom we are likely to derive some benefit for the care of the soul. Just as dyers first prepare by certain treatments that which is going to receive the dye, and then apply the colour, whether it be purple or some other shade, in the same way will we, if the glory of the good is destined to abide with us as indelible, then understand the sacred and mystical teachings after we have received preliminary initiation by those external [i.e. pagan] means. And like those who have become accustomed to seeing the [reflected] sun in water, so will we direct our eyes to the light itself.

The dominant theme here is that of "preparation" for apprehension of the ideal: Our study of pagan authors helps us to prepare for the greatest of all struggles. Pagan literature is like the unseen preparatory material that dyers use before they apply the glorious color that is the Holy Scriptures; it provides a preliminary initiation, but the Scriptures are sacred mysteries. The Scriptures are the light itself; pagan literature is reflected light that prepares us to look upon the real thing. These images all trace their origin back to Plato's *Republic* (Döring 2003): the "eye of the soul" which is raised up through dialectic (533c–d), the simile of dyers and their wool (429d–e), and the progress from the vision of reflected images to contemplation of the light itself (515e–516b). Basil's assumption is that intelligible, unchanging reality is contained in the Scriptures, not Plato's world of Forms; the "eye of the soul" gains understanding of the Scriptures through ascent up a pedagogical ladder. Basil's work was widely read and admired throughout the Middle Ages where Greek was understood; from the fifteenth century on it gained enormous popularity in western Europe through the Latin translation of Leonardo Bruni (1370–1444).

St. Augustine (354–430) similarly believed that the products of pagan learning could be presented to students in order to prepare them to acquire knowledge of "the one God himself" (*On Christian Teaching* 144). The liberal arts, especially the mathematical subjects, condition the student for contemplation of higher things (*On Order* 2.12–16). The influence of Plato, crucial in Augustine's conversion to Christianity (*Confessions* Bks. 7–8), is evident everywhere in his writings. Like Basil, he applied Plato's image of "the eye of the soul" to describe the apprehension of intelligible reality (*Various Questions* 46.2).

Divinization

Philo's goal to "know divine matters," and the aspiration of learned Christians to "know God," both reflect a view about philosophy that traces its origins to Plato's *Theaetetus*, where Socrates tells his interlocutor Theodorus that "we must try to escape as quickly as possible from here to there," and that this escape is "assimilation to god, as far as possible" (176a–b). Assimilation to god, or "divinization," is an ideal that was understood and sought in different ways by different ancient people. Early Christians, for instance, could strive for it through life in the desert or in the monastery. For Platonists from the third century A.D. on – i.e., Plotinus and his Neoplatonist successors – divinization was the supreme goal, progress towards which was afforded by the study of texts.

Naturally enough, the texts which they studied above all were the Platonic writings – not *all* of them but rather those that were considered most useful and relevant to their goal. Once agreement was reached on the identity of these fundamental dialogues, two further developments occurred: certain scholars proposed the "correct" organization and reading order of these Platonic writings, and commentaries on each of them were written in order to facilitate their study. The surviving evidence for these reading orders shows a clear desire to draw students progressively to works that deal with the contemplation of transcendental being, in particular the *Timaeus* and the *Parmenides*, which

were (in that order) the final two in most reading lists (Koch 2013; Tarrant 2014). For a similar reason, Platonists also included some of Aristotle's writings in their curriculum, most notably the *Categories* and *Metaphysics*.

The Later Tradition

Throughout the Middle Ages, arithmetic, geometry, astronomy, and harmonics preserved their role as preparation for the study of philosophy and theology. Boethius (ca. 480–ca. 524), who had confidence that these subjects could lead the student to comprehension of what really exists, appears to have been the first to apply the medieval title *quadrivium* to this set of subjects (*Training in Arithmetic* 1).

For 350 years after the reintroduction of Plato's works into western Europe around the beginning of the fifteenth century, "Platonism" implied especially the emphases and preoccupations of the Neoplatonists of late Antiquity. It is unsurprising, therefore, to find that when the great Renaissance humanist Marsilio Ficino came to select and arrange the first ten works of Plato which he would translate into Latin and later incorporate into his 1484 edition (the first printed edition of Plato's complete works in any language), this selection and arrangement aimed to provide for the ascent of the reader's mind to the vision of God, just as the Neoplatonic sequences of late Antiquity had done (the *Parmenides* and the *Philebus* occupy the ninth and tenth places). Ficino makes this intention clear in his preface to the 1464 collection of these ten works which he addressed to Cosimo de' Medici (Toussaint 2013).

It is a common belief that the Neoplatonic interpretation of Plato lost its dominance as a result of the translations and exegeses of the dialogues by Friedrich Schleiermacher (1768–1834). This belief is overstated, but there is no question that these publications (1804–28) did mark a turning point in the study of Plato (Tigerstedt 1974, pp. 5–7). Yet it was central to Schleiermacher's project, too, to determine the order in which the dialogues were composed and should be read (Lamm 2013). The sequence which he decreed

would find no acceptance from any Platonic scholar today, but Schleiermacher's purpose was a pedagogical one, and his solution demonstrates the same concern that much earlier thinkers had shown to raise the student's mind through dialectic to contemplation of the ideal which truly exists. In the *Republic*, which is among the last dialogues that Schleiermacher prescribed, that object of contemplation is "the Good."

At about the same time that Schleiermacher's translations were first appearing, Johann Gottlieb Fichte (1762–1814), follower and interpreter of Immanuel Kant, published the *Addresses to the German Nation* which he had delivered in Berlin in 1806 when the city was under occupation by Napoleon. The second and third *Addresses* deal directly with education. Fichte's idealism represented a radical development of Kant's and is unmistakable in both of these *Addresses*, especially in his assertion of human freedom. Obvious too is the influence of Platonic idealism. Only one extract can be provided here, but many others, equally illustrative, could be presented without difficulty (*Address* 3, 29; trans. G.H. Turnbull):

[The student] is a link in the eternal chain of spiritual life in a higher social order. A training which has undertaken to include the whole of his being should undoubtedly lead him to a knowledge of this higher order also. Just as it led him to sketch out for himself by his own activity an image of that moral world-order which never is, but always is to be, so must it lead him to create in thought by the same self-activity an image of that supersensuous world-order in which nothing becomes, and which never has become, but which simply is for ever; all this in such a way that he intimately understands and perceives that it could not be otherwise. Under proper guidance he will complete his attempts at such an image, and find at the end that nothing really exists but life, the spiritual life which lives in thought, and that everything else does not really exist, but only appears to exist.

The effect of philosophical idealism on educational theory is apparent in other, mainly German, thinkers of the past 250 years (especially Kant, Hegel and Schelling). Nowhere, however, is it expressed so forcefully and directly as it is in these works, and never during this time did it exercise such influence as it did on the development of German nationalism through Fichte's *Addresses*.

Introducing philosophy as a subject matter in formal education; Practice of philosophical dialogue in educational settings, The

Introduction

Philosophy has been highly important throughout the history of Western education. It was clearly present during the period of Classical Greece, led by the sophists, but also by Socrates, Plato, and Aristotle. It regained its importance throughout the Middle Ages, most especially with the rise of the European renaissance – starting around 1000 A.D. – in schools and universities. Philosophy continued and was maintained, at least in some countries, with the implementation of obligatory formal education.

Over recent decades, we have found ourselves in an apparently contradictory situation. On the one hand, there is a notable awareness of the decreasing importance of the humanities, among which many people (mistakenly, in my opinion) include philosophy. The damage done to education by this abandonment of the humanities in general – and philosophy in particular – has often been decried (Nussbaum 2010).

Translation into English: Tom Lardner

On the other hand, we have witnessed a notable increase in the presence of philosophy in formal education. One concrete example is the growth of philosophical practice at the primary school level within the general framework of philosophy for children or with children. Similarly, interest in civic or social values education, which is often linked to philosophical learning, has been on the rise. We should also highlight UNESCO's commitment to the presence of philosophy in formal as well as informal education. In short, there is plenty of evidence available to shine a positive light on the situation, backed up by a number of UNESCO reports.

There is, in other words, a notable effort to extend the presence of philosophy at the primary school level and to consolidate or initiate – depending on the country – its presence in secondary schools. The dominant trend is to present philosophy as a specific activity, akin to a process of inquiry that is regarded as essential in the education of children and young adults. That is why this article is entitled “Philosophical Inquiry in Education.” What follows seeks to clarify the concept of philosophical inquiry, justify the importance of that activity in education, and finally to take a look at those environments where it should be present.

Clarifying the Concept

One feature of philosophy is that those who practice it do not often agree on exactly how to define it, although there tends to be mutual understanding and at least a partial agreement as to what they are doing. When we move on to talking about its presence in education, we encounter another problem apart from the definition itself. There is still a debate between those who, following Kant, emphasize the importance of teaching students to philosophize, and those, more akin to Hegel, who place importance on teaching philosophy – i.e., teaching certain content and knowledge pertaining to philosophy.

While this article focuses here on philosophical inquiry, which puts the emphasis on philosophy as an activity, it is also necessary to make clear from

the start that one cannot engage in philosophical inquiry without addressing certain subjects and concepts belonging specifically to the philosophical discipline. These are the themes that often appear in introductory manuals to philosophy or in higher level philosophical encyclopedias that can be consulted on the internet. These manuals and encyclopedias include, among others, the basic issues of metaphysics, such as unity, reality, truth, the good, beauty, etc., or those related to Kant's four questions concerning what we can know, what we should do, what may we hope for, and what it means to be human. This does not rule out, of course, that any subject or issue from human experience can and should be addressed from a philosophical perspective.

Focusing on those aspects that characterize philosophical inquiry, especially on what philosophers normally do, three features stand out. Firstly, it is the kind of thought that shows a clear capacity to analyze and reason. Secondly, it shows a special preference for discussions about concepts and subjects that are ambiguous, vague, uncertain, borderline, etc. Finally, philosophers create and work with wide-ranging frames of reference, what we could also call global concepts, making connections between theory and practice, or between abstract thought and real-life experiences (Rondhuis 2005). It is possible to add another feature as a corollary, following from those described above: a “philosophical inquiry” aims at seeking out the problems with what we accept as “given,” while working to clarify and bring closer to more generally acceptable “resting points in inquiry” those issues that seem vague and purely subjective. This allows to talk about progress: people are getting better at philosophically addressing and discussing issues and also at differentiating between good and poor reasons and asking always for stronger and better-founded justifications of ideas (Golding 2013).

Those features of philosophical inquiry are found in the ideas of Lipman and many other authors working in the area of philosophy with children and for children, who have contributed important ideas and practices concerning the presence of philosophical inquiry in the classroom. Lipman stresses the importance of fostering

higher-level or multidimensional thinking, a kind of critical, creative, and careful thinking, with all the cognitive and affective dimensions that this implies. This is the sort of thinking that help human beings to advance in the difficult path toward the truth. Or, following the work of Michel Tozzi (1994), it is also possible to summarize the basic features of philosophical inquiry into three general points. In such inquiry, people first problematize, that is, call into question what they normally accept as certain and well known. Then, they conceptualize, which means being rigorous and precise in the use of concepts. And finally, they present their points of view, avoiding the use of fallacies and invalid arguments.

In its efforts to support the presence of philosophy, UNESCO “interprets philosophy in a broad sense as dealing with universal problems of human life and existence and instilling independent thinking for individuals. Philosophy is at the heart of human knowledge, and its scope is as wide as UNESCO’s own fields of competence.” (UNESCO 2005). This perspective on philosophical inquiry is similar to those described above. It is viewpoint that roots itself in classical philosophers and the Socratic method, where irony (problematizing) is combined with maieutic (the thoughtful emergence of knowledge). It is also a model that was highly present in the teaching of philosophy in Medieval European schools and universities, beginning with Abelard and revived in a way by Leonard Nelson’s (1922) powerful proposal. It has spread and taken on great importance since that time.

Given these basic characteristics of philosophical inquiry, we can now choose – according to preference or subject – among a number of inquiry methods that are currently popular in the academic philosophical community. One major trend follows Husserl’s phenomenological method, which has the strong point of focusing on the things themselves, tentatively putting aside what we take for granted. The second trend is that which has come to be called analytic philosophy. This trend focuses on language itself as the central issue, placing value on the analysis of everyday

language and language games for formal education. Then there is the hermeneutic approach, which seeks out intersubjective dialogue in order to reach a personal appropriation of that which is expressed in texts – whether written, visual, or of any other kind. Finally, it is possible to opt for a deconstructive philosophical inquiry, a postmodern approach highlighted by its ability to disassemble texts, identifying their genealogy along with their internal ruptures, which helps to question meanings that are derived in an unreflective manner. At the same time, this approach serves to highlight the limits of any rational project.

Justifying Philosophy’s Presence

Today philosophical inquiry can be found in all levels of education – primary, secondary, and university. UNESCO coordinated a splendid project between 2009 and 2011 which resulted in the publication of six reports on *Teaching of philosophy in...: Latin America and the Caribbean, the Arab region, Asia and the Pacific, English-speaking African countries, French-speaking African countries, Europe, and North America*. These reports were followed by five general conferences organized to discuss these issues. The conferences were held in Tunisia, Santo Domingo, Milan, Manila, and Bamako. Generally, these reports are optimistic about the presence of philosophy, although very different situations make it difficult to generalize. Also it is DOUBTFUL that philosophy is being done in a similar way in all the places WHERE it is taught. Most likely all the experiences have a certain family resemblance, but it is less certain that philosophical inquiry is being practiced everywhere.

In any case, in these times of crisis in the humanities – when society is making far-reaching demands on educators – it is needed to provide arguments to justify why students should devote time in their schedule to philosophical inquiry, which obviously takes time away from other material and subjects. Justifying this by noting the extra-philosophical benefits from

the activity does not mean negating its intrinsic value. Nor does it mean that we are surrendering in a way to a market perspective. Rather, it only means that teachers of philosophy have to give reasons for why students should learn philosophical inquiry. This is simply trying to address a basic demand in a democratic society – students in particular, but also their families and society in general, devote a huge amount of resources to education. Justification and accountability are fundamental.

The intrinsic value of practicing philosophical inquiry can be a leading argument in our justification. Doing philosophy is always a first-person activity, that is, it is something that no one can do for us. It is only oneself who can respond to two basic questions: what kind of person do I want to be and what kind of world do I want to live in. The assertion that Plato put in the mouth of Socrates is still valid: “the unexamined life is not worth living for a human being.” As such, philosophy is essential for attaining a full human life, something that makes it intrinsically valuable. Forgoing philosophy is to avoid taking ownership over one’s own life.

A second argument, based in a sense on an extrinsic value, establishes a direct link between philosophical inquiry and the construction of democratic societies. The appearance of philosophy in classical Greece coincides with the Athenian democracy’s period of splendor. It is difficult to conceive of that particular democracy – the advocate of isonomy, isegoria, and parrhesia – without acknowledging the contribution of its philosophers, especially the sophists. More recently, we can cite the role played by the enlightened *les philosophes* in the eighteenth century, during the fall of the absolute monarchies and the birth of contemporary democracies. In 1916, shortly after the rise of totalitarian political regimes throughout Europe, John Dewey linked democracy with education, regarding democracy not only as a political regime but as a way of life depending on processes of deliberation based on rigorous argument. UNESCO showed the same commitment when, at the dawn of the twenty-

first century, it titled its book about the teaching of philosophy, *Philosophy and the school of Liberty*.

The link between philosophy and democracy is not, however, intrinsic or obvious. Many philosophers say that democracy needs people who are educated with the philosophical skills attained through familiarization with philosophical inquiry. With this in mind, the Spanish philosopher José Antonio Marina has called for the inclusion of philosophical competency in education, invoking the concept of competencies or skills that are guiding contemporary educational reform. It is clear, however, that such philosophical skills can be present without implying the construction of democratic societies. There are well-known examples throughout history. It is enough to remember that Popper considered Plato, Marx, and other philosophers as “enemies of liberty,” or to cite Lukacs’ evaluation of the German idealist philosophers, who advocated an assault on reason, to be reminded of the antidemocratic spirit of some good philosophers. The practice of philosophical inquiry only contributes to democracy if an explicit choice in favor of democracy precedes such inquiry (García Moriyón 2013).

Other arguments serve to justify the practice of philosophical inquiry in the classroom by citing its positive effects on students’ cognitive and affective growth, as well as on their academic performance in general. In other words, it is a justification that appeals to extrinsic benefits – apart from the philosophical reflection itself, yet derived from it. The usefulness of this approach lies in that it does not resort to philosophical argument in validating the positive effect of philosophizing in the classroom. Rather, it cites educational and psychological research and provides indisputable evidence that this effect is positive and significant. It was Matthew Lipman who explicitly introduced this approach when he included the results of research by experts in educational psychology in his first book (Lipman et al. 1980). Since that time there have been many studies demonstrating these positive

outcomes, including a number of meta-analyses (Trickey and Topping 2004) and longitudinal studies. We can confidently state that the benefits of philosophical inquiry for the educational process have been proven beyond any doubt.

It is true that these studies have evaluated the educational effect of philosophical inquiry when it is practiced in a certain way, i.e., when philosophy is done in classrooms that have been transformed into communities of philosophical inquiry – the distinguishing mark of the philosophy for children project and other, similar approaches. In any case, we saw above that the effect of philosophy depends on how teachers understand and practice philosophy in the classroom. Yet it is not always taught and learned in the same way, and experience shows that it is clearly positive when philosophy in the classroom is done in the form of communities of philosophical inquiry.

The Presence of Philosophical Inquiry in Education

Now that the meaning of philosophical inquiry has been clarified and we have provided a brief justification for its presence in education, it is needed to look at how it should be present. It is time to explore how to practice philosophical inquiry in formal education, leaving aside for now its presence in other educational environments – in nonformal as well as informal education. These other environments are surely important and are currently expanding, but it is better to put them aside now for reasons of space.

Recent educational guidelines stress the importance of competencies as basic elements running through all materials and subjects. This emphasis on competencies can be controversial, so to avoid confusion, we will clarify the issue by looking at thoughts on education from some years back, for example, the Delors report from 1996, *La educación encierra un tesoro* (*Learning: the Treasure Within*) and one that came out soon thereafter in 1999 by Morin, *Les sept savoirs nécessaires à l'éducation du futur*. These views serve to clarify the meaning of competencies, avoiding reductionist interpretations of same. This approach gives

great weight to, among other sources, the evaluation done by Gert Biesta (2013), who warned of the risk of excessively focusing on two educational objectives – qualification (especially professional) and socialization – while ignoring subjectification. The reports point out that it is the latter which makes growth and empowerment possible for students.

Accordingly, in looking for competencies or skills related to improving the educational process of subjectification, it would seem necessary to include specific time slots in all subjects when students can reflect on the fundamentals of each discipline. This refers to the need to problematize and clarify the basic concepts of each subject area, in order to achieve full understanding of them. Similarly, the learning of subject matter must be compared and contrasted with that which is learned in other subjects, as well as related to the students' everyday experience – in order to attain a global framework of understanding of their personal lives and of the world they want to live in. Therefore, it is essential that teachers in general include philosophical inquiry in their habitual educational practice. Only in this way, according to Biesta's critique, will we attain integrated learning in a truly educative experience.

Such inquiry, however, requires its own space. In accordance with the solid and coherent proposal put forth by Matthew Lipman and Ann Sharp, children must have some time each week devoted solely to philosophical reflection. This should occur throughout their entire formal obligatory education process, i.e., in every year of that process. Only if that time is allocated can the skills and abilities acquired through philosophical practice grow into true behavioral habits – habits that are necessary in the education of critical, creative, and caring people. Finally, a well-prepared teaching corps is needed to lead this philosophical inquiry, teachers who can transmit and exemplify philosophical content and procedures in their educational activity – with the goal of facilitating children's learning such that the skills become behavioral habits.

It is not easy to demand specific time in the curriculum for philosophical inquiry in an era when that curriculum is already loaded. The

importance of allocating that time, however, is evident. This is already partially being done, at least within the European Union, in three areas. One is civic and social values education, which has become part of the basic curriculum and is being taught, as can be expected, with a clearly philosophical imprint. Another is religious education, which in some countries such as the United Kingdom has a less faith-based and more philosophical focus. Finally, there are standard philosophy classes, which for now are only given in some countries and at the secondary level. Although they remain insufficient, these are three areas in which there is a genuine possibility of progressing in the implementation of philosophical inquiry as a cornerstone of an educational project able to meet the challenges and demands of today's society.

[Ethics of care](#); [Gilligan](#); [Kant](#); [Kohlberg](#); [Philosophy of education](#); [Theories of moral development](#)

The American psychologist Lawrence Kohlberg (1927–1987) is a modern classic in the fields of moral social psychology and theory of a moral development. His cognitivist theory of moral development has become a paradigm in the psychology of education. Students of teaching and education in many countries have been taught that there are six universal developmental modes (stages or schemas) of moral thinking, which are an empirical fact verified by Kohlberg and his followers in hundreds of empirical studies. Thus, the Kohlberg theory must be true because it is empirically verified. Nevertheless, one might ask can there be empirical proof on transcendental (philosophical) theory of morality and its development. Jürgen Habermas was the first to note that Kohlberg's theory of moral stages is a kind of rational reconstruction and that, as such, it cannot be empirically verified or falsified (Habermas 1995). Kohlberg intentionally wanted to do empirical research in the field of moral theory which traditionally has been considered an area of pure metaphysics and philosophical speculation. He believed that his empirical studies can solve the tension between facts and values, as a title of his article implies: From Is to Ought: *How to Commit the Naturalistic Fallacy and Get Away with It in the Study of Moral Development* (Kohlberg 1981). If Kohlberg is right, there is no gap between facts (what there is) and values (what there ought to be), and hence human morality is after all a naturalistic phenomenon and not a transcendental (*noumenal*) entity of the Kantian type. This is strange statement from Kohlberg

who wants to follow Kant's practical philosophy which includes the model of the "two Kingdoms." Kohlberg sees no contradiction in here. Surely empirical research must have some role in ethical theory, but we still believe there is a gap or a Hume's guillotine between "Is" and "Ought." In this matter, we agree with Harvey Siegel who writes that "neither Kohlberg nor anyone else can justify judgments of moral adequacy by appeal to the facts of development" (Siegel 1986, p. 76).

This kind of philosophical critique of Kohlberg's moral theory does not have much weight within the disciplines of psychology and education, in which empirical evidence is considered the hard currency. Of course, the moral development of a human being is an empirical phenomenon, but it also has a transcendental or philosophical dimension. The most famous opponent of Kohlberg is the feminist thinker Carol Gilligan, who presents both philosophical and empirical counterclaims against Kohlberg's cognitivist theory of moral development. Gilligan's main criticism is that Kohlberg constructs what he considers "the highest stage of moral development" from a male viewpoint and thus it is not neutral and impartial at all. Gilligan claims that the Kohlbergian ethic of justice is only one aspect of moral maturity – Kohlberg rejects the side of moral feelings and sentiments (see entry "[Gilligan-Kohlberg Controversy](#)" in EEPAT).

The so-called Gilligan-Kohlberg controversy touches at the heart of philosophical ethics. The basic question concerns the source of our morality: reason (duty) or love (moral sentiments, virtues of friendship). This was also central issue in Francis Hutcheson's, David Hume's, Jean-Jacques Rousseau's, Adam Smith's, Immanuel Kant's, and Georg Wilhelm Friedrich Hegel's ethical theories. In order to understand the philosophical root of the Gilligan-Kohlberg debate, it is worthwhile to take overview of the eighteenth century moral theories.

Bernard de Mandeville (1670–1704)

The good point to start is from British egoism and Bernard de Mandeville. In Oliver Stone's film

Wall Street, a character called Gekko illustrates in his speech very nicely Bernard de Mandeville's private-vice-public-benefit moral theory (de Mandeville 2004) which corresponds nicely with Kohlberg's concept of preconventional moral consciousness:

The point is, ladies and gentleman, that greed – for lack of a better word – is good. Greed is right. Greed works. Greed clarifies, cuts through, and captures the essence of the evolutionary spirit. Greed, in all of its forms – greed for life, for money, for love, knowledge – has marked the upward surge of mankind.

Mandeville claims that a private vice like selfishness is most beneficial to public welfare. Mandeville declares that people who act for their own benefit do more good for the society than superficial altruists. So, a successful society must be built on the vice of selfishness. There is no point to chase higher virtues, like Lord Shaftesbury does, because the search is a "wild-Goose-Chase" (Mandeville 2004, p. 331). For Mandeville, morality is as uncertain as fashion and is dependent on teaching and the subtle propaganda of dishonest civic leaders. Selfishness is certain and constant because it lies in the essence of man.

Francis Hutcheson (1694–1746)

Scottish moral sentimentalists Francis Hutcheson (1694–1746), David Hume (1711–1776), and Adam Smith (1723–1790) fought fiercely against Mandeville's moral theory and concept of man. Hutcheson's (2004, pp. 21–22; 69–75) counterclaim against Mandeville is that there are such things as a natural moral sense and natural moral sentiments. Hutcheson adopted the notion of moral sense from Lord Shaftesbury (2004, p. 52), who was a student of John Locke. Hutcheson (2004, p. 121) claims that moral sense motivates our actions and makes us sensitive to moral qualities of action:

... but had we no Sense of moral Qualities in Actions, nor any Conceptions of them, except as advantageous or hurtful, we never could have honour'd or lov'd Agents for publick Love, or had any regard to their Actions, further than they affected ourselves in particular. We might have

form'd the metaphysical Idea of publick Good, but we had never desir'd it, further than it tended to our own private Interest, without a Principle of Benevolence; nor admir'd and lov'd those who were studious of it, without a moral Sense.

Hutcheson agrees with Shaftesbury that God has given us a moral sense and along with it the feeling of nobler pleasure which comes from intending well for others and that by doing so “we undesignedly promote our greatest private good” (Hutcheson 2004, p. 75; Shaftesbury 2004, p. 88).

David Hume (1711–1776)

In the footsteps of Shaftesbury and Hutcheson followed two ethical thinkers that many contemporaries considered the brightest minds on Earth: David Hume and Jean-Jacques Rousseau. Although Hume followed Hutcheson in many ways, he did not believe in such thing as universal love of mankind. He preferred the concept of sympathy which is at work only when people are close to us. For Hume passions and sentiments are primary and reason secondary. In his work *A Treatise of Human Nature*, Hume (2004) proclaims that “Reason is, and ought only to be the slave of the passions, and can never pretend to any other office than to serve and obey them” (Hume 2004, p. 283). Of course this slavery is not absolute. Reason can correct passions and moral sentiments. At its best, reason can correct or reorientate moral sentiments, but in no way moral sentiments can be derived from reason (Hume 2004, p. 313):

Since morals, therefore, have an influence on the actions and affections, it follows, that they cannot be deriv'd from reason; and that because reason alone, as we have already prov'd, can never have any such influence. Morals excite passions, and produce or prevent actions. Reason of itself is utterly impotent in this particular. The rules of morality, therefore, are not conclusions of our reason... 'tis in vain to pretend, that morality is discover'd only by a deduction of reason. An active principle can never be founded on an inactive; and if reason be inactive in itself, it must remain so in all its shapes and appearances, whether it exerts itself in natural or moral subjects, whether it considers the powers of external bodies, or the actions of rational beings. It would be tedious to repeat all the arguments, by which I have prov'd, that reason is

perfectly inert, and can never either prevent or produce any action or affection.

Hume agrees with Mandeville that human beings possess primary self-interest, but unlike Mandeville, Hume thinks that there exists also sympathy (Hume 2004, p. 337): “. . . we naturally sympathize with others in the sentiments they entertain of us. Thus self-interest is the original motive to the establishment of justice: but a sympathy with public interest is the source of the moral approbation, which attends that virtue.”

Jean-Jacques Rousseau (1712–1778)

Concerning the moral passions, Jean-Jacques Rousseau holds very much the same opinion as his (former) friend Hume, but he is much more pessimistic concerning the benefits of civilization. In his first public work *A Discourse on the Sciences and Arts* (First Discourse), Rousseau (2016a) claims that the advancement of the sciences and arts has caused the corruption of virtue and morality. Due to the civilization process, people have lost their natural emotional sensitivity (*la sensibilité*) to the pain and suffering of the fellow man (see example Kontio 2003). For Rousseau, an uncorrupted and uncivilized natural man is not a Hobbesian egoistic violent person-owner but a kind and caring creature (noble savage) of God. In *Second Discourse*, the concept of the state of nature becomes more complex and less romantic (see Lähde 2008, pp. 67–165). Also the picture of the civilization process gets more sophisticated, but the role of passions remains essential in Rousseau's thinking. Like Hume, Rousseau acknowledges that self-preservation or self-interest is a principle of the human soul, but there exists also another principle, which is pity. Pity is “an innate repugnance to see his fellow suffer” (Rousseau 2016b, p. 19). Also animals have the same feeling, but humans – unlike animals – are free agents even in the state of nature. In *Second Discourse*, Rousseau also clarifies the relation between his two concepts of self-love: amour-de-soi and amour-propre (Rousseau 2016b, p. 41):

We must not confuse egocentrism (*amour-propre*) with love of oneself (*amour-de-soi*), two passions very different by virtue of both their nature and their effects: Love of oneself is a natural sentiment which moves every animal to be vigilant in its own preservation and which, directed in man by reason and modified by pity, produces humanity and virtues. Egocentrism is merely a sentiment that is relative, artificial and born in society, which moves each individual to value himself more than anyone else, which inspires in men all the evils they cause one another, and which is true source of honor. With this well understood, I say that in our primitive state, in the veritable state of nature, egocentrism does not exist.

The sense of being hurt is possible only in a social context in a civilized State in which a struggle for property (distribution) and a struggle for recognition exist. If an action happens in a non-social context, no feelings of hatred or desire for revenge can emerge.

Immanuel Kant (1724–1804)

Hume, Rousseau, and Smith, due to their eloquent rhetoric and enormous knowledge on the history of philosophy, made an impressive contribution to the theory of moral sentiments. The contemporary philosophers did not have a chance in the debate against these two friends. Only a hermit from Königsberg could really compete with Hume and Rousseau in every area of philosophy (epistemology, aesthetics, social philosophy, logic, rhetoric, philosophy of religion, and ethics), and also in fashion. He is, of course, Immanuel Kant (1724–1804) – the greatest representative of rationalistic ethics of all times.

The most fundamental concepts in Immanuel Kant's practical philosophy are the presupposition of freedom of will and the notion of duty. Kant concludes that although natural necessity covers all happenings (at the level of appearances; the phenomenal world) in the world, human beings possess an inherent transcendental freedom. The causality of freedom exists alongside the causality of nature. The human being is simultaneously a member of two kingdoms: the kingdom of necessity (natural causality in the sensible world) and the kingdom of freedom (causality of freedom in

the intelligible world) (Kant 1971, p. 104; Kant 2002, p. 80). The causality of freedom simply means that a human being has the capacity (faculty) to begin a process in the world just by the power of his or her will. This capacity exists despite the lack of empirical proof (proof at the level of appearances).

Kant postulates without a proof or deduction that there exists such a thing as the causality of reason or freedom which is related to the timeless essence of the human being, i.e., the transcendental ego (Kant 2007, pp. A552/B580):

The causality of reason in its intelligible character does not arise or start working at certain time in producing an effect. For then it would itself be subjected to the natural law of appearances, to the extent that this law determines causal series in time, and its causality would then be nature not freedom.

Kant says that a human cannot comprehend without contradiction the paradoxical relationship of the causality of freedom and the causality of nature. Kant calls this the third antinomy of pure reason (Kant 2007, pp. A446–447/B474–475).

As a member of the kingdom of freedom, the human being – or at least the transcendental ego – can exercise his or her freedom of will and choose to follow a duty. Kant thinks that a morally worthy action means following a duty. From the moral point of view, the significance of the motive behind an action surpasses that of its outcome. The motive of a morally worthy action is duty, and duty is derived from the so-called categorical imperative. Dishonest persons occasionally act according to the categorical imperative, while virtuous persons do so all the time. Nevertheless, a dishonest person does not employ their freedom of will and choose to follow the categorical imperative, which is why their actions have no moral worth. Only a person that is rational and free and possesses good will can act morally. Rationally oriented will inserts the moral dimension into an action. Without the moral dimension, an action is irrational and unfree – but the action could still be carried out in accordance with the categorical imperative.

According to Kant, people have two kinds of imperatives: hypothetical and categorical imperatives. A hypothetical imperative is a rule of action

in the pursuit of a particular goal. A hypothetical imperative dictates “if you want X do Y.” Kant claims that reason also produces the absolute maxim of moral action, the categorical imperative. A categorical imperative is unconditional. It simply says “do X.” This law applies to all rational beings, not only human beings. Again there is no proof or deduction involved in this law. It is exclusively a “fact of Reason.”

At least the following three formulations can be found in relation to the categorical imperative in *Groundwork of the Metaphysic of Morals* (Kant 2002, pp. 50–57):

1. Act only on that maxim through which you can at the same time will that it should become a universal law.
2. Act as if the maxim of your action were to become through your will a universal law of nature.
3. Act in such a way that you always treat humanity, whether in your own person or in the person of any other, never simply as a means, but always at the same time as an end.

Kant’s practical philosophy contains many paradoxes and difficulties. The most famous paradox concerns teaching and moral development. It is called the pedagogical paradox (see Kant 2015). This is one way to present the paradox. If we truly follow the categorical imperative in school education, we must treat pupils as free persons and not as a means for bringing up mature adult persons (i.e., childhood is the means and adulthood the end). Then again, the purpose of education is to educate a pupil – by means of the use of power, which is an inappropriate way of treating a person – so that she can become an enlightened mature person in the future. If a pupil is not a free and mature person, how can we treat her like one? If we do not treat her as a free person in education, we will treat her only as a means to an end, although that end is the pupil’s future adult personality. Thus, if we treat her only as a means, how can she ever be more than a mere means? This is a specific situation in which two different duties can be seen to be in conflict – a teacher has both the duty to make use of power in education

and the duty to respect his or her pupils as persons. Kant himself strongly opposed the view that a moral duty could sometimes exist in conflict with another moral rule. Nevertheless, we are not prepared to jump to the conclusion – like MacIntyre does – that Kant’s project of Enlightenment is a total failure. Kant’s practical philosophy is a major resource for modern theories of law, ethics, and education, but it is one-sided. It underestimates the role of moral sentiments and moral virtues subordinating them under the practical reason and cognitive elements of human morality. In his last opus magnum *Metaphysic of Morals*, Kant (1996) writes about a plenty of virtues (doctrine of virtues) and morally relevant feelings, but the core of his argument remains unaltered.

Adam Smith (1723–1790)

Adam Smith is well remembered because of his concept of “invisible hand” which illustrates how the market mechanisms work in civil society (e.g., economy). At the time of Adam Smith a new economic order (capitalism) was rising and this new economic order based on economic exchange between isolated self-centered individuals. Thomas Hobbes’s, John Locke’s, and Bernard de Mandeville’s egoistic moral theories (e.g., British moral egoism) created suitable ideological ground for this new capitalistic mode of production. Nevertheless, Adam Smith surely did not want to support the moral theory of British egoism although his book *The Wealth of Nations* (Smith 1973) suits well into the world view of British moral egoism. In the book *The Theory of Moral Sentiments* (Smith 1976; later TMS) Smith presents a moral theory which is the total opposite of moral egoism.

So there is inherent contradiction or at least a tension in Adam Smith’s social philosophy. This contradiction is known as *Das Adam-Smith-Problem*. On one hand, Adam Smith defends the free market and faceless economic exchange relationships, in which egoistic and rational individuals strive only for their material interests. The sphere of this egoistic economy is called

civil society, and there is no place for compassion and humanity in the civil society. On the other hand, Adam Smith claims that human morality is based on such feeling as sympathy and benevolence. Adam Smith himself of course did not think that there is any contradiction in the situation in which the individual acts egoistically in the economic sphere (civil society) and feels humanity and compassion toward his fellow men in the ethical sphere. Adam Smith considers moral sentiments to be a precondition for a free market society. There rich and healthy people take voluntary care of the drop-outs, invalids, elders, etc., without a State-founded social policy. Thus in no way Adam Smith would support any form of Social Darwinism or nowadays cold hearted global capitalism.

Unlike Hume, Adam Smith did not believe such thing as “moral sense” and considers such notion as bad usage of English tongue (TMS vii 3.3.15). Instead of moral sense Smith speaks about sense of propriety (TMS i.1.3.-4.). Tronto explains Smith’s sense of propriety as following (Tronto 1993, p. 46): “Propriety refers to the sentiment we share, being by nature sociable, that makes us eager to be sure that others perceive us as proper. If we did not develop a sense of propriety, perhaps we would be able to ignore the situations of others. But our desire to be accepted, our sense of propriety, causes us to develop an ability to put ourselves in others’ positions.”

Sense of propriety is related to Smith’s idea of the impartial spectator. Smith claims that moral point of view is the moral sentiment of impartial spectator. If we are engaged in moral conflict our instant moral feelings might be more or less biased. In social interaction we learn to imagine the reaction of the others who have no particular favorable emotion towards any engaged party. We learn to imagine what kind of moral feelings the impartial spectator would feel. We also have to assume that the impartial spectator is well-informed and sympathetic to somewhat normal degree (TMS, iii.2.31–32). When we examine the morality of our own action we should examine like the impartial spectator would examine (TMS iii.1.2.). The voice of the impartial spectator is a voice of conscience. It is a proper way to judge ourselves (TMS iii.1.3).

Besides the sense of propriety Smith presents even more demanding ethical maxim. He wants also to speak about universal benevolence in the spirit of Stoic cosmopolitanism. Notion of universal benevolence goes far beyond the ordinary sense of propriety which could at best include all the citizens of our own country (TMS vi.2.3.1). It also presuppose benevolent God.

Thus we can see three Smithian perspectives of morality:

1. Man’s has natural inclinations towards self-interest with underdeveloped sense of propriety
2. Sense of propriety with different degrees
3. Universal benevolence which presuppose benevolent God

Georg Wilhelm Friedrich Hegel (1770–1831)

In the beginning of the nineteenth century, there were two major alternatives in moral theory: the Scottish theory of moral sentiments and the Kantian ethics of duty. Georg Wilhelm Friedrich Hegel read carefully the texts of David Hume, Jean-Jacques Rousseau, Immanuel Kant, and Adam Smith. He wanted to create a synthetic practical philosophy which would resolve the antithetical contradiction of love and reason in moral theory. From his early work *Das Leben Jesu* (Hegel 1906) to his last opus magnum *The Philosophy of Right* (Hegel 2001), Hegel tries to create a grand synthesis that would “overcome” (*Aufheben*) the tension of love and reason both in society and in human consciousness.

In his early text *System of Ethical Life* (*System der Sittlichkeit*) (Hegel 1979), Hegel introduces a three-level model of society, which consists of the family, the civil society, and the State. A *sittliche* State means a community of reciprocally well-behaving and caring citizens. In *Philosophy of Right*, Hegel (2001) creates a grandiose theory of society based on these three instances. The family is the sphere of love within which man takes care of his beloved. In this sphere, love “rules” and overcomes reason. The civil society

is the sphere of private contracts and egoistic economic exchange. This sphere is ruled by cold reason and Adam Smith's invisible hand. According to Hegel, society cannot manage only with these two instances. Hegel calls for a value community called the *sittliche* (ethical) State which is ruled by rational feeling. This rational feeling surpasses the contradiction between loving one's family and the egoistic reason of civil society. For Hegel, the *sittliche* (sitte means custom or habit) State is a sphere of reciprocal good behavior and caring for each other. In the *sittliche* State, people feel solidarity and compassion toward the "abstract other," toward another citizen of the State. In the level of the state, familial love is extended towards all citizens and is cultivated into rational feeling which ties up the individuals into a reciprocal ethical community.

Gilligan's critique of Kohlberg resembles partly Hegel's critique of Kant's ethical theory. James Gordon Finlayson (2000) describes the difference of Kant's and Hegel's ethics in the following way:

On the one hand, Kant and his followers defend a version of the moral standpoint, that consists in formal and universally valid principles, which have their basis in rationality. On the other, Hegel and his followers claim that formally valid moral principles are themselves historically and socially situated; that they only accrue validity within a set of distinctively "modern" cultural practices and political institutions, which are the product of an historical evolution. . .

In *Phenomenology of Spirit* Hegel (1977) uses Sophocles's play *Antigone* to illustrate the social and historical nature of human morality or *Sittlichkeit* (ethical life; decency). From the Hegelian or communitarian point of view, Kant's categorical imperative is just an empty formula which does not help in concrete moral conflicts. In Sophocles's play, there are two ethical powers in contradiction: the paternal morality of Creon and the maternal morality of Antigone. In Sophocles's play, and also in real life, following purely a heartless cognitive moral reasoning might lead to a disaster or at least to coldness of the heart.

Thus behind the Gilligan-Kohlberg controversy is the over 200-year-old debate concerning the role of reason (duty) and love (moral sentiments) in morality.

Educational philosophy and theory (EPAT) as subjects of interest remain outside the mainstream of thinking in science education, whether the research field or professional classroom practice. Science education is known to have borrowed ideas from pedagogues and philosophers in the past – e.g., from Rousseau, Pestalozzi, Herbart, and Dewey – however the subfield of academic philosophy of education has been little canvassed and remains on the whole an underdeveloped area. At first glance such a state of affairs may not seem all too surprising since science education is mainly concerned with educating students about particular science subjects or disciplines. But this necessarily implies a tight link between subject content and educational issues and aims. Essential philo-educational questions arise at both levels, confronting researcher and teacher, often in ways that can intersect:

What should be the ultimate aim(s) of science education? Accumulation of knowledge? Should science education enhance both critical thinking and moral education? Or should it be preoccupied with preparing the next generation of specialists? Should the quality of science education be supervised by national standards? What is the nature of science, and thereto, is it authentically represented in textbooks, lab work, and classroom discourse? Does a hidden epistemology and cultural bias/ideology exist behind conventional curriculum and school science? Does a teacher's personal beliefs and conceptions of scientific knowledge and development reflect current views of science history, epistemology, and practice? How does a science teacher's personal philosophy and identity enhance or constrict authentic views of science and/or a learner's capability to understand, appreciate, or critique science? Are learners' cultural views, beliefs, and personal preconceptions more a hindrance or help? Should school science learning theories ape scientific epistemology and practices?

If science education is to mean more than mere instructional techniques with associated texts to encompass broader aims including ideals about what constitutes an educated citizen (i.e., defining "scientific literacy"), or foundational questions about the *nature* of education, of learning, of knowledge, or of science, then educational philosophy and theory must come into view (Nola and Irzik 2005).

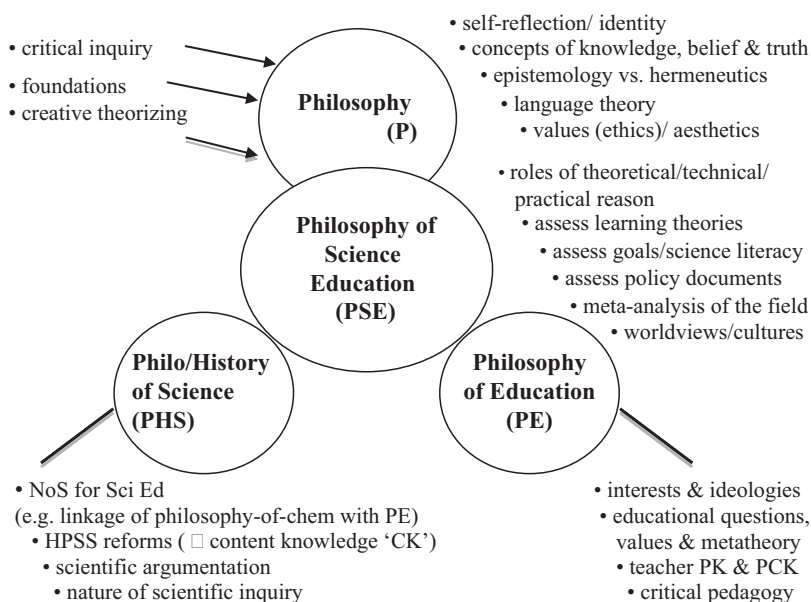

An education *in* science has historically been associated with narrow "technical" training in specialized disciplines (e.g., conventional school science), with broader aims of liberal education (e.g., independent thinking, cultural enlightenment), with teaching science for "social relevance" (e.g., science-technology-society-environment: STSE reforms), or lately with "science for engineers" (e.g., the newest US STEM reforms) – the last one an updated version of the older vocational interest (Norris 1997; Pedretti and Nazir 2011). The vocational focus – high school science courses as prerequisites for techno-professional careers – has been a predominant aspect of teaching science since its inception in the 1900s and remains an expectation of parents, students, and society in general. Yet all these diverse curricular directions (or "orientations" or "emphases") imply or assume a particular philosophy of education that is rarely openly articulated or even acknowledged: whether to teach science

(1) for intellectual development (accumulation of knowledge), (2) for individual fulfillment (character), or (3) for socioeconomic or sociopolitical benefit (vocations, citizenship, etc.; cf. Matthews 2015; Roberts 1988). All three, in turn, have strong affinities with earlier, classically defined educational theories and perspectives: the first can be associated with the original knowledge-based educational project of Plato, the second is with Rousseau, and the last is a cross-cultural and timeless expectation of most societies, although in the USA the philosophy was modified by Dewey and progressivism (e.g., as social adaptation or reconstruction; cf. Eisner 1992; Schulz 2014).

When educational goals are examined historically, the foregoing three are ubiquitous; they persistently present themselves albeit in different guises, and they certainly can be identified throughout science educational reform history. No one normally holds exclusively to one or the other, although usually one or the other is emphasized over the other two at a given time (or two may be mixed and dominate over the third) – depending upon the defined educational or socioeconomic "crisis" at hand and under influence of respective social group interests. Such buried philosophies usually surface when diverse stakeholders (teachers, parents, science education researchers, State-controlled ministries, industry, and policy decision-makers) attempt to give voice to notions of "science literacy" and find they too often conflict and can't seem to be "balanced" or reconciled.

The field of science education research has over the last 30 years been staked out by incompatible positions from positivism to post-modernism, from "diehard realism to radical constructivism," the latter encompassing versions of epistemological and sociological relativism (impacted by studies in the post-positivist philosophy, history, and sociology of science). Thereto, teachers' personal and professional identities are in conflict when curriculum orientations clash, especially when they are exposed to discordant academic perspectives on the *nature of science* (NoS). Modern science teacher education has tended overall to bypass philosophy and

Philosophy of Education and Science Education, Fig. 1 PSE Synoptic framework

philosophy of education for courses on instructional techniques, classroom management, cultural studies, and learning theories from psychology and cognitive science – which still dominate the field – but a shift toward EPAT could have positive results for helping clarify the *identity* of both the research field and teacher professionalism (Fensham 2004; Schulz 2014). Minimally it would help teachers develop a philosophical orientated critical mind-set toward educational fads and ideologies that often follow in the wake of a perceived “crisis in science education,” which ensue upon economic and sociopolitical situated national and/or global disorders. At least three so-called crises have been identified: the aftermath of the 1957 “sputnik shock,” later on in the early 1980s with the US *Nation at Risk* report during the neoconservative Reagan era, and another in the late 1990s following various TIMSS and PISA publications, those international standardized science and mathematics education reports. All have in their time and for their own (edu-philosophical) reasons lamented the supposed deplorable state of either national or global science literacy.

Philosophy *for* science education has been of scattered interest among researchers for several decades, especially their limited foray into its subfields, which needs to be acknowledged (e.g.,

language studies, poststructuralism, postmodernism, feminism, hermeneutics, scientific argumentation, Rorty-influenced pragmatism, “critical theory”). The value of the subdiscipline of philosophy *of science* for science education has been generally recognized since the 1960s and has currently developed into the worldwide history and philosophy of science (HPS) reform movement (Matthews 2015). Philosophy *of* education itself has made a major impact on science education in the past only in so far as John Dewey’s ideas and progressivism have continued to influence educational thinking (Fensham 2004). Of lesser influence, though still significant, especially for those arguing today for the value of teaching science for liberal education purposes, have been Scheffler, Peters, and Hirst, themselves influenced by the 1950s/1960s Anglo-analytic philosophy of language and philosophy of science.

Yet the question of the necessity to develop an “in-house” philosophy *of* science education (PSE) has only recently been addressed, although math educators have debated the character of “philosophy of mathematics education” for almost three decades. Such a philosophy would need to take into consideration (if not to integrate) developments in such diverse fields as philosophy proper, philosophy of science, and philosophy of education (see Fig. 1; Schulz 2014):

The framework in-itself assumes neither prior philosophical positions (e.g., metaphysical realism or epistemological relativism) nor pedagogical approaches (e.g., constructivism, multiculturalism, sociopolitical activism, etc.). As a graphic organizer, it does provide science teachers and researchers a holistic framework to undertake analysis of individual topics and perhaps help clarify their own thinking, bias, and positioning with respect to different approaches and ideas. The main point is to show that any particular PSE as it develops for the teacher or researcher should take into consideration, and deliberate upon, the discourses pertinent to the three other major academic fields when they impinge upon key topics in science education. At minimum it should contribute to helping develop a philosophic mind-set.

In sum (as the figure illustrates), any philosophy of science education (PSE) is foremost a *philosophy* (“P”) and as such receives its merit from whatever value is assigned to philosophy as a discipline of critical inquiry – unfortunately, its benefit for the field may not appear at all obvious to science educators. Furthermore, such a philosophy would need to consider issues and developments in the philosophy, history, and sociology of science (“PHS”) and analyze them for their appropriateness for improving learning *of* and *about* science. Finally, such a philosophy would need to consider issues and developments in the philosophy of education and curriculum theory (“PE”) and analyze them for their appropriateness for education in science, as to what that can *mean* and how it could be conceived and best achieved. A fully developed or “mature” PSE can be understood as an appropriate integration of all three fields.

As one specific example, it could contribute to clarifying the dissimilar roles that theoretical, technical, and practical reason play (Aristotle, Habermas) in different reform initiatives which to this day remain confused or ignored. Science teachers are primarily trained in using theoretical reason (discipline-structured knowledge and instruction in traditional classrooms) and not in the other two modes, whereas STSE and especially STEM reforms presume the primary use of

technical reason. Researchers arguing for science-societal-issues (SSI) and sociopolitical or “activism” reform movements expect teachers and students to not only distinguish technical from practical or pragmatic reasoning but expect proficiency, to make effective use of them in classroom discourse, research, and ethical decision-making and action. Barring such clarification and preparation, reform programs will continue to face many predictable hurdles, including being poorly implemented or, at worst, confronting resistance by science teachers.

PSE ultimately aims at improving science education as a research field as well as assisting teachers in broadening their theoretical frameworks and enhancing their practice. Likewise, it aims to raise awareness among researchers to explicitly front their educational philosophies and theories, since the tendency in the past has been to make prescriptive arguments for various reform projects (e.g., the 1950s “science for scientists,” STSE, SSI, STEM, activism) based on obscure or perhaps concealed – or partly hidden – educo-political and philo-theoretical premises. This frequently coordinates with individual authors’ own favored philosophies of science (i.e., realist, empiricist, pragmatist, social constructivist, etc.), whose biases are at best semitransparent.

In Europe, science educators have drawn upon other educational and philosophical traditions, whether Ernst Mach’s educational ideas (little known outside of Germany/Finland) or the more established and occasionally contested *Bildung/Didaktik* tradition, one whose roots in romanticism can be traced back some 200 years. Mach’s educational theory and *Bildung* – also Rousseau, Hirst, and Dewey – represent in fact what can be called *metatheories* of education, those that go considerably beyond learning theory (e.g., constructivism) and seek to answer broader questions of what an educated person should ideally become or what educational institutions should strive in achieving for their citizens. It is well known such theories go back to Antiquity, beginning with the Greek idea of *paideia* (e.g., Plato, Isocrates, Aristotle, Cicero) and are always normative and prescriptive.

Modern metatheories are required to answer the four key educational questions: *what* to teach (curriculum), *how* to teach (instruction), *when* to teach (stages of learner maturity), and especially *why* to teach (specification of outcome or aim). Some educational theorists (e.g., Kieran Egan) have argued that educational development could substantially differ from psychological development, and hence educational metatheory should proceed autonomously from the findings of scientific psychology in prescribing educational progress and aims.

It is in the contested field of educational philosophy and theorizing that science education now finds itself becoming increasingly embroiled, whether drawing with some measure upon classical theories of Plato, Rousseau, and *Bildung* or upon relatively more topical educational (meta) theories of Mach, Peters, Dewey, Egan, Gardner, Noddings, and others. Most importantly, it is within the confines of the framework of the specified educational philosophy that the meaning of “what counts as science education” in general, and thereto, the meaning of “science literacy,” will eventually be spelled out. One can expect that just as educational philosophies are often incompatible, so too will be the resulting expressions of science literacy programs.

This can be illustrated with some contemporary developments. A number of researchers, presently still in the minority, have sought to elaborate an unconventional or “provocative” PSE (self-described) by drawing upon ideas and values from poststructuralist, postcolonialist, and feminist theory, as a philosophy of education, intending to “envision and create a critical and emancipatory science education for the twenty-first century” (Zembylas 2006, p. 585). Approaches to employ insight from Lyotardian postmodernism, nonetheless, have been met with considerable criticism, not least of which are problematic arguments concerning PE and PS (Schulz 2007). Others have argued also on emancipatory grounds and aligned with critical theory and critical pedagogy (and drawing upon Deleuze, Foucault, and others), to develop an overt politicized and “activist” science education

for students, that is, a predominant focus on “science education as/for sociopolitical action.” Such desired normative projects openly espoused by certain researchers represent a *fourth*, non-traditional goal (next to the common three mentioned above) that seek to fundamentally reconstruct and reorientate curriculum and the schooling of science education for social *transformation* (and not social adaptation) purposes, according to Eisner’s (1992) categorization of curriculum ideologies.

This newer sociopolitical variety of PSE has drawn criticism from a liberal education perspective, which points out that it significantly downplays the importance of scientific knowledge and discovery for its own sake and neglects the personal and aesthetic dimensions of science, especially the aspects of beauty, creativity, and wonder (Hadzigeorgiou 2015). It purposively seeks to shift the weight of the primary goal of science education away from the conventional one of preparing the next generation of scientists, engineers, doctors, and other techno-science-based professions for an exclusive stress instead on “science for citizens.” In other words, one aims for achieving critical citizenship for global sustainability, including a critical and ethical distancing from our “knowledge economy” with its techno-scientific base in post-industrial society, and often from Western science itself.

Turning away from the interests of researchers, and focusing instead on the immediate perspective of the classroom science teacher, PSE can be made practical if it allows for integration of the multiple philosophies that a teacher carries, linked with a heuristic teaching model that bridges philosophical abstraction with the teaching situation, allowing choices about the what, the how, and the why of science teaching (Janssen and Berkel 2015).

The latest discourse and stimulating debates concerning EPAT topics as related to the explicit emergence of various philosophies of science education (PSEs) have opened up new intellectual territory for the discipline of science education, encompassing both researchers and teachers, but to different degrees. In general it can be admitted

the research field requires EPAT as a capacity to think deeper and more systematically about the unique cultural, educational, and epistemological dimensions of teaching and learning of science as philosophy, as profession, and as practice. Philosophy as a discipline of critical inquiry, and philosophy of education as a subdiscipline, would ideally enable teachers to develop a reflective, critical PSE to help integrate their teaching philosophies and identities and, hence, examine curricular, cultural, and epistemological issues as they arise: whether associated with classroom discourse, textbook exposition, curriculum change, societal identified crises, reform initiatives, or professional policy deliberations.

Philosophy of Education: Its Current Trajectory and Challenges

Randall Curren

Department of Philosophy, University of
Rochester, Rochester, NY, USA

Philosophy of education is a domain of philosophical inquiry into the nature and aims of education; the diverse normative dimensions of education; the aspects of learning, teaching, and curricula; and the character and structure of educational theory and its own place in that theory. It seeks understanding of educational matters and to provide practical guidance for educational practice and policy. Throughout its history, philosophy of education has been shaped by related philosophical developments and by contemporaneous educational, social, economic, and political circumstances. Over the past half century, it has also come to exhibit features associated with its professionalization as a research specialization.

Historical Overview

What we know of the origins of philosophy of education in the West suggests that it began in Greek Antiquity in the pedagogical claims and counterclaims of the adult educators we now know as philosophers, orators, and sophists (all of whom claimed the title “philosopher” in their time) and in debates about the role of slave pedagogues, the invention of group lessons for children, and the virtues and limitations of Spartan education. In the aftermath of the Peloponnesian Wars, the philosopher-moralists of Athens called for systematic investments in education, and they explored related questions about justice, virtue, happiness, human development, civic friendship, political stability, the relationships between education and law, and the tools of statesmanship.

So it was that in the works of Plato and Aristotle, many of the perennial problems of philosophy of education were framed: What is education?

How does it contribute to human well-being or flourishing? To what extent, and by what means, can the aim of educating children for their own good be reconciled with educating them for the common good? How can education contribute to civic unity? Should education be the same for everyone? Should education be a matter of individual parental choice or publicly controlled? Through what forms of learning and instruction are virtues of character and intellect acquired? How does rationality develop, and what role does instruction play in that development? To what extent and by what means can education “emancipate” human beings or enhance their freedom? What is knowledge and how is it acquired? Can understanding and knowledge be *transmitted* through teaching? How are methods of inquiry and methods of instruction related to one another? What is the role of the arts in education? What role do practical arts and the development of talents play in a “liberal” education? How are education and work related to one another?

Other questions of enduring interest got their footing in the early modern period, in the midst of the scientific revolution and the seemingly endless religious persecution and wars of the Reformation. Philosophers, from René Descartes and Thomas Hobbes to John Locke and Jean-Jacques Rousseau, were occupied with understanding the new science, reconciling it with religious faith and moral knowledge, and rethinking the relationships between church, State, and moral formation: What must be learned through experience to be understood? To what extent is learning through inquiry or discovery feasible? To what extent can education rely on “natural” learning, motivated by curiosity? Should societies forgo the imposition of a State religion and trust the spontaneous activity of human reason to impart the moral prerequisites of good citizenship? In the nineteenth and early twentieth centuries, the industrial revolution, growth of mass schooling, new-found respectability of democracy, and consolidation of the modern system of the arts and aesthetics cast new light on enduring questions of philosophy of education and prompted some new ones: Is mass schooling desirable? Is it compatible with cultural excellence? Should all students receive the same

education? What is the relationship between education and labor? How is education related to socioeconomic status and opportunity?

The history of philosophical inquiry concerning education reveals an occupation with the nature, aims, and means of education, with philosophical aspects of teaching and learning, and with matters of educational authority, responsibility, equity, and entitlement. Through most of this history, philosophical inquiry concerning education rarely announced itself *as* philosophy of education, no one made a living as a philosopher of education, and no societies or journals of philosophy of education had yet been founded. All of this began to change in the middle of the twentieth century. Philosophy of education constituted itself as a profession employed primarily in faculties of education and as a scholarly enterprise straddling education and philosophy. Journals and societies were founded, a handful of institutions established Ph.D. programs in philosophy of education, and the prestige of research stimulated a growing stream of publications, much as it did in other academic domains. As its professional advancement has progressed, philosophy of education has come to exhibit traits associated with the rising costs and diminishing returns on research in a field’s established core. One consequence of this is that the nature and limits of philosophy of education are now harder to identify.

Professionalization, Fragmentation, and Strategies of Renewal

Judging from what is presented and published under the aegis of the philosophy of education societies of Australasia, Great Britain, and North America, philosophy of education is exploding in so many directions away from its historic core that one may wonder whether it is simply disintegrating. It seems intent on leaving no far-flung theoretical stone unturned, on what often appears the merest supposition that so important a theory would naturally have *some* educational implications. To write about Derrida or Dualism, Wittgenstein or Whiteness, or Levinas or Inferentialism may be thought so

obviously rich in practical implications that education need not be mentioned at all. Are these exploding fragments of a field meaningfully tethered to enduring central questions about education? If so, is there a body of ongoing inquiry into those central questions that informs the diverse fragments?

Similar concerns have been expressed about other philosophical subfields in recent decades. Philosophers of law have asked whether their own field, once so plainly defined by a cluster of conceptual and normative questions about the nature and boundaries of law, authority, obligation, responsibility, and liberty, has come to a standstill. Philosophers of science, once similarly focused on the nature of science and logic of scientific laws, explanation, evidence, and theory, have also worried about the fragmentation of their field and the extent to which its far-flung parts are not informed by work on the fundamental questions. All three fields, all of them philosophies of domains of norm-governed human endeavor, have exhibited dramatic out-migration from their centers. As fields of inquiry, law and education have looked beyond themselves for periodic intellectual renewal, and philosophy of law and philosophy of education have followed suit. Yet the patterns of out-migration have been very different. Philosophy of law has advanced and critiqued feminist, neo-Marxist, economic, humanistic, and semiotic analyses of core aspects of law while moving beyond the field's defining core to investigate diverse, specific legal rules, procedures, and principles. The explosion away from the core has been characterized by detailed engagement with puzzling and controversial features of legal systems and developments pertaining to them, relying on intimate knowledge of law and framed in terms accessible to legal scholars and practitioners who are not philosophers. Aspirations to shape practice are not misplaced. The movement away from the core of philosophy of science has followed a similar pattern to the extent it has occupied itself substantially with what is distinctive in different sciences – their distinctive ontological puzzles and modes of inquiry, confirmation, and explanation. The occupation with one or another diverse science has

diminished communication between philosophers of science and collective memory of work in the field's core that could usefully inform their work. With these drawbacks of abandoning the core having been recognized and discussed, there has been a significant renaissance of work on the field's central topics in recent years.

Why should these patterns recur across diverse fields of inquiry? There is a dynamic of diminishing marginal returns on investment that explains it (Tainter 1988, 111 ff.). As a field constitutes itself as a self-governing professional enterprise, it will begin by addressing the most basic and important problems in its domain, a domain defined by its object of study. It will address the nature of the objects in the domain, their properties, and their variety and relationships to one another. If the domain is one of human practice, it will not only seek understanding but will identify norms of success and provide guidance on achieving success. Only by starting in this way is a field likely to attract interest and establish the external and internal legitimacy a profession requires. External legitimacy is predicated on a promise of value to the host sociopolitical system, and internal legitimacy is predicated on intrinsic intellectual rewards and socioeconomic return on energy invested in acquiring professional expertise. The pioneers of fields of inquiry establish the starting points of such legitimacy by demonstrating the success of their methods in producing model solutions to fundamental problems. The course of subsequent work within that research paradigm will follow a predictable path. Improvements in the answers to the most basic questions will be increasingly difficult to obtain, as energy invested in mastering increasingly complex debates and methods yields smaller and smaller refinements. Marginal return on investment in further research on the field's defining questions will decline, and this will yield incentives to (1) work on relatively unexplored but increasingly peripheral problems and (2) search outside the field's established parameters for new sources of intellectual "energy" or new research paradigms.

Both strategies for preserving an acceptable return on investment in research are themselves subject to declining marginal returns, but the

former is more reliably conducive to maintaining the legitimacy of a professionalized field of inquiry. As the examples of medicine, law, and other fields demonstrate, progress on peripheral problems can be conducive to both external legitimacy and internal legitimacy in the form of intellectual gratification and feasible career paths. Prospecting for transformative theoretical paradigms is more adventuresome. In philosophy of education, literary studies, and some related fields, it also often trades on a status hierarchy that honors abstraction. But it is a strategy analogous to prospecting for gold or prospecting for petroleum at a point when energy return on energy invested in petroleum exploration and development is in sharp decline.

Looking Ahead

In order to flourish in the years ahead, philosophy of education must recommit itself to its central problems and find the patience and resourcefulness to do philosophically sound and interesting work *on fundamental and controversial aspects of education*. Only in this way can it replenish itself with talent, bolster its legitimacy, and set itself on a trajectory of accumulating success. In developing its periphery, it would do well to observe the norms of counterpart domains of practical philosophy, such as philosophy of law and biomedical ethics – norms that counsel normative clarity and serious engagement with what can be learned of the institutional and human realities in one's domain of inquiry.

Introduction

Philosophy with children (PWC) as well as philosophy for children (P4C) as practices of philosophical thinking of children are essentially connected to the American philosopher Matthew Lipman. Lipman designed the community of inquiry (COI) as a form of philosophizing for

children, created plenty of resources for classroom work, and developed the philosophical foundation of the programme. On a practical level, he founded the Institute for the Advancement of Philosophy for Children at Montclair State University where teachers are educated and where philosophers get acquainted with the P4C programme and the *Thinking* journal as a source of reflection on the practice. P4C eventually spilled over the border of the country: it is present in 50 countries, and Lipman's resources have been translated into more than 20 languages.

Lipman did not coordinate the project on his own; he was helped by his colleagues, especially by Ann M. Sharp. The seminars held in Montclair were attended by philosophers from all around the world who later founded national centers for the P4C. In different countries, the programme was adapted to the social and cultural environment and the local philosophical traditions. For a clearer distinction, Lipman tried to differentiate between his own programme and other principles of philosophical work with children.

Thus, in her approach to P4C that includes children below 5 years of age with the help of picturebooks, Karin Murris, on Lipman's request, started using the term philosophy with children, "which has also been taken up by others as it expresses the democratic and collaborative nature of the practice: philosophy adults do with, not for children." (Haynes and Murris 2011, p. 300). One could use PWC as a general term, referring to every practice, including Lipman's (similar goes for P4C: it can refer to every practice or Lipman's exclusively), or in a narrow sense, for every non-Lipman practice. The former is more commonly used, and it is also used by The International Council of Philosophical Inquiry with Children (ICPIC), which was established in 1985, "to strengthen communications among those in different parts of the world who are engaged in philosophical inquiry with children, in teacher education, in research and for school administrators looking to initiate and develop programs that would encourage children's philosophical thinking" (ICPIC 2015). This is how the term PWC is used in this article.

It should be noted that the P4C programme was developed in the USA, where – as in some other countries – they did not incorporate philosophy in their preuniversity curriculum. Teaching philosophy as a school subject on an upper-secondary education level has a long tradition in European countries. Independently from the P4C programme, there was a debate in Europe on different approaches to the teaching of philosophy and the reasons for it being limited only to upper-secondary level of education; some of these were the French group *Greph* (*groupe de recherches sur l'enseignement philosophique*), the dialogic and pragmatic philosophy didactics by Ekkehard Martens, a German philosopher, and discussions within the AIPPH (*Association Internationale des Professeurs de Philosophie*) on the difference between teaching about philosophy and doing philosophy. Thus, some countries began with independent initiatives to incorporate the teaching of philosophy also into primary education. Simultaneously, there were other principles of philosophical practice (philosophical counseling, the philosophy cafe, the neo-Socratic dialogue ...) emerging independently from the P4C, which, similarly to the latter, are founded on a belief that parallel to the academic philosophy there is the philosophy in everyday life, meaning that besides the theoretical philosophy there also exists philosophy as a way of life. Today, PWC is one of many philosophical practices and as such it is not only influenced by pedagogical and philosophical ideas, but also by other philosophical practices which, reciprocally, it influences as well.

For PWC, a diversity of philosophical practices may be compared to the Wittgenstein concept of family resemblance: there is no common essence, only a string of resemblances, but not a single property connects all the members of a family. However, it seems that philosophers, theorists, and practitioners who work with the PWC are all somehow interconnected. Primarily, they are a part of a common space of the PWC, defined by magazines, conferences, and societies. The other connecting element is grounded in the content: PWC is marked by the connection to Matthew Lipman, who established the link philosophy-child. This connection to Lipman

can be represented by continuation and modification, but it can also have a form of criticism.

Modification: The Structure of the Practice

The 2008 publication of the *Philosophy for Children, Practitioner's Handbook*, presents five traditional steps of the Lipman model, albeit slightly modified: (1) the reading of a philosophical story; (2) asking questions and forming the programme of work; (3) discussion on the questions in the COI; (4) self-evaluation of the practice, philosophical exercises, and activities; and (5) in between each episode, the moderator presents a mind game and a guided discussion on an important concept according to the discussion plan from the handbook. Students may also be involved in a nondialogical philosophical activity (e.g., an interview with parents on an important philosophical question, taking pictures, doing art, etc.) (Gregory 2008, p. 9).

The comparison of standard instructions of the P4C and the PWC instructions (which emerged in the context of the work done in English schools) shows a number of similarities and differences. Sara Stanley suggests the following procedure: (1) presenting the stimulus, (2) thinking time, (3) recorded thinking time, (4) collecting questions, (5) analyzing and deciding upon questions, (6) dialogue, and (7) closure and evaluation (Stanley 2006, p. 31). There are no obvious differences besides the second step (asking questions) being divided into several steps. However, there are two new moments incorporated, the “thinking time” and the “recorded thinking time” – important innovations which introduce the element of silence and the element of writing that the classical P4C approach omitted.

Hymer and Sutcliffe, in their 10-step model, also strive for a more structured research. Their model breaks the dialogue down into three different steps: first words, building, last words. The first step is dedicated to the students' suggestions on how to handle a problem, while the last step helps an individual to have a last say on the topic, to summarize, perhaps ask a new question (Hymer and

Sutcliffe 2012, p. 10). Therefore, last words are used to introduce postdebate commentaries that do not construct the dialogue any more. (The first level of dialogue is similarly parsed by Peter Worley – his philosophical enquiry method [PhiE] consists of five steps: stimulus, first thoughts, task questions, talk time, and enquiry.) Beate Borresen's work follows the same direction, introducing a log sheet into the procedure, which enables the individual to reflect on each step of the COI. Catherine C. McCall, who developed the Community of Philosophical Inquiry (CoPI) while working with Lipman, took another direction. She developed an 18-step approach that focuses on a detailed description of each step of a discussion. Ekkehard Martens developed an integrative model including five methods (phenomenology, hermeneutics, analysis, dialectics, speculation), extracted from the history of philosophy. Oscar Brenifier continues to invent new strategies that force the students to think, thus nurturing their thinking.

Criticism

Oscar Brenifier developed his approach to the philosophical practice with children exclusively of the P4C. He attended the 2003 ICPIP congress in Varna and published a critical article on the “Lipman Method.” His attention was mainly drawn by the demonstration of the P4C he witnessed. The children participating in the demonstration were stringing opinions with no critical thought on the subject. In a discussion they held with Brenifier, they also claimed that philosophy is interesting mainly due to the fact that “there is no ‘true’ and no ‘false’ and that everyone can say what he wants” (Brenifier 2007, p. 226).

The demonstration of the P4C was focused on expressing opinions, not on the analysis and justification of those, keeping the method on a pre-philosophy level. According to Brenifier, this is also evident from the children's statements that the charm of philosophy is in the absence of true answers, which is a point of view defended by those who have not yet encountered philosophy, the goal of which is to show the narrow-mindedness of the common-sense relativism.

Brenifier's critic of Lipman received a number of responses. Pierre Lebuis (Lebuis 2005), a Canadian practitioner of P4C, noted that he agreed with Brenifier's critic of the P4C practice in Varna, but declared that that was not the Lipman practice. The described demonstration of the communal research deviated from P4C. The reason for the deviation, according to Lebuis, is most probably the limited training of the teachers, which should not be attributed to the programme itself, but rather to the problems related to the implementation of the programme.

In this manner, Lebuis exempts Lipman from the critic and indirectly raises awareness of an unusual fact: Brenifier, who criticizes Lipman sharply, is closer to him than many a person within the PWC movement. In his criticism, Brenifier enumerates the activities that the facilitators of the COI should provide: "They must produce questions, formulate hypotheses, interrogate pre-suppositions, give counter-arguments, find the contradictions, analyse ideas, produce concepts, problematize statements, identify the issues, etc.," (Brenifier 2007, p. 237) which corresponds to Lipman's description of the elements of philosophical research in *Thinking and Education*: the articulation of disagreements and the quest for understanding; fostering cognitive skills (e.g., assumption finding, generalization, exemplification) through dialogical practice; learning to employ cognitive tools (e.g., reasons, criteria, concepts, algorithms, rules, principles); and joining together in cooperative reasoning (e.g., building on each other's ideas, offering counter-examples or alternative hypotheses, etc.) (Lipman 1991, p. 242).

Seven years before Brenifier, Susan Gardner opened a debate on the same grounds. In the article "Inquiry is no mere Conversation" she draws attention to the "underrating of the role of facilitator," which leads to the devaluation of an "otherwise brilliant pedagogical method" (Gardner 1996, p. 102), but she takes a step further than Lebuis. Gardner emphasizes the relationship between COI and the truth: the communal research is essentially a research, therefore it seeks truth. This is why in understanding the facilitation of COI, it does not suffice to rely

primarily on the autonomy of the pupils. Gardner does not accept the reason for difficulties to lie only in the strenuous implementation of the programme, but rather focuses on searching for deeper reasons for them. Doing so, she uses Lipman's statement that all research should reach for the truth, at the same time noting that "his writing [is] so rich with insight, particularly with regard to the processes and procedures of inquiry that I fear that his comments with regard to the importance of truth as its regulative ideal are too often overlooked" (Gardner 1996, p. 103).

When analyzing the reasons for a research to slip into conversation, she pinpoints the fact that Lipman in his texts writes about the "natural philosophical propensity" of children, thus giving an impression that a teacher should let the children speak freely, and the dialogue will flow correctly. According to her analysis, Lipman's suggestion of using modeling as a key method in educating teachers "masks the intricacies and in particular the philosophical nuances employed by experts for ensuring a successful community" (Gardner 1996, p. 104).

It should be noted that the title of the article per se, "Inquiry is no mere Conversation," bears proof of her faithfulness to Lipman, who, in *Thinking in Education*, named one of the chapters "The art of conversation," and another one "The structure of dialogue" (Lipman 1991, p. 235). From the content of these two chapters it is clear how Lipman considers various theories, and bases his own view on the discussion of these theories, but does not evaluate them. Thus, he starts his discussion of the dialogue with a view that emphasizes a "disclosure" of a subject in dialogue on one side and the persuasion at the other side, claiming that the dialogue happens somewhere in between, while the COI dialogue is a "dialogue that is disciplined by logic" (Lipman 1991, p. 236). So, in Lipman's writings we find a plurality of ideas that cannot be found in the conclusions he makes. This plurality in written form often anticipates the plurality of understandings and methods of work that later emerged within the PWC.

Brenifier's article received response also from Walter Kohan, who worked in Brazil. He agrees with Brenifier's criticism on many points, but at

the same time exposes the key differences. The specificity of his point of view is best shown through the answer on Brenifier's address of relativism. Kohan points out that Lipman had always outspokenly objected relativism, and therefore, Brenifier's objection to Lipman is unjustified. However, Brenifier and many others within the PWC movement are connected by philosophical underestimation of relativism. Philosophical concepts are controversial, so no one can claim that he is the only one who holds the truth. The concept of truth, as well as other philosophical concepts, can be understood in a number of ways. "This is why what counts most is not for the children to be relativists or absolutists, but for them to be philosophers, essentially the people who openly, creatively and critically deal with different concepts on the grounds of their experience" (Kohan 2005).

Kohan thus does not defend Lipman from Brenifier's accusations, but rather addresses Brenifier and the PWC, claiming that they force feed the children their own perception of truth instead of opening up a space where children could think of the truth on their own. In this manner, Brenifier's criticism led to a dialogue that questioned several of the fundamental concepts of the P4C. Paradoxically, the most radical criticism on Lipman was not expressed by Brenifier as an outside observer, but rather by Kohan, who completed his doctorate with Lipman.

However, the story does not end here. In an issue of the *Journal of Philosophy of Education*, dedicated to philosophy for children, Murris and Haynes include also epistemological and moral relativism into the "recurring themes in the practice of PWC educators." They attach it to the popular belief that "philosophy has no right or wrong answers" (Haynes and Murris 2011, p. 295). They, too, do not comply with the standard instruction in P4C on critical research of every aspect presented in a discussion, as "every participant [is] a potential source of insight and worthy of being listened to responsively. (...) We value the rich openings philosophical teaching creates for everyone involved to play freely with new ideas. The aim of education should not be a mere focusing on the acquisition of knowledge, or a process of socialization into an existing order,

but to speak with one's own voice and to bring something new into the world ..." (Haynes and Murris 2011, p. 296). In order for "other" and "different" to be encountered, mere critical research of every opinion does not suffice, but rather an openness that enables the new to emerge in a discussion. Thus, the fight against relativism becomes more complex. The rigidity of thinking is enriched by new spaces opening up and the open-mindedness toward the otherness. The apparatus of critical thought is not only nonadequate but can act harmfully as well, since it can, when put into central focus in an inappropriate manner, close a space within which the children are searching for their voice.

Conclusion

An overview of different models of practice and a discussion on the objectives of the philosophical practice with children has shown that the demarcation line between the P4C and PWC cannot be drawn between Lipman and different representatives of the PWC, but rather that the differentiation happens within Lipman's work as well as among different representatives of the PWC. The aforementioned discussion has thus led from a mere stating of opinions of the children, past the structured practice in which a facilitator leads and steers the children in quest of truth (simultaneously teaching them about thinking and other skills), to the practice of philosophy based, again, on the thinking of the children. This time, it is not based on expressing opinions, but on "philosophy as an experience of thinking which doesn't admit of any definite order. It aspires to think the unthinkable. (...) It opens the door to difference. In short, it allows an encounter with childhood" (Kohan 2002, p. 11). The first and the last do not represent the two extreme poles within the PWC as they do the extreme poles of every practice aiming to connect philosophy and children.

Lipman's text offers a plurality of principles that cannot be found in his conclusions. This plurality on a textual level anticipates the plurality of interpretations of his work within the PWC.

When Walter Kohan insists on philosophy not being “an ability but an event; not a tool but an experience” (Kohan 2002, p. 10), he is being true to the connection between philosophy and a child, which is at the very heart of Lipman’s work. The development of PWC could be understood as a deviation from Lipman’s ideas, but the pluralization of the programme evident in the new resources, modifications in the structure of work, and the introduction of ideas from different philosophical schools may also be understood as an expression of importance of the Lipman’s programme.

Introduction

Philosophy for Children (P4C) is a designation first associated with Matthew Lipman’s and Ann Margaret Sharp’s particular approach, which now exists within a broader, global educational movement, Philosophy with Children (PwC). Today, many approaches that share similar commitments to the Lipman-Sharp (LS) approach use the P4C label as well. Throughout this entry, LS-P4C will be used to indicate the Lipman-Sharp approach. LS-P4C was the first attempt to develop a comprehensive curriculum designed to engage children and teenagers in philosophical inquiry. Often referred to as the “Lipman approach,” LS-P4C is better understood as the result of an extensive and equal collaboration between Matthew Lipman (1922–2010) and Ann Margaret Sharp (1942–2010), cofounders of the Institute for the Advancement of Philosophy for Children (IAPC) at Montclair State University in Montclair, New Jersey. With affiliate centers in over 40 countries worldwide, the IAPC has served as the home of LS-P4C since its founding in 1974. Globally, versions of P4C and PwC are represented by the numerous constituents of the International Council for Philosophical Inquiry with Children (ICPIC), established in 1985.

The Lipman-Sharp Approach

The genesis of P4C is often marked by the appearance of *Harry Stottlemeier's Discovery* (1982), a philosophical novel written by Matthew Lipman between 1967 and 1969 and first published in 1970. Initial publication of *Harry* came with support from the National Endowment for the Humanities (NEH) for use in a successful pilot in the Montclair, NJ, school district. In the novel, Harry Stottlemeier is a fifth grader who stumbles upon some of the rules of formal logic (Aristotelian) and explores them in different contexts with his friends. Although this is a consistent thread throughout the novel, the characters also grapple with a variety of philosophical concepts and questions drawn from the philosophical canon including: *Invention versus Discovery*; *Thoughts and Reality*; *Children's Rights*; *Can a person have more than one personality?*; *Do animals have culture?*

In its infancy, Lipman envisioned LS-P4C as a series of such novels, although he had a hunch that the program could become more than a curricular one (Lipman 2008). With the founding of the IAPC and with significant contribution from Sharp, LS-P4C further evolved into a pedagogical program aimed at the improvement of thinking with a particular commitment to rigorous and respectful philosophical dialogue. Lipman and Sharp were aided in their endeavors by colleagues from throughout the world at various times and in various ways. It is because of this collaboration that LS-P4C today continues to be unique within the field of PwC and pre-college philosophy in that it represents a comprehensive pedagogical approach with its own empirically verified, systematic curriculum and classroom methodology.

There are four distinguishing features of the LS-P4C approach that mark its unique place in the field:

1. Clear theoretical foundations in philosophy, psychology, and educational theory
2. Clearly defined pedagogical objectives that guide and inform the approach
3. A systematic curriculum involving philosophical novels and teacher manuals

4. An empirically researched and supported model of classroom discussion

Although other programs and approaches across PwC reflect similar features, none reflect all four in a systematic and comprehensive way as LS-P4C does.

Theoretical Foundations

P4C curriculum and methodology are grounded in social-constructivist learning theories. These theories point to social interaction (dialogue) as a mechanism for the internalization of new and more complex ways of thinking and speaking (Mercer and Littleton 2007). An important insight of these theories is that the modeling of these more complex ways of speaking and thinking is not exclusively the role of the teacher. When groups of young people engage in thoughtful and disciplined discussion, any one of them may activate effective ways of thinking and speaking that serve as strategies to be internalized by others. The insights of these theories are reflected in both the practice of classroom dialogue, advocated for in LS-P4C, and in the varied dialogic episodes occurring in the IAPC curriculum novels.

The philosophical foundations of P4C curricular content draw upon Lipman's and Sharp's vast knowledge of the (mostly Western) philosophical canon. The pedagogical components of the approach more specifically draw upon the insights of numerous American philosophers including Justus Buchler (1954) and the pragmatists John Dewey (1916) and Charles Sanders Peirce (1955). Lipman's and Sharp's conception of critical thinking is also strongly influenced by pragmatist epistemology that sees the "truth" replaced by "reflective equilibrium" as something that evolves over time, through an ongoing process of inquiry, communal scrutiny, and verification in action (Gregory 2007). Additionally, the theories of John Dewey (1916) are reflected in P4C's particular philosophy of education as essentially supporting children in awakening to, and grappling with, that which is problematic in whatever subject matter they are engaged (Lipman 2008).

Pedagogical Objectives

Central to the LS-P4C approach is a commitment to helping children strengthen their capacities for inquiry, with the goal of helping them to arrive at their own reasonable, philosophical judgments concerning questions and issues that arise in their own experience. This commitment is established and elucidated in a vast collection of theoretical materials from Lipman, Sharp, and their colleagues in P4C and PwC. Although often generalized as empowering children to “think for themselves,” LS-P4C advocates understand “thinking for oneself” to involve the application and development of critical, creative, and caring thinking.

Critical Thinking. Although largely developed alongside a number of different critical thinking programs and perspectives, LS-P4C is unique in its focus on judgment as the key function of critical thinking. According to LS-P4C, critical thinking involves the application of criteria, sensitivity to context, inferential reasoning, metacognition, and self-correction (Lipman 2003b). Critical thinking for LS-P4C is also concerned with application, where the product of this kind of thinking results in a judgment that can be put into practice or initiate a change. This practical aspect of critical thinking is deeply informed by C. S. Peirce’s (1955) concern with protecting the results of one’s inquiry from turning into meaningless abstractions and unjustified beliefs. Doing so means evaluating the results according to their practical consequences (Gregory 2007). Consistent with Peirce’s concern, the LS-P4C teacher manuals and methodological literature reflect a focus on testing ideas in action.

Creative Thinking. Where critical thinking might be understood as the application of rules and standard criteria of logic and inferential reasoning in a given context, creative thinking, in contrast, involves going outside those rules to generate new possible answers, new criteria, or new ways of framing things. Lipman referred to this as a “freshness,” which he linked with a sense of wonder that is essential to philosophical thinking and inquiry (2003b). Lipman and Sharp characterized creative thinking in part as thinking that is original or precedent setting; imaginative in

envisioning possible worlds; independent in presenting their own thoughts rather than mirroring those of others; experimental in trying on new ways of proceeding; expressive of our experience with our thoughts and perceptions; surprising in what it creates, thereby generating new wonder; and maieutic in its attempt to bring out the best in the world (Lipman 2003b).

Caring Thinking. One of the most unique aspects of LS-P4C’s pedagogical vision and its conception of higher-order thinking is the role of caring thinking. The idea of caring thinking arose from Lipman’s and Sharp’s sensitivity to the role that our passions and emotions play in thinking. To that end, Lipman and Sharp identify caring thinking as thinking, that is, at a minimum: concerned with the problems and challenges that others face; careful to maintain the cognitive excellence of the process and product of one’s thinking; normative in searching for what ought to be rather than simply describing what is; and deliberative in weighing contextual factors prior to making a judgment (Lipman 2003b). Caring thinking is thus thinking that reflects care through a sensitivity to how we are thinking, what is worth thinking about, and what is important to consider as we are thinking. A number of P4C programs around the world, especially ones concerned with developing pro-social behaviors and the reduction of violence, make caring thinking their central focus.

IAPC Curriculum

The LS-P4C/IAPC curriculum is designed to help teachers and students develop a philosophical ear – to recognize philosophical dimensions of their experience and of school subjects – to engage in group dialogue and to practice critical, creative, and caring thinking. The LS-P4C curriculum includes ten novels, each with an accompanying teacher manual (to which several other authors contributed). Eight of these, *Elfie* (2003a), *Kio and Gus* (1982), *Pixie* (1981), *Harry Stottlemeier’s Discovery* (1982), *Nous* (1996a), *Lisa* (1983), *Mark* (1980), and *Suki* (1978), are published directly by the IAPC. Two others, *The Doll Hospital* (1999) and *Geraldo* (2000), were published by the Australian Council for Educational Research (ACER).

IAPC Novels. One of the most unique contributions Lipman made to the field of PwC is the philosophical novel as philosophical text. Together, Lipman and Sharp continued the development and use of the philosophical novel in service of their particular educational aims. Within the LS-P4C, the novel plays a number of important roles, some but not all of which can be filled by good literature in a variety of traditions and disciplines. Lipman and Sharp were not against teachers using materials from outside of the IAPC curriculum, but did see the philosophical novels as best equipped to fully address the pedagogical commitments and theoretical insights of their model. To that end, Lipman and Sharp encouraged others to develop their own philosophical novels. The privilege that the LS-P4C approach grants to the philosophical novel is grounded in its ability to serve as both a stimulus for, and a model of, philosophical sensitivity and multidimensional thinking (DeMarzio 2007).

The LS-P4C novels are meant to serve first and foremost as a stimulus for the questioning and wonderment of the students reading them. Lipman and Sharp were sensitive to exposing young people to philosophical ideas without “hitting them over the head” with them. Where traditional children’s literature may touch upon a variety of philosophically interesting ideas or themes, they all too often reflect a lesson or a “moral to the story” that cannot be ignored by even the most careless reader. The LS-P4C novels attempt to balance *story* with *philosophy* in ways that allow children to uncover the philosophical issues that emerge for them (DeMarzio 2007). Maintaining this balance helps the philosophical ideas and issues embedded in the story to remain connected to the context in which they are explored by the characters. When the philosophical concept emerges in this way, the objectives of problem finding (critical thinking) and contextual attentiveness (caring thinking) are supported. When the children are allowed to draw the ideas from the stimulus, they are also given an opportunity to generate wonder and express their thoughts about the text in ways reflective of creative thinking.

Equally important to serving as a stimulus for philosophical inquiry, the LS-P4C novels serve as models for group discussion and for critical, caring, and creative thinking (DeMarzio 2007). Characters like Harry, Lisa, and Suki discover logical reasoning, engage in self-correction, and consider matters of context. They do so while confronting issues that are ethical, metaphysical, aesthetic, and epistemological in nature. Throughout their shared inquiries, they are considerate of others who have suffered personal losses, have physical disabilities or whose behavior might be considered anti-social. They engage in the kind of behavior conducive to good communal inquiry, including acknowledging, clarifying, and building upon the ideas of others. They also hold each other accountable for their ideas and thoughts in ways that reflect sensitivity and rigor.

In addition to modeling the processes and dispositions of good inquiry, each of the characters in the LS-P4C novels exemplifies a kind of thinking or a type of thinker (DeMarzio 2007). Harry is a critical thinker who approaches things logically. Lisa is a caring thinker who displays a deep sensitivity to context and the experiences of others. Suki is the creative thinker who sees things through the eyes of an artist and helps other to look at things in novel ways. Seldom depicted dealing with a problem on their own, the character’s collaborations represent the various ways that these kinds of thinking can be enlisted in support of each other.

IAPC Manuals. Where the LS-P4C novels model the interplay of different kinds and processes of thinking, the manuals help supplement the skills and conceptual depth that make the interplay possible (Lipman 1996b). Lipman and Sharp populated their curriculum manuals with two distinct tools – Philosophical Discussion Plans and Philosophical Exercises – meant to be activated by the teacher based on her assessment of the group’s skill in philosophizing together. These plans and exercises correspond to each of the “leading philosophical ideas” written into each section of the novel.

Exercises aim to help increase precision in the use of cognitive skills. For example, if during a

discussion the participants are having a hard time establishing criteria, then the teacher might have them work together through an exercise to get more practice in doing so.

Discussion plans help the group to delve deeper into a philosophical concept or issue, often testing the conceptual boundaries that frame them. They can be used to provoke an inquiry themselves or to explore different ways of opening up a concept. For example, if the participants are exploring the concept of human families and the teacher sees that they are struggling to frame the concept as anything beyond blood relationships, the teacher might bring in a discussion plan that looks at love, trust, or familiarity as potential criteria relevant to considerations of family. Discussion plans are typically constructed in ways that pit criteria against each other or that present the criteria as questions of growing complexity. At no point in the manuals do discussion plans or exercises include final answers at which participants should arrive. Instead, they are constructed in ways that maintain the sense of problematicity central to the LS-P4C approach.

Equally important to LS-P4C approach is that the novels and manuals not be moved through systematically, like a typical curriculum workbook. The true spirit of the approach allows for a class to struggle through a chapter in the novel for months, to reflect on, assess, and revise their practice with support from exercises and discussion plans drawn from anywhere in the manual or even constructed by the teacher or the students themselves. The LS-P4C curriculum is meant to stimulate and enhance respectful, collaborative, and rigorous philosophical inquiry into concepts that the group has deemed meaningful and worthwhile. This leads us to what should be understood as the central component of the LS-P4C approach – the community of inquiry.

Community of Inquiry

The LS-P4C model of group dialogue is widely referred to as the community of inquiry (CI/CoI) or community of philosophical inquiry (CoPI), although these terms did not appear in Lipman's

and Sharp's work until 1978. Often attributed to C. S. Peirce, Lipman's and Sharp's notion of the classroom community of inquiry also drew on Dewey's (1916) writing on problem-based inquiry in schools and on Justus Buchler's (1954) writing on classroom dialogue as a form of philosophical inquiry. CI is represented in the LS-P4C/IAPC training materials as a dialogue community, working/thinking together to determine what is most reasonable to believe or do, in response to a contestable question. A reasonable conclusion in CI for Lipman and Sharp is seldom, if ever, understood as a consensus view. Instead, typical products of an effective CI might be: the elimination of indefensible claims; a new or more comprehensive understanding of an issue or concept; a plan for how to act or live; or a more noble vision of society. Framing CI as a goal-oriented task lends itself to ongoing reflection and assessment by the group.

Lipman and Sharp recommended a particular sequence of practice for the LS-P4C approach, not as a rigid method, but as a set of components that teachers were welcome to experiment with, based upon the group's needs and development. The essential parts of the sequence and relevant pedagogical justifications are as follows:

- **Engaging with a Stimulus** – For Lipman and Sharp, this may come in a variety of forms, including, but not limited to, shared experiences, works of art, and important or troubling world events. However, when the group lacks the experience to mine these stimuli for the philosophically problematic, the LS-P4C novels are a helpful resource.
- **Student-Generated Question** – Letting students generate questions in response to their engagement with a stimulus is meant to give them practice in recognizing the philosophical, discovering the problematic, and digging beneath the surface. For Lipman and Sharp, it is also a practical strategy for keeping students engaged. The assumption here is that students will be more intrinsically motivated to inquire into things they identify as meaningful. It is also practice of caring thinking. When the

teacher lets the students control key components of the inquiry process, she is modeling respect and collaboration and setting the stage for an egalitarian participation structure. This egalitarian structure has been identified as an important component in classroom discussion in a number of empirical studies.

- **Inquiry Dialogue** – In the LS-P4C approach, this stage of the sequence is where the majority of the group's time is spent. In a typical LS-P4C classroom, a group might spend 25 min constructing a list of student questions and then spend 10–15 independent inquiry sessions engaging as a CI in response to the questions. Depending on the skill of the group and the results of group and individual assessment, the teacher might also include sessions where the group works on an exercise or discussion plan. It is in the CI that the group practices and hones its skills in critical, creative, and caring thinking.

The LS-P4C facilitator is an invaluable part of the CI. Initially, the facilitator is often a visiting philosopher or the classroom teacher. In the LS-P4C approach, the students should eventually take on the various responsibilities of facilitation as they internalize the facilitator's moves, resulting in a group that facilitates itself. To achieve this ideal, the facilitator serves the important role of modeling and supporting the virtues of good communal inquiry (Gregory 2007). She helps the students to be clear in what they are saying and thinking, and helps them to see how their thoughts and comments relate to the contributions of others. She tracks the inquiry, names argumentation and inquiry moves as they arise, and helps students see important points that emerge. She does this with a sensitivity to letting the students determine the trajectory of the inquiry. Said another way, while the participants determine the direction in which they want the inquiry to go, it is the facilitator's job to help them go there together, critically, creatively, and caringly (Splitter and Sharp 1995).

- **Metacognitive Reflection** – Essential to the LS-P4C approach is the use of post-inquiry

reflection. Because the CI itself is a kind of moral and cognitive engagement, it is ripe for analysis and experimentation. A teacher in the LS-P4C vein will set aside time at the end of each inquiry session to ask the group to assess its work. She might ask them to reflect on the cognitive, moral, political or philosophical criteria that define and shape a good community of inquiry. Typical assessment questions might include: *Are we looking at the issue from different perspectives? Are we making sure that no one is dominating the discussion? Are we challenging each other's thinking? Are we building toward a reasonable conclusion? Are we digging deep into concepts and ideas? Are we getting better at [one of these] than we used to be? How can we improve our practice and/or our thinking next time?* These meta-cognitive practices help clarify and reinforce the norms of good inquiry, and encourage students to treat thinking itself as something to be strategized about and improved upon.

- The final stage in the sequence involves the group translating the inquiry into some mode other than dialogue, like doing an art or action project that in some way implements the new judgments and also continues the inquiry. Testing the results of the inquiry in this way is an important step that maintains the applicability and meaning of philosophical inquiry in our daily lives. It is also an important test within the pragmatist epistemological tradition (Lipman 2001, 2003).

The Future of LS-P4C

The history of LS-P4C is one of experimentation and evolution. The approach has grown from an idea of a dime-store novel for young people to a curriculum and then to what today might best be understood as a pedagogical vision for what education can and should be. The LS-P4C approach continues to grow through the work of the IAPC, whose mission is to advance P4C via educational programming, dissemination, and professional affiliation and through continued empirical and theoretical research. The LS-P4C approach continues to produce empirically verified educational results, and the IAPC is committed to increasing

the effectiveness of the approach through a deeper and more nuanced understanding of the various aspects of the approach outlined here.

Philosophy with Picturebooks

Karin Murriss

University of Cape Town, Cape Town, South Africa

Background

Philosophy with picturebooks as an educational philosophy and practice can be understood only in the context of the Philosophy for Children (P4C) program. Since Matthew Lipman et al. (1977) outlined the educational philosophy of this program, there have been differences of opinion about the kinds of texts best suited to teaching philosophy in education. The program is radically different from other approaches in three distinct ways.

First, there is an *entangled relationship between text and philosophy*. In collaboration with colleagues at the Institute for the Advancement of Philosophy for Children (IAPC), based at Montclair State University (USA), Matthew Lipman (1922–2010) developed this comprehensive curriculum consisting of seven dedicated and (deliberately imageless) novels and accompanying manuals to support and guide teachers in the use of the texts for all phases of preuniversity schooling. Lipman argued that “without a curriculum of some kind...the chances that one will be able to do philosophy at all are greatly reduced” (Lipman 1997, p. 1). The curriculum had been specifically designed for teachers who had not studied academic philosophy. In that sense, the P4C curriculum has become the “archetypal” text for P4C, the yardstick against which all others are measured.

Secondly, Lipman's philosophy *of* and *in* education radically opened up a space for a new branch of philosophy: *philosophy of childhood*. His *logically* and not *empirically* sequenced P4C curriculum bypasses any stage theory of children's cognitive development. In education, the influence of psychological theories of child development as the basis for curriculum construction still remains very strong (File et al. 2012). In contrast, the P4C program sequences practice in a range of thinking skills and exploration of recurring philosophical *concepts* rather than competences (Lipman et al. 1977). The exercises and discussion plans in the different manuals are sequenced *logically*, whereas an empirical sequence would involve a correspondence "to already existing stages of cognitive development derived from descriptions of children's behaviour in non-educational contexts" (Lipman 1988, p. 147). P4C's curriculum conceptualization expresses a philosophy of childhood that is (albeit in a limited sense) nondevelopmentalist which therefore demands a pedagogy that is post-developmental. Developmentalism involves an essentialist view of a child and generalizations about what individual children as a matter of fact are capable of, views that are a result of age-related prejudices. The configuration of "child as philosopher" (Haynes 2008, 2014) has helped to expose such discriminatory and limiting views, spearheaded by Gareth Matthews (1994). Like Lipman, Matthews regarded children's capacities to philosophize as a historically neglected area of interest in education and child development.

Thirdly, the P4C program assumes an *entangled relationship between text and pedagogy*: the "teaching methodology" (Lipman et al. 1977, pp. 59–80) for reading the philosophical novels is philosophical inquiry. Lipman compared academic philosophy to memorizing the inscriptions in a graveyard: memorizing a collection of names and dates. A pedagogy is needed that does justice to philosophizing as an *activity* – philosophy as "a way of life" (Lipman 1991) – and academic philosophy is in need of reconceptualization. For Lipman (and Dewey) we cannot "educate *for* enquiry unless we have education *as* enquiry – unless, that is, the qualitative

character we desire to have in the end is loaded into the means" (Lipman 1991, pp. 15, 245, fn 3). After reading Russian psychologist Lev Vygotsky's work in the late 1940s (Lipman 1996, p. xiii), and especially inspired by George Herbert Mead, Lipman (1993, p. 319) developed his curriculum on "an explicit theory of thinking as internalized speech."

American Pragmatist Charles Sanders Peirce (1839–1914) was the first to fuse together the terms "community" and "inquiry" in the domain of scientific inquiry, but it was Lipman who introduced the method as a pedagogy for the teaching of philosophy in schools (Lipman et al. 1977, Ch7). The basic assumption is that learning philosophy is best achieved by engagement in philosophical practices. Further developed in collaboration with Sharp and other colleagues, Lipman (1991, pp. 15–16) describes the community of enquiry as:

A dialogue that tries to conform to logic, it moves forward indirectly like a boat tacking into the wind, but in the process its progress comes to resemble that of thinking itself. Consequently, when this process is internalized or introjected by the participants, they come to think in *moves* that resemble its *procedures*. They come to think as the process thinks.

Laurance Splitter and Ann Margaret Sharp, who have written extensively on the subject, prefer not to give a definition of a community of inquiry, because it is one of those key concepts, they say, "...which takes on new aspects and dimensions as teachers and students apply it and modify it to their purposes. A community of enquiry is at once imminent and transcendent: it provides a framework which pervades the everyday life of its participants and it serves as an ideal to strive for" (Splitter and Sharp 1995, pp. 17–18). They explain that the internalization of the variety of voices in a community of inquiry will lead to a richer, more varied "inner" dialogue and, as a result, a better, more reasonable thinking through "self-correction." They continue that it is because we define ourselves *as persons* through the dialogues and conversations we engage in, that the ethical, social, and ontological aspects of the community of inquiry are central to the very notion of

reason itself (Splitter and Sharp 1995, pp. 32–33). David Kennedy (2006, pp. 159) suggests that in inner dialogue we also address the “child within” – the child the adult once was and still is.

The key educational idea is that the fictional novels *model* children and adults engaging in communities of philosophical inquiry. Lipman explains (1997, p. 1) that student teachers and qualified teachers need “models of *doing philosophy* that are clear, practical and specific. They need to be able to distinguish essentially decidable concepts from essentially contestable concepts, if they are to understand why only the latter are truly philosophical.” The novels function as *models*. They are not a narrative version of the history of philosophy (as, e.g., attempted in Jostein Gaarder’s *Sophie’s World*, 1994), but central philosophical ideas, themes, and questions have been “injected into” the text without the use of technical jargon. The history of Western philosophy is presented as a mode of thinking, with the novels representing the kind of thinking that is typical of the history of philosophy.

The philosophical thinking in the novels is enacted by fictional, thoughtful children who reflect explicitly on their thought processes in the way adult philosophers would do, but that children “normally” do not. Engagement of real children with the “abnormal” conversations in the novels (Kennedy 2011, p. 61) helps them “develop their own philosophy, their own way of thinking about the world” through the community of inquiry pedagogy (Lipman 2008, p. 166). In that sense, the P4C curriculum positions the ideal-philosopher-child (Murriss 2015).

Philosophy with Picturebooks

Lipman’s pioneering work reaches beyond the mere introduction of just another subject in the curriculum, that of philosophy. It profoundly questions how schools regard knowledge and how subjects are taught. For Lipman the statements of which human knowledge is said to be composed are, in fact, answers to questions by now long forgotten (Lipman and Sharp 1984, p. 158). What we now call factual knowledge is

the generally accepted outcome of previous inquiries. The P4C curriculum focuses on questions, not answers, on thinking, not knowledge.

The program has inspired others to create a variety of alternative resources and approaches to support teachers in their philosophical work, either for practical reasons (e.g., shorter, cheaper) or philosophical and pedagogical reasons (for the program’s lack of internal consistency, see Murriss 1997; for its Anglo-American philosophy bias, see Martens 1999, 2008).

The current positivist educational climate has provoked P4C advocates to justify the addition of P4C to the existing curriculum by pointing out its usefulness in terms of raising standards, teaching thinking skills, creativity, citizenship, inclusion, and emotional literacy. These are justifications that are often motivated by accountability or the need to secure funding. Understandably, such an instrumental approach has been criticized (Vansiegelheim 2005; Long 2005). P4C can be the home of a complex mixture of educational ideas and philosophical traditions as practitioners situate the approach rhizomatically in their own cultural, ethnic, religious, and socioeconomic contexts and infuse the practice with their own identity and beliefs.

P4C challenges many perceived wisdoms about classroom size, epistemological expertise, the limits of scientific knowledge, and who should ask the questions in class (see, e.g., Benjamin and Ecchevarria 1992). It questions what it means to be a child and what it means to be treated *as* a citizen. Some authors emphasize the radical democratic nature of the practice. The concept of “democracy” is understood to include moral principles such as freedom and equality and implies that schools make space for children to actively participate as citizens in contexts that are meaningful to them. Depending on one’s practice, P4C can nibble away at the very undemocratic foundations of modern education itself (Kennedy 2006; Kohan 2002; Haynes 2008).

Although Lipman himself was very much inspired by the philosophies of both Plato and American pragmatism (especially John Dewey) and later on also used Vygotskian socio-constructivism to theorize the pedagogy, others

have used a wide range of other philosophies and educational theories to justify P4C, including Kantian philosophy (McCall 2009), semiotics, critical pedagogy (Kohan and Wozniak 2009), postmodernism (Kennedy 2006), and critical posthumanism (Murris 2016).

Disrupting the paradigm of adult philosophy with its emphasis on language, logic, and rationality, David Kennedy, Walter Kohan, and others have influenced the choice of text, the text-pedagogy relationship, and how texts are read in P4C (Haynes and Murris 2012). These dimensions explain the reasons and motivations for the subsequent diversification of practices – differences in the field are related to implicit or explicit views of a child, what philosophy is, and ideas about how philosophy can learn from a child. Since the early 1990s the introduction of these alternatives to the P4C curriculum has generated new debates about the necessary requirement for teachers of P4C (and the trainers of these teachers) to have a background in academic philosophy. The phrase “philosophy with children” was born to distinguish between the “official” Philosophy *for* Children program and other approaches such as “philosophy with picturebooks” (Murris 1992). The phrase philosophy “with” children articulated an important difference and became more widely used much later by what Vansieleghem and Kennedy (2011) refer to as the “second-generation” P4C proponents. They broke with a strategic uniformity to the educational approach and “welcomed difference as a principle of growth” (Vansieleghem and Kennedy 2011, p. 172). The emphasis for many of them, but certainly not all, is no longer on a curriculum that models the normative ideal of analytic reason, but on dialogue that generates communal reflection, philosophical conversations, and democratic practices that include child and young people’s voice – regarded as a potentially transformative power in deciding what counts as philosophy. The diversity of P4C theory and practice is entangled with questions about philosophy, what it is, and which texts one should choose for teaching it.

The picturebook has been a recurrent feature in the diversification. Why is this? What is peculiar

about the picturebook that makes it such a suitable philosophical text?

The P4C curriculum contains the promise of a complete, whole, continuous curriculum that expresses a developmental view of a human being – in terms of development in understanding philosophical concepts. The latter are introduced in an age-related sequential manner, each time with “a little more depth, breadth and sophistication” (Lipman et al. 1977, p. 59). The philosophical child for Lipman (1993), Matthews (1992, 1993, 2006, 2009), and others (Wartenberg 2009; Mohr-Lone 2012) is the child whose verbal utterances resemble the ideas of established academic philosophers, and the picturebooks are selected on the basis of the classical philosophical themes and topics they “contain,” such as freedom versus determinism, lying versus truth telling, or justified anger (Costello 2012).

Other approaches to the use of picturebooks for P4C focus on critical and creative thinking approaches to literacy education (Roche 2015). Avoiding the term “philosophy” can be helpful in not alienating teachers, but the risk attached is that P4C is conceptualized as a mere thinking skills approach without the history of philosophical inquiry to draw on as resource. For Lipman, thinking skills should always be taught in the context of a humanistic discipline, such as philosophy – a discipline that is “representative of the heritage of human thought” (Lipman 1988, p. 40; 1991, pp. 29–30). The task of philosophy is to encourage children to think for themselves *in*, *about*, and *among* the disciplines, which involves an induction into the higher-order thinking and critical reflection upon the methodology of each discipline: its assumptions, criteria, procedures, and modes of reasoning (Lipman 1991, pp. 263–264). A crucial question is how this is done and how the implied reader is positioned in the texts that are chosen for the philosophical work.

Philosophy with picturebooks was introduced by Murris (1992) and further developed in collaboration with Joanna Haynes after they met in 1994 (Murris and Haynes 2002; Haynes and Murris 2012). Philosophy with picturebooks has proven to be popular in practice, not only in early years’ settings or primary/elementary education.

Picturebooks are short, self-contained stories, not too expensive, and sometimes already available in schools, at least those with the financial resources to provide books. In such schools, teachers are familiar with the medium, and the children are used to, and often appreciate, visual texts.

Good quality picturebooks are more than just books with illustrations (hence the spelling of “picturebooks,” instead of “picture books”). Oft-quoted, classic points of reference in children’s literature research argue that picturebooks involve *two* very different interdependent sign systems (the *images* and the *words*) (Nikolajeva and Scott 2006; Sipe 1998). The reader, so the argument goes, is pulled in different directions of meaning-making by the use of these two different sign systems; the linear direction of the text invites readers to continue reading; the pictures compel them to ponder. Importantly, the “gaps” between text and image may be experienced differently as people grow older, which challenges teachers to listen and respond differently from children (Haynes and Murris 2012). In their influential article, Maria Nikolajeva and Carole Scott (2000, p. 238) argue that a picturebook “speaks to both adults and children” and that “the two audiences may approach textual and visual gaps differently and fill them in different ways.” Children’s literature scholar David Lewis (2001, p. 74) describes metaphorically how in contemporary picturebooks “[w]ords are never ‘just words’... [they] are always partial, incomplete, unfinished, waiting the flesh of the pictures. Similarly, the pictures are perpetually pregnant with potential narrative meaning, indeterminate, unfinished, awaiting the closure provided by the words. But the words and the pictures come from outside the picturebook.” The interaction between image and text is neither stable nor predictable. “Boundaries have dissolved,” writes Lewis, “inviting a promiscuous mixing of forms” (Lewis 2001, p.90). Picturebook narratives often feature unusual characters (e.g., humans covered in body hair, aliens), extreme concepts (e.g., immortality, the size of the universe), and obscure thought experiments.

These narratives provoke philosophical conversations – “‘a language of languages,’ a

focus on ‘something greater than the judgments,’ that is, the criteria for those judgments” (Lipman 2008, p. 59). These criteria, in turn, interlock with other criteria that are interlocked with other criteria and so on, and, although no answers yet emerge, the process is “intriguing, exciting, illuminating” (Lipman 2008, p. 59). They generate inquiries that focus on meaning, rather than learning, on understanding, rather than truth – provoking *conceptual questioning*. Reading picturebooks philosophically does not involve a process of finding out what pictures denote or literally represent, but requires sensitivity in bringing together what is said and what is unsaid. These judgments are often complex and unpredictable and involve emotional, imaginative, and reasoned responses – not necessarily with a focus on the philosophical concepts that adults find interesting (Murris 1997).

Lipman’s P4C novels position the “abnormal” child, the thinking child – the adult philosopher’s child modeled in communities of inquiry with peers. In contrast, philosophy with picturebooks often involves children in inquiries about fantastical scenarios in the void between reality and fantasy, rather than about the world as it “is” (for the adult philosopher). The perspective of what it means to be child-philosopher-like is firmly embedded in adult assumptions and desires about how a child should be. In contrast, philosophy with picturebooks does not locate the philosophical “in” texts themselves but in the space *in between* text, child reader, and adult reader (teacher). Gert Biesta (2011, p. 317) writes about “exposure” as the quality of human interaction, which “makes the event of the incoming of uniqueness possible.” It is this kind of philosophy that cannot be mapped out or modeled by the philosophical novels. It could not be; it escapes representation. This position assumes that we have to be more modest in our claims about what narratives can do when doing philosophy in class. A pedagogy of exposure involves consciously giving up regarding education as the formation of childhood as well as regarding children as adult opportunities to carry out adults’ ideals and to use education as an instrument for such ends (Kohan 2011, p. 430).

Although the sociocultural orientation of the way in which the P4C community of inquiry is often theorized was revolutionary at the time, its constructivist ontology seems ironically rather *individualistic* some 45 years after its introduction. What is assumed is that students and teachers learn P4C through a process of “internalization” and therefore presupposes a humanist subjectivity based on binaries such as inner/outer, nature/culture, and matter/discourse and an anthropocentric perspective of what it is to be human/child (and therefore what is involved in teaching philosophy). In philosophy with picturebooks there is a dynamic entanglement between philosophy, the democratic practice of the community of inquiry pedagogy, the notion of the competent child as (implied) philosophical reader, teachers as philosophical readers, and the epistemological ambiguity and aesthetic qualities of the picturebooks. The ontology and epistemology this practice assumes are *relational*.

Moving toward a critical posthumanist orientation, P4C scholars have recently started to pay more attention (this includes the analysis of philosophical enquiries) to the picturebook’s *materiality*: the effects of graphic design, choice of art style, visual grammar, use of colors, and medium (paper, virtual, etc.) (Murris 2016). In fact, there are infinite material-discursive elements that could and should be considered when reading texts philosophically. How these “languages” interact, connect, and influence each other also depends on what readers “bring to” the narrative themselves and the affordances of the material environment. From this perspective the preparation and education of teachers for philosophical practice should be less focused on induction in set curricula and more on the acquisition of a wide range of philosophical content knowledge from various traditions *in combination with* the learning of philosophical pedagogical skills and attitudes. The philosophy teacher does not scaffold existing truths, but problematizes the relationship that both students and teachers have to truths in which they are already installed (Kohan 2011, p.346). The choice of text can hinder or support this experiential process of bringing something new into the world.

Introduction

David Harvey (1989 as cited Tuck and McKenzie 2015, p. 1) notes: “How we represent space and time in theory matters, because it affects how we and others interpret and then act with respect to the world”. Edward Casey in his book *The Fate of Place* in 1997 also ruminated that discussions on place have been important, if not always a central theme, for much of the history of Western philosophy. Many contemporary thinkers, inspired most prominently, perhaps, by Martin Heidegger, have made “place” a central concern of theory (particularly ontological meanings) and illustrated that it mattered. Jeff Malpas (2006), for example, argued that throughout his life Heidegger was concerned with understanding “the ‘placed’ character of being,” with “the place of being – as a topology of being” (p. 305). Cresswell (2015) in later writings postulates Heidegger saw place as a

spiritual and philosophical endeavor with the authentic human existence being one rooted in place. Scholars in a range of disciplines have adopted place as a central conceptual and philosophical theme, but in particular geography, humanities and social sciences have been central to understanding how place comes to be activated through and within the relations of humans with others. Areas that have been theorized in literature include place in relation to the body, the local, the regional, and the global. Place as a theme has incorporated a range of foci such as location, architecture, place attachment, place identity, sense of place and in the arts the production, practice, and performance of place. In more contemporary times, theoretical frames have sought to unsettle the romantic sometimes more static physical notions of place with critical, feminist, poststructuralist, and new materialist theorists taking up conceptual ideas around gendered spaces, contested spaces, embodied spaces, the politics of space, cultural topographies, cyberspace, nomadism, spaces of desire, monumental spaces, forgotten spaces, and the materiality and relations of objects and entities (human and nonhuman).

Place and the Geographers

Place as a key theoretical concept emerged principally from the discipline of geography. The early physical geographers understood place primarily as a static spatially bound concept where localized social and material practices were enacted (Tuck and McKenzie 2015). A revival in the later 1970s saw key scholars reinsert “place” outside of its spatial framing to be focused on the social relations that become inscribed within these locales, as they exist necessarily *in* place and *across* places (Cresswell 2015; Massey 1994). Cresswell (2015) argues for “spaces” or locations to become “places” people must imbue meaning to them. Cresswell (2015) (drawing on the work of political geographer John Agnew) recognized a meaningful location as having three aspects: location, locale, and sense of place. Location is the physical setting that can be static (a town) or moving (a ship); locale is the material setting

where social relations are enacted and meanings are produced; and sense of place is the subjective, emotional attachment personal or shared that are evoked by a place. Cresswell (2015) notes the theoretical contribution of Yi-Fu Tuan here who used the term “topophilia” to define the affective bond between people and place and argued people come to know the world through places. “Places” in this insistence are theorized as shared temporal spaces. The work of Edward Relph is also significant here with his philosophical commitment to phenomenology and his introduction of the concept of “placelessness” which came to be a useful term for later theorizations of the human experience of place and mobility in a globalized world (Cresswell 2015). Massey (1994) in her substantial body of work on place also around this time identified that place was not only a set of social relations and networks, but she believed there was a need to pay attention to the complex politics and power of these relations and how they were constantly being played out through shared lives. For Massey, place was open and hybrid and the product of interconnecting flows (Cresswell 2015). A place therefore by its very nature was full of power and symbolism, a complex web of relations of domination and subordination, of solidarity and co-operation. How these relations were negotiated revealed the power and politics of “place” boundaries and the temporal constraints of time. While for Massey (1994), time is often conveyed as having a “coherence and logic to its telling, while space does not” (p. 267). Places have spaces between them, while time provides space its characteristics of fluidity and place its opportunity to pause.

Theorizing Identity and Community Through Place

Physical locales, through the experience of being in space and time, have been theorized as lived spaces, as the site for the cultural production of identity, and offered as the location for place dwellers to connect to the real, material geographies of place and with the imagined, symbolic geographies of space. Theories on community and cultural identity extended these ideas by

discussing how identity (in community) could be produced through and between places and that these places could then become the terrain for elaborating strategies of selfhood. This construction of a community or communal way of being in “place” is a central theme of place theory and place pedagogy. David Gruenewald (see for example Gruenewald and Smith 2008) often discussed in his early work the importance of “real world,” “community based” pedagogies as central to place-based theories, although this work was often limited by the idea of a static “community” existing in a specific “place.” These “orderly” “static” views of community places have not gone uncontested and like many key conceptual ideas in place theory have been disrupted in more contemporary theorizing within the disciplines of geography and other social sciences, spilling over into the education theory literature (Tuck and McKenzie 2015). The focus on the local community specifically came under scrutiny within discourses of globalization, as the relevance of “place” in a global, open, unbounded world with the relative collapsing of space-time due to increased mobility was questioned. Massey (1994) argued that even though humans are living through a time of spatial upheaval, an era of powerful globalization place provides ironically a backcloth for theorizing experiences of colonialization and decolonization, dislocation, otherness, and disorientation. The unsettling of place as “ordered” and “located” allowed for the analyzing of those changes at both at the level of geographical and social relations. For example, deeper analysis of place allowed for the revealing through feminist theorizing the implications of sexism, exposing power relations in colonialization by contrasting indigenous and settlers histories past and present, and for noticing economical relations of capital and corporate accumulation.

Spatial, Phenomenology, Poststructuralism, and Assemblage Theory

Through this unique relationship with time-space compression, place is often theorized as having

both elements of order and chaos. Order, because all spatial locations of phenomena are caused; and therefore they can in principle be explained in “time.” Order also because there are indeed spatial systems, sets of phenomena in which spatial arrangements are also part of the constitution of a system. Yet chaos is also an element inherent to our understandings of the spatial, because although the location of each set of phenomena may be directly caused, the spatial positioning of one in relation to the other may not. That is, place encounters become unintended consequences – paradoxical mixtures that often end up manifesting as unexpected relations between sets of phenomena. Building on assemblage theory, these relations can be mapped as having two roles for place, a material existence and an expressive existence, and two forces supporting place coherence, territorializing forces, and deterritorializing forces (Cresswell 2015). Cresswell (2015) on the changing set of theoretical relationships noted with a phenomenological emphasis on gathering, and the post-structuralist notion of assemblage, places become syncretic wholes made up of parts. Cresswell writing on the history of the idea of place noted traditionally there emerged three main ways place was approached: a descriptive (surface) approach, a social constructionist approach, and a phenomenological approach. In order to represent the complexity, he identified that geographers (such as Doreen Massey) were writing accounts outside of these approaches by incorporating syncretic and descriptive accounts that were informed by phenomenology, post-structuralism, and assemblage theory. This represented what Massey came to call the “throwntogetherness” of place.

Decolonizing Conceptions of Place

Tuck and McKenzie (2015) write, “decolonizing conceptualizations of place confront, undermine, disavow, and unsettle understandings of place” (p. 49). They note that indigenous philosophies and theories (though they do critique the notion of theorizing as too narrow to represent the ways

indigenous people speak of their interactions or relationship to “place”) “represent significant epistemological and ontological departures from those [philosophies of place] that have merged in Western Frames” (p. 51). They explain how “place” and “space” are imbued with a colonizing settler history and that an “ontology of the land” encompasses a material, spiritual, emotional, and intellectual understanding that is more akin to an ontological conceptualization of place that does not prioritize the human or the place but a collective and shared relation to the “land.” The perspectives of Indigenous have been central to recent shifts in re-theorizing space, place, and time outside of Western frameworks. Theoretical work on place in decolonizing spaces brings to the surface issues of replacement and emplacement and the invisibility of Indigenous people’s perspectives in settler epistemologies that repeatedly foreclose discussions on the urgency of decolonization (Tuck and McKenzie 2015).

Place and the New Materialist Turn

The recent new materialist turn has provided also a useful segue here for theorizing even further the entangled and complex materiality of bodies and entities as it sets about supporting the means for re-configuring the dynamism of space, time, and matter through the conceptions of all things “intra-acting with” and “being in” the world (Barad 2007). Barad (2007) for example introduces the apparatuses for studying diffraction as the means for pointing out the specificity of particular entanglements and the entangled effects that “differences” make. Thinking about the nature of differences and space, time, mattering is to consider that prior to their intraaction entanglements do not exist. As humans, writes Barad (2007), we are not outside observers of this entangled world nor are we located in a particular place, but we are part of the world, “part of the world-body space in its dynamic structuration” (p. 185). *Onto-epistem-ology* is the term she proposes for describing the study of knowing in being, coming to terms with how “specific intra-

actions matter” (p. 185) and our humanness of being in and with place in the world.

Place in Education Theory

Until more recent times, it has been argued education theory has for the most part ignored the importance of “place” as a relational concept. In her essay in the 2005 edition of the philosophy of education, Ruitenberg (2005) goes to great lengths drawing on the work of David Orr and others that beyond place as a static physical concept, the place where learning occurs, and place has had no particular impact in contemporary education. She notes in her introduction that education philosopher Michael Peters has also in the past been quoted as saying “modern educational theory has all but ignored questions of space, of geography, of architecture” (2005, p. 212). Emanating from this limited view of place, theorizing place-based pedagogies, has focused primarily on teaching strategies around engaging learners to get to “know a place” to build place-based attachments. Place-based education, according to Stone (2009), was fundamental to schooling that supported environmental education and sustainability. He argued that when places were known deeply and were well loved, they had the best chance of being conserved and cared for in the future. “When people acquire a deep knowledge of a particular place, they begin to care about what happens to the landscape, creatures, and people in it” (Stone 2009, p. 13).

Gruenewald and Smith (2008) have also argued that place-based education rooted in community settings should be reclaimed as central places of public education and that this could alter the role of schools and places of learning with and through connection to places. A significant element of a place-based pedagogy for education therefore has been the opportunity for children to be active learners in the real world and to take their learning outside of the classroom. Ruitenberg (2005) wary of this often narrow emphasis on place pedagogies and outdoor or environmental education has argued this limits

the focus of place-based education on the natural environment, with this “connection to place” is presented mostly with “a hint of nostalgia and romanticism” (p. 212). She contends place means more than the natural environment, places are political spaces often with contested histories and . . . “each (inhabited) place has a spatial configuration through which power and other socio-politico-cultural mechanisms are at play” (p. 215).

Radical or Critical Place Pedagogies

Theorists of place-based education resisting a romantic nostalgia of place, as evident in education discourses around children needing to “re-connect to place” or develop a “sense of place,” have embraced critical theory as enacted through a more radical critical pedagogy of place. New forms of radical place-based pedagogies by critical place-based theorists in education, similarly to cultural and radical geographers in earlier times, have drawn attention to structures of oppression based on race, class, and gender. By interrogating classroom pedagogies and curriculum content, they have questioned how and why certain ways of conceptualizing place are being valued and prioritized in classrooms. A radical or critical pedagogy such as that taken up in contemporary times by education theorists such as Ruitenberg focus on supporting students to consider conflicting interpretations of places, and the multiplicity of meanings they have for others. It supports students to notice the complexity of place relations who is welcome, who is able to live, work, and play in which spaces, and why, and who benefits and who loses from the different modes of emplacement. Armed with a radical pedagogy of place “students are taught to see the multiplicity of and conflicts between interpretations of a place, the traces of meanings carried by the place in the past, the openness to future interpretation and meaning-construction”. Therefore, “(a) radical pedagogy of place does not pretend to offer answers to or ‘correct’ interpretations of hotly contested places”(Ruitenberg 2005, p. 218). Payne and Wattchow’s (2009, p. 18)

slow ecopedagogy of place that comes from the experiential education and experiential learning tradition that has been well represented in “place-based education” provides an example of a “phenomenological deconstruction at the personal, social, cultural, and ecological layers of experience.” They position this work as a response to the intercorporeal and ecocentric turns of contemporary theorizing that sought to address a new ontological ethics of human-nature encounters. This shift to a more radical theorizing of place contested “traditional/dominant epistemic and anthropocentric metaphors of learning, teaching, thinking, and knowing” (Payne and Wattchow 2009, p. 30) and illustrated a turning point where educational theorists begun to move outside and disrupt “under-theorized” definitions of “place” (Tuck and McKenzie 2015). Much of this disruption came from a realization that binaries are not useful in conceiving place. Nespor (2008, p. 481) articulated this well when he wrote: “A division of the world into parallel binaries such as place and nonplace, inhabitant and resident, commons and markets, or local and global, turns complex, changing relations into discrete states, chops gradients into well-bounded regions, and obscures the critical questions of how places are constituted and connected to one another.”

Posthumanist and New Materialist Theorizing

Recent contemporary theorizing of place-based education drawing on key concepts of place, human and nonhuman relations using posthumanist and new materialist theorizing is seeking to disrupt the Cartesian divide between human and other entities. This work challenged the simplistic dichotomies/binaries of animal/human, nature/culture, subject/object, place/nonplace that constructed how place came to be viewed within the impending consequences of the Anthropocene (Malone 2015). Malone (2015) for example in her recent theorizing argues that by considering multispecies relations as

multifarious and diffractive place encounters it supports educational opportunities that question the impact of anthropocentrism and human exceptionalism in the classroom, especially through the disruption of traditional research methodologies and pedagogies in outdoor learning, environmental and sustainability education. Malone (2015) states these new theories provide “the spaces for interrogating further child/body/species/place relations as assemblages, associations and relationships that could be useful when considering the complexity of core concepts in sustainability education like interdependency and multiple ecologies” (p. 54).

Conclusion: Complexity of Place Theorizing

Theorizing about or through concepts of “place” as identified through these varied theoretical turns are by definition ambiguous and contradictory. Seemingly an ordered and simple concept, place is also simultaneously complex and contested. In no context is the nature and purpose of this complexity of negotiations of place more evident than when gazing into classrooms and noticing the subtleties of contrasting definitions being espoused. Education will continue to evolve as an important contested location where epistemological and ontological questions of place/space/time/matter relations exist in the complexity of heterogeneous “space.” Place theorizing has and will continue to be an essential philosophical, conceptual, and methodological activity for furthering deeper understandings of education.

Placing Semiotics Within the Academy

John N. Deely

Saint Vincent College and Seminary, Latrobe, PA, USA

Synonyms

Epistemology; Humanities; Science; Sebeok; Semiosis; Specialization

Introduction

Today's academy culminates in universities, the central institution of education feeding the intellectual culture of humankind. In historical context, philosophy (science in the "cenoscopic" sense of critical control of objectivity unaided by instruments), along with literature, preceded university life but came to form an integral part of university curriculum. But modern science (in the "ideoscopic" sense, knowledge that could never be attained without instruments) began its distinctive development in the dawning years of the seventeenth century, and its acceptance within the university was anything but smooth. Intellectual advance depends on logic, but old habits have to be overcome, and such displacement is seldom easy within culture. It took more than two centuries for modern science to gain its standing – a standing so firm that students now think of the university in terms of science above all, as evidenced in the acronym STEM (science, technology, engineering, mathematics) for early twenty-first-century attempts at a "core curriculum". Where is semiotics in such a scheme?

Demise of "Common Sense" as an Unresolved Problem

In the context of intellectual culture, no revolution had greater importance than the one that took place in the early seventeenth century,

dramatically marked by the 1633 trial and condemnation of Galileo for teaching the twin heresies that the Earth is not the universe's center and that the sun does not revolve around the Earth. It was a bad day – but not only for religious authorities, students of scripture, and theologians. Among the hardest hit victims of this fiasco was "common sense", which still has not managed to regain a serious semblance of credibility in learned circles. The eighteenth-century attempt by Thomas Reid to identify common sense as the test of the truth of knowledge and the morality of actions fell by the wayside, and the Enlightenment view that scientific knowledge based on systematic observation, experiment, and mathematization could ultimately replace all of prescientific opinions, became the accepted view.

Yet, there remains at the heart of human knowledge an unresolved problem that the rise of modern science serves to underscore rather than resolve: the inescapable conundrum that unless human awareness as preceding all scientific training and refinement has some validity in its own right, then nothing even of science can truly be knowledge. For to begin study of science presupposes the common awareness of human animals out of which the development even of modern science as species-specifically human becomes possible in the first place. Stjernfelt (2007) puts the matter in *semiotic terms*: in order for it to be true that the Way of Signs leads everywhere in nature, it must also be true that "science is continuous with everyday knowledge which is, in turn, continuous with animal cognition and so on indefinitely down the scale of evolution" (p. 8).

Among the early modern philosophers, notably Berkeley and Hume, this problem never came to be recognized as such. Instead, they assumed that mental representation was the beginning of all awareness, an assumption that led to the famous "problem of the external world"; for even though empiricists followed by preference Locke rather than Descartes, they failed to observe or comment upon the fatal assumption (that Locke shared with Descartes) that the direct objects of our apprehension are mental representations formed by our own minds. The "problem of the external world" arose in modernity from just this assumption: that

the mind itself makes whatever is a direct and immediate object of awareness. Locke and Descartes identified this immediate object with ideas. Kant rejected this as too subjective, as “subjectivism”; and in proposing his alternate solution of the senses as giving rise to phenomena distinct from the things provoking sensation, he thought to preserve the universality of scientific knowledge: it is to the phenomena that reason then by its a-priori forms contributes objective necessary structure. Yet Kantian “objectivism” proved no less idealistic than the criticized subjectivism of Descartes and Locke, inasmuch as Kant’s own view was no less divorced from an awareness “scientific” in the sense of giving us an actual knowledge of the “way things are” in their subjective constitution and intersubjective relations obtaining independently of whether we are aware of them or not (Deely 2001).

By way of epistemological warning of “road-block ahead”, it followed that ontology and epistemology in modern parlance mean, in fact, the unknowable because unattainable (what was termed in Latin times *ens reale*) versus the knowable (termed in Latin times *ens rationis*). On this point, between Descartes and Kant there is only this difference: for Descartes *ens rationis* was conceived subjectively, whereas for Kant it was definitively objective, yet wholly determined in its knowability by human subjectivity.

Cryptosemiotics, an Historical Interlude

Semiotics was forced underground in the modern interval, called after Sebeok (1976, 1979) the “cryptosemiotic interlude”, for the very “epistemology” upon which the leading modern philosophers all agreed as the starting point of human knowledge already presupposed that the Way of Signs did not exist in its own right. The Way of Signs is a path that categorically rejects the view that only mental representations of whatever sort are the immediate final terminus of knowledge. It is a path that “leads everywhere in nature, including those domains where humans have never set foot” (Emmeche 1994, p. 126). That idea proves impossible within modern theories of

knowledge united in the common assumption that subjective representation is somehow the heart and essence of human knowing.

The problem with epistemology is not the existence of things in themselves. The problem rather is the theory which makes things “unknowable”. That is a thesis the science of modernity never fully bought into, unlike the philosophers. The doctors studying cancer want to know precisely what this deformation of cells is as it occurs, whether we understand it or not, precisely because only by our coming to know that can we then come to do something about it, namely, cure the cancer.

Semiotic Consciousness, Its Nature and Levels of Development

Semiotics began with the general proposal by Augustine that the difference between nature and culture is irrelevant to the action of signs, for whenever one thing comes to make something other than itself present in our awareness, *signs are at work*. Whether the one thing or the other has its origin inside or outside of our minds and bodies, from nature or from culture, is irrelevant to the action of signs. Material objects which are also themselves signs existing outside of us presuppose cognitive qualities inside of us which are themselves already signs as manifesting something other than themselves, something they themselves are not. The wife is not the idea of wife; yet when the idea of wife fails, the woman sensed cannot be recognized as wife. So there are objects external to our bodies which can be signs only when perceived in conjunction with concepts internal to us and which relate us to those very material objects recognized as this or that – wife, mother, lover, or whatever.

But still we are not at the heart of the matter, given that sensation is a vehicle of semiosis prior to concept formation. For human beings are animals, and all animal awareness begins with sensations, not with *ideas* of sensations, à la Locke, but with sensations as that incipient *experience of objectivity* brought about by the action of some sensible thing upon an animal’s organs of sense.

Light reflects off different bodies differently, and when this differently reflected light strikes some animal's organ of sight, what the animal will "see" depends not only upon the surface reflecting light but also upon the constitution of the animal's eye. The result will be some color. How does this color exist? Neither "in the thing stimulating" as some medievals thought, nor "in the eye of the beholder", as the early moderns postulated. It exists precisely *between* the two as a *relation* connecting one to the other, arising from the action of stimulation here and now.

There is another angle, especially decisive from the semiotic point of view. The animal sensing color simultaneously senses a shape and a position or movement: shape is not color, but is revealed dependently upon color; so the relation of color to shape and position or movement, etc. is already a sign-relation – color is the vehicle on the basis of which shape and position are revealed in sensation. There is no moment of awareness in which this action of signs is not at work, for *all objects are significates, and all concepts are vehicles supporting interpretive sign-relations*: from the very beginning of sensation, prescissively (analytically and not experimentally) distinguished from perceptions and intellections, our awareness depends also upon signs that precede concept formation. This action of signs within sensation is different from the perception of a woman as wife. Whereas *perception* of material objects requires and presupposes concepts formed within the perceiver, *sensation* of basic qualities *logically* precedes formation of concepts and provides the very material which concepts are formed to interpret.

All animals interpret what is sensed according to a certain status: something to be sought, something to be shunned, or something safe to ignore. The *human* animal further creates concepts that make it possible to discover what these objects of perception are (correctly or incorrectly interpreted by the animal, as the case may be), whether awareness dependent or awareness independent, apart from their specific status in relation to the animal. So, intellectual concepts can make objects *knowable* according to what they are in themselves. But the signs of sensation, considered as prior to

objects perceived and/or objects understood, *objectify* something of the animal's surroundings wholly and solely on the basis of the interaction of the animal's body with the surrounding bodies of the immediate physical environment. Accordingly, even though we do not experience sensations wholly separated from our perceptions, sense experience, analytically considered, differs both from sense perception and from understanding, in that the latter two require and presuppose those psychological qualities or states that we call concepts or ideas, while sensations are *prior to concept formations* and presuppose only the action of the physical surroundings upon the external sense organs of the animal body.

There are, as Poincot showed (1632: Bk. 1, ques. 6), no grounds for holding that external sense, prescissively distinguished as such within perception and understanding, attains directly as its proper object only an image produced by the mind itself. The semiosis of sensations gives rise to an awareness (as a nascent objectivity), which simply cannot be classified as epistemological or ontological in any *modern* sense, because the *relations* upon which objectification depends at this level are prior to any such differentiation. Thus, semiotics takes us to the very heart of the problem of knowledge, namely, how it is that signs are able to lead us everywhere in nature.

Facing the Problem of Specialization vis-à-vis the Modern Fragmentation of University Culture

Within the universities, in the seventeenth century when science in the modern sense began to take hold, specialization presented itself as a *sine qua non*, as a necessity for scientific advance in this modern or ideoscopic sense dependent upon the instrumental extensions of the environmental awareness as species specific to human animals (contrasting with the exclusively cenoscopic medieval science). As specializations required for scientific advance in knowledge took hold, general opinions of previous philosophy fragmented. By the late nineteenth century, diversity of specializations threatened the very notion
